# Flora of the Carolinas, Virginia, and Georgia -- Current Status 

The publication nearly forty years ago of the Manual of the Vascular Flora of the Carolinas, by A.E. Radford, H.E. Ahles, and C.R. Bell, was a landmark. It was the result of an extraordinary effort to document the flora of the Carolinas, and after its publication, the existence of "the Manual" helped generate an interest in and further studies of the flora of the region. Since its publication in 1968 , many additional species have been documented as part of the region's flora, additional alien species have become naturalized, new species have been described, monographs have given new taxonomic insights into groups, nomenclature accepted in 1968 has been found to be invalid, new and more reliable keys have been developed, and systematic treatments have (one hopes) generally advanced. Increasingly, identification of the flora of our area (and other states of the Southeast and Mid-Atlantic) by academic researchers, agency personnel, and advanced amateurs is hampered by the lack of an up-to-date flora. Without such a flora, identification must involve reference to herbaria and thousands of monographs, papers, and other floras -- resources not readily available to many people who need them. The absence in the region of a single-source modern standard for the systematic treatment, nomenclature, and identification of the flora compromises scientific studies, ecological research, and agency inventory, management, and monitoring of ecosystem and species biodiversity.

Current Status. Since 1990, I (and collaborators) have been working on a new treatment of the flora of the Carolinas, Virginia, and Georgia, to fill the need for a new standard reference to aid in the consistent identification of the flora of the region. While building on the tradition of the Manual, the Flora is not a revision or second edition; it takes some different approaches, has features the Manual lacks, lacks features the Manual has, and has an expanded geographic scope. Initial draft treatments are now complete for about $90 \%$ of families, genera, and species, based on extensive research in the field, library, and herbarium. Prior to publication, additional herbarium research and annotation (based primarily at the UNC Herbarium, but involving other collections with regional coverage) and field testing will be completed. This work will of course result in changes to draft treatments.

The Flora will include treatment of all species in Virginia, North Carolina, South Carolina, and Georgia (the primary flora area), with less detailed treatment of species occurring east of the Mississippi River and south of the Ohio River and Mason-Dixon line, excluding Florida (the secondary flora area of Alabama, Tennessee, Kentucky, West Virginia, District of Columbia, Maryland, and Delaware). A selection of taxa occurring in a tertiary area including southern Pennsylvania, southern New Jersey, Mississippi, the Florida Parishes of Louisiana (those east of the Mississippi River), and northern Florida (especially the Panhandle and counties adjacent to Georgia) has also been included; this selection emphasizes native taxa and species believed to be potentially present in the primary or secondary areas. Approximately 5600 species and infraspecific taxa are recognized for the primary flora area (Carolinas and Virginia), with an additional 1000 taxa from the secondary flora area. Approximately 6600 taxa will be keyed and treated. Originally, Georgia was part of the secondary flora area, but has been added to the primary area. The treatments are being revised gradually to reflect this change, and some process "messiness" will be apparent to the user.

Publication of the first edition is projected to occur in several years, and to be intermediate in format and content between a "guide" (such as Wofford, Clewell, or Wunderlin) and a full "manual" (such as Radford, Ahles, \& Bell, Fernald, or Gleason \& Cronquist). For instance, full descriptions of each genus and species will not be included in the first edition, but detailed discussion of taxonomy, habitats, and rarity, comparison to unrelated but similar species, extensive bibliography (providing access to systematic, ecological, and population biology literature), and illustrations will be included. A "county dot map atlas" for the flora area is planned (and initial steps are underway), but will be issued as a separate publication at a later date.

Current review copies are available at any time from the author (over 1000 have already been distributed). These are being distributed in order to improve the quality of the formally published edition, by generating substantial review and comment prior to publication by a wide variety of users. Copies are provided at cost of xerox reproduction. The Flora can also be downloaded in pdf files from the website of the University of North Carolina Herbarium (www.herbarium.unc.edu).

## Features

Taxonomic treatment. Taxonomic treatments generally follow recent monographic and revisionary work, but an effort is made to provide a certain rough consistency of "splitting" vs. "lumping" across different taxonomic groups. As is generally true in recent treatments, generic and family concepts are often narrower than those used in the "RAB Manual", based on new evidence, including (but not limited to) cladistic methods applied to morphologic and molecular data. Ironically, these results have often resulted in a validation of earlier, narrower generic (and familial) concepts espoused by Small, Rydberg, and others. Varieties are less frequently recognized than by Fernald, though a considerable number of species and infraspecific taxa "lumped" by RAB are recognized (generally following more recent monographic or revisionary work). Some taxa not formally recognized are discussed and characters for their recognition provided.

Detailed keys. Keys are subjected to rigorous testing in the field and herbarium, by hundreds of users. To the degree feasible, keys are structured to emphasize characters that are readily observable and available for long parts of the year, such as vegetative characters (of course, this is not possible for all groups). Multiple characters are provided. Terminology strives to avoid abstruse technical terms which do not significantly add meaning (for some genera, an introduction to morphological characters and terms used is provided as "Identification notes" preceding the key). Geographic distributions and habitats are sometimes included in the keys as pragmatic, useful, secondary "characters," but are placed in brackets to indicate that they are not "true" characters. The keys include all species from the primary flora area (North Carolina, South Carolina, and Virginia), as well as all species occurring in a broader secondary area. The inclusion in the keys of taxa from the broader, secondary area will facilitate the discovery of range
extensions, as well as extending the usefulness of the Flora to a broader geographic area. In some cases, several alternate keys are provided. The primary emphasis of the keys is pragmatism -- effective and efficient identification. For this reason, a key to a genus sometimes includes closely similar taxa not in the genus that may be mistaken for it. Another example is that the "family key" to ferns and fern allies is actually a key to genera, allowing an emphasis in the key on readily observable characteristics, rather than the technical characters often needed to distinguish fern families. Keys are based on herbarium specimens, though reference is made when live characters may differ from those of pressed specimens. Some keys have been adapted from literature cited; where the adaptation is particularly close, credit is given to the source by specific citation. All keys should be regarded as "draft"; many will be substantially altered prior to publication, based on additional field and herbarium testing.

Habitat. Information is provided about the habitat of the taxon. Especially for more localized, specialized, or rare taxa, the habitat is described in considerable detail. Supplemental habitat information for GA rare species is taken from online information posted by the Georgia Natural Heritage Program.

Native status. The native or alien status is stated. If there is a question, that is mentioned or discussed. For aliens, an opinion is given as to whether the taxon is naturalized, persistent, waif, etc. in the primary flora area.

Flowering/fruiting dates. Flowering and fruiting dates are provided for the primary flora area, in a format similar to the Manual. These are derived from herbarium specimens viewed by the author (collected from within the Flora area), from field observations by the author (within the Flora area), and from literature cited.

Distribution of species. A statement of the rangewide distribution of each taxon treated is provided. This is based on published distribution maps and distribution statements in other floras, amended and improved by additional herbarium specimens and published records (such as the "Noteworthy Collections" section in Castanea). The distribution within the primary area is provided by state and physiographic province.

Literature. Nearly all genera have citations to recent, pertinent systematic literature, as well as more limited citations to literature on ecology and population biology. The intent is to provide the user with access into more detailed literature, and to document the literature basis of the treatment followed in the Flora. So far, about 1500 references are cited, and more will be added prior to publication.

Synonymy. Cited synonymy is provided to regional floras, monographs, revisions, and other significant floristic treatments. This allows comparison of the treatment in the Flora to other treatments, and convenient access to the other treatments. Synonymy is provided comprehensively for the following floras: Radford, Ahles, \& Bell (1968); Small (1933); Fernald (1950); Gleason and Cronquist 1st edition (1952); Godfrey \& Wooten (1979, 1981); Vascular Flora of the Southeastern States (Cronquist 1980, Isely 1990); Wofford (1989); Gleason and Cronquist 2nd edition (1991); Kartesz (1999); and Flora of North America (1993, 1997, 2000). Also, cited synonymy is provided for some families to other important and influential works, such as Hitchcock \& Chase for grasses, Correll for orchids, Luer for orchids, Mackenzie for Carex, Wilbur for legumes (1961), etc. Synonymy used in recent monographs and revisions is also cited. All names attributed to the Flora area in other floras, monographs, and revisions are accounted for.

Rarity. Species monitored as rare, threatened, or endangered by the state agencies of North Carolina, South Carolina, and Virginia, or by the U.S. Fish and Wildlife Service, are so indicated. While the details of rarity status will change, this will still provide the user a preliminary indication that the taxon is one of conservation concern.

Comments and discussion. Miscellaneous comments and discussion are provided for many species and genera, including discussion of biogeography, more details on distribution of rare species, additional notes on identification not included in the keys, information of particular interest on species biology and ecology, habitat, uses, discovery in the flora area or a state, etc. These "idiosyncratic comments" (as they have been called) add to the general usefulness and interest of what is intended to be a rigorous, practical, and interesting flora.

## Introduction

The understanding of the flora of the Carolinas, Virginia, and Georgia has progressed substantially since the publication thirty years ago of the landmark Manual of the Vascular Flora of the Carolinas, by A.E. Radford, H.E. Ahles, and C.R. Bell. Many additional species have been documented as part of the region's flora, additional alien species have become naturalized, new species have been described, monographs have given new taxonomic insights into groups, nomenclature accepted in 1968 has been found to be invalid, new and more reliable keys have been developed, and systematic treatments have advanced. Increasingly, identification of the flora of our area (and other states of the Southeast and Mid-Atlantic) by academic researchers, agency personnel, and advanced amateurs is hampered by the lack of an up-to-date flora. Without such a flora, identification must involve reference to herbaria and thousands of monographs, papers, and other floras -- resources not readily available to most people who need them. The absence in the region of a modern standard for the systematic treatment, nomenclature, and identification of the flora compromises scientific studies, ecological research, and agency inventory, management, and monitoring of ecosystems and rare species.

I intend this new flora for the Carolinas, Virginia, and Georgia to fulfill part of the need, until a thorough revision of the Manual is feasible. The emphasis of the Flora is on workable and detailed keys to all taxa, emphasizing vegetative characters where possible(to extend the period of the year in which species can be identified), detailed description of known habitats in the 3-state region, additional characters or hints useful in discrimination from similar species (including species not closely related but superficially similar and therefore confused), reference to the body of recent literature various aspects of the flora of our area, and discussion of abundance, phytogeography, and ecology. Our knowledge of the flora of our region is far poorer than is generally
recognized, and past floras have sometimes contributed to this impression, by obscuring taxonomic judgments or "lumping" poorly known taxa. An attempt is here made to draw attention to taxonomic questions or controversies, while at the same time presenting (as best as possible) a useable, current, consensus treatment. In making taxonomic decisions, I have generally relied strongly on recent monographs and revisions and the checklist of Kartesz (1999) (reviewed by hundreds of experts), but have tempered published treatments with field knowledge, examination of herbarium material, and consultation with other botanists in the region. While reluctant to disagree with recent monographs (by authors who have studied the groups in more detail than I have), I have also attempted to impose a somewhat consistent concept of taxonomic categories (family, genus, species, subspecies, and variety), so as not to have a very uneven treatment, with some genera divided finely and others coarsely.

The geographic scope of the Flora is Virginia, North Carolina, South Carolina, and Georgia. The three recent atlases of the Virginia flora (the most recent being Harvill et al., 1992) have done much to elucidate the state's flora, and to encourage a new wave of floristic exploration. The addition of the state of Virginia to the geographical scope covered by Radford, Ahles, \& Bell offers a number of advantages. The four-state region is a compact and relatively natural unit; Virginia, with its strong representation of Southern Aappalachian and Southeastern Coastal Plain species, has stronger floristic affinities to the Carolinas than to states to its north and west, with which it has often been treated in the past (as in Fernald, Gleason \& Cronquist, etc.). The four-state coverage will provide botanists working primarily in one state with a greater regional perspective, and should promote an increased knowledge of each state's flora, by making readily available information on species nearby.

## Taxonomic Philosophy

The concept that floras should be "conservative" (i.e. should take a "lumping" approach) strikes me as dangerous. Horton (1972), for instance, states "manual treatments in general should be conservative, leaving the fine points of distinction among taxa, especially infraspecific ones, to the monographer." Floras become the standard used by the great majority of users in an area, and taxa that are "lumped" are lost to the conciousness of all botanists other than a few specialists. Thus, two parallel taxonomies are established, one in common use and one (based on the best judgments of experts in the groups) not used, except by a few, interested in (and able to) seek out the papers of specialists. Ecological studies, species lists for parks or natural areas, rare species surveys, and assessments of the ecological significance of potential conservation areas are all flawed if not based on the best current information available. Moreover, from the standpoint of information theory and information management, a species list using a "lumped" taxonomy has lost information; if a "split" taxonomy has been used, the information is retained.

Even a casual perusal of the synonymy listed under the species of nearly any substantial genus in our flora will reveal taxa that have been variously treated as species, infraspecific taxa (variety or subspecies), and included within another taxon. Further studies, sometimes based on different techniques, sometimes simply by a different taxonomist with a different taxonomic philosophy, often result in the overturning of a previous taxonomic judgment. The basic categories of our taxonomy still do not have generally accepted, consensus definitions and criteria. With the taxonomy of our area still in such flux, I am inclined to provisionally accept some infraspecific taxa (or at least mention their alleged characters in the discussion under a species) so that they are not "lost in the shuffle."

The problem of the infraspecific categories variety and subspecies is a vexing one. A recent study of current practice in the use of various infraspecific categories showed that the usage of variety and subspecies was profoundly muddled, with regional traditions as important as taxonomic philosophy in determining usage (Hamilton \& Reichard 1992). Anderson, Crum, \& Buck (1990), in a recent checklist of North American mosses, concluded "we have been unwilling to list both subspecies and varieties because the differences between them are not clear to us. As far as we can judge, a subspecies and a variety are the same thing. The varietal designation has long been used in botany, more specifically in bryology, and we see no particular gain, at least at this stage of our knowledge, in attempting to erect more than the single infraspecific category, variety". Holmgren (1994) has also presented a strong argument for use of the varietal rank. The International Code of Botanical Nomenclature provides a strong basis for the use of "variety" as the primary taxonomic level below species, and "subspecies" only when an additional intervening level is desired. "4.1. The secondary ranks of taxa in descending sequence are tribe (tribus) between family and genus, section (sectio) and series (series) between genus and species, and variety (varietas) and form (forma) below species. 4.2. If a greater number of ranks of taxa is desired, the terms for these are made by adding the prefix "sub-" to the terms denoting the principal or secondary ranks. A plant may thus be assigned to taxa of the following ranks (in descending sequence): regnum, subregnum, divisio or phylum, subdivisio or subphylum, classis, subclassis, ordo, subordo, familia, subfamilia, tribus, subtribus, genus, subgenus, sectio, subsectio, series, subseries, species, subspecies, varietas, subvarietas, forma, subforma" (Greuter et al. 2000).

While I strongly agree with this sentiment, standardizing all infraspecific taxa recognized in our area to either variety or subspecies would involve hundreds of new combinations; such proliferation of combinations (not based on new knowledge of the taxa) seems undesirable, though such an approach was taken by Dorn (1988) in the considerably smaller flora of Wyoming. For now, I am primarily using variety where choices exist, but accepting subspecies where an equivalent varietal name does not exist. Occasionally (following recent monographers), I have accepted subspecies as an infraspecific category indicating a more distinctive taxon than variety. This is not a happy solution, since it means that the categories of subspecies and variety are not used consistently to indicate a different level of taxonomic distinction. I have been disinclined to use quadrinomials, as, for instance, Chamaecrista nictitans (Linnaeus) Moench ssp. nictitans var. aspera (Muhlenberg ex Elliott) Irwin \& Barneby, because they generally strike me as unwieldy, impractical, and unnecessarily confusing, without providing sufficient compensating benefits (our state of knowledge rarely warranting or supporting such finely distinguished classifications of relationships).

In general, the user or reader will find the following general differences in taxonomic treatment, as compared to other floristic treatments of the area, such as Radford, Ahles, \& Bell (RAB), Fernald (F), Gleason and Cronquist, 1st and 2nd editions (G, C), Small (S), Godfrey \& Wooten (GW), the treatments so far published as part of the vascular flora of the southeastern states (SE),

Kartesz (K), Wofford (W), and Harvill et al. (H). Family level taxonomy generally follows Cronquist's recent work (reflected in C and K), with a few groups split more finely; this represents a generally somewhat finer splitting than RAB, F, G, GW, W, and H, substantially coarser than $S$. Generic level taxonomy has for the last several decades been generally headed towards finer divisions; this treatment reflects that trend, with genera split somewhat more than RAB, F, G, W, and H, about the same as C, GW, K , and SE, and more coarsely than S. It is interesting to note, though, that our generic concepts are now perhaps more than halfway back to Small and Rrydberg! At the species level, the treatment is about equivalent to C, K, and SE, slightly more finely split than F and G, substantially more finely split than RAB, GW, H, and W, and substantially coarser than S. Infraspecific taxa are recognized much more frequently than $R A B, H$, and $W$, somewhat more frequently than $G W$, about the same as $C, G, K, S E$, and much less frequently than $F$ (probably less than half of Fernaldian varieties are recognized at any level). S did not use varieties (except very exceptionally); many taxa recognized by $S$ as species are here regarded as varieties, or not recognized at all. Overall and on average, substantially more taxa are recognized than are by RAB and H, slightly more than by C, G, GW, W, about the same as $K$ and SE, and substantially fewer than by $F$ or $S$.

The Flora is being prepared as time allows. Drafts of family and genus treatments are being made available to interested botanists for use and field-testing. Some treatments must be considered tentative until further testing in the field and herbarium can be accomplished. All treatments should be considered as works in progress at this time, likely to change slightly or greatly before publication. For some species, determination of the distributions, habitats, and phenology requires additional herbarium and field work, not yet completed. I welcome suggestions on format and content.

## Progress (as of June 10, 2005)

Working drafts now completed of: 193 families, 1229 genera, 4561 species or infraspecific taxa.
Estimated totals in $1^{\circ}$ and $2^{\circ}$ flora area: 234 families, 1343 genera, 6000 species or infraspecific taxa.
Percentage complete: families ( $82.9 \%$ ), genera ( $93.6 \%$ ), species ( $79.6 \%$ ).

## Contents (as of June 10, 2005)

Genus name in bold italics $=$ working draft completed
Family name in bold = working draft completed
Genus or family name in regular type = working draft not yet completed
[in brackets are the number of genera with completed drafts, and the number of species or infraspecific taxa]

## FERNS AND FERN ALLIES

Aspidiaceae: [see Dryopteridaceae, Thelypteridaceae]
Aspleniaceae [1: 17]: Asplenium [17].
Azollaceae [1: 2]: Azolla [2].
Blechnaceae [2: 3]: Blechnum [1], Woodwardia [2]
Dennstaedtiaceae [2: 3]: Dennstaedtia [1], Pteridium [2].
Dryopteridaceae [12: 30]: Arachniodes [1], Athyrium [2], Cyrtomium [2], Cystopteris [5], Deparia [2], Diplazium [1],
Dryopteris [9], Gymnocarpium [2], Matteuccia [1], Onoclea [1], Polystichum [1], Woodsia [3].
Equisetaceae [1: 5]: Equisetum [5].
Grammitidaceae [1: 1]: Micropolypodium [1].
Hymenophyllaceae [2: 5]: Hymenophyllum [2], Trichomanes [3].
Isoetaceae: Isoetes (in progress).
Lycopodiaceae [8: 18]: Dendrolycopodium [3], Diphasiastrum [2], Huperzia [4], Lycopodiella [4], Lycopodium [2],
Palhinhaea [1], Pseudolycopodiella [1], Spinulum [1].
Lygodiaceae [1: 2]: Lygodium [2].
Marsileaceae [2: 3]: Marsilea [2], Pilularia [1].
Ophioglossaceae [4: 17]: Botrychium [3], Botrypus [1], Ophioglossum [6], Sceptridium [7].
Osmundaceae [1: 4]: Osmunda [4].
Polypodiaceae [3: 5]: Phlebodium [1], Pleopeltis [1], Polypodium [3].
Psilotaceae [1: 1]: Psilotum [1].
Pteridaceae [7: 19]: Adiantum [4], Argyrochosma [1], Astrolepis [2], Cheilanthes [5], Cryptogramma [1], Pellaea [4], Pteris
[2]. [and also see Dennstaedtiaceae]
Salviniaceae [1: 2]: Salvinia [2].
Schizaeaceae [1: 1]: Schizaea [1]. [and also see Lygodiaceae]
Selaginellaceae [1: 8]: Selaginella [8].
Thelypteridaceae [3: 10]: Macrothelypteris [1], Phegopteris [2], Thelypteris [7].
Vittariaceae [1: 2]: Vittaria [2].

## GYMNOSPERMS

```
Cephalotaxaceae [1: 1]: Cephalotaxus [1].
Cupressaceae [6: 9]: Chamaecyparis [1], Cunninghamia [1], Juniperus [3], Platycladus [1], Taxodium [2], Thuja [1].
Ginkgoaceae [1: 1]: Ginkgo [1].
Pinaceae [6: 24]: Abies [2], Cedrus [1], Larix [1], Picea [3], Pinus [15], Tsuga [2].
Taxaceae [2: 2]: Taxus [1], Torreya [1].
Taxodiaceae: [see Cupressaceae]
Zamiaceae [1: 1]: Zamia [1].
```

DICOTYLEDONS

Acanthaceae [9: 22]: Dicliptera [1], Dyschoriste [2], Elytraria [1], Hygrophila [2], Justicia [5], Pseuderanthemum [1], Ruellia [8], Stenandrium [1], Yeatesia [1].
Aceraceae: [see Sapindaceae]
Actinidiaceae: Actinidia.
Adoxaceae [1: 4]: Sambucus [4], Viburnum (in progress).
Aizoaceae [3: 5]: Sesuvium [3], Tetragonia [1], Trianthema [1]. [also see Molluginaceae]
Altingiaceae [1: 1]: Liquidambar [1].
Amaranthaceae [7: 11]: Achyranthes [1], Alternanthera [3], Amaranthus (in progress), Celosia [2], Froelichia [2], Gomphrena [1], Guilleminea [1], Iresine [1].

Anacardiaceae [3: 13]: Cotinus [2], Rhus [6], Toxicodendron [5].
Annonaceae [1: 7]: Asimina [7].
Apiaceae [45: 101]: Aegopodium [1], Aethusa [1], Ammi [2], Ammoselinum [2], Anethum [1], Angelica [3], Anthriscus [3], Apium [2], Bupleurum [2], Carum [1], Centella [1], Chaerophyllum [4], Ciclospermum [1], Cicuta [4], Conioselinum [1], Conium [1], Coriandrum [1], Cryptotaenia [1], Daucus [2], Erigenia [1], Eryngium [10], Falcaria [1], Foeniculum [1], Heracleum [1], Hydrocotyle [8], Ligusticum [1], Lilaeopsis [2], Osmorhiza [2], Oxypolis [4], Pastinaca, Perideridia [1], Petroselinum [1], Peucedanum [1], Pimpinella [1], Polytaenia [1[, Pseudotaenidia [1], Ptilimnium [6], Sanicula [7], Scandix [1], Sium [1], Spermolepis [3], Taenidia [1], Thaspium [4], Torilis [3], Trepocarpus [1], Zizia [3].

Asclepiadaceae: [see Apocynaceae]
Asteraceae [123: 471]: Acanthospermum [3], Achillea (in progress), Acmella [2], Ageratina [5], Ageratum [2], Ambrosia (in progress), Ampelaster [1], Amphiachyris [1], Anaphalis [1], Antennaria [9], Anthemis [4], Arctium (in progress), Arnica [1], Arnoglossum [6], Artemisia [11], Aster (in progress), Astranthium [1], Baccharis [4], Balduina [3], Balsamita [1], Bellis [1], Berlandiera [1], Bidens (in progress), Bigelowia [2], Boltonia [4], Borrichia [1], Brickellia [2], Brintonia [1], Calyptocarpus [1], Carduus [3], Carphephorus [5], Centaurea [9], Chamaemelum [2], Chaptalia [1], Chondrilla [1], Chrysanthemum [1], Chrysogonum [3], Chrysoma [1], Chrysopsis [5], Cichorium [1], Cirsium [14], Cnicus [1], Conyza [4], Coreopsis [20], Cosmos [2], Crepis [4], Croptilon [1], Dendranthema [1], Doellingeria [3], Dracopis [1], Echinacea [5], Echnops [1], Eclipta [1], Elephantopus [4], Emilia [1], Erechtites [2], Erigeron [10], Eupatorium [29], Eurybia [16], Euthamia [5], Eutrochium [5], Facelis [1], Filago [3], Fleischmannia [1], Gaillardia [3], Galinsoga [2], Gamochaeta [8, in progress], Gnaphalium [1], Grindelia [2], Guizotia [1], Gymnostyles [1], Hartwrightia [1], Hasteola [1], Helenium [7], Helianthus [30], Heliopsis [3], Heterotheca [3], Hieracium [13], Hymenopappus [1], Hypochaeris [4], Inula [1], Ionactis [1], Iva [6], Ixeris [1], Krigia [5], Lactuca (in progress), Lapsana [1], Leontodon [2], Leucanthemum [2], Liatris (in progress), Lygodesmia [1], Madia [1], Marshallia [7], Matricaria [2], Melanthera [1], Mikania [1], Oclemena [2], Oligoneuron [3], Onopordum [1], Packera [10], Palafoxia [1], Parthenium [5], Petasites [1], Picris [2], Pityopsis [8], Pluchea [6], Polymnia [2], Prenanthes [10], Pseudognaphalium [5], Pterocaulon [1], Pyrrhopappus [1], Ratibida [2], Rudbeckia (in progress), Rugelia [1], Santolina [1], Sclerolepis [1], Scolymus [1], Senecio [1], Sericocarpus [3], Silphium (in progress), Silybum [1], Smallanthus [1], Solidago (in progress), Soliva [1], Sonchus (in progress), Stokesia [1], Symphyotrichum (in progress), Tagetes [3], Tanacetum [2], Taraxacum (in progress), Tetragonotheca [1], Tragopogon [3], Tussilago [1], Verbesina [7], Vernonia (in progress), Xanthium (in progress), Youngia [1], Zinnia [2].
Aucubaceae: [see Garryaceae]
Balsaminaceae [1: 3]: Impatiens [3].
Bataceae [1: 1]: Batis [1].
Begoniaceae [1: 1]: Begonia [1].
Berberidaceae [7: 11]: Berberis [3], Caulophyllum [2], Diphylleia [1], Jeffersonia [1], Mahonia [2], Nandina [1], Podophyllum [1].
Betulaceae [5: 19]: Alnus [6], Betula [8], Carpinus [2], Corylus [2], Ostrya [1].
Bignoniaceae [4:5]: Bignonia [1], Campsis [1], Catalpa [2], Macfadyena [1].
Boraginaceae [14: 36]: Amsinckia [1], Anchusa [1], Borago [1], Buglossoides [1], Cynoglossum [3], Echium [2], Hackelia [1], Heliotropium [5], Lithospermum [4], Mertensia [1], Myosotis [8], Onosmodium [5], Plagiobothrys [1], Symphytum [2].
Brassicaceae [49: 123]: Alliaria [1], Allysum [1], Arabidopsis [2], Arabis [10], Armoracia [1], Barbarea [2], Berteroa [1], Boechera (in progress), Brassica [4], Braya [1], Bunias [2], Cakile [3], Calepina [1], Camelina [2], Capsella [1], Cardamine [18], Chorispora [1], Cleome [2], Coincya [1], Conringia [1], Descurainia [3], Diplotaxis [3], Draba [6], Eruca [1], Erucastrum [1], Erysimum [3], Hesperis [1], Iberis [1], Isatis [1], Leavenworthia [10], Lepidium (in progress), Lobularia [1], Lunaria [1], Matthiola [1], Microthlaspi [1], Moricandia [1], Nasturtium [3], Neobeckia [1], Paysonia [5], Physaria [2], Polanisia [3], Raphanus [2], Rapistrum [1], Rorippa [7], Sinapis [2], Sibara [1], Sisymbrium [2], Teesdalia [1], Thlaspi [2], Turritis [1], Warea [1].
Buddlejaceae: [see Scrophulariaceae].
Buxaceae [2: 3]: Buxus [1], Pachysandra [2].
Cabombaceae [2: 2]: Brasenia [1], Cabomba [1].
Cactaceae [1: 6]: Opuntia [6].
Caesalpiniaceae: [see Fabaceae]
Callitrichaceae: [see Plantaginaceae].
Calycanthaceae [1: 2]: Calycanthus [2]
Calyceraceae [1: 1]: Acicarpha [1].
Campanulaceae [5: 10]: Campanula [6], Campanulastrum [1], Jasione [1], Lobelia (in progress), Platycodon [1], Triodanis (in progress), Wahlenbergia [1].
Cannabaceae [3: 8]: Cannabis [1], Celtis [3], Humulus [4]
Capparaceae: [see Cleomaceae]
Caprifoliaceae [3: 23]: Lonicera [16], Symphoricarpos [3], Triosteum [4]. [also see Adoxaceae, Diervillaceae, Linnaeaceae]
Caryophyllaceae [24: 81]: Agrostemma [1], Arenaria [3], Cerastium [10], Dianthus [3], Drymaria [1], Holosteum [1], Honckenya [1], Lychnis [1], Minuartia [8], Moehringia [1], Moenchia [1], Myosoton [1], Paronychia [11], Petrorhagia [1], Polycarpon [1], Sagina [2], Saponaria [1], Scleranthus [1], Silene [16], Spergula [3], Spergularia [2], Stellaria
[9], Stipulicda [1], Vaccaria [1].
Casuarinaceae [1: 1]: Casuarina [1].
Celastraceae [4: 13]: Celastrus [2], Crossopetalum [1], Euonymus [9], Paxistima [1]
Celtidaceae: [see Cannabaceae]
Ceratophyllaceae [1: 3]: Ceratophyllum [3].
Chenopodiaceae [9: 16]: Atriplex [4], Bassia [2], Beta [1], Chenopodium (in progress), Cycloloma [1], Salicornia [2], Salsola
[2], Sarcocornia [1], Spinacia [1], Suaeda [2].
Chrysobalanaceae [1: 1]: Licania [1].
Cistaceae [3: 21]: Crocanthemum [8], Hudsonia [3], Lechea [10].
Cleomaceae [2: 5]: Cleome [2], Polanisia [3].
Clethraceae [1: 2]: Clethra [2].
Clusiaceae: [see Hypericaceae]
Compositae: [see Asteraceae]
Convolvulaceae [7: 28]: Calystegia (in progress), Convolvulus [1], Cuscuta (in progress), Dichondra [1], Evolvulus [2], Ipomoea [16], Jacquem ontia [1], Merremia [1], Stylisma [6].
Cornaceae: Cornus (in progress).
Crassulaceae [5: 19]: Crassula [2], Diamorpha [1], Hylotelephium [3], Rhodiola [1], Sedum [12]. [and also see Penthoraceae]
Cucurbitaceae [9: 13]: Cayaponia [1], Citrullus [1], Cucumis [2], Cucurbita [3], Echinocystis [1], Lagenaria [1], Luffa [2], Melothria [1], Sicyos [1].
Cuscutaceae: [see Convolvulaceae]
Cyrillaceae [2: 3]: Cliftonia [1], Cyrilla [2].
Diapensiaceae [3: 5]: Galax [1], Pyxidanthera [2], Shortia [2].
Diervillaceae [2, 4]: Diervilla [3], Weigela [1].
Dionaeaceae [1: 1]: [see Droseraceae].
Dipsacaceae [2: 4]: Dipsacus [3], Knautia [1].
Droseraceae [1: 6]: Dionaea [1], Drosera [6].
Ebenaceae [1: 1]: Diospyros [1].
Elaeagnaceae [1: 4]: Elaeagnus [4].
Elatinaceae [1: 4]: Elatine [4].
Empetraceae: [see Ericaceae]
Ericaceae [28: 96]: Agarista [1], Andromeda [1], Arctostaphylos [1], Bejaria [1], Calluna [1], Ceratiola [1], Chamaedaphne [1], Chimaphila [2], Elliottia [1], Epigaea [1], Erica [1], Eubotrys [2], Gaultheria [2], Gaylussacia [9], Hypopitys [1], Kalmia [6], Leucothoe [2], Lyonia [6], Menziesia [1], Monotropa [1], Monotropsis [1], Orthilia [1], Oxydendrum [1], Pieris [3], Pyrola [3], Rhododendron [18], Vaccinium [26], Zenobia [1].
Euphorbiaceae [12: 59]: Acalypha [6], Chamaesyce [13], Cnidoscolus [1], Croton [9], Ditrysinia [1], Euphorbia [20], Manihot [1], Ricinus [1], Stillingia [2], Tragia [3], Triadica [1], Vernicia [1]. [and also see Phyllanthaceae]
Fabaceae [66: 261]: Abrus [1], Acacia [1], Aeschynomene [5], Albizia [1], Alysicarpus [1], Amorpha [8], Amphicarpaea [2], Apios [2], Arachis [1], Astragalus [8], Baptisia [11], Centrosema [1], Cercis [1], Chamaecrista [5], Cladrastis [1], Clitoria [2], Crotalaria [10], Cytisus [1], Dalea [11], Desmanthus [1], Desmodium [26], Dioclea [1], Erythrina [1], Galactia [7], Genista [1], Gleditsia [2], Glottidium [1], Glycine [1], Glycyrrhiza [1], Gymnocladus [1], Indigofera [4], Kummerowia [2], Lablab [1], Lathyrus [10], Lespedeza [14], Leucaena [1], Lotus [3], Lupinus [4], Macroptilium [1], Medicago [7], Melilotus [4], Mimosa [3], Mucuna [1], Neptunia [2], Orbexilum [6], Parkinsonia [1], Pediomelum [2], Phaseolus [5], Pisum [1], Pueraria [1], Rhynchosia [6], Robinia [8], Securigera [1], Senna [6], Sesbania [2], Strophostyles [3], Stylosanthes [1], Styphnolobium [1], Tephrosia [4], Thermopsis [3], Trifolium [23], Trigonella [1], Ulex [1], Vicia [20], Vigna [2], Wisteria [3], Zornia [1]. [and also see Krameriaceae]
Fagaceae [3: 45]: Castanea [4], Fagus [2], Quercus [39].
Fumariaceae [6: 11]: Adlumia [1], Capnoides [1], Corydalis [3], Dicentra [4], Fumaria [1], Lamprocapnos [1].
Garryaceae [1:1]: Aucuba [1].
Gelsemiaceae [1: 2]: Gelsemium [2].
Gentianaceae [8: 36]: Bartonia [3], Centaurium [3], Frasera [1], Gentiana [9], Gentianella [2], Gentianopsis [1], Obolaria [1], Sabatia [16]. [and also see Menyanthaceae]
Geraniaceae [2: 12]: Erodium [2], Geranium [10].
Grossulariaceae [1: 8]: Ribes [8].
Guttiferae: [see Hypericaceae]
Haloragaceae [2: 12]: Myriophyllum (in progress), Proserpinaca [4].
Hamamelidaceae [2: 3]: Fothergilla [2], Hamamelis [1]. [and also see Altingiaceae]
Hippocastanaceae: [see Sapindaceae]
Hydrangeaceae [4: 11]: Decumaria [1], Deutzia [1], Hydrangea [5], Philadelphus [4].
Hydrastidaceae [1: 1]: Hydrastis [1].
Hydroleaceae [1: 3]: Hydrolea [3].
Hydrophyllaceae [6: 19]: Ellisia [1], Hydrophyllum [5], Nama [1], Nemophila [1], Phacelia [8].
Hypericaceae [2: 42]: Hypericum [38], Triadenum [4].
Illiciaceae [1: 2]: Illicium [2].
Iteaceae [1: 1]: Itea [1].
Juglandaceae [2: 15]: Carya [13], Juglans [2].
Krameriaceae [1: 1]: Krameria [1].
Labiatae: [see Lamiaceae]
Lamiaceae [44: 138]: Agastache [3], Ajuga [3], Blephilia [3], Callicarpa [2], Clerodendrum [3], Clinopodium [9], Collinsonia [4], Conradina [1], Cunila [1], Dicerandra [5], Dracocephalum [1], Elsholtzia [1], Galeopsis [3], Glechoma [1],

Hedeoma [2], Hyptis [2], Hyssopus [1], Lamiastrum [1], Lamium [5], Leonotis [1], Leonurus [3], Lycopus [8], Macbridea [1], Marrubium [1], Meehania [1], Melissa [1], Mentha [9], Monarda [11], Mosla [1], Nepeta [1], Ocimum [1], Origanum [1], Perilla [2], Physostegia [4], Prunella [3], Pycnanthemum [18], Rosmarinus [1], Salvia [8], Satureja [1], Scutellaria (in progress), Sideritis [1], Stachys (in progress), Synandra [1], Teucrium (in progress), Thymus [1], Trichostema [5], Vitex [1].
Lardizabalaceae [1: 1]: Akebia [1].
Lauraceae [6: 10]: Cinnamomum [1], Laurus [1], Lindera [4], Litsea [1], Persea [2], Sassafras [1].
Leguminosae: [see Fabaceae].
Leitneriaceae: [see Simaroubaceae].
Lentibulariaceae [2: 19]: Pinguicula [3], Utricularia [16].
Lepuropetalaceae: [see Parnassiaceae].
Limnanthaceae [1: 1]: Floerkea [1].
Linaceae [1: 9]: Linum [9].
Linnaeaceae [3: 3]: Abelia [1], Kolkwitzia [1], Linnaea [1].
Loganiaceae [2: 5]: Mitreola [3], Spigelia [2]. [and also see Gelsemiaceae].
Loranthaceae: [see Viscaceae].
Lythraceae [9: 14]: Ammania [2], Cuphea [2], Decodon [1], Didiplis [1], Lagerstroemia [1], Lythrum [4], Punica [1], Rotala [1], Trapa [1].
Magnoliaceae [2: 9]: Liriodendron [1], Magnolia [8].
Malvaceae [21: 41]: Abelmoschus [1], Abutilon [1], Alcea [1], Althaea [1], Anoda [1], Callirhoe [3], Firmiana [1], Gossypium [1], Hibiscus [8], Iliamna [2], Kosteletzkya [2], Malva [4], Malvastrum [1], Malvaviscus [1], Melochia [1], Modiola [1], Napaea [1], Pavonia [1], Sida [5], Tilia [3], Triumfetta [1].
Martyniaceae [1: 1]: Proboscidea [1].
Melastomataceae [1: 10]: Rhexia [10].
Meliaceae [1: 1]: Melia [1].
Menispermaceae [3: 3]: Calycocarpum [1], Cocculus [1], Menispermum [1].
Menyanthaceae [2: 4]: Menyanthes [1], Nymphoides [3].
Mimosaceae: [see Fabaceae]
Molluginaceae [1: 1]: Mollugo [1].
Moraceae [6: 8]: Broussonetia [1], Cudrania [1], Fatoua [1], Ficus [2], Maclura [1], Morus [2].
Myricaceae [3: 7]: Comptonia [1], Morella [5], Myrica [1].
Myrsinaceae [4: 22]: Anagallis [4], Glaux [1], Lysimachia [16], Trientalis [1].
Nelumbonaceae [1: 2]: Nelumbo [2].
Nyctaginaceae [2: 5]: Boerhavia [2], Mirabilis [3].
Nymphaeaceae [2: 8]: Nuphar [6], Nymphaea [2]. [and also see Nelumbonaceae]
Nyssaceae [1: 4]: Nyssa [4].
Oleaceae [7: 23]: Chionanthus [1], Forestiera [4], Forsythia [2], Fraxinus [6], Ligustrum [8], Osmanthus [1], Syringa [1].
Onagraceae [6: 73]: Chamerion [1], Circaea [3], Epilobium [6], Gaura [5], Ludwigia [28], Oenothera [30].
Orobanchaceae [13: 29]: Agalinis (in progress), Aureolaria [7], Buchnera [2], Castilleja [2], Conopholis [1], Dasistoma [1], Epifagus [1], Macranthera [1], Melampyrum [3], Orobanche [4], Pedicularis [3], Schwalbea [1], Seymeria [2], Striga [1].
Oxalidaceae: Oxalis (in progress).
Paeoniaceae [1: 1]: Paeonia [1].
Papaveraceae [8: 14]: Argemone [2], Chelidonium [1], Eschscholtzia [1], Glaucium [1], Macleaya [1], Papaver [6], Sanguinaria [1], Stylophorum [1]. [and also see Fumariaceae]
Parnassiaceae [2: 5]: Lepuropetalon [1], Parnassia [4].
Passifloraceae [1: 3]: Passiflora [3].
Paulowniaceae [1: 1]: Paulownia [1].
Pedaliaceae [1: 1]: Sesamum [1].
Penthoraceae [1: 1]: Penthorum [1].
Phrymaceae [4: 12]: Lindernia [6], Mazus [2], Mimulus [3], Phryma [1].
Phyllanthaceae [1: 1]: Phyllanthus [3].
Phytolaccaceae [1: 2]: Phytolacca [2].
Piperaceae [1]: Peperomia [1].
Pittosporaceae [1: 1]: Pittosporum [1].
Plantaginaceae [23: 67]: Amphianthus [1], Antirrhinum [2], Bacopa [5], Callitriche (in progress), Chaenorrhinum [1], Chelone [4], Collinsia [1], Cymbalaria [1], Digitalis [2], Gratiola [7], Kickxia [2], Leucospora [1], Limnophila [1], Limosella [1], Linaria [1], Mecardonia [1], Micranthemum [2], Misopates [1], Nuttallanthus [3], Penstemon [12], Plantago [13], Scoparia [2], Sophronanthe [2], Veronica (in progress), Veronicastrum [1]
Platanaceae [1: 1]: Platanus [1].
Plumbaginaceae [1: 1]: Limonium [1].
Podostemaceae [1: 1]: Podostemum [1].
Polemoniaceae [3: 27]: Ipomopsis [1], Phlox [23], Polemonium [3].
Polygalaceae [1: 23]: Polygala [23].
Polygonaceae [7: 19]: Brunnichia [1], Eriogonum [3], Fagopyrum [1], Fallopia [5], Persicaria (in progress), Polygonella [6], Polygonum (in progress), Reynoutria [2], Rheum [1], Rumex (in progress).
Portulacaceae [4: 18]: Claytonia [4], Montia (in progress), Phemeranthus (6), Portulaca [8], Talinum [1].
Primulaceae [2: 3]: Dodecatheon [2], Hottonia [1].
Punicaceae: [see Lythraceae].

Ranunculaceae [20: 90]: Aconitum [3], Actaea [5], Adonis [1], Anemonella [1], Anemone [10], Aquilegia [2], Caltha [1], Clematis [17], Consolida [2], Coptis [1], Delphinium [5], Enemion [1], Eranthis [1], Helleborus [1], Myosurus [1], Nigella [1], Ranunculus [26], Thalictrum [9], Trautvetteria [1], Xanthorhiza [1]. [and also see Hydrastidaceae]
Resedaceae [1: 5]: Reseda [5].
Rhamnaceae [6: 14]: Berchemia [1], Ceanothus [4], Frangula [2], Hovenia [1], Rhamnus [5], Sageretia [1].
Rhizophoraceae [1: 1]: Rhizophora [1].
Rosaceae [25: 91]: Agrimonia [7], Amelanchier (in progress), Aphanes [1], Argentina [1], Aronia [3], Aruncus [3], Chaenomeles [1], Crataegus (48-in progress), Dalibarda [1], Exochorda [1], Filipendula [2], Fragaria (in progress), Geum [9], Kerria [1], Malus (in progress), Neviusia [1], Physocarpus [2], Porteranthus [2], Potentilla [11], Prunus (in progress), Pyracantha (in progress), Pyrus [2], Rhodotypos [1], Rosa (in progress), Rubus [20], Sanguisorba [3], Sibbaldiopsis [1], Sorbaria [1], Sorbus [2], Spiraea [11], Stephanandra [1], Waldsteinia [3]. [and also see Chrysobalanaceae]
Rubiaceae [12: 49]: Asperula [1], Cephalanthus [1], Cruciata [1], Diodia (in progress), Galium, Houstonia, Mitchella [1], Mitracarpus [1], Oldenlandia [3], Paederia (in progress), Pentodon [1], Pinckneya [1], Richardia [2], Sherardia [1], Spermacoce (in progress).
Rutaceae [4: 6]: Citrus[1], Ptelea [2], Ruta [1], Zanthoxylum [2].
Salicaceae [2: 24]: Populus, Salix.
Samolaceae [1: 1]: Samolus [1].
Santalaceae [4: 4]: Buckleya [1], Comandra [1], Nestronia [1], Pyrularia [1].
Sapindaceae [5:24]: Acer [13], Aesculus [6], Cardiospermum [1], Koelreuteria [3], Sapindus [1].
Sapotaceae [1: 5]: Sideroxylon [5].
Sarraceniaceae [1: 11]: Sarracenia [11].
Saururaceae [1: 1]: Saururus [1].
Saxifragaceae [8: 23]: Astilbe [2], Boykinia [1], Chrysosplenium [1], Heuchera [8], Mitella [1], Saxifraga [7], Sullivantia [1], Tiarella [2]. [and also see Grossulariaceae, Hydrangeaceae, Iteaceae, Parnassiaceae, and Penthoraceae]
Schisandraceae [1: 1]: Schisandra [1].
Scrophulariaceae [3: 10]: Buddleja [2], Scrophularia [2], Verbascum [6]. [and also see Orobanchaceae, Phrymaceae, and Plantaginaceae]
Simaroubaceae [2: 2]: Ailanthus [1], Leitneria [1].
Solanaceae [10: 26]: Calibrachoa [1], Capsicum [1], Datura [4], Lycium [3], Nicandra [1], Nicotiana [2], Nierembergia [1], Petunia [1], Physalis [11], Salpichroa [1], Solanum (in progress).
Sphenocleaceae [1: 1]: Sphenoclea [1].
Staphyleaceae [1: 1]: Staphylea [1].
Styracaceae [2: 8]: Halesia [5], Styrax [3].
Symplocaceae [1: 1]: Symplocos [1].
Tamaricaceae: Tamarix (in progress).
Tetrachondraceae [1: 1]: Polypremum [1].
Theaceae [4: 6]: Camellia [2], Franklinia [1], Gordonia [1], Stewartia [2].
Thymelaeaceae [1: 1]: Dirca [1].
Trapaceae: [see Lythraceae]
Tropaeolaceae [1: 1]: Tropaeolum [1].
Turneraceae [1: 1]: Piriqueta [1].
Ulmaceae [2: 10]: Planera [1], Ulmus [9]. [also see Celtidaceae].
Umbelliferae: [see Apiaceae].
Urticaceae [5: 14]: Boehmeria [2], Laportea [1], Parietaria [4], Pilea [3], Urtica [4].
Valerianaceae [2: 5]: Valeriana [2], Valerianella [3].
Verbenaceae [3: 6]: Glandularia [3], Lantana (in progress), Phyla [2], Stylodon [1], Verbena (in progress). [and also see Lamiaceae and Phrymaceae]
Violaceae [2: 39]: Hybanthus [2], Viola [40].
Viscaceae [1: 1]: Phoradendron [1].
Vitaceae [4: 17]: Ampelopsis, Cissus, Parthenocissus, Vitis.
Zygophyllaceae [2: 3]: Kallstroemia [1], Tribulus [2].

## MONOCOTYLEDONS

Acoraceae [1: 2]: Acorus [2].
Agavaceae [4: 10]: Camassia [1], Manfreda [1], Schoenolirion [3], Yucca [5].
Alismataceae [3: 28]: Alisma [3], Echinodorus [4], Sagittaria [21].
Alliaceae [3: 18]: Allium [15], Ipheion [1], Nothoscordum [2].
Alstroemeriaceae [1: 1]: Alstroemeria [1].
Amaryllidaceae [8: 23]: Crinum [2], Galanthus [2], Hymenocallis [6], Leucojum [1], Lycoris [1], Narcissus [6], Sternbergia [1], Zephyranthes [4].
Araceae [15: 28]: Arisaema [5], Arum [1], Calla [1], Colocasia [1], Landoltia [1], Lemna [7], Orontium [1], Peltandra [2], Pinellia [1], Pistia [1], Spirodela [1], Symplocarpus [1], Wolffia [3], Wolffiella [1], Xanthosoma [1]. [and also see Acoraceae]
Arecaceae [4: 5]: Butia [1], Rhapidophyllum [1], Sabal [2], Serenoa [1].
Asparagaceae [1: 1]: Asparagus [1].
Bromeliaceae [1: 4]: Tillandsia [4].

Burmanniaceae [2: 3]: Apteria [1], Burmannia [2].
Cannaceae [1: 3]: Canna [3].
Colchicaceae [2: 7]: Colchicum [1], Uvularia [6].
Commelinaceae [4: 18]: Commelina [9], Cuthbertia [2], Murdannia [2], Tradescantia [5].
Convallariaceae: [see Ruscaceae].
Cymodoceaceae [2: 2]: Halodule [1], Syringodium [1].
Cyperaceae [17: 372]: Bolboschoenus [4], Bulbostylis [6], Carex (in progress), Cladium [2], Cymophyllus [1], Cyperus [59], Dulichium [1], Eleocharis (in progress), Eriophorum [4], Fimbristylis [13], Fuirena [4], Isolepis [2], Kyllinga [4], Lipocarpha [3], Rhynchospora [71], Schoenoplectus [12], Scirpus [11], Scleria [12], Trichophorum [2].
Dioscoreaceae [1: 5]: Dioscorea [5]
Eriocaulaceae [3: 12]: Eriocaulon (8), Lachnocaulon [3], Syngonanthus [1].
Gramineae: [see Poaceae]
Haemodoraceae [1: 1]: Lachnanthes [1].
Hemerocallidaceae [1: 2]: Hemerocallis [2].
Hostaceae [1: 3]: Hosta [3].
Hyacinthaceae [4: 8]: Hyacinthoides [2], Hyacinthus [1[, Muscari [3], Ornithogalum [2].
Hydrocharitaceae [5: 7]: Egeria [1], Elodea [3], Hydrilla [1], Limnobium [1], Vallisneria [1].
Hypoxidaceae [1: 6]: Hypoxis [6].
Iridaceae [5: 15]: Belamcanda [1], Calydorea [1], Crocus, Crocosmia [1], Gladiolus (in progress), Herbertia (in progress), Iris (in progress), Nemastylis [1], Sisyrinchium [11].
Juncaceae [2: 45]: Juncus [38], Luzula [7].
Juncaginaceae [1: 1]: Triglochin [1].
Lemnaceae: [see Araceae]
Liliaceae [8: 25]: Clintonia [2], Erythronium [6], Lilium [10], Medeola [1], Prosartes [2], Streptopus [2], Tricyrtis [1], Tulipa [1]. [and also see Agavaceae, Alliaceae, Amaryllidaceae, Asparagaceae, Colchicaceae, Hemerocallidaceae, Hostaceae, Hyacinthaceae, Hypoxidaceae, Melanthiaceae, Nartheciaceae, Ruscaceae, Smilacaceae, Themidaceae, Tofieldiaceae, Trilliaceae] - for disposition of genera in the formerly very broadly interpreted Liliaceae, see beginning of Liliaceae family treatment in the main text.
Marantaceae [1: 1]: Thalia [1].
Mayacaceae [1: 1]: Mayaca [1].
Melanthiaceae [9: 17]: Amianthium [1], Anticlea [1], Chamaelirium [1], Helonias [1], Schoenocaulon [1], Stenanthium [5], Veratrum [5], Xerophyllum [1], Zigadenus [1].
Najadaceae [1: 5]: Najas [5].
Nartheciaceae [3: 7]: Aletris [4], Lophiola [1], Narthecium [2].
Nolinaceae: [see Ruscaceae]
Orchidaceae [26: 84]: Aplectrum [1], Arethusa [1], Calopogon [5], Cleistes [2], Coeloglossum [1], Corallorrhiza [6], Cypripedium [7], Epidendrum [1], Epipactis [1], Galearis [1], Goodyera [2], Habenaria [2], Hexalectris [1], Isotria [2], Liparis [2], Listera [3], Malaxis [4], Platanthera [17], Platythelys [1], Pogonia [1], Ponthieva [1], Pteroglossaspis [1], Spiranthes [18], Tipularia [1], Triphora [1], Zeuxine [1].

Reviews, comments, contributions, and support have so far been gratefully received from the following: Jim Allison, Jame Amoroso, Lewis Anderson, Loran Anderson, Matthew Barnett-Lawrence, Rodney Bartgis, Jeffrey Beam, Allen Belden, Millie Blaha, Marj Boyer, Ted Bradley, Edwin Bridges, Richard Broadwell, Dan Brunton, A.J. Bullard, Bill Burk, Julian Campbell, Susan Carr, Jay Carter, Linda Chafin, Roy Coomans, Bob Dellinger, Pete Diamond, Jamey Donaldson, Wilbur Duncan, Mary Felton, Gary Fleming, Cecil Frost, Chris Frye, Chick Gaddy, Kancheepuram Gandhi, Bill Gensel, Bob Godfrey, Tom Govus, Ben Hafer, Arthur Haines, Jim Hardin, Karin Heiman, Hal Horwitz, John Kartesz, Gary Kauffman, Benson Kirkman, Bob Kral, Julia Larke, Chris Lea, Richard LeBlond, Harry LeGrand, Steve Leonard, Chris Ludwig, Laura Mason, Jim Massey, Jim Matthews, Bob McCartney, Kathleen McCoy, Carol Ann McCormick, Patrick McMillan, Julie Moore, Mike Moore, Larry Morse, Bill Moye, Nora Murdock, Zack Murrell, Robert Naczi, John Nelson, Guy Nesom, Claire Newell, Cary Norquist, Shawn Oakley, Doug Ogle, Tom Patrick, Karen Patterson, Linda Pearsall, Sam Pearsall, Bob Peet, Dan Pittillo, Bert Pittman, Richard Porcher, Milo Pyne, Al Radford, Tom Rawinski, Doug Rayner, Mary Russo, Mike Schafale, Alan Smith, Inge Smith, Bruce Sorrie, Dave Taylor, John Thieret, Nancy Van Alstine, Brian van Eerden, Dan Ward, Donna Ware, Allison Weakley, Tom Wentworth, Peter White, Tom Wieboldt, Gene Wofford, Donna Wright, Richard Wright, Steve Young, NatureServe (Durham Office), the Southern Resource Office of The Nature Conservancy, the North Carolina Natural Heritage Program (Division of Parks and Recreation), the Virginia Division of Natural Heritage, the Conservation Trust for North Carolina, and the NCU, NCSC, DUKE, UGA, VDB at BRIT, FSU, US, BRIT, WILLI, BOON, WCUH, and UNCC herbaria.

## FERNS AND FERN ALLIES

## ARTIFICIAL KEY TO THE GENERA OF FERNS AND FERN ALLIES

## Key A -- Pteridophytes reduced to thalloid or filamentous, free-living gametophytes

1 Gametophytes filamentous . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Trichomanes (HYMENOPHYLLACEAE)
1 Gametophytes thalloid, ribbon-like and branched.

2 Gemmae uniseriate (1 cell wide) . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Vittaria (VITTARIACEAE)

## Key B -- Pteridophytes growing as floating or rooted aquatics

1 Plant a floating aquatic.
2 Leaves less than 1 mm long, reddish or green, without hairs on the upper surface . . . . . . . . . . . Azolla (AZOLLACEAE)
2 Leaves 5-50 mm long, bright green, with obvious hairs on the upper surface . . . . . . . . . . . Salvinia (SALVINIACEAE)
1 Plant a rooted aquatic
3 Plant cloverlike, with 4 leaf segments borne terminally . . . . . . . . . . . . . . . . . Marsilea quadrifolia (MARSILEACEAE)
3 Leaves linear
4 Plants cormose, with numerous undivided leaves . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Isoetes (ISOETACEAE)
4 Plants rhizomatous, the leaves reduced to a winged petiole . . . . . . . . . . . . Pilularia americana (MARSILEACEAE)

Key C -- Pteridophytes with leaves not "fern-like"
unlobed, variously awl-shaped, scale-like, or terete)

1 Stem obviously jointed; leaves scale-like, borne in a whorl at each of the distant joints; spores borne in a terminal strobilus with peltate scales

Equisetum (EQUISETACEAE)
1 Stem not jointed; leaves scale-like or larger, but if scale-like not borne in whorls at distant joints; spores borne variously, but if in a terminal strobilus the scales not peltate.
2 Leaves linear, grass-like, 1-50 cm long, $20 \times$ or more as long as wide
3 Leaves solitary (though often the internodes very short from a thin, creeping rhizome); sporangia borne in a spherical (ca. 3 mm in diameter) sporocarp on a separate branch from the rhizome

Pilularia (MARSILEACEAE)
3 Leaves numerous from a corm or short rhizome; sporangia either borne in the expanded leaf bases (Isoetes) or in 2 rows at the tip of the linear fertile leaves (Schizaea).
4 Leaves straight, arching, or flaccid, from a 2-3-lobed corm; sporangia borne in the expanded, hyaline leaf bases
Isoetes (ISOETACEAE)
4 Leaves notably spiral-curly, from a short rhizome; sporangia borne in 2 rows at the tip of the linear fertile leaves
Schizaea (SCHIZAEACEAE)
2 Leaves various (scale-like, awl-like, moss-like, or flat), but not linear and grass-like, mostly 1-10x as long as wide.
5 Leaves inconspicuous, reduced to a few nerveless scales (less than 1.5 mm long), the internodes much longer than the leaves; sporangia yellowish, 3-locular, 1-2 mm in diameter; stems upright, repeatedly branched dichotomously Psilotum (PSILOTACEAE)
5 Leaves either larger or, if scale-like, with nerves and longer than the internodes (the leaves thus overlapping); sporangia yellowish to brownish, 1-locular, less than 1 mm in diameter; stems either subterranean or surficial
rhizomes or erect or ascending (and sometimes dichotomously branched in whole or in part in Huperzia, Diphasiastrum, and Dendrolycopodium).
6 Plant with leaves very numerous and overlapping along the creeping, ascending, or erect stems, the leaves usually scale-like or awl-like, 0.5-2 (-3) mm wide, typically acute, acuminate, or hair-tipped; sporangia either in terminal strobili (axillary to specialized, smaller leaves) or axillary to normal leaves.
$7 \quad$ Sporangia borne in flattened or quadrangular strobili sessile at the tips of leafy branches; spores and sporangia of two sizes, the megasporangia larger and borne basally in the strobili

7 Sporangia borne either in the axils of normal foliage leaves, or in strobili sessile at the tips of leafy branches or stalked on specialized branches with fewer and smaller leaves; spores and sporangia of one size.
8 Leafy stems erect, simple or dichotomously branched, the ultimate branches vertically oriented; sporophylls like the sterile leaves or only slightly reduced, in annual bands along the stem; vegetative reproduction by leafy gemmae near stem apex . . . . . . . . . . . . . . . . Huperzia (LYCOPODIACEAE)
8 Leafy stems prostrate or erect, if erect then generally branched, the ultimate branches spreading (horizontal) or ascending; sporophylls differing from sterile leaves, either broader and shorter, or more spreading, aggregated into terminal cones; lacking vegetative reproduction by gemmae.
9 Leaves herbaceous, pale or yellow-green, dull, deciduous; leafy stems creeping; rhizome dying back annually to an underground vegetative tuber at apex; [of wetlands, mostly on moist or wet sands or peats].
10 Leaves of the prostrate stems 0.5-1.2 mm wide, ciliate-toothed or not toothed; leaves of the erect stem many, overlapping, spirally arranged; leaves of the strobilus resembling leaves of the prostrate and upright stems in size and shape; upright stems $1.5-15 \mathrm{~mm}$ in diameter (including the leaves). $\qquad$ Lycopodiella (LYCOPODIACEAE)
10 Leaves of the prostrate stems $1.3-2.1 \mathrm{~mm}$ wide, not toothed; leaves of the erect stem few, not overlapping, whorled; leaves of the strobilus much reduced relative to leaves of the prostrate and upright stems; upright stems $1.5-3 \mathrm{~mm}$ in diameter (including the leaves)...

> Pseudolycopodiella (LYCOPODIACEAE)

9 Leaves rigid, bright to dark green, shiny, evergreen; leafy stems mainly erect, treelike, fanlike, or creeping (if creeping, then the leaves with elongate, hyaline hair-tips); rhizome trailing, perennial; [of uplands, mostly in moist to dry soils].
11 Branches 1-5 mm wide (including the leaves), compressed to quadrangular, with 4 ranks of leaves; branching of strobilus stalks dichotomous . . Diphasiastrum (LYCOPODIACEAE)
11 Branches 4-12 mm wide, terete (to somewhat compressed in Dendrolycopodium obscurum), with 6 or more ranks of leaves; branching of strobilus stalks (when present), pseudomonopodial (falsely appearing to have a main axis from which branches arise). 12 Strobili borne on elongate, sparsely leafy peduncles borne at the tips of leafy, ascending branches; leaves with attenuate, hyaline hair-tips .

Lycopodium (LYCOPODIACEAE)
12 Strobili sessile, borne directly above densely leafy portions of upright branches; leaves acuminate to acute.
13 Erect leafy stems $3-8 \mathrm{~mm}$ in diameter (including the leaves), treelike or fanlike, with a definite main axis; leaves acute at the apex; horizontal shoots subterranean, without winter biud constreictions

Dendrolycopodium (LYCOPODIACEAE)
13 Erect leafy stems 10 mm or more in diameter (including the leaves), branched 14 times subdichoromously; leaves with a 0.4-1.0 mm long stiff spinule; horizontal shoots at or near the ground surface, with winter bud constrictions

Spinulum (LYCOPODIACEAE)
6 Plant with leaves not as above (see below).
14 Plant with 1 (-several) leaves, the sterile leaf blade 0.3-24 cm long, ovate to lanceolate, entire-margined, obtuse, the longer fertile portion with 2 rows of sporangia somewhat imbedded in it Ophioglossum (OPHIOGLOSSACEAE)
14 Plant with many leaves, generally 5 or more, not divided into separate sterile and fertile segments, the leaves either (a) small, 0.3-1.6 cm long, obovate, scattered along a very thin creeping rhizome, or (b) larger, (2-) 8-30 cm long, cordate at base, the tip long-attenuate (often proliferous, bearing a plantlet at the tip).
15 Leaf blades (2-) 8-30 cm long, cordate at the base, the tip long-attenuate, often proliferous (bearing a plantlet at the tip); sporangia in indusiate sori on the undersurface; leaf texture moderately thick; rhizome erect or ascending, 1.0-1.5 mm in diameter, the leaves clustered from its tip . $\qquad$
Asplenium rhizophyllum (ASPLENIACEAE)
15 Leaf blades 0.3-1.6 cm long, cuneate at the base, rounded to obtuse at the tip, not proliferous; sporangia solitary in a marginal pocket on the leaf; leaf texture very thin; rhizome creeping on the surface of rock or bark, 0.1-0.3 mm in diameter, the leaves scattered along it

Trichomanes petersii (HYMENOPHYLLACEAE)

Key D -- Small pteridophytes, epipetric or epiphytic, growing on rock, tree bark, walls,

## or over rock in thin soil mats or in small soil pockets

1 Leaves pinnatifid or bipinnatifid, most of the pinnae not fully divided from one another (the rachis winged by leaf tissue most or all of its length). \{key Hymenophyllum and Trichomanes under this lead\} 2 Leaves bipinnatifid, at least the lowermost pinnae deeply lobed.

3 Lowermost (and other) pinnae with numerous, rather even lobes .......... Phegopteris (THELYPTERIDACEAE) 3 Lowermost pinnae with a few, irregular lobes (the upper pinnae unlobed) . . . . . . Pteris multifida (PTERIDACEAE) 2 Leaves pinnatifid, the pinnae not lobed.

4 Leaf blades with a long-attenuate apex, blade unlobed for $1 / 3$ its length; sori elongate Asplenium (ASPLENIACEAE)
4 Leaves without a long-attenuate apex, blade lobed for most of its length; sori round.
5 Plants dwarf, the leave blades less than 5 cm long; [occurring only in permanently moist habitats, as in grottoes
behind waterfalls] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Micropolypodium (GRAMMITIDACEAE)
5 Plants larger, the leave blades $7-30 \mathrm{~cm}$ long; [occurring on moist to dry habitats].
6 Leaf blade densely scaly on the lower surface; leaf segment margins entire; rhizome 1-2 mm in diameter
Pleopeltis (POLYPODIACEAE)
6 Leaf blade scaleless on the lower surface; leaf segment margins denticulate; rhizome 3-6 mm in diameter
Polypodium (POLYPODIACEAE)
1 Leaves pinnate, pinnate-pinnatifid, 2-pinnate, or even more divided (the rachis naked for most of its length, often winged in the apical portion).
7 Leaves pinnate or pinnate-pinnatifid.
8 Leaves of a very delicate texture, 1 cell thick; sori borne in cups on the leaf margins; [of rock outcrops with high air humidity].
9 Indusium ("involucre") bivalvate (deeply divided into 2 flaps); receptacle not exserted from between the 2 flaps of the indusium .

Hymenophyllum (HYMENOPHYLLACEAE)
9 Indusium ("involucre") tubular or funnelform, sometimes slightly 2-lobed; receptacle long and whiplike, exserted from the mouth of the tubular indusium

Trichomanes (HYMENOPHYLLACEAE)
8 Leaves of an herbaceous, subcoriaceous, or coriaceous texture, more than 1 cell thick; sori otherwise; [of various habitats, not strictly of moist sites].
10 Pinnae more than 1 cm wide; leaves subcoriaceous to coriaceous; veins anastamosing, rejoining to form a netlike pattern

Cyrtomium (DRYOPTERIDACEAE)
10 Pinnae less than 1 cm wide; leaves herbaceous to subcoriaceous; veins free, not rejoining.
11 Sori on the undersurface of the leaf, away from the margins .......... Asplenium (ASPLENIACEAE)
11 Sori on the undersurface of the leaf, marginal and more-or-less hidden beneath either the unmodified revolute leaf margin or under a modified, reflexed false indusium.
12 Leaf undersurface densely covered with stellate and ciliate scales
Astrolepis sinuata ssp. sinuata (PTERIDACEAE)
12 Leaf undersurface glabrous or with non-stellate scales.
13 Rachis dark-brown or purple; leaf margin unmodified, though often revolute
Pellaea (PTERIDACEAE)
13 Rachis green or tan; leaf margin modified into a false indusium, reflexed to cover the sori
Pteris vittata (PTERIDACEAE)
7 Leaves bipinnate or more divided.
14 Leaf blade pentagonal or broadly triangular in outline, ca. $1 \times$ as long as wide.
15 Leaf blade pentagonal in outline, the terminal pinna by far the largest; rhizome 5-8 mm in diameter; indusia present, thick, persistent, and reniform; [introduced species, naturalized in moist ravines in SC]

Arachniodes (DRYOPTERIDACEAE)
15 Leaf blade broadly triangular in outline, the basal pinnae by far the largest; rhizome ca. 1 mm in diameter; indusia absent; [native species of mountain peaks of $n$. NC and VA]. Gymnocarpium (DRYOPTERIDACEAE)
14 Leaf blade elongate, mostly lanceolate, generally $4 \times$ or more as long as wide (except in Adiantum capillus-veneris, with leaf blade often only $1.5-3 \times$ as long as wide, but not notably triangular or pentagonal in outline).
16 Sori not marginal, either naked, or slightly to strongly hidden by indusia.
17 Leaf blades 3-12 cm long; sori elongate, covered by a flap-like, entire indusium
Asplenium (ASPLENIACEAE)
17 Leaf blades 4-30 (-50) cm long; sori globular, surrounded or covered by an entire, ciliate, or divided indusium.
18 Veins reaching the margin; indusium attached under one side of the sorus, hoodlike or pocketlike, arching over the sorus; petioles glabrous or sparsely beset with scales, the petiole bases not persistent

18 Veins ending short of the margin; indusium attached under the sorus, cuplike (divided into 3-6 lanceolate to ovate lobes which surround the sorus from below) or of minute numerous septate hairs, which extend out from under the sorus on all sides; petioles often densely beset with scales, the petiole bases persistent

Woodsia (DRYOPTERIDACEAE)
16 Sori marginal, usually more-or-less hidden under the revolute margin of the pinnule.
19 Sori round or oblong, distinct and separate along the pinnule margins; leaves bright-green, glabrous, herbaceous, delicate, and flexible . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Adiantum (PTERIDACEAE)
19 Sori continuous along the pinnule margins; leaves mostly dark-green or glaucous, often pubescent, coriaceous, tough, and stiff.

20 Leaves strongly dimorphic, the fertile leaves obviously longer than the sterile and with narrow elongate ultimate segments
20 Leaves essentially monomorphic.
21 Lower leaf surfaces covered with whitish powder, otherwise glabrous or sparsely pubescent . .
[Argyrochosma] (PTERIDACEAE)
21 Lower leaf surfaces pubescent (or glabrous in Cheilanthes alabamensis), never with conspicuous whitish powder

Cheilanthes (PTERIDACEAE)

## Key E -- Small pteridophytes, terrestrial, growing in soil, not associated with rock outcrops

1 Petiole branched once dichotomously, each branch bearing 3-7 pinnae in one direction only, the outline of the blade fanshaped, often broader than long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Adiantum pedatum (PTERIDACEAE)
1 Petiole not branched dichotomously, the outline of the blade either longer than broad or triangular and about as wide as long 2 Leaves pinnatifid or bipinnatifid, most of the pinnae not fully divided from one another (the rachis winged by leaf tissue most or all of its length).
3 Sporangia borne on an erect stalk that arises at or above ground level from the petiole of the sterile leaf blade (joining the petiole of the sterile leaf above the rhizome) . . . . . . . . . . . . . . . . Botrychium (OPHIOGLOSSACEAE)
3 Sporangia either borne on normal leaf blades or on specialized (fertile) leaves separate from the rhizome.
4 Leaves monomorphic, the sori borne on normal leaf blades . . . . . . . . . Phegopteris (THELYPTERIDACEAE)
4 Leaves dimorphic, the sori borne on leaves significantly different than normal leaves.
5 Fertile leaf woody, brown, with bead-like segments; pinnae margins entire, often wavy or the lowermost even somewhat lobed; pinnae mostly with obtuse apices, tending to be borne opposite

Onoclea (DRYOPTERIDACEAE)
5 Fertile leaf stiff but herbaceous, green, the pinnae linear, not at all bead-like; pinnae margins finely serrulate, otherwise slightly wavy or straight; pinnae mostly with acute apices, tending to be borne alternate

Woodwardia areolata (BLECHNACEAE)
2 Leaves pinnate, pinnate-pinnatifid, 2-pinnate, or even more divided (the rachis naked for most of its length, often winged in the apical portion)
6 Leaves broadly triangular in outline, about as broad as long; sporangia borne on an erect stalk that arises at or above ground level from the petiole of the sterile leaf blade (joining the petiole of the sterile leaf above the rhizome)

Sceptridium (OPHIOGLOSSACEAE)
6 Leaves lanceolate in outline, much longer than broad; sporangia either borne on normal leaf blades, on slightly dimorphic blades, or on an erect stalk that arises at or above ground level from the petiole of the sterile leaf blade (joining the petiole of the sterile leaf above the rhizome).
7 Leaf blades 1-8 cm long; sporangia borne on an erect stalk that arises at or above ground level from the petiole of the sterile leaf blade (joining the petiole of the sterile leaf above the rhizome)

Botrychium (OPHIOGLOSSACEAE)
7 Leaf blades 10-30 (-100) cm long; sporangia either borne on normal leaf blades or on slightly dimorphic blades. 8 Leaves dark green, subcoriaceous, evergreen ................. . . Polystichum (DRYOPTERIDACEAE) 8 Leaves light to medium green, herbaceous, deciduous to semi-evergreen.

9 Sori continuous along the midrib of the pinna
Blechnum (BLECHNACEAE)
9 Sori distinct.
10 Sori elongate; leaf blades somewhat dimorphic, the fertile larger and erect, the sterile smaller and prostrate, the larger leaf blades $2-4(-6.5) \mathrm{cm}$ widesplenium platyneuron (ASPLENIACEAE)
10 Sori round; leaf blades monomorphic; the larger leaf blades $5-15 \mathrm{~cm}$ wide
Thelypteris (THELYPTERIDACEAE)

Key F -- Medium to large pteridophytes, epipetric, growing on rock, walls, over rock in thin soil mats or in small soil pockets, or on tree trunks

1 Leaves vine-like, 0.3-10 m long, the branching dichotomous, 1 branch of each dichotomy terminating in a pair of pinnae, the pinnae often widely spaced (more than 10 cm apart) . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Lygodium (LYGODIACEAE)
1 Leaves not vine-like, 0.3-1 m long, the branching not as described above, the pinnae regularly and more-or-less closely spaced (mostly less than 10 cm apart).
2 Leaves 1-pinnate-pinnatifid or less divided, the pinnae entire, toothed, lobed or pinnatifid.
3 Sori marginal, continuous, covered by a reflexed false indusium along the leaf margin; pinnae usually opposite, linear, not toothed or lobed

Pteris vittata (PTERIDACEAE)
3 Sori neither marginal nor continuous, slightly to entirely covered by an elongate or roundish indusium (sometimes ciliate, toothed, or divided into narrow segments); pinnae usually at least in part alternate, mostly lanceolate, toothed, lobed, or pinnatifid.
4 Sori elongate, the indusium flap-like, attached along the side; leaf blades (if more than 30 cm long) less than 7 cm wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Asplenium platyneuron (ASPLENIACEAE)
4 Sori circular or globular, the indusium peltate, reniform, or cuplike; leaf blades (if more than 30 cm long) more than 5 cm wide.

5 Leaves pinnatifid . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Phlebodium (POLYPODIACEAE)
5 Leaves 1-pinnate or more divided.
6 Leaves 1-pinnate, the pinnae toothed and each with a slight to prominent lobe near the base on the side towards the leaf tip, dark green, subcoriaceous to coriaceous; indusia peltate.
7 Veins anastamosing, rejoining to form a netlike pattern; pinnae 4-25 pairs per leaf; [non-native, rarely naturalized] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Cyrtomium (DRYOPTERIDACEAE)
7 Veins branching dichotomously, free, not rejoining to form a netlike pattern; pinnae 25-50 pairs on larger leaves; [native, common]

Polystichum (DRYOPTERIDACEAE)
6 Leaves 1-pinnate-pinnatifid, the pinnae pinnatifid, generally lacking a prominent basal lobe, light green to dark green, herbaceous to subcoriaceous; indusium either reniform or cuplike.
8 Vascular bundles in the petiole 3-7
Dryopteris (DRYOPTERIDACEAE)
8 Vascular bundles in the petiole 2, uniting above.
9 Indusium reniform, arching over the sorus . . . . . . . Thelypteris (THELYPTERIDACEAE)
9 Indusium cuplike, attached beneath the sorus and consisting of 3-6 lanceolate to ovate segments . . . . . . . . . . . . . . . . . . . . . . . . . Woodsia obtusa (DRYOPTERIDACEAE)
2 Leaves 2-pinnate or more divided, the pinnae divided to their midribs.
9 Sori marginal and borne on the underside of the false indusium; petioles and rachis shiny black or reddish-black, glabrous except at the very base of the petiole; pinnules fan-shaped or obliquely elongateAdiantum (PTERIDACEAE)
9 Sori not marginal, borne on the undersurface of the leaf blade (if marginal, as in Pteridium and Dennstaedtia, borne on the undersurface of the leaf); petioles darkened only basally (if at all), rachis green, tan, or reddish; pinnules not notably fan-shaped or obliquely elongate.
10 Leaf blades pentagonal or broadly triangular in outline, ca. $1 \times$ as long as wide.
11 Leaf blade pentagonal in outline, the terminal pinna the largest; sori submarginal, roundish, the indusium reniform

Arachniodes (DRYOPTERIDACEAE)
11 Leaf blade broadly triangular in outline, the basal pinnae the largest; sori marginal, linear, indusium absent, protected by the revolute leaf margin and a minute false indusium . . Pteridium (DENNSTAEDTIACEAE)
10 Leaf blades elongate, mostly lanceolate, generally $4 \times$ or more as long as wide.
12 Outline of leaf blade narrowed to base, the widest point more than 7 pinna pairs above the base, the lowermost pinnae $1 / 4$ or less as long as the longest pinnae; rhizomes long-creeping, the leaves scattered, forming clonal patches $\qquad$ Thelypteris noveboracensis (THELYPTERIDACEAE)
12 Outline of the leaf blade slightly if at all narrowed to the base, the widest point less than 5 pinna pairs from the base, the lowermost pinnae more than $1 / 2$ as long as the longest pinnae; rhizomes short-creeping, the leaves clustered, not forming clonal patches (or with rhizomes long-creeping, leaves scattered, forming clonal patches in Dennstaedtia).
13 Rhizomes long-creeping, leaves scattered, forming clonal patches; vascular bundles in the petiole 1, U-shaped (even in the lower petiole); sori very small, marginal in sinuses, the indusium cuplike, 2parted, the outer part a modified tooth of the leaf blade; leaf blades conspicuously puberulent with septate hairs . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Dennstaedtia (DENNSTAEDTIACEAE)
13 Rhizomes short-creeping, the leaves clustered, not forming clonal patchesascular bundles in the petiole 2-7 (sometimes uniting to 1 in the upper petiole); sori mostly larger, mostly not marginal, the indusium not as above (though cuplike inWoodsia obtusa); leaf blades either glabrous, glabrescent, with flattened scales, or puberulent with glandular trichomes.
14 Vascular bundles (3-) 5 ( -7 ) in the petiole . . . . . . . . . . . . . Dryopteris (DRYOPTERIDACEAE) 14 Vascular bundles 2 in the petiole (or uniting near the leaf blade into 1).

15 Leaves 25-65 cm wide, with whitish, straight, acicular hairs; [species adventive and weedy, presently known in our area only from the Coastal Plain of SC]

Macrothelypteris (THELYPTERIDACEAE)
15 Leaves 5-25 (-30) cm wide, with scales and minute glands (sometimes also with septate hairs); [native species, widespread].
16 Leaves 1-pinnate-pinnatifid; indusium cuplike, attached beneath the sorus and consisting of 3-6 lanceolate to ovate segments

Woodsia obtusa (DRYOPTERIDACEAE)
16 Leaves 2-pinnate-pinnatifid; indusium flaplike or pocketlike, attached at one side of the sorus and arching over it.
17 Leaves $10-30 \mathrm{~cm}$ wide, the tip acute to acuminate; indusium flaplike.
Athyrium (DRYOPTERIDACEAE)
17 Leaves $4-9 \mathrm{~cm}$ wide, the tip long-attenuate; indusium pocketlike or hoodlike.
Cystopteris bulbifera (DRYOPTERIDACEAE)

Key G -- Medium to large pteridophytes, terrestrial,
growing in soil, not associated with rock outcrops
1 Leaves vine-like, 0.3-10 m long, the branching dichotomous, 1 branch of each dichotomy terminating in a pair of pinnae, the pinnae often widely spaced (more than 10 cm apart)

Lygodium (LYGODIACEAE)
1 Leaves not vine-like, 0.3-3 m long, the branching not as described above, the pinnae regularly and more-or-less closely spaced (mostly less than 10 cm apart).
2 Leaf blades broadly (about equilaterally) triangular, pentagonal, or flabellate in outline, 0.7-1.3× as long as wide.

3 Leaf blades flabellate or fan-shaped in outline, the petiole branched once dichotomously, each branch bearing 3-7 pinnae in one direction only . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Adiantum pedatum (PTERIDACEAE)
3 Leaf blades pentagonal or broadly triangular in outline, the petiole not branched dichotomously.
4 Leaf blade pentagonal in outline, the terminal pinna the largest; sori submarginal, roundish, the indusium reniform Arachniodes simplicior (DRYOPTERIDACEAE)
4 Leaf blade broadly triangular in outline, the basal pinnae the largest; sori marginal, linear, indusium absent, protected by the revolute leaf margin and a minute false indusium (Pteridium), or sporangia borne in a stalked, specialized, fertile portion of the blade (Botrychium).
5 Sporangia borne in marginal, linear sori, indusium absent, protected by the revolute leaf margin and a minute false indusium; texture of mature blades somewhat fleshy; plants solitary from a short underground rhizome with thick, mycorrhizal roots; [primarily of moist forests] . . . . Botrypus (OPHIOGLOSSACEAE)
5 Sporangia borne in a stalked, specialized, fertile portion of the blade; texture of mature leaf blades hard and stiff; plants colonial from deep-seated rhizomes; [primarily of moist to dry woodlands and savannas]

Pteridium (DENNSTAEDTIACEAE)
2 Leaves elongate in outline, mostly ovate, lanceolate, oblanceolate, or narrowly triangular, 1.5-10× or more as long as wide.
6 Leaves 2-pinnate or more divided, the pinnae divided to their midribs.
7 Leaf blade divided into sterile and fertile portions, the fertile pinnae basal, the sterile pinnules $30-70 \mathrm{~mm}$ long and 8-23 mm wide, serrulate, rounded basally, rounded to somewhat acute apically, the fertile pinnae terminal and greatly reduced in size, the fertile pinnules $7-11 \mathrm{~mm}$ long and $2-3 \mathrm{~mm}$ wide

Osmunda regalis var. spectabilis (OSMUNDACEAE)
7 Leaf blade not divided into sterile and fertile portions (though often not all pinnules on a leaf bearing sporangia), the pinnules bearing sporangia only slightly if at all reduced in size, both fertile and sterile pinnules usually 4-20 mm long and 2-10 mm wide.
8 Rhizomes long-creeping, leaves scattered, forming clonal patches; vascular bundles in the petiole 1, Ushaped (even in the lower petiole); sori very small, marginal in sinuses, the indusium cuplike, 2-parted, the outer part a modified tooth of the leaf blade; leaf blades conspicuously puberulent with septate hairs

Dennstaedtia (DENNSTAEDTIACEAE)
8 Rhizomes short-creeping, the leaves clustered, not forming clonal patches; vascular bundles in the petiole 2-7 (sometimes uniting to 1 in the upper petiole); sori mostly larger, mostly not marginal, the indusium not as above (though cuplike in Woodsia obtusa); leaf blades either glabrous, glabrescent, with flattened scales, or puberulent with glandular trichomes. 9 Vascular bundles (3-)5(-7) in the petiole . . . . . . . . . . . . . . . . . Dryopteris (DRYOPTERIDACEAE) $9 \quad$ Vascular bundles 2 in the petiole (or uniting near the leaf blade into 1).

10 Leaves $25-65 \mathrm{~cm}$ wide, with whitish, straight, acicular hairs; [species adventive and weedy, presently known in our area only from the Coastal Plain of SC]

10 Leaves $5-25(-30) \mathrm{cm}$ wide, with scales and minute glands (sometimes also with septate hairs); [native species, widespread].
11 Leaves 1-pinnate-pinnatifid; indusium cuplike, attached beneath the sorus and consisting of 3-6 lanceolate to ovate segments ........... Woodsia obtusa (DRYOPTERIDACEAE)
11 Leaves 2-pinnate-pinnatifid; indusium flaplike or pocketlike, attached at one side of the sorus and arching over it.
12 Leaves $10-30 \mathrm{~cm}$ wide, the tip acute to acuminate; indusium flaplike . . . . . . . . . . . . .
Athyrium (DRYOPTERIDACEAE)
12 Leaves 4-9 cm wide, the tip long-attenuate; indusium pocketlike or hoodlike $\qquad$ Cystopteris bulbifera (DRYOPTERIDACEAE)
6 Leaves 1-pinnate-pinnatifid or less divided, the pinnae entire, toothed, lobed or pinnatifid.
13 Leaves 1-pinnatifid, most of the pinnae not fully divided from one another (the rachis winged by leaf tissue most or all of its length); leaves dimorphic, the fertile much modified, stiff and/or woody.
14 Fertile leaf woody, brown, with bead-like segments; pinnae margins entire, often wavy or the lowermost even somewhat lobed; pinnae mostly with obtuse apices, tending to be borne opposite

## Onoclea sensibilis var. sensibilis (DRYOPTERIDACEAE)

14 Fertile leaf stiff but herbaceous, green, the pinnae linear, not at all bead-like; pinnae margins finely serrulate, otherwise slightly wavy or straight; pinnae mostly with acute apices, tending to be borne alternate

Woodwardia areolata (BLECHNACEAE)
13 Leaves 1-pinnate or 1-pinnate-pinnatifid, the pinnae fully divided from one another (the rachis naked for most of its length, often winged in the terminal portion); leaves dimorphic or not.
15 Rhizomes long-creeping, leaves scattered, forming clonal patches.
16 Sori roundish, borne away from the main veins; pinna lobes of sterile leaves with the lateral veins free and pinnately arranged (the lowermost lateral vein sometimes joining that of the adjacent pinna lobe just below the sinus, but the remainder of the lateral veins all free)

16 Sori elongate, borne end to end along either side of the main veins; pinna lobes of sterile leaves with reticulate, chain-like venation along the central vein . . . . Woodwardia virginica (BLECHNACEAE)
15 Rhizomes short-creeping, the leaves clustered, not forming clonal patches (or rhizomes of both types, but leaves borne only in clusters on the short erect ones, in Matteucia)
17 Plants moderately to very robust, the leaves typically 6-30 dm tall; leaves either strongly dimorphic,
the fertile leaves very unlike the sterile, brown at maturity (Matteucia and Osmunda cinnamomea) or the fertile pinnae very unlike the sterile, brown at maturity, borne as an interruption in the blade, with normal green pinnae above and below (Osmunda claytoniana); rachises scaleless, petioles scaleless (except at the base in Matteucia).
18 Leaves strongly tapering to the base from the broadest point (well beyond the midpoint of the blade), the basalmost pinnae much less than $1 / 2$ as long as the largest pinnae Matteucia struthiopteris (DRYOPTERIDACEAE)
18 Leaves slightly if at all tapering to the base, about equally broad through much of their length, the basalmost pinnae much more than $1 / 2$ as long as the largest pinnae

Osmunda (OSMUNDACEAE)
17 Plants mostly less robust, the leaves $3-10 \mathrm{dm}$ tall (except Dryopteris ludoviciana, D. celsa, and D. goldiana to 15 dm ); leaves not at all or only slightly dimorphic, the fertile differing in various ways, such as having narrower pinnae (as in Dryopteris ludoviciana, Polystichum acrostichoides, Diplazium, and Thelypteris palustris) or the fertile leaves taller and more deciduous (as in Asplenium platyneuron and Dryopteris cristata), but not as described in the first lead; rachises and petioles variously scaly or scaleless, but at least the petiole and often also the rachis scaly if the plants over 1 m tall.
18 Sori elongate, the indusium elongate, attached along one side as a flap.
19 Petiole and rachis lustrous brownish-black; fertile leaves $2-8(-12) \mathrm{cm}$ wide
Asplenium platyneuron (ASPLENIACEAE)
19 Petiole and rachis green; fertile leaves 10-20 (-30) cm wide.
20 Leaves 1-pinnate-pinnatifid (the pinnae pinnatifid) . . Deparia (DRYOPTERIDACEAE) 20 Leaves 1 -pinnate (the pinnae entire) . . . . . . . . . . Diplazium (DRYOPTERIDACEAE)
18 Sori roundish, the indusium kidney-shaped or roundish, attached by a central stalk.
21 Leaves 1-pinnate, the pinnae toothed and each with a slight to prominent lobe near the base on the side towards the leaf tip, dark green, subcoriaceous to coriaceous; indusia peltate . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Polystichum (DRYOPTERIDACEAE)
21 Leaves 1-pinnate-pinnatifid, the pinnae pinnatifid, generally lacking a prominent basal lobe, light green to dark green, herbaceous to subcoriaceous; indusium reniform.
22 Vascular bundles in the petiole 4-7 ........... Dryopteris (DRYOPTERIDACEAE)
22 Vascular bundles in the petiole 2, uniting above
Thelypteris (THELYPTERIDACEAE)

## ASPLENIACEAE Frank 1877 (Spleenwort Family)

A family of a single genus and more than 720 species, of nearly cosmopolitan distribution. Murakami et al. (1999) conducted a molecular phylogenetic analysis of the Aspleniaceae, which confirmed that Camptosorus should be included in Asplenium, but suggested that Phyllitis is better separated from Asplenium. A later and more comprehensive study shows Phyllitis and Camptosorus to be deeply embedded in Asplenium (Schneider et al. 2004), a conclusion followed here. References: Kramer \& Viane in Kramer \& Green (1993); Schneider et al. (2004).

## Asplenium Linnaeus 1753 (Spleenwort)

Asplenium is a large, nearly cosmopolitan genus of more than 720 species, with centers of diversity in the Appalachians, Central America mountains, Andes, and Himalayas. References: Wagner, Moran, \& Werth in FNA (1993b); Moran (1982); Taylor, Mohlenbrock, \& Burton (1976); Murakami et al. (1999); Kramer \& Viane in Kramer \& Green (1993).

Identification notes: Several of the more frequently encountered sterile hybrids are included in the key and treated fully below.
1 Leaves simple, unlobed (or sometimes with a few, irregular forkings); veins free or anastamosing-areolate.
2 Leaf blades 0-3 mm wide, linear, forking or with a few toothlike projections . . . . . . . . . . . . . . . . . . . [A. septentrionale] 2 Leaf blades 10-40 mm wide, lanceolate, lance-attenuate, or oblong.

3 Leaf apex long-attenuate and characteristically producing plantlets at the tip; veins anastomosing . A. rhizophyllum 3 Leaf apex acute or obtuse, not attenuate, not producing plantlets at the tip; veins free.

4 Longer indusia of each frond avg. 1.2 cm long; leaves (1-) avg. 2.3 (-3.4) dm long; [native in TN, AL, and elsewhere, in natural limestone sinkholes] . . . . . . . . . . . . . . . . . . [A. scolopendrium var. americanum]
4 Longer indusia of each frond avg. 1.7 cm long; leaves (1-) avg. 3 (-6) dm long; [rarely introduced in North America, typically in artificial settings, such as wells] . . . . . . . . . . . [A. scolopendrium var. scolopendrium]
1 Leaves pinnatifid (at least in the lower half of the leaf), pinnate, pinnate-pinnatifid, bipinnate, or tripinnate, the apex obtuse, acute, acuminate, or attenuate; veins free.
5 Rachis dull green throughout its length, or at least towards the tip; leaves pinnatifid to tripinnate, the outline of the leaf blade narrowly to broadly triangular, widest at the base.
6 Petiole dark throughout its length (from base to first leaflet).
7 Leaves bipinnate at the base, pinnate-pinnatifid above; spores normal $\qquad$ . A. bradleyi 7 Leaves pinnate at the base, pinnatifid above; spores abortive (very rarely normal, outside of our area)
A. xebenoides
$6 \quad$ Petiole partially or entirely green (darkened or not at its base).

Leaves pinnatifid or pinnate through most or all of their lengths.
9 Leaves pinnatifid, sometimes fully pinnate at the base; spores normal
A. pinnatifidum

9 Leaves pinnate, sometimes pinnate-pinnatifid at the base; spores abortive A. $\times$ trudellii

8 Leaves bipinnate to tripinnate.
10 Petiole darkened towards the base; pinnules toothed, lacerate, pinnatifid, or pinnate; leaves bipinnate to tripinnate, the leaf blades lanceolate-ovate to lanceolate-oblong; ultimate leaf segments sessile or nearly so; [of acidic rocks]
A. montanum

10 Petiole entirely green; pinnules toothed; leaves bipinnate, the leaf blades ovate-triangular; ultimate leaf segments mostly stalked; [of calcareous rocks] . . . . . . . . . . . . . . . . A. ruta-m uraria var. cryptolepis
5 Rachis shiny black or dark brown throughout its length; leaves pinnate, the outline of the leaf blade linear, lanceolate, or oblanceolate, with more-or-less parallel sides for much of its length.
11 Pinnae orbicular to obovate-oblong, $1-2 \times$ as long as wide, the base more-or-less symmetrical (if auriculate, only slightly so and on the side of the pinna towards the base of the leaf); old leaf rachises often with persistent projections left from the disarticulation of the pinnae.
12 Sori 4-6 (-9) per pinna, up to 2 mm long; rhizome scales up to 3 mm long; petiole relatively thin, shiny, coppery or bronze; pinnae mostly alternate, suborbicular, spaced more distantly, thinner in texture, set at a fairly oblique angle to the rachis, often slightly auriculate on the side of the pinna towards the leaf base; spores mostly 29-36 $\mu$ long; stomate guard cells mostly 38-43 $\mu$ long; [mostly of noncalcareous rocks]

## A. trichomanes ssp. trichomanes

12 Sori 4-9 (-12) per pinna, up to 3 mm long; rhizome scales up to 5 mm long; petiole relatively thicker, blackishbrown; pinnae mostly opposite, oblong, spaced more closely, thicker in texture, set at a nearly right angle to the rachis, rarely at all auriculate; spores mostly 34-43 $\mu$ long; stomate guard cells mostly 41-49 $\mu$ long; [of calcareous rocks] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. trichomanes ssp. quadrivalens
11 Pinnae oblong-rectangular, $2 \times$ or more as long as wide, the base asymmetrical or auricled (more prominently auricled on the side of the pinna towards the tip of the leaf); old leaf rachises lacking persistent projections left from the disarticulation of the pinnae.
13 Leaves slightly dimorphic, the fertile upright and larger, the sterile spreading and smaller; pinna auricles prominent, often overlapping the rachis; [terrestrial, often not associated with rock outcrops] . . A. platyneuron
13 Leaves not dimorphic; pinna auricles less prominent, usually not overlapping the rachis; [epipetric, always growing in crevices of rock outcrops or in thin soil immediately adjacent to exposed rock].
14 Main vein of the pinna running along the basal edge; sori 1 (-3) per pinna, $1.5-3 \mathrm{~mm}$ long, borne along the basal edge, the indusium translucent, whitish, opening towards the leaf tip $\qquad$ A. monanthes

14 Main vein of the pinna running more-or-less medially; sori 4-10 per pinna (on well-developed pinnae), 1.01.5 mm long, borne on both sides of the main vein, the indusium opaque, greenish, opening towards the pinna tip.
15 Pinnae margins subentire; pinnae blue-green, coriaceous, borne at right angles to the rachis or slightly reflexed, usually strictly opposite throughout the entire length of the leaf blade .. A. resiliens 15 Pinnae margins shallowly crenate or crenate-serrate; pinnae bright-green, subcoriaceous, borne at right angles to the rachis or ascending, opposite below but usually becoming alternate in the apical $1 / 3-1 / 2$ of the leaf blade
16 Pinna margins crenate to serrate; pinna base lacking an auricle, or the auricle rudimentary; veins evident; spores 64 per sporangium
A. heterochroum

16 Pinna margins shallowly crenate; pinna base with auricle; veins obscure; spores 32 per sporangium
A. heteroresiliens

Asplenium bradleyi D.C. Eaton, Bradley's Spleenwort. Pd (GA, NC, SC, VA), Mt (GA, NC, VA), Cp (GA, SC): dry outcrops of felsic sedimentary or metasedimentary rocks, such as sandstone, quartzite, or metaquartzite, at low to moderate elevations; rare (NC Rare, SC Rare, VA Watch List). April-October. PA, MD, OH, KY, s. IL, and MO south to c. NC, c. GA, AL, TN, and AR, reaching its greatest abundance in the Ozarkian highlands. This species is a fertile allotetraploid derived from hybridization between A. montanum and A. platyneuron. Its chromosome complement can be symbolized MMPP. The sterile hybrid has also been found in NC; its chromosome complement is MP. [= RAB, C, F, FNA, G, K, S, W; = A. $\times$ bradleyi]

Asplenium ×ebenoides R.R. Scott (pro species) [A. platyneuron $\times$ rhizophyllum], Scott's Spleenwort. Mt (GA, NC, VA), Pd, Cp (VA): moist outcrops of calcareous sedimentary rocks, such as limestone, dolostone, and on coquina limestone (shell marl), at low elevations; rare. May-October. VT, NJ, c. PA, OH, s. IL, and MO south to e. VA, w. NC, nw. GA, c. AL, TN, and AR. So far as is known, $A$. ×ebenoides is a sterile hybrid throughout our range (chromosome complement symbolized PR). In AL, however, one population in Hale County has undergone chromosome doubling and is a fertile allotetraploid (PPRR). Populations of this taxon, especially if consisting of many individuals, should be checked for fertile spores. [ $=\mathrm{K} ;=\times$ Asplenosorus ebenoides (R.R. Scott) Wherry -- F; = Asplenosorus ebenoides (R.R. Scott) Wherry -- G; = Asplenium ebenoides R.R. Scott -- FNA, S]

Asplenium heterochroum Kunze, Bicolored Spleenwort. Cp (GA, SC): fairly moist outcrops of calcareous sedimentary rocks, such as coquina limestone ("marl"); rare (GA Special Concern). Se. and sc. GA (Jones \& Coile 1988) south to $n$. FL; West Indies; Belize. [= FNA, K; < A. heterochroum Kunze -- S, in part]

Asplenium heteroresiliens W.H. Wagner, Marl Spleenwort, Carolina Spleenwort, Wagner's Spleenwort, Morzenti's Spleenwort. Cp (GA, NC, SC): fairly moist outcrops of calcareous sedimentary rocks, such as coquina limestone ("marl"), along small blackwater streams or larger rivers, at low elevations, and rarely also on old ruins made of tabby (a cement made from lime, sand and oyster shells); rare (US Species of Concern, GA Threatened, NC Endangered, SC Rare). April-October. Rare and scattered from se. NC to se. GA, sw. GA, and n. FL, on the Coastal Plain. This species is an apogamous (producing viable spores asexually) allopentaploid derived from hybridization of the sexual tetraploid $H$. heterochroum Kunze (of Florida and the West Indies) and the apogamous triploid $A$. resiliens. Its chromosome complement can be symbolized EEEHH. [= RAB; = A. $\times$ heteroresiliens --

FNA, K; < A. heterochroum Kunze -- S, in part]
Asplenium monanthes Linnaeus, Single-sorus Spleenwort. Mt (NC, SC): moist outcrops of calcareous to semi-calcareous metamorphic rocks, such as mylonite or marble, near waterfalls in humid escarpment gorges with high rainfall, at low elevations; rare (NC Endangered, SC Rare). April-October. Scattered in highly humid (montane or maritime) parts of the tropics, subtropics, and warm temerate areas, known from se. and sw. North America, the West Indies (Hispaniola and Jamaica), n. South America, Central America, Mexico, South Africa, Hawaii, and Sandwich Islands, the Azores, Madeira Islands, Madagascar, and the Philippines. In the continental United States, it is known from widely scattered sites with humid and calcareous microhabitats: humid escarpment gorges in Transylvania County, NC and Oconee County, SC; moist limestone outcrops in n. peninsular and Panhandle FL (Nelson 2000); sinkholes limestone talus in the collapsed mouth of a sinkhole in Jackson County, AL; and the Huachuca Mountains, Cochise County, AZ. [= RAB, FNA, K, W]

Asplenium montanum Willdenow, Mountain Spleenwort. Mt, Pd (GA, NC, SC, VA): moist to dry outcrops of metamorphic, sedimentary, or igneous rocks, such as gneiss, schist, amphibolite, quartzite, rhyolite, sandstone, mostly at moderate to high elevations (up to over 2000 m ), but in the Piedmont to as low as 150 m ; common. May-October. Primarily Appalachian: s. VT, MA, NY, OH, and KY south to c. NC, n. GA and AL; absent from the Ozarkian highlands. A. montanum is one of the diploid progenitors of the reticulately evolved Appalachian Asplenium complex; its chromosome complement is symbolized MM. It is one parent of $A$. bradleyi, A. pinnatifidum, and A. ×trudellii (and of other sterile hybrids). [= RAB, C, F, FNA, G, K, S, W]

Asplenium pinnatifidum Nuttall, Lobed Spleenwort. Pd, Mt (GA, NC, SC, VA): fairly moist to very dry outcrops of felsic sedimentary or (mostly low-grade) metamorphic rocks, such as sandstone, phyllite, and schist, at low to moderate elevations; uncommon (NC Watch List, SC Rare). May-October. NJ, se. PA, wc. PA, s. OH, IN, IL, and MO south to w. NC, c. GA (Jones \& Coile 1988), AL, n. MS, AR, and e. OK. This species is a fertile allotetraploid derived from hybridization of $A$. montanum and $A$. rhizophyllum; its chromosome complement is symbolized MMRR. [= RAB, C, F, FNA, S, W; = A. pinnatifidum var. pinnatifidum -- G; = A. $\times$ pinnatifidum -K ]

Asplenium platyneuron (Linnaeus) Britton, Sterns, \& Poggenburg, Ebony Spleenwort. Mt, Pd, Cp (GA, NC, SC, VA): moist to dry soils of forests, woodlands, old fields; also on outcrops, especially of calcareous rocks, at low to moderate elevations; common. April-October. Québec, Ontario, se. MN, IA, and se. CO south to FL, TX, NM, and AZ (and varieties or relatives reported from Central and South America). This species is one of the diploid progenitors involved in the reticulately evolved Appalachian Asplenium complex. It is one parent of A. bradleyi and A. xebenoides (as well as other sterile hybrids). A. platyneuron in general, and var. platyneuron specifically, is by far the most common of our Asplenia, and the only one found characteristically away from rock. A. platyneuron var. incisum does not seem to warrant taxonomic recognition. Strikingly large plants of the outer Atlantic Coastal Plain and Gulf Coastal Plain have been named var. bacculum-rubrum (Featherman) Fernald; they are probably not worthy of taxonomic recognition. They can be distinguished as follows: var. bacculum-rubrum has the longest pinnae more than 3.5-6 cm long, the pinnae often coarsely serrate-incised to pinnatifid and the larger leaves to (30-) 40-70 (-100) cm tall, with 45-70 pairs of pinnae (vs. longest pinnae less than 3.5 cm long, pinnae subentire to pinnatifid, larger leaves to 20-45 (-50) cm tall, with 25-50 pairs of pinnae). [= RAB, C, FNA, S, W; > A. platyneuron var. bacculum-rubrum (Featherman) Fernald - F, G, K; > A. platyneuron var. incisum (Howe ex Peck) B.L. Robinson -- F]

Asplenium resiliens Kunze, Blackstem Spleenwort. Mt (GA, NC, SC, VA), Pd (GA, NC, VA), Cp (GA): moist to dry outcrops of calcareous sedimentary or metamorphic rocks, such as limestone, dolostone, or marble, sometimes on narrow seams of calcareous materials in otherwise acidic rocks, mostly at low to moderate elevations, but remarkably on Grandfather Mountain at over 1800 m ; common in VA, rare in VA Piedmont, NC, and SC (NC Watch List, SC Rare). April-October. Sc. PA, KY, s. IL, MO, se. KS, OK, TX, CO, and s, NV south to FL, TX, AZ, and Mexico; also in the West Indies, Central America, and South America. This species is a triploid (EEE), unable to produce viable spores by sexual means, but producing spores apogamously. It is a parent species of the rare $A$. heteroresiliens. [= RAB, C, F, FNA, G, K, S, W]

Asplenium rhizophyllum Linnaeus, Walking Fern. Mt (GA, NC, SC, VA), Pd (GA, NC, VA), Cp (NC, VA): moist outcrops of calcareous sedimentary, calcareous metamorphic, or mafic metamorphic rocks, such as limestone, dolostone, calcareous siltstone, amphibolite, mostly at low to moderate elevations, rarely to 1500 m or higher; common (but local) in VA Mountains, uncommon in VA Piedmont, rare in VA Coastal Plain, uncommon in NC Mountains, rare in NC Piedmont and Coastal Plain (SC Rare). MayOctober. S. Québec, Ontario and se. MN south to c. GA, AL, MS, AR, OK, and IA. This species, sometimes placed in the genus Camptosorus because of its strikingly different morphology from (most) other Asplenium, is one of the diploid progenitors of the reticulately evolved Appalachian Asplenium complex. It is a parent of A. pinnatifidum and A. xebenoides (as well as other sterile hybrids), both of which have inherited a limited ability to produce plantlets at the attenuate leaf-tip. It is closely related to Asplenium sibiricum of e. Asia. [= RAB, C, FNA, K, W; = Camptosorus rhizophyllus (Linnaeus) Link -- F, G, S]

Asplenium ruta-muraria Linnaeus var. cryptolepis (Fernald) Wherry, American Wall-rue. Mt (GA, NC, VA), Pd (VA): moist to dry outcrops of calcareous sedimentary or metamorphic rocks, such as limestone, dolostone, or marble, at low to moderate elevations; uncommon in VA (rare in Piedmont, rare in NC) (GA Special Concern). May-October. A. ruta-muraria is a circumboreal species of Europe, Asia, and North America; in North America it ranges as var. cryptolepis from VT, s. Ontario and n. MI south to n. NJ, w. NC, nw. GA (Jones \& Coile 1988), n. AL, TN, and AR. Var. ohionis is very likely only a form. The relationship of North American A. ruta-muraria (here distinguished as var. cryptolepis), a tetraploid, to the diploid and tetraploid subspecies of $A$. rutamuraria present in Europe and e. Asia is uncertain. Given the prevalence of allopolyploidy in Asplenium and slight morphologic differences between American and European material, I prefer not to assume its identity to the European plants. In Europe A. rutamuraria is an abundant plant of masonry, such as the defensive walls of towns and cities; it is very rarely seen on walls in North America, presumably because they are not old enough. [<A. ruta-muraria -- RAB, C, FNA, W; > A. cryptolepis Fernald var. cryptolepis -- F, S; > A. cryptolepis Fernald var. ohionis Fernald -- F, S; > A. ruta-muraria var. ohionis (Fernald) Wherry -- G; > A. ruta-muraria var. cryptolepis - G; > A. ruta-muraria var. lanceolum Christ -- K; > A. ruta-muraria var. cryptolepis - K, in a narrower sense]

Asplenium trichomanes Linnaeus ssp. quadrivalens D.E. Meyer emend. Lovis, Maidenhair Spleenwort. Mt (VA): moist outcrops of calcareous sedimentary rocks, such as limestone or dolostone; rare (VA Watch List). May-October. Ssp. quadrivalens is known from North America and Europe (at least); in North America it is substantially rarer than ssp. trichomanes and more limited in range, occurring from New England and s. Ontario south to w. VA, OH, and s. IL, and in British Columbia, WA, and OR. Ssp.
quadrivalens is a tetraploid of uncertain origin, presumably autotetraploid, but perhaps the result of the hybridization of 2 ecologically differentiated diploid races of $A$. trichomanes. [= FNA, K, W; < A. trichomanes -- RAB, C, F, G, S]

Asplenium trichomanes Linnaeus ssp. trichomanes, Maidenhair Spleenwort. Mt, Pd (GA, NC, SC, VA): moist outcrops of slightly to strongly calcareous sedimentary or metamorphic rocks and moderately to strongly mafic metamorphic and igneous rocks, such as limestone, dolostone, mafic and intermediate gneisses and schists, amphibolite, most typically in strong shade, as under overhangs; common (SC Rare). May-October. A. trichomanes as a whole is a complex species, with diploid, tetraploid, and hexaploid elements, occurring in North America, Europe, Australia, New Zealand, and Asia. Ssp. trichomanes is known to occur in Europe and North America (at least); in North America, it ranges from Newfoundland to AK, south to NC, c. GA (Jones \& Coile 1988), c. AL, AR, OK, w. TX, se. AZ, and w. OR. Ssp. trichomanes is a diploid, probably involved in the origin of ssp. quadrivalens. [= FNA, K, W; < A. trichomanes -- RAB, C, F, G, S]

Asplenium $\times$ trudellii Wherry (pro species) [montanum $\times$ pinnatifidum], Trudell's Spleenwort. Pd (GA, VA), Mt (GA, NC, VA): moist outcrops of felsic sedimentary or metamorphic rocks, such as sandstone, phyllite, schist, at low elevations; rare. MayOctober. This taxon is a sterile triploid hybrid (MMR) of A. montanum and A. pinnatifidum. It is considerably more common than most other sterile Asplenium hybrids, sometimes occurring without one or either parents. There are some reports that it can sometimes produce fertile spores. [= F, FNA, K; = Asplenium pinnatifidum Nuttall var. trudellii (Wherry) Clute -- G; = Asplenium trudellii Wherry -- S; = ×Asplenosorus trudellii (Wherry) Mickel]

Asplenium scolopendrium Linnaeus var. americanum (Fernald) Kartesz \& Gandhi, American Hart's-tongue Fern, is a very rare taxon, occurring in humid sinkholes in e. TN and n. AL, and other habitats, farther north in c. NY, n. MI, and Ontario; it is also reported as naturalized in MD by Reed (1953). [= FNA, K; = Phyllitis scolopendrium (Linnaeus) Newman var. americana Fernald -C, F, G]

Asplenium scolopendrium Linnaeus var. scolopendrium is reported as naturalized in a well in MD by Reed (1953). [=FNA, K; = Phyllitis scolopendrium (Linnaeus) Newman var. scolopendrium -- C, F, G]

Asplenium septentrionale (Linnaeus) Hoffmann, Forked Spleenwort, occurs in WV (Hardy and Monroe counties), close to the VA line. It occurs on acidic rocks and may well be found in our area, as it is so inconspicuous. Its chromosome formula is SSSS. [ $=\mathrm{C}, \mathrm{FNA}, \mathrm{K}$ ]

The following additional hybrids (with both parents occurring in our area) are known; not all have been reported from our area, but all could plausibly occur here. They can usually be fairly readily recognized by observers experienced with both of their parents; their morphology is intermediate between the two parents, and they are usually (though not always) found in close proximity to both parents.

Asplenium ×alternifolium Wulfen (pro sp.) [A. septentrionale $\times$ trichomanes]. Chromosome formula $=$ SSTT. Known from Hardy County, WV (Wagner et al. 1991). [= FNA, K]
Asplenium $\times$ boydstoniae (Walter) Short [A. ebenoides $\times$ platyneuron]. Chromosome formula $=$ PPPR. Known from Hale County, AL. This hybrid can only occur in association with fertile (autotetraploid) A. ebenoides, which is so far knbown only from Hale County, AL. [= FNA, K]
Asplenium $\times$ clermontiae Syme $[A$. ruta-muraria $\times$ trichomanes $]$. Chromosome formula $=$ TTUU. Known from $\mathrm{OH} .[=\mathrm{K} ;=A$. $\times$ clermontae -- FNA, orthographic variant]
Asplenium $\times$ gravesii Maxon [A. bradleyi $\times$ pinnatifidum]. Chromosome formula $=$ MMPR. Known from GA, VA, TN, KY, and other states. [= FNA, K]
Asplenium $\times$ herb-wagneri W.C. Taylor \& Mohlenbrock [A. pinnatifidum $\times$ trichomanes]. Chromosome formula $=$ MRT. [ $=$ FNA, K]
Asplenium $\times$ inexpectatum (E.L. Braun ex Friesner) Morton [A. rhizophyllum $\times$ ruta-muraria]. Chromosome formula $=$ RUU. [= FNA, K]
Asplenium $\times$ kentuckiense $T . N$. McCoy [A. pinnatifidum $\times$ platyneuron]. Chromosome formula $=$ MPR. Known from several localities in the VA Mountains and Piedmont. [= FNA, K]
Asplenium $\times$ morganii W.H. Wagner [A. platyneuron $\times$ ruta-muraria]. Chromosome formula $=$ PUU. Known from MD. [= K]
Asplenium $\times$ shawneense (R.C. Moran) H.E. Ballard [A. rhizophyllum $\times$ trichomanes]. Chromosome formula $=$ RT. [= FNA, K]
Asplenium $\times$ virginicum Maxon [A. platyneuron $\times$ trichomanes]. Chromosome formula $=$ PT. [=FNA, K]
Asplenium $\times$ wherryi D.M. Smith $[A$. bradleyi $\times$ montanum]. Chromosome formula $=$ MMP. Known from Murray Co. GA. [=FNA, K ]

## Camptosorus

[see Asplenium]
Phyllitis
[see Asplenium]

## AZOLLACEAE Wettst. 1903 (Mosquito Fern Family)

Azollaceae consists of the single genus Azolla, with about 6 species. References: Lumpkin in FNA (1993b).

## Azolla Lamarck 1783 (Mosquito Fern)

A small genus of about 6 species, floating aquatics, in tropical and warm temperate regions. Very un-fernlike, this floating aquatic looks superficially more like an aquatic liverwort. In some years and some places it occurs in great abundance, covering the surface
of the water with a green or red mass of vegetation. Azolla has a symbiotic, nitrogen-fixing cyanobacterium, Anabaena azollae Strasburger. The nitrogen-fixing capabilities of Azolla have resulted in its use as a fertilizer, green manure, and livestock feed, much promoted in recent years, but used historically in Asian rice paddies for centuries (Lumpkin in FNA 1993b). References: Lumpkin in FNA (1993b).

1 Largest hairs on upper leaf lobe with 2 or more cells; megaspores densely covered with tangled filaments ..... A caroliniana
1 Largest hairs on upper leaf lobe with 1 cell; megaspores with raised angular bumps, visible through a sparse layer of filaments
A. filiculoides

Azolla caroliniana Willdenow, Eastern Mosquito Fern, Water fern. Cp (GA, NC, SC, VA), Mt, Pd (NC, SC, VA): stagnant waters of interdune ponds, limesink ponds, old millponds, beaver ponds, floodplain sloughs; uncommon (though often locally abundant, rare in Mountains and Piedmont of Virginia only). June-September. Widespread in the se. United States, extending irregularly north (partly from introductions) into s. New England and MN, and south into the tropics. [= RAB, C, F, FNA, G, K, S]

Azolla filiculoides Lamarck. Cp (GA): freshwater lake; rare, introduced from w. North America. This species is reported for e. GA from a freshwater lake on Sapelo Island, McIntosh Co. (Bates \& Browne 1981), presumably as an accidental introduction. [= FNA, K]

## BLECHNACEAE (C. Presl) Copeland 1947 (Deer Fern Family)

A family of about 9 genera and 250 species, cosmopolitan in distribution. References: Lellinger (1985); Cranfill in FNA (1993b); Kramer, Chambers, \& Hennipman in Kramer \& Green (1993).

1 Veins of sterile leaves free; sori continuous . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Blechnum
1 Veins of sterile leaves anastomosing; sori distinct from one another, in rows . . . . . . . . . . ................. Woodwardia

## Blechnum Linnaeus 1753 (Deer Fern)

A genus of about 220 species, of nearly cosmopolitan distribution (mostly tropical and especially Southern Hemisphere). References: Kramer, Chambers, \& Hennipman in Kramer \& Green (1993).

Blechnum occidentale Linnaeus var. minor Hooker, Hammock Fern. Cp (GA): moist forests; rare. S. GA south to FL, the West Indies, Central America, and South America. [= FNA; <B. occidentale -- K, S]

## Woodwardia J.E. Smith 1793 (Chain Fern)

A genus of about 13 species of temperate and tropical portions of the Northern Hemisphere. References: Kramer, Chambers, \& Hennipman in Kramer \& Green (1993).

1 Sterile leaves pinnatifid, the pinnae 7-10 pairs per leaf, basally not distinct from one another, the rachis therefore winged by leaf tissue throughout its length, the pinnae merely finely serrulate. W. areolata

1 Sterile leaves pinnate-pinnatifid, the pinnae 15-20 pairs per leaf, fully distinct, the rachis therefore not winged by leaf tissue, the pinnae themselves pinnatifid W. virginica

Woodwardia areolata (Linnaeus) T. Moore, Netted Chain Fern. Cp, Pd, Mt (GA, NC, SC, VA): moist to wet, acid, organic soils, such as bogs, blackwater bottomlands, pocosins; common (rare in VA Mountains). May-September. Ranging from Nova Scotia west to MI and MO, south to FL and e. TX, primarily on the Coastal Plain. When fruiting structures are not present, sometimes confused with Onoclea, but $W$. areolata has the pinnae tending to be alternate (vs. tending to be opposite), the pinnae tending to be acute or acuminate (vs. obtuse), and the pinna margin finely serrulate (vs. entire). See Cranfill (1983) for a discussion of the geography and ecology of W. areolata. [= RAB, C, F, FNA, G, K, W; = Lorinseria areolata (Linnaeus) K. Presl -- S]

Woodwardia virginica (Linnaeus) J.E. Smith, Virginia Chain Fern. Cp, Mt, Pd (GA, NC, SC, VA): moist to wet, acid, organic soils, such as bogs, blackwater bottomlands, pocosins, sometimes in standing water, as in periodically flooded coastal plain depression ponds; common (rare in VA Mountains and VA Piedmont). June-September. Ranging from Nova Scotia west to MI and IL, south to FL and TX, and in Bermuda, primarily on the Coastal Plain. Sometimes confused when sterile with Osmunda cinnamomea (which see for discussion). [= RAB, C, F, FNA, G, K, W; = Anchistea virginica (Linnaeus) K. Presl -- S]

## DENNSTAEDTIACEAE Pichi Sermolli 1970 (Bracken Family)

A family of about 16 genera and 370 species, of cosmopolitan distribution; the circumscription is very uncertain and controversial, however. References: Lellinger (1985); Cranfill in FNA (1993b); Kramer in Kramer \& Green (1993).

1 Leaf blades elongate in outline, at least $4 \times$ as long as broad, membranaceous; sori globular, separate

## Dennstaedtia Bernhardi 1801 (Cuplet Fern)

A genus of about 45 species, of tropical to temperate distribution; Dennstaedtia is poorly known and of uncertain circumscription. References: Nauman \& Evans in FNA (1993b); Kramer in Kramer \& Green (1993).

Dennstaedtia punctilobula (Michaux) T. Moore, Hay-scented Fern, Pasture Fern, Boulder Fern. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): rocky or dry woodlands and forests, rock outcrops, pastures, clearings, roadbanks; common (uncommon in Piedmont, rare in Coastal Plain). June-September. Nova Scotia and Québec west to MI, south to NC, n. GA, n. AL, and AR, progressively more montane southwards. This common species can be distinguished from other woodland ferns with deciduous fronds of similar size and shape (such as Athyrium, Dryopteris, and Thelypteris) by the following characteristics: leaves yellow-green or pale-green in color, with whitish-gray glandular trichomes, petioles silvery-pilose, leaves borne scattered (as clonal patches), sori tiny (less than 0.5 mm in diameter). Dennstaedtia is a large, pantropical genus; only D. punctilobula is temperate in distribution. Anatomical evidence indicates that it is not closely related to tropical Dennstaedtia, and its separation from that genus may be warranted. [= RAB, C, F, FNA, G, K, S, W]

* Dennstaedtia cicutaria (Sw.) T. Moore. AL. \{investigate status\} [= K]

## Pteridium Gleditsch ex Scopoli 1760 (Bracken)

A genus of 2-11 species, cosmopolitan in distribution. Pteridium is a notorious and nearly worldwide weed (though less consequential in our area than in many parts of the world), nearly impossible to eradicate because of its deeply subterranean rhizomes. Bracken fiddleheads are sometimes eaten, but they are poisonous and highly carcinogenic. Bracken is not favored by grazing animals, and increases its abundance under grazing pressure. In overgrazed pastures, however, cattle will graze on bracken, the carcinogenic compound (shikimic acid) then transmittable to humans through milk. References: Jacobs \& Peck in FNA (1993b).

1 Terminal segments of well-developed pinnules $2-4 \times$ as long as broad, about 3-7 mm wide, the margins usually pubescent; lower surface of rachis and costae shaggy pubescent . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. aquilinum var. latiusculum
1 Terminal segments of well-developed pinnules 6-15× as long as broad, about 2-5 mm wide, the margins usually glabrous or sparsely pilose; lower surface of rachis and costae glabrous or sparsely pilose . . . . . . P. aquilinum var. pseudocaudatum

Pteridium aquilinum (Linnaeus) Kuhn var. Iatiusculum (Desvaux) Underwood ex Heller, Eastern Bracken. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): mainly in dry woodlands, forests, and heath balds, up to 1600 m in elevation; common (rare in Coastal Plain). July-September. The species is nearly worldwide in distribution; var. latiusculum is itself very widely distributed, occurring in most of North America (largely replaced by var. pseudocaudatum in the Southeast), in Mexico, and in Eurasia. The relationship of these two varieties is discussed in detail by Speer \& Hilu (1999) and Speer, Werth, \& Hilu (1999). [= RAB, C, F, FNA, G, K, W; = P. latiusculum (Desvaux) Hieronymus var. latiusculum -- S]

Pteridium aquilinum (Linnaeus) Kuhn var. pseudocaudatum (Clute) Heller, Tailed Bracken, Southern Bracken. Cp, Pd (GA, NC, SC, VA), Mt (GA, NC, SC): mainly in dry sandy woodlands, often locally abundant in sandhills and flatwoods; common (uncommon in Piedmont). July-September. Var. pseudocaudatum is primarily a variety of the Southeastern Coastal Plain (where it is ubiquitous and abundant), but is reported north to MA, OH, IN, s. MI, and MO. [= RAB, C, F, FNA, G, K, W; = P. latiusculum (Desvaux) Hieronymus var. pseudocaudatum (Clute) Maxon -- S]

DRYOPTERIDACEAE Ching 1965 (Wood-fern Family)
A family of about 47 genera and 1700 species, cosmopolitan in distribution, but concentrated in temperate and montane areas. References: Smith in FNA (1993b); Lellinger (1985); Kramer et al. in Kramer \& Green (1993).

1 Leaves dimorphic, the pinnae or pinnules of the fertile leaves contracted, brown, and more-or-less beadlike; [subfamily Athyrioideae, tribe Onocleeae].
2 Sterile leaves pinnate-pinnatifid, 6-25 dm tall, broadest towards the tip; fertile leaves 1-pinnate; veins free; rhizomes of 2 types, the slender, creeping rhizomes leafless, giving rise at intervals to extremely stout, vertical rhizomes which bear a cluster of many leaves Matteucia
2 Sterile leaves pinnatifid, 2-10 dm tall, broadest near the base; fertile leaves 2-pinnate; veins netted; rhizomes all slender and creeping, the leaves borne scattered along the rhizome . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Onoclea
1 Leaves monomorphic (the fertile like the sterile), or slightly dimorphic (the fertile differing from the sterile only in size, shape, or orientation).
3 Sori elongate, indusia present and flaplike, attached along a long side; vascular bundles in the petiole 2; [subfamily Athyrioideae, tribe Physematieae].
4 Leaves 2-pinnate to 3-pinnate (the pinnae at least 1-pinnate); sori elongate, 2-3× as long as wide, the larger sori generally curved and extending across the veins Athyrium
4 Leaves 1-pinnate to 1-pinnate-pinnatifid (the pinnae entire or pinnatifid); sori elongate, 2.5-6× as long as wide, even the larger sori generally straight and not extending across the veins.
5 Leaves 1-pinnate-pinnatifid, the pinnae pinnatifid . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Deparia 5 Leaves 1-pinnate, the pinnae entire . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Diplazium
3 Sori round, indusia present or absent, if present reniform, peltate, cuplike, or lateral (but not attached along a long side);
vascular bundles in the petiole either 2 or 4-7.
6 Leaf blades pentagonal or broadly triangular in outline, ca. $1 \times$ as long as wide.
7 Leaf blade pentagonal in outline, the terminal pinna by far the largest; rhizome 5-8 mm in diameter; indusia present, thick, persistent, and reniform; vascular bundles in the lower petiole 4-7; [introduced species, naturalized in moist ravines in SC]; [subfamily Dryopteridoideae, tribe Dryopterideae] . . . . . . . . Arachniodes
7 Leaf blade broadly triangular in outline, the basal pinnae by far the largest; rhizome ca. 1 mm in diameter; indusia absent; vascular bundles in the lower petiole 2; [native species of mountain peaks of $n$. NC and VA]; [subfamily Athyrioideae, tribe Physematieae]

Gymnocarpium
6 Leaf blades lanceolate, oblong, or ovate in outline, $2 \times$ or more as long as wide.
8 Leaves 1-pinnate, the pinnae toothed and each with a slight to prominent lobe near the base on the side towards the leaf tip, dark green, subcoriaceous to coriaceous; indusia peltate; [subfamily Dryopteridoideae, tribe Dryopterideae].
9 Veins anastamosing, rejoining to form a netlike pattern; pinnae 4-25 pairs per leaf; [non-native, rarely
naturalized] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Cyrtomium
9 Veins branching dichotomously, free, not rejoining to form a netlike pattern; pinnae 25-50 pairs on larger
leaves; [plant a common native species]
Polystichum
8 Leaves 1-pinnate-pinnatifid to more divided, the pinnae pinnatifid or themselves fully divided, generally lacking a prominent basal lobe, light green to dark green, herbaceous to subcoriaceous; indusia reniform, cuplike, or lateral.
10 Indusia reniform; vascular bundles in the lower petiole 4-7; plants medium to large, the larger leaf blades $23-100 \mathrm{~cm}$ long, (8-) 10-40 cm wide; [subfamily Dryopteridoideae, tribe Dryopterideae] . . . . . Dryopteris 10 Indusia hoodlike, pocketlike, cuplike, or consisting of numerous hairs attached below the sorus; vascular bundles in the lower petiole 2; plants small to medium, the larger leaf blades $5-65 \mathrm{~cm}$ long, $1.5-12 \mathrm{~cm}$ wide (sometimes longer or wider in Cystopteris bulbifera, distinguishable by its long-attenuate leaf tip and bulblets); [subfamily Athyrioideae, tribe Physematieae].
11 Indusium attached under one side of the sorus, hoodlike or pocketlike, arching over the sorus; petioles glabrous or sparsely beset with scales, the petiole bases not persistent . . . . . . Cystopteris 11 Indusium attached under the sorus, cuplike (divided into 3-6 lanceolate to ovate lobes which surround the sorus from below) or of minute numerous septate hairs, which extend out from under the sorus on all sides; petioles often densely beset with scales, the petiole bases persistent. Woodsia

## Arachniodes Blume 1828 (East Indian Holly Fern)

A genus of about 50-60 species, of tropical and warm temperate regions, and especially of Asia and America. References: Smith in FNA (1993b); Kramer et al. in Kramer \& Green (1993).

* Arachniodes simplicior (Makino) Ohwi, Simpler East Indian Holly Fern. Pd (SC): moist banks in forested creek ravine; rare, introduced from Japan and China. Gordon (1981) discusses this interesting introduced population, apparently established for several decades at the time of its discovery, and likely originating from spores. [= FNA, K]

## Athyrium Roth 1799 (Lady Fern)

A genus of about 180 species, cosmopolitan in distribution, but concentrated in e. and se. Asia. Kelloff et al. (2002) and Kelloff \& Werth (1998) support recognition of two taxa at either specific or infraspecific levels, based on morphology, allozymes, and spores. References: Kato in FNA (1993b); Kramer et al. in Kramer \& Green (1993); Kelloff et al. (2002).

Identification notes: Athyrium and Deparia superficially resemble Dryopteris, and they often grow together. Athyrium and Deparia have linear, flap-like sori (vs. rounded, reniform sori). Sterile individuals can be distinguished by the number of vascular bundles in the petiole (easily determined by breaking off a leaf and counting the vascular bundles, which will appear as thread-like strands); Athyrium and Deparia have 2, Dryopteris has 4-7.

1 Leaf blade widest near middle (the fourth or fifth pair of pinnae from the base the largest); margins of indusium toothed or ciliate (not glandular); rachis glandular; spores yellow or brown, finely papillose; petiole scales persistent, up to 1 cm long and 1.5 mm wide
A. angustum

1 Leaf blade widest near base (the second or third pair of pinnae from the base the largest); margins of indusium ciliate and glandular-ciliate; rachis eglandular; spores brown or dark brown, reticulate-wrinkled; petiole scales early deciduous, up to 5 mm long and 1 mm wide
A. asplenioides

Athyrium angustum (Willdenow) K. PresI, Northern Lady Fern. Mt (NC, VA?): rock outcrops on grassy balds at high elevations; rare (NC Watch List). June-September. The occurrence of this northern species is not fully documented in NC or VA; it was found in the 1980's by Murray Evans on Hump Mountain, on or near the TN-NC border. Newfoundland and $n$. Québec west to Saskatchewan, south to w. NC, e. TN, OH, MO, and NE. Reported for VA by Kartesz (1999). [= S; = A. filix-femina (Linnaeus) Roth ex Mertens var. michauxii (Sprengel) Farwell -- C, F, G; = A. filix-femina var. angustum (Willdenow) G. Lawson -- FNA; = A. filixfemina ssp. angustum (Willdenow) Clausen -- K, W]

Athyrium asplenioides (Michaux) A.A. Eaton, Southern Lady Fern. Mt, Pd, Cp (GA, NC, SC, VA): moist forests; common. May-September. MA, WV, IL, and KS south to n . FL and e. TX. [= RAB, S; = A. filix-femina (Linnaeus) Roth ex Mertens var.

```
asplenioides (Michaux) Farwell -- C, F, FNA, G; = A. filix-femina ssp. asplenioides (Michaux) Hultén -- K, W]
```

Cyrtomium K. Presl 1836 (Net-veined Holly Fern)
A genus of about 15 species, of temperate regions of Africa, Asia, and the Pacific Islands. Perhaps better treated as a portion of Polystichum; at the least, Cyrtomium is closely related to Polystichum. Both species in our area are apogamous triploids. References: Yatskievych in FNA (1993b); MacDougal (1976); Kramer et al. in Kramer \& Green (1993).

1 Leaf coriaceous, the upper surface dark green and shiny; pinnae 4-10 (-12) pairs per leaf, 1.5-3 cm wide, the margins coarsely toothed or undulate
C. falcatum

1 Leaf less coriaceous, the upper surface pale green and dull; pinnae (8-) 10-25 pairs per leaf, 1-2 cm wide, the margins finely denticulate ..................................................................................... . . . . fortunei var. fortunei

* Cyrtomium falcatum (Linnaeus f.) K. Presl, Asian Net-veined Holly Fern. Cp (GA, NC, SC), Mt (GA?, VA): ditches, old mortar of brick walls; rare, native of e. Asia. [= FNA, K, S; = Polystichum falcatum Linnaeus f.]
* Cyrtomium fortunei J. Smith var. fortunei, Fortune's Net-veined Holly Fern. Cp (GA, SC), Pd? (GA?): old mortar of brick walls; rare, native of se. China. Two other varieties are known; neither appears to be naturalized in North America. [= FNA; < C. fortunei -- K]

## Cystopteris Bernhardi 1806 (Bladder Fern, Brittle Fern)

A genus of about 20 species, semicosmopolitan in distribution, primarily of temperate regions but also in montane to alpine settings in tropical regions. References: Haufler, Moran, \& Windham in FNA (1993b); Haufler, Windham, \& Ranker (1990); Kramer et al. in Kramer \& Green (1993).

Identification notes: See Woodsia for suggestions on distinguishing between Cystopteris and Woodsia, similar ferns often confused.

1 Lowest pair of pinnae the longest, thus the leaf widest at the base; bulblets often present on the rachis; indusia, rachises, and veins with stalked glands (these sometimes sparse in C. tennesseensis).
2 Leaf blade $10-55 \mathrm{~cm}$ long, usually $2-3 \times$ as long as the reddish to tan petiole; bulblets usually present, smooth, green, 2-3 mm in diameter, usually on the rachis and the costa; spores $20-27 \mu$ long C. bulbifera

2 Leaf blade 6-25 cm long, usually about $1 \times$ as long as the dark brown petiole; bulblets present or absent, deformed and scaly, dark, less than 1.5 mm in diameter, on the rachis only; spores 25-35 $\mu$ long
C. tennesseensis

1 Lowest pair of pinnae shorter than the second or third pair, thus the leaf widest above the base; bulblets never present; indusia, rachises, and veins eglandular.
3 Leaf blade (2.5-) 3-4× as long as wide; pinnae usually perpendicular to the rachis (or even reflexed); margins of pinnae serrulate, the teeth sharp; basal pinnules sessile, truncate to rounded at the base; indusium up to1 mm long, lanceolate; pinnae usually perpendicular to rachis; [on rock outcrops]
3 Leaf blade 2-2.5 (-3)× as long as wide; pinnae usually at an acute angle to the rachis, curving toward the blade apex; margins of pinnae crenulate, the teeth rounded; basal pinnules short-stalked or sessile, rounded to cuneate at the base; indusium about 0.5 mm long, ovate to round; pinnae usually at an acute angle to the rachis; [on rock outcrops or forest floor].
4 Rhizome long-creeping, the apex extending 10-60 mm beyond the last of the widely-spaced petioles (especially as seen from late spring to summer); rhizome covered with scales and tan to golden hairs; spores 20-32 $\mu$ long; leaves membranaceous in texture; basal pinnules conspicuously stalked; petiole green to tan, darkened at base; lowermost pinnules of each pinna deeply cut; [typically on forest floor, less commonly on rocks]
4 Rhizome short-creeping, the apex extending only $1-5 \mathrm{~mm}$ beyond the last of the closely-spaced petioles; rhizome covered with scales, lacking hairs; spores $32-42 \mu$ long; leaves thicker in texture; basal pinnules slightly stalked or merely cuneate to the base; petiole dark brown; lowermost pinnules of each pinna slightly lobed; [often on rocks, less commonly on forest floor]
C. tenuis

Cystopteris bulbifera (Linnaeus) Bernhardi, Bulblet Fern, Bulblet Bladder Fern. Mt (GA, NC, VA), Pd (NC, VA): moist outcrops and talus of calcareous rocks, rarely up to 1500 m elevation; uncommon, rare in Piedmont (SC Rare). May-August. Newfoundland west to MN, south to NC, AL, and AR; also disjunct in UT, AZ, NM, and TX. This species is a diploid involved in the reticulate evolution of Cystopteris in e. North America. It is one parent of C. tennesseensis. Its genome can be symbolized BB. [= RAB, C, F, FNA, G, K, S, W]

Cystopteris fragilis (Linnaeus) Bernhardi, Fragile Fern, Brittle Fern. Mt (NC, VA): cliffs, ascending in our area to 1650 m ; rare (VA Rare). June-September. Circumboreal, in North America ranging from Newfoundland west to AK, south to MA, CT, NJ, montane NC, VA, KY, MO, OK, TX, NM, and AZ. This species is a fertile allotetraploid, presumed to be derived from hybridization between C. reevesiana Lellinger and an extinct or currently undiscovered second parent (C. "hemifragilis"); its genome can be symbolized HHRR (Paler \& Barrington 1995). C. fragilis appears to be a complex needing further study; additional entities may be found to warrant taxonomic recognition (see FNA for discussion). [= FNA, K, W; = C. fragilis var. fragilis -- C, F, G, S]

Cystopteris protrusa (Weatherby) Blasdell, Lowland Bladder Fern. Mt, Pd (GA, NC, SC, VA): rich woods or on moss- and soil-covered talus in boulderfields, occasionally on ledges of rock outcrops; common (SC Rare). April-June. NY and Ontario west to $M N$, south to GA, AL, MS, LA, AR, e. KS, and IA. This species is a diploid involved in the reticulate evolution of Cystopteris in e.

North America. It is one parent of $C$. tennesseensis and $C$. tenuis. Its genome can be symbolized PP. $[=R A B, C, F N A, K, W$; $=C$. fragilis var. protrusa Weatherby -- F, G, S]

Cystopteris tennesseensis Shaver, Tennessee Bladder Fern. Mt (GA, NC, VA), Cp (NC): moist to dry outcrops of calcareous rocks, including coquina limestone ("marl") in the outer Coastal Plain; rare (GA Special Concern, NC Rare, VA Rare). April-June. PA, KY, IL, WI, and IA south to NC, $n$. AL, AR, and OK. This species is a fertile allotetraploid derived from hybridization between C. bulbifera and C. protrusa. Its genome can be symbolized BBPP. Haufler, Windham, \& Ranker (1990) consider this a "successfully fledged and vigorous young species," adapted to a hybrid niche not successfully utilized by either parent [= RAB, C, FNA, K, W]

Cystopteris tenuis (Michaux) Desvaux, Mackay's Bladder Fern. Mt (GA, NC, VA), Pd (VA): moist outcrops and cliffs of metamorphic and sedimentary rocks, occasionally in moist soils near rock outcrops; uncommon (NC Rare). May-August. Newfoundland west to MN and NE, south to VA, IL, and MO, and in the mountains to NC, TN, and n. GA. This species is a fertile allotetraploid derived from hybridization between C. protrusa and an extinct or currently undiscovered second parent ( $C$. "hemifragilis"); its genome can be symbolized HHPP (Paler \& Barrington 1995). [= FNA, K, W; = C. fragilis var. mackayi Lawson -C, F, G]

Hybrids frequently occur where two or more species of Cystopteris grow in proximity. The following hybrids may be anticipated in our area:

Cystopteris bulbifera $\times$ tennesseensis.
Cystopteris bulbifera $\times$ tenuis [C. $\times$ illinoensis R.C. Moran].
Cystopteris fragilis $\times$ tenuis.
Cystopteris protrusa $\times$ tennesseensis.
Cystopteris protrusa $\times$ tenuis.
Cystopteris tennesseensis $\times$ tenuis [C. $\times$ wagneri R.C. Moran].

## Deparia Hooker \& Greville 1829

A genus of about 40-50 species, primarily in tropical to warm temperate Asia and Africa. Our species is the only species native to the New World; it has several very closely related species in e. Asia (in section Lunathyrium). References: Kato in FNA (1993b); Kramer et al. in Kramer \& Green (1993).

1 Leaf blade narrowed to base; petiole bases swollen, with 2 rows of teeth; [plant a common native species of moist forests]; [section Lunathyrium] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . D. acrostichoide
1 Leaves widest at the base; petiole bases not markedly swollen, lacking teeth; [plant an exotic species, rarely introduced and naturalized]; [section Athyriopsis] D. petersenii

Deparia acrostichoides (Swartz) M. Kato, Silvery Spleenwort. Mt, Pd (GA, NC, SC, VA), Cp (NC, VA): moist forests, cove forests; common (uncommon in Piedmont, rare in Coastal Plain). June-September. Nova Scotia west to MN, south to NC, SC, n. GA, n. AL, and AR. Unlike Athyrium, Deparia has the costal groove not continuous with the rachis groove. In addition, Deparia has multicellular hairs on the leaf blades. It stores starch in the swollen, persistent petiole bases. [= FNA, K, W; = Athyrium
thelypteroides (Michaux) Desvaux -- RAB, C, F, G; = Diplazium acrostichoides (Swartz) Butters -- S]

* Deparia petersenii (Kunze) M. Kato. Cp (GA): disturbed areas; rare, native to se. Asia. Introduced and naturalized in the Southeast, including in c. and s. GA, AL, and FL. [= FNA; = Deparia petersonii - K, orthographic variant; = Deparia japonica (Thunberg) M. Kato, misapplied; = Diplazium japonicum (Thunberg) Beddome, misapplied]

Diplazium Swartz 1800 (Twin-sorus Fern, Glade Fern)
A genus of about 400 species, primarily tropical and north temperate in distribution. References: Kato in FNA (1993b); Kramer et al. in Kramer \& Green (1993).

Diplazium pycnocarpon (Sprengel) M. Broun, Glade Fern. Mt (GA, NC, SC, VA), Pd (NC, VA), Cp (VA): very nutrient-rich, loamy or seepy forests, over calcareous sedimentary (such as limestone or dolostone) or mafic metamorphic or igneous rocks (such as greenstone or amphibolite); uncommon (rare in Coastal Plain and south of VA) (NC Watch List, SC Rare). July-September. Widespread in e. North America, much more common in limestone areas of the Ridge and Valley than in the primarily acid-soil Blue Ridge and Piedmont. [= FNA, K; = Athyrium pycnocarpon Sprengel -- RAB, C, F, G; = Homalosorus pycnocarpos (Sprengel) PichiSermolli -- S, W]

## Dryopteris Adanson 1763 (Wood-fern, Shield-fern)

A genus of about 250 species, nearly cosmopolitan, but concentrated in temperate Asia. References: Montgomery \& Wagner in FNA (1993b); Montgomery \& Paulton (1981); Montgomery (1982); Kramer et al. in Kramer \& Green (1993); Hoshizaki \& Wilson (1999).

Identification notes: Dryopteris and Athyrium are often confused when not fertile; they can be easily distinguished by breaking off a leaf and counting vascular bundles (which will appear as thread-like strands). Dryopteris has 5 and Athyrium has 2.

Many Dryopteris species will hybridize with one another to form sterile hybrids. Whenever two or more Dryopteris species are found growing together, there is a good chance that hybrids are present. Hybrids generally show intermediacy between the two parents, and have abortive sporangia or spores. For further information on hybrids, see the discussion of hybrids following the species accounts.

1 Leaves bipinnate-pinnatifid to tripinnate-pinnatifid (or to quadripinnate in the lower pinnae).
2 Leaves evergreen, minutely glandular-pubescent, especially on the indusium, rachis, and pinnae midribs; first basalpointed pinnule of the basal pinna shorter than or equal to the next outermost basal-pointed pinnule; first basal-pointed pinnule of the basal pinna usually less than $2 \times$ as long as the first tip-pointed pinnule of the basal pinna . . D. intermedia
2 Leaves deciduous, lacking gland-tipped hairs (except occasionally on the indusium); first basal-pointed pinnule of the basal pinna longer than the next outermost basal-pointed pinnule; first basal-pointed pinnule of the basal pinna more than $2 \times$ as long as the first tip-pointed pinnule of the basal pinna.
3 Leaf blade ca. $1 \times$ as long as the petiole; indusium occasionally glandular; first basal-pointed pinnule of the basal pinna $2.5-5 \times$ as long as the first tip-pointed pinnule of the basal pinna . . . . . . . . . . . . . . . . . . . D. campyloptera 3 Leaf blade $2 \times$ as long as the petiole; indusium glabrous; first basal-pointed pinnule of the basal pinna ca. $2 \times$ as long as the first tip-pointed pinnule of the basal pinna
D. carthusiana 1 Leaves pinnate-pinnatifid to bipinnate (or to bipinnate-pinnatifid in the lower pinnae).

4 Sori marginal; leaves evergreen, gray-green, leathery in texture
4 Sori medial or submedial; leaves evergreen or deciduous, dark- to bright-green, thin to stiff in texture.
5 Leaves dimorphic, the deciduous, fertile leaves erect, $2-3 \times$ as long as the spreading, evergreen, sterile leaves, which form a winter "rosette"; fertile leaves linear-lanceolate in outline, generally $4-8 \times$ as long as wide; pinnae mostly $1.5-3 \times$ as long as wide, triangular; scales at base of petiole tan.
6 Fertile pinnae nearly in plane of the blade (like a closed Venetian blind); fertile leaves 12-20 cm wide
D. clintoniana

6 Fertile pinnae usually twisted out of the plane of the leaf axes, often nearly to 90 degrees (like an open Venetian blind); fertile leaves $8-12 \mathrm{~cm}$ wide
D. cristata

5 Leaves not dimorphic, or only slightly so, deciduous ( $D$. celsa and D. goldiana) or evergreen (D. Iudoviciana); fertile leaves lanceolate to ovate in outline, generally $1.5-4 \times$ as long as wide; pinnae mostly $3-4 \times$ as long as wide; scales at base of petiole dark brown with tan margins.
$7 \quad$ Leaves evergreen, fertile only towards the tip, the fertile pinnae and segments narrower than the sterile and more widely spaced; scales at the petiole base light brown, not shiny . . . . . . . . . . . . . . . . . . . D. Iudoviciana 7 Leaves deciduous, fertile throughout or nearly so, the fertile pinnae and segments not differentiated from sterile ones; scales at petiole base medium to dark brown, shiny or not.
8 Sori submedial, not touching the costule at maturity; leaf blade lanceolate, usually $2-4 \times$ as long as wide, gradually tapering at the apex; scales at the petiole base medium to dark brown, with a narrow black central band
D. celsa

8 Sori medial, touching the costule at maturity; leaf blade ovate to narrowly ovate, usually $1.5-3 \times$ as long as wide; abruptly tapering at the apex; scales at the petiole base dark brown, nearly black, with a narrow pale margin
D. goldiana

Dryopteris campyloptera Clarkson, Mountain Wood-fern. Mt (NC, VA): spruce-fir forests, northern hardwood forests; common (VA Watch List). July-September. Newfoundland and n. Québec south to extreme n. PA, and from extreme s. PA south through e. WV and w. VA to e. TN and w. NC. This species is a fertile allotetraploid derived from hybridization of $D$. intermedia and the northern and western D. expansa (K. Presl) Fraser-Jenkins \& Jermy, which does not (now) reach our area. The chromosome complement is symbolized EEII. [= RAB, C, K, S, W; = D. spinulosa (O.F. Mueller) Watt var. americana (Fischer ex Kunze) Fernald -- F; = D. austriaca (Jacquin) Woynar ex Schinz \& Thellung var. austriaca -- G]

Dryopteris carthusiana (Villars) H.P. Fuchs, Spinulose Wood-fern, Toothed Wood-fern. Mt (GA, NC, SC, VA), Pd, Cp (NC, SC, VA): acidic, organic-rich bogs, swamps, less frequently in moist rocky ravines, rich forests, and sloping rock outcrops; common, uncommon to rare south and east of VA Mountains (GA Special Concern, SC Rare). June-September. Irregularly circumboreal, in North America ranging from n. Québec west to Yukon, south to NC, SC, TN, AR, NE, w. MT, and WA. This species is a fertile allotetraploid derived from hybridization of $D$. intermedia and " $D$. semicristata," a hypothetical species which may now be extinct. Its chromosome complement is symbolized IISS. [= C, FNA, K, W; = D. spinulosa (O.F. Mueller) Watt -- RAB, S; = D. spinulosa var. spinulosa -- F; = D. austriaca (Jacquin) Woynar ex Schinz \& Thellung var. spinulosa (O.F. Mueller) Fiori -- G]

Dryopteris celsa (W. Palmer) Knowlton, W. Palmer, \& Pollard ex Small, Log Fern. Mt (GA, NC, SC, VA), Cp, Pd (NC, SC, VA): swamps, seepage bogs; uncommon (GA Special Concern). June-September. Ranging (scattered) from ne. NJ and ne. NY west to s. IL, e. MO, and AR, south to SC, nw. GA, n. AL, TN, and n. LA; disjunct in w. NY and w. MI. This species is a fertile allotetraploid derived from hybridization of D. goldiana and D. Iudoviciana; its chromosome complement is symbolized GGLL (Werth 1991). [= RAB, C, F, FNA, K, S, W; = D. goldiana (Hooker ex Goldie) ssp. celsa W. Palmer -- G]

Dryopteris clintoniana (D.C. Eaton) Dowell, Clinton's Wood-fern, Broad Swamp Fern. Pd? (VA?): moist to wet forests; rare. This species is fertile allohexaploid derived from hybridization of $D$. cristata and $D$. goldiana; its chromosome complement is symbolized GGLLSS. This species has a disputed southern distribution; it is sometimes attributed to our area (as by Shetler \& Orli 2000). It is definitely known as far south as se. PA, sc. PA, and OH. It is provisionally accepted for our area; additional study is needed. [= FNA, C, G, K; = D. cristata (Linnaeus) A. Gray var. clintoniana (D.C. Eaton) Underwood - F]

Dryopteris cristata (Linnaeus) A. Gray, Crested Wood-fern. Mt (NC, VA), Pd (*GA, NC, VA), Cp (NC, VA): bogs, swamp forests; uncommon (GA Special Concern). July-September. Circumboreal, in North America from Newfoundland to s. Saskatchewan and se. British Columbia, south to NC, TN, OH, IN, n. IL, IA, NE, and ID; disjunct in AL. This species is a fertile allotetraploid derived from hybridization of D. Iudoviciana and "D. semicristata," a hypothetical species which may be extinct. Its chromosome complement is symbolized LLSS. It has also served as a "parent species" of $D$. clintoniana, a fertile allohexaploid
derived from $D$. cristata $\times$ goldiana. Thus, its genome constitutes two thirds of the genome of $D$. clintoniana. [=RAB, C, FNA, G, K, S, W; = D. cristata var. cristata -- F]

Dryopteris goldiana (Hooker ex Goldie) A. Gray, Goldie's Wood-fern. Mt (GA, NC, SC, VA), Pd (VA): boulderfield forests, rich cove forests, seepage swamps, especially over calcareous sedimentary or mafic metamorphic or igneous rocks; uncommon (NC Watch List, SC Rare). June-September. New Brunswick west to s. Ontario and MN, south to nw. SC, n. GA, n. AL, TN, KY, IL, and IA. This species is one of the diploid "parent species" of the e. North American reticulately-evolved Dryopteris complex. Its genome (symbolized GG) forms half of the genome of the tetraploid D. celsa, and one third of the hexaploid D. clintoniana, which does not occur as far south as our area. [= RAB, C, F, FNA, K, S, W; = D. goldiana ssp. goldiana -- G]

Dryopteris intermedia (Muhlenberg ex Willdenow) A. Gray, Fancy Fern, Evergreen Wood-fern. Mt (GA, NC, SC, VA), Pd, Cp (NC, VA): cove forests, other moist, rocky forests, over a variety of substrates; common (uncommon in Piedmont, rare in Coastal Plain) (SC Rare). June-September. Newfoundland west to MN, south to n. GA and AR. This species is one of the diploid "parent species" of the e. North American reticulately-evolved Dryopteris complex. Its genome (symbolized II) forms half of the genome of the tetraploids D. campyloptera and D. carthusiana. [= RAB, C, FNA, K, S, W; = D. spinulosa (O.F. Mueller) Watt var. intermedia (Muhlenberg ex Willdenow) Underwood -- F; = D. austriaca (Jacquin) Woynar ex Schinz \& Thellung var. intermedia (Muhlenberg ex Willdenow) Morton -- G]

Dryopteris Iudoviciana (Kunze) Small, Southern Wood-fern. Cp (GA, NC, SC): blackwater swamp forests; rare (NC Watch List). June-September. A Southeastern Coastal Plain species: e. NC south to s. FL, west to s. AL and s. MS (Sorrie \& Leonard 1999); disjunct in the West Gulf Coastal Plain of LA and AR. This species is one of the diploid "parent species" of the e. North American reticulately-evolved Dryopteris complex. Its genome (symbolized LL) forms half of the genome of the tetraploids $D$. cristata and $D$. celsa, as well as contributing one third of the genome of $D$. clintoniana indirectly (via its daughter species $D$. cristata). [= RAB, FNA, K, S]

Dryopteris marginalis (Linnaeus) A. Gray, Marginal Wood-fern. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): rock outcrops, boulderfield forests, other rocky forests; common (less common in Piedmont, rare in Coastal Plain). June-September. Newfoundland west to s. Ontario and MI, south to SC, c. GA, AL, TN, AR, and e. OK. D. marginalis has not participated in the reticulate evolution of Dryopteris in e. North America; it does, however, form sterile hybrids with some other species. [= RAB, C, F, FNA, G, K, S, W]

The following hybrids are known between species which occur in our area. If the hybrid has been reported from our area, it is so indicated. In addition, the chromosome formulae are indicated, using the conventions listed at the end. These hybrids all have unbalanced chromosome complements which do not allow pairing. Thus, all produce aborted spores (if they produce spores at all), which can be recognized (at $30-40 \times$ ) by their irregular size, shape, and color. For further information on these hybrids and a key to them, see Montgomery (1982).
D. campyloptera $\times$ intermedia. Known from NC. Chromosome formula $=$ EII.
D. campyloptera $\times$ marginalis. Known from VA. Chromosome formula $=$ EIM.
D. carthusiana $\times$ cristata $[D . \times u l i g i n o s a(A . B r a u n ~ e x ~ D o w e l l) ~ D r u c e] . ~ K n o w n ~ f r o m ~ V A . ~ C h r o m o s o m e ~ f o r m u l a ~=I L S S . ~$
D. carthusiana $\times$ intermedia [D. $\times$ triploidea Wherry]. Known from NC and VA. Chromosome formula $=1 I S$. This is one of the commonest Dryopteris hybrids.
D. carthusiana $\times \boldsymbol{m}$ arginalis $[\boldsymbol{D} . \times$ pittsfordensis Slosson]. Chromosome formula $=I M S$.
D. celsa $\times$ cristata. Known from NC. Chromosome formula $=$ GLLS.
D. celsa $\times$ goldiana. Chromosome formula $=G G L$.
D. celsa $\times$ intermedia [D. $\times$ separabilis (Wm. Palmer) Small]. Known from NC and VA. Chromosome formula $=$ GIL.
D. celsa $\times$ ludoviciana [D. xaustralis (Wherry) Small]. Known from GA, NC, SC, and VA. Chromosome formula $=$ GLL.
D. celsa $\times$ marginalis [D. $\times$ leedsii Wherry]. Chromosome formula $=$ GLM.
D. clintoniana $\times$ marginalis $[D . \times b u r g e s s i i$ Boivin]. Chromosome formula $=$ GLMS.
D. cristata $\times$ intermedia [D. $\times$ boottii (Tuckerman) Underwood]. Known from VA. Chromosome formula $=I L S$. This is one of the commonest Dryopteris hybrids.

D. goldiana $\times$ intermedia. Known from NC. Chromosome formula $=\mathrm{GI}$
D. goldiana $\times$ marginalis. [D. $\times n$ neowherryi W.H. Wagner]. Known from NC and VA. Chromosome formula $=$ GM.
D. intermedia $\times$ marginalis. Known from VA. Chromosome formula $=I M$.
$E=D$. expansa
$G=D$. goldiana
I = D. intermedia
$\mathrm{L}=\mathrm{D}$. Iudoviciana
$S=D$. "semicristata" (hypothetical taxon, perhaps extinct)

## Gymnocarpium Newman 1851 (Oak Fern)

A genus of about 8 species, north temperate in distribution. References: Pryer in FNA (1993b); Pryer \& Haufler (1993)=Z; Pryer (1992); Kramer et al. in Kramer \& Green (1990). Key based on FNA.

1 Sessile basal basiscopic pinnule of the proximal pinnae with basal basiscopic pinnulet shorter than the adjacent pinnulet; pinnae of second pair sessile, with basal pinnules shorter than the adjacent pinnule (or second basal pinule rarely stalked); spores 27-31 $\mu \mathrm{m}$ in diameter
G. appalachianum

1 Sessile basal basiscopic pinnule of the proximal pinnae with basal basiscopic pinnulet more or less equal in length to the
adjacent pinnulet; pinnae of second pair usually sessile, with basal pinnules more or less equal in length to the adjacent pinnule; spores 34-39 $\mu \mathrm{m}$ in diameter

Gymnocarpium appalachianum Pryer \& Haufler, Appalachian Oak Fern. Mt (NC, VA): moist, rocky forests, at medium to high elevations; uncommon (US Species of Concern, NC Rare, VA Watch List). June-September. Endemic to the c. and s. Appalachians (known from ne. WV, nw. VA, sc. PA, and disjunct in nw. NC and OH). Electrophoretic and morphologic analyses show that it is one of the diploid parents of the widespread allotetraploid G. dryopteris. In NC, it is limited to a single site, below the north-facing summit cliffs on Bluff Mountain, Ashe County, where seepage results in extensive ice formations which frequently persist until June. [= FNA, K, Z; < G. dryopteris (Linnaeus) Newman - C, G, W; < Dryopteris disjuncta (Ledeb.) C.V. Morton - F]

Gymnocarpium dryopteris (Linnaeus) Newman is circumboreal, occurring throughout northern and central Eurasia, Greenland, south in North America to MD (?), s. PA, OH, MI, WI, IA, w. SD, CO, n. NM, and c. AZ. Since it approaches our area from the north and closely resembles G. appalachianum, it should be carefully sought in our area, especially in the mountains of VA. See Pryer \& Haufler (1993) for a detailed analysis of the distinguishing features between G. appalachianum and G. dryopteris. Gymnocarpium robertianum (Hoffmann) Newman of n. North America, south to MI, MN, and WI. [= FNA, K, Z; Dryopteris disjuncta (Ledeb.) C.V. Morton - F, misapplied; < G. dryopteris - C, G (also see G. appalachianum)]

Triploids are known from the mountains of VA. Their identity is uncertain; based on geography they are presumably $G$. appalachianum $\times$ dryopteris, but could be G. $\times$ brittonii (Sarvela) Pryer \& Haufler [= G. disjunctum $\times$ dryopteris]. Triploids can be distinguished from G. appalachianum by the presence of malformed spores, irregular in shape and size, often intermixed with large round spores (vs. all spores reniform and relatively uniform in size and shape). [G. ×brittonii (Sarvela) Pryer \& Haufler - K]

## Matteuccia Todaro 1866 (Ostrich Fern)

A genus of 1 species, north temperate in distribution. Two other species formerly included in Matteucia (or sometimes in Onoclea) are better treated in the genus Pentarhizidium Hayata (Gastony \& Ungerer 1997). References: Johnson in FNA (1993b); Kramer et al. in Kramer \& Green (1990).

Matteuccia struthiopteris (Linnaeus) Todaro var. pensylvanica (Willdenow) C.V. Morton, Ostrich Fern. Mt, Pd (VA): alluvial forests and calcareous wetlands; rare (VA Rare). The species is circumboreal; the North American var. pensylvanica ranges from Newfoundland west to AK, south to VA, MO, SD, and British Columbia. The North American var. pensylvanica is separated from the Eurasian var. struthiopteris on the basis of its concolorous rhizome scales (vs. bicolorous scales) and less truncate pinna lobes. Matteuccia stores starch in its persistent petiole bases. [= FNA, G; < M. struthiopteris -- C, K; = Pteretis pensylvanica (Willdenow) Fernald -- F]

## Onoclea Linnaeus 1753 (Sensitive Fern)

A genus of 1 species, of temperate e. North America and e. Asia. References: Johnson in FNA (1993b); Kramer et al. in Kramer \& Green (1990).

Onoclea sensibilis Linnaeus var. sensibilis, Sensitive Fern, Bead Fern. Mt, Pd, Cp (GA, NC, SC, VA): marshes, swamps, wet disturbed places; common. May-June. The species ranges from Newfoundland west to MN and CO, south to FL, TX, and CO; also in e. Asia. Var. sensibilis is North American; var. interrupta is Asian. The recognition of two varieties is supported by molecular evidence. The genus is monotypic. The specific epithet and common name refer to the fact that the fronds wither at the first touch of frost, not that they respond to touch. The peculiar fertile leaves (with their brown, beadlike, fertile pinnules) are collected for use in dried arrangements. The expanded, persistent petiole bases store starch. [< O. sensibilis -- RAB, C, F, FNA, G, K, S, W]

## Polystichum Roth 1799 (Holly Fern)

A genus of about 180 species, nearly cosmopolitan in distribution. References: D.H. Wagner in FNA (1993b); Kramer et al. in Kramer \& Green (1990).

Polystichum acrostichoides (Michaux) Schott, Christmas Fern. Mt, Pd, Cp (GA, NC, SC, VA): moist to dry forests and woodlands; common. June-September. Nova Scotia west to MN, south to s. FL and e. TX; also in Mexico. One of the most familiar ferns in e. North America. Var. lonchitoides Brooks, allegedly endemic to $W V$, is of uncertain taxonomic value. [= RAB, C, F, FNA, G, S, W; > P. acrostichoides var. acrostichoides -- K; > P. acrostichoides var. lonchitoides Brook - K]

## Woodsia R. Brown 1810 (Woodsia, Cliff Fern)

A genus of about 30 species, of temperate and cool-temperate regions, widespread in the Northern Hemisphere, in montane tropical South America, and south temperate in Africa and South America. References: Windham in FNA (1993b); Kramer et al. in Kramer \& Green (1990).

Identification notes: Woodsia species and Cystopteris species are all small ferns with thin-textured leaves, occurring primarily on
or near rock outcrops; they frequently occur together or in proximity to one another and are often confused. Woodsia has the indusium divided into a series of scale-like or hair-like structures, attached below the sorus; Cystopteris has an undivided indusium, pocket-like or hood-like, attached around one side of the sorus. Woodsia has persistent dark petiole bases; in Cystopteris the petiole bases are deciduous. Woodsia has the final veinlets not reaching the margin; Cystopteris veins do reach the margin.

1 Petioles with a distinct joint about 1-3 cm above the base, the petiole bases of former leaves forming a fairly even stubble; leaf blade lacking glands (though bearing both long septate hairs and pale linear scales); indusium of numerous filamentous segments W. ilvensis

1 Petioles lacking a distinct joint, the petiole bases of former leaves disintegrating irregularly and forming an uneven stubble; leaf blade with stalked glands, at least below on the costae, costules, and veins (and also bearing nonglandular hairs and/or linear scales); indusium of 3-6 lanceolate segments.
2 Rachis with flattened, septate, white hairs and elongate stipitate glands; leaf blade with flattened, septate, white hairs and elongate stipitate glands . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . W. appalachiana
2 Rachis with scattered scales; leaf blade with sparse to dense stipitate glands . . . . . . . . . . . . W. obtusa ssp. obtusa
Woodsia appalachiana T.M.C. Taylor, Appalachian Woodsia, Appalachian Cliff Fern, Mountain Woodsia. Mt (GA, NC, VA), Pd (NC, VA): on cliffs of sandstone, shale, granite, granitic gneiss, and hornblende gneiss; uncommon, rare in North Carolina (NC Rare). June-September. Endemic to the Southern and Central Appalachians of VA, WV, NC, and TN and the Ozarks of AR. This species is similar to $W$. scopulina of the western mountains of AK south to CO and CA. The eastern plants have been variously treated as a full species, a subspecies or variety of $W$. scopulina, or as indistinguishable from $W$. scopulina (see synonymy). It now appears that $W$. appalachiana may be a rather cryptic but distinct element of a reticulate complex also involving $W$. scopulina ssp. scopulina (of the Rocky Mountains) and W. scopulina ssp. laurentiana Windham (primarily of the Rocky Mountains but also disjunct eastwards in Ontario and Québec). Windham in FNA (1993b) treats these three entities as subspecies, and suggests that ssp. laurentiana is the allotetraploid derivative of hybridization of the eastern and western diploids. If this is indeed so, each of the 3 entities should be recognized at the species level. [= F, K; < W. scopulina D.C. Eaton -- RAB, C, S, W; = W. scopulina ssp. appalachiana (T.M.C. Taylor) Windham -- FNA; = W. scopulina var. appalachiana (T.M.C. Taylor) Morton -- G]

Woodsia ilvensis (Linnaeus) R. Brown, Rusty Woodsia, Rusty Cliff Fern. Mt (NC, VA): cliffs of amphibolite, greenstone, other rocks; uncommon, rare in NC and apparently only in the northernmost few counties of that state (NC Rare). June-September. Circumboreal, ranging in North America from Newfoundland and AK south to VA, nw. NC, OH, n. IL, nw. IA, Saskatchewan, and British Columbia. [= RAB, C, F, FNA, G, K, S, W]

Woodsia obtusa (Sprengel) Torrey ssp. obtusa, Common Woodsia, Blunt-lobed Cliff Fern. Mt, Pd, Cp (GA, NC, SC, VA): rock outcrops of various sorts, moist talus, terrestrial near rock outcrops; common. June-September. ME, Québec, MN, and e. NE, south to FL and TX. [= FNA, K; < W. obtusa -- RAB, C, F, G, S, W]

## EQUISETACEAE L.C. Richard ex de Candolle 1805 (Horsetail Family)

A family with a single genus and about 15 species. References: Hauke in FNA (1993b); Lellinger (1985); Mickel (1979); Hauke in Kramer \& Green (1990); Des Marais et al. (2003).

Equisetum Linnaeus 1753 (Horsetail, Scouring Rush)
A genus of about 15 species, nearly cosmopolitan in distribution. References: Hauke in FNA (1993b); Lellinger (1985); Mickel (1979); Hauke in Kramer \& Green (1990); Des Marais et al. (2003); Guillon (2004).

1 Stems perennial, evergreen, stiff; sterile and fertile stems monomorphic and either unbranched or with 2-3 short and unequal branches per node; [subgenus Hippochaete].
2 Main erect stems unbranched (rarely branched as a result of injury); stems 3-18 mm in diameter; stomatal lines 1 on each slope of the stem ridges
E. hyemale ssp. affine

2 Main erect stems usually with 2-3 branches at the nodes; stems 1.5-7 mm in diameter; stomatal lines 1-2 on each slope of the stem ridges . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . E. ramosissimum ssp. ramosissimum
1 Stems annual, deciduous, the sterile stems flexible; sterile and fertile stems dimorphic or monomorphic, usually branched (often copiously so) but sometimes unbranched or sparsely and irregularly so; [subgenus Equisetum].
3 Sterile and fertile stems monomorphic; sterile and fertile stems sparsely and irregularly branched; stem ridges 12-24, indistinct; diameter of the central cavity of the stem about 4/5's of the stem diameter . . . . . . . . . . . . . . . . . . E. fluviatile
3 Sterile and fertile stems dimorphic; sterile stems copiously branched and green, fertile stems unbranched or branched, green, tan, brown, or purplish; stem ridges 4-18, distinct; diameter of the central cavity of the stem usually less than $3 / 4$ 's of the stem diameter.
4 Sheaths of the sterile stems 3-10 mm long, the teeth dark brown with white margins; sterile stems regularly whorled with simple branches (rarely rebranching) . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . E. arvense 4 Sheaths of the sterile stems $10-30 \mathrm{~mm}$ long, the teeth reddish-brown with brown margins; sterile stems regularly whorled with branches which regularly rebranch . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . E. sylvaticum

Equisetum arvense Linnaeus, Field Horsetail. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): moist streambanks, bottomlands, moist disturbed sites; common. March-April. A circumboreal species, occurring throughout North America. [= RAB, C, FNA, G, K, S, W; E. arvense var. arvense -- F]

Equisetum fluviatile Linnaeus, Water Horsetail, Pipes. Mt (VA): open calcareous wetlands; rare (VA Rare). June-August.

Circumboreal, south in North America to n. VA, PA, IL, IA, and WA. [= C, F, FNA, G, K, W]
Equisetum hyemale Linnaeus ssp. affine (Engelmann) Calder \& R.L. Taylor, Tall Scouring Rush. Mt, Pd, Cp (GA, NC, SC, VA): riverbanks, alluvial floodplains; common (uncommon in NC and SC). May-September. Ssp. affine occurs nearly throughout North America and in Mexico and Guatemala; ssp. hyemale is Eurasian. [= FNA; E. hyemale var. affine (Engelmann) A.A. Eaton -$R A B, C, K, W ;>E$. hyemale var. affine $-F$, in a narrower sense; > E. hyemale var. robustum (A. Braun) A.A. Eaton -- F; > E. hyemale var. pseudohyemale (Farwell) Morton -- G; > E. hyemale var. elatum (Engelmann) Morton -- G; E. praealtum Rafinesque -S ; = Hippochaete hyemalis (Linnaeus) Bruhin ssp. affinis (Engelmann) W.A. Weber]

Equisetum ramosissimum Desfontaines ssp. ramosissimum, Branched Scouring Rush. Cp (NC): disturbed areas; rare, introduced from the Old World, where it is widespread in Europe, Asia, and Africa. This species was apparently introduced long ago on ship's ballast to Wilmington (New Hanover Co. NC), and other southeastern ports, such as Pensacola, FL and New Orleans, LA. It is naturalized on the Wilmington waterfront, persisting in disturbed areas, such as in gravel along railroad tracks. Hauke (1979, 1984 , 1992) discusses the occurrence of this species in North America. Ssp. debile (Roxburgh) Hauke occurs in se. Asia and southern Pacific Islands; it is not known to be naturalized in North America. [= FNA; < E. ramosissimum -- K; = Hippochaete ramosissima (Desfontaines) Farwell ssp. ramosissima]

Equisetum sylvaticum Linnaeus, Woodland Horsetail. Mt (VA): seepage swamps; rare (VA Rare). Circumboreal, south in North America to MD, n. VA, WV, OH, MI, WI, IA, WY, MT, and WA. [=C, FNA, K; > E. sylvaticum var. sylvaticum - F, G; > E. sylvaticum var. pauciramosum Milde -- F, G]

Equisetum $\times$ ferrissii Clute (pro sp.) [=E. hyemale $\times$ laevigatum]. There are old reports, repeated in RAB, S, and FNA, of the occurrence of $E . \times$ ferrissii Clute (pro sp.) [= E. hyemale $\times$ laevigatum] in our area; documentation of these reports is not known; it is reported for Prince George's County, MD ((Shetler \& Orli 2000). E. xferrissii may be distinguished from E. hyemale var. affine (to which it will key above) by the failure of its cones to produce spores at all or the production of aborted spores (vs. production of normal spores) and most stem sheaths lacking a blackish band well below the teeth (vs. most stem sheaths with a narrow to broad blackish band well below the teeth). [= FNA, K; = Hippochaete $\times$ ferrissii (Clute) Škoda \& Holub] \{add synonymy\}

Equisetum laevigatum A. Braun. Widespread in n. North America, south to CT, NY, PA, KY, AR, and TX. There are old reports, repeated in $R A B$, and $S$, of this species in our area; documentation of these reports is not known. It will key to $E$. hyemale ssp. affine in the above key, but has the strobilus apex rounded (vs. pointed), and aerial stems annual (vs. perennial). [= FNA, K; = Hippochaete laevigata (A. Braun) Farwell] \{add synonymy\}

Equisetum $\times$ litorale Kühlewein ex Ruprecht (pro sp.) [arvense $\times$ fluviatile] is reported by FNA for VA. It can be distinguished from E. arvense by its white, mis-shapen spores. [= FNA, K] \{add synonymy\}

## GRAMMITIDACEAE (C. Presi) Ching 1940 (Dwarf Polypody Family)

A family of 5-10 genera and about 500-600 species, tropical to subtropical. References: Smith in FNA (1993b); Parris in Kramer \& Green (1990).

## Micropolypodium Hayata (Dwarf Polypody)

A genus of about 30 species, mainly of tropical America and e. and se. Asia. Micropolypodium has traditionally been considered a part of a broadly circumscribed Grammitis, but has been recircumscribed at the generic level by Smith (1992). Smith in FNA (1993b) states that our species "probably warrants generic status under the name Micropolypodium Hayata, a primarily neotropical genus with representatives in eastern Asia (Malaysia, China, Sikkim, Taiwan, and Japan)." References: Smith in FNA (1993b); Massey et al. (1983); Smith (1992)=Z.

Micropolypodium nimbatum (Jenman) A.R. Smith, Dwarf Polypody. Mt (NC): on ceiling of grotto in spray cliff of waterfall in humid gorge; rare (US Species of Concern, NC Endangered). Sporophytes (juvenile only) have been found at only a single site in North America, in Macon County, NC. Gametophytes (and/or sporophytes) may be present at other spray cliffs in the escarpment gorges of sw. NC or adjacent SC and GA. Other than this disjunct temperate-zone occurrence, the species is known from Cuba, Jamaica, and Hispaniola. See Moran (1998) for an interesting discussion and overview of independent fern gametophytes in e. North America. [= Z; = Grammitis nimbata (Jenman) Proctor -- RAB, FNA, K]

## HYMENOPHYLLACEAE Link 1833 (Filmy Fern Family)

A family of 6-10 (or many more) genera and 600-650 species. See Moran (1998) for an interesting discussion and overview of independent fern gametophytes in e. North America. References: Farrar in FNA (1993b); Iwatsuki in Kramer \& Green (1990); Morton (1968).

1 Sporophytes present.

## Hymenophyllum J.E. Smith 1793 (Filmy Fern)

As here very broadly circumscribed, a genus of about 330 species, almost strictly tropical in distribution. Sphaerocionium C. Presl and other segregates are often recognized; these segregates may well be warranted. Iwatsuki in Kramer \& Green (1990) takes a broad view of the genus, recognizing only Sphaerocionium among the potential segregates. If this distinction is recognized, $H$. tunbrigense is in Hymenophyllum and H. tayloriae in Sphaerocionium (the combination has not been made). References: Raine, Farrar, \& Sheffield (1991); Iwatsuki in Kramer \& Green (1990); Morton (1968).

1 Sporophytes present.
Leaf blade with stellate hairs . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . H. tayloriae
$2 \quad$ Leaf blade glabrous . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . H. tunbrigense
1 Gametophytes only present.
3 Gemmae present; margin crenate, composed predominantly of cells with concave outer walls; archegonia and antheridia rare; plant forming sprawling, ribbon-like forms; branches filamentous to broad; proliferations abundant, arising marginally and centrally
H. tayloriae

3 Gemmae absent; margin entire, composed predominantly of straight-sided cells; archegonia and antheridia common, often present on the same gametophyte; plant typically forming rosettes; branches always broad; proliferations few, always marginal H. tunbrigense

Hymenophyllum tayloriae Farrar \& Raine, Gorge Filmy Fern. Mt (GA, NC, SC): spray cliffs near waterfalls, permanently moist ceilings of grottoes in escarpment gorges with high rainfall; rare (GA Special Concern, NC Watch List). This species is endemic to the southern end of the Southern Appalachians (Transylvania, Jackson, and Macon counties, NC, Pickens and Oconee counties, SC, Rabun County, GA (Davison 1997) and sites in e. TN and n. AL. It was recently named (in honor of the first collector), following the demonstration that it represented a gametophyte distinct from the gametophytes of any (sporophytically) known species (Raine, Farrar, \& Sheffield 1991), including H. tunbrigense, present in the close vicinity. Raine, Farrar, \& Sheffield (1991) point out that " $H$. tayloriae is distinguished from the independent gametophytes of Vittaria appalachiana Farrar \& Mickel by its 2-dimensional spathulate gemmae (those of $V$. appalachiana are uniseriate), rhizoid attachment only to marginal cells, yellow-green color, and glossy texture. Thalloid liverworts of similar size are generally more than one cell thick or have a distinct midrib, have notched apical meristems, and do not produce spathulate gemmae." An immature sporophyte, collected by Taylor in 1936, has stalked stellate hairs on the margins and midrib of the leaf and was the only sporophytic collection of the species until the recent discovery of additional juvenile sporophytes in AL (FNA 1993b). [= FNA, K; = "a branching ribbon-like gametophyte with marginal rhizoids and small, ovate, plate-like gemmae several cells wide, of the genus Hymenophyllum" -- RAB; = Sphaerocionium sp. 1]

Hymenophyllum tunbrigense (Linnaeus) J.E. Smith, Tunbridge Filmy Fern. Mt (SC): moist rock faces in an escarpment gorge with high rainfall; rare (SC Rare). June-September. The occurrence of this filmy fern in the escarpment gorge of Eastatoe Creek (and its tributaries) is remarkable. Overall, H. tunbrigense is a "Gulf Stream plant," found in highly humid, climates in the West Indies, and the maritime west coast of the British Isles. H. tunbrigense somewhat resembles Trichomanes boschianum. This species may yet be found in NC in similarly rugged and humid escarpment gorges. It differs from $T$. boschianum in having the sporangia not extending beyond the deeply 2 -lobed involucre (as opposed to having the sporangia exserted beyond the slightly bilobed, funnelform involucre). [= RAB, FNA, K, W]

## Trichomanes Linnaeus 1753 (Filmy Fern)

Depending on circumscription, a genus of 80-300 species, primarily tropical. Dubuisson et al. (2003) and other molecular phylogenetic studies of Trichomanes suggest that some of the segregates may warrant recognition at the generic level. References: Iwatsuki in Kramer \& Green (1990); Morton (1968); Dubuisson et al. (2003).

1 Plant a sporophyte (thus with simple, lobed, or pinnate-pinnatifid leaves).
2 Leaves pinnate-pinnatifid, more than 5 cm long; [subgenus Trichomanes, section Lacosteopsis] ....... T. boschianum
2 Leaves simple to slightly lobed, less than 2 cm long; [subgenus Didymoglossum, section Didymoglossum] .. T. petersii
1 Plant a gametophyte (thus filamentous, forming felt-like mats).
3 Gametophytes free-living, distant from sporophytes of T. boschianum or T. petersii
T. intricatum (see discussion under T. intricatum)

3 Gametophytes growing in association with or in proximity to sporophytes of $T$. boschianum or $T$. petersii.
T. boschianum or $\boldsymbol{T}$. petersii (see discussion under T. intricatum)

Trichomanes boschianum Sturm, Appalachian Filmy Fern. Mt (GA, NC, SC, VA): on rock outcrops, usually vertical or overhanging, usually in deeply shaded grottoes receiving seepage or spray from waterfalls; rare (GA Rare, NC Threatened, SC Rare). June-September. W. NC and w. SC west to ne. GA, AL, MS (Menapace, Davison, \& Webb 1998), and AR, and north to s. $\mathrm{OH}, \mathrm{KY}$, and s. IL; also disjunct in Chihuahua, Mexico. See Belden et al. (2004) for more details on the first documented Virginia occurrence. [= RAB, C, F, FNA, G, K, S, W]

Trichomanes intricatum Farrar, Grotto-felt, Appalachian Trichomanes, Weft Fern. Mt, Pd (GA, NC, SC, VA): on ceilings or back walls of grottoes, especially in humid gorges or near or behind waterfalls; rare (NC Watch List, VA Watch List). This species is rather widespread in e. North America, from VT, MA, CT, IN, and IL south to NC, SC, GA, AL, TN, and KY. T. intricatum cannot be morphologically distinguished from gametophytes of $T$. boschianum or $T$. petersii; the electrophoretic and phytogeographic evidence of Farrar (1992) leave little question, however, that it should be considered a distinct species. Although Farrar (1992) found that 30
of 30 populations of Trichomanes gametophytes "east of the Mississippi River that were not within or adjacent to sporophyte populations of $T$. boschianum or $T$. petersii" were $T$. intricatum, the key above (based on proximity to sporophytes) should be considered to provide only a presumptive or likely identification of gametophytes. Farrar (1992) also showed that independent gametophytes in AR were those of $T$. boschianum and T. petersii. Farrar (1992) points out the "intriguing possibility that somewhere in the Appalachian Mountains sporophytes of this species may yet exist." Probably the most likely area in which to search for the sporophyte generation of $T$. intricatum is the escarpment gorge region of NC, SC, and GA near Highlands, NC, where topography, waterfalls, and the highest rainfall east of the Cascade Mountains combine to create microclimatic conditions that have favored the relict survival of numerous species of mosses, liverworts, and ferns. Any filmy-fern sporophyte which differs from $T$. boschianum, $T$. petersii, or Hymenophyllum tunbrigense should be investigated carefully. Vittaria appalachiana and Hymenophyllum tayloriae gametophytes differ from Trichomanes intricatum in being thallose rather than filamentous. [= FNA, K; = "a filamentous gametophyte, with spindle-shaped gemmae one cell wide but with the cells decreasing in size toward the apices, of the genus Trichomanes" -- RAB]

Trichomanes petersii A. Gray, Dwarf Filmy Fern. Mt (NC, SC), Cp (GA): on vertical faces of acidic rock outcrops in humid gorges, primarily of the Savannah River drainage, in the context of the very humid escarpment gorges on relatively dry rocks, not on rocks receiving substantial seepage or spray from waterfalls, also on outcrops of Altamaha Grit in the Coastal Plain; rare (GA Rare, NC Threatened, SC Rare). June-August. W. NC and w. SC southwest to FL, AL, MS, and LA, and north to AR and s. IL; also in Mexico and Guatemala. This diminutive species is often overlooked, except by bryologists and hepaticologists; it does superficially resemble a moss or liverwort more than a fern. It occurs on tree bark in some parts of its range. [= RAB, FNA, K, S, W; = Didymoglossum petersii (A. Gray) Copeland]

## ISOETACEAE Dumortier 1829 (Quillwort, Merlin's-grass)

A family of a single genus and about 300 species. Isoetaceae, along with Selaginellaceae and Lycopodiaceae, now appear to be only distantly related to other extant pteridophytes and seed plants (Pryer et al. 2001). References: Jermy in Kramer \& Green (1990).

## Isoetes Linnaeus 1753 (Quillwort, Merlin's-grass)

A genus of about 300 species, cosmopolitan in distribution. References: Taylor et al. in FNA (1993b); Hoot, Napier, \& Taylor (2004); Boom (1982); Kott \& Britton (1983); Brunton \& Britton (1996a, 1996b, 1997, 1998, 1999); Caplen \& Werth (2000a, 2000b); Musselman \& Knepper (1994); Musselman, Bray, \& Knepper (1996, 1997); Musselman et al. (1995); Musselman, Taylor, \& Bray (2001); Musselman (2001)=Z; Jermy in Kramer \& Green (1990).

Isoetes acadiensis L. Kott, Acadian Quillwort. Cp (VA): freshwater tidal marshes; rare. A tetraploid species (2n=44). [= FNA, K; < I. tuckermanii A. Braun - C, F, G]

Isoetes appalachiana Brunton \& Britton, Appalachian Quillwort. Cp (NC, SC, VA), Pd (SC), Mt (VA): seepages, small woodland streams, ephemeral wetlands, backwaters; uncommon (GA Special Concern). A tetraploid species ( $2 \mathrm{n}=44$ ), apparently derived from a southern I. engelmannii entity and I. valida (Hoot, Napier, \& Turner 2004), genotype=SSVV. See Brunton \& Britton (1997) for additional information. [=K, Z; < I. engelmannii -- RAB, C, FNA, W; < I. engelmannii var. engelmannii - F, S; > I. engelmannii var. georgiana Engelmann]

Isoetes boomii N. Luebke, Boom's Quillwort. Cp (GA): shallow water of slow-moving streams; rare (GA Special Concern). Known from Laurens County, GA and AL. A hexaploid species ( $2 \mathrm{n}=66$ ). [= FNA, K; < I. boomii - Z (also see I. georgiana)]

Isoetes butleri Engelmann, Butler's Quillwort. Mt (GA): seepage areas on calcareous glades; rare (GA Special Concern). Occurs in calcareous areas of the midwest, extending east to c. TN, nw. GA (Jones \& Coile 1988), and n. AL. A diploid species (2n=22), genotype=BB. [= C, F, FNA, G, K, S, Z]

Isoetes engelmannii A. Braun. Cp, Pd, Mt (NC, SC, VA): usually in permanent water bodies with active current; common. A diploid species $(2 n=22)$. Apparently there are 2 cryptic taxa currently called I. engelmannii (Hoot, Napier, \& Taylor 2004), genotype NN and genotype SS. [= K, Z; <I. engelmannii -- RAB, C, G, FNA, W (also see I. appalachiana, I. hyemalis, and I. valida); < I. engelmannii var. engelmannii-F,S]

Isoetes flaccida A. Braun var. alata Pfeiffer, Winged Florida Quillwort. Cp (GA): springs, streambottoms, riverbottoms, ditches; rare. S. GA and FL. A diploid species (2n=22). [= FNA, K, S; < I. flaccida - Z]

Isoetes georgiana N. Luebke, Georgia Quillwort. Cp (GA): \{\}. Known only from GA (Colquitt, Dodge, Irwin, Tift, Tucker, Turner, and Worth counties). A hexaploid species ( $2 n=66$ ). See Brunton \& Britton (1996b) for additional information. Musselman (2001) indicates that this may be conspecific with I. boomii. [= FNA, K; <I. boomii-Z]

Isoetes hyemalis Brunton, Wintergreen Quillwort. Cp (GA, NC, SC, VA), Pd (GA?, NC, VA): blackwater streams and sandy streambanks; rare (GA Special Concern, VA Rare). Sc. VA south through e. and c. NC to GA, AL, and FL Panhandle (Nelson 2000), in the Coastal Plain and lower Piedmont. A tetraploid species ( $2 \mathrm{n}=44$ ), apparently derived from 2 unknown or extinct species, $X$ and $Y$ (Hoot, Napier, \& Taylor 2004). See Brunton, Britton, \& Taylor (1994) and Brunton \& Britton (1996a) for additional information on this species. [= K, Z; <I. engelmannii -- RAB, C, G; < I. engelmannii var. engelmannii - F, S]

Isoetes junciformis Brunton \& Britton, Rush Quillwort. Cp (GA): ephemeral wetland swales in bottomland hardwood swamps; rare (GA Special Concern). In sw. GA Coastal Plain (Tift and probably Calhoun counties, GA). A tetraploid species ( $2 \mathrm{n}=44$ ). See Brunton \& Britton (1999) for additional information. [= Z]

Isoetes lacustris Linnaeus, Lake Quillwort. Mt (VA): (VA Rare). July-September. A decaploid species (2n=110). [= FNA, C, K; > I. macrospora Durieu - F, G, W]

Isoetes mattaponica L.J. Musselman \& W.C. Taylor, Mattaponi River Quillwort. Cp (VA): tidal rivers; uncommon? Rivers flowing into Chesapeake Bay. A diploid relative of $I$. acadiensis. A diploid species ( $2 \mathrm{n}=22$ ). See Musselman, Taylor, \& Bray (2001)
for additional information on this species.
Isoetes melanopoda Gay \& Durieu ex Durieu, Blackfoot Quillwort. Pd (NC, SC, VA), Cp (SC): clay soils in low woods, seeps on sandstone or granitic rocks; rare (GA Special Concern, VA Rare). In MS (Sorrie \& Leonard 1999). A diploid species (2n=22), genotype= PP. [= FNA, K, C, G, Z; < I. melanopoda -- RAB (also see I. melanospora, I. virginica, I. piedmontana)]

Isoetes melanospora Engelmann, Black-spored Quillwort. Pd (GA, SC): in pools on granite flatrocks; rare (US Endangered, GA Endangered). A diploid species (2n=22). [= Z, S; <I. melanospora -- FNA, K; <I. melanopoda -- RAB]

Isoetes microvela Brunton. Cp (NC): banks of rivers in the outer Coastal Plain; rare. May-July (-September). See Brunton \& Britton (1998) for additional information. [= K]

Isoetes piedmontana (N.E. Pfeiffer) C.F. Reed, Piedmont Quillwort. Pd (GA, NC, SC, VA), Cp (GA): in seepage on granitic flatrocks; uncommon (VA Rare). [= K, Z; < I. melanopoda -- RAB; < I. virginica -- C, F, FNA, G]

Isoetes riparia Engelmann ex A. Braun, Shore Quillwort. (VA Watch List). A tetraploid species ( $2 \mathrm{n}=44$ ), apparently derived from the southern I. engelmannii entity and I. echinospora (Hoot, Napier, \& Taylor 2004). [<I. riparia - RAB, C, FNA (also see I. saccharata); > I. riparia var. riparia -- G, K; > I. riparia var. amesii (A.A. Eaton) Proctor - G, K; > I. riparia var. robbinsii (A.A. Eaton) Proctor - G; > I. riparia var. reticulata (A.A. Eaton) Proctor - G]

Isoetes saccharata Engelmann. Cp (VA): \{disentangle from I. riparia\} [ $=\mathrm{K} ;<\operatorname{l}$. riparia - C, FNA; = I. riparia var. palmeri (A.A. Eaton) Proctor - G]

Isoetes sp. 1. Pd (SC): pools on granite flatrocks; rare. Forty Acre Rock, Lancaster County, SC. Being worked on by W.C. Taylor.

Isoetes sp. 3. $\mathrm{Cp}(\mathrm{VA})$ : tidal marshes. A diploid relative of I. melanopoda. Being worked on by C. Caplen. A diploid species (2n=22).

Isoetes tegetiformans Rury, Mat-forming Merlin's-grass. Pd (GA): in shallow pools on granite flatrocks; rare (US Endangered, GA Endangered). Endemic to a few granite flatrocks in ne. GA, near the SC line. A diploid species $(2 n=22)$, genotype=TT. [= FNA, K, Z]

Isoetes valida (Engelmann) Clute, Mountain Quillwort, Carolina Quillwort. Mt (NC, SC, VA): bogs (growing in Sphagnum), pools, ponds; common (GA Special Concern). A diploid species ( $2 \mathrm{n}=22$ ). Genotype=VV. [=K, Z; = I. caroliniana (A.A. Eaton) N. Luebke -- FNA; <I. engelmannii -- RAB, C, W; = I. engelmannii A. Braun var. caroliniana A.A. Eaton - F, S]

Isoetes virginica N.E. Pfeiffer, Virginia Quillwort. Mt (VA), Pd (NC, SC?, VA): in woodland streams; rare (US Species of Concern, VA Rare). July-September. See Brunton, Britton, \& Wieboldt (1996) for additional information. [= C, K; < I. melanopoda Gay \& Durieu ex Durieu -- RAB; < I. virginica -- C, F, FNA, G, W (also see I. piedmontana)]

Isoetes louisianensis Thieret, Louisiana Quillwort. S. AL, MS, and LA. [= FNA, K] \{add to synonymy\}
Isoetes tenella Léman, Spiny-spore Quillwort. South to PA and NJ (Kartesz 1999). [= K; = I. echinospora Durieu - FNA; > I. echinospora var. echinospora - F, G; > I. echinospora var. muricata (Durieu) Engelmann - C, F, G; > I. echinospora var. braunii (Durieu) Engelmann - G; > I. muricata Durieu] \{add synonymy\}

Isoetes tennesseensis N.T. Luebke \& J.M. Budke. Endemic to Polk County, TN, near the North Carolina-Georgia state line, in the Hiawassee River. An octoploid species. See Luebke \& Budke (2003) for additional information. [< I. lacustris - FNA, K, formerly misidentified as a southern disjunct population of I. lacustris]

Isoetes tuckermanii A. Braun, Tuckerman's Quillwort. South to MD (Kartesz 1999). A tetraploid species (2n-44), apparently derived from hybridization of a northern I. engelmannii entity and an unknown or extinct species, Z (Hoot, Napier, \& Taylor 2004), genotype=NNZZ. [= FNA, K; < I. tuckermanii - C, F, G]

The following hybrids are known from our area, or nearby:

Isoetes ×altonharvillii Musselman \& Bray [I. engelmannii × valida]. Known from Mountains, Piedmont, and Coastal Plain of VA. [= K ]
Isoetes $\times$ bruntonii Knepper \& Musselman [I. engelmannii $\times$ hyemalis]. Known from Coastal Plain of VA. [= K]
Isoetes $\times$ fairbrothersii Montgomery \& Taylor [I. engelmannii $\times$ macrospora]. Known from s. NJ. [= K]
Isoetes $\times$ carltaylorii Musselman [I. engelmannii? $\times$ riparia]. Known from Coastal Plain of VA.

## LYCOPODIACEAE Mirbel 1802 (Clubmoss Family)

A family of $10-15$ genera and about 400 species. Lycopodiaceae, along with Selaginellaceae and Isoetaceae, now appear to be only distantly related to other extant pteridophytes and seed plants (Pryer et al. 2001). The division of North American Lycopodium into three or more genera has been strongly advocated by Wagner \& Beitel (1992), Wagner \& Beitel in FNA (1993), Haines (2003a), and nearly all other recent authors. The traditionally broad Lycopodium appears to include a number of natural groups which are strikingly different from one another and have constituted separate lineages for tens to hundreds of millions of years. These natural groups are separable by numerous morphological, developmental, and anatomical characters, karyotype, and inability to hybridize. Wagner \& Beitel divide Lycopodium of our area into six genera in three subfamilies, as follows: Huperzia in Subfamily Huperzioideae, Lycopodium and Diphasiastrum in Subfamily Lycopodioideae, and Lycopodiella, Palhinhaea, and Pseudolycopodiella in Subfamily Lycopodielloideae. Haines (2003a) further divides Lycopodium into 3 genera: Dendrolycopodium, Spinulum, and Lycopodium s.s. The reasoning behind this division is very strong, and it is here followed. Profound diferences in anatomy, morphology, reproduction, gametophyte morphology, and karyotype support this separation. The chromosome numbers of our genera: Dendrolycopodium ( $x=34$ ), Diphasiastrum ( $x=23$ ), Huperzia ( $x=67,68$ ), Lycopodiella ( $x=78$ ), Lycopodium ( $x=34$ ), Palhinhaea ( $\mathrm{x}=55$ ), Pseudolycopodiella ( $\mathrm{x}=35$ ), and Spinulum ( $\mathrm{x}=34$ ). Øllgaard in Kramer \& Green (1990) and Wikström \& Kenrick (2000) follow a somewhat broader coarse, recognizing 3 genera for our species (corresponding to the subfamilies of Wagner \& Beitel 1992), and recognizing as sections the genera of Wagner \& Beitel (1992). Øllgaard states that the "genera are very distinct, and also the sections within Lycopodiella and Lycopodium seem to represent ancient, independent evolutionary lines." Wikström \&

Kenrick $(2000,2001)$ suggest that the phylogenetic separation of Lycopodium (including Diphasiastrum) and Lycopodiella (including Pseudolycopodiella and Palhinhaea) occurred at least as long ago as the early Jurassic (208 million years before present), and the divergence of Huperzia from Lycopodium and Lycopodiella still longer ago. References: Lellinger (1985); Mickel (1979); Wagner and Beitel (1992); Beitel (1979); Snyder \& Bruce (1986); Wagner \& Beitel in FNA (1993b); Øllgaard in Kramer \& Green (1990); Wikström \& Kenrick (2000, 2001); Øllgaard (1987); Haines (2003a). Key based in part on Haines (2003a).

1 Leafy stems erect, simple or dichotomously branched, the ultimate branches vertically oriented; sporophylls like the sterile leaves or only slightly reduced, in annual bands along the stem; vegetative reproduction by leafy gemmae near the stem apex; [subfamily Huperzioideae]

Huperzia
1 Leafy stems prostrate or erect, if erect then generally branched, the ultimate branches spreading (horizontal) or ascending; sporophylls differing from sterile leaves, either broader and shorter, or more spreading, aggregated into terminal cones; lacking vegetative reproduction by gemmae; [subfamily Lycopodioideae].
2 Leaves herbaceous, pale or yellow-green, dull, deciduous; principal leafy stems creeping (except erect and repeatedly branched in Palhinhaea); rhizome dying back annually to an underground vegetative tuber at apex; spores rugulate; [of wetlands, mostly on moist or wet sands or peats]; [subfamily Lycopodielloideae].
3 Upright shoots repeatedly branched; strobili nodding at the ends of the branches; [known to occur from se. SC southwards]

Palhinhaea
3 Upright shoots not branched; strobili erect on upright shoots; [widespread in our area].
4 Leaves of the prostrate stems $0.5-1.2 \mathrm{~mm}$ wide, ciliate-toothed or not toothed; leaves of the erect stem many, overlapping, spiral; leaves of the strobilus (sporophylls) resembling leaves of the prostrate and upright stems in size and shape; upright stems $1.5-15 \mathrm{~mm}$ in diameter (including the leaves)

Lycopodiella
4 Leaves of the prostrate stems 1.3-2.1 mm wide, not toothed; leaves of the erect stem few, not overlapping, whorled; leaves of the strobilus (sporophylls) much reduced relative to leaves of the prostrate and upright stems; upright stems $1.5-3 \mathrm{~mm}$ in diameter (including the leaves) .................. Pseudolycopodiella
2 Leaves rigid, bright to dark green, shiny, evergreen; principal leafy stems mainly erect, treelike, fanlike, or creeping (if creeping, then the leaves with elongate, hyaline hair-tips); rhizome trailing, perennial; spores reticulate; [of uplands, mostly in moist to dry soils].
5 Branches 1-5 mm wide (including the leaves), compressed to quadrangular, with 4 ranks of leaves; branching of strobilus stalks dichotomous Diphasiastrum
5 Branches 4-12 mm wide, terete (to somewhat compressed in Dendrolycopodium obscurum), with 6 or more ranks of leaves; branching of strobilus stalks (when present), pseudomonopodial (falsely appearing to have a main axis from which branches arise).
6 Strobili borne on elongate, sparsely leafy peduncles borne at the tips of leafy, ascending branches; leaves with attenuate, hyaline hair-tips . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Lycopodium
6 Strobili sessile, borne directly above densely leafy portions of upright branches; leaves acuminate to acute.
7 Erect leafy stems $3-8 \mathrm{~mm}$ in diameter (including the leaves), treelike or fanlike, with a definite main axis; leaves acute at the apex; horizontal shoots subterranean, without winter biud constreictions

7 Erect leafy stems 10 mm or more in diameter (including the leaves), branched 1-4 times subdichoromously; leaves with a $0.4-1.0 \mathrm{~mm}$ long stiff spinulel; horizontal shoots at or near the ground surface, with winter bud constrictions

Spinulum

## Dendrolycopodium A. Haines 2003 (Tree-clubmoss)

A genus of 4 species, temperate and subarctic. Haines (2003a) makes the case for this genus as distinct from Lycopodium s.s. and other relatives. References: Wagner \& Beitel in FNA (1993b); Wagner, Beitel, \& Moran (1989); Hickey (1977); Øllgaard in Kramer \& Green (1990); Haines (2003a)=Z.

1 Leaves of the main vertical axis spreading (30-90 degree angle to stem) in the vicinity of the lower lateral branches, prickly to the touch; branchlets round in cross-section, the 6 ranks of leaves (2 lateral ranks, 2 adaxial ranks, and 2 abaxial ranks) equal in length and spreading to ascending

> D. dendroideum

1 Leaves of the main vertical axis appressed (15-30 degree angle to stem) in the vicinity of the lower lateral branches, soft to the touch; branchlets slightly to strongly dorsiventrally flattened in cross-section, the 6 ranks of leaves ( 4 lateral ranks, 1 adaxial rank, 1 abaxial rank) round or slightly to very unequal, the abaxial leaves more appressed and mostly shorter than (to equal to) the spreading lateral leaves.
2 Abaxial leaves of the horizontal branchlets about one half to two thirds as long as the lateral leaves; leaves of the abaxial and adaxial ranks generally appressed to the branchlet, the lateral 4 ranks spreading at a (27-) ca. 40 (-59) degree angle from the branchlet, thus the branchlet and leaves together ca. $6-9 \mathrm{~mm}$ wide
2 Abaxial leaves of the horizontal branchlets about the same length as the lateral leaves; leaves of all the ranks spreading at a (21-) ca. $27(-36)$ degree angle from the branchlet, thus the branchlet and leaves together 3.5-6 (-7) mm wide
D. hickeyi

Dendrolycopodium dendroideum (Michaux) A. Haines, Tree Ground-pine, Round-branch Clubmoss, Prickly Tree-clubmoss. Mt (NC, VA): openings, grassy balds, high elevation spruce-fir and northern hardwood forests; rare (NC Watch List, VA Watch List). July-September. The northernmost of the L. obscurum complex, ranging from $n$. Québec and Newfoundland west to AK, south to w. NC, MO, MN, SD, CO, MT, ID, and WA; also in Asia. [ $=$ Z; < Lycopodium obscurum var. dendroideum (Michaux) D.C. Eaton -- RAB, F, G; = Lycopodium dendroideum Michaux -- FNA, K, W; < L. obscurum -- C]

Dendrolycopodium hickeyi (W.H. Wagner, Beitel, \& R.C. Moran) A. Haines, Pennsylvania Ground-pine, Hickey's Treeclubmoss. Mt (NC, VA): grassy balds, bog margins, forest openings; rare (NC Watch List, VA Watch List). July-September. N. Québec and Newfoundland west to MN, south to NJ, w. NC, and n. IN. [= Z; < Lycopodium obscurum var. dendroideum (Michaux) D.C. Eaton -- RAB, F, G; = Lycopodium hickeyi W.H. Wagner, Beitel, \& R.C. Moran -- FNA, K; = Lycopodium obscurum var. isophyllum Hickey -- W; < L. obscurum -- C]

Dendrolycopodium obscurum (Linnaeus) A. Haines, Common Ground-pine, Flat-branched Tree-clubmoss. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): acidic forests; common (uncommon in Piedmont and Coastal Plain). July-September. The southernmost of the L. obscurum complex, ranging from Nova Scotia and New Brunswick west to MI and WI, south to n. GA, n. AL, and IN. [= Z; = Lycopodium obscurum Linnaeus -- FNA, K; = Lycopodium obscurum var. obscurum -- RAB, F, G, W; < L. obscurum -- C, S]

## Diphasiastrum Holub 1975 (Flat-branched Clubmoss, Running Cedar)

A genus of about $15-20$ species, mostly north temperate amd subarctic. This group is sometimes treated as Lycopodium section Complanata (Øllgaard in Kramer \& Green 1990, Øllgaard 1987, Wikström \& Kenrick 2000). References: Wagner \& Beitel in FNA (1993b); Haines (2003a)=Z; Øllgaard in Kramer \& Green (1990); Wikström \& Kenrick (2000).

1 Foliage dark green, not glaucous; horizontal branchlets $2-4 \mathrm{~mm}$ wide (including the leaves); branchlets without conspicuous annual constrictions; rhizomes $0-1 \mathrm{~cm}$ deep (which can be determined by pulling up a single upright shoot -- the depth to rhizome is approximately the length of the white portion of the vertical stem); abaxial rank of leaves shorter than lateral ranks (thus the branchlets flat in cross-section)
D. digitatum

1 Foliage blue-green, glaucous; horizontal branchlets 1-2 mm wide (including the leaves); branchlets with conspicuous annual constrictions; rhizomes (1-) 5-12 cm deep; abaxial rank of leaves as long as lateral ranks (thus the branchlets more-or-less square in cross-section)
D. tristachyum

Diphasiastrum digitatum (Dillenius ex A. Braun) Holub, Common Running-cedar, Fan Ground- pine. Mt, Pd (GA, NC, SC, VA), $C p$ (NC, SC, VA): dry to mesic forests and openings, especially common in disturbed sites, such as successional pine forests; common. July-September. Widespread in e. North America. Hickey \& Beitel (1979) and Holub (1975a \& 1975b) explain the nomenclatural decision to accept the epithet 'digitatum' over the more familiar 'flabelliforme.' [= FNA, Z; = Lycopodium flabelliforme (Fernald) Blanch -- RAB, S; = Lycopodium digitatum Dillenius ex A. Braun -- C, K, W; = Lycopodium complanatum Linnaeus var. flabelliforme Fernald -- F, G]

Diphasiastrum tristachyum (Pursh) Holub, Blue Running-cedar, Ground-cedar. Mt (GA, NC, SC, VA), Pd (NC, VA), Cp (VA): dry forests, glades, balds, barrens, forest openings; uncommon, rare in Piedmont and Coastal Plain (GA Special Concern, SC Rare). July-September. Widespread in ne. North America, south in the mountains to nw. SC, ne. GA, and AL. [= FNA, Z; = Lycopodium tristachyum Pursh -- RAB, C, F, G, K, S, W]

Diphasiastrum $\times$ habereri (House) Holub [D. digitatum $\times$ tristachyum; is known from widely scattered localities in our area. [= FNA, Z; $=$ Lycopodium $\times$ habereri House -K ]

## Huperzia Bernhardi (Firmoss, Clubmoss)

A genus of about $10-15$ species, north temperate and arctic (and tropical mountains of Asia). Within the Lycopodiaceae, Huperzia has "an isolated position", basal to the remainder of the family, and is sometimes separated in a separate family, the Huperziaceae (Haines 2003a). References: Wagner \& Beitel in FNA (1993b); Haines (2003a)=Z; Øllgaard in Kramer \& Green (1990); Wikström \& Kenrick (2000).

Identification notes: Several hybrids are known from our area; they usually occur in intermediate habitats (such as in thin soil at the base of cliffs) and generally are found in proximity to both parents, but sometimes occur in the absence of one or both parents. Hybrids can be recognized by their intermediate morphology.

1 Leaves oblanceolate, the apical portion toothed with 1-8 large, irregular teeth; leaves $6-15 \mathrm{~mm}$ long, $1.0-2.5 \mathrm{~mm}$ wide; stomates on lower leaf surface only (visible at $10 \times$ or preferably 20-40×); spores 23-29 $\mu \mathrm{m}$ in diameter; [mainly of forest soils] .
H. lucidula

1 Leaves lanceolate (awl-shaped), margins not toothed, or minutely toothed in the apical portion only with 1-3 low teeth; leaves 3-9 mm long, 0.6-1.3 mm wide; stomates on both leaf surfaces (visible at $10 \times$ or preferably 20-40×); spores 29-38 $\mu \mathrm{m}$ in diameter; [mainly of rock outcrops].
2 Leaves spreading, (3-) 5-9 mm long, ca. 1 mm wide, usually sparsely toothed; stomates relatively few on the upper leaf surface (1-25 on each side of midrib); [of outcrops at low to medium elevations]
H. porophila

2 Leaves ascending to spreading, 2-7.5 mm long, 0.6-0.8 (-1.0) mm wide, untoothed (though sometimes with minute, single cell bumps); stomates relatively many on the upper leaf surface (30-90 on each side of midrib); [of high to medium elevations].
3 Leaves dimorphic, those at the base longer and spreading wider from the shoot axis than those from the apical portion of the plant; gemmiferous branches borne throughout the apical portion of mature shoots; lateral leaves of gemmae 0.5-1.1 mm wide H. appressa

3 Leaves relatively monomorphic; gemmiferous branches, if present at all, borne in 1 pseudowhorl at the apex of seasonal growth; lateral leaves of gemmae 1.3-2.5 mm wide
[H. selago]

Huperzia appressa (Desvaux) A. Löve \& D. Löve, Appalachian Firmoss. Mt (GA, NC, VA): rock outcrops at high elevations (very rarely at middle elevations), rarely also in seepage or along banks of small streams at high elevations, and in fens (on hummocks); rare (NC Rare, VA Rare). June-August. N. Québec and Newfoundland west to Ontario, MI, and MN and south along the Appalachians to w. NC, e. TN, and ne. GA. This species was named in 1992 as $H$. appalachiana (Beitel \& Mickel 1992), but $H$. appressa (Desvaux) A. Löve \& D. Löve is an older combination that applies to the same species (Haines 2003a). Though morphologically only subtly differentiated from the circumboreal $H$. selago (for distinctions see Beitel \& Mickel 1992; Brunton Wagner, \& Beitel 1992; Haines 2003a), the case for the distinctness of H . appressa is confirmed by the production of sterile (abortive-spored) hybrids where it co-occurs with H. selago. [= Z; = H. appalachiana Beitel \& Mickel -- FNA, K; <Lycopodium selago Linnaeus -- RAB, S, W; ><Lycopodium selago Linnaeus var. appressum (Desvaux) Petrovic -- C, F; ><Lycopodium selago var. selago -- C, G]

Huperzia lucidula (Michaux) Trevisan, Shining Firmoss, Shining Clubmoss. Mt (GA, NC, SC, VA), Pd (NC, VA), Cp (VA): moist forests and ravines; common (uncommon in Piedmont and Coastal Plain). June-August. Widespread in ne. North America, south to SC, TN, IN, IL, and MO. [= FNA, K, Z; = Lycopodium lucidulum Michaux -- RAB, C, F, G, S, W]

Huperzia porophila (Lloyd \& Underwood) Holub, Rock Clubmoss. Mt (GA, NC, SC, VA): rock outcrops and cliffs, especially in the spray of waterfalls, at low to medium elevations; rare (GA Special Concern, NC Rare, SC Rare, VA Rare). June-August. Centered in the sedimentary Central Appalachians, H. porophila ranges from ne. PA, WV, OH, and WI south to NC, TN, nw. AL, and e. MO. Waterway (1986) clarified the distinctions between H. porophila and H. lucidula. [= FNA, K; = Lycopodium porophilum Lloyd \& Underwood -- RAB, C, F, S, W; < Lycopodium selago var. patens (Beauvois) Desvaux -- G, misapplied]

Huperzia selago (Linnaeus) Bernhardi ex Martius \& Schrank, Northern Firmoss, is circumboreal, ranging south in North America to NY, New England, and the Great Lakes region, and disjunct to OH. It could easily occur as a disjunct in our area, and should be sought in the high mountains. [= FNA, Z; >< Lycopodium selago Linnaeus var. appressum (Desvaux) Petrovic -- C, F; >< Lycopodium selago var. selago -- C, G; > Huperzia selago (Linnaeus) Bernhardi ex Martius \& Schrank var. selago -- K]

Huperzia ×bartleyi (Cusick) Kartesz \& Gandhi [H. lucidula x porophila] is reported for NC by Waterway (1986). This hybrid can be told from its parents by the presence of stomates on both surfaces of the leaf (unlike H. lucidula), but their marked lower density on the upper surface (unlike H. porophila). [= K, Z]

Huperzia $\times$ protoporophila A. Haines [H. appressa $\times$ lucidula] may be expected at cliff bases on high elevation rocky summits. It is known from Chimney Rock Park, Rutherford County (the lowest elevation occurrence of H. appressa in NC) and from Roan Mountain, Mitchell County, and Grandfather Mountain, Avery County. This hybrid can be told from its parents by the presence of stomates on both surfaces of the leaf (unlike H. lucidula), but their marked lower density on the upper surface (unlike $H$. appressa). An additional useful character is the distribution of gemmiphores (i.e., gemmiferous branches): those of Huperzia appressa are abundantly distributed throughout the apical portion of mature plants, while those of the hybrid are confined to 1 or 2 pseudowhorls at the apex of annual growth (i.e., there are large gaps between the pseudowhorls of gemmiferous branches). [= Z]

## Lycopodiella Holub 1964 (Bog Clubmoss)

(also see Pseudolycopodiella)

A genus of about 15-20 species, temperate and tropical. Additional research on this genus in our area is needed. Two fertile tetraploid species were recently named from MI (Bruce, Wagner, \& Beitel 1991), and additional cryptic or semicryptic species may be found in the Southeastern Coastal Plain. This group is variously treated as genus Lycopodiella, or as Lycopodiella section Lycopodiella (Øllgaard in Kramer \& Green 1990, Wikström \& Kenrick 2000). References: Wagner \& Beitel in FNA (1993b); Øllgaard in Kramer \& Green (1990); Wikström \& Kenrick (2000); Haines (2002, 2003a, 2003b)=Z.

Identification notes: Species of this genus are difficult to identify. They often grow together; it is not uncommon to find two or more species at a single site in the Coastal Plain. Hybrids occur. Juvenile plants, resprouting in spring or after fire are especially difficult. In contrast to the other species, Pseudolycopodiella caroliniana and, to a lesser degree, L. prostrata, are dorsiventrally flattened (or apparently distichous), but it seems that juvenile sprouts of all species are somewhat flattened.

1 Leaves of the horizontal shoots entire (rarely those toward the shoot apex with a few teeth); horizontal shoots, excluding the leaves, 0.5-0.9 (-1.0) mm in diameter; each horizontal shoot segment commonly producing a single upright shoot; [in our area, a plant of the Mountains]
L. inundata

1 Leaves of the horizontal shoots toothed (except when inundated); horizontal shoots, excluding the leaves, 1.5-5.0 mm in diameter; each horizontal shoot segment producing 2-6 upright shoots; [collectively primarily of the Coastal Plain, with some disjunctions inland into the Piedmont and Mountains].
2 Fertile leaves (sporophylls) 2.9-5.0 (-5.2) mm long, appressed at maturity, entire or with short teeth less than 0.3 mm long; strobili $3-6 \mathrm{~mm}$ in diameter at maturity
Fertile leaves (sporophylls) 5.5-9 mm long, spreading, with 1-8 teeth per margin, some or all of the teeth exceeding 0.3 mm in length; strobili $10-20 \mathrm{~mm}$ in diameter at maturity.
3 Prostrate stems arching, not in contact with the ground (and rooting) all along their length, 8-11 mm wide (including leaves), the stem (stripped of leaves) 2-4 mm in diameter; leaves of the prostrate stem of one size and shape, spreading to ascending, $5-7 \mathrm{~mm}$ long, $0.5-0.7 \mathrm{~mm}$ wide; erect stems many, equally spaced along the prostrate stems, progressively shorter and sterile towards the apex of the prostrate stems $\qquad$ . L. alopecuroides
3 Prostrate stems creeping, in contact with the ground (and rooting) all along their length, 12-19 mm wide (including leaves), the stem (stripped of leaves) 1-2.2 mm in diameter; leaves of the prostrate stems dimorphic, spreading to reflexed, the upper leaves smaller ( $4-5 \mathrm{~mm}$ long, $0.4-0.6 \mathrm{~mm}$ wide) than the lateral leaves ( $7-8 \mathrm{~mm}$ long, $0.7-1.8 \mathrm{~mm}$ wide); erect stems few, clustered well behind the apex of the prostrate stems, mostly fertile and subequal in length .

Lycopodiella alopecuroides (Linnaeus) Cranfill, Foxtail Clubmoss. Cp, Pd, Mt (GA, NC, SC, VA): savannas, seepages, and other wet, sandy sites; common (rare in Mountains and Piedmont). July-September. Primarily Southeastern Coastal Plain: se. MA south to FL and west to se. TX, and disjunct in the Cumberland Plateau of KY, TN, and VA, the Allegheny Mountains of WV (Morton et al. 2004), the e. Highland Rim of TN, and in ME (Haynes 2001). [= FNA, K, Z; < Lycopodium alopecuroides Linnaeus -- RAB (also see L. prostrata); = Lycopodium alopecuroides Linnaeus -- C, G, S, W]

Lycopodiella appressa (Chapman) Cranfill, Southern Bog Clubmoss. Cp, Pd (GA, NC, SC, VA), Mt (GA, NC, SC): savannas, seepages, bogs; common (rare in Mountains and Piedmont). July-September. Primarily Southeastern Coastal Plain: se. Newfoundland and MA, south to FL, west to OK, AR, and TX, and disjunct in the mountains of KY, TN, NC, and in sw. MI. [= FNA, $\mathrm{K}, \mathrm{Z}$; = Lycopodium appressum (Chapman) Lloyd \& Underwood -- RAB, C, S, W; = Lycopodium inundatum Linnaeus var. bigelovii Tuckerman -- F, G]

Lycopodiella inundata (Linnaeus) Holub, Northern Bog Clubmoss. Mt (NC, VA): gravelly or sandy seepage areas in bogs at middle to high elevations; rare (NC Rare, VA Rare). July-September. A circumboreal species, ranging south in the Appalachians to NC, where it was first found in 1986 (Weakley, in prep.). [= FNA, K, Z; = Lycopodium inundatum Linnaeus -- C, W; = Lycopodium inundatum var. inundatum -- F, G]

Lycopodiella prostrata (Harper) Cranfill, Featherstem Clubmoss, Prostrate Bog Clubmoss. Cp (GA, NC, SC); Pd (GA): savannas, seepages; uncommon. July-September. A Southeastern Coastal plain endemic, ranging from se. NC south to FL and west to TX. [= FNA, K; < Lycopodium alopecuroides -- RAB; = Lycopodium prostratum Harper -- C, S]

All pairwise combinations of sympatric species form fertile hybrids (only L. inundata and L. prostrata are entirely allopatric and not known to hybridize). The following hybrids should be expected where the parents grow together. Which occur in our area is uncertain at present.

Lycopodiella alopecuroides $\times$ appressa. [= Lycopodiella $\times$ copelandii (Eiger) Cranfill $-\mathrm{K}, \mathrm{Z}$; Lycopodium $\times$ copelandii Eiger]
Lycopodiella alopecuroides $\times$ inundata. [= Lycopodiella $\times$ robusta (R.J. Eaton) A. Haines $-Z]$. See Haynes (2002) for additional information.

Lycopodiella alopecuroides $\times$ prostrata. [= Lycopodiella $\times$ brucei Cranfill -K ; = Lycopodium $\times$ brucei (Cranfill) Lellinger] Lycopodiella appressa $\times$ inundata. [Lycopodiella $\times$ gilmanii A. Haines $-Z$ ]. Earlier tentative reports of Lycopodiella margueritae J.G. Bruce, W.H. Wagner, \& Beitel for the Mountains of Virginia are apparently based on this hybrid. See Haynes (2003a, 2003b) for additional information. [= Lycopodiella margaritiae J.G. Bruce, W.H. Wagner, \& BeiteI - K, misapplied; = Lycopodiella $\times$ gilmanii A. Haines - Z]

Lycopodiella appressa $\times$ prostrata.

Lycopodium Linnaeus 1753 (Running Clubmoss)
(see also Dendrolycopodium, Diphasiastrum, Huperzia, Lycopodiella, Palhinhaea, Pseudolycopodiella, and Spinulum)
A genus of 5-10 species, mainly temperate and subarctic. The prospective fractionation of Lycopodium has resulted in the creation of more natural genera, more comparabvle to those in other groups of plants. References: Wagner \& Beitel in FNA (1993b); Wagner, Beitel, \& Moran (1989); Hickey (1977); Øllgaard in Kramer \& Green (1990); Haines (2003a)=Z.

1 Strobili 2-5, borne on alternate "pedicels" branching from the central "peduncle"; leaves 4-6 mm, spreading to loosely ascending . $\qquad$ alternate "pedicels" branching from the central "peduncle"; leaves 4-6 mm, spreading to loosely L. clavatum

1 Strobili 1 (rarely 2, if then, the 2 strobili not on separate "pedicels," but sessile at the top of the "peduncle"; leaves $3-5 \mathrm{~mm}$ long, ascending to appressed
[L. lagopus]
Lycopodium clavatum Linnaeus, Running Clubmoss. Mt (GA, NC, SC, VA), Pd, Cp (VA): openings, balds, roadbanks, open forests; uncommon (rare in Piedmont and Coastal Plain) (GA Special Concern). July-September. Circumboreal, south in e. North America along the Appalachians to NC and n. GA. [= RAB, FNA, K, W, Z; < L. clavatum -- C (see also L. lagopus)]; = L. clavatum var. clavatum -- F, G, S]

Lycopodium lagopus (C. Hartman) G. Zinserling ex Kuzeneva-Prochorova ranges south to c. PA (Rhoads \& Klein 1993) and Tucker County, in e. WV (Gottlieb 2002). [= FNA, K, Z; < L. clavatum -- C; > L. clavatum Linnaeus var. monostachyon Greville \& Hooker -- F, G; > L. clavatum var. megastachyon Fernald \& Bissel -- F, G; > L. clavatum var. brevispicatum Peck -- F]

## Palhinhaea Vasconcellos \& Franco 1967 (Nodding Clubmoss)

A genus of 10-15 species, tropical and subtropical. This group is variously treated as the genus Palhinhaea or as Lycopodiella section Campylostachys (Øllgaard in Kramer \& Green 1990, Wikström \& Kenrick (2000). References: Wagner \& Beitel in FNA (1993b); Øllgaard in Kramer \& Green (1990); Wikström \& Kenrick (2000).

Palhinhaea cernua (Linnaeus) Vasconcellos \& Franco, Nodding Clubmoss, Staghorn Clubmoss. Cp (GA, SC): wet savannas, disturbed moist areas; uncommon (rare in SC). This species is pantropical, occurring in the both the Neotropics and the Paleotropics. Its occurrence in our area may be adventive. [= FNA; =? Lycopodiella cernua (Linnaeus) Pichi Sermolli var. cernua -K; = Lycopodium cernuum Linnaeus -- S]

## Pseudolycopodiella Holub 1983 (Carolina Bog Clubmoss)

A genus of about 12 species, subcosmopolitan. This group has often been treated as section of $L$ cycopodium (or of Lycopodiella); it appears to warrant status as a genus separate from Lycopodiella. In addition to the morphologic distinctions, this species has considerable anatomical differences, a different base chromosome number than the four species of Lycopodiella ( $x=35 \mathrm{vs} . x=78$ ), and does not hybridize with Lycopodiella (Wagner \& Beitel 1992). Øllgaard in Kramer \& Green (1990) and Wikström \& Kenrick (2000) retain it as Lycopodiella section Carolinianae. References: Wagner \& Beitel in FNA (1993b); Haines (2003a)=Z; Øllgaard in Kramer \& Green (1990); Wikström \& Kenrick (2000).

Pseudolycopodiella caroliniana (Linnaeus) Holub, Carolina Bog Clubmoss, Slender Clubmoss. Cp (GA, NC, SC, VA): savannas, seepages; uncommon, rare in VA (VA Rare). July-September. This species occurs in se. North America, the West Indies, and is widespread in the Southern Hemisphere; in North America, it ranges from MA south to FL and west to e. TX. [= FNA, Z; = Lycopodium carolinianum Linnaeus -- RAB, C, F, G, S; =? Lycopodiella caroliniana (Linnaeus) Pichi Sermolli var. caroliniana -K ]

## Spinulum A. Haines (Bristly Clubmoss)

A genus of 3 species, north temperate and subarctic. References: Wagner \& Beitel in FNA (1993b); Wagner, Beitel, \& Moran (1989); Hickey (1977); Øllgaard in Kramer \& Green (1990); Haines (2003a)=Z.

Spinulum annotinum (Linnaeus) A. Haines, Stiff Clubmoss, Bristly Clubmoss. Mt (VA): high elevation hardwood or coniferous forests; uncommon (NC Watch List). August-October. A circumboreal species, south in North America to NJ and MN, and in the Appalachians to WV, sw. VA, and e. TN (Blount County). Two varieties have been considered to reach our area in VA: var. acrifolium Fernald and var. annotinum. They are doubtfully distinct but need further study. This species was reported for NC by Lellinger (1985) and FNA, and is apparently indicated as occurring in NC on the range map in Mickel (1979); there is apparently no documentation for these reports, though the species occurs in Grayson County, VA, a county adjacent to NC. There is also an old collection from the Great Smoky Mountains of TN. Its occurrence in NC is certainly plausible, and it should be sought. [= Z; Lycopodium annotinum Linnaeus -- C, FNA, K, W; > L. annotinum var. acrifolium Fernald -- F, G; > L. annotinum var. annotinum - F, G]

## LYGODIACEAE C. Presi 1845 (Climbing Fern Family)

A family with a single genus and about 40 species, of tropical and temperate regions, particularly equatorial and south temperate. Sometimes included in the Schizaeaceae, but the relationship is remote and unclear. References: Nauman in FNA (1993b).

## Lygodium Swartz 1800 (Climbing Fern)

A genus of about 40 species, mostly tropical, with a few temperate species.
1 Sterile pinnae palmately lobed into $4-8$ smooth to undulate lobes . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . L. palmatum
1 Sterile pinnae pinnately divided into numerous serrate pinnules . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . L. japonicum

* Lygodium japonicum (Thunberg) Swartz, Japanese Climbing Fern. Cp, Pd (GA, NC, SC): disturbed areas; rare, introduced from Asia. June-September. Rare in our area, but common and weedy in FL, the leaves (up to 30 m in length!) climbing into the canopy of trees in swamp forests and other wet habitats. [= RAB, FNA, K, S]

Lygodium palmatum (Bernhardi) Swartz, American Climbing Fern, Hartford Fern. Mt (GA, NC, SC, VA), Pd, Cp (NC, SC, VA): bogs, moist thickets, swamp forests, in strongly acid soils; uncommon (GA Special Concern, SC Rare, VA Watch List). JulySeptember. Widespread in e. North America, but uncommon or rare in most of its range. The species is perhaps most common in the Cumberland Plateau of KY and TN. Garrison (1992) discusses two forms of the species, "one with long appressed hairs scattered over the lower (abaxial) side of the sterile leaflets and the other relatively hair-free." The two forms appear to be geographically differentiated, the pubescent form predominating south and west of Maryland, the glabrous form occurring primarily in the Northeast. Both forms are present in our area. Further research is needed to determine the taxonomic significance of this variation in pubescence. [= RAB, C, F, FNA, G, K, S, W]

## MARSILEACEAE Mirbel 1802 (Water-clover Family)

A family of 3 genera and about 55-75 species, nearly cosmopolitan. References: Johnson in FNA (1993b); Kramer in Kramer \& Green (1990).

## Marsilea Linnaeus 1753 (Water-clover)

A genus of 50-70 species, nearly cosmopolitan. References: Johnson in FNA (1993b); Kramer in Kramer \& Green (1990); Knepper, Johnson, \& Musselman (2002).

| 1 | Leaves strongly bicolored . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . M. mutica |

| 1 Leaves unicolored . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . M. Muadrifolia |  |

1 Leaves unicolored M. quadrifolia

* Marsilea mutica Mettenius. Cp (VA), Pd (GA): ditches, ponds; rare, introduced from Australasia.
* Marsilea quadrifolia Linnaeus, European Water-clover. Pd (NC): shallow water of artificial impoundment; rare; native of Europe. Not seen fertile in NC. First reported for our area in 1992; sold in garden stores as an aquatic to be grown in water gardens, and likely to be encountered more widely in the future. [= C, F, FNA, G, K]

## Pilularia Linnaeus 1753 (Pillwort)

A genus of 3-6 species, nearly cosmopolitan. References: Dennis \& Webb (1981); Kramer in Kramer \& Green (1990).
Pilularia americana A. Braun, American Pillwort. Pd (GA, SC): vernal pools and seepage areas on granitic flatrocks; rare (GA Special Concern). This peculiar plant has a puzzling distribution, being known from several disjunct regions: OR to s. CA; NE to TX; AR; TN; and GA to SC. The fragmented distribution may be at least partly explainable by the inconspicuous nature of the plant. It lacks a leaf-blade, the $1-8 \mathrm{~cm}$ long petiole being narrowly winged, appearing rather like an Isoetes or Juncus leaf. In vegetative condition, it may be recognized as a "fern" by the typical coiled ("fiddlehead") development of young leaves. The primary rhizome produces individual "fronds" at nodes, a short rhizome branch at each node also produces "fronds." First reported for SC in 1993 (J. Allison, pers. comm.). [= FNA, K, S]

## OPHIOGLOSSACEAE (R. Brown) Agardh 1822 (Adder's-tongue Family)

A family of $7-8$ genera and about $75-115$ species. The Ophioglossaceae is only distantly related to the leptosporangiate ferns; Pryer et al. (2004) indicate that it is most closely related to Psilotaceae. References: Wagner \& Wagner in FNA (1993b); Wagner in Kramer \& Green (1990).

1 Sterile portion of the leaf simple, unlobed; fertile stalks unbranched, the sporangia embedded in a linear spike Ophioglossum 1 Sterile portion of the leaf blade pinnate, pinnatifid, or more divided; fertile stalks branched, the sporangia sessile or stalked.

2 Fertile stalk joined to stalk of sterile leaf blade near the rhizome, far below the base of the leaf blade, and usually at or below the surface of the ground; leaves evergreen

Sceptridium
2 Fertile stalk joined to stalk of sterile leaf blade near the base of the leaf blade, far above the rhizome, and usually well above the surface of the ground; leaves deciduous.
3 Sterile portion of the leaf blade 1-2-pinnate; plants usually less than 20 cm tall; sterile blade fleshy in texture, 1-8 cm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Botrychium 3 Sterile portion of the leaf blade 3-pinnate or even more finely divided; plants (9-) 30-50 cm tall; sterile blade herbaceous in texture, $10-40 \mathrm{~cm}$ long Botrypus

## Botrychium Swartz 1801 (Moonwort)

A genus of 25-30 species, nearly cosmopolitan, but primarily temperate and concentrated in North America and e. Asia. Botrychium as traditionally circumscribed to include Botrypus and Sceptridium is very heterogeneous (Hauk, Parks, \& Chase 2003); I have here accepted the arguments of Hauk (1996), Hauk, Parks, \& Chase (2003), and others recommending recognition of the anciently divergent and molecularly and morphologically distinctive segregates as genera. References: Wagner in Kramer \& Green (1990); Hauk, Parks, \& Chase (2003).

1 Sterile pinnae contracted at the base, thus cuneate or wedge-shaped; leaf blades pinnate to nearly simple, 1-6 cm long, $0.3-2$ cm wide; pinna margins entire, the apices round; [section Simplex]
B. simplex var. simplex

1 Sterile pinnae (or pinnules of 2-pinnate blades) not contracted at the base, thus oblong or elongate; leaf blades pinnate, pinnate-pinnatifid, or 2-pinnate, 1-8 cm long, 0.8-6 cm wide; pinna or pinnule margins entire, lobed, or incised, the pinna apices round, obtuse, or acute; [section Lanceolatum].
2 Sterile pinnae apices obtuse to round at the apex, their segments (and undivided pinnae) about as long as wide, round, obtuse, or truncate at the apex; leaf blade mostly short-petioled (rarely sessile), the petiole (0-) 1-3 cm long; leaf blade pinnate to pinnate-pinnatifid
B. matricariifolium

2 Sterile pinnae acute at the apex, their segments (and undivided pinnae) at least twice as long as wide, mostly lanceolate, acute at the apex; leaf blade sessile, leaf blade pinnate-pinnatifid to 2-pinnate . B. lanceolatum var. angustisegmentum

Botrychium lanceolatum (S.G. Gmelin) Angström var. angustisegmentum Pease \& A.H. Moore, Lanceleaf Moonwort, Narrow Triangle Moonwort. Mt (NC, VA): forests and grassy balds; rare (NC Rare, VA Rare). July-August. Var. angustisegmentum ranges from Newfoundland and Ontario south to VA, WV, NC, OH, MI, and MN, and in the Rocky Mountains of Canada and MT. Var. lanceolatum is widespread in $w$. North America. The two varieties are genetically distinct (Farrar \& Wendel 1996). [= C, F, G,

K, W; = B. lanceolatum ssp. angustisegmentum (Pease \& A.H. Moore) R.T. Clausen -- FNA]
Botrychium matricariifolium (A. Braun ex Duwell) A. Braun ex W.D.J. Koch, Daisyleaf Moonwort. Mt (NC, VA): forests (often successional) and old fields; uncommon (NC Rare). June-August. Newfoundland and Alberta south to NC, TN, KY, WV, OH, IL, WI, MN, and ND. [= FNA, K, W; = B. matricariaefolium -- F, G (orthographic variant); > B. matricariaefolium var. matricariaefolium -C]

Botrychium simplex E. Hitchcock var. simplex, Least Moonwort. Mt (NC, VA): forests; rare (NC Rare, VA Rare). May-June. Widespread in n . North America, from Newfoundland and British Columbia south to NJ, VA, NC, MI, IN, WI, IA, SD, WY, CO, NM, UT, NV, and CA. Wagner \& Wagner in FNA (1993b) discuss variation within B. simplex. Farrar \& Wendel (1996) indicate that 3 varieties of $B$. simplex have strong genetic divergence, comparable to that usually distinguishing species. $[=C, F, G ;<B$. simplex -FNA, K, W]

## Botrypus Richard 1801 (Rattlesnake Fern)

A genus of 1-2 species, of North America (and depending on circumscription) Asia. References: Hauk, Parks, \& Chase (2003)
Botrypus virginianus (Linnaeus) Holub, Rattlesnake Fern, Sang-find. Mt, Pd, Cp (GA, NC, SC, VA): in a wide range of fairly dry, mesic, and wet forests, cove forests; common. April-June. Newfoundland and British Columbia south to FL and CA. [= Botrychium virginianum (Linnaeus) Swartz -- RAB, C, FNA, G, K, W; = B. virginianum var. virginianum -- F; = Osmundopteris virginiana (Linnaeus) Small -- S]

## Ophioglossum Linnaeus 1753 (Adder's-tongue)

A genus of about 25-30 species, nearly cosmopolitan, primarily tropical. References: Lellinger (1985); Wagner in Kramer \& Green (1990).

1 Underground stem globose, nearly spherical, 3-11 mm in diameter; fertile spikes commonly with a conspicuous, acute or attenuate sterile portion (apiculum) at its apex; sterile blade 1-4 cm long, 0.5-2.5 cm wide, borne horizontally near the ground .
 Underground stem narrowly cylindrical or irregularly elongate, $2-4 \mathrm{~mm}$ in diameter; fertile spikes without a sterile portion at the apex or the sterile portion inconspicuous; sterile blade $0.5-10 \mathrm{~cm}$ long, $0.2-5.5 \mathrm{~cm}$ wide, borne horizontally, ascending, or vertically.
2 Sterile blade 0.2-1 cm wide, the polygonal venation areoles usually lacking both smaller areoles and free included veinlets O. nudicaule

2 Sterile blade (0.5-) 1.2-5 cm wide, the polygonal venation areoles either with smaller areoles or with free included veinlets. 3 Large areoles of the of the sterile blade subdivided into smaller areoles, further subvided into smaller areoles and free veinlets; sterile blade apiculate O. engelmannii

3 Large areoles ot the sterile blade subdivided into smaller areoles, which lack free veinlets; sterile blade obtuse or acute.
4 Sterile blade ovate-lanceolate, the base obtuse to nearly truncate, broadest less than a quarter of the way from the base to the apex; primary areoles mostly more than 2 mm wide, without included veinlets .. O. petiolatum 4 Sterile blade ovate to elliptic, the base cuneate to obtuse, broadest between one quarter and one half of the way from the base to the tip; primary areoles mostly less than 2 mm wide, with included veinlets.
5 Sterile blade elliptic, broadest near the middle, acute to attenuate at the base, pale green, dull, herbaceous in texture; basal frond sheath membranaceous and ephemeral; spores 50-60 $\mu$ in diameter . . O. pusillum
5 Sterile blade ovate, broadest below the middle, obtuse at the base, dark green, shiny, firm in texture; basal frond sheath leathery and tending to persist; spores $35-45 \mu$ in diameter . . . . . . . . . . O. pycnostichum

Ophioglossum crotalophoroides Walter, Bulbous Adder's-tongue. Cp (GA, NC, SC), Pd (GA): moist ditchbanks and grassy roadside flats; rare (or overlooked) north of GA. March-September. A Southeastern Coastal Plain species, ranging from e. NC (Dare County) south to FL and west to TX; also in Mexico, the West Indies, Central America, and South America. [= RAB, FNA, S; > O. crotalophoroides var. crotalophoroides -- K; > O. crotalophoroides var. nanum Osten ex de Lichtenstein - K]

Ophioglossum engelmannii Prantl, Engelmann's Adder's-tongue, Limestone Adder's-tongue. Mt (GA, NC?, VA), Pd (GA): dry barrens and glades over calcareous rocks, very rarely on granite; uncommon (GA Special Concern, VA Watch List). MarchJune. W. VA, IN, IL, KS, and AZ south to FL and TX; also in Mexico and Central America. Ascribed to NC by Wagner \& Wagner in FNA (1993b), the documentation unknown. [= C, F, FNA, G, K, S, W]

Ophioglossum nudicaule Linnaeus f., Slender Adder's-tongue. Cp (GA, NC, SC), Pd (GA): lawns and other moist, grassy areas; rare or overlooked. E. NC south to s. FL, west to TX; also in Mexico, the West Indies, Central and South America, Asia, and Africa. First reported from NC by Thomas \& Marx (1979). [= RAB, FNA, K; > O. dendroneuron E.P. St. John - S; > O. mononeuron E.P. St. John - S; O. tenerum Mettenius - S]

Ophioglossum petiolatum Hooker, Long-stem Adder's-tongue. Cp (GA, NC, SC, VA): maritime wet grasslands, moist ditchbanks, and grassy roadside flats; rare or overlooked north of GA (NC Watch List, SC Rare, VA Rare). March-November. Widespread in se. United States, from se. VA south to FL and west to TX and OK; also in the West Indies, Mexico, n. South America, and Asia. First reported for NC by Thomas \& Marx (1979). Wagner \& Wagner in FNA (1993b) suggest that this species is likely introduced in North America. [= RAB, FNA, K; O. floridanum E. St. John - S] \{add synonymy\}

Ophioglossum pusillum Rafinesque, Northern Adder's-tongue. Mt (NC?, VA): moist streamside meadow; rare (VA Rare). March-July. Nova Scotia west to ND, south to VA, possibly NC, IN, and NE; and in the Pacific Northwest. [= FNA, K; = O. vulgatum

## Linnaeus var. pseudopodum (Blake) Farwell -- F]

Ophioglossum pycnostichum (Fernald) A. \& D. Löve, Southern Adder's-tongue. Pd, Mt (GA, NC, SC, VA), Cp (NC, SC, VA): bottomland forests, moist loamy soils of successsional forests and old fields; uncommon (or overlooked) (SC Rare). March-July. Fairly widespread in e. North America, mostly south of the Wisconsinan glaciation, from s. NJ, IN, IL, and s. MI south to FL, MS, and e. TX. O. vulgatum (defined narrowly) is Eurasian. The best treatment of this complex is uncertain. [= W; = O. vulgatum Linnaeus var. pycnostichum Fernald -- RAB, C, F; < O. vulgatum Linnaeus -- FNA, G, K, S]

## Sceptridium Lyon 1905 (Grape Fern)

A genus of ca. 14 species, nearly cosmopolitan. References: Hauk, Parks, \& Chase (2003); Hauk (1996).
1 Sterile leaf 4-pinnate-pinnatifid, finely divided, the ultimate segments lacerate and linear, less than 3 mm wide .. S. dissectum
1 Sterile leaf 2-pinnate to 4-pinnate, not finely divided, the ultimate segments ovate or oblong, more than 8 mm wide.
2 Sterile pinnae entirely divided into short, round or acute pinnules; lateral pinnules with an inconspicuous and poorlydeveloped central vein; plant producing 1 or 2 leaves per season.
3 Sterile pinna and pinnule apices obtuse to acute (rarely round); ultimate segments mostly rounded at the base, not fan-shaped, ovate or oblong; ultimate segments often crowded and overlapping
S. multifidum

3 Sterile pinna and pinnule apices round to obtuse; ultimate segments cuneate, rounded, or truncate at the base; ultimate segments remote or overlapping.
4 Stalk of the basal sterile pinnae (10-) $15-70 \mathrm{~mm}$ long; roots irregularly ribbed, blackish; ultimate leaf segments fan-shaped, obovate, longer than wide, pinnately veined, the midrib weakly developed; sporulating AugustOctober . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. jenmanii 4 Stalk of the basal sterile pinnae 4-15 (-20) mm long; roots smooth, yellowish; ultimate leaf segments about as long as wide, subflabellately veined, lacking a midrib; sporulating January-April . . . . . . . . . . . . S. Iunarioides
2 Sterile pinnae (or their terminal portion) elongate (the sides often nearly parallel), entire to shallowly lobed, not divided into pinnules; lateral pinnules with a conspicuous and well-developed central vein; plant producing 1 leaf per season.
$5 \quad$ Sterile pinna and pinnule apices obtuse to rounded (to somewhat acute); ultimate segments mostly ovate, narrowly ovate, or oblong, mostly about $2 \times$ as long as broad or less; overwintering leaves green, not bronze . . S. oneidense 5 Sterile pinna and pinnule apices acute; ultimate segments mostly oblong or lanceolate-oblong, often more than $2 \times$ as long as broad; overwintering leaves bronze (or green if covered by leaves).
$6 \quad$ Sterile blade mostly 2-pinnate, the segments sharply serrulate
S. biternatum

6 Sterile blade mostly 3-pinnate (or more divided, those forms keyed above), the segments entire to obscurely serrulate or crenulate
S. dissectum

Sceptridium biternatum (Savigny) Lyon, Southern Grapefern. Mt, Pd, Cp (GA, NC, SC, VA): moist forests, clearings, old fields; common. August-October. Widespread in se. United States, from MD, PA, s. IN, s. IL, and se. MO south to FL and e. TX. [= Botrychium biternatum (Savigny) Underwood -- RAB, C, FNA, K, S, W; B. dissectum var. tenuifolium (Underwood) Farwell -- F, G]

Sceptridium dissectum (Sprengel) Lyon, Cut-leaf Grape Fern, Dissected Grapefern. Mt, Pd, Cp (GA, NC, SC, VA): moist forests, clearings, old fields; common (rare in Coastal Plain of NC, SC, and GA). August-October. Widespread in ne. North America, from Nova Scotia and Québec west to Ontario and MI, south to FL and TX; also in the West Indies. The two forms have caused much confusion. In our area, forma obliquum is much more common and widely distributed, often confused with $B$. biternatum. Forma dissectum is fairly common in our area only in VA (rare in NC and SC), occurring primarily in the Mountains. The different distributions of the 2 forms suggest that further research is needed. [= Botrychium dissectum Sprengel -- RAB, C, F, FNA, $\mathrm{K}, \mathrm{W} ;<B$. dissectum var. obliquum (Muhlenberg ex Willdenow) Clute -- $\mathrm{G} ;<\mathrm{B}$. dissectum var. dissectum -G ; < B. dissectum -S , in a narrower sense; < B. obliquum Muhlenberg ex Willdenow -- S; =]

Sceptridium jenmanii (Underwood) Lyon, Alabama Grapefern. Mt (GA, NC, SC, VA), Pd (GA, NC, SC), Cp (GA): moist to dryish forests and disturbed areas; rare (NC Rare, VA Rare). August-October. VA and TN south to FL, AL, and e. LA; also in the West Indies. This species probably arose as a hybrid between B. biternatum and B. lunarioides (Michaux) Swartz, followed by polyploidization, resulting in a fertile taxon functioning as a species. [= Botrychium jenmanii Underwood - C, FNA, K, W; = B. alabamense Maxon -- RAB, S]

Sceptridium lunarioides (Michaux) Holub, Winter Grapefern. Cp (GA, SC), Pd (GA, NC): old fields, pastures, young forests; rare (NC Rare, SC Rare). January-April. W. NC and s. SC south to n. FL, and west to e. TX and se. OK. Wagner (1992) proposes that B. lunarioides be treated in a new monotypic section, Hiemobotrychium, of Botrychium, subgenus Sceptridium. The species is hard to spot, and all the more difficult to find because of its phenology; the leaves appear in late fall and die by early spring. [= Botrychium lunarioides (Michaux) Swartz -- RAB, FNA, K; = Holubiella lunarioides (Michaux) Škoda]

Sceptridium multifidum (S.G. Gmelin) M. Nishida, Leather Grapefern. Mt (NC, VA): grassy balds and high elevation meadows; rare (NC Rare, VA Rare). August-September. Widespread in n. North America, from Labrador and Alaska south PA, OH (and in the mountains to VA and NC), IN, IL, IA, NE, CO, NM, and CA. [= Botrychium multifidum (S.G. Gmelin) Treviranus -- C, FNA, K, W; >B. multifidum var. multifidum -- F, G; > B. multifidum var. intermedium (D.C. Eaton) Farwell -- F, G]

Sceptridium oneidense (Gilbert) Holub, Bluntlobe Grapefern. Mt (NC, VA), Pd (VA): moist or boggy forests, bogs; rare (NC Rare, VA Watch List). July-October. Northeastern in distribution and local in its occurrence, from New Brunswick, Québec, and Ontario south to NC, TN, KY, IN, and WI. Recent studies by Warren Hauk suggest that B. oneidense may not be distinct from $B$. dissectum. [= Botrychium oneidense (Gilbert) House -- RAB, C, FNA, K, W; = B. dissectum forma oneidense (Gilbert) Clute -- F ("embarassingly transitional"); = B. multifidum var. oneidense (Gilbert) Farwell -- G]

A family of 1-3 genera and about 15-25 species. References: Lellinger (1985); Whetstone \& Atkinson in FNA (1993b); Kramer in Kramer \& Green (1990); Yatabe, Nishida, \& Murakami (1999).

## Osmunda Linnaeus (Royal Fern, Cinnamon Fern, Interrupted Fern)

A genus of about 10 species (or if circumscribed more broadly as suggested by molecular phylogenetics to include Todea and Leptopteris, of $15-25$ species), tropical and temperate (most diverse in e. and se. Asia and e. North America). References: Lellinger (1985); Whetstone \& Atkinson in FNA (1993b); Kramer in Kramer \& Green (1990); Yatabe, Nishida, \& Murakami (1999).

Identification notes: Sterile plants of Osmunda cinnamomea are sometimes confused with Woodwardia virginica, which also has rather coarse, pinnate-pinnatifid leaves and grows in similar wet, acid places. Osmunda is much coarser, has cinnamon tufts of tomentum present in the axils of the pinnae (vs. absent), has the rachis greenish and rather fleshy in texture (vs. brown and wiry), and bears fronds clumped or tufted from a massive, woody, ascending rhizome covered with old petiole bases (vs. fronds borne scattered along a thick, horizontal, creeping rhizome).

1 Leaves bipinnate, each pinna fully divided into distinct pinnules, the larger pinnules 3-7 cm long and 0.7-2.0 cm wide; spores borne on modified pinnae in the terminal portion of the leaf blade; veins mostly 2-forked; [subgenus Osmunda]
O. regalis var. spectabilis

1 Leaves pinnate-pinnatifid, each pinna pinnatifid but not divided into distinct pinnules; spores borne either on separate, modified, fertile leaves, or on modified pinnae in the middle of the leaf blade; veins mostly 1 -forked.
2 Spores borne on modified pinnae in the middle of the leaf blade, pinnae above and below the fertile portion green and leafy; sterile pinnae lacking a tuft of brown tomentum at the base; [subgenus Osmunda] O. claytoniana var. claytoniana
2 Spores borne on separate, modified fertile leaves which (normally) lack green leafy portions; sterile pinnae with a prominent tuft of brown tomentum at the base; [subgenus Osmundastrum].
3 Leaf surfaces and upper portion of the rachis not glandular ................. O. cinnamomea var. cinnamomea 3 Leaf surfaces and upper portion of the rachis densely glandular pubescent . . . . . O. cinnamomea var. glandulosa

Osmunda cinnamomea Linnaeus var. cinnamomea, Cinnamon Fern. Cp, Pd, Mt (GA, NC, SC, VA): bogs, peatlands, pocosins, wet savannas, floodplains, blackwater stream swamps; common. March-May. Labrador west to MN, south to FL, TX, NM, Central America, and South America. The species also occurs in e. Asia, where generally treated as a separate variety. "When the rbcL trees, the fossil and morphological evidences are all taken into account, it can be concluded that the extant Osmunda cinnamomea has no closely related living species in Osmundaceae, and it has evolutionarily very static morphology with no significant modification for more than 200 million years. Thus we can call extant Osmunda cinnamomea a 'living fossil' (Yatabe, Kishima, \& Murakami 1999). [= C, F, K; < O. cinnamomea -- RAB, FNA, G, S, W]

Osmunda cinnamomea Linnaeus var. glandulosa Waters, Glandular Cinnamon Fern. Cp (SC, VA), Mt (VA): acidic seepage swamps, sphagnous seeps; rare (VA Rare). March-May. This taxon is poorly understood, but appears to be worthy of taxonomic recognition. It is known from scattered locations in e. North America. [= F, K; < O. cinnamomea -- FNA]

Osmunda claytoniana Linnaeus var. claytoniana, Interrupted Fern. Mt (GA, NC, SC, VA), Pd (VA), Cp (VA): upland forests, woodlands, and balds, moist to rather dry; common (uncommon in Piedmont, rare in Coastal Plain). March-June. Newfoundland west to MN, south to n. GA, TN, and AR; another variety occurs in e. and sc. Asia. [= C, F; < O. claytoniana -- RAB, FNA, G, K, S, W]

Osmunda regalis Linnaeus var. spectabilis (Willdenow) A. Gray, Royal Fern. Cp, Mt, Pd (GA, NC, SC, VA): bogs, marshes (including tidal), moist forests, floodplains, swamp forests; common. March-June. Newfoundland west to Saskatchewan, south to FL, TX, and Mexico; var. regalis is widespread in Eurasia, var. japonica is Japanese. [= RAB, C, F, FNA, G, K, W; < O. regalis -- S]

The hybrid Osmunda $\times$ ruggii R . Tryon [O. claytoniana var. claytoniana $\times$ regalis var. spectabilis] is known from Giles County, VA and one other historic population in CT. It has 2-pinnate sterile leaves, with the pinnules sessile. [= K]

## POLYPODIACEAE (Polypody Family)

A family of about $35-40$ genera and 500-700 species, cosmopolitan, especially tropical. References: Smith in FNA (1993b); Hennipman, Veldhoen, \& Kramer in Kramer \& Green (1990).

1 Leaf blade densely scaly on the lower surface; rhizome 1-2 mm in diameter; leaf segment margins entire ........ Pleopeltis
1 Leaf blade scaleless on the lower surface; rhizome 3-15 (-30) mm in diameter; leaf segment margins denticulate (Polypodium) or entire (Phlebodium).
2 Venation highly reticulate, with 3-4 rows of areoles between the midvein and the margin; rhizome 8-15 (-30) mm in diameter; leaf blade $10-50 \mathrm{~cm}$ wide

Phlebodium
2 Venation free or with a row of areoles between the midvein and the margin; rhizome 3-6 mm in diameter; leaf blade <9 cm wide

A genus of 2-4 species, of tropical and subtropical regions of the Western Hemisphere. References: Hennipman, Veldhoen, \& Kramer in Kramer \& Green (1990).

Phlebodium aureum (Linnaeus) J. Smith, Goldfoot Fern, Golden Polypody. Cp (GA): epiphytic on the old leaf bases of Sabal palmetto, and rarely terrestrial on calcareous soils; rare (GA Special Concern). E. GA (Chatham County), a county adjacent to the SC line) south to FL. [= FNA, K, S; = Polypodium aureum Linnaeus]

## Pleopeltis Humboldt \& Bonpland ex Willdenow 1810 (Shielded-Sorus Polypody)

A genus of about 50 species, primarily tropical. Windham (1993) makes a compelling case, based on morphological, chemical, and molecular data, that the "scaly polypodies" (including the above taxon) are more closely related to Pleopeltis and should be placed there, rather than in Polypodium. References: Windham (1993); Andrews \& Windham in FNA (1993b); Hennipman, Veldhoen, \& Kramer in Kramer \& Green (1990).

Pleopeltis polypodioides (Linnaeus) E.G. Andrews \& Windham ssp. michauxiana (Weatherby) E.G. Andrews \& Windham, Resurrection Fern, Scaly Polypody. Cp, Pd, Mt (GA, NC, SC, VA): on tree limbs and trunks (especially when leaning) and on rocks; common (rare in n. VA). June-October. Ssp. michauxiana ranges from se. MD, IL, MO, and se. KS, south to s. FL and TX; also in Mexico and Guatemala. Ssp. polypodioides ranges in the West Indies, Central America and South America. Four additional varieties are tropical in Central America, South America, and Africa. [= FNA, K; < Polypodium polypodioides (Linnaeus) Watt -RAB; = Polypodium polypodioides (Linnaeus) Watt var. michauxianum Weatherby -- C, F, G, W; <? Marginaria polypodioides (Linnaeus) Tidestrom -- S]

Polypodium Linnaeus 1753 (Polypody)
(also see Phlebodium and Pleopeltis)
A genus of about 100 species, cosmopolitan. References: Haufler et al. in FNA (1993b); Haufler, Windham, \& Rabe (1995)=Z; Haufler \& Windham (1991); Bryan \& Soltis (1987); Kott \& Britton (1982); Hennipman, Veldhoen, \& Kramer in Kramer \& Green (1990); Cusick (2002).
[Note: three leads]
1 Leaf blade averaging 5.8 cm wide (range of 3.2-8.2 cm ), widest at the base, thus the blade elongate-deltoid in outline; rhizome scales averaging 1.1 mm wide, mostly golden brown throughout; paraphyses (sporangiasters) usually more than 40 per sorus (range of 25-120); leaves mostly lobed to apex, without an attenuate, unlobed tip . . . . . . . . . . . . . . . . . . . . P. appalachianum
1 Leaf blade averaging 4.5 cm wide (range of $3.0-5.8 \mathrm{~cm}$ ); blade widest near the middle, thus the blade oblong to narrowly lanceolate in outline; rhizome scales averaging 1.5 mm wide, mostly brown, with a dark central stripe; paraphyses (sporangiasters) usually fewer than 40 per sorus (range of 7-69); leaves mostly with an attenuate, unlobed tip . $\boldsymbol{P}$. virginianum
1 Characters intermediate; spores abortive
P. $\times$ incognitum

Polypodium appalachianum Haufler \& Windham [P. virginianum complex], Appalachian Rockcap Fern. Mt (GA, NC, SC, VA): moist rocks at low to high elevations, especially in ravines, on north-facing outcrops, and in other moist sites; uncommon. June-October. Newfoundland west to e. Ontario, south to n. GA and n. AL; nearly restricted to the Appalachian Mountains. Its chromosome complement can be symbolized as AA. It is one parent of $P$. virginianum. [= FNA, $K, Z$; < P. virginianum -- RAB, C, F, $\mathrm{S}, \mathrm{W}$, in part; < $P$. vulgare Linnaeus var. virginianum (Linnaeus) Eaton -- G , in part]

Polypodium virginianum Linnaeus [P. virginianum complex], Common Rockcap Fern. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): moist rocks; common (rare in Coastal Plain). June-October. Haufler and Windham (1991) indicate that the tetraploid cytotype ( $P$. virginianum) of the $P$. virginianum complex is an allotetraploid derivative of the sterile hybrid of the diploid occurring in our area ( $P$. appalachianum) and another diploid with a boreal distribution ( $P$. sibiricum Siplivinsky). Electrophoretic evidence supports this finding (Bryan \& Soltis 1987, Haufler, Windham, \& Rabe 1995). Thus, Polypodium in our area is another classic example of the reticulate evolution of pteridophytes, and the cytotypes must be treated as species and given names. Unfortunately, the two species are somewhat cryptic, and the relatively frequent triploid backcross makes field identification still more problematic. Individuals not identified to species may be referred to as "Polypodium virginianum complex." The chromosome complement of $P$. virginianum can be symbolized as AASS. [= FNA, K, Z; < P. virginianum -- RAB, C, F, S, W (see also P. appalachianum); < $P$. vulgare Linnaeus var. virginianum (Linnaeus) Eaton -- G (see also $P$. appalachianum)]

Polypodium $\times$ incognitum Cusick is the triploid hybrid [ $P$. appalachianum $\times$ virginianum]. It is rather frequent; there is some evidence that it may reproduce successfully via apogamous spores. It is best recognized by the spores, which are irregular in size and shape. Morphologically, it tends to intermediacy between the two parents, but can closely resemble either. Its chromosome complement can be symbolized AAS.

PSILOTACEAE Kanitz 1887 (Whiskfern Family)
A family of 2 genera and 4-12 species, pantropical and warm temperate. References: Lellinger (1985); Thieret in FNA (1993b); Kramer in Kramer \& Green (1990).

## Psilotum Swartz 1800 (Whiskfern)

A genus of 2-3 species, tropical and warm temperate. Psilotum lacks roots and true leaves. Other than the Australasian genus Tmesipteris, Psilotum has no close living relatives, and the 2 genera are usually considered to comprise a distinct class (Wagner 1977). The stem is chlorophyllose. Fungal cells interspersed in the outer layers of the rhizome aid in the absorption of nutrients. References: Lellinger (1985); Thieret in FNA (1993b); Kramer in Kramer \& Green (1990).

Identification notes: The stiff, dichotomously-branched habit of $P$ silotum is unmistakable.

Psilotum nudum (Linnaeus) Palisot de Beauvois, Whiskfern. Cp (GA, NC, SC), Pd* (NC): in moist bottomland forests, on soil, stumps, and tree bases, along building foundations (where introduced); rare (GA Special Concern, NC Rare, SC Rare). AprilSeptember. S. SC south to s. FL, west to e. TX, disjunct (and apparently native) in ne. NC (Perry \& Musselman 1994), rarely naturalized around buildings in c. NC; also in sw. United States and in the tropics of Central and South America, Africa, and Asia. [= RAB, FNA, K, S]

## PTERIDACEAE (Maidenhair Fern Family)

A family of about 40 genera and about 1000 species. This family may be further subdivided, into families Adiantaceae (Adiantum), Cheilanthaceae (Cheilanthes, Notholaena, Astrolepis, Pellaea, Cryptogramma), and Pteridaceae (Pteris). References: Lellinger (1985); Windham in FNA (1993b); Tryon, Tryon, \& Kramer in Kramer \& Green (1990).

1 Sori round or oblong, distinct and separate along the pinnule margins; leaves bright-green, glabrous, herbaceous, delicate, and flexible; [subfamily Adiantoideae].

Adiantum
1 Sori continuous along the pinnule margins; leaves mostly dark-green or glaucous, often pubescent, coriaceous, tough, and stiff. 2 Leaves strongly dimorphic, the fertile leaves obviously longer than the sterile and with narrow elongate ultimate segments; [subfamily Cheilanthoideae]
[Cryptogramma] 2 Leaves essentially monomorphic.

3 Leaves 2-5-pinnate, the ultimate leaf-segments 1-4 (-8) mm long, more-or-less densely hairy (glabrous in Cheilanthes alabamensis) or covered on the undersurface with a whitish powder; [subfamily Cheilanthoideae].
4 Lower leaf surfaces covered with whitish powder, otherwise glabrous or sparsely pubescent . [Argyrochosma] 4 Lower leaf surfaces pubescent (or glabrous in Cheilanthes alabamensis), never with conspicuous whitish powder

Cheilanthes
3 Leaves 1-2-pinnate, the ultimate leaf-segments $8-100 \mathrm{~mm}$ long, glabrous or sparsely and inconspicuously hairy. 5 Leaf undersurface densely covered with stellate and ciliate scales; [subfamily Cheilanthoideae] ... Astrolepis 5 Leaf undersurface glabrous or with non-stellate scales.

6 Rachis dark-brown or purple; [subfamily Cheilanthoideae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Pellaea 6 Rachis green or tan; [subfamily Pteridoideae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Pteris

## Adiantum Linnaeus 1753 (Maidenhair Fern)

A genus of 150-200 species, nearly cosmopolitan. References: Paris in FNA (1993b); Tryon, Tryon, \& Kramer in Kramer \& Green (1990).

1 Petiole and rachises roughly pubescent; [rare introduction] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. hispidulum
1 Petiole and rachises glabrous; [collectively common natives].
2 Leaves longer than broad, pinnately divided, with a main central axis, not fanlike; ultimate segments rhombic, about as long as broad to slightly longer than broad . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. capillus-veneris
2 Leaves broader than long, dichotomously divided at the summit of the petiole, the two main branches pedately branched, fanlike; ultimate segments oblong, more than $2 \times$ as long as broad.
3 Ultimate segments at middle of penultimate divisions usually more than $3.2 \times$ as long as broad, the apices with sharply denticulate, angular lobes, these lobes separated by deep sinuses 0.6-4 mm deep; segment stalks 0.2-0.9 (1.3) mm long; [disjunct in se. PA on serpentine from a generally more northern and western distribution]
[A. aleuticum]
3 Ultimate segments at middle of penultimate divisions usually less than $3.2 \times$ as long as broad, the apices with rounded, crenulate, or crenate-denticulate lobes, these lobes separated by shallow sinuses 0.1-2.0 (-3.7) mm deep; segment stalks 0.5-1.5 (-1.7) mm long
A. pedatum

Adiantum capillus-veneris Linnaeus, Venus'-hair Fern, Southern Maidenhair. Cp (GA, NC, SC), Mt (GA, VA): moist calcareous rocks, in the Coastal Plain of NC and SC on "marl" (coquina limestone), in the mountains of VA (formerly) on limestone: rare (NC Rare, VA Rare). June-July. Widespread on several continents, in e. North America largely southern in distribution, from e, NC, w. VA, MO, CO, UT, and CO south; also disjunct in SD and British Columbia, and in Mexico, the West Indies, tropical and warm temperate portions of Central and South America, Eurasia, and Africa. There is some question whether North American plants are conspecific with those in the Old World (Paris in FNA 1993b). [= RAB, C, F, FNA, G, K, S, W]

* Adiantum hispidulum Sw., Rough Maidenhair, Garden Maidenhair. Cp (GA): stone walls; rare, introduced from Asia. Reported for GA (FNA, Kartesz 1999). [= FNA, K, S]

Adiantum pedatum Linnaeus, Northern Maidenhair. Mt, Pd (GA, NC, SC, VA), Cp (GA, NC, VA): moist forests and cliffs, especially in seepage; common (uncommon in Piedmont, rare in Coastal Plain). June-August. Widespread in e. United States, from Nova Scotia and New Brunswick west to Ontario and MN, south to GA, AL, MS, LA, and OK. [= RAB, FNA, G, K, S, W; = A. pedatum ssp. pedatum -- C; = A. pedatum var. pedatum -- F]

Adiantum aleuticum (Ruprecht) Paris is disjunct on serpentine in se. PA and MD (FNA). It occurs as well at scattered locations in ne. and w. North America, from s. AK south to s. CA, AZ, and Mexico (Chihuahua). [= FNA, K; = A. pedatum Linnaeus ssp. calderi Cody -- C; = A. pedatum Linnaeus var. aleuticum Ruprecht -- F]

## Argyrochosma (J. Smith) Windham 1987 (Powdery Cloak Fern)

A genus of about 20 species, of s. North America, Central America, South America, and the West Indies. Traditionally treated as a component of Notholaena (or sometimes Pellaea) (Tryon, Tryon, \& Kramer in Kramer \& Green 1990), but best recognized as a separate genus (Windham in FNA 1993b, Windham 1987, Gastony \& Rollo 1998). Molecular studies show that this group is more closely related to Pellaea and Astrolepis than to Notholaena. References: Windham in FNA (1993b); Windham (1987); Tryon, Tryon, \& Kramer in Kramer \& Green (1990); Gastony \& Rollo (1998).

Argyrochosma dealbata (Pursh) Windham occurs on calcareous rocks east to AR and KY. It has leaves 3-5-pinnate, the small ultimate segments covered below with a whitish powder. [= FNA, K; = Notholaena dealbata (Pursh) Kunze -- C, F, G; = Cheilanthes dealbata Pursh; = Pellaea dealbata (Pursh) Prantl]

## Astrolepis D.M. Benham \& Windham 1992 (Star-scaled Cloak Fern)

A genus of about 8 species, of s. North America, Central America, South America, and the West Indies. This group of species has traditionally been placed either in Notholaena or Cheilanthes, but is best recognized as a separate genus, more closely related to Argyrochosma, Pellaea, and Cheilanthes than to Notholaena (Gastony \& Rollo 1998) References: Benham \& Windham in FNA (1993b); Tryon, Tryon, \& Kramer in Kramer \& Green (1990); Gastony \& Rollo (1998).

1 Scales of the upper leaf surface dense and usually persistent; largest pinnae asymmetrically lobed or entire; [rare eastern disjunct known from AL]
[A. integerrima]
1 Scales of the upper leaf surface sparse and usually deciduous; largest pinnae usually symmetrically lobed; [rare eastern disjunct known from GA] A. sinuata $s s p$. sinuata

Astrolepis sinuata (Lagasca ex Swartz) D.M. Benham \& Windham ssp. sinuata, Wavy Cloak-fern. Pd (GA): granitic outcrops and boulders; rare (GA Special Concern). TX west to AZ, south into Central and South America; disjunct in GA. Its leaves are pinnate-pinnatifid, with 30-60 pairs of pinnae. [= FNA, K; Cheilanthes sinuata (Lagasca ex Swartz) Domin; Notholaena sinuata (Lagasca ex Swartz) Kaulfuss]

Astrolepis integerrima (Hooker) D.M. Benham \& Windham occurs as a disjunct on Ketona dolomite in c. AL (Bibb County). Its primary distribution is in sw. United States and Mexico. This taxon is apparently an apogamous triploid derived from Astrolepis cochisensis (Goodding) D.M. Benham \& Windham and an unknown taxon. [= FNA; = Astrolepis $\times$ integerrima -- K; = Cheilanthes integerrima (Hooker) Mickel; = Notholaena integerrima (Hooker) Hevly]

Cheilanthes Swartz 1806 (Lip-fern)
(also see Argyrochosma, Astrolepis)
A genus of about 150 species, primarily in the Western Hemisphere. References: Lellinger (1985)=Z; Windham \& Rabe in FNA (1993b); Tryon, Tryon, \& Kramer in Kramer \& Green (1990); Gastony \& Rollo (1998).

1 Leaf surfaces glabrescent; ["Cheilanthes alabamensis group"]
Ch. alabamensis
1 Leaf surfaces pubescent (tomentose, villous, or lanose).
2 Petiole and rachis with a mixture of flattened scales (in C. tomentosa these very narrow and superficially mistakable for hairs) and jointed hairs (as seen at 10x); plants tufted, without creeping rhizomes; margins of leaf segments strongly under-rolled, modified into a scarious flap (false indusium) that covers the sori; [subgenus Physapteris].
3 Leaf blade nearly glabrous above, appearing dark green; scales 0.2-1.0 mm wide, lanceolate; tomentum on the leaf under-surface chestnut-brown (at maturity, whitish when young) . . . . . . . . . . . . . . . . . . . . . . . . . . . Ch. castanea
3 Leaf blade villous above, appearing whitish or gray-green; scales ca. 0.1 mm wide, linear, nearly hair-like; tomentum on the leaf under-surface white, tan, or silver-gray . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Ch. tomentosa
2 Petiole and rachis with hairs only (as seen at $10 \times$ ); plants mat-forming (with leaves scattered along creeping rhizomes) or tufted (without creeping rhizomes); margins of leaf segments under-rolled but not modified into a scarious flap, the sori more-or-less exposed at maturity; [subgenus Cheilanthes].
4 Petiole and rachis glabrous to sparsely pubescent with rather straight hairs; leaves 3-pinnate, with 7-12 (-15) pairs of pinnae, the lower surface lanose (the hairs curly); leaf blades 2.5-10 (-15) cm long; ultimate segments 1-3 mm long, beadlike

Ch. feei
4 Petiole and rachis rather densely pubescent with long jointed hairs; leaves 2-pinnate-pinnatifid (rarely to 3-pinnate),
with 12-20 pairs of pinnae, the lower surface tomentose (the hairs straight or bent); leaf blades (4-) 8-24 cm long; ultimate segments $3-5 \mathrm{~mm}$ long, elongate

Ch. Ianosa

Cheilanthes alabamensis (Buckley) Kunze, Alabama Lip-fern. Mt (GA, NC, VA): dry outcrops of limestone; rare (GA Special Concern, NC Rare, VA Rare). June-September. VA, w. NC, s. MO, and OK south and west to n. GA, AL, TX, NM, se. AZ, and Mexico. Considering morphology and chromosome number (sharing $x=29$ with Pellaea, in contrast to $x=30$ in the rest of Cheilanthes), it has been suggested that Ch. alabamensis and close relatives could be placed equally well in Pellaea, as $P$ alabamensis (Buckley) Baker ex Hooker, as done by Cranfill (1980). Windham \& Rabe in FNA (1993b) suggest that Ch. alabamensis is uncomfortably placed in either Cheilanthes and Pellaea and that "it may constitute a natural group worthy of consideration as a distinct genus." A molecular analysis suggests that Ch. alabamensis and close relatives form a monophyletic group sister to the rest of Cheilanthes; this could be the basis for status as a separate genus or for inclusion in Cheilanthes (but not for inclusion in Pellaea) (Gastony \& Rollo 1998). Our plants are apparently apogamous triploids. [= RAB, C, F, FNA, G, K, S, W, Z]

Cheilanthes castanea Maxon, Chestnut Lip-fern. Mt, Pd (VA): dry outcrops of sedimentary or metamorphic rocks (including calcareous shales and siltstones); rare (VA Rare). June-September. Sw. TX to s. AZ, with scattered disjunct occurrences in c. OK, n. AR, e. WV, and c. and w. VA (to be expected elsewhere in our area). The ultimate segments of the pinnules tend to be roundish and closely spaced, so that they overlap the adjacent segments of the pinnule and the segments of the adjacent pinnule. These characters do not match some descriptions (such as in Z). Whether or not Ch. castanea is distinct from or merely a form of Ch. eatonii is controversial. The complex of the 2 taxa includes apogamous triploids and sexual tetraploids. $[=W, Z$; $<C h$. eatonii Baker -- C, FNA, K]

Cheilanthes feei T. Moore, Slender Lip-fern. Mt (VA): dry outcrops of calcareous sedimentary rocks (dolostone); rare (VA Rare). June-September. WI, MN SD, MT, Alberta, and British Columbia south to AR, TX, NM, AZ, s. CA, and n. Mexico; disjunct eastwards in KY and $w$. VA. The only known site in our area is on a dolostone cliff in Pulaski County, VA, where disjunct about 450 km east of a population in Bullitt County, KY, and an additional 200 km from other populations in IL (Wieboldt \& Bentley 1982, Porter \& Wieboldt 1991). The species is an apogamous triploid of unknown parentage. [= C, FNA, G, K, W, Z]

Cheilanthes Ianosa (Michaux) D.C. Eaton, Hairy Lip-fern. Mt, Pd (GA, NC, SC, VA); Cp (GA): dry outcrops of felsic or intermediate metamorphic and igneous rocks; uncommon. June-September. CT, NY, PA, s. IL, MO, and KS south to FL, AL, MS, LA, and e. TX, and disjunct in WI and MN. Much the commonest lip-fern in our area, a sexual diploid, and the most "eastern" of a predominantly western genus. [= RAB, C, FNA, G, K, W, S, Z; = Ch. vestita (Sprengel) Swartz -- F]

Cheilanthes tomentosa Link, Woolly Lip-fern. Mt, Pd (GA, NC, SC, VA), Cp (GA, SC): dry outcrops of intermediate or calcareous metamorphic, igneous, or sedimentary rocks (including sandstone outcrops in the Coastal Plain of GA and SC); uncommon (rare in Coastal Plain). June-September. Primarily Appalachian, from PA south to KY, GA, and AL, also at scattered localities from AR, OK, and KS south and west to NM, AZ, and Mexico. The species is an apogamous triploid. [= RAB, C, FNA, G, K, W, S, Z; = Ch. lanosa -- F, misapplied]

## Cryptogramma R. Brown 1823 (Parsley Fern)

A genus of about 10 species, of temperate Eurasia, North America, and South America. References: Alverson in FNA (1993b); Tryon, Tryon, \& Kramer in Kramer \& Green (1990).

Cryptogramma stelleri (S.G. Gmelin) Prantl in Engler, Slender Rock-brake, ranges south to c. PA and WV (Randolph County). It is a small fern of calcareous rocks, with dimorphic pinnate-pinnatifid to 2-pinnate leaves to 20 cm long. [= FNA, C, F, G, K]

Pellaea Link 1841 (Cliff-brake)
(also see Argyrochosma, Astrolepis, Cheilanthes)
A genus of about 40 species, mostly in the Western Hemisphere. References: Gastony (1988); Gastony, Yatskievych, \& Dixon (1992); Windham in FNA (1993b); Tryon, Tryon, \& Kramer in Kramer \& Green (1990); Gastony \& Rollo (1998); Heafner (2001). Key based in part on Heafner (2001).

1 Petioles terete, glabrous or pubescent; rhizome scales uniformly orangish-brown, entire.
2 Petioles and rachises sparsely to densely pubescent, dull; pinnae long-stalked, those towards the base of the leaf on stalks $5-15 \mathrm{~mm}$ long; [of a variety of substrates, including non-calcareous] . . . . . . . . . . . . . . . . . . . . . . . P. atropurpurea
2 Petioles and rachises glabrous to very sparsely pubescent, shiny; pinnae sessile or short-stalked, those towards the base of the leaf on stalks 0-4 (-6) mm long; [strictly of calcareous substrates] . . . . . . . . . . . . . . . . . . P. glabella ssp. glabella
1 Petioles slightly grooved or flattened, glabrous; rhizome scales with a blackish median stripe and pale brown margins, obscurely toothed.
3 Ultimate segments thin in texture, not strongly rolled, acute to acuminate at the apex, but lacking a mucr or cusp
$P$. viridis
3 Ultimate segments leathery, strongly rolled, mucronate at the apex.
4 Leaves oblong to elliptic in outline; pinnae either ternate towards the base of the leaf and simple towards the tip of the leaf, or all simple; [known from outcrops in the upper Piedmont of SC] . . . . . . . . . . . P. ternifolia ssp. arizonic 4 Leaves usually narrowly triangular in outline; pinnae usually pinnate towards the base, becoming ternate to simple towards the tip; [known from outcrops in Piedmont of NC]
P. wrightiana

Pellaea atropurpurea (Linnaeus) Link, Purple Cliff-brake. Mt, Pd, Cp (GA, NC, SC, VA): outcrops of limestone and other rocks (usually either calcareous or mafic), rarely on masonry walls (Wieboldt 1995); common only in the Ridge and Valley of VA,
otherwise uncommon to rare (SC Rare). May-September. This species is an apogamously-reproducing triploid, either an allopolyploid derived from the hybridization of a sexually-reproducing diploid species and sexually-reproducing tetraploid, or an autopolyploid of an undiscovered or extinct species. Gastony, Yatskievych, \& Dixon (1992) provide convincing evidence that modern P. glabella is not one of the parental taxa, as indicated by Lellinger (1985). P. atropurpurea is widespread in e. North America, from VT, NY, MN, SD, Saskatchewan, and Alberta south to FL, AL, TN, AR, TX, NM, AZ, and Mexico; also in Guatemala. [= RAB, C, F, FNA, K, S, W; = P. atropurpurea var. atropurpurea -- G; = P. ×atropurpurea]

Pellaea glabella Mettenius ex Kuhn ssp. glabella, Smooth Cliff-brake. Mt (VA): dry, exposed outcrops of calcareous rocks (limestone, dolostone), rarely on masonry walls (Wieboldt 1995); rare (VA Watch List). May-September. The diploid, sexuallyreproducing $P$. glabella ssp. missouriensis (Gastony) Windham is (so far as is known) restricted to MO; the apogamouslyreproducing autotetraploid derivative, ssp. glabella, is more widespread, ranging from VT, ONT, and MN, south to VA, TN, KY, AR, OK, and n. TX. Two additional taxa (both western) have been variously treated as additional subspecies of $P$. glabella or as two subspecies of $P$. occidentalis (E.E. Nelson) Rydberg. [= FNA, K; = P. glabella var. glabella -- C ; = $P$. atropurpurea var. bushii Mackenzie -- G; < P. glabella -- F, S, W]

Pellaea ternifolia (Cavanilles) Link ssp. arizonica Windham, Arizona Cliff-brake. Pd (SC): on granitic outcrops; rare. A remarkable disjunct from sw. United States and Mexico to w. SC; see Heafner (2001) for additional information. When discovered, it was believed that this was a SC record for P. wrightiana (Platt \& Townsend 1996), but Heafner (2001) has demonstrated that this actually represents $P$. ternifolia ssp. arizonica. [= FNA, K]

* Pellaea viridis (Forsskål) Prantl, Green Cliffbrake. Cp (GA): outcrop of Altamaha Grit; rare, introduced from Africa. This species is naturalized on an Altamaha Grit outcrop in Coffee County, GA (J. Allison, pers. comm.). Various infraspecific taxa have been recognized in the native range. [= K; = Cheilanthes viridis (Forsskål) Swartz]

Pellaea wrightiana Hooker, Wright's Cliff-brake. Pd (NC): south-facing outcrops of Carolina slate or granitic rock with infrequent nutrient-rich seepage; rare (NC Endangered). May-September. OK west to se. CO and sw. UT, south to TX, AZ, and Mexico, with a few, remarkable disjunct occurrences in c. NC. P. wrightiana is apparently a sexually-reproducing allotetraploid derivative of hybridization between $P$. ternata (Cavanilles) Link and P. truncata Goodding. [= RAB, FNA, K]

Pteris Linnaeus 1753 (Brake)
A genus of about 250-300 species, warm temperate and tropical. References: Nauman in FNA (1993b); Tryon, Tryon, \& Kramer in Kramer \& Green (1990).

1 Rachis winged; pinnae (at least the basal ones) with 1-several lobes or pinnules; outline of leaf blade ovate to orbicular, typically nearly as wide as long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. $\boldsymbol{m}$ ultifida
1 Rachis not winged; pinnae strictly simple, without lobes or pinnules; outline of leaf blade lanceolate, typically $3 \times$ or more as long as wide P. vittata

* Pteris multifida Poiret, Spider Brake. Cp, Pd (GA, NC, SC), Mt (GA): old walls with lime mortar; rare, introduced from the Tropics. [= RAB, FNA, K; = Pycnodoria multifida (Poiret) Small -- S]

Pteris vittata Linnaeus, Ladder Brake. Cp (GA, SC): old walls with lime mortar; rare, introduced from China. [= RAB, FNA, K; = Pycnodoria vittata (Linaeus) Small -- S]

## SALVINIACEAE Dumortier 1829 (Floating Fern Family)

A family of a single genus and about 10 species. References: Nauman in FNA (1993b); Schneller in Kramer \& Green (1990).

Salvinia Séguier 1754 (Water Spangles)
A genus of about 10 species, mostly tropical. References: Nauman in FNA (1993b); Lellinger (1985)=Z; Jacono (1999); Schneller in Kramer \& Green (1990).

1 Leaves 5-15 mm long; multicellular hairs of the upper leaf surface with 4 free, spreading branches (use $10 \times$ magnification . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . $S$. minima
1 Leaves to 50 mm long; multicellular hairs of the upper leaf surface with 4 branches joined at their tips, forming a cage-like structure (use $10 \times$ magnification)

* Salvinia minima Baker, Water Spangles. Cp (GA, SC): quiet waters; rare, probably introduced in our area from further south. [= FNA, K, Z; S. auriculata -- S, misapplied]

Salvinia molesta D.S. Mitchell. Cp (NC, SC), Pd (NC), Mt (VA): still waters of farm ponds, calcareous seepage ponds, and other situations; rare, introduced (potentially a serious weed in our area). S. molesta has been found at scattered sites in NC (Brunswick, Carteret, Craven, Cumberland, Duplin, Durham, Johnston, Jones, Lenoir, Mecklenburg, New Hanover, Onslow, Orange, Person, Pitt, Sampson, and Wake counties), SC (Colleton County), and VA (Shenendoah County), where it has been subjected to extermination efforts; it will likely be reintroduced (Anonymous 1999, D. Patterson, pers. comm.). This species is considered a noxious aquatic weed and has been reported from other southeastern states, such as TX and LA (Jacono 1999). Moran \& Smith (1999) support the continued use of the name S. molesta for this species, as opposed to the ambiguous name S. adnata Desvaux. [= FNA, K, Z]

## SCHIZAEACEAE Kaulf. 1827 (Curly-grass Family)

A family of 3-4 genera and about 30 species (depending on circumscription). The Lygodiaceae is often combined with the Schizaeaceae. References: Wagner in FNA (1993b); Kramer in Kramer \& Green (1990).

## Schizaea J.E. Smith 1793 (Curly-grass Fern)

A genus of about 10 species (excluding Actinostachys), mostly tropical. References: Wagner in FNA (1993b); Kramer in Kramer \& Green (1990).

* Schizaea pusilla Pursh, Curly-grass Fern. Cp (NC): moist, peaty soil under Chamaecyparis thyoides; rare, apparently introduced. May-July. In acid, boggy sites in DE, NJ, NY, Newfoundland, Nova Scotia, and New Brunswick; a similar or possibly identical plant is known from Peru. The leaves are filiform, 1-12 cm long. Spores of Schizaea have been identified in Pleistocene organic sediment from Singletary Lake (Bladen County, NC) and Rockyhock Bay (Chowan County, NC) (Whitehead 1963). Its native occurrence in our area as an extant species is plausible. See LeBlond \& Weakley (2002) for further information on this species' occurrence in North Carolina. [= FNA, C, F, G, K]

## SELAGINELLACEAE Willk. 1861 (Spikemoss Family)

A family of a single genus (as currently broadly conceived) and about 700-750 species. References: Valdespino in FNA (1993b); Tryon (1955); Lellinger (1985); Buck (1977); Somers \& Buck (1975); Jermy in Kramer \& Green (1990). Key adapted in part from Valdespino in FNA (1993b).

## Selaginella Palisot de Beauvois 1804 (Spikemoss)

As currently conceived broadly, a genus of about 700-750 species, cosmopolitan, but mostly tropical. It appears likely that Selaginella will likely be subdivided, based on morphology and molecular phylogenetic analyses (Soják 1992; Škoda 1997; Korall, Kenrick, \& Therrien 1999). Selaginellaceae, along with Lycopodiaceae and Isoetaceae, now appear to be only distantly related to other extant pteridophytes and seed plants (Pryer et al. 2001). References: Valdespino in FNA (1993b); Tryon (1955); Lellinger (1985); Buck (1977); Somers \& Buck (1975); Jermy in Kramer \& Green (1990). Key adapted in part from Valdespino in FNA (1993b).

Selaginella acanthonota Underwood, Spiny Spikemoss, Sand Spikemoss. Cp (GA, NC, SC): sandhills, Altamaha Grit glades; uncommon. June-August. S. acanthonota ranges from se. NC south to s. FL, west to panhandle FL. The complex comprising S. acanthonota, S. arenicola, and S. riddellii has been controversial. The complex ranges from se. NC south to s. FL and west to c. TX. S. arenicola Underwood ssp. arenicola is more southern, from n . GA south to s. FL and west to e. panhandle FL. S. arenicola ssp. riddellii (Van Eseltine) R. Tryon occurs in TX, OK, AR, LA, AL, and GA. See Tryon (1955) and Valdespino in FNA (1993b) for additional information on the complex. [= FNA, K; < S. arenicola -- RAB; = S. arenicola Underwood ssp. acanthonota (Underwood) R. Tryon; = Bryodesma acanthonota (Underwood) Škoda]

Selaginella apoda (Linnaeus) Spring, Meadow Spikemoss. Cp, Pd, Mt (GA, NC, SC, VA): seepages, bogs, spray cliffs, stream margins, other moist habitats; common. June-October. S. ME, NY, OH, s. IN, AR, and e. OK south to FL, GA, AL, MS, LA, and e. TX. Often overlooked by vascular plant botanists as a moss or liverwort. S. ludoviciana of the Gulf Coast east to GA, and S. eclipes, more northern, are superficially very similar. [= RAB, C, F, FNA, G, K, W; = Diplostachyum apodum (Linnaeus) Beauvois -S; = Lycopodioides apodum (Linnaeus) Kuntze]

Selaginella arenicola Underwood ssp. arenicola, Sand Spikemoss. Cp (GA): dry sands. E. GA south to s. FL, se. GA, and Panhandle FL. [= FNA, K; = S. arenicola -- S, in the narrow sense; = Bryodesma arenicola (Underwood) Soják]

Selaginella arenicola Underwood ssp. riddellii (Van Eseltine) R.M. Tryon, Riddell Spikemoss. Pd, Cp (GA): dry sands, granite outcrops; uncommon? E. and c. GA west to TX and OK. [= FNA, K; = Bryodesma arenicola (Underwood) Soják ssp. riddellii (Van Eseltine) Škoda]

* Selaginella braunii Baker, Treelet Spikemoss, Braun's Spikemoss. Cp (NC): naturalized around graveyards or gardens; rare, introduced, native of China. [= FNA, K; Lycopodioides]
* Selaginella kraussiana (Kunze) A. Braun, Krauss's Spikemoss, Mat Spikemoss. Cp (GA, NC, SC, VA?): naturalized around gardens or lawns; rare, introduced. [= FNA, K; Lycopodioides]

Selaginella ludoviciana (A. Braun) A. Braun, Gulf Spikemoss, Louisiana Spikemoss. Cp (GA): swamp margins, wet meadows; rare (GA Special Concern). Gulf Coastal Plain from n. FL and sw. GA west to e. LA. [= FNA, K; = Diplostachyon ludovicianum (A. Braun) Small - S ; = Lycopodioides Iudovicianum (A. Braun) Kuntze]

Selaginella rupestris (Linnaeus) Spring, Rock Spikemoss. Pd, Mt (GA, NC, SC, VA): granite flatrocks, other, mostly acidic, rock outcrops, occasionally on greenstone or calcareous shales; common. June-September. S. Greenland and Nova Scotia west to Alberta, south to GA, AL, AR, OK, and NE. Valdespino in FNA (1993b) suggests that two or more cryptic or semicryptic species are present within what is currently called S. rupestris. Additional study is needed. [= RAB, C, F, FNA, G, K, S, W; = Bryodesma rupestre (Linnaeus) J. Sojak]

Selaginella tortipila A. Braun, Twisted-hair Spikemoss. Mt, Pd (GA, NC, SC): rock outcrops, mostly at high elevations; common. July-September. Endemic to the Southern Appalachians (rarely into the Piedmont) of NC, TN, SC, and GA. Occurring close to the VA border; it should be sought there. [= RAB, FNA, K, S, W; = Bryodesma tortipila (A. Braun) J. Sojak]

* Selaginella uncinata (Desv. ex Poir.) Baker, Blue Spikemoss. Cp, Mt (GA): moist forests; rare, introduced from China. Introduced in sw. GA and other places in the Southeastern United States. [= FNA, K; Lycopodioides] \{not yet keyed\}

Selaginella eclipes W.R. Buck, Hidden Meadow Spikemoss, from Québec and Ontario south to NY, OH, KY, AR, and OK, differs from $S$. apoda in having the dorsal leaves with long attenuate apices with a well-developed midrib (vs. with acute apices, or if attenuate, then usually keeled and without a well-developed midrib), and the mature megaspores shiny, the reticulation lax (observed at $40 \times$ ) (vs. dull and closely reticulate). Given its semi-cryptic separation from S. apoda, it could easily be present in our area. \{not keyed\} [= FNA, K; = S. apoda (Linnaeus) Spring ssp. eclipes (W.R. Buck) Škoda; Lycopodioides]

## THELYPTERIDACEAE Pichi Sermolli 1970 (Marsh Fern Family)

A family of 6-30 genera (generic circumscription especially controversial and problematic) and about 900 species. References: Smith in FNA (1993b); Smith \& Cranfill (2002); Lellinger (1985); Mickel (1979); Smith in Kramer \& Green (1990).

1 Leaf blades 7-25 (-30) cm long, triangular, not more than $2 \times$ as long as wide; rachis with adnate wings between the pinnae; sori without indusia; midribs of pinnae lacking an adaxial groove

Phegopteris
1 Leaf blades (15-) 20-100 cm long, lanceolate, oblong-lanceolate, or triangular, more than $2 \times$ as long as wide; rachis without adnate wings between the pinnae; sori with reniform indusia; midribs of pinnae with an adaxial groove (adaxial groove lacking in Macrothelypteris).
2 Midribs of the pinnae lacking an adaxial groove; leaf bipinnate to tripinnate . . . . . . . . . . . . . . . . . . . . . Macrothelypteris
2 Midribs of the pinnae with an adaxial groove; leaf pinnate to pinnate-pinnatifid ......................... Thelypteris

## Macrothelypteris (H. Itô) Ching 1963 (Maiden Fern)

A genus of about 10 species, tropical and subtropical. References: Smith in Kramer \& Green (1990).

* Macrothelypteris torresiana (Gaudichaud-Beaupré) Ching, Mariana Maiden Fern. Cp, Pd (GA, SC): disturbed areas; uncommon (rare in SC), introduced from the Asian and African tropics. Leonard (1972) discusses the history of this species in the southeastern United States. [= FNA, K; = Dryopteris setigera Blume -- S, misapplied; = Thelypteris torresiana (GaudichaudBeaupré) Alston]

## Phegopteris (C. Presl) Fée 1852 (Beech Fern)

A genus of 3 species, north temperate and boreal. References: Smith in Kramer \& Green (1990).

1 Rachis wings absent between the two basal pinna pairs; rachis bearing on its lower surface numerous tan to brown, lanceolate scales (these mostly 6-12 cells wide at the base) and acicular hairs $0.3-1.0 \mathrm{~mm}$ long

Ph. connectilis
1 Rachis wings present between the two basal pinna pairs; rachis bearing on its lower surface relatively few, white to pale tan, narrowly lanceolate scales (these mostly 3-5 cells wide at thebase) and hairs 0.1-0.25 mm long

Ph. hexagonoptera
Phegopteris connectilis (Michaux) Watt, Northern Beech Fern. Mt (NC): moist cliffs where wet by spray from waterfalls (at medium elevations), also on high elevation cliffs wet by seepage and in spruce-fir forests; rare (NC Rare). April-August. A circumboreal species, at its southern limit in North America in NC, TN, IA, MT, and OR. Most of the occurrences in NC are at waterfalls in the escarpment gorges of Transylvania, Macon, and Jackson counties, near Highlands. The Southern Appalachian occurrences are disjunct; the species ranges south to $W V$, and is apparently absent from VA, $n$. NC, and $n$. TN. The species is a triploid, reproducing apogamously. [= FNA, K; = Thelypteris phegopteris (Linnaeus) Slosson -- RAB, C, G, W; = Dryopteris phegopteris (Linnaeus) C. Christensen -- F; = Phegopteris phegopteris (Linnaeus) Keyserling -- S]

Phegopteris hexagonoptera (Michaux) Fée, Broad Beech Fern. Mt, Pd, Cp (GA, NC, SC, VA): mesic to submesic forests; common (uncommon in the Coastal Plain). April-August. Widespread in eastern North America, from Québec west to Ontario, WI, and MN, south to FL and e. TX. [= FNA, K, S; = Thelypteris hexagonoptera (Michaux) Weatherby -- RAB, C, G, W; = Dryopteris hexagonoptera (Michaux) C. Christensen -- F]

## Thelypteris Schmidel 1763 (Maiden Fern, Shield Fern, Marsh Fern)

A genus of about 875 species, cosmopolitan, perhaps warranting separation into various segregates. Thelypteris is a large and rather heterogeneous group, even with the removal of Phegopteris and Macrothelypteris. Our species fall into several subgenera, sometimes treated as genera: subgenus or genus Thelypteris (Th. palustris var. pubescens), subgenus or genus Parathelypteris (Th. noveboracensis, Th. simulata), subgenus Cyclosorus or genus Christella (Th. dentata, Th. hispidula var. versicolor, Th. kunthii, Th. ovata var. ovata), and subgenus or genus Stegnogramma (Th. pilosa var. alabamensis). The appropriate names, should the segregate genera be adopted, are listed in synonymy. References: Smith (1981); Smith in Kramer \& Green (1990).

1 Leaves 5-15 (-20) cm wide; rhizome scales 1-4 mm long, lanceolate to ovate, glabrous, pale brown to golden brown, flexible and very thin.
2 Leaf blade broadest near the middle, gradually reduced to the base, the petiole less than $1 / 3$ the length of the blade; [of upland and wetland habitats]; [subgenus or genus Parathelypteris] . . . . . . . . . . . . . . . . . . . . . . . Th. noveboracensis
2 Leaf blade broadest near the base, the pinnae stopping abruptly, the petiole $2 / 3$ to fully as long as the blade; [of wetland habitats].
3 Undersurface of blades without glands; lateral veins of sterile lobes forked once between the pinnule midvein and the margin; lower surface of costae with tan, ovate scales; lobes of fertile leaves revolute; indusia ciliate (rarely glabrous); [subgenus or genus Thelypteris] Th. palustris var. pubescens
3 Undersurface of blades with minute, sessile, globular, golden to reddish glands; lateral veins of sterile lobes simple, not forked between the pinnule midvein and the margin; lower surface of costae lacking scales; lobes of fertile leaves plane to slightly revolute; indusia with minute glands along the margins; [subgenus or genus Parathelypteris]

Th. simulata
1 Leaves (6-) 10-35 cm wide; rhizome scales 2-6 mm long, linear-lanceolate, usually minutely pilose, yellowish-brown to brown, stiff and rather thick; [subgenus Cyclosorus or genus Christella].
4 Basal veins from adjacent lobes of the pinna uniting below the sinus (between the sinus and the costa), with a united vein continuing to the sinus.
5 Rachises and petioles usually purplish; costae densely short-hairy on the lower surface, the hairs 0-0.1 (-0.2) mm long (about half as long as the costa width); widest point of the leaf usually 3-5 pairs of pinnae up from the base

Th. dentata
5 Rachises and petioles usually tan; costae sparsely hairy on the lower surface, the hairs variable in length, most of them more than 0.3 mm long and at least some more than 0.5 mm long (the longer as long as or longer than the costa width); widest point of the leaf usually 1-3 pairs of pinnae up from the base . . . Th. hispidula var. versicolor
4 Basal veins from adjacent lobes of the pinna not meeting at all, or reaching the sinus at the same point, thus without a united vein to the sinus.
6 Upper surface of the costae and costules glabrous above (rarely minutely hairy, the hairs never exceeding 0.2 mm in length), eglandular . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Th. ovata var. ovata
6 Upper surface of the costae and costules with at least a few stout hairs more than 0.3 mm long; upper leaf surface pubescent to nearly glabrous, also glandular with stipitate glands.
7 Lowermost 1-2 pairs of pinnae distinctly shorter than the pair above (ca. 3/4's as long); basal veins from adjacent lobes of the pinna always meeting . . . . . . . . . . . . . . . . . . . . . . . . . . . Th. hispidula var. versicolor
7 Lowermost pair of pinnae equal to or very slightly shorter than the next pair above; basal veins from adjacent lobes of the pinna not meeting at all, or reaching the sinus at the same point . . . . . . . . . . . . . . . . Th. kunthii

* Thelypteris dentata (Forsskål) E. P. St. John, Downy Maiden Fern. Cp (GA, SC), Pd (GA): disturbed areas; rare, native to tropical and subtropical Asia and Africa. [= FNA, K, S; = Christella dentata (Forsskål) Brownsey \& Jermy]
* Thelypteris hispidula (Decaisne) C.F. Reed var. versicolor (R. St. John) Lellinger, Hairy Maiden Fern. Cp (GA, SC): on soil in disturbed areas; rare. In our area, probably only adventive from further south. [= FNA, K; = Th. versicolor R. St. John -- S; < Christella hispidula (Decaisne) Holttum; = Th. quadrangularis (Fee) Schelpe var. versicolor (R. St. John) A.R. Smith]

Thelypteris kunthii (Desvaux) C.V. Morton, Kunth's Maiden Fern, Southern Shield Fern. Cp (GA, NC, SC), Pd (GA): coquina limestone ("marl') outcrops, calcareous bluffs and sinkhole slopes, also adventive on and around coquina limestone (marl) riprap around small bridges and ditches; rare (in NC, perhaps only recently adventive from further south). May-August. In North America, ranging from se. NC south to FL and west to TX. [= RAB, FNA, K; < Th. normalis (C. Christensen) Moxley -- S; < Christella normalis (C. Christensen) Holttum]

Thelypteris noveboracensis (Linnaeus) Nieuwland, New York Fern. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): mesic forests, bottomland forests, bogs, submesic forests; common. May-August. Newfoundland and WI south to GA, AL, and AR. Distinctive in the leaves tapering about equally both to tip and base. [= RAB, C, FNA, G, K, S, W; = Dryopteris noveboracensis (Linnaeus) A. Gray -- F; = Parathelypteris noveboracensis (Linnaeus) Ching]

Thelypteris ovata R. P. St. John var. ovata, Ovate Maiden Fern. Cp (GA, SC): on coquina limestone ("marl") or in disturbed, calcareous areas; rare (GA Rare). S. SC south to s. FL, west to s. AL; and in the Bahamas. In our area, perhaps only adventive from further south. Var. lindheimeri (C. Christensen) A.R. Smith occurs in TX, Mexico, Belize, Guatemala, and Jamaica. [= FNA, K; > Th. ovata var. ovata - S, in a narrower sense; > Th. ovata var. harperi (C. Christensen) R. P. St. John -- S; = Christella ovata (R.P. St. John) Löve \& Löve]

Thelypteris palustris Schott var. pubescens (Lawson) Fernald, Marsh Fern. Cp, Pd, Mt (GA, NC, SC, VA): bogs, marshes (including freshwater tidal marshes), and bottomland forests; common. June-September. The species is circumboreal, occurring in n . Europe, n . Asia, and n . North America. Var. pubescens is the American variety, ranging from Newfoundland and Manitoba south to FL and TX. [= C, FNA, G, K, W; < Th. palustris -- RAB; = Dryopteris thelypteris (Linnaeus) Swartz var. pubescens (Lawson) A.R. Prince ex Weatherby -- F; < Th. thelypteris (Linnaeus) Nieuwland -- S]

Thelypteris simulata (Davenport) Nieuwland, Bog Fern, Massachusetts Fern. Mt (NC), Cp (VA): in NC in acid peat bogs at about 1000 meters in elevation, in VA in acid seepage swamps in the Coastal Plain; rare (NC Threatened, VA Rare). JulySeptember. Northeastern, ranging from Nova Scotia south to ne. VA (Accomack, New Kent, Northampton and Westmoreland counties) and n. WV (Tucker and Preston counties), and disjunct in NC (Alleghany and Avery counties) and WI. Discovered in NC in the 1980's. Presently known in NC only from two sites. [= C, FNA, G, S, W; = Dryopteris simulata Davenport -- F; = Parathelypteris simulata (Davenport) Holttum]

Thelypteris burksiorum J.E. Watkins \& D.R. Farrar is a narrow endemic of moist sandstone rocks in nc. AL. Watkins \& Farrar (2002) present evidence for its recognition as a species distinct from Thelypteris pilosa. It differs from all our species in having elongate sori (vs. round to slightly oblong), sporangia with minute puberulence (vs. glabrous), and small (less than 20 cm long) evergreen leaf blades. It is in a fourth group (see discussion above), subgenus or genus Stegnogramma. The appropriate combination for its recognition at the species level in Stegnogramma has not been made. [= Thelypteris pilosa (M. Martens \& Galeotti) Crawford var. alabamensis Crawford -- FNA; = Stegnogramma pilosa (M. Martens \& Galeotti) K. Iwatsuki var. alabamensis (Crawford) K. Iwatsuki] \{add to key\}

## VITTARIACEAE (C. Presl) Ching 1940 (Shoestring Fern Family)

A family of about 9 genera and 100 species. References: Crane (1997); Kramer in Kramer \& Green (1990).

Vittaria J.E. Smith 1793 (Shoestring Fern)
A genus of about 50 species, tropics and subtropics. References: Farrar in FNA (1993b); Farrar \& Mickel (1991); Kramer in Kramer \& Green (1990). Key adapted from Farrar in FNA.

1 Sporophytes present, the leaves linear, 10-60 cm long and 1-3 mm wide
V. lineata

1 Gametophytes only present.
2 Gemmae with 2-12 body cells (with at least some present with 2-3 body cells); end cells of gemmae often swollen and larger than the medial cells; rhizoid primordia often absent on 1 or both end cells, seldom present on medial cells; sporophytes apparently not produced
V. appalachiana

2 Gemmae with 4-16 body cells; end cells of gemmae equal to or smaller than the medial cells; rhizoid primordia regularly present on the end cells, as well as on some medial cells; sporophytes frequently produced (and small sporophytes often present in largely gametophytic colonies)
V. lineata

Vittaria appalachiana Farrar \& Mickel, Appalachian Shoestring Fern, "Appalachian Gametophyte." Mt (GA, NC, SC, VA), Pd (NC, VA): shaded grottoes, undersides of overhanging rock outcrops, especially in moist gorges or on spray cliffs in the vicinity of waterfalls, usually on felsic metamorphic rocks, such as mica schist, mica gneiss, granite gneiss, or metaquartzite; rare (NC Watch List, VA Watch List). This reduced species consists of "a branched, ribbon-like thallus one cell in thickness, usually differentiated into basal and upright branches; basal branches attached to the substrate by numerous short, brown rhizoids emanating from marginal and interior cells; upright branches terminating in the production of gemmae" (Farrar \& Mickel 1991). The species is often overlooked or mistaken for a liverwort; it is most often collected by bryologists and hepaticologists, and was first noted in 1824 by von Schweinitz, who considered it a Jungermannia. Southern and Central Appalachians, south of the glacial boundary, from se. PA, sw. NY, and ne. OH south through c. TN and c. KY to n. GA, n. AL, and n. MS (Menapace, Davison, \& Webb 1998). Although this species has been known for some time (often referred to as the "Appalachian Gametophyte"), it was only recently named formally (Farrar \& Mickel 1991). A range of evidence (morphologic, electrophoretic, and developmental) indicates that it is not the
gametophyte of any known Vittaria sporophyte; instead, it is a distinct taxon, reproducing vegetatively by gemmae, having lost the capability of producing sporophytes. For additional information, see Farrar (1974), Farrar (1978), Gastony (1977), Farrar, Parks, \& McAlpin (1983), and Pittillo et al. (1975). [= FNA; = "a branching, ribbon-like gametophyte, with diffuse rhizoids and linear-shaped gemmae only one cell wide, of the genus Vittaria" -- RAB; = "thalloid, irregularly shaped gametophytes of a species of Vittaria" -- C]

Vittaria lineata (Linnaeus) Smith, Shoestring Fern. Cp, Pd (GA): epiphyte on the bark of Sabal palmetto, but the northernmost site (in Lincoln County, GA, adjacent to SC) was on rock; rare. Se. GA and formerly ec. GA south through FL. Sporophytic plants have pendant linear leaves, $1-3 \mathrm{~mm}$ wide and up to 60 cm long. [= FNA, K, S]

## GYMNOSPERMS

The gymnosperms are a likely artificial grouping of about 16 families, about 86 genera, and about 850 species. References: Kramer \& Green (1990).

```
cone with valvate scales ....................... Cunninghamia (CUPRESSACEAE)
```

14 Leaves parallel-sided for most of their length, the apex acute; seeds borne singly in a soft fleshy to leathery aril.
15 Leaves 2.0-7.5 cm long (at least the larger on a branch > 4 cm long) . . . . . . . . . . . ................................... Cephalotaxus (CEPHALOTAXACEAE)
15 Leaves 1.0-3.8 cm long
16 Leaves flexible, the tips pointed but not piercing to the touch; fleshy "cone" ca. 5 mm long, ca. 5 mm in diameter, red when ripe, the seed exposed at the top by a gap in the aril . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Taxus (TAXACEAE)
16 Leaves stiff, the tips piercing to the touch; fleshy "cone" 2.5-3 cm long, ca. 2 cm in diameter, dark green to purple when ripe, seed entirely surrounded by fleshy tissue.

Torreya (TAXACEAE)

## CEPHALOTAXACEAE (Plum-yew Family)

A family of 1 genus and ca. 10 species, trees and shrubs, of e. Asia. References: Farjon (1998); Tripp (1995)=Z; Page in Kramer \& Green (1990).

Cephalotaxus Siebold and Zuccarini ex Endlicher 1842 (Plum-yew)

* Cephalotaxus ? harringtonia (Knight ex J. Forbes) K. Koch, Plum-yew. Pd (NC): suburban woodlands; rarely grown horticulturally, rarely naturalizing in the vicinity of plantings (as in Chapel Hill, Orange County, NC), introduced from Asia. [? Cephalotaxus harringtonia (Knight ex J. Forbes) K. Koch]

## CUPRESSACEAE (Cypress Family)

(including TAXODIACEAE)

A family of about 25-30 genera and about 120 species. Recent studies indicate that the separation of the Taxodiaceae from the Cupressaceae is not warranted, and they are here combined (Gadek et al. 2000; Brunsfeld et al. 1994). The subfamilial classification used here follows Gadek et al. (2000). References: Hart \& Price (1990); Hardin (1971); Watson \& Eckenwalder in FNA (1993b); Page in Kramer \& Green (1990).

## 1 Leaves alternate.

2 Leaves evergreen, rigid, more than 2 cm long, tapering from near the base to a long-acuminate apex; [subfamily Cunninghamioideae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Cunninghamia
2 Leaves deciduous, flexible, less than 2 cm long, parallel-sided, the apex short-acute; [subfamily Taxodioideae] Taxodium 1 Leaves opposite or whorled; [subfamily Cupressoideae].

3 Branchlets not disposed in one plane, thus bushy and not fan-like; plants dioecious, male and female cones on separate plants; mature female cones fleshy and berry-like, with smooth surfaces, indehiscent . . . . . . . . . . . . . . . . . . . . Juniperus
3 Branchlets disposed in one plane, thus flattened and fan-like; plants monoecious, male and female cones on the same plant; mature female cones woody or leathery, with irregular surfaces, dehiscent.
4 Female cones globose and woody, the hard scales peltate, not imbricate; ultimate branchlets (including the scale leaves) about 1 mm broad . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Chamaecyparis
4 Female cones ellipsoid and leathery, the pliable scales basally attached, imbricate; ultimate branchlets (including the scale leaves) about 1.5 mm broad
5 Branchlets flattened in vertical planes; seeds wingless; [planted tree, sometimes persistent] ..... Platycladus 5 Branchlets flattened in horizontal planes; seeds winged; [native tree, but also sometimes planted] . . . . . Thuja

## Chamaecyparis Spach 1841 (White Cedar)

A genus of about 5-8 species, trees, of warm temperate to cool temperate North America and Asia. References: Michener in FNA (1993b); Farjon (1998)=Z; Page in Kramer \& Green (1990).

Chamaecyparis thyoides (Linnaeus) Britton, Sterns, \& Poggenburg, Atlantic White Cedar, Juniper. Cp (GA, NC, SC, VA): peat dome and streamhead pocosins, blackwater stream swamps, hillside seepages, in highly acidic, peaty or sandy soils; uncommon (GA Rare, VA Rare). March-April; October-November. S. ME south to n. FL and west to s. MS. From NJ south it is strictly a tree of the Coastal Plain; northwards it is often found in kettle-hole bogs. In SC and GA, Ch. thyoides is absent in the outer Coastal Plain, occurring primarily in the fall-line Sandhills. A prized timber tree, now much reduced in abundance, formerly used for cabinetry, boat-building, shingles, and other uses. The wood is valuable enough (and resistant enough to rot) to have been mined from bogs in NJ. NC has some of the largest remaining stands of Atlantic White Cedar, in areas of very difficult access, such as the interiors of major peat-domes and large peat-filled Carolina bays. The species is generally known as "juniper" in our area. The genus consists of 6 species -- ours, 2 in w. North America, and 3 in Japan \& Taiwan. [= RAB, C, F, FNA, G, K, S; Ch. thyoides var. thyoides - Z; = Cupressus thyoides Linnaeus]

## Cunninghamia R. Brown 1826 (China-fir)

A genus of 2 species, trees, of e. Asia (China and Taiwan). References: Farjon (1998)=Z; Page in Kramer \& Green (1990).

* Cunninghamia lanceolata (Lambert) Hooker, China-fir. Pd (NC): planted horticulturally; rare, perhaps only persistent, introduced from China. A variety of forms are seen, some with dark-green, others with glaucous-blue foliage. [= K, Z; C. sinensis R. Brown]

## Cupressus Linnaeus (Cypress)

The circumscription of Cupressus may require modification, as it appears that Old World and New World members do not form a monophyletic group; New World members would be placed in a new genus. References: Little et al. (2004).

* Cupressus ×leylandii A.B. Jackson \& Dallimore, Leyland Cypress, is commonly planted as an ornamental tree in our area. It is a hybrid between Cupressus nootkatensis D. Don in Lambert [Chamaecyparis nootkatensis (D. Don in Lambert) Spach; Callitropsis nootkatensis (D.Don in Lambert) Örest.] and Cupressus macrocarpa Hartweg. [= $\times$ Cupressocyparis leylandii (A.B. Jackson \& Dallimore) Dallimore \& A.B. Jackson] \{not yet keyed\}

## Juniperus Linnaeus 1753 (Red Cedar, Juniper, Savin)

A genus of about 60 species, trees and shrubs, of temperate, boreal, and subtropical regions of the Northern Hemisphere. Various species of Juniperus, especially creeping species, are frequently used in landscaping. Molecular studies suggest that section Juniperus (J. communis var. depressa in our area) and section Sabina (J. virginiana in our area) are quite divergent (Adams \& Demeke 1993). Small's (1933) recognition of the genus Sabina may prove to be warranted; some modern authors accept it (especially Europeans) and recent moleclar evidence provides some support. References: Adams in FNA (1993b); Adams (1986); Adams \& Demeke (1993); Adams (1995); Page in Kramer \& Green (1990).

1 Leaves flat-acicular, 5-20 mm long, never scale-like, with a white line on the upper surface; leaves borne in whorls of 3, spreading at 45-90 degrees from the twig; female cone ("berry") axillary, maturing in 2-3 years; [section Juniperus]

1 Leaves primarily scale-like, ca. 1-2 mm long, though acicular and 2-10 mm long on young trees and some lower branches of larger trees, without a white line on the upper surface (though generally somewhat glaucous); leaves of mature twigs borne in opposite pairs of 2 , decussate (thus 4 -ranked), appressed to the twig (leaves of immature twigs sometimes in whorls of 3 , spreading at 10-45 degrees from the twig); female cones ("berries") terminal on short branches, maturing the first year; [section Sabina].
2 Female cones ("berries") 3-4 mm long; terminal twigs $0.75-0.90 \mathrm{~mm}$ wide (including the scale-like leaves); scale leaves 1.20-1.45 mm long, obtuse to acute; trees generally with rounded crowns, the lower branches often drooping. J. virginiana var. silicicola

2 Female cones ("berries") 4-7 mm long; terminal twigs $0.85-1.00 \mathrm{~mm}$ wide (including the scale-like leaves); scale leaves $1.40-1.65 \mathrm{~mm}$ long, acute; trees generally with sharply tapered crowns, the lower branches generally ascending
J. virginiana var. virginiana

Juniperus communis Linnaeus var. depressa Pursh, Ground Juniper, Mountain Juniper, Common Juniper. Mt (NC, SC, VA), Pd (GA, NC, VA), Cp (SC, VA): in thin soil around rock outcrops on mountain summits and Piedmont monadnocks and rocky bluffs (in GA and NC), high elevation old fields (in VA), xeric Coastal plain sandhills (in SC and VA); rare (GA Special Concern, NC Rare, SC Rare, VA Rare). March-April; fleshy cone maturing in second or third year. This species is circumpolar, widespread in $n$. North America, $n$. Europe, and $n$. Asia. In North America it is primarily northern and montane, occurring nearly throughout Canada and AK, south in the Appalachians to $n$. GA, south in the Rocky Mountains to NM, AZ, and CA. Its berry is the juniper berry used as a spice, as well as the main flavoring of gin. It is sometimes planted as a landscaping plant. In e. North America, it is rare and scattered south of PA, MI, and WI, ranging south to a few disjunct sites in VA, NC, SC, GA, and s. IN. As a native species, it is very rare in the Southeast; in NC known only from a few sites, notably Mount Satulah (Macon County) and King's Pinnacle (Gaston County). In SC, a notable population occurs in sandy soils in Aiken County (Hitchcock Woods). Definitely in our area is var. depressa, a decumbent shrub, up to about 1 meter high, forming large clonal patches. Harvill et al. (1992) report scattered sites for var. communis in montane VA; these are based on columnar trees. Adams in FNA (1993b) considers var. depressa to be the only variety occurring in e. United States, and states that var. depressa sometimes forms columnar trees to 10 m tall; such individuals may be the basis of reports of var. communis from our area. Additional problems about the status of Juniperus communis in our area remain unresolved; variation in growth form, morphologic characters, and habitat suggest the possibility of the presence of several native taxa. See Coker \& Totten (1945) for additional discussion. [= RAB, C, F, FNA, G, K, W; J. sibirica Burgsdorff -- S]

Juniperus virginiana Linnaeus var. silicicola (Small) E. Murray, Southern Red Cedar, Coastal Red Cedar. Cp (GA, NC, SC, VA?): maritime forests and scrub, hammocks, coastal shell middens and natural shell deposits, brackish marshes, and other sandy or peaty, circumneutral situations; common. January-February; October-November. Var. silicicola ranges from e. NC south to s. FL, and possibly west to MS. Many recent authors have treated this taxon as a species, but Adams (1986) and Adams in FNA (1993b) consider varietal status more appropriate; Adams (1995) suggests that the two may have diverged as recently as the Pleistocene. The two varieties are said to intergrade in GA. Large individuals can be as much as a meter in diameter. [= FNA, K; = Juniperus silicicola (Small) Bailey -- RAB; = Sabina silicicola Small -- S; = Juniperus virginiana ssp. silicicola (Small) J. Silba]

Juniperus virginiana Linnaeus var. virginiana, Eastern Red Cedar. Pd, Mt, Cp (GA, NC, SC, VA): in a wide variety of
forests, pastures, old fields, roadsides, and fencerows, primarily upland, occurring most abundantly on on circumneutral soils (including shrink-swell clays), derived from mafic or calcareous rocks; common (especially in the Piedmont). January-March; October-November. Var. virginiana ranges throughout e. United States. The wood is much used for fenceposts and the traditional southern cedar chest (which takes advantage of the moth-deterrent properties of cedar wood). [= C, F, FNA, G, K; = Juniperus virginiana -- RAB, W; = Sabina virginiana (Linnaeus) Antoine -- S]

## Platycladus Spach 1842 (Chinese Arborvitae)

A monotypic genus, a tree, of e. Asia (n. China and Manchuria). Platycladus is distinct from Thuja. References: Watson \& Eckenwalder in FNA (1993); Page in Kramer \& Green (1990).

* Platycladus orientalis (Linnaeus) Franco, Oriental Arborvitae, Tree-of-life. Cp, Mt (NC): commonly planted, especially in graveyards, and rarely persisting and spreading to pastures, fields, and roadsides; rare, introduced from Asia. [= FNA, K; = Biota orientalis (Linnaeus) Endlicher -- S; = Thuja orientalis Linnaeus]

## Taxodium L.C. Richard 1810 (Bald-cypress)

A genus of 3 species, trees, of e. North America and Mexico. There has been much debate over whether the two taxa of Taxodium in our area should be treated as species or varieties, and if as varieties, the proper nomenclature. I agree with Godfrey (1988), in his preference "to recognize two species ... because it is my perception that the vast majority of trees (populations) are thus distinguishable." At least in our area, true intermediates appear to be non-existent, though the "mimicry" of the two species creates "pseudo-intermediates" that can cause difficulties in identification. Occasionally, the two species can be seen growing together, in "hybrid habitats," as at the junction of Lake Waccamaw and the Waccamaw River (Columbus County, NC); there are no intermediates, and with both species present for comparison, even juvenile trees are readily identifiable. Neufeld (1986) discusses the different architecture and ecophysiology of the two species. The only other species in the genus is T. mucronatum Tenore, ranging from s. TX south to Mexico and Guatemala. West of the Mississippi River, the architecture of $T$. distichum comes to resemble that of $T$. mucronatum, suggesting the possibility of introgression. For this and other reasons, Watson in FNA (1993b) and other authors prefer to treat $T$. mucronatum as a third variety of $T$. distichum, T. distichum var. mexicanum Gordon. Taxodium is most closely related to Glyptostrobus and Cryptomeris. References: Godfrey (1988)=Z; Duncan and Duncan (1988); Watson in FNA (1993b); Page in Kramer \& Green (1990). Key adapted from Z.

1 Larger knees short, rarely more than 4 dm tall, usually columnar or broad and mound-like, with thick, compact bark on top; leafy branchlets ascending from the twigs, secundly erect (the base often curving, the apical portion of the branchlet borne in a vertical plane), except on juvenile trees (which mimic $T$. distichum); leaves subulate, spirally arranged, not spreading laterally and featherlike (except on juvemile trees), ascending or appressed; leaves mostly 3-10 mm long (to 15 mm long on juvenile trees); bark thick (1-2.5 cm thick), furrowed, dark-brown, not exfoliating;[trees of isolated depressions (clay-based Carolina bays, depression ponds), wet savannas, pocosins and other wet peaty habitats, and, less commonly, blackwater swamps and natural lakes] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . T. ascendens
1 Larger knees often tall, often over 4 dm tall, usually narrowly conical, with thin, shreddy bark on top; leafy branchlets spreading laterally from the twigs, except in the crowns of mature trees (which mimic $T$. ascendens); leaves linear, flat, spirally arranged but by twisting of their basal portions spreading laterally and featherlike (pseudodistichous), appressed only on drooping branches of the crown, if at all; leaves mostly $8-20 \mathrm{~mm}$ long (sometimes less on crown branches); bark thin (less than 1 cm thick), exfoliating in shreddy, orange-brown strips; [trees of brownwater swamp forests, blackwater swamp forests, natural lakes, and millponds]
T. distichum

Taxodium ascendens Brongniart, Pond-cypress. Cp (GA, NC, SC, VA?): limesink ponds (dolines), clay-based Carolina bays, wet savannas, pocosins and other wet, peaty habitats, shores of natural blackwater lakes, swamps of blackwater streams; common. March-April; October. E. NC (or se. VA) south to s. FL, west to e. LA; it is surely one of the most scenic trees of eastern North America. Material resembling $T$. ascendens occurs in se. VA; its taxonomic status is uncertain. [= RAB, G, K, S, Z; < T. distichum -- F; = T. distichum var. imbricarium (Nuttall) Croom -- FNA; = T. distichum var. nutans (Aiton) Sweet]

Taxodium distichum (Linnaeus) L.C. Richard, Bald-cypress. Cp (GA, NC, SC, VA), Pd* (NC): brownwater and blackwater swamps, usually in riverine situations; common. March-April; October. DE and e. MD south to FL and west to e. TX and se. OK, north along the Mississippi River and its tributaries to s. IN and s. IL. This species is sometimes planted as an ornamental in upland sites. [= RAB, G, K, S, Z; = T. distichum var. distichum -- C, FNA; <T. distichum -- F (see also $T$. ascendens)]

Thuja Linnaeus 1753 (Arborvitae)
A genus of 5 species, trees, of e. North America, w. North America, and e. Asia. References: Chambers in FNA (1993b); Page in Kramer \& Green (1990).

Thuja occidentalis Linnaeus, American Arborvitae, Northern White Cedar, Flat Cedar. Mt (NC?, VA), Pd (VA): dry limestone, dolostone, and calcareous sandstone cliffs, talus, and bouldefields, rarely in our area in calcareous swamps, also planted and persisting around old homesites and cemeteries (mainly in the Mountains); uncommon (rare in VA Piedmont, rare in NC, where perhaps only introduced). March-April. Nova Scotia, Hudson Bay, and Manitoba south to PA (where considered strictly introduced by Rhoads \& Klein 1993), OH, n. IN, n. IL, and in the mountains to WV, w. VA, and e. TN. This species is alleged by various

Flora of the Carolinas, Virginia, and Georgia, Working Draft of 10 June 2005 -- GINKGOACEAE
authors to have occurred as a native species in nw. NC on limestone bluffs in Alleghany, Ashe, and/or Burke counties, but it has not been relocated in this century, and little apparently suitable habitat occurs in NC. [= RAB, C, F, FNA, G, K, S, W]

## GINKGOACEAE Engler in Engler \& Prantl 1897 (Ginkgo Family)

A family of a single genus and single species, a tree, native of China. Ginkgo has no close living relatives. References: Whetstone in FNA (1993b); Page in Kramer \& Green (1990).

## Ginkgo Linnaeus 1771 (Ginkgo, Maidenhair Tree)

A monotypic genus, a tree, native of China. Ginkgo is famous as a "living fossil," known from fossils nearly 200 million years old which are nearly identical to modern plants; it may be extinct as a native plant. References: Whetstone in FNA (1993b); Page in Kramer \& Green (1990).

* Ginkgo biloba Linnaeus, Ginkgo, Maidenhair Tree. Pd, Mt (NC): frequently planted, rarely escaped to suburban woodlands and yards; rare, native to se. China. As pointed out by Whetstone in FNA (1993b), Ginkgo is only weakly naturalized. [= C, FNA, K]

## PINACEAE (Pine Family)

A family of about 12 genera and about 220 species, trees and shrubs, almost exclusively in the Northern Hemisphere. References: Thieret in FNA (1993b); Price (1989)=Z; Page in Kramer \& Green (1990).

1 Leaves flat and linear; [subfamily Abietoideae].
2 Leaves attached directly to twig; cones 4-5 cm long, erect . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Abies
2 Leaves jointed, on short, persistent base; cones 1-3.8 cm long, pendant . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Tsuga 1 Leaves needle-like, angular rather than flat in cross-section

3 Leaves borne singly, 4-sided; [subfamily Abietoideae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Picea
3 Leaves either borne on short spur-shoots or in fascicles of 2-5, rounded to somewhat flattened in cross-section, but not 4 -sided.
4 Leaves evergreen, more than 3 cm long, borne in fascicles of 2-5; [subfamily Pinoideae] . . . . . . . . . . . . . . . . . Pinus 4 Leaves deciduous or evergreen, less than 3 cm long, borne on short spur-shoots; [subfamily Laricoideae].

5 Leaves evergreen; cones 6-12 cm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Cedrus
5 Leaves deciduous; cones 1-2 cm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Larix

## Abies P. Miller 1754 (Fir)

A genus of about 40-50 species, trees, of temperate regions of the Northern Hemisphere, south to Central America. Our 2 native species and other non-natives are grown as ornamentals, especially in the mountains. References: Hunt in FNA (1993b); Liu (1971) $=$ Y; Page in Kramer \& Green (1990).

1 Cones 10-15 cm long; [section Abies] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. alba
1 Cones 3.5-8 cm long; [section Balsameae].
2 Bracts of the mature cones shorter than the scales or slightly exserted beyond the scales; stomatal rows (4-) 7 (-8) on each side of the midvein on the lower leaf surface (visible at $10 \times$ ); [plant of the Central Appalachians and north, from Page and Madison counties, VA, northwards].
A. balsamea

2 Bracts of the mature cones longer than the scales and reflexed; stomatal rows (8-) 10 (-12) on each side of the midvein on the lower leaf surface (visible at $10 \times$ ); [plant of the Southern Appalachians, from Grayson and Smyth counties, VA, southwards]
A. fraseri

* Abies alba P. Miller, European Fir, Silver Fir. Mt (NC): naturalized in Highlands, NC (Macon Co.), from plantings made by Harbison in the late 1800's (J.D. Pittillo, pers. comm.); rare. May; October. [= Y]

Abies balsamea (Linnaeus) P. Miller, Balsam Fir, Northern Balsam. Mt (VA): high elevation forests and cliffs; rare (VA Rare). April-May. Newfoundland and Labrador west to n. Alberta, south to NY, PA, MI, WI, and IA, and (disjunct) in the mountains to n. VA (known in our area as a native only from Page and Madison counties, VA). There has been considerable debate over the taxonomic status of some, especially southern, populations of A. balsamea, which show some transition in characters towards $A$. fraseri, and have been variously treated as A. intermedia Fulling, A. balsamea var. phanerolepis Fernald, or A. ×phanerolepis (Fernald) Liu. Variation in e. North American Abies is somewhat clinal, with the greatest geographical and morphological discontinuity between $n$. VA and s. VA. It seems best, therefore, to recognize A. fraseri as a species and A. balsamea as a species including the clinal var. phanerolepis. The balsam woolly adelgid is afflicting this species in Shenandoah National Park. [= C, FNA, K, W, Y, Z; <A. balsamea var. balsamea - F, G; < A. balsamea var. phanerolepis Fernald -- F, G; < A. ×phanerolepis (Fernald) Liu - Y; <A. intermedia Fulling]

Abies fraseri (Pursh) Poiret, Fraser Fir, She Balsam, Southern Balsam. Mt (*GA, NC, VA): high elevation forests, from about 1500-2037m; uncommon (US Species of Concern, NC Rare, VA Rare). May-June; September-November. Southern Appalachian endemic, from Grayson and Smyth counties, VA (notably, Mount Rogers) south to e. TN and sw. NC. This species is threatened as a native species by a virulent alien pest, the balsam woolly adelgid, and environmental damage caused by pollution. Populations on

Mt. Rogers and, to a lesser extent, Roan and Grandfather mountains, appear to be relatively healthy. A. fraseri is closely related to the northern Balsam Fir, A. balsamea, and may be a relatively recent derivative of it. During the 1970's and 1980's, the cultivation of Fraser Fir Christmas trees became an important part of the economy of the North Carolina mountains. Most Christmas tree plantations are at $1000-1500 \mathrm{~m}$ in elevation; below 1000 m , Fraser Fir is very susceptible to a fungal root rot (Phytophthora), above 1500 m it grows too slowly to be profitable and is often "flagged" by winds, ruining its shape for commercial purposes. [= RAB, C, F, FNA, G, K, S, W, Y, Z]

## Cedrus Trew 1757 (Cedar)

A genus of 2-4 species, trees, native to $n$. Africa to Asia. References: Page in Kramer \& Green (1990).

* Cedrus deodara (Roxburgh ex D. Don) G. Don, Deodar Cedar. Pd, Cp (NC, SC): frequently planted, rarely escaped to suburban woodlands; rare. [= K]

## Larix P. Miller 1754 (Larch)

A genus of about 10 species, trees, of cold temperate and boreal regions of the Northern Hemisphere. References: Parker in FNA (1993b); Page in Kramer \& Green (1990).

1 Leaves 2.5-3 cm long; cones 2-3.5 cm long; [alien species rarely planted] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . L. decidua
1 Leaves 1-2.5 cm long; cones 1.2-2 cm long; [native species south to MD and WV] . . . . . . . . . . ................ [L. laricina]

* Larix decidua P. Miller, European Larch. Mt (NC): forests; rare, introduced from Europe. Planted as an ornamental and experimentally as a forest tree, persisting and sometimes escaping in the high mountains of NC. [= F, K]

Larix laricina (Du Roi) K. Koch, Eastern Larch or Tamarack, ranges south in bogs and swamps to Garrett County, MD and Preston County, WV. [= FNA, C, F, G, K]

Picea A. Dietrich 1824 (Spruce)

A genus of about 40 species, trees, of cool temperate and boreal parts of the Northern Hemisphere. References: Taylor in FNA (1993b); Page in Kramer \& Green (1990).

1 Cones 10-16 cm long; upper branches spreading to ascending, the lower drooping; outer bud scales without hairlike projections; [plant an alien, but widely planted as an ornamental and sometimes as an experimental timber plantation tree] ...
$\qquad$
1 Cones 1.5-4.5 cm long; upper branches ascending, the lower spreading; outer bud scales prolonged into minute hairlike projections; [plant native].
2 Cones 1.5-2.5 cm long, gray at maturity, long-persistent . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [P. mariana]
2 Cones 2.5-4.5 cm long, red-brown at maturity, short-persistent . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. rubens

* Picea abies (Linnaeus) H. Karsten, Norway Spruce. Mt (NC, VA): persisting and escaping from forestry plantations at moderate or high elevations, notably in Great Smoky Mountains National Park (Kephart Prong), Mount Mitchell State Park, and the Biltmore Estate; rare, introduced from n. Europe. [= FNA, K]

Picea rubens Sargent, Red Spruce, He Balsam. Mt (NC, VA): common to dominant in spruce and spruce-fir forests at high elevations, scattered in northern hardwood forests, heath balds, boulderfield forests, ridges, and rarely coves, also in bogs or swampy forests at lower elevations (down to about 1000m), ranging in moisture tolerance from dry ridges (though these are often fog-bathed) to saturated peats; uncommon. May-June; October. Nova Scotia and New Brunswick south (interruptedly) to w. NC and e. TN. Hardin (1971) discusses the existence of southern populations of $P$. rubens growing in bogs (notably Long Hope Valley, Ashe and Watauga counties, NC and Pineola Bog, Avery County, NC) with shorter than normal leaves ( $8-10 \mathrm{~mm}$ long vs. 12-15 mm long). He suggests that "this may be ecotypic, but one wonders whether the short leaves and bog habitat might reflect a few Black Spruce genes that have persisted since the Pleistocene." Further study with modern electrophoretic and molecular techniques seems warranted. [= RAB, C, F, FNA, G, K, S, W, Z; > P. australis Small -- S]

* Picea mariana (P. Miller) Britton, Sterns, \& Poggenburg, Black Spruce, ranges south to s. PA. It has also been reported from bogs in our area: for NC (Small 1933) and for VA (Fernald 1950). These reports are apparently based on misidentifications of short-leaved, bog-inhabiting populations of $P$. rubens (see discussion under $P$. rubens). [= C, F, FNA, G; > $P$. mariana var. mariana -K]

Pinus Linnaeus 1753 (Pine)

A genus of about 110 species, trees, of the Northern Hemisphere, south to Central America. References: Kral in FNA (1993b); Duncan \& Duncan (1988); Gernandt et al. (2005); Price, Liston, \& Strauss (1998); Richardson (1998); Page in Kramer \& Green (1990).

Identification notes: Young saplings generally have shorter needles than larger saplings and mature trees; measurements in the key are those of mature trees.

## Main Key

Needles 5 in each bundle; each needle with 1 vascular bundle; [subgenus Strobus, section
1 Needles $2-3(-4)$ in each bundle; each needle with 2 vascular bundles; [subgenus Pinus].
2 Bracts and bud scales fimbriate; sheath more than 1.3 cm long; needles $20-50 \mathrm{~cm}$ long, in bundles of 3 ( -4 ); twigs about 1 cm in diameter; [subgenus Pinus, section Trifoliae, subsection Australes] . . . . . . . . . . . . . . . . . . . . . . . . . . . P. palustris
2 Bracts and bud scales entire or edged with hairs, but not fimbriate; sheath less than 1.5 cm long; needles (2-) 3-30 cm long, in bundles of 2-4; twigs less than 1 cm in diameter.
3 Needles in bundles of 3 , or 2 and 3 , or 3 and 4 (predominantly or at least substantially in 3 's); [subgenus Pinus, section Trifoliae, subsection Australes]
4 Needles in bundles of 2 and 3
5 Needles 3-7 cm long; prickles on cones $3-8 \mathrm{~mm}$ long, stout (more than 1 mm wide at base of prickle)
$P$. pungens
5 Needles 5-30 cm long; prickles on cones 1-3 mm long, slender (less than 1 mm wide at base of prickle).
6 Needles 17-30 cm long; cones (6) 12-15 cm long . . . . . . . . . . . . . . . . . . . . . . P. elliottii var. elliottii
6 Needles 5-12 cm long; cones 4-7 cm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. echinata
4 Needles in bundles of 3 (rarely with a few 2 's), or 3 and 4.
7 Cones distinctly longer than broad when open or closed, 5-13 cm long; needles mostly (10-) 12-23 (-28) cm long, $0.7-1.5 \mathrm{~mm}$ wide; buds not resinous (or only slightly so); trunks not producing adventitious sprouts (epicormic sprouting) P. taeda

7 Cones about as broad as long, 3-6 cm long; needles (4-) 7-16 (-20) cm long, 1.5-2.0 mm wide; buds resinous; trunks commonly producing adventitious sprouts (epicormic sprouting), especially in response to fire.
8 Needles (10-) 16-20 (-21) cm long, persisting 3-4 years; cones serotinous; [trees of pocosins, savannas, and other wetlands of the Coastal Pain] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. serotina
8 Needles (4-) 7-10 (-15) cm long, persisting only 2 years; cones opening at maturity, not serotinous; [trees of ridges, slopes, bottomlands, and bogs of the Mountains and Piedmont] . . . . . . . . P. rigida 3 Needles in bundles of 2 only.

## 9 Needles stout, 1.3-2 mm wide.

10 Leaves 7-15 cm long; cones 4-6 cm long, each scale bearing a small depressed mucro; [introduced tree, usually planted only on Coastal Plain barrier islands]; [subgenus Pinus, section Pinus, subsection Pinus] .
$P$. thunbergiana
10 Leaves 3-6 (-8) cm long; cones either 6-9 cm long with each scale bearing a stout, woody spine, or 3-6 cm long, unarmed; [native tree of the Mountains and upper Piedmont or introduced tree south to MD and WV]. 11 Cones 6-9 cm long with each scale bearing a stout, woody spine; [native tree of the Mountains and upper Piedmont; [subgenus Pinus, section Trifoliae, subsection Australes] . . . . . . . . . P. pungens 11 Cones $3-6 \mathrm{~cm}$ long, unarmed; [introduced tree south to MD and WV][subgenus Pinus, section Pinus, subsection Pinus]
[P. sylvestris]
9 Needles slender to somewhat stout, $0.5-1.2 \mathrm{~mm}$ wide.
12 Needles $15-25 \mathrm{~cm}$ long; [trees naturalized on barrier islands]; [subgenus Pinus, section Pinus, subsection Pinaster]
P. pinaster

12 Needles 2-17 cm long; [trees generally elsewhere].
13 Needles $10-17 \mathrm{~cm}$ long; branches brittle; spring shoots with a single node, with 1 whorl of branches; [trees of the north, sometimes planted in our mountains]; [subgenus Pinus, section Pinus, subsection Pinus] . $\qquad$ P. resinosa

13 Needles 2-13 cm long; branches flexible; spring shoots usually with several nodes (several whorls of branches); [trees of various habitats].
14 Needles 2-8 cm long, generally twisted; cones opening at maturity, not serotinous, the scales bearing prominent, slender prickles 2-5 mm long; [subgenus Pinus, section Trifoliae, subsection Contortae]
$P$. virginiana
14 Needles 5-13 cm long, twisted or not; cones opening at maturity or serotinous, the scales bearing prominent, short, stout prickles or minute, deciduous prickles, and also with a faint to conspicuous horizontal ridge.
15 Anthers yellow; bark tight, closely ridged, not sloughing off, reminiscent of a hardwood; [native trees of mesic to fairly wet, fertile soils]; [subgenus Pinus, section Trifoliae, subsection Australes]
P. glabra

15 Anthers dark orange; bark flaky, the laminated layers sloughing off in a manner typical of a pine; [non-native (in our immediate area) trees of xeric sands]; [subgenus Pinus, section Trifoliae, subsection Contortae]
P. clausa

## Auxiliary Key to common pines of the Piedmont

1 Needles 12-25 cm long, predominantly in bundles of 3; winter buds more than 1 cm long; cones 6-15 cm long, falling soon after releasing seed; bark plates thick, without crater-like blisters

1 Needles 2-13 cm long, predominantly in bundles of 2; winter buds less than 1 cm long; cones 3-7 cm long, persisting on trees for several years after releasing seed; bark plates thin, with or without crater-like blisters.
2 Needles 7-13 cm long, not twisted, or slightly so, in bundles of 2 (usually with some in bundles of 3), rather slender, less than 1.0 mm wide; bark plates mostly more than 4 cm wide, with crater-like blisters ca. 1 mm in diameter; winter buds not very resinous; $3-4$ year-old twigs rough and flaking . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. echinata
2 Needles 2-8 cm long, typically twisted, in bundles of 2, rather stout, often 1.0-1.2 mm wide; bark plates mostly about 2 cm wide, without crater-like blisters; winter buds very resinous; 3-4 year-old twigs smoothish to rough, but not flaking
$P$ virginiana
Pinus clausa (Chapman ex Engelmann) Vasey ex Sargent, Sand Pine. Cp (GA, *NC): persisting after experimental planting in plantations; rare, native to Florida. P. clausa is closely related to P. virginiana, the northeastern North American P. banksiana, and the northwestern North American P. contorta complex. [= FNA, K, S, Z]

Pinus echinata P. Miller, Shortleaf Pine, Rosemary Pine, Yellow Pine. Pd, Mt, Cp (GA, NC, SC, VA): dry rocky ridges and slopes, sandhills, old fields, forests, generally in rather xeric sites, but also occurring in mesic to even wet sites; common. March-April; September-October. Widespread in se. North America, north to s. NY, NJ, s. PA, s. OH, s. IL, s. MO, and e. OK, perhaps reaching its greatest importance in dry, sandstone landscapes, such as the Cumberland Plateau of WV, KY, TN, and AL, and the Ozarks and Ouachitas of AR, MO, and OK. [= RAB, C, F, FNA, G, K, S, W, Z]

Pinus elliottii Engelmann var. elliottii, Slash Pine. Cp (GA, NC*, SC): native in wet pine flatwoods and maritime forests in SC, extensively planted in SC and NC in silvicultural plantations on a wide variety of soils, many of them unsuitable for its successful growth; common. January-February; October-November. P. elliottii var. elliottii ranges from e. SC south to c. peninsular FL, west to e. LA; var. densa Little \& Dorman is restricted to c. and s. peninsular FL. P. elliottii var. densa is perhaps better treated as a full species, Pinus densa (Little \& Dorman) de Laubenfels \& Silba. P. elliottii var. elliottii has been extensively planted throughout the Coastal Plain of NC and SC, where it now occupies tens of thousands of hectares. Superficially, $P$. elliottii resembles both $P$. palustris and $P$. taeda, with cone size and needle length intermediate. P. elliottii var. elliottii is sometimes difficult to tell from $P$. taeda; additional helpful characteristics are the seed cones on $1.5-3 \mathrm{~cm}$ long stalks (vs. essentially sessile), seed cones reddishbrown and glossy, appearing varnished (vs. brown and dull), needles thicker and a dark glossy green (vs. thinner and a yellowish green); bark prominently flaking off and revealing reddish patches (vs. not notably flaking off and revealing reddish patches). [= FNA, K, Z; < P. elliottii -- RAB; P. caribaea Morelet -- S in part, misapplied; $P$. palustris P . Miller -- S in part, misapplied; $P$. heterophylla -- S]

Pinus glabra Walter, Spruce Pine, Walter's Pine. Cp (GA, SC): bottomland forests, rich, moist soils; common, uncommon in SC. March-April; September-October. SC south to $n$. FL and west to se. LA. This pine is unusual in growing in moist (even infrequently flooded), fertile habitats, usually mixed with bottomland hardwoods, and apparently rather shade tolerant, sometimes growing as an understory tree. [= RAB, FNA, K, S, Z]

Pinus palustris P. Miller, Longleaf Pine, Southern Pine. Cp, Pd (GA, NC, SC, VA), Mt (GA): formerly throughout the Coastal Plain, Sandhills, and lower Piedmont, on a wide variety of soils (sandy, loamy, clayey, or peaty), from very dry to very wet conditions, in savannas, woodlands, and forests affected by relatively frequent natural (lightning caused) fires (likely augmented augmented by native Americans), now reduced to less than a tenth of its former abundance by a variety of forces, including turpentining, timbering, free-range hogs, fire suppression, and "site conversion" by foresters to other trees, now extremely rare in VA and north of the Neuse River in NC, still occurring in some abundance in the outer Coastal Plain from Carteret County, NC south into GA, in the Bladen Lakes area of Bladen and Cumberland counties, and in the Sandhills of Harnett, Hoke, Scotland, Richmond, Moore, Anson, and Montgomery counties, NC and south into GA; common (locally) (VA Rare). March-April; September-October. A Southeastern Coastal Plain endemic: se. VA south to FL and west to se. TX; it extends slightly into the Piedmont in most states where it occurs, and further into the Piedmont and low mountains in GA and AL. "The species has been heavily exploited for timber and turpentine production, and it has been estimated that by 1930 only ten percent of its original volume of timber remained" (Price 1989); certainly much less now remains. Longleaf Pine is the state tree of NC. A hybrid with P. taeda, P. $\times$ sondereggeri H.H. Chapman, occurs. [= RAB, C, FNA, K; = P. australis Michaux f. -- F, G, S]

Pinus pinaster Aiton, Maritime Pine, Cluster Pine. Cp (NC): planted and naturalized on barrier islands; rare, introduced from Mediterranean Europe. P. pinaster is reported by Brown (1959) to be "introduced from Mediterranean region and planted on sandflats in vicinity of Corolla, Currituck Banks, Bodie and Hatteras Island 1936-1940.... Now producing seeds and becoming naturalized near Cape Hatteras Lighthouse. More resistant to salt spray than native pines" (Brown 1959). Graetz (1973) discusses its use on the Outer Banks and concludes that it is "not as well adapted to inclement beach conditions as Japanese black pine." P. pinaster is conspicuous just south of Nags Head on NC 12 (Dare County, NC), further south at Bodie Island Lighthouse (Dare County, NC), on Ocracoke Island (Hyde County, NC), and elsewhere. It has needles in 2's, (10-) 15-20 (-25) cm long. [= K]

Pinus pungens Lambert, Table Mountain Pine, Burr Pine, Hickory Pine. Mt (GA, NC, SC, VA), Pd (NC, SC, VA): dry ridges, cliffs, shale barrens, usually requiring fire for its reproduction, occurring at least up to 5000 feet in elevation; common (rare in Coastal Plain). May; September-October. A Central and Southern Appalachian endemic: n. NJ, through se. PA, w. MD, WV, w. VA, w. NC, and e. TN to nw. SC and ne. GA. [= RAB, F, FNA, G, K, S, W, Z]

Pinus resinosa Aiton, Red Pine. Mt (NC, VA): in pine plantations, and persisting after silvicultural planting; rare. This species is native as far south as WV (Pendleton and Hardy counties) and PA (Luzerne, Wyoming, Tioga, and Centre counties). [=C, F, FNA, G, K]

Pinus rigida P. Miller, Pitch Pine. Mt (GA, NC, SC, VA), Pd (NC, SC, VA), Cp (VA): primarily on dry ridges, more or less requiring fire for its reproduction, less commonly in peat soils of mountain bogs (and then often at elevations of 800-1000 m) and also scattered through a variety of forest types; uncommon (rare in Coastal Plain of VA). May; September-October. S. Canada and s. ME south to n . GA. It is abundant near sea level in the Pine Barrens of NJ , but in NC is limited to the mountains and upper Piedmont; it is replaced in Coastal Plain fire-maintained wetland communities by the related Pinus serotina. [= RAB, C, F, FNA, G, $\mathrm{K}, \mathrm{S}, \mathrm{W}, \mathrm{Z}$; $=P$. rigida ssp. rigida]

Pinus serotina Michaux, Pocosin Pine, Pond Pine, Marsh Pine. Cp (GA, NC, SC, VA), Pd (NC, SC, VA): peaty soils of pocosins, swamps of small blackwater streams; common, rare in Piedmont. April; August (or at any time of year in response to fire). A Southeastern Coastal Plain endemic: s. NJ south to n . FL and se. AL, restricted to the Coastal Plain. A remarkable tree,
well-adapted to fire by its serotinous cones and its ability to resprout needles from the branches, trunk ("epicormic sprouting"), or roots following fire. Extensive areas of peatland in the outer Coastal Plain are dominated by P. serotina, sometimes codominant with Gordonia lasianthus. Following fires which destroy all branches but do not kill the trees, epicormic sprouting results in entire forests of odd-looking cylindrical pond pines, the trunk thickly beset with needles, the outline of the tree a narrow cylinder 10-20 meters tall and less than 1 meter in diameter from base to summit. $P$. serotina is clearly a southern relative of $P$. rigida. It normally occurs in fire-maintained wetlands associated with ("downhill" from) P. palustris. On deep peats, P. serotina is stunted and of very irregular form; on mineral or shallower organic soils it can reach large size. Even when well-developed, the trunk is typically twisted and gnarled, helping to distinguish it from $P$. taeda. [= RAB, C, F, FNA, K, S, Z; = P. rigida P . Miller ssp. serotina (Michaux) Clausen]

Pinus strobus Linnaeus, Eastern White Pine. Mt (GA, NC, SC, VA), Pd (NC, SC, VA), Cp (SC, VA): moist to dry forests, bottomlands, dry, rocky ridges in humid gorges; common (rare in Coastal Plain). April; August-September. Widespread in ne. North America, south to VA, w. and (rarely) c. NC, nw. SC, n. GA, e. TN, KY, IN, n. IL, e. IA, and MN. P. strobus was probably the tallest tree in e. North America, reaching heights of 60-70 meters. It was a very important timber tree historically. In NC a notable relict and disjunct stand of $P$. strobus occurs on bluffs of the Deep River in the eastern Piedmont of Chatham County; in VA $P$. strobus is widely but irregularly distributed in the lower Piedmont. [= RAB, C, F, FNA, G, K, W, Z; = Strobus strobus (Linnaeus) Small -- S]

Pinus taeda Linnaeus, Loblolly Pine, Old Field Pine. Cp, Pd (GA, NC, SC, VA): forests, fields, pine plantations; common, much more abundant and widespread than formerly, occurring further west than as a native. March-April; October-November. Widespread in se. North America, ranging north to s. NJ, VA, TN, AR, and se. OK. See P. elliottii for additional characters to distinguish these two species. [= RAB, C, F, FNA, G, K, S, W, Z]

Pinus thunbergiana Franco, Japanese Black Pine. Cp (GA?, NC, SC): planted and persisting, sometimes appearing native, on barrier islands; rare, native of Japan. Growing in maritime situations in its native land, this tree's strong resistance to salt spray is the reason for its horticultural use in our area. Following moderate storm events on the coast, $P$. thunbergiana's needles remain green and undamaged, even when needles of $P$. taeda, native to such situations, are salt-killed. [=K; =? P. thunbergii Parlin]

Pinus virginiana P. Miller, Virginia Pine, Scrub Pine, Jersey Pine. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): dry forests and woodlands, especially on slopes and ridges, also common in certain areas as weedy successional tree on nearly any kind of site; common (rare in the Coastal plain). March-May; September-November. Primarily a Central and Southern Appalachian endemic: s. NY, NJ, and PA, south through VA, WV, s. OH, s. IL, KY, TN, and NC to nw. SC, n. GA, n. AL, and ne. MS. A small, scrubby pine, occurring in very dense, monospecific stands in the upper Piedmont as a result of secondary succession of old fields. [= RAB, C, F, FNA, G, K, S, W, Z]

Pinus sylvestris Linnaeus var. sylvestris, Scots Pine, is introduced and at least weakly naturalized south to MD (Kartesz 1999) and e. WV (Morton et al. 2004). [= FNA; < P. sylvestris - C, F, G, K]

The following pines occur on barrier islands in NC and SC: P. taeda, P. palustris, $P$. elliottii var. elliottii, $P$. thunbergii, and $P$. pinaster (the latter two not native). In the Coastal Plain, the pines are P. palustris, P. serotina, P. echinata, P. taeda, P. glabra, and $P$. elliottii var. elliottii. In the Piedmont, three pines are common and typically present in disturbed upland soils. The auxiliary key is useful in separating these sometimes confusing trees.

## Tsuga Carrière 1847 (Hemlock)

A genus of about 14 species, trees, of North America and e. Asia (China, Japan, and Taiwan). References: Taylor in FNA (1993b); Page in Kramer \& Green (19\90).

1 Most of the leaves $8-13 \mathrm{~mm}$ long, those originating from the sides and lower surface of the twig spreading more or less distichously in a horizontal plane, normally sized, those borne on the upper surface of the twig more or less appressed, dwarf, mostly $1 / 6$ to $1 / 2$ as long as the adjacent lateral leaves, $1-3(-6) \mathrm{mm}$ long, the whitened undersurface (consisting of rows of stomata) exposed upward; leaf margins minutely serrulate; leaf apices obtuse to rounded; seed cones 12-25 mm long

1 Most of the leaves $10-18 \mathrm{~mm}$ long, those originating from the sides and lower surface of the twig spreading more or less distichously in a horizontal plane, normally sized, those borne on the upper surface of the twig not appressed, spreading at a $60-90$ degree angle from the twig, more or less normally sized, mostly $3 / 4$ to as long as the adjacent lateral leaves, $8-15 \mathrm{~mm}$ long, the whitened undersurface (consisting of rows of stomata) not exposed upward; leaf margins entire; leaf apices minutely retuse (notched), truncate, or rounded; seed cones 20-38 mm long
T. caroliniana

Tsuga canadensis (Linnaeus) Carrière, Eastern Hemlock, Canada Hemlock. Mt (GA, NC, SC, VA), Pd (NC, VA), Cp (VA): in a wide variety of habitats in the mountains, most typically and abundantly in moist sites in ravines or coves along streams, but likely to be found in all but the driest habitats between 300 and 1500 m (even occurring in peaty bogs, where it has a sickly yellow color and short life expectancy); in the western piedmont of NC limited to progressively rarer microhabitats (primarily north-facing river bluffs), reaching its eastward limit in NC at a disjunct stand at Hemlock Bluff State Natural Area, Wake County (but uncommon in the piedmont of VA and even present, though rare, in the coastal plain of VA); common (rare in Piedmont south of VA, rare in Coastal Plain in VA only). March-April; September-November. Widespread in ne. North America, south to w. and c. VA, w. and (rarely) c. NC, nw. SC, n. GA, n. AL, TN, KY, IN, WI, and MN. One of the largest trees commonly encountered nowadays in our area, but probably not naturally larger than many other trees -- because of its low timber value, it is often left by loggers. The hemlock woolly adelgic is severely affecting this species. [= RAB, C, F, FNA, G, K, S, W, Z]

Tsuga caroliniana Engelmann, Carolina Hemlock. Mt (GA, NC, SC, VA), Pd (NC, SC, VA): primarily in open forests on ridge tops, rocky bluffs, or gorge walls, generally in drier and rockier sites than T. canadensis, but the two sometimes growing in close proximity or even intermixed in humid gorges; very limited in the western Piedmont, apparently reaching its eastern limit in NC at Hanging Rock State Park, Stokes County, and ranging east to Halifax County in the Piedmont of VA; uncommon (rare in piedmont)
(GA Special Concern). March-April; August-September. T. caroliniana is a rather narrow Southern Appalachian endemic, occurring only in w. NC, e. TN, sw. and sc. VA, nw. SC, and n. GA. Carolina Hemlock has achieved a substantial reputation in NC as a Christmas tree, and is finally coming into favor as an ornamental; Coker and Totten (1945) wrote "the Carolina Hemlock is a very beautiful tree in cultivation, perhaps the handsomest of any eastern American conifer, combining in a remarkable way delicacy, symmetry, and strength." The hemlock woolly adelgid threatens this species. [= RAB, C, F, FNA, G, K, S, W, Z]

The folk taxonomy of conifers in our area is an interesting, though tangled, story. The town of Spruce Pine, NC is apparently named for Tsuga canadensis. Spruce Pinnacle in Buncombe County, NC is crowned with old Tsuga caroliniana. Picea rubens and Abies fraseri are called "He Balsam" and "She Balsam" (considered the male and female of a single species), Tamarack Post Office in Watauga County, NC and Tamarack Ridge in Highland County, VA are named for the abundance of Picea rubens! The generally used common name for Juniperus is "cedar," and Chamaecyparis is called "juniper."

## TAXACEAE S.F. Gray 1821 (Yew Family)

A family of about 4 genera and ca. 16-20 species, shrubs and trees, of isolated regions of the Northern Hemisphere and New Caledonia. References: Hils in FNA (1993b); Price (1990); Page in Kramer \& Green (1990).

1 Leaves flexible, the tips pointed but not piercing to the touch; fleshy "cone" ca. 5 mm long, ca. 5 mm in diameter, red when ripe, the seed exposed at the top by a gap in the aril. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Taxus
1 Leaves stiff, the tips piercing to the touch; fleshy "cone" $2.5-3 \mathrm{~cm}$ long, ca .2 cm in diameter, dark green to purple when ripe, seed entirely surrounded by fleshy tissue Torreya

## Taxus Linnaeus 1753 (Yew)

The genus consists of about 8 very closely related species, trees and shrubs, of temperate regions of the Northern Hemisphere. The species have been termed "discouragingly similar" by Hils in FNA (1993b). In e. North America, T. canadensis occurs in ne. North America, and T. floridana Chapman is endemic to panhandle FL. T. brevifolia Nuttall, Pacific Yew, of British Columbia and Alberta south to MT, ID, OR, and CA, has recently been widely publicized as the source of an anti-cancer drug, present in all species of the genus. T. baccata Linnaeus is native to Europe, and 3-4 additional species occur in Japan and e. mainland Asia (Price 1990). References: Hils in FNA (1993b); Farjon (1998)=Z; Page in Kramer \& Green (1990).

1 Leaf undersurfaces usually lacking cuticular papillae along the stomatal bands; shrubs to 2 m tall; [of w . NC and VA northwards] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . T. Tanadensis
1 Leaf undersurfaces with cuticular papillae along the stomatal bands; shrubs or small trees to 10 m tall; [of Panhandle FL] . . [T. floridana]

Taxus canadensis Marshall, Canada Yew, American Yew. Mt (NC, VA), Pd (VA): cliffs, bluffs, and rocky slopes over calcareous or mafic rocks, red spruce and hemlock swamps and bogs; uncommon in VA, rare in NC (NC Rare). April-May. Newfoundland, Labrador, MN, and s. Manitoba south to nw. NC, ne. TN, KY, and IA. Taxus was first found in NC in 1968 (McDowell 1969). In our area, Taxus occurs primarily on limestone and mafic bluffs, but at its southernmost site in the "hanging valley" of Long Hope Creek (Ashe and Watauga counties, NC), Taxus is found in red spruce swamps and bog edges, where it is locally rather common. Deer have a devastating effect on populations of this species in our area. [= C, F, FNA, G, K, W, Z; = T. baccata Linnaeus ssp. canadensis (Marshall) Pilger]

* Taxus baccata Linnaeus, English Yew. Planted as hedges and ornamentals, escaping locally, as in Rock Creek Park, DC (Shetler \& Orli 2000). [= K, Z; = T. baccata ssp. baccata] \{not keyed\}
* Taxus cuspidata Siebold \& Zuccarini, Japanese Yew. Planted as hedges and ornamentals, possibly escaping locally (Shetler \& Orli 2000). [= K; > T. cuspidata var. cuspidata - Z; = T. baccata Linnaeus ssp. cuspidata (Siebold \& Zuccarini) Pilger] \{not keyed\}

Taxus floridana Nuttall ex Chapman, Florida Yew. Endemic to Panhandle FL. [= FNA, K, S, Z; =T. baccata Linnaeus ssp. floridana (Nuttall ex Chapman) Pilger; = T. baccata var. floridana (Nuttall ex Chapman) Silba]

## Torreya Arnott 1838 (Torreya, Stinking Cedar)

The genus consists of 6-7 species, trees, of temperate regions of the Northern Hemisphere -- 1 in FL and adjacent GA, 1 in CA, 1 in Japan, and 4 in c. and s. China and adjacent Burma (Price 1990). References: Hils in FNA (1993b); Page in Kramer \& Green (1990).

Torreya taxifolia Arnott, Florida Torreya. Cp (GA), *Mt (*NC): moist ravines and bluffs, and also rarely established near plantings; rare (US Endangered, GA Endangered). An endangered endemic of ravines along the Apalachicola River in panhandle FL and sw. GA. Pittillo and Brown (1988) report that "young saplings [are] established downslope and beneath transplanted trees south of Highlands [Macon County, NC]." Godfrey (1988) reports that the national champion Florida Torreya is in Warren County, NC, with "a near-basal circumference of 9 feet, a spread of 52 feet, and a height of 60 feet. It is estimated that it may have been planted there about 1830." [= FNA, K; = Tumion taxifolium (Arnott) Greene -- S]

A family of about 9-11 genera and 100-185 species, of tropical and warm temperate North America, Central America, South America, Africa, and Australia. References: Landry in FNA (1993b); Johnson \& Wilson in Kramer \& Green (1990); Jones (1993).

## Zamia Linnaeus

A genus of about 30-60 species, of extreme se. North America, West Indies, Central America, and South America. References: Landry in FNA (1993b); Johnson \& Wilson in Kramer \& Green (1990); Ward (2001)=Y; Stevenson (1991)=Z.

Zamia floridana Alphonse de Candolle var. umbrosa (Small) D.B. Ward, Coontie. Cp (GA): maritime forests, pinelands; rare (GA Special Concern). E. GA (Glynn Co.) south to FL. Zamia floridana var. floridana is more widespread in the FL Peninsula. Ward (2001), Landry in FNA (1993b), and Stevenson (1991) conclude that North American Zamia belongs to one of several Zamia species in the West Indies. Ward (2001) concludes that $Z$. floridana is the correct name for this taxon, and that varietal status is warranted for the "umbrosa" entity. [= Y; < Zamia integrifolia Linnaeus f. in Aiton -- FNA, S, Z; < Z. pumila Linnaeus -- K, misapplied; $=$ Z. umbrosa Small -- ; < Z. floridana Alphonse de Candolle]

## DICOTYLEDONS

## ACANTHACEAE (Acanthus Family)

A family of about 230 genera and about 3450 species, herbs, shrubs, vines, and trees, largely tropical. References: Wasshausen (1998); Long (1970); McDade \& Moody (1999).

1 Leaves in a basal rosette (sometimes with smaller leaves on a scape).
2 Leaves glabrate, to 22 cm long and 8 cm wide; corolla $0.8-1.3 \mathrm{~cm}$ long; capsule $8-10 \mathrm{~mm}$ long; stamens 2 ; [of moist to wet swamps].

Elytraria
2 Leaves pubescent, to 10 cm long and 3 cm wide; corolla $1.8-4 \mathrm{~cm}$ long; capsule $9-18 \mathrm{~mm}$ long; stamens 4 ; [of dry upland pinelands].
3 Leaves 2-10 cm long, 1-3 cm wide; corolla 3-4 cm long; calyx lobes 15-30 mm long; capsule 12-18 mm long ..... . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Ruellia ciliosa 3 Leaves 1.5-2.5 cm long, 0.7-0.8 cm wide; corolla ca. 2 cm long; calyx lobes 6-9 mm long; capsule ca. 10 mm long

1 Leaves cauline
4 Stamens 2; corolla distinctly 2-lipped (except with 4 nearly equal lobes in Yeatesia).
5 Bracts and bractlets inconspicuous, 2-5 mm long, linear or triangular; stem subterete or obscurely 4-angled Justicia 5 Bracts and/or bractlets subtending the flowers conspicuous, $5-15 \mathrm{~mm}$ long, obovate; stem terete or 6-angled.

6 Stem six-angled in cross-section; corolla conspicuously 2-lipped. Dicliptera
6 Stem terete in cross-section; corolla 4-lobed, the lobes nearly equal Yeatesia
4 Stamens 4; corolla not distinctly 2-lipped, the corolla lobes of nearly equal size (except distinctly 2-lipped in Hygrophila).
7 Corolla distinctly 2-lipped
Hygrophila
7 Corolla not distinctly 2-lipped, the corolla lobes of nearly equal size.
8 Calyx lobes linear-aristate; anther sacs awned or pointed at the base . . . . . . . . . . . . . . . . . . . . . Dyschoriste
8 Calyx lobes lanceolate or linear; anther sacs blunt . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Ruellia

Andrographis Wallich (False Water-willow)
A genus of about 20 species of tropical Asia.

* Andrographis echioides (Linnaeus) Nees, native of India, is reported for chrome ore piles near Newport News, VA, by Reed (1961); it is likely not established in our area. [= K] \{not keyed\}

Dicliptera Antoine Laurent de Jussieu (Dicliptera, Foldwing)
A genus of about 150 species, largely tropical, but extending into warm temperate regions. References: Wasshausen (1998)=Y; Long (1970) $=$ Z.

Dicliptera brachiata (Pursh) Sprengel, Dicliptera, Branched Foldwing. Cp (GA, NC, SC, VA), Pd (GA, NC, SC): bottomland forests; uncommon. August-October. Se. VA south to c. peninsular FL, west to TX, and north in the interior to c. TN, s. IN, s. IL, MO, and se. KS. [= RAB, C, F, GW, K, Y; = Diapedium brachiatum (Pursh) Kuntze -- S; > Dicliptera brachiata var. brachiata -- Z]

A genus of about 65 species, of tropical and warm temperate regions. References: Wasshausen (1998) $=\mathrm{Y}$; Long (1970)=Z.

1 Corolla 10-15 mm long (including the 3-5 mm lobes); capsule $8-10 \mathrm{~mm}$ long; [of floodplain forests] . . . . . . . . . D. humistrata
1 Corolla 25-27 mm long (including the $5-10 \mathrm{~mm}$ lobes); capsule $10-14 \mathrm{~mm}$ long; [of pinelands] . . . . . . . . . . . D. oblongifolia
Dyschoriste humistrata (Michaux) Kuntze, Swamp Twinflower, Swamp Dyschoriste. Cp (GA, SC): bottomland forests, especially on soils over limestone; uncommon, rare north of GA (SC Rare). April-May. SC to c. peninsular FL, west to panhandle FL. [= RAB, GW, K, S, Y]

Dyschoriste oblongifolia (Michaux) Kuntze, Blue Twinflower, Pineland Dyschoriste. Cp (GA, SC): pine savannas, flatwoods, and sandhills; uncommon. April-May. SC to s. FL, west to panhandle FL. The basis of Small's (1933) attribution of this species to VA is unknown. [= RAB, K, S, Y; > Dyschoriste oblongifolia var. oblongifolia -- Z]

## Elytraria Michaux (Elytraria)

A genus of about 17 species, of tropical and warm temperate regions of the Western and Eastern Hemispheres. The placement of this genus in the Acanthaceae is uncertain (McDade \& Moody 1999, McDade et al. 2000). References: Long (1970)=Z; Ward (2004d) $=\mathrm{Y}$.

Elytraria caroliniensis (J.F. Gmelin) Persoon var. caroliniensis, Carolina Elytraria. Cp (GA, SC): swamp forests over coquina limestone ("marl"); rare. June-August. Var. caroliniensis ranges from se. SC south to c. peninsular FL, west to panhandle FL and sw. GA. Var. angustifolia (Fernald) Blake is restricted to s. FL. Ward (2004d) also recognizes E. caroliniensis var. vahliana (Nees in Augustin de Candolle) D.B. Ward, in ne. and Panhandle FL, south to c. peninsular FL. [=K, Y, Z; < E. caroliniensis -- RAB; = E. carolinensis var. carolinensis -- GW, misspelling; = Tubiflora carolinensis J.F. Gmelin -- S, misspelling]

## Hygrophila R. Brown

A genus of about 25 species, of tropical regions. References: Wasshausen (1998)=Y; Les \& Wunderlin (1981)=Z. Key based on $Y$.
1 Leaf blades 5-12 cm long; calyx segments ca. 5 mm long, glabrous; flowers borne in axillary clusters .......... H. lacustris
1 Leaf blades 1-3.5 cm long; calyx segments ca. 2 mm long, pubescent; flowers borne in terminal and axillary spikes
H. polysperma

Hygrophila lacustris (Schlectendahl \& Chamisso) Nees. Cp (GA): shallow water of swamps and shores; rare (GA Special Concern). Sw. GA south to FL Peninsula, west to e. TX; West Indies. [= GW, K, S; = Hygrophila costata Nees et al.; = Ruellia lacustris Schlectendahl \& Chamisso]

* Hygrophila polysperma (Roxburgh) T. Anderson. Cp (VA): lakes, doubtfully established but frequently reintroduced; rare, native of the East Indies. Grown for the aquarium trade, and sporadically introduced to bodies of water, apparently well-established in FL (Les \& Wunderlin 1981). [= GW (footnote), K, Y, Z]

## Justicia Linnaeus (Water-willow)

A genus of about 600 species, herbs and shrubs of the tropics and warm temperate North America. References: Wasshausen (1998) $=\mathrm{Y}$; Long (1970)=Z. Key based in part on $Y$.

1 Spike densely flowered; seeds verrucose; primary leaves averaging 6-8× as long as wide; [of the Piedmont, Mountains, and Coastal Plain] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . J. americana
1 Spike loosely flowered; seeds smooth or minutely muricate (with very fine, sharp projections); primary leaves either ca. 2-6× as long as wide or more than $8 \times$ as long as wide; [of the Coastal Plain].
2 Corolla purple, $18-30 \mathrm{~mm}$ long; leaves averaging more than $8 \times$ as long as wide; cystoliths parallel to the midvein of the leaf; [of s. GA south into FL].
3 Upper leaf blades 4-7 cm long, not channeled, tough but not fleshy; calyx segments $5-7 \mathrm{~mm}$ long, <1 mm wide ....
3 Upper leaf blades $8-13.5 \mathrm{~cm}$ long, channeled, fleshy; calyx segments $11-15 \mathrm{~mm}$ long, ca. 1 mm wide . J. crassifolia 2 Corolla pale lavender to white, $8-13 \mathrm{~mm}$ long; leaves averaging $2-6 \times$ as long as wide; cystoliths parallel to the secondary veins of the leaf; [of the Coastal Plain throughout our area].
4 Spikes lax, the flowers usually borne singly, secund; seeds smooth; leaves averaging ca. $5 \times$ as long as wide J. ovata var. lanceolata

4 Spikes somewhat congested, the flowers borne in opposite pairs; seeds minutely muricate (with very fine, sharp projections); leaves averaging ca. $3 \times$ as long as wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . J. ovata var. ovata

Justicia americana (Linnaeus) Vahl, American Water-willow. Pd, Mt (GA, NC, SC, VA), Cp (NC, VA): river and stream beds, in shallow water, often rooted in rocky shallows; common. June-October. W. Québec west to MI and WI, south to GA, TX, and KS. [= RAB, C, G, GW, K, W, Y, Z; > J. americana var. americana - F; > J. americana var. subcoriacea Fernald -- F, G; > J. mortuifluminis Fernald -- F; = Dianthera americana Linnaeus -- S]

Justicia angusta (Chapman) Small, Pineland Water-willow, Narrowleaf Water-willow. Cp (GA): roadside ditches, savannas;
rare (GA Special Concern). Se. GA (Camden County) (Sorrie 1998b) south to s. FL. [=K, Y; < J. ovata -- GW, in part; < J. crassifolia (Chapman) Chapman ex Small -- S, in part; = J. ovata (Walter) Lindau var. angusta (Chapman) R.W. Long -- Z]

Justicia crassifolia (Chapman) Chapman ex Small. Cp (GA): flatwoods, cypress ponds; rare. S. GA to the FL Panhandle. [= GW, K, Y; < J. crassifolia - S, in part only)]

Justicia ovata (Walter) LIndau var. lanceolata (Chapman) R.W. Long. Cp (GA): swamps, marshes; uncommon. May. Se. GA west to TX, north in the Mississippi Embayment to s. IL, s. IN, w. KY. Needs additional study; may warrant specific status. [= K, Y, Z; < J. ovata -- GW; = J. lanceolata (Chapman) Small -- S]

Justicia ovata (Walter) Lindau var. ovata, Coastal Plain Water-willow, Loose-flower Water-willow. Cp (GA, NC, SC, VA): swamps, marshes; common. May-July. S. VA south to c. peninsular FL, Panhandle FL, and se. AL. [= C, K, Y, Z; < J. ovata -RAB, F, GW; J. humilis Michaux var. humilis -- G; = J. ovata (Walter) Lindau -- S, in the narrow sense]

## Pseuderanthemum Radlk.

A genus of about 60 species, mostly shrubs, of tropical regions.

* Pseuderanthemum variabile (R. Brown) Radlk., Night-and-Afternoon, has been reported as a greenhouse weed from SC (Nelson \& Kelly 1997). It is not included as a regular member of the flora of this region because "it is unlikely that it could persist anywhere in South Carolina outside a greenhouse environment" (Nelson \& Kelly 1997). [= K]

## Ruellia Linnaeus (Wild-petunia)

A genus of about 150 species, of the tropics and temperate North America. References: Wasshausen (1998)=Y; Long (1970)=Z.

1 Principal leaves linear-lanceolate, $>10 \times$ as long as wide ( $8-27 \mathrm{~cm}$ long, $0.7-2 \mathrm{~cm}$ wide); [alien, cultivated and naturalized] . . .
. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . R. tweediana

1 Principal leaves elliptic, ovate or broadly lanceolate, $2-5 \times$ as long as wide (2-16 cm long, $0.5-7 \mathrm{~cm}$ broad); [native]
2 Calyx lobes narrowly linear-lanceolate, flattened to the tip, 1-4 mm wide
R. strepens

2 Calyx lobes linear, filiform or setaceous at least apically, $<1.2 \mathrm{~mm}$ wide at their widest point (usually the base).
3 Corolla 6-10 cm long, opening at night and withering by mid-morning; calyx lobes 2.5-4.5 cm long; [of Coastal Plain bogs and wet pine flatwoods] R. noctiflora 3 Corolla $3-7 \mathrm{~cm}$ long, opening during the day; calyx lobes $1-3 \mathrm{~cm}$ long; [of various habitats].

4 Flowers borne on peduncles $0.2-7 \mathrm{~cm}$ long, from the axils of lower and median nodes.
5 Stem usually divergently branched; calyx lobes $0.5-1 \mathrm{~mm}$ wide, tapering from the base to a very slender tip; [of dry to wet pine woodlands of the Coastal Plain]
R. pinetorum

5 Stem simple or with a few ascending branches; calyx lobes $0.7-1.2 \mathrm{~mm}$ wide, widest near the middle and tapering to the apex; [of dry woodlands, forests, and glades of the Piedmont and Mountains] R. purshiana 4 Flowers sessile or subsessile, in the axils of median and upper nodes.

6 Leaves sessile or subsessile; flower-bearing nodes usually 4-8; stem typically branched at base; stigma lobe 1
R. humilis

6 Leaves petioled; flower-bearing nodes usually 1-3; stem typically simple below (unless damaged), sometimes branched upwards; stigma lobes (1-) 2.
7 Plant with all leaves caulescent; leaves ovate, lanceolate, elliptic, or oblong; [plant widespread in our area and common] $\boldsymbol{R}$. caroliniensis
$7 \quad$ Plant with a rosette of basal leaves; leaves spatulate to obovate; [plant rare, restricted to dry pinelands in the Coastal Plain] R. ciliosa var. cinerascens

Ruellia caroliniensis (J.F. Gmelin) Steudel, Carolina Wild-petunia, Common Wild-petunia. Cp, Pd, Mt (GA, NC, SC, VA): dry to moist forests and woodlands; common. May-September. NJ, s. OH, and s. IN, south to FL and TX. [=RAB, C, G; >R. caroliniensis var. caroliniensis -- $F$; $>$. caroliniensis var. cheloniformis Fernald -- $;$; $>$. caroliniensis var. dentata (Nees) Fernald -F; > R. caroliniensis var. membranacea Fernald -- F; > R. caroliniensis var. nanella Fernald -- F; > R. caroliniensis var. salicina Fernald -- F; > R. caroliniensis var. semicalva Fernald -- F; = R. caroliniensis ssp. caroliniensis var. caroliniensis -- K, Y, Z; R. parviflora (Nees) Britton -- S ; $>$ R. caroliniensis -- W, in part only (see also $R$. ciliosa)]

Ruellia ciliosa Pursh var. cinerascens Fernald, Sandhills Wild-petunia. Cp (GA, NC, SC): sandhills, particularly in loamy, submesic swales; rare (NC Rare, SC Rare). May-September. Sc. NC south to c. peninsular FL, west to se. LA. Although treated as only subspecifically distinct from $R$. caroliniensis by many recent authors, there seem ample differences in morphology, distribution, and habitat to warrant specific distinction. [= RAB, S; = R. caroliniensis (J.F. Gmelin) Steudel ssp. ciliosa (Pursh) R.W. Long var. cinerascens (Fernald) Kartesz \& Gandhi -- K, Y, Z; < R. caroliniensis -- W, in part]

Ruellia humilis Nuttall, Low Wild-petunia, Hairy Wild-petunia. Mt (GA, VA), Pd (NC, VA): diabase glades and woodlands; rare (NC Threatened, VA Watch List). May-September. PA west to se. MN and NE, south to c. NC, AL, and TX. Piedmont plants of NC are uniformly white-flowered. [= RAB, K, W, Y, Z; > R. humilis var. calvescens Fernald -- C, F, G; > R. humilis var. frondosa Fernald -- $\mathrm{F}, \mathrm{G}$; > R. humilis var. humilis -- $\mathrm{F}, \mathrm{G}$ ]

Ruellia noctiflora (Nees) A. Gray, Night-flowering Wild-petunia. Cp (GA): wet pinelands and savannas; rare (GA Special Concern). (May-) June-July (-August). E. GA (in counties immediately adjacent to SC) south to n. FL and west to se. LA. [= GW, K, S, Y]

Ruellia pinetorum Fernald, Pineland Wild-petunia. Cp (GA, SC): dry to wet pinelands; rare (SC Rare). May-September. SC south to Panhandle FL, west to TX. Although treated as only subspecifically distinct from $R$. pedunculata by many recent authors,
there seem ample differences in morphology, distribution, and habitat to warrant specific distinction. First reported for GA by Sorrie (1998b). [= RAB, F; R. pedunculata Torrey ex A. Gray ssp. pinetorum (Fernald) R.W. Long -- K, Y, Z]

Ruellia purshiana Fernald, Pursh's Wild-petunia. Pd (GA, NC, SC, VA), Mt (GA, NC, VA): dry woodlands and forests, especially over mafic or calcareous rocks; uncommon (NC Rare). May-September. MD south to GA and AL, in and adjacent to the Appalachians. [= RAB, F, K, W, Y, Z; R. pedunculata Torrey ex A. Gray -- C, G, in part]

Ruellia strepens Linnaeus, Limestone Wild-petunia. Mt (GA, VA), Pd (NC, VA), Cp (NC, SC, VA): calcareous forests; uncommon, rare south of VA (NC Rare, SC Rare). May-September. NJ west to OH and IA, south to se. and sc. NC, e. SC, AL, and TX. [= RAB, C, F, G, K, S, W, Y, Z]

* Ruellia tweediana Grisebach, Mexican Bluebell. Cp (GA, SC): disturbed areas; rare, introduced from e. Mexico. MaySeptember. [R. brittoniana Leonard emend Fernald -- RAB, GW, K, Z; R. caerulea - K, orthographic variant; R. malacosperma Greenman -- S, misapplied; $R$. coerulea Morong -- Y]

## Stenandrium Nees

A genus of about 25 species, of tropical to warm temperate New World. References: Wasshausen (1998)=Y; Long (1970)=Z.
Stenandrium dulce (Cavanilles) Nees var. dulce, Sweet Shaggytuft. Cp (GA): pine savannas; rare. GA to FL. Var. dulce ranges from GA south to FL; var. floridanum A. Gray is restricted to s. peninsular FL. [= K, Y; Gerardia floridana (A. Gray) Small -S; S. dulce var. floridanum A. Gray - Z]

## Yeatesia Small (Bractspike)

A genus of 3-4 species, of warm temperate to tropical areas, se, United States to ne. Mexico. References: Wasshausen (1998)=Y; Long (1970) $=$ Z.

Yeatesia viridiflora (Nees) Small, Yellow bract-spike, Cp (GA): rich bottomlands; rare. Sw. GA (Jones \& Coile 1988) and FL west to TX (Kartesz 1999). [= K, S, Y; = Dicliptera viridiflora (Nees) R.W. Long - Z; Dicliptera halei Riddell]

## ACERACEAE (Maple Family)

(see SAPINDACEAE)

## ACTINIDIACEAE (Kiwi-fruit Family)

A family of 3 genera and 340-360 species, trees, shrubs, and lianas, of tropical and warm temperate Asia. References: Dressler \& Bayer in Kubitzki (2004).
Actinidia Lindley (Kiwi-fruit)
A genus of 40-60 species, lianas, of e. and se. Asia. References: Dressler \& Bayer in Kubitzki (2004).
Various species in the genus Actinidia are in cultivation in our area. Some show potential to escape and naturalize.

## ADOXACEAE (Moschatel Family)

A family of about 4 genera and about 165 species, shrubs, small trees, and herbs (here interpreted as including Sambucus and Viburnum). There now appears to be little doubt that Sambucus and Viburnum are more naturally placed in the Adoxaceae, in contrast to their traditional placement in the Caprifoliaceae (Zhang et al. 2003, Eriksson \& Donoghue 1997). References: Ferguson (1966a).
1 Leaves pinnately compound; fruit $3-5$-seeded . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Sambucus
1 Leaves simple; fruit 1 -seeded . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Viburnum

## Sambucus Linnaeus (Elderberry)

A genus of about 9 species of shrubs and small trees, north temperate and subtropical. References: Bolli (1994)=Z; Ferguson $(1966 a)=Y$.

1 Inflorescence racemose, normally longer than broad; fruits red when ripe; pith of stems and second-year branches brown; leaves with 5-7 leaflets, these never further divided; foliage and young twigs puberulent; [primarily of the Mountains, extending into the Piedmont in VA] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. racemosa var. pubens
1 Inflorescence cymose, normally broader than long; fruits black or deep purple when ripe; pith of stems and second-year
branches white; leaves with 5-11 leaflets, the lower leaflets sometimes further divided; foliage and young twigs glabrous or with trichomes mostly limited to the veins of the leaves; [collectively widespread].
2 Fruits black, 6-8 mm in diameter; plant a small tree; [rare, restricted, and alien] . . . . . . . . . . . . . . . . . . . . . . . . . [S. nigra]
2 Fruits purplish black, 4-6 mm in diameter; plant a shrub to small tree (usually multi-stemmed from the base); [common, widespread, and native]
S. canadensis

Sambucus canadensis Linnaeus, Common Elderberry. Cp, Pd, Mt (GA, NC, SC, VA): streambanks, thickets, moist forests, disturbed areas; common. Late April-July; July-August. The species ranges from Nova Scotia west to Manitoba, south to FL, TX, Mexico; West Indies. The leaflets, particularly of young shoots or stunted sprouts, are often variegated. This is one of the first woody plants to leaf out in the spring. Bolli (1994) treats this taxon as a subspecies of a broadly defined S. nigra. He recognizes 6 subspecies: ssp. nigra in Europe, ssp. palmensis (Link) R. Bolli in the Canary Islands, ssp. maderensis (Lowe) R. Bolli in Madeira Island, ssp. canadensis in eastern North America, Mexico, Central America, and the West Indies, ssp. cerulea (Rafinesque) R. Bolli of western North America, and ssp. peruviana (Humboldt, Bonplandt, and Kunth) R. Bolli of South America. I prefer to retain these taxa at the species level, particularly as Bolli states "the geographical races, in the following defined as subspecies, turned out to be the biological units in Sambucus." Bolli further discusses 3 races within what is here called S. canadensis (his S. nigra ssp. canadensis), one from eastern North America, another from montane Mexico and Central America, and a third from subtropical se. North America and the West Indies; he considers these geographic races to represent "morphological and perhaps genetical" differences, and that "at present, all races are probably interconnected." This variation may be worthy of taxonomic recognition at the varietal level, and these "races" have formerly been considered to be species or varieties. Plants of most of our area represent S. canadensis var. canadensis, while evergreen, bipinnate plants of FL, s. GA, s. AL, s. MS, s. LA, se. TX, and the West Indies represent S. canadensis var. laciniata A. Gray. [= RAB, C, GW, W, Y; > S. canadensis var. canadensis - F, G; > S. canadensis var submollis Rehder -- F, G; = S. nigra Linnaeus ssp. canadensis (Linnaeus) R. Bolli -- K, Z; > S. canadensis - S, in a narrow sense; > S. simpsonii Rehder ex Sargent -- S; > Sambucus canadensis Linnaeus var. laciniata A. Gray]

Sambucus racemosa Linnaeus var. pubens (Michaux) Koehne, Red Elderberry. Mt (GA, NC, VA): spruce-fir and northern hardwood forests, primarily at high elevations in the Mountains, though sometimes descending in our area to at least as low as 500 m ; uncommon (GA Special Concern). Late April-early June; late June-August. As interpreted here, S. racemosa is an interruptedly circumboreal species, represented in ne. North America by var. pubens, in n. Europe by var. racemosa, and in ne. Asia and nw. North America by several additional varieties. S. racemosa var. pubens ranges from Newfoundland west to British Columbia (?), south to PA, IN, IL, and in the mountains to w. NC, e. TN, and ne. GA (Jones \& Coile 1988). [= S. pubens -- RAB, F, G, S, W; = S. racemosa ssp. pubens (Michaux) House var. pubens -- C; < S. pubens ssp. pubens - Y; < S. racemosa var. racemosa -- K, Z]

* Sambucus nigra Linnaeus, European Elder, is escaped from cultivation, introduced from Europe. [= C, F, G; = S. nigra ssp. nigra -- K, Z]

## Viburnum Linnaeus (Viburnum)

A genus of about 150 species of shrubs and small trees, largely temperate, and primarily in Asia and North America. References: McAtee (1956)=Z; Ferguson (1966a)=Y; Weckman et al. (2002).

Section Odontotinus OW: acerifolium, dilatatum
Section Odontotinus NW: carolinianum, dentatum, molle, rafinesquianum, recognitum
Section Lentago: cassinoides, lentago, nudum, prunifolium, rufidulum
Section Pseudotinus: lantanoides
Section Opulus: opulus
Section Solenotinus: sieboldii
Section Viburnum: lantana
Section Tomentosa: plicatum
bracteatum, macrocephalum, obovatum, setigerum, rhytidophyllum
Viburnum acerifolium Linnaeus var. acerifolium, Mapleleaf Viburnum, Dockmackie. [=F, Z; < V. acerifolium -- RAB, C, G, K, $S, W, Y ;>V$. acerifolium var. densiflorum (Chapman) McAtee $-Z ;>V$. acerifolium var. ovatum (Rehder) McAtee - Z]

Viburnum acerifolium Linnaeus var. glabrescens Rehder. [=F, Z; < V. acerifolium -- RAB, C, G, K, S, W, Y]
Viburnum bracteatum Rehder, Limerock Arrow-wood. Mt (GA): calcareous forests and woodlandfsl rare (GA Endangered).
East to se. TN (Chester, Wofford, \& Kral 1997) and nw. GA (Jones \& Coile 1988). [= K, S, Y, Z]

dentatum -- GW, W; > V. recognitum var. recognitum - Z; >V. recognitum var. alabamense McAtee -- Z]
Viburnum rufidulum Rafinesque, Southern Black Haw. Mt, Pd, Cp (GA): [= RAB, C, F, G, K, S, W, Y, Z; > V. rufidulum - S; > V. rufotomentosum Small]

Viburnum setigerum Hance, Tea Viburnum. Pd (NC): introduced, rarely naturalizing into suburban woodlands. \{Guilford Courthouse NPS\} Also naturalizing in KY (Weckman et al. 2002). [= K]

* Viburnum sieboldii Miq., Siebold Viburnum. (VA). Also naturalizing in KY (Weckman et al. 2002). [= C, F, K; = V. sieboldiZ, orthographic variant]
* Viburnum lantana Linnaeus, Wayfaring Tree, native of Eurasia, is widely planted and sometimes escaped or persistent, reportedly as far south as MD (Kartesz 1999) and KY (Weckman et al. 2002). [= C, F, G, K, Z]
* Viburnum macrocephalum Fortune, Chinese Snowball. Reported as naturalized in the Mountains of NC (Pittillo 2003, pers. comm.). \{investigate\}

Viburnum molle Michaux, in c. TN (Chester, Wofford, \& Kral 1997). [= C, F, G, K, Y, Z]
Viburnum opulus Linnaeus var. americanum Aiton, Cranberry-tree, Highbush-cranberry, south to s. PA (Rhoads \& Klein 1993), NJ , and n. WV. [= C, G, K; = V. trilobum Marshall -- F; = V. opulus var. trilobum (Marshall) McAtee - Z]

* Viburnum plicatum Thunberg, Doublefile Viburnum, introduced and naturalized in se. and sw. PA (Rhoads \& Klein 1993). [= C, G, K, Z]
* Viburnum rhytidophyllum Hemsley, Leatherleaf Viburnum. Planted and escaping at least as far south as KY (Weckman et al. 2002). [= K]

## AIZOACEAE Rudolphi 1830 (Fig-marigold Family)

A family of about 128 genera and about 1850-2500 species, mostly succulent herbs and subshrubs, of tropical and subtropical regions, especially in s. Africa and Australia. References: Boetsch (2002); Vivrette, Bleck, \& Ferren in FNA (2003b); Hartmann in Kubitzki, Rohwer, \& Bittrich (1993).

1 Leaves linear, lanceolate, or oblanceolate, the blade much longer than wide; [subfamily Sesuvioideae]
Sesuvium
1 Leaves orbicular, obovate, or triangular-ovate, the blade about as wide as long.

| 2 | Leaves alternate; fruit an indehiscent nut; [subfamily Tetragonioideae] . . . . . . . . . . . . . . . . . . . . . . . . . . . Tetragonia |
| :--- | :--- |
| 2 | Leaves opposite to subopposite; fruit a circumcissile capsule; [subfamily Sesuvioideae] . . . . . . . . . . . . Trianthema |

## Sesuvium Linnaeus 1759 (Sea-purslane)

A genus of about 8-12 species, especially in tropical and subtropical coastal areas. References: Boetsch (2002)=Z; Ferren in FNA (2003b); Hartmann in Kubitzki, Rohwer, \& Bittrich (1993).

[^0]A genus of about 60-85 species, mostly tropical and warm temperate. References: Boetsch (2002)=Y; Vivrette in FNA (2003b); Taylor (1994)=Z; Hartmann in Kubitzki, Rohwer, \& Bittrich (1993).

* Tetragonia tetragonioides (Pallas) Kuntze, New Zealand Spinach. Pd (NC): persistent after cultivation; rare, introduced from e. Asia. July-November. Tetragonia is sometimes segregated into the Tetragoniaceae. T. tetragonioides is a member of subgenus Tetragonioides (Taylor 1994). [= C, F, FNA, G, K, Y, Z; T. expansa Murray -- RAB]

## Trianthema Linnaeus 1753 (Horse-purslane)

A genus of about 17-20 species, of tropical and warm temperate areas, especially Australia. References: Boetsch (2002)=Z; Ferren in FNA (2003b); Hartmann in Kubitzki, Rohwer, \& Bittrich (1993).

* Trianthema portulacastrum Linnaeus, Horse-purslane. Cp (GA, NC, SC, VA): disturbed areas; rare, introduced from the Gulf Coast and the tropics. April-November. [= RAB, C, F, FNA, G, GW, K, S, Z]

## ALTINGIACEAE (Sweet-gum Family)

A family of 2 genera and about 12 species, trees, of e. Asia, Indomalaysia, e. North America, Central America, and e.
Mediterranean. Various molecular studies show that Liquidambar is better separated from the Hamamelidaceae (Hoot, Magallón, and Crane 1999). References: Endress in Kubitzki, Rohwer, \& Bittrich (1993); Hoot, Magallón, and Crane (1999).

## Liquidambar Linnaeus 1753 (Sweet Gum)

A genus of 4-5 species, trees, north temperate, of e. North America, Central America (Mexico to Nicaragua), e. Asia (s. China, Taiwan, Vietnam), and e. Mediterranean (Turkey, Rhodos, Cyprus). References: Endress in Kubitzki, Rohwer, \& Bittrich (1993); Li \& Donoghue (1999).

Liquidambar styraciflua Linnaeus, Sweet Gum, Red Gum. Cp, Pd, Mt (GA, NC, SC, VA): swamp forests, floodplains, moist forests, depressional wetlands, old fields, disturbed areas; common (absent from much of the Mountains). April-May; AugustSeptember. CT west to s. OH, s. IL and OK, south to FL, TX, and Guatemala. One of the most spectacular of our trees in the fall; a single tree often has a mixture of green, yellow, orange, dark red, bronze, and purple leaves. The sap was previously gathered as a source of chewing gum. The bark is one of the favorite foods of beavers. Although sometimes thought of as a small and weedy tree, Liquidambar reaches its greatest abundance and size in Coastal Plain swamp forests, where it can reach 2 meters in diameter. Along with such species as Pinus taeda, Quercus phellos, and others, Liquidambar is a good example of a primarily bottomland tree which has proven to be an excellent colonizer of disturbed uplands. [= RAB, C, F, FNA, G, GW, K, S, W]

## AMARANTHACEAE A.L. de Jussieu 1789 (Amaranth Family)

A family of about 65-71 genera and 750-1000 species, mostly herbs, but including shrubs and trees, of tropical and warm temperate (rarely cold temperate) regions. References: Robertson \& Clemants in FNA (2003b); Townsend in Kubitzki, Rohwer, \& Bittrich (1993).

```
Subfamily Amaranthoideae
    Tribe Celosieae: Celosia.
    Tribe Amarantheae, subtribe Amaranthinae: Amaranthus.
    Tribe Amarantheae, subtribe Aervinae: Achyranthes.
Subfamily Gomphrenoideae
    Tribe Gomphrenae, subtribe Froelichiinae: Alternanthera, Froelichia, Guellimenea.
    Tribe Gomphrenae, subtribe Gomphreninae: Gomphrena,Iresine.
```

## Achyranthes Linnaeus 1753 (Chaff-flower)

A genus of 6-8 species, of warm temperate and tropical regions of the Old World. References: Robertson in FNA (2003b);
Townsend in Kubitzki, Rohwer, \& Bittrich (1993).

* Achyranthes aspera Linnaeus var. aspera. SC wool-combing mills. [= FNA] \{not yet keyed\}
* Achyranthes aspera Linnaeus var. pubescens (Moq.) Townsend, Devil's-horsewhip, is reported as occurring in MD and other eastern states by Kartesz (1999). \{investigate\} [= FNA, K] \{not yet keyed\}
* Achyranthes japonica (Miq.) Nakai var. hachijoensis Honda, Japanese Chaff-flower, native of e. Asia, is escaped in KY and WV (Mingo and Wayne counties) (Medley et al. 1985). It will likely become established in our area as well. [=FNA, K] \{not yet keyed\}

A genus of about 100 species, tropical and warm temperate, especially in America. References: Clemants in FNA (2003b); Townsend in Kubitzki, Rohwer, \& Bittrich (1993). Key based in part on Clemants in FNA (2003b).

1 Inflorescences borne on peduncles 1-7 cm long, these from the leaf axils or terminal; [of aquatic to wet sites]
$\qquad$
1 Inflorescences sessile, in the leaf axils; [of dry to moist sites].
2 Tepals dimorphic; tepal hairs barbed.
3 Leaf blades longer than broad; tepals $3-5 \mathrm{~mm}$ long, densely villous ............................. A. caracasana 3 Leaf blades as broad as long; tepals $5-7 \mathrm{~mm}$ long, sparsely villous . . . . . . . . . . . . . . . . . . . . . . . . . A. pungens
2 Tepals monomorphic; tepal hairs not barbed.
4 Mature fruit included within the tepals; spikes globular; stems sericeous . . . . . . . . . . . . . . . . . A. paronychioides
4 Mature fruit exserted between the tepals; spikes narrow, short-cylindric; stems glabrous to pubescent in lines (the nodes also pubescent)
A. sessilis

* Alternanthera caracasana Kunth. Cp (GA, NC, SC): disturbed areas; rare, introduced from South America. Reported for Coastal Plain of SC, and in s. Coastal Plain of GA (Jones \& Coile 1988) and for NC (FNA, K) and MD (K). [= FNA, K]
* Alternanthera paronychioides St.-Hilaire. Cp (GA, NC, SC): disturbed areas; rare, introduced from tropical America. JulyOctober. [= FNA; Alternanthera paronychioides St.-Hilaire var. paronychioides -- K; Alternanthera polygonoides (Linnaeus) R. Brown ex Sweet, misapplied -- RAB, G; Achyranthes polygonoides (Linnaeus) Lamarck, misapplied -- S]

Alternanthera philoxeroides (Martius) Grisebach, Alligator-weed. Cp (GA, NC, SC, VA): floating in mats on the surface of the waters of blackwater rivers, sloughs, ditches, ponds, and in very moist soil of ditches and shores; common, introduced from tropical America. April-October. This plant is a serious weed. [= RAB, C, FNA, K; Achyranthes philoxeroides (Martius) Standley -S]

Alternanthera pungens Kunth. Cp (SC): habitat unknown; rare. Reported by Small (1933) for the Coastal Plain of SC; known from scattered locations in AL, FL, LA, NY, and TX (Clemants in FNA 2003b). [= FNA, K; Achyranthes repens Linnaeus -- S, misapplied]

* Alternanthera sessilis (Linnaeus) R. Brown ex Augustin de Candolle, Sessile Joyweed. Cp (GA, SC): disturbed wet muck; rare, introduced from the Tropics. First reported for SC by Nelson \& Kelly (1997). Apparently now known in the Southeast from SC, FL, AL, MS, LA, TX (Brown \& Marcus 1998) and GA (Jones \& Coile 1988). [= FNA, GW, K]

## Amaranthus Linnaeus 1753 (Amaranth, Pigweed)

A genus of about 60 species, all annual herbs, of tropical and temperate regions. References: Mosyakin \& Robertson in FNA (2003b); Costea \& Tardif (2003b)=Y; Henrickson (1999)=Z; Sauer (1955)=X; Costea, Sanders \& Waines (2001a, 2001b); Townsend in Kubitzki, Rohwer, \& Bittrich (1993). Key based closely on Mosyakin \& Robertson in FNA (2003b) and Sauer (1955).

1 Plants dioecious; [subgenus Acnida] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Key A
1 Plants monoecious (the pistillate and staminate flowers intermingled, or in separate inflorescences on the same plant);
[subgenera Albersia and Amaranthus]
Key B

## Key A - Amaranthus, subgenus Acnida

1 Plants pistillate.
2 Tepals lacking, or rudimentary (often only 1-2 present, these <1 (2) mm long and lacking a visible midvein); subgenus Acnida, section Acnida].
3 Seed 2-3 mm long; utricle $2.5-4 \mathrm{~mm}$ long
A. cannabinus 3 Seed 0.7-1.2 mm long; utricle 1-2.5 mm long.

4 Utricle with conspicuous and regular longitudinal ridges; bract > 1.5 mm long, with a stout midrib not far excurrent beyond the bract blade
A. australis

4 Utricle smooth or irregularly tuberculate; bract < 1.5 mm long, with a slender excurrent midrib . A. tuberculatus 2 Tepals present and well-developed (usually 5 present, at least the outer tepals $>2 \mathrm{~mm}$ long and with a visible midvein).

5 Tepals 1 or 2, lanceolate to linear; [subgenus Acnida, section Acnida] . . . . . . . . . . . . . . . . . . . . . . A. tuberculatus 5 Tepals 5, at least the inner spatulate; [subgenus Acnida, section Saueranthus].

6 Outermost tepal obtuse or notched (similar to the others), the midvein excurrent slightly or not at all
A. arenicola

6 Outermost tepal acute or acuminate (dissimilar to the inner obtuse tepals), the midvein excurrent into a rigid point
A. palmeri

1 Plants staminate (some identifications following this lead may not be reliable).
7 Outer tepals without prominent midribs, not appreciably longer than the inner tepals; bracts <2 mm long, the midribs usually not prominent (except sometimes in A. australis).
8 Bracts < 1 mm long; midribs scarcely excurrent . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. cannabinus 8 Bracts $>1 \mathrm{~mm}$ long; midribs often conspicuously excurrent.
$9 \quad$ Bracts with moderately prominent midribs; midribs of outer tepals excurrent A. australis 9 Bracts with slender midribs; midribs of outer sepals not excurrent . . . . . . . . . . . . . . . . . . . A. tuberculatus
7 Outer tepals with prominent midribs, usually longer than the inner tepals; bracts $>2 \mathrm{~mm}$ long (or $1-2 \mathrm{~mm}$ long in $A$.
tuberculatus), mostly with prominent midribs.
10 Outer tepals with apex acute or obtuse; dark midribs not excurrent . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. arenicola
10 Outer tepals with apex acuminate; midribs excurrent as rigid spines.
11 Bracts ca. 4 mm long, equaling or exceeding the outer tepals
A. palmeri

11 Bracts ca. 2 mm long, shorter than the outer tepals . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. tuberculatus

## Key B - Amaranthus, subgenera Albersia and Amaranthus

1 Inflorescences axillary clusters of glomerules (sometimes leafy terminal spikes also present); [subgenus Albersia].
2 Pistillate flowers usually with 3 tepals; utricles usually regularly dehiscent (indehiscent in $A$. blitum).
3 Utricles indehiscent; leaf blades usually deeply notched at the tip
A. blitum

3 Utricles dehiscent; leaf blades obtuse, acuminate, or very shallowly notched at the tip.
4 Tepals of pistillate flowers acute to short-acuminate at the tip, not reflexed; seeds 0.6-1.0 mm in diameter
A. albus

4 Tepals of the pistillate flowers long-aristate at the tip, usually reflexed outwards; seeds $1.0-1.4 \mathrm{~mm}$ in diameter
[A. thunbergii]
2 Pistillate flowers usually with (4-) 5 tepals; utricles usually indehiscent or tardily dehiscent (regularly dehiscent in $A$. blitoides).
5 Inflorescence axes thickened, becoming indurate at maturity . . . . . . . . . . . . . . . . . A. crassipes var. crassipes 5 Inflorescence axes not thickened, not indurate at maturity.

6 Utricles with regular, circumscissile dehiscence . . . . . .
6 Utricles indehiscent (or tardily and irregularly dehiscent).
7 Leaves crisped-erose, conspicuously undulate (non planar) . . . . . . . . . . . . . . . . . . . . . . . . . . . A. crispus 7 Leaves entire or erose, plane or slightly undulate.

8 Leaves ovate, obovate -rhombic, to narrowly ovate or lanceolate; plants not fleshy; [alien of disturbed situations]. $\qquad$ A. polygonoides

8 Leaves orbicular or obovate; plants fleshy; [native of sea-beaches] . . . . . . . . . . . . . . . . A. pumilus
1 Inflorescences terminal spikes or panicles, leafless or nearly so at least in the distal portions (axillary spikes or clusters usually also present).
9 Utricles indehiscent; tepals of pistillate flowers usually 2-3 (5 in A. spinosus); inflorescence bracts shorter than the tepals.
10 Stems with paired nodal spines; tepals of pistillate flowers 5 ; [subgenus Amaranthus] . ............. A. spinosus
10 Stems lacking spines; tepals of pistillate flowers 2-3; [subgenus Albersia].
11 Utricles distinctly rugose, equaling or slightly exceeding the tepals; terminal inflorescences usually thin and interrupted $\qquad$ A. viridis

11 Utricles smooth to faintly rugose (occasionally wrinkled or rugose in dried material), distinctly exceeding the tepals; terminal inflorescences usually thick and dense (or thin and interrupted in some forms of $A$. blitum). 12 Utricles subglobose to obovate, compressed; seeds filling the fruit almost completely; leaf blades usually deeply notched at the tip; annual A. blitum

12 Utricles ellipsoid, slightly to distinctly inflated; seeds filling only the proximal portions of the fruit; leaf blades shallowly notched at the tip; short-lived perennials, or annuals
9 Utricles dehiscent; tepals of pistillate flowers usually usually 5 (3-5 in A. powellii); inflorescence bracts exceeding the tepals (shorter than the tepals in some cultivated forms); [subgenus Amaranthus].
13 Fully developed inflorescences large and robust, usually brightly colored (red, purple, occasionally white or yellow, rarely green); bracts usually not exceeding style branches at maturity (occasionally longer than the style branches in A. hypochondriacus); seeds white, ivory, red, brown, or black; [cultivated, only weakly naturalized].

14 Inflorescences stiff, erect
A. hypochondriacus 14 Inflorescences lax, erect to drooping.

15 Tepals of pistillate flowers (at least the inner tepals of the pistillate flowers) obovate or spatulate, the tip obtuse to slightly notched; style branches spreading or reflexed
[A. caudatus]
15 Tepals of pistillate flowers oblong to lanceolate, the tip acute; style branches erect or slightly reflexed..
A. cruentus

13 Fully developed inflorescences moderately large, usually green (rarely with some whitish or reddish coloration); bracts exceeding the style branches and tepals; seeds brown or black; [wild and weedy].
16 Tepals of pistillate flowers obtuse, rounded, or slightly notched at the tip; plants rather densely pubescent .... A. retroflexus

16 Tepals of pistillate flowers acute, acuminate, or aristate at the tip; plants slightly pubescent when young, becoming glabrous or nearly so.
17 Bracts 2-4 mm long; inflorescences usually soft and lax, with spreading branches . . . . . . . A. hybridus
17 Bracts 4-7 mm long; inflorescences usually stiff, with erect branches
A. powellii

* Amaranthus albus Linnaeus, Tumbleweed Amaranth. Cp, Pd, Mt (VA), ?? (GA, NC, SC): disturbed areas, agricultural fields; common. July-October. [= C, FNA, G, K, W, Y; A. albus var. albus -- F; A. graecizans Linnaeus, misapplied]
* Amaranthus arenicola I.M. Johnston, Sandhill Amaranth. Cp, Pd (VA): rare, introduced from western North America. [= C, FNA, G, K, X; A. torreyi -- F]

Amaranthus australis (A. Gray) J.D. Sauer, Southern Water-hemp. Cp (GA, NC, VA): tidal marshes, ditches; uncommon. VA, TN, AR, and TX south into West Indies, Mexico, and $n$. South America. This annual is alleged to sometimes get as large as 9 m tall and 30 cm diameter at the base of the stem! [= FNA, GW, K, X; Acnida cuspidata Bert. ex Sprengel; Acnida alabamensis

## Standley]

Amaranthus blitoides S. Watson, Matweed Amaranth, Prostrate Pigweed. (GA, SC, VA): [= C, FNA, K, S, Y; A. graecizans Linnaeus -- RAB, F, misapplied]

* Amaranthus blitum Linnaeus, Purple Amaranth, Livid Amaranth. Pd (SC) ?? (GA, NC, VA): First reported from South Carolina by Hill \& Horn (1997). [= C, FNA, G, K; A. lividus -- RAB, F, G; Amaranthus blitum Linnaeus ssp. emarginatus (MoquinTandon ex Uline \& Bray) Carretero -- Y]

Amaranthus cannabinus (Linnaeus) J.D. Sauer, Salt-marsh Water-hemp. Cp (GA, NC, SC, VA): salt, brackish, and freshwater tidal marshes, especially along the banks of tidal guts; common. July-December. Extremely variable in size, flowering and fruiting at heights ranging from 3 dm to 4 m tall. The stem can reach 10 cm in diameter at the base. [= RAB, C, FNA, GW, K, X; Acnida cannabina Linnaeus -- F, G, S]
*? Amaranthus crassipes Schlechtendahl var. crassipes, Spreading Amaranth. (SC): shores and wet areas; rare, probably introduced from tropical America. [= Z; A. crassipes - RAB, C, G, GW, K, S, in the narrow sense; A. crassipes - FNA, in a broad sense]

* Amaranthus crispus (Lespinasse \& Thévenau) A. Braun, Crisp-leaved Amaranth. Cp (NC, VA): disturbed areas, especially around seaports; introduced from South America. [= FNA, K, S]
* Amaranthus cruentus Linnaeus, Red Amaranth, Blood Amaranth, Purple Amaranth. (NC, SC): introduced from Central America. [= RAB, C, F, FNA, K, S, Y]
* Amaranthus deflexus Linnaeus, Large-fruit Amaranth, Argentine Amaranth. (GA, VA): introduced from South America. Reported for VA by Kartesz (1999) and FNA. [= FNA, K]
* Amaranthus hybridus Linnaeus, Smooth Amaranth, Green Amaranth, Hybrid Amaranth, Smooth Pigweed. Cp, Pd, Mt (GA, NC, SC, VA): July-O ctober. [= RAB, C, F, FNA, G, K, S, W; Amaranthus hybridus ssp. hybridus - Y]
* Amaranthus hypochondriacus Linnaeus, Prince's-feather. (VA): Type locality is "Virginia". Possibly of hybrid origin, from $A$. cruentus $\times$ powellii. [= FNA, K]
* Amaranthus palmeri S. Watson, Careless-weed. (GA, NC, SC, VA): [= RAB, C, F, FNA, G, K, X]
* Amaranthus polygonoides Linnaeus, Tropical Amaranth, Smartweed Amaranth. Cp (SC): disturbed areas; rare, introduced from tropical America. Reported for SC by FNA and Kartesz (1999). [= FNA, K]
* Amaranthus powellii S. Watson, Green Amaranth, Powell's Amaranth. (GA, NC, SC, VA): Widespread and common in PA (Rhoads \& Klein 1993). Many earlier reports of A. retroflexus may actually pertain to this species. [= FNA, K; Amaranthus retroflexus Linnaeus var. powellii (S. Watson) Boivin; Amaranthus powellii ssp. powellii - Y]

Amaranthus pumilus Rafinesque, Seabeach Amaranth, Dwarf Amaranth. Cp (NC, SC, VA): sea beaches, fore-dunes, island end flats, rarely on sound-side beaches; rare (US Threatened, NC Threatened, SC, Rare, VA Rare). Se. MA south to c. SC; presently known to be extant only from NC, n. SC, e. MD, DE (McAvoy 2002), se. NY (Long Island), VA, and NJ. Seeds of this plant require cold stratification, high temperatures, and light to germinate (Baskin \& Baskin 1998); this is apparently responsible for the late seasonality of the species (germination in late spring and early summer) and its seed-banking. See Hancock \& Hosier (2003) for discussion of the ecology of this interesting species. [= RAB, C, F, FNA, G, GW, K, S]

* Amaranthus retroflexus Linnaeus, Rough Pigweed, Redroot. Mt, Pd, Cp (GA, NC, SC, VA): July-October. [= RAB, C, F, FNA, G, K, S, W, Y]
* Amaranthus spinosus Linnaeus, Spiny Amaranth. Cp, Pd, Mt (GA, NC, SC, VA): introduced from tropical America. JulyOctober. [= RAB, C, F, FNA, G, K, S, W, Y]
* Amaranthus tuberculatus (Moquin-Tandon) J.D. Sauer, Inland Water-hemp. (GA, NC, SC). July-October. [= RAB, C, FNA, GW, K, W, X; Amaranthus rudis J.D. Sauer - K; Acnida altissima (Riddell) Moquin-Tandon ex Standley var. altissima -- F; Acnida altissima var. subnuda (S. Watson) Fernald -- F; Acnida altissima var. prostrata (Uline \& Bray) Fernald -- F; Acnida altissima -- G; Acnida subnuda (S. Watson) Standley -- G, S; Acnida tamariscina (Nuttall) Wood - GW, misapplied; Amaranthus tamariscinus Nuttall - X, misapplied; Amaranthus tuberculatus var. tuberculatus - Y]
* Amaranthus viridis Linnaeus, Slender Amaranth, Tropical Green Amaranth. (GA, NC, SC, VA): introduced from South America. [= RAB, C, F, FNA, G, K, Y; Amaranthus gracilis Desfontaines -- S]
* Amaranthus caudatus Linnaeus, Love-lies-bleeding, is cultivated and rarely escaped or persistent in TN (Chester, Wofford, \& Kral 1997), and scattered in PA (Rhoads \& Klein 1993). [= FNA, K, Y]
* Amaranthus thunbergii Moquin-Tandon, Thunberg's Amaranth. Collected from near wool-combing mills in SC; probably not naturalized. [= FNA, K]

## Celosia Linnaeus 1753 (Cockscomb)

A genus of about 45 species, of tropical and warm temperate regions of America and Africa. References: Robertson (1981)=Z; Robertson in FNA (2003b); Townsend in Kubitzki, Rohwer, \& Bittrich (1993).
1 Inflorescence of crowded spikes . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. argentea

1 Inflorescence crested, fanlike, or elaborately lobed . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. cristata

* Celosia argentea Linnaeus. Cp, Pd, Mt (NC): commonly cultivated, rarely escaped or persistent in disturbed areas, such as along creeks; rare, introduced from the Tropics. July-November. [= RAB, C, FNA, G, K, Z; C. argentea var. argentea -- F]
* Celosia cristata Linnaeus, Cockscomb. Pd (NC): commonly cultivated, rarely escaped or persistent in disturbed areas; rare, introduced from the Tropics. July-November. C. cristata is clearly closely related to and likely derived from C. argentea; it has been variously treated as a species, variety, or form. It is popular in gardens and institutional landscaping, but is not universally appreciated; Stace (1997) calls it "probably the world's ugliest plant." [= C, FNA, G, K, Z; C. argentea Linnaeus var. cristata (Linnaeus) Kuntze -- F]

## Froelichia Moench 1794 (Cottonweed, Snake-cotton)

A genus of about 18 species of tropical and subtropical America. References: McCauley in FNA (2003b); Robertson (1981)=Z; Townsend in Kubitzki, Rohwer, \& Bittrich (1993).

1 Calyx flask-shaped in fruit, ca. 5 mm long; plant 10-20 dm tall, not branching from the base ................... F. floridana
1 Calyx conical in fruit, ca. $3-4 \mathrm{~mm}$ long; plant $2-7 \mathrm{dm}$ tall, branching from the base $\ldots$. . . . . . . . . . . . . . . . . . . . F. gracilis
Froelichia floridana (Nuttall) Moquin-Tandon, Florida Cottonseed, Common Cottonweed. Cp (GA, NC, SC): sandhills, sandy fields, sandy roadsides; common (rare in NC). June-October. S. NC south to FL, and west to LA, north in the interior to w. TN; disjunct (probably introduced) in DE and e. MD. F. campestris Small is more midwestern, ranging from OH, IN, WI, and SD south to KY, AR, and TX; it is sometimes treated as a variety of $F$. floridana, but seems amply distinct in morphology, and with an allopatric distribution. [= RAB, S; F. floridana var. floridana -- C, F, G, K, Z; F. floridana - FNA, in a broad sense]

* Froelichia gracilis (Hooker) Moquin-Tandon, Slender Cottonweed. Cp, Pd (GA, NC, SC, VA), Mt (NC, VA): vacant lots, sandy fields, railroad banks; rare, introduced from mw. United States. June-October. [= RAB, C, F, FNA, G, K, W, Z]

## Gomphrena Linnaeus 1753 (Globe-amaranth)

A genus of about 100-120 species, of the tropics and subtropics of America and Australia (naturalized elsewhere). References: Clemants in FNA (2003b); Townsend in Kubitzki, Rohwer, \& Bittrich (1993). Key based on Clemants in FNA (2003b).

1 Heads 20-28 mm in diameter; stems erect . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . G. globosa
1 Heads 8-16 mm in diameter; stems prostrate or decumbent . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . G. serrata

* Gomphrena globosa Linnaeus, Globe-amaranth. Cp (SC) (VA?): disturbed areas; rare, introduced from s. Asia. Introduced and known from scattered locations in s. PA (Rhoads \& Klein 1993). Also reported for VA (Kartesz 1999) and MD (Reed1961b). [= K]

Gomphrena serrata Linnaeus, Arrasa con todo. Cp (GA), (VA?): sandy woodlands and disturbed areas; rare. Also reported for VA by Kartesz (1999) \{investigate\}. [= K; G. dispersa Standley - S]

## Guilleminea Kunth 1823

A genus of 2-5 species of sw. North America, Central America, and South America. References: Clemants in FNA (2003b); Henrickson (1987)=Z; Townsend in Kubitzki, Rohwer, \& Bittrich (1993).

* Guilleminea densa (Humboldt \& Bonplandt ex Willdenow) Moquin-Tandon var. aggregata Uline \& Bray. Cp (SC): sandy disturbed area; rare, introduced from sw. United States. First reported for SC by Nelson \& Kelly (1997). [=FNA, K, Z]

## Iresine P. Browne 1856 (Bloodleaf)

A genus of about 80 species of tropical and temperate regions (especially America). References: Clemants in FNA (2003b); Townsend in Kubitzki, Rohwer, \& Bittrich (1993).

1 Plant an annual to weak perennial, 4-30 dm tall, with fibrous roots; tepals 0.6-0.8 mm long, the tips obtuse to rounded [I. diffusa] 1 Plant a perennial, 3-10 dm tall, with stolons; tepals 1.0-1.3 mm long, the tips acute to acuminate ............ I. rhizomatosa

Iresine rhizomatosa Standley. $\mathrm{Cp}(\mathrm{GA}, \mathrm{NC}, \mathrm{SC}, \mathrm{VA}), \mathrm{Pd}(\mathrm{VA})$ : moist interdune thickets, edges of maritime forests, moist thickets inland; rare (VA Watch List). August-October. MD south to FL, west to se. TX; also inland from KY and TN west and south to KS and n . TX. [= RAB, C, F, FNA, G, K, S]

Iresine diffusa Humboldt \& Bonpland ex Willdenow was reported for NC by Small (1933), so far as is known in error. It is known from n. FL, not far from GA. [= FNA, K; Iresine celosia Linnaeus - S]

## ANACARDIACEAE (Cashew Family)

A family of about 70 genera and about 875 species, trees, shrubs, lianas, and rarely herbs, of tropical, subtropical, and temperate regions. References: Barkley (1937).

```
1 Leaves simple
Cotinus
1 Leaves compound.
    2 Fruits red, glandular pubescent; foliage and stems lacking contact poisons; inflorescences dense, either terminal or lateral
        on last year's growth
            Rhus
```

2 Fruits white or yellow, glabrous or puberulent (the hairs not glandular); foliage and stems containing contact poisons; inflorescences openly branched, axillary

Toxicodendron

Cotinus P. Miller (Smoketree)

A genus of 3-5 species, of southeastern United States and temperate Eurasia.

1 Leaves elliptic, to 10 cm long; [planted tree] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [C. coggygria]
1 Leaves obovate, to 20 cm long; [native tree of calcareous habitats] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. obovatus
Cotinus obovatus Rafinesque, American Smoketree. Mt (GA): limestone woodlands and glades; rare (GA Special Concern). Se. TN (Cumberland Plateau) (Chester, Wofford, \& Kral 1997), nw. GA, and n. AL west to OK and TX. It is a small tree of limestone woodlands and glade margins. It is occasionally planted as an ornamental tree. [=K; = C. americanus Nuttall -- S]

* Cotinus coggygria Scopoli, European Smoketree, is planted as an ornamental. There is no evidence of its naturalization or persistence in our area. [= K]

## Rhus Linnaeus (Sumac)

A genus of about 25 species, trees, shrubs, and lianas, temperate and subtropical, of Eurasia, Hawaii, North America, and n. Central America. References: Hardin \& Phillips (1985a); Miller, Young, \& Wen (2001).

1 Leaves 3-foliolate; shrub to 2 m tall; inflorescence of small lateral and terminal clusters; [subgenus Lobadium]
$\qquad$
1 Leaves (5-) 7-31-foliolate; shrub or small tree, to 12 m tall; inflorescence of dense, terminal panicles; [subgenus $R h u s$ ].
2 Rachis of the leaf winged between each pair of adjacent leaflets; stems and petioles puberulent; leaflets entire to remotely toothed.
3 Leaflets 11-23, attenuate to base, 4-9 cm long, 1-2 cm wide, typically with an obtuse tip $\qquad$ 3 Leaflets 5-13, rounded to base on the upper side, 4-9 cm long, $1.5-4 \mathrm{~cm}$ wide, typically with an acute to acuminate tip . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Rh. copallinum var. latifolia
2 Rachis of the leaf not winged between each pair of adjacent leaflets (sometimes winged between the last 1 or 2 pairs of leaflets on each side of the rachis); stems and petioles either densely villous or essentially glabrous; leaflets sharply and rather coarsely serrate.
4 Leaflets densely pubescent (rarely sparsely pubescent); short shrubs to 1 m tall; stems densely long-pubescent; rachis of the leaf often winged terminally; leaflets mostly ovate, averaging about $2 \times$ as long as wide, acute Rh. michauxii
4 Leaflets glabrous, glaucous beneath; medium shrubs to small trees, to 12 m tall; stems densely long-pubescent or essentially glabrous; rachis of the leaf not winged; leaflets mostly lanceolate, averaging $3-4 \times$ as long as wide, acuminate.
5 Stems essentially glabrous; pubescence of the fruit short and blunt-tipped . . . . . . . . . . . . . . . . . . . Rh. glabra
5 Stems densely long-pubescent; pubescence of the fruit long and pointed . . . . . . . . . . . . .... Rh. typhina
\{add Rh. copallinum var. leucantha to key\}
Rhus aromatica Aiton var. aromatica, Fragrant Sumac, Squawbush. Pd, Mt (GA, NC, SC, VA), Cp (GA): rocky, rather dry, woodlands, usually over mafic rocks (such as gabbro or diabase) or calcareous rocks, less commonly in sandy soils; uncommon. Late February-early May; late April-June. The species ranges throughout much of temperate North America; var. aromatica is the most eastern component of the complex, widespread in e. North America west to TX, KS, and MI. The foliage of Rh. aromatica bears some superficial resemblance to Toxicodendron pubescens. [= C, F, G, K; < Rh. aromatica -- RAB, W; Schmaltzia crenata (P. Miller) Greene -- S]

Rhus copallinum Linnaeus var. copallinum, Winged Sumac, Flameleaf Sumac. Cp, Pd, Mt? (GA, NC, SC, VA?): sandhills, dry woodlands, old fields, roadsides; common. The relative ranges, habitats, and characteristics of the varieties of $R$. copallinum need further elucidation. [= K; <Rh. copallina -- RAB, W; <Rh. copallinum -- C, G, S; Rh. copallina var. copallina -- F]

Rhus copallinum Linnaeus var. latifolia Engler, Eastern Winged Sumac. Mt (GA, NC, SC?, VA), Pd (GA?, NC?, SC?, VA): rocky glades, dry woodlands; uncommon. See comments under var. copallinum. [=K; < Rh. copallina -- RAB, W; < Rh. copallinum -- C, G, S; Rh. copallina var. latifolia -- F]

Rhus copallinum Linnaeus var. leucantha (Jacquin) Augustin de Candolle, Southern Winged Sumac. [= K; < Rh. copallina RAB, W; < Rh. copallinum - C, G; Rh. leucantha Jacquin - S; Rh. obtusifolia (Small) Small - S]

Rhus glabra Linnaeus, Smooth Sumac. Mt, Pd, Cp (GA, NC, SC, VA): disturbed areas, clearings, roadsides, woodlands; common (rare in Coastal Plain). Late May-July; June-October. Widespread in e. North America. [= RAB, C, G, K, S, W; Rh. glabra var. glabra -- F]

Rhus michauxii Sargent, Michaux's Sumac, Dwarf Sumac. Cp (NC, SC), Pd (GA, NC, VA): in the fall line sandhills characteristically in submesic, loamy swales, usually associated with such species as Paspalum bifidum, Helianthus divaricatus, Tridens carolinianus, Rhus copallinum, Anthaenantia villosa, Gymnopogon sp., and Aristida lanosa; in the eastern Piedmont on sandy soils derived from granite; in the central Piedmont on clayey soils derived from mafic rocks such as gabbro or mafic Carolina
slates, probably all of its habitats (formerly) in frequently burned situations; rare (US Endangered, GA Endangered, NC Endangered, SC Rare, VA Rare). June; August-September. Rare and scattered (though formerly more common) from s. VA south to GA. Large populations were found in sc. VA (Nottoway and Dinwiddie counties) in frequently burned military artillery "impact areas" (Fleming \& Ludwig 1996). Barden \& Matthews (2004) present a detailed account of its discovery by André Michaux in 1794 in what is now Union County, NC. [= RAB, K, S; = Rh. pumila Michaux]

Rhus typhina Linnaeus, Staghorn Sumac. Mt (GA, NC, SC, VA), Pd (NC, SC, VA): roadsides, old pastures, thickets, clearings, rock outcrops, barrens; common (uncommon in upper Piedmont only) (GA Special Concern). May-June; JuneSeptember. Widespread in ne. North America, south in the mountains to n. GA. The apparently older epithet "hirta" was rejected in 1999. The species, especially in its cut-leaved forms, forma laciniata (Wood) Rehder and forma dissecta Rehder, is very popular in Europe as a cultivated ornamental. [= RAB, C, F, G, K, W; Rh. hirta (Linnaeus) Sudworth -- S]

Two hybrids have been documented to occur naturally in our area: Rhus $\times$ pulvinata Greene (glabra $\times$ typhina) and Rhus $\times$ ashei (Small) Greene (glabra $\times$ michauxii). They are intermediate between their parents. For instance, $R$. $\times$ ashei has sparsely pubescent leaves and stems, slight winging of the rachis between the terminal leaflets, potentially greater stature than $R$. michauxii, and leaflets with a length/width ratio of 2.5-3. Hardin \& Phillips (1985b) discuss other natural and artificial hybrids in Rhus.

## Toxicodendron P. Miller (Poison Ivy, Poison Oak, Poison Sumac)

A genus of about 10-15 species, trees and shrubs, primarily temperate, of North America, n. South America, Indonesia, and e. Asia. References: Gillis (1971)=Z.

Leaflets 7-13, entire; small tree
T. vernix

1 Leaflets 3, toothed, lobed, or entire; shrub or vine.
2 Fruits glabrous (or very sparsely pubescent); leaflets coarsely toothed or notched (rarely entire); lower surfaces of leaflets glabrous to pubescent, but without tufts of tannish hairs in the vein axils.
3 Leaflets suborbicular or broadly ovate, nearly as wide as long; petiole glabrous (rarely glabrescent); plant a shrub, the stems upright, entirely lacking aerial roots, not vining; fruits (3-) 4-7 mm in diameter . . . . . . . . . . . . T. rydbergii 3 Leaflets ovate to lanceolate; petiole puberulent to densely pubescent; plant a shrub or vine, the stems upright or twining; fruits 2.5-5.5 mm in diameter . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . T. radicans var. negundo
2 Fruits pubescent or papillose; leaflets entire, coarsely toothed, undulate, or round-lobed; lower surfaces of leaflets either velvety puberulent, sometimes becoming glabrate in age (T. pubescens) or glabrous (glabrescent or rarely pilose beneath) but with prominent tufts of tannish hairs present in the vein axils (T. radicans ssp. radicans).
4 Leaves sparsely pubescent (rarely pilose beneath), the apex and the lobes (if present) generally acute to acuminate; drupes; plant a high-climbing vine or stoloniferous shrub; [of mesic, swampy, or dry habitats]
T. radicans var. radicans

4 Leaves velvety puberulent (sometimes becoming glabrate in age), the apex and the lobes (if present) generally obtuse to broadly acute; drupes pubescent (becoming glabrate); plant a stoloniferous shrub; [of dry habitats, especially sandhills]
T. pubescens

Toxicodendron pubescens P. Miller, Poison Oak. Cp, Pd, Mt (GA, NC, SC, VA): dry woodlands, around dry rock outcrops in the Piedmont and Mountains, especially prevalent in sandhills; common (uncommon in Piedmont and Mountains). Late April-May; August-October. Primarily Southeastern: NY (Long Island) south to n. FL, west to e. TX, inland to WV, e. TN, c. TN, se. MO, and s. KS. The nomenclatural confusion may still not be resolved. [=C, K; Rhus toxicodendron -- RAB, F, G; T. toxicodendron (Linnaeus) Britton -- S; T. toxicarium Gillis -- W, Z; T. quercifolium (Michaux) Greene]

Toxicodendron radicans (Linnaeus) Kuntze var. negundo (Greene) Reveal, Midwestern Poison Ivy. Mt, Pd (VA): in a wide range of habitats, including mesic forests, rock outcrops, open areas, and disturbed ground; uncommon? Late April-May; AugustOctober. NY west to MI, MN, and NE, south to sw. VA, KY, AR, and TX, almost entirely in or west of the Appalachians. In our area seemingly mostly in the New River drainage; to be expected in nw. NC. [= C; = Rhus radicans var. vulgaris (Michaux) Augustin de Candolle forma negundo (Greene) Fernald -- F, G; = T. radicans ssp. negundo (Greene) Gillis -- K, Z]

Toxicodendron radicans (Linnaeus) Kuntze var. radicans, Eastern Poison Ivy. Pd, Cp, Mt (GA, NC, SC, VA): in a wide range of habitats, including mesic forests, rock outcrops, swamp forests, brackish marshes, open areas, disturbed ground, usually in more mesic to hydric sites than T. pubescens, and particularly common in areas with fertile soils, such as bottomlands or over calcareous rocks or calcareous sands (as in maritime forests; common. Late April-May; August-October. Var. radicans is the typical poison ivy of the Atlantic and Gulf Coastal Plains, rarely found west of the Appalachians. It ranges from Nova Scotia south to s. FL (and the Bahamas), west to e. TX, inland to VT, c. PA, WV, KY, and AR. It is normally a vine, climbing by adventitious roots, and can attain diameters of 10 cm and climb to the crowns of forest trees. It can also resemble $T$. pubescens in habit, producing numerous meter-high upright stems from rhizomes. T. radicans var. radicans is ubiquitous in our area, absent only from the high mountains of NC. [= C; < Rhus radicans Linnaeus -- RAB; = Rhus radicans var. radicans -- $\mathrm{F}, \mathrm{G} ;=$ Rhus radicans var. vulgaris (Michaux) Augustin de Candolle forma vulgaris -- F, G; < T. radicans -- GW, S, W; = T. radicans ssp. radicans -- K]

Toxicodendron rydbergii (Small ex Rydberg) Greene, Western Poison Ivy. Mt (VA): acid pine-oak forests and woodlands at moderate elevations; rare (VA Rare). Nova Scotia west to British Columbia, south to New England, NY, n. OH, n. IL, IA, w. KS, w. TX, AZ, and OR; disjunct in the Appalachians in PA, WV, and VA. Reported for NC by Gillis (1971), but the location (Cumberland Co., in the fall-line Sandhills), does not seem plausible \{investigate further with specimen\}. [= C, K, Z; = Rhus radicans var. rydbergii (Small) Rehder -- F, G; = T. radicans (Linnaeus) Kuntze var. rydbergii (Small ex Rydberg) Erskine]

Toxicodendron vernix (Linnaeus) Kuntze, Poison Sumac, Thunderwood. Cp, Mt, Pd (GA, NC, SC, VA): in peaty habitats, in the Sandhills frequent in streamhead pocosins and sandhill seepage bogs, in the mountains in bogs; uncommon (rare in Mountains and Piedmont). May-early June; August-September. Widespread in e. North America. The leaf rachis and leaflet petiolules are usually a dark red or maroon color. The leaves turn a very attractive shade of orange-red in autumn. [= C, GW, K, S, W; = Rhus

Toxicodendron radicans (Linnaeus) Kuntze var. pubens (Engelmann ex S. Watson) Reveal is reported for VA by Kartesz (1999). \{investigate - Tom Wieboldt\} [<T. radicans - GW, S, W; T. radicans ssp. pubens (Engelmann ex S. Watson) Gillis - K, Z] \{not yet keyed\}

## ANNONACEAE A.L. de Jussieu 1789 (Custard-apple Family)

A family of about 128 genera and about 2300 species, trees, shrubs, and lianas, mostly tropical. Kessler in Kubitzki, Rohwer, \& Bittrich (1993).

## Asimina Adanson 1763 (Pawpaw)

A genus of 8 species of shrubs and small trees, endemic to e. North America. References: Kral (1960)=Z; Wilbur (1970a)=Y; Godfrey (1988)=X; Ward (2001); Kessler in Kubitzki, Rohwer, \& Bittrich (1993).

1 Leaves herbaceous in texture, obovate, $>6 \mathrm{~cm}$ wide, acute-acuminate at the apex; peduncles with bracts; flowers reddishmaroon; [shrubs and trees]; [collectively widespread in our area]; [section Asimina, subsection Asimina].
2 Flowering peduncles $3-8 \mathrm{~mm}$ long, the hairs tan to rusty; leaves $6-15(-20) \mathrm{cm}$ long; sepals 4-7 mm long; outer petals 1013 mm long; fruit 1-3 (-6) cm long; plant a shrub to 2 m (rarely to 5 m ) tall; [primarily of the Coastal Plain in our area, extending into the Piedmont in NC and SC, and into the Mountains in SC]
A. parviflora

2 Flowering peduncles (10-) 15-20 (-25) mm long, the hairs dark reddish-brown; leaves $15-35 \mathrm{~cm}$ long; sepals $8-12 \mathrm{~mm}$ long; outer petals $15-25 \mathrm{~mm}$ long; fruit (3-) $7-15 \mathrm{~cm}$ long; plant a tree to 15 m tall; [widespread in our area] .... A. triloba
1 Leaves coriaceous in texture, linear to oval, blunt at the tip (or acute-acuminate); peduncles lacking bracts; flowers maroon, pale pink, yellow, cream, or white; [shrubs to 1.75 m tall]; [of e. GA, very rarely e. SC, and southwards]; [section Asimina, subsection Pityothamna].
3 Flowers borne on growth of the previous year, appearing before or with leaf expansion; young growth densely pubescent with blond to tan pubescence (except $A$. ×nashii, which may be sparsely or densely pubescent, the hairs tan or red).
4 Young leaves densely tomentose on the upper and lower surfaces with blonde or tan pubescence; bark of older wood brown to gray
A. incana

4 Young leaves sparsely pubescent; bark of older wood reddish brown
A. $\times$ nashii

3 Flowers borne on growth of the current year, appearing after leaf expansion; young growth glabrous to sparsely pubescent, the hairs reddish.
5 Outer petals maroon or red, 1.5-3 cm long; leaves erect and secund, 4-11 cm long, 1-4 cm wide, averaging $3-5 \times$ as long as wide; leaf tips obtuse, rounded, or rounded-emarginate (rarely somewhat acute) . ........... A. pygmaea 5 Outer petals yellowish white or pale pink, 3-10 cm long; leaves erect and secund, or not, (4-) 7-15 (-20) cm long, 0.53 cm wide, averaging $6-15 \times$ as long as wide; leaf tips acute or obtuse.
6 Leaves (4-) $7-15 \mathrm{~cm}$ long, $1.5-3 \mathrm{~cm}$ wide, oblong to oblong-lanceolate (rarely broadly spatulate) . . . A. $\times$ nashii 6 Leaves 5-15 (-20) cm long, 0.5-3 cm wide, linear linear-elliptic, or oblanceolate.

7 Leaves widest at or shortly above the middle, mostly $10-15 \times$ as long as wide; leaf margins revolute; outer petals white; new growth pubescent, becoming glabrous with age . . . . . . . . . . . . . . . . . . . . A. Iongifolia
7 Leaves widest near the tip, mostly $6-12 \times$ as long as wide; leaf margins slightly revolute; outer petals white or pink; new growth glabrous or very sparsely pubescent, becoming glabrous with age ..... A. spatulata

Asimina incana (W. Bartram) Exell, Flag Pawpaw, Polecat Bush, Woolly Pawpaw. Cp (GA): dry pinelands; uncommon. E. GA south to c. peninsular FL, occurring in dry pinelands. [= FNA, K, Y; Pityothamnus incanus (W. Bartram) Small -- S; A. speciosa Nash -- Z; A. incarna -- X, orthographic variant]

Asimina longifolia Kral, Slimleaf Pawpaw. Cp (GA): dry pinelands; common. Se. GA south to c. peninsular FL, west to about the Suwannee River in the e. Panhandle of FL. [= A. longifolia var. longifolia -- FNA, X, Z; < Pityothamnus angustifolius (Rafinesque) Small -- S, in part; < A. angustifolia Rafinesque -- K, Y, in part]

Asimina $\times$ nashii Kral [A. incana $\times$ longifolia]. $\mathrm{Cp}(\mathrm{GA})$ : dry pinelands; rare. Occurs in the area of overlap of the two parents. It is known from e. GA. [= FNA, K, X, Z]

Asimina parviflora (Michaux) Dunal, Dwarf Pawpaw, Small-flowered Pawpaw, Small-fruited Pawpaw. Cp (GA, NC, SC, VA), Pd (GA, NC, SC), Mt (GA, SC): sandy or rocky, dry to fairly moist forests; common. April-May; July-September. Se. VA south to c. peninsular FL, west to se. TX, primarily on the Coastal Plain, but inland to sw. SC, n. GA, sc. TN, and n. MS. [= RAB, C, F, G, FNA, K, S, W, X, Y, Z]

Asimina pygmaea (W. Bartram) Dunal, Dwarf Pawpaw. Cp (GA): pine flatwoods, wet savannas; rare (GA Special Concern). Se. GA south to c. peninsular FL. It is a dwarf shrub 2-3 dm tall of pine flatwoods, occupying wetter sites than the other "pineland pawpaws." [= FNA, GW, X, Z; A. pygmea -- K, Y, orthographic variant; Pityothamnus pygmeus (W. Bartram) Small]

Asimina reticulata Shuttleworth ex Chapman, Netleaf Pawpaw. Cp (GA): wet flatwoods, savannas; rare (GA Special Concern). Reported for GA by GAHP (2003) and Kartesz (1999). [= FNA, K; Pityothamnus reticulatus (Shuttleworth ex Chapman) Small - S; A. cuneata Shuttleworth ex A. Gray] \{add to key; add synonymy\}

Asimina spatulata (Kral) D.B. Ward, Slimleaf Pawpaw. Cp (GA, SC): dry pinelands, dry maritime forest; rare. E. GA (very near se. SC), southwards to n. FL, west to Panhandle FL and s. AL; disjunct in Charleston County, SC (P. McMillan, pers.comm. 2004). [= Asimina longifolia Kral var. spatulata Kral - FNA, X, Z; < Pityothamnus angustifolius (Rafinesque) Small -- S, in part; < A. angustifolia Rafinesque -- K, Y, in part]

Asimina triloba (Linnaeus) Dunal, Common Pawpaw, Indian-banana. Mt, Pd, Cp (GA, NC, SC, VA): alluvial forests, other moist, nutrient-rich forests; common. March-May; August-October. NJ, w. NY, and s. Ontario west to s. MI and e. NE, south to panhandle FL, s. LA, and ne. TX. [= RAB, C, F, FNA, G, K, S, W, X, Y, Z]

## APIACEAE or UMBELLIFERAE (Carrot Family)

 (also see ARALIACEAE)A family of about 445 genera and about 3540 species of herbs (rarely shrubs or trees), cosmopolitan, but especially north temperate. Hydrocotyle is more closely related to Araliaceae, and has been transferred there (Chandler \& Plunkett 2004). References: Mathias \& Constance (1945)=MC.
[only a small fragment of the key to genera complete at this time]

1 Fruits (partly to fully mature) with thin-edged wings; flowers yellow, maroon, or white; central flower of each umbellet staminate and pedicelled; fruits all pedicelled in all umbellets
1 Fruits ribbed (with rounded, cordlike ribs), lacking thin-edged wings; flowers yellow; central flower of each umbellet either staminate and pedicelled, or pistillate and sessile; fruits all pedicelled in some umbellets (those with a staminate central flower), or the central fruit sessile in some umbellets (those with a pistillate central flower)

Zizia

## Aegopodium Linnaeus (Goutweed)

A genus of 7 species of herbs of temperate Eurasia. References: Mathias \& Constance (1945)=MC.

* Aegopodium podograria Linnaeus, Goutweed. Mt, Pd (GA, NC, VA), Cp (SC, VA): disturbed areas; rare, native of Europe. The cultivated forms encountered in our area are usually those with white-margined or variegated leaves. [= C, F, K, MC; > Ae. podograria var. podograria - RAB, G; > Ae. podograria var. variegatum Bailey -- RAB, G]

## Aethusa Linnaeus

* Aethusa cynapium Linnaeus, Fool's-parsley, is introduced and naturalized in ne. United States, at least as far south as se. PA (Rhoads \& Klein 1993) and Pocahontas County, WV. [= C, K]

## AmmiLinnaeus (Bishop's-weed)

A genus of about 4 species of herbs, distributed in Eurasia. References: Mathias \& Constance (1945)=MC.
1 Lower leaves with elliptic to narrowly elliptic segments; fruits $1.5-2 \mathrm{~mm}$ long; rays not rigid and thickened at maturity; bracts not strongly reflexed in fruit
1 Lower leaves with filiform segments; fruits 2-2.8 mm long; rays rigid and thickened at maturity; bracts strongly reflexed in fruit .
A. visnaga

* Ammimajus Linnaeus, Bullwort. Cp (GA, SC): disturbed areas; rare, native of Mediterranean Europe. June. [= RAB, K, MC, S]
* Ammi visnaga (Linnaeus) Lamarck, Toothpick-plant. Cp (NC): dry sandy roadsides; rare, native of Mediterranean Europe. May-June. [= RAB, K, MC, S]

## Ammoselinum Torrey \& A. Gray (Sand-parsley)

A genus of 3 species of herbs, of sc. and sw. North America and temperate s. South America. References: Mathias \& Constance (1945)=MC.

| 1 | Umbels sessile; fruit glabrous (or slightly roughened) . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. butleri |
| :--- | :--- |
| 1 Umbels pedunculate; fruit roughened with well-developed teeth . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [A. popei] |  |

1 Umbels pedunculate; fruit roughened with well-developed teeth
[A. popei]

* Ammoselinum butleri (Engelmann ex S. Watson) Coulter \& Rose. Pd (NC): disturbed places; rare, native further south and west. March-April. Boufford (1977) reports the naturalization of this diminutive midwestern umbel on a grassy, weed-covered slope. [ $=\mathrm{GW}, \mathrm{K}, \mathrm{MC}$ ]

Ammoselinum popei Torrey \& A. Gray, Sand-parsley, ranges from OK, TX, and NM south to ne. Mexico (Nuevo Léon); disjunct and apparently native in the Nashville Basin of c. TN. [= K, MC]

A monotypic genus, the single species apparently native to sw. Asia. References: Mathias \& Constance (1945)=MC.

* Anethum graveolens Linnaeus, Dill, Dillweed. Mt, Pd (NC, VA): roadsides, disturbed areas, abandoned garden plots; rare, native of Mediterranean Europe. June-July. [= RAB, C, F, G, K, MC, S]

## Angelica Linnaeus (Angelica)

A genus of about 110 species, herbs of the northern hemisphere. References: Mathias \& Constance (1945)=MC.
1 Umbels densely pubescent; ovary and fruit pubescent; larger leaflets 3-6 cm long, 1-2.5 cm wide, obtuse at the apex; [widespread in our area, in dry to mesic habitats] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. venenosa
1 Umbels glabrous or sparsely pubescent; ovary and fruit glabrous or sparsely pubescent; larger leaflets $8-15 \mathrm{~cm}$ long, 4-8 cm wide, acute to acuminate at the apex; [restricted to the Mountains in our area, in mesic habitats].
2 Leaflets acute, the margin hyaline and mostly glabrous; [rare and possibly only introduced in our area] . A. atropurpurea
2 Leaflets acuminate, the margin ciliolate; [native] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. triquinata
*? Angelica atropurpurea Linnaeus, Purple Angelica. Mt (NC): moist roadsides and streambanks; rare, possibly introduced from nc. North America. May-June; July-August. [= RAB, C, G, K, MC, W; > A. atropurpurea var. atropurpurea -- F]

Angelica triquinata Michaux, Mountain Angelica, Filmy Angelica. Mt (GA, NC, VA): mesic forests at moderate to high elevations, grassy balds, brookbanks; common. August-September; September-October. PA south to sw. NC, se. TN, and n. GA, a Southern and Central Appalachian endemic. The nectar is very attractive, but apparently strongly intoxicating, to yellow jackets and hornets; on the grassy balds of Roan Mountain one can see thousands of umbels of Angelica densely coated by lethargic bees. [= RAB, C, F, G, K, MC, W; A. curtisii Buckley -- S]

Angelica venenosa (Greenway) Fernald, Hairy Angelica. Mt, Pd, Cp (GA, NC, SC, VA): dry forests and woodlands, woodland borders, longleaf pine sandhills; common. June-August; July-September. MA west to MN, south to panhandle FL, MS, and AR. Populations of this species in dry sandhill communities in the Fall Line Sandhills have a number of peculiar features: basal leaves often borne appressed against the ground, small leaflets, coarse and more equilateral toothing of the leaflets. These populations may be worthy of taxonomic recognition; they need further study. [= RAB, C, F, G, K, MC, W; A. villosa (Walter) Britton, Sterns, \& Poggenburg -- S]

Angelica dentata (Chapman) Coulter \& Rose, Sandhill Angelica. Cp (GA): sandhills; rare (GA Special Concern). Sw. GA, sc. GA, and Panhandle FL. [= K, MC] \{not yet keyed\}

Angelica lucida Linnaeus is reported by Harvill et al. (1992) for Warren County, VA. More information is needed to substantiate this surprising record, presumably from cultivation. [ $=\mathrm{K}, \mathrm{MC}$; = Coelopleurum lucidum (Linnaeus) Fernald - F] \{not keyed; add synonymy\}

## Anthriscus Persoon (Chervil)

A genus of about 10 species, herbs, of Eurasia and mountains of Africa. References: Spalik (1996)=Z; Mathias \& Constance (1945)=MC.

1 Fruit ovoid, 2.9-3.2 mm long, hispid with hooked hairs; [section Anthriscus] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. caucalis 1 Fruit lanceolate or linear, 6-10 mm long, glabrous.

2 Beak of fruit (1-) 2-4 mm long; plant an annual; umbel rays pubescent; [section Anthriscus] . . . . . . . . . . . . A. cerefolium
2 Beak of fruit ca. 1 mm long; plant a perennial; umbel rays glabrous (or nearly so); [section Cacosciadium]
A. sylvestris ssp. sylvestris

* Anthriscus caucalis Bieberstein, Bur Chervil, Bur-parsley. Mt (NC), Pd (NC, SC, VA), Cp (NC, SC): disturbed areas; rare, introduced from Europe. April-May; May-June. First reported for South Carolina by Hill \& Horn (1997). [= C, K, Z; A. scandicina (Weber ex Wiggers) Mansfeld -- RAB, F, G, MC]
* Anthriscus cerefolium (Linnaeus) Hoffmann, Garden Chervil. Pd (VA): cultivated in gardens, sometimes persistent or escaped; rare, introduced from Europe. May-July. [= C, F, G, K, MC, Z]
* Anthriscus sylvestris (Linnaeus) Hoffmann ssp. sylvestris, Wild Chervil, Cow-parsley. Mt (VA): moist disturbed areas; rare, introduced from Europe. May-July. This species has also been reported from the NC-TN state line, on Roan Mountain (Mellichamp, Matthews, \& Smithka 1987,1988 ), but the population is actually entirely in TN. [ $=Z ;<A$. sylvestris -- C, F, G, K, MC]

## Apium Linnaeus (Celery)

A genus of about 25 species, herbs, of temperate and subtropical regions. References: Mathias \& Constance (1945)=MC.

| 1 | Involucel absent; fresh plant smelling of celery; stem solid . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. graveolens var. dulce |
| :--- | :--- |
| 1 Involucel present; fresh plant not smelling of celery; stem hollow . . . . . . . . . . . . . . . . . . . . . . . . . . . A. Aodiflorum |  |

* Apium graveolens Linnaeus var. dulce (P. Miller) Augustin de Candolle, Celery. Cp (NC, SC): disturbed areas, escaped or
persisting from cultivation; rare, native of Europe. June-July; July-August. [= K; < A. graveolens Linnaeus -- RAB, C, F, G, MC; < Celeri graveolens (Linnaeus) Britton -- S]
* Apium nodiflorum (Linnaeus) Lagasca y Segura, Fool's Watercress. Cp (SC): disturbed areas near old seaports; rare, introduced from Europe. [= RAB, K, MC; = Ciclospermum nodiflorum (Linnaeus) W.D.J. Koch -- S]

Bupleurum Linnaeus (Hare's-ear, Thoroughwax)
A genus of about 190 species, herbs and shrubs, primarily Eurasian. References: Mathias \& Constance (1945)=MC.

1 Upper leaves ovate perfoliat B. rotundifolium

* Bupleurum gerardii Allioni. Mt (VA): disturbed areas over limestone; rare, native of Eurasia. [B. odontites Linnaeus -- K, apparently misapplied; B. fontanesii Guss. ex Careul -- C, G, MC, apparently misapplied]
* Bupleurum rotundifolium Linnaeus, Hare's-ear, Thoroughwax. Mt (VA), Pd (NC, VA): lawns, disturbed areas; rare, native of Eurasia. June. [= RAB, C, F, G, K, MC, S, W]
* Bupleurum lancifolium Hornemann is reported as a waif for MD by Shetler \& Orli (2000) and Reed (1964). [= K] \{not keyed\} * Bupleurum odontites Linnaeus is reported as a waif for MD by Shetler \& Orli (2000) and Reed (1964). [= K; B. fontanesii Guss. ex Careul -- C, G, MC] \{not keyed\}

## Carum Linnaeus (Caraway)

A genus of about 30 species, temperate. References: Mathias \& Constance (1945)=MC

* Carum carvi Linnaeus, Caraway. Mt (NC, VA): disturbed areas; rare, native of Eurasia. May-June. [= RAB, C, F, G, K, MC]

## Centella Linnaeus (Centella, Coinleaf)

A genus of about 40 species, of warm temperate and tropical regions, centered in s. Africa. References: Mathias \& Constance (1945)=MC.

Centella erecta (Linnaeus f.) Fernald, Centella, Coinleaf. Cp (GA, NC, SC, VA): savannas, pondshores, ditches, and a wide variety of other moist to wet habitats; common. June-August; July-September. DE south to FL, west to TX. C. erecta has sometimes been included in the pantropical C. asiatica, but the two taxa differ in morphology and chromosome number (C. erecta has $\mathrm{n}=27, C$. asiatica has $\mathrm{n}=9$ ). [ $=\mathrm{C}, \mathrm{F}, \mathrm{G}, \mathrm{K}, \mathrm{Z} ;<\mathrm{C}$. asiatica (Linnaeus) Urban -- RAB, GW, misapplied; C. repanda (Persoon) Small -- S]

## Chaerophyllum Linnaeus (Chervil)

A genus of about 35 species, herbs, of north temperate areas. References: Mathias \& Constance (1945)=MC.

1 Ribs of fruit broad, the intervals between the ribs much narrower than the ribs.
2 Fruit pubescent . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Ch. tainturieri var. dasycarpum
2 Fruit glabrous . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Ch. tainturieri var. tainturieri
1 Ribs of fruit narrow, the intervals between the ribs equal to or wider than the ribs.
3 Fruit glabrous, 6-10 mm long, 1.5-2 mm broad ................................. . Ch. procumbens var. procumbens

Chaerophyllum procumbens (Linnaeus) Crantz var. procumbens, Common Spreading Chervil. Pd, Cp (NC, SC, VA), Mt (VA), province \{GA\}: alluvial forests; common (uncommon in NC, rare in SC) (GA Special Concern). Late March-April; April-May. NY and s. Ontario to MI, s. WI, and e. NE, south to GA, AR, and OK. [= RAB, C, F, G, K, MC; < Ch. procumbens -- GW, W; = Ch. procumbens -- S , in the narrow sense]

Chaerophyllum procumbens (Linnaeus) Crantz var. shortii Torrey \& A. Gray, Short's Spreading Chervil. Mt (VA), Pd (SC): nutrient-rich mountain forests, alluvial forests; rare. March-April. W. PA west to IN, south to SC, TN, and LA. The validity of this variety needs additional study. [= RAB, C, F, G, K, MC; < Ch. procumbens -- GW, W; = Ch. shortii (Torrey \& A. Gray Bush -- S]

Chaerophyllum tainturieri Hooker var. dasycarpum Hooker ex S. Watson, Southern Chervil. Cp (GA?, SC): disturbed areas; rare. March-April; April-May. E. SC south to s. AL and west to TX. The distinctiveness of this taxon needs further evaluation. [=K, MC; < Ch. tainturieri -- RAB, C, F, G, GW; = Ch. dasycarpum (Hooker ex S. Watson) Nuttall ex Small -- S]

Chaerophyllum tainturieri Hooker var. tainturieri, Southern Chervil. Cp, Pd, Mt (GA, NC, SC, VA): roadsides, disturbed areas, fields; common. March-April; April-May. MD west to NE, south to FL, TX, and AZ. [=K, MC; <Ch. tainturieri -- RAB, C, F, G, GW, W; > Ch. tainturieri var. tainturieri - F, in a narrower sense; > Ch. tainturieri var. floridanum Coulter \& Rose -- F; > Ch. teinturièri -- S , in the narrow sense, and orthographic variant; Ch. floridanum (Coulter \& Rose) Bush -- S; ? Ch. texanum Coulter \& Rose]

* Chaerophyllum bulbosum Linnaeus, Parsnip Chervil. Waif in DC. [= K] \{not keyed\}
* Chaerophyllum temulem Linnaeus, Rough Chervil, introduced, as a waif south to PA and NJ (Kartesz 1999). [= K] \{not keyed\} Chaerophyllum texanum Coulter \& Rose is reported as a native in the Nashville Basin of TN (Chester, Wofford, \& Kral 1997). It has usually been included recently in Ch. tainturieri. \{investigate\}. [< Ch. tainturieri var. tainturieri -- K, in part] \{not keyed\}

Ciclospermum Lagasca y Segura (Marsh-parsley)
A genus of 3 species, herbs, of tropical and warm temperate America. References: Mathias \& Constance (1945)=MC.
Ciclospermum leptophyllum (Persoon) Sprague ex Britton \& Wilson, Marsh-parsley. Cp (GA, NC, SC), Pd (GA, SC): freshwater marshes, disturbed areas, roadside ditches; uncommon. April-early June; June-July. Widespread in se. North America, from NC and OK south into tropical America. [= Apium leptophyllum (Persoon) F. Mueller ex Bentham -- RAB, C, G, GW, MC; = Cyclospermum leptophyllum -- K, orthographic variant; Ciclospermum ammi Lagasca y Segura -- S]

## Cicuta Linnaeus (Water-hemlock)

A genus of 8 species, herbs, north temperate in distribution. References: Mulligan (1980)=Z; Mathias \& Constance (1945)=MC.
1 Flowers usually aborting (if present, the fruits $1.5-2 \mathrm{~mm}$ long); axils of upper leaves bearing clusters of bulbils; leaflets with narrowly linear segments, usually less than 5 mm wide C. bulbifera

1 Flowers usually forming mature fruits 2-4 mm long; axils of leaves not bearing bulbils; leaflets lanceolate, usually more than 6 mm wide.
2 Dorsal and lateral corky ribs of the fruit much narrower than the oil tubes; fruit abruptly and unevenly constricted at the commissure . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. bolanderi
2 Dorsal and lateral corky ribs of the fruit equaling to slightly exceeding the width of the oil tubes; fruit restricted or not at the commissure, but not as above.
3 Lateral ribs of the commissure flush against one another; leaflets lanceolate, 0.6-3 cm wide
3 Lateral ribs of the commissure separated by a groove; leaflets ovate, up to 3.5-5 cm wide .......... C. mexicana
Cicuta bolanderi S. Watson. Mt, Pd (NC), \{GA\}: marshes, bogs, seepages, ditches, swamp forests; rare. Scattered in distribution, from NJ, WI, and MN south to GA, TX, Mexico, and AZ. Further study is needed of the distinctiveness, distribution, and ecology of this species. [=K, MC; C. maculata var. maculata -- C, F, G, in part; C. maculata Linnaeus var. bolanderi (S. Watson) Mulligan -- Z]

Cicuta bulbifera Linnaeus, Bulb-bearing Water-hemlock. Pd (VA), Cp (NC): marshes and swamps; rare (VA Rare). JulySeptember. Newfoundland west to AK, south to MD, n. VA (?), OH, KY, IN, IL, IA, NE, MT, ID, and OR; disjunct (perhaps introduced only) in NC and FL. [= C, F, G, K, MC, Z]

Cicuta maculata Linnaeus var. maculata, Water-hemlock. Cp, Pd, Mt (GA, NC, SC, VA): marshes, bogs, seepages, ditches, swamp forests; common. May-August; July-September. Nova Scotia west to Alaska, south to FL, CA, and Mexico. Two other varieties are more northern or western: var. victorinii (Fernald) Boivin of Québec and var. angustifolia Hooker of western North America. All parts of the plant, especially the tubers, are dangerously poisonous. [C. maculata -- RAB, GW, MC, S, W; C. maculata var. maculata -- C, F, G, in part only (also see var. bolanderi); C. maculata var. maculata -- K, Z, in part only (also see C. mexicana)]

Cicuta mexicana Coulter \& Rose, Southern Water-hemlock. Cp (GA, NC, SC, VA), Pd, Mt (GA, NC?): marshes, bogs, seepages, ditches, swamp forests, floating vegetation mats; uncommon. May-August; July-September. Se. VA (GW), south to FL, and west to TX, south into Mexico (more inland records in our area and westward are of uncertain disposition). Though not recognized by Mulligan (1980), this taxon appears to warrant taxonomic recognition. It is a generally coarser plant than C. maculata. [= RAB, GW, MC; C. maculata var. curtissii (Coulter \& Rose) Fernald -- F, G; C. curtissii Coulter \& Rose -- S]

## Conioselinum Hoffmann (Hemlock-parsley)

A genus of about 10 species, herbs, north temperate in distribution. References: Mathias \& Constance (1945)=MC.
Conioselinum chinense (Linnaeus) Britton, Sterns, \& Poggenburg, Hemlock-parsley. Mt (NC, VA): nutrient-rich seepage over cliffs and through boulderfields, at high elevations, known from seepage over cliffs and through boulderfields at about 1500 m on the north slope of Grandfather Mountain (Avery County, NC), and from a north-facing greenstone cliff-top seep at 1150 m on Stony Man, Page County (VA); rare (NC Endangered, VA Rare). July-September. The specific epithet is a misnomer, the species Native to $n$. North America (the specific epithet a misnomer): south to PA, IN, and IA, and disjunct in VA and NC) and ne. Asia (e. Siberia), but not found in China (the epithet a mistake based on confusion between "Genesee," New York, and "Chinensem"). The single NC population was first discovered in 1842 by Asa Gray and John Carey, and not seen again until 1989. The VA population was first reported by Fleming \& Ludwig (1996). The report of the species from Roan Mountain was found to be in error; see Anthriscus (Mellichamp, Matthews, \& Smithka 1987, 1988). [= RAB, C, F, G, K, MC, S, W]

Conium Linnaeus (Poison-hemlock)

A genus of 6 species, herbs, north temperate and s. African in distribution. References: Mathias \& Constance (1945)=MC.

* Conium maculatum Linnaeus, Poison-hemlock. Pd (GA, NC, SC, VA), Mt, Cp (NC, SC, VA): ditches, roadsides, streambanks, disturbed areas; common, native of Eurasia. May-June; June-July. All parts of the plant are highly toxic if ingested, often causing respiratory failure in humans and other mammals. [= RAB, C, F, GW, K, MC, S, W]

Coriandrum Linnaeus (Coriander, Cilantro)
A genus of 3 species, herbs, sw. Asian in distribution. References: Mathias \& Constance (1945)=MC.

* Coriandrum sativum Linnaeus, Coriander, Cilantro, Mexican-parsley, Chinese-parsley. Pd (NC, SC, VA), Mt (VA): disturbed areas, cultivated in gardens, sometimes persisting or escaped; rare, native of Eurasia. June-July. [= RAB, C, F, G, K, MC, S]

Cryptotaenia Augustin de Candolle (Honewort)
A genus of 6 species, herbs, in north temperate areas (and montane Africa). References: Mathias \& Constance=MC.
Cryptotaenia canadensis (Linnaeus) Augustin de Candolle, Honewort. Mt, Pd, Cp (GA, NC, SC, VA): moist and nutrient-rich forests (alluvial, bottomland, slope, and cove forests); common (rare in Coastal Plain south of VA). May-June; June-August. New Brunswick and Québec to Manitoba, south to e. GA, sw. GA, panhandle FL, AL, and TX; also in Japan. [= RAB, C, F, GW, K, MC; = Deringa canadensis (Linnaeus) Kuntze -- S]

Cynosciadium Augustin de Candolle
References: Mathias \& Constance (1945)=MC.
Cynosciadium digitatum Augustin de Candolle is reported east to TN (Kartesz 1999). [= K, MC]

## Daucus Linnaeus (Wild Carrot, Queen-Anne's-lace)

A genus of about 22 species, herbs, of temperate and tropical areas, primarily Old World. References: Mathias \& Constance (1945)=MC .

1 Involucral bracts scarious-margined, spreading or reflexed in fruit; spines of fruit not prominently barbed apically; umbel rays $10-65 \mathrm{~mm}$ long (at least some in a given inflorescence usually exceeding 3 cm ); umbellets (10-) 20-numerous flowered; central flower of the umbel usually dark purple; plant a freely-branched biennial
D. carota

1 Involucral bracts not scarious-margined, appressed-ascending in fruit; spines of fruit prominently barbed apically; umbel rays 526 mm long; umbellets 5-12 flowered; central flower of the umbel white; plant an unbranched (or rarely few-branched) annual .
D. pusillus

* Daucus carota Linnaeus, Queen-Anne's-Lace, Carrot, Wild Carrot. Pd, Mt, Cp (GA, NC, SC, VA): pastures, fields, roadsides, waste places; common, native of Europe. May-September. The cultivated carrot is a form with a fleshy taproot rich in carotene; the familiar field weed has a "carroty" flavor, but the root is woody and tan in color. [= RAB, C, F, G, K, MC, S, W]

Daucus pusillus Michaux, American Queen-Anne's-lace. Cp (GA, NC, SC, VA?), Pd (GA, SC, VA?), Mt (GA): pastures, fields, roadsides, waste places; uncommon. April-May; May-June. This native relative of $D$. carota is smaller and less branched. Widespread in Southeastern United States, north to NC and MO. It should be expected in the lower Piedmont of NC and in the Coastal Plain of se. VA, which it closely approaches. Robert Wright has collected this species as a waif in Henrico County, VA (R. Wright, 2002, pers. comm.). [RAB, C, F, G, K, MC, S, W]

Erigenia Nuttall (Harbinger-of-spring, Pepper-and-salt)
A monotypic genus, an herb of e. North America. References: Buddell \& Thieret (1985)=Z; Mathias \& Constance (1945)=MC.
Erigenia bulbosa (Michaux) Nuttall, Harbinger-of-spring, Pepper-and-salt, Erigenia. Mt (GA, NC?, VA), Pd (VA): mesic, nutrient-rich forests, either over calcareous substrate or on very rich alluvial deposits (such as riverbanks); rare (GA Special Concern, NC Watch List, VA Watch List). February-April. S. PA w. NY, s. Ontario, c. MI, and se. WI south to MD, DC, w. VA, e. TN, nw. GA, c. AL, n. MS, sw. AR, and se. KS. Reported a number of times from NC, perhaps never with documentation. Rodgers (1950) states "reported in mtns. of N.C. by Kephart and Hyams." The past or present existence of Erigenia in NC remains uncertain. It occurs in several counties of TN immediately adjacent to the NC line (Chester, Wofford, \& Kral 1997). See Buddell \& Thieret (1985) for a very interesting and entertaining account of this plant. [= RAB (excluded), C, F, G, K, MC, S, W, Z]

A genus of about 250 species, herbs, tropical and temperate. References: Bell (1963)=Z; Mathias \& Constance (1945)=MC.
1 Leaves coriaceous, palmately lobed, the lobes and teeth tipped with stout spines
E. maritimum

1 Leaves thin, fleshy, or subcoriaceous, entire, toothed, palmately lobed, or pinnately incised, the teeth or lobes (if present) unarmed or with weak spines.
2 Inflorescence unbranched, the heads solitary on peduncles from the leaf axils of the prostrate to erect stem
3 Leaves pinnately lobed or dissected . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . E. divaricatum
3 Leaves entire, irregularly toothed (rarely with some irregular lobing).
4 Heads subglobose or hemispherical when fully developed, about as wide as long; bracts subtending the head barely extending beyond the base of the head E. baldwinii

4 Heads cylindrical, longer than wide; bracts subtending the head longer than the radius of the head, thus extending conspicuously beyond the base of the head
E. prostratum

2 Inflorescence branched, the heads in a cyme borne terminally on the erect stem.
5 Blades of basal and lower cauline leaves 3-7 (-10) cm long, acute to obtuse apically, cordate to truncate basally, with a length/width ratio of 1.5-3 (-6) . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . E. integrifolium
5 Blades of basal and lower cauline leaves $10-100 \mathrm{~cm}$ long, acute to acuminate apically, clasping basally, with a length/width ratio of 5-50.
6 Leaves parallel-veined, with marginal bristles; flowers greenish-white.
$7 \quad$ Larger leaves more than 1.5 cm wide; marginal bristles of leaves solitary
E. yuccifolium var. yuccifolium

7 Larger leaves less than 1.5 cm wide; marginal bristles in fascicles of 1-2 (-4), those on the lower portion of the leaf usually in fascicles of $2-3$. . . . . . . . . . . . . . . . . . . . . . . . . . . . E. yuccifolium var. synchaetum
6 Leaves evidently reticulate-veined, with or without marginal bristles; flowers blue.
8 Leaves ovate, pinnately divided; [of dry, sandy habitats]
E. aromaticum

8 Leaves lanceolate to linear, merely toothed; [of marshes and wet pinelands].
9 Styles 3.0-3.5 mm long at maturity, scarcely exceeding the bractlets (which subtend each flower); heads subglobose to hemispherical, 6-12 mm in diameter; middle cusp of the bractlets elongate, distinctly longer than the lateral cusps . . . . . . . . . . . . . . . . . . . . . . . . E. aquaticum var. aquaticum
9 Styles 4.0-6.0 mm long at maturity, exceeding the bractlets; heads globose, 9-15 mm in diameter; middle cusp of the bractlets about equal in length to the lateral cusps . . E. aquaticum var. ravenelii

Eryngium aquaticum Linnaeus var. aquaticum, Marsh Eryngo. Cp (GA, NC, SC, VA): tidal freshwater to brackish marshes; uncommon. July-September. NJ to ne. FL along the Atlantic coast, mostly in brackish marshes. [= RAB, K, MC, Z; E. aquaticum -C, $\mathrm{F}, \mathrm{G} ;<\mathrm{E}$. aquaticum -- GW; E. virginianum Lamarck -- S]

Eryngium aquaticum Linnaeus var. ravenelii (A. Gray) Mathias \& Constance, Ravenel's Eryngo. Cp (GA, NC, SC): wet savannas, mostly or entirely over calcareous substrate; rare (NC Watch List, SC Rare). July-September. Se. NC (Onslow and Pender counties) south to sw. GA and n. FL. McMillan (2003) suggests that it may warrant specific status distinct from $E$. aquaticum. [= RAB, K, MC, Z; <E. aquaticum -- GW; E. ravenelii A. Gray -- S]

Eryngium aromaticum Baldwin. Cp (GA): dry pinelands; uncommon. Ranges east to e. GA. [= K, MC, S, Z]
Eryngium baldwinii Sprengel. Cp (GA): pinelands, temporary pools, ditches, other moist to wet sites; uncommon. Se. GA and sw. GA south to FL. [= GW, K, MC, S, Z]

* Eryngium divaricatum Hooker \& Arnott. Cp (NC): disturbed areas, introduced on ballast at Wilmington port; rare, introduced from South America. July-October. Not seen in recent years and probably not persistent. [= RAB, K, MC, S, Z]

Eryngium integrifolium Walter, Savanna Eryngo. Cp (GA, NC, SC), Mt (GA, NC, SC), Pd (GA, NC, SC, VA): savannas, pine flatwoods, seepages, other moist, nutrient-poor places; common (rare in Piedmont and Mountains). August-October. Se. VA (Greensville County) (Belden et al. 2004) and e. NC south to FL, west to OK and TX, inland in c. TN. [= RAB, K, MC, S, W, Z; E. ludovicianum Morong - S]

* Eryngium maritimum Linnaeus, Sea Holly. Cp (NC): ocean and soundside dunes; rare, presumably introduced from Europe, though perhaps adventive. July. [= RAB, C, G, K, MC, Z]

Eryngium prostratum Nuttall ex Augustin de Candolle, Spreading Eryngo. Cp, Pd (GA, NC, SC, VA), Mt (NC, SC): moist ditches and lawns, other moist, open habitats; uncommon, definitely native further south, perhaps only rather recently spread north to our area. May-October. Se. VA south to FL, west to OK and TX. [= RAB, C, GW, K, MC, S, W, Z; > E. prostratum var. prostratum - F, G; > E. prostratum var. disjunctum Fernald -- F, G]

Eryngium yuccifolium Michaux var. synchaetum A. Gray ex Coulter \& Rose, Southern Rattlesnake-master. Cp (GA, NC, SC): wet savannas, especially those over calcareous clay soils; rare (NC Watch List). June-August. A Southeastern Coastal Plain endemic: se. NC to s. FL and west across the Gulf Coastal Plain, the exact range limits obscure. The distinction between the two varieties, seemingly clear in NC and elsewhere in states bordering the Atlantic, seems to become less straightforward further west, as in LA and AR. In NC it has been seen in Pender, Brunswick, Columbus, Bladen, and Robeson counties. [= RAB, $K, M C, Z ;<E$. yuccifolium -- GW; = E. synchaetum (Gray ex Coulter \& Rose) Coulter \& Rose -- S]

Eryngium yuccifolium Michaux var. yuccifolium, Northern Rattlesnake-master. Pd, Mt, Cp (GA, NC, SC, VA): diabase barrens and glades, olivine barrens, pine savannas, pine flatwoods over loamy or clay soils, other open sites with at least periodic moisture, generally in sites showing some prairie affinities; uncommon (VA Rare). June-August. Widespread in southeastern and midwestern North America, the exact range limits of the typic variety and var. synchaetum somewhat obscure. [= RAB, K, MC, Z; < E. yuccifolium -- C, F, G, W; < E. yuccifolium -- GW (also see E. yuccifolium var. synchaetum); = E. aquaticum -- S, misapplied]

* Eryngium campestre Linnaeus, Field Eryngo, is reported as a ballast waif in AL (Mobile), MD, and NJ (Z; Kartesz 1999). [= K, Z] \{not yet keyed; add synonymy \}

Eryngium foetidum Linnaeus is reported as introduced in GA and FL (Kartesz 1999). [= K] \{not yet keyed; add synonymy\}

## Falcaria Fabricius (Sickleweed)

A monotypic genus, an herb, of Eurasia. References: Mathias \& Constance (1945)=MC.

* Falcaria vulgaris Bernhardi, Sickleweed. Mt (VA): disturbed areas; rare, native of Eurasia. July-September. [= C, F, K; F. sioides (Wibel) Ascherson -- G, MC]

## Foeniculum P . Miller (Fennel)

A genus of 4-5 species, herbs, of Asia and Mediterranean Europe. References: Mathias \& Constance (1945)=MC.

* Foeniculum vulgare P. Miller, Fennel. Cp, Mt (GA, NC, SC, VA), Pd (NC, SC, VA): fields, dredge spoil, old gardens, waste places, vacant lots; uncommon (locally common), native of Mediterranean Europe. June-August; August-September. This is the common garden fennel, cultivated for its seeds, leaves, "bulbs" (finnocchio), and ornamental appearance (especially bronze forms), widely used in Mediterranean cuisines. [= RAB, C, F, G, K, MC, W; = Foeniculum foeniculum (Linnaeus) Karsten -- S]

## Heracleum Linnaeus (Cow-parsnip, Hogweed)

A genus of about 65 species, herbs, north temperate (and tropical mountains). References: Mathias \& Constance (1945)=MC.
Heracleum maximum W. Bartram, Masterwort, Cow-parsnip, American Hogweed. Mt (GA, NC, VA): forests, roadbanks, meadows, forest openings; uncommon (GA Special Concern). May-July; July-August. Labrador west to AK, south to PA, OH, IN, IL, MO, KS, NM, AZ, CA, and in the Appalachians south to w. NC, e. TN, and n. GA; also in e. Siberia. The synonymy reflects two questions, one nomenclatural, the other taxonomic. North American plants are very similar to European ones, leading some workers to treat our plants as a subspecies or variety of the European. If recognized as specifically distinct from European $H$. sphondylium, the nomenclatural question is whether to accept Bartram's (older) name as validly published. [=F, GW, K; = H. lanatum Michaux -- RAB, C, G, MC, W; = H. sphondylium Linnaeus var. lanatum (Michaux) Dorn; H. sphondylium Linnaeus ssp. montanum (Schleicher ex Gaudin) Briquet]

* Heracleum mantegazzianum Sommier \& Levier, native to the Caucasus Mountains, has been introduced in ne. North America and is becoming established; it may eventually spread to our area. It is considerably larger and coarser even than H. maximum (not a paltry herb itself), reaching 5.5 m in height, the hollow stems to 15 cm in diameter, the lower leaves to 2.5 m long, and the umbels to 5 dm across. More modestly-sized individuals may be distinguished from $H$. maximum by wider oil tubes on the fruit [(0.6-) $0.8-$ 1.0 mm wide vs. 0.3-0.5 (-0.8). [= K] \{not keyed\}

## Hydrocotyle Linnaeus (Water-pennywort)

(see ARALIACEAE)

## Ligusticum Linnaeus (Lovage)

A genus of 40-50 species, herbs, circumboreal and north temperate. References: Mathias \& Constance (1945)=MC.
Ligusticum canadense (Linnaeus) Britton, Nondo, Angelico, American Lovage. Mt, Pd (GA, NC, SC, VA), Cp (NC): moist to dryish, nutrient-rich forests and woodlands; common (rare in Coastal Plain). June-July; August-September. S. PA south to c. GA and AL; also in s. MO and n. AR, centered in the Southern and Central Appalachians and the Ozarks-Ouachitas, but extending considerably into adjacent provinces, and even slightly into the Coastal Plain. A distinctive character is the straightish and toothless basal portion of each leaflet. [= RAB, C, F, G, K, MC, S, W]

## Lilaeopsis Greene (Lilaeopsis)

A genus of about 13 species, herbs, warm temperate and tropical, of America, Australia, and New Zealand. References: Affolter (1985)=Z; Mathias \& Constance (1945)=MC.

1 Leaves 7-30 (or more) cm long, often spatulate, up to 11 mm wide towards the apex, with (7-) 10-20 transverse septae; peduncles much shorter than the leaves L. carolinensis

1 Leaves 1-5 cm long, linear (rarely spatulate), 1-2 (-5) mm wide, with 4-8 (-10) transverse septae; peduncles about as long as or longer than the leaves . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . L. chinensis

Lilaeopsis carolinensis Coulter \& Rose, Carolina Lilaeopsis. Cp (GA, NC, SC, VA): freshwater marshes and pondshores, ditches, interdune ponds, shores of brackish to freshwater estuarine sounds and rivers; rare (GA Special Concern, NC Rare, SC Rare, VA Rare). May-June. Se. VA south to FL and west to LA; it is also found in s. South America, in Argentina, Brazil, and Paraguay. [= RAB, F, GW, K, S, Z; L. attenuata (Hooker \& Arnott) Fernald -- C, G, MC]

Lilaeopsis chinensis (Linnaeus) Kuntze, Marsh Lilaeopsis. Cp (GA, NC, SC, VA): brackish and freshwater tidal marshes,
especially in mud-flats in the intertidal zone; uncommon. May-June. Nova Scotia south to FL and west to TX (Brown \& Marcus 1998). The epithet "chinensis" is a misnomer; the species is native to e. North America and has nothing to do with China. [= RAB, F, G, GW, K, MC, Z; L. lineata (Michaux) Greene -- S]

## Osmorhiza Rafinesque (Sweet Cicely, Wild Chervil)

A genus of about 10 species, herbs, of temperate North America, temperate South America, montane tropical Central and South America, and Asia (Wen et al. 2002). References: Lowry \& Jones (1979)=Z; Mathias \& Constance (1945)=MC; Wen et al. (2002).

1 Styles plus stylopodium 0.5-1.5 mm long; flowers 4-7 (-8) per umbellet; flowers 3-4 mm across; umbellets 3-5 (-6) per umbel, on rays $2-8(-10) \mathrm{cm}$ long, the umbel therefore relatively uncrowded; roots (and foliage) not strongly anise-scented

1 Styles plus stylopodium 2.0-3.5 mm long; flowers (7-) 9-18 per umbellet; flowers 5-6 mm across; umbellets 4-6 (-8) per umbel, on rays 1.5-5.0 (-7.5) cm long, the umbel therefore rather crowded; roots (and foliage) strongly anise-scented . . O. Iongistylis

Osmorhiza claytonii (Michaux) C.B. Clarke, Bland Sweet Cicely, Hairy Sweet Cicely. Mt (GA, NC, VA), Pd (NC, SC, VA), Cp (VA): cove forests, other moist fertile forests; common, rare in Piedmont and Coastal Plain (SC Rare). April-May; May-June. Nova Scotia and Québec west to Saskatchewan, south to NC, n. GA, AL, and AR. [= RAB, C, F, G, K, MC, W, Z; = Osmorrhiza claytonii -S , misspelling]

Osmorhiza longistylis (Torrey) Augustin de Candolle, Anise-root, Smooth Sweet Cicely. Pd (GA, NC, SC, VA), Mt, Cp (GA, NC, VA): moist, fertile forests; common, rare in Coastal Plain. April-May; May-June. Québec west to Saskatchewan, south to GA, TX , and CO. [= RAB, C, F, G, K, W, Z; > O. longistylis var. brachycoma Blake; > O. longistylis var. longistylis - F, MC; > 0 . longistylis var. villicaulis Fernald -- F, MC; = Osmorrhiza longistylis -- S , misspelling]

## Oxypolis Rafinesque (Dropwort, Hog-fennel, Cowbane)

A genus of about 7 species, herbs, of temperate North America. References: Mathias \& Constance (1945)=MC; Kral (1981); Tucker et al. (1983).

1 Leaves reduced to hollow, linear, nodose-septate quills, consisting of the petiole and leaflet-less rachis, undivided.
2 Mature fruits with corky-thickened peripheral ribs, the fruit with a narrowly rectangular cross-section, about as thick near the ends of the ribs as at the center, 0.8-2 mm thick at the edge; plants with stoloniferous rhizomes 1-3 (-10) dm long; lower nodes often losing their leaves by flowering ; umbellets/umbel 5-9 (-12)
O. canbyi

2 Mature fruits with peripheral ribs progressively thinning away from the seed cavity, the fruit with a fusiform cross-section, distinctly thinner towards the ends of the ribs than at the center, 0.2 mm thick at the edge; plants with stout rhizomes or a caudex, not long stoloniferous; lower nodes generally retaining their leaves until flowering; umbellets/umbel 10-20

1 Leaves with 1-13 leaflets, the leaflets flat.
3 Leaflets 1-3, entire, palmately disposed, parallel-veined . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . O. denticulata
3 Leaflets (5-) 7-11 (-13), pinnately disposed, usually toothed (rarely entire), net-veined .................... O. rigidior
Oxypolis canbyi (Coulter \& Rose) Fernald, Canby's Cowbane. Cp (GA, NC, SC): clay-based Carolina bays and other depressional wetlands; rare (US Endangered, GA Endangered, NC Endangered, SC Rare). July-August; August-September. Sw. GA through SC to se. NC (mostly in the middle and inner Coastal Plain), and from e. MD to (formerly) DE. See Tucker et al. (1983) for detailed information on this rare species and a comparison of it to the more widespread O. filiformis. [= C, F, G, K, MC]

Oxypolis denticulata (Baldwin) J.R. Edmondson, Savanna Cowbane. Cp (GA, NC, SC, VA): wet pine savannas, sandhill seepages; rare (US Species of Concern, GA Special Concern, NC Watch List, VA Rare). September-October; October-November. Scattered from se. VA south to Panhandle FL; alleged occurrences in e. TX are based on mis-identifications of narrow-leafleted forms of O. rigidior (Sorrie, pers. comm.). Edmondson (2005) shows that the correct name for this species is O. denticulata. [= Oxypolis ternata (Nuttall) A. Heller -- RAB, C, F, G, GW, K, MC, S]

Oxypolis filiform is (Walter) Britton, Water Dropwort. Cp (GA, NC, SC): wet savannas, sandhill seepages; uncommon. JulyAugust; August-September. Se. NC south to s. FL, west to se. TX, and in the West Indies. [= RAB, GW, K, MC, S]

Oxypolis rigidior (Linnaeus) Rafinesque, Cowbane, Pig-potato. Mt, Pd, Cp (GA, NC, SC, VA): bogs, swamps, wet meadows, streambanks, sandhill seepages; common. August-October; October-November. NY west to MN and south to n. FL and TX. It is very variable in the size and shape of the leaflets. [= $\mathrm{RAB}, \mathrm{C}, \mathrm{F}, \mathrm{G}, \mathrm{GW}, \mathrm{K}, \mathrm{MC}, \mathrm{S}, \mathrm{W} ;>\mathrm{O}$. rigidior var. rigidior $-\mathrm{F} ;>\mathrm{O}$. rigidior var. ambigua (Nuttall) Robinson -- F; > O. rigidior - S, in a narrower sense; > O. turgida Small -- S]

Pastinaca Linnaeus (Parsnip)
References: Mathias \& Constance (1945)=MC.

* Pastinaca sativa Linnaeus, Parsnip. \{NC, SC, VA\} [= K, MC]

Perideridia Reichenbach

References: Mathias \& Constance (1945)=MC.
Perideridia americana (Nuttall ex Augustin de Candolle) Reichenbach, Eastern Yampah, ranges east to the Nashville Basin of c. TN (Davidson, Rutherford, Williamson, and Giles counties) (Chester, Wofford, \& Kral 1997; Estes 2004). [= C, K, MC; = Eulophus americanus Nuttall ex Augustin de Candolle -- S]

Petroselinum J. Hill (Parsley)

A genus of about 2 species, herbs, of Mediterranean Europe. References: Mathias \& Constance (1945)=MC.

* Petroselinum crispum (P. Miller) Nyman ex A.W. Hill, Parsley, Garden Parsley. Cp (SC), Pd (GA, NC): commonly cultivated in gardens, rarely persistent or weakly escaped, introduced from Mediterranean Europe. June-July. [= RAB, C, F, G, K, MC; = Apium petroselinum Linnaeus -- S]

## Peucedanum Linnaeus (Masterwort)

* Peucedanum ostruthium (Linnaeus) W.D.J. Koch, Masterwort, is naturalized in ne. United States, is reported from Carter County, TN (a county immediately adjacent to our area) (Chester, Wofford, \& Kral 1997), and also is reported for scattered localities in PA (Rhoads \& Klein 1993). [= C, K; = Imperatoria ostruthia Linnaeus]

## Pimpinella Linnaeus

A genus of about 150 species, herbs, of Europe and Africa.

* Pimpinella saxifraga Linnaeus ssp. saxifraga, Burnet-saxifrage. Mt (VA): disturbed areas; rare, introduced from Eurasia. [= K ; < P. saxifraga -- $\mathrm{C}, \mathrm{F}, \mathrm{G}]$

Polytaenia Augustin de Candolle
References: Mathias \& Constance (1945)=MC.
Polytaenia nuttallii Augustin de Candolle, Prairie-parsley, ranges from MI west to NE, south to TX and NM, occurring as a disjunct eastwards in prairie-like or glade situations in MS and c. TN (Chester, Wofford, \& Kral 1998). [= C, F, G, K, MC; = Pleiotaenia nuttallii (Augustin de Candolle) Coulter \& Rose -- S]

## Pseudotaenidia Mackenzie (Mountain Pimpernel)

A monotypic genus, an herb, endemic to the central Appalachians. Although this species has been traditionally separated into a monotypic genus, Pseudotaenidia; Cronquist (1982) has suggested that Pseudotaenidia be submerged in Taenidia. Cronquist's argument that the two monotypes are most closely related to one another is very likely correct, but the conclusion that they should be united in a single genus does not necessarily follow (particularly considering the narrow generic concepts used in the Apiaceae). References: Cronquist (1982)=Z; Mathias \& Constance (1945)=MC.

Pseudotaenidia montana Mackenzie, Mountain Pimpernel, Shale-barren Pimpernel. Mt (VA): shale barrens and rocky woodlands over shale, greenstone, calcareous sandstone, and other calcareous and mafic rocks; rare (VA Watch List). May-June. A Central Appalachian endemic: w. VA and e. WV north to sc. PA. [= F, G, MC, W; = Taenidia montana (Mackenzie) Cronquist -C, K, Z]

## Ptilimnium Rafinesque (Bishopweed, Harperella)

A genus of 5-8 species, herbs, temperate, of e. North America. References: Easterly (1957)=Z; Kral (1981a)=Y; Rose (1911)=X; Mathias \& Constance (1945)=MC; Weakley \& Nesom (2004)=Q; Kress, Maddox, \& Roesel (1994).

1 Leaves reduced to hollow, linear, nodose-septate quills, consisting of the petiole and leaflet-less rachis, undivided.
2 Leaves $8-30 \mathrm{~cm}$ long; plants $4-10 \mathrm{dm}$ tall, not proliferating from the nodes (strictly annual); rays $10-25 \mathrm{~mm}$ long, 6-15 per inflorescence; pedicels $3.0-6.0 \mathrm{~mm}$ long; [of still water of Coastal Plain ponds] . . . . . . . . . . . . . . . . . . . . . . Pt. nodosum
2 Leaves 4-12 (-15) cm long; plants 1-5 (-8) dm tall, proliferating from the nodes (thus adventitiously perennial); rays $1-9 \mathrm{~mm}$ long, 2-5 (-9) per inflorescence; pedicels 0.5-2.0 (-2.5) mm long; [of shoals, outcrops, and banks of rocky streams or rivers]

Pt. viviparum
1 Leaves dissected into filiform or linear segments.
3 Leaf segments verticillate on the rachis (4 or more segments at major nodes of each leaf); styles 1.5-3.0 mm long ......
Pt. costatum

3 Leaf segments alternate, opposite, or in whorls of 3 on the rachis; styles 0.2-1.5 mm long.
4 Styles $0.5-1.5 \mathrm{~mm}$ long; fruits $1-2 \mathrm{~mm}$ long.
4 Styles 0.2-0.5 mm long; fruits $1.4-4.2 \mathrm{~mm}$ long.
5 Fruits 2.7-4.2 mm long; umbellets usually 5-7 per umbel; flowers usually 5-7 (-8) per umbellet; bracts subtending the umbels and umbellets with $1(-3)$ linear segments; leaf segments of mid-stem leaves 15-30 (40), capillary to linear, $0.5-1.9 \mathrm{~mm}$ wide; flowering May-early June; fruiting late May-July $\qquad$ Pt. ahlesii
5 Fruits $1.4-2.0 \mathrm{~mm}$ long; umbellets usually 10 or more per umbel; flowers usually 10 or more per umbellet; bracts subtending the umbel and umbellets with (1-) 3-5 linear segments; leaf segments of mid-stem leaves 50 or more, capillary, usually less than 0.5 mm wide (except in submersed leaves); flowering June-August, fruiting July-September

Pt. capillaceum
Ptilimnium ahlesii Weakley \& Nesom, Carolina Bishopweed, Coastal Bishopweed. Cp (GA, NC, SC): tidal freshwater marshes; rare (GA Special Concern, NC Rare). May-June; Late May-July. This species, recognized but not validly named by H.E. Ahles, ranges from se. NC (Onslow, New Hanover, and Brunswick counties) south through SC to e. GA. The lowermost leaves (withering prior to fruiting) sometimes lack leaflets and thus closely approach the quill-leaves of Pt. fluviatile and Pt. nodosum, corroborating Easterly's combination of Harperella into Ptilimnium. [= Q; = Pt. macrospermum, nomen nudum]

Ptilimnium capillaceum (Michaux) Rafinesque, Eastern Bishopweed, Atlantic Bishopweed. Cp, Pd (GA, NC, SC, VA): ditches, marshes, other wet places; common. June-August; July-September. MA, NY, and MO south to FL and TX. [= RAB, C, F, G, GW, K, MC, Q, S, W, Z]

Ptilimnium costatum (Elliott) Rafinesque, Big Bishopweed. Cp (NC), Pd, Mt (GA): tidal freshwater marshes (NC), wet prairies (GA), bottomland hardwood forests (GA); rare (GA Special Concern, NC Rare). July-August. Se. NC south to GA, and west to IL, MO, and TX; it is rare and disjunct through much of that range. It has the potential to be a great deal larger and coarser than any other member of the genus, but individuals will be encountered no larger than a fairly robust plant of Pt. species 1 or Pt. capillaceum. [= RAB, C, F, G, GW, K, MC, Q, S, Z]

Ptilimnium nodosum (Rose) Mathias, Pond Harperella. Cp (GA, SC): upland depression ponds, seepage on granite outcrops; rare (US Endangered, GA Endangered, SC Rare). June. Known only from a few sites in SC and c. GA. See Pt. viviparum for comments. [= RAB, GW, MC, Z; < P. nodosum (Rose) Mathias -- C, K, Y, in part only (also see Pt. fluviatile); = Harperella nodosa Rose -- S, X]

Ptilimnium viviparum (Rose) Mathias, Atlantic River Harperella. Pd (NC, VA): rocky riverbeds; rare (US Endangered, NC Endangered). July-August. Some authors, such as C, K, and Kral (1981a) prefer to include Pt. fluviatile and Pt. viviparum in Pt. nodosum, but recent electrophoretic and morphologic data suggest the existence of 3 taxa: Pt. viviparum of w . MD, e. WV, VA, and c. NC, Pt. fluviatile of n. AL and AR, and Pt. nodosum of SC and GA. See Maddox \& Bartgis (1990) and Kress, Maddox, \& Roesel (1994) for additional information. Further electrophoretic and morphologic studies are underway. Belden et al. (2004) provide details on the Virginia occurrence in Aquia Creek, Stafford County. [= MC; < Pt. fluviatile (Rose) Mathias -- RAB, G, GW, Z, in part; $\ll$ Pt. nodosum (Rose) Mathias -- C, K, Y, in part; = Pt. viviparum (Rose) Mathias -- F ; < Harperella fluviatilis Rose -- S , X , in part; = Harperella vivipara Rose -- X]

Ptilimnium fluviatile (Rose) Mathias, Gulf River Harperella. Similar to Pt. viviparum. N. AL and AR. [= Pt. fluviatilis -- MC, orthographic variant; < Pt. fluviatile (Rose) Mathias -- RAB, G, GW, Z, in part; << Pt. nodosum (Rose) Mathias -- C, K, Y, in part; < Harperella fluviatilis Rose -- S, X] \{not yet keyed\}

Ptilimnium nuttallii (Augustin de Candolle) Britton, Midwestern Bishopweed, ranges from KY, MO, and KS south to se. TN (Chester, Wofford, \& Kral 1997), AL, LA, and e. TX. [= C, F, G, GW, K, MC, Q, S, Z]

Sanicula Linnaeus (Sanicle, Snakeroot)
A genus of about 40 species, herbs, nearly cosmopolitan. References: Pryer \& Phillippe (1989)=Z; Mathias \& Constance $(1945)=M C$. Key based in part on Z.

Identification notes: Sanicula species cannot be reliably determined from sterile plants. Fruits or flowers are required for identification of Sanicula species. An important character is the length of the styles in relation to the calyx and/or to the bristles on the fruit. In the longer-styled species, the styles are slender and curved outward, sometimes enmeshed in the bristles, but distinctly longer than them or than the calyx. In the shorter-styled species, the styles are straight to slightly curved, shorter than or about as long as the bristles, and more or less included in the calyx. In most species the calyx is inconspicuous, but consists of 5 deltoid to narrowly triangular (or even subulate) calyx lobes, $0.4-2.0 \mathrm{~mm}$ long, at the summit of the schizocarp (the fruit).

1 Styles $1.5 \times$ or more as long as the calyx; umbellets dimorphic -- some contain both perfect and staminate flowers, while others contain staminate flowers only (except sometimes S. canadensis var. grandis, which may have polygamous umbellets only).
2 Calyx lobes $0.4-0.7 \mathrm{~mm}$ long, deltoid, flexible or weak in texture, the apices acute to obtuse; petals yellowish green, much longer than the calyx
S. odorata

2 Calyx lobes $0.7-2.0 \mathrm{~mm}$ long, narrowly triangular to subulate, rigid in texture, the apices acute-acuminate; petals white or greenish-white, equal to or slightly longer than the calyx.
3 Styles about $1.5 \times$ as long as the calyx, inconspicuously exserted from between the calyx lobes and recurved; umbellets usually polygamous (rarely some staminate only); polygamous umbellets with 6-18 flowers (3 perfect and 3-15 staminate); fruit with a short but distinct pedicel 0.5-1.0 mm long; bases of fruit bristles dilated but not bulbous, often minutely papillose
S. canadensis var. grandis

3 Styles more than $2 \times$ as long as the calyx, conspicuously exserted from the calyx and recurved; umbellets dimorphic, some polygamous and others staminate only; polygamous umbellets with 12-120 flowers (3-4 perfect and the remainder staminate); fruits sessile to subsessile; bases of fruit bristles prominently bulbous, with a minutely warty-

1 Styles shorter than (or rarely as long as) the calyx; umbellets usually monomorphic (all containing both perfect and staminate flowers), with staminate flowers 1-7 per umbellet.
4 Sepals on mature fruit connivent, forming a beak-like structure equaling or usually exceeding the adjacent fruit bristles, the tips of the sepals subulate and incurved; pedicels of staminate flowers 3-8 mm long; [mostly of the Mountains in our area, rarely in the Piedmont of VA]
S. trifoliata

4 Sepals on mature fruit somewhat spreading, loose, inconspicuous and immersed in the adjacent fruit bristles, the tips of the sepals acute or narrowly acute, straight; pedicels of staminate flowers 1-2 (-3) mm long; [collectively widespread in our area].
5 Plant a perennial, from thickened, cordlike roots; umbellets with 7-9 flowers (3 perfect and 4-6 staminate). S. smallii 5 Plant a biennial, from slender, fibrous roots; umbellets with 4-6 flowers (3 perfect and 1-3 staminate).

6 Larger leaves mostly 8-15 cm across; leaf teeth weak, hyaline; [widespread in our area, mostly not in the Coastal plain south of VA] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. canadensis var. canadensis
6 Larger leaves mostly 3-8 cm across, thick in texture; leaf teeth stiff, sharp, and prominently whitened; [of the Coastal Plain in our area]
S. canadensis var. floridana

Sanicula canadensis Linnaeus var. canadensis, Canada Sanicle, Black Snakeroot. Mt, Pd, Cp (GA, NC, SC, VA): dry-mesic to mesic forests; common. April-May; June-July. VT and s. Ontario west to MN and SD, south to Panhandle FL and e. TX. [= F, G, $Z$; < S. canadensis -- RAB $, ~ C, M C, W$; < S. canadensis var. canadensis -- K, in part; = S. canadensis $-S$, in a narrow sense]

Sanicula canadensis Linnaeus var. floridana (Bicknell) H. Wolff, Florida Sanicle, Florida Snakeroot. Cp (GA, NC, SC, VA): dry-mesic to mesic, sandy forests, often associated with Fagus grandifolia (and southwards Magnolia grandiflora); uncommon? April-May; June-July. Se. VA south to c. peninsular FL, west to s. MS, in the Coastal Plain. Additional differences between var. floridana and var. canadensis should be investigated. They may not be worthy of taxonomic differentiation. [=F, G; < S. canadensis -- RAB, C, MC, S; < S. canadensis var. canadensis -- K, in part; = S. floridana Bicknell -- S]

Sanicula canadensis Linnaeus var. grandis Fernald, Large Sanicle. Mt? (NC?, VA?): \{attributed to our area in various floras, possibly incorrectly; confirmation needed from herbarium work, and information on habitats, rarity, phenology\}. VT and n. NY west to s. Ontario, WI, se. MN, and n. IA, south to PA, WV, n. KY, c. IL, and allegedly south in the Mountains to VA and/or NC. [= F, K, Z; < S. canadensis -- RAB, C, MC, W]

Sanicula marilandica Linnaeus, Maryland Sanicle. Mt, Cp (GA, NC, SC, VA), Pd (NC, SC, VA): mesic to dry-mesic nutrientrich forests; (common, uncommon in Coastal Plain). May-June; July-August. Québec and Newfoundland west to BC, south to Panhandle FL, se. LA, NM, and WA. The Coastal plain populations (designated as var. petiolulata by Fernald) are disjunct from the main range of distribution, occur in rather different (more acidic) habitats, and warrant additional study. The primary morphological difference indicated by $F$ is that var. petiolulata has "the leaflets of 1 or 2 lower cauline leaves on petiolules $1.5-5 \mathrm{~cm}$ long" (vs. sessile or short-petiolulate). [= RAB, C, K, MC, W, Z; > S. marilandica var. marilandica-F,G; > S. marilandica var. petiolulata Fernald -- F, G; = S. marylandica -- S, orthographic variant]

Sanicula odorata (Rafinesque) K.M. Pryer \& L.R. Phillippe, Clustered Sanicle, Clustered Snakeroot. Mt, Pd, Cp (GA, NC, SC VA): mesic to dry-mesic nutrient-rich forests; uncommon. May-June; June-July. Nova Scotia and Québec west to MN and e. SD, south to Panhandle FL and e. TX. [= K, Z; = S. gregaria Bicknell -- RAB, C, F, G, MC, S, W]

Sanicula smallii Bicknell, Southern Sanicle, Small's Sanicle. Pd, Cp, Mt (GA, NC, SC, VA): mesic to dry-mesic forests; common (uncommon in Coastal Plain). April; May-June. C. VA, sw. VA, KY, se. MO, south to Panhandle FL, se. LA, c. LA, and e. TX. [= RAB, C, F, G, K, MC, S, W]

Sanicula trifoliata Bicknell, Beaked Sanicle, Large-fruited Sanicle. Mt (GA, NC, SC, VA), Pd (VA): cove forests, other mesic, nutrient-rich forests; common (rare in Piedmont) (GA Special Concern). May; June-July. Québec and VT west to s. WI and se. MN, south to n. VA, w. NC, n. GA, c. TN, c. IL, and ne. IA. [= RAB, C, F, G, K, MC, S, W, Z]

Scandix Linnaeus (Venus'-comb)

A genus of about 15-20 species, herbs, temperate, of Eurasia. References: Mathias \& Constance (1945)=MC.

* Scandix pecten-veneris Linnaeus, Venus'-comb, Shepherd's-needle. Pd (GA, NC, SC): roadsides, fields, disturbed areas; rare, native of Mediterranean Europe. March-April. [= RAB, C, G, K, MC, S]

## Sium Linnaeus (Water-parsnip)

A genus of about 14 species, herbs, of the northern hemisphere. References: Mathias \& Constance (1945)=MC.
Sium suave Walter, Water-parsnip. Cp, Pd (GA, NC, SC, VA), Mt (NC, SC, VA): freshwater marshes, brackish marshes, swamp forests; uncommon (rare in Piedmont and Mountains). June-August; August-October. Newfoundland west to Alaska and Siberia, south to FL and CA. The plant can be very coarse, up to 3 m in height and the stem to 5 cm in diameter. [= RAB, C, F, G, GW, K, MC, W; > S. suave - F, in a narrower sense; > S. floridanum Small -- F, S; > S. cicutifolium Schrank -- S]

Sium floridanum Small. valid? In GA. [= MC]

A genus of 5 species, herbs, of North America, Argentina, and Hawaii. References: Mathias \& Constance (1945)=MC.

Spermolepis divaricata (Walter) Rafinesque ex Seringe, Southern Spermolepis, Roughfruit Spermolepis. Cp (GA, NC, SC, VA), Pd (GA, SC): sandy roadsides, disturbed areas; common. April-May; May-June. VA south to s. FL, west to TX, and north in the interior to $K S$ and MO. Apparently native in our area, though weedy in behavior, and perhaps introduced only in VA. [= RAB, C, G, GW, K, MC, S]

* Spermolepis echinata (Nuttall ex Augustin de Candolle) Heller, Bristlefruit Spermolepis, Hooked Spermolepis. Cp (GA, SC, VA): sandy roadsides, disturbed areas; rare, introduced from sc. United States. April; May. [= RAB, C, F, G, K, MC, S]

Spermolepis inermis (Nuttall ex Augustin de Candolle) Mathias \& Constance, Western Spermolepis. Mt (GA), Cp (NC*): calcareous prairies in the Mountains (GA), disturbed areas in the Coastal Plain (NC); rare (GA Rare), northeastwards in our area introduced from sc. United States. April; May. [= RAB, C, F, G, K, MC; S. patens (Nuttall ex Augustin de Candolle) B.L. Robinson -$\mathrm{S}]$

Taenidia (Torrey \& A. Gray) Drude (Yellow Pimpernel)
(also see Pseudotaenidia)
A monotypic genus (unless Pseudotaenidia is included), an herb, temperate, of e. North America. References: Mathias \& Constance (1945)=MC.

Taenidia integerrima (Linnaeus) Drude, Yellow Pimpernel. Pd, Mt (GA, NC, SC, VA), Cp (VA): in rocky, dry to dry-mesic forests and woodlands over mafic or calcareous rock, such as diabase, amphibolite, calcareous siltstone, calcareous shale, or limestone; common (uncommon in NC and SC). April-May; May-June. Widespread in e. North America, south to c. GA. [= RAB, C, F, G, K, MC, S, W]

Thaspium Nuttall (Meadow-parsnip)

A genus of 3-4 species, herbs, temperate, of e. North America. References: Mathias \& Constance (1945)=MC; Cooperrider (1985) $=$ Z; Coulter \& Rose (1900) $=\mathrm{Y}$.
[Note: because Thaspium and Zizia are often confused when not in fruit, a combined key emphasizing vegetative characters has been provided; it may also be helpful to use the key to genera, and if a clear answer is obtained, then use the Thaspium-Zizia combined key, skipping taxa of the "wrong" genus]

1 Leaves 3-4-ternate, the very numerous ultimate segments 1-3 mm wide; petals white (fading to yellowish tan in older herbarium material) . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Thaspium pinnatifidum
1 Leaves simple, 3-foliolate, or 2-3-ternate, the final leaflets or segments more than 5 mm wide; petals yellow, maroon, or pale yellow.
2 Basal leaves 2-ternate or more divided.
3 Leaflets coarsely and rather lacerately serrate or incised, many of the teeth at least 2 mm long as measured on the shorter side; umbel rays 8-10, less than 3.5 cm long even in fruit; petals pale to creamy yellow

3 Leaflets finely to coarsely serrate, but not lacerate or incised, few if any of the teeth more than 2 mm long as measured on the shorter side; umbel rays mostly either more in number or longer; petals golden yellow.
4 Teeth of the leaflets fine, averaging (4-) 5-10 per cm of margin, acuminate (the 2 sides making an angle of about 45 degrees); umbel rays (8-) 10-18, in fruit 2.5-4 (-5) cm long; basal leaves many-foliolate, the leaflets mostly acuminate; fruit ca. $2 \times$ as long as wide

Zizia aurea
4 Teeth of the leaflets coarse, averaging (1-) 2-3 (-4) per cm of margin, acute to obtuse (the 2 sides making an angle of about 90 degrees); umbel rays $4-10(-12)$, the longest to 11 cm long in fruit (some on a plant at least 5 cm long); basal leaves 3-5 (-7)-foliolate, the leaflets mostly rounded to obtuse at the apex; fruit 1-1.5× as long as wide

Zizia trifoliata
2 Basal leaves simple or 3-foliolate.
5 Teeth of the leaflets coarse, averaging 2-3 (-4) per cm of margin, the long side of most of the teeth 2-10 mm long; basal leaves mostly 3-foliolate (or more divided); middle and upper stem leaves equally or more divided than the basal leaves (the most divided leaves usually those of the mid-stem)

Zizia trifoliata
5 Teeth of the leaflets fine, averaging 4-10 per cm of margin, the long side of most of the teeth 0.5-2 (-4) mm long; basal leaves simple (and cordate) or 3-foliolate; middle and upper stem leaves 3 -foliolate (rarely simple).
6 Teeth relatively acute, without a well-developed callous tip and a thickened, translucent border (use 10×); lower portion of stem puberulent, the upper nodes also usually puberulent (use $10 \times$ ); leaf margins often ciliolate; umbel rays 7-15; flowers golden yellow Zizia aptera
6 Teeth relatively obtuse, with a well-developed callous tip and a thickened, translucent border (use $10 \times$ ); lower portion of stem glabrous, the upper nodes sometimes minutely roughened; leaf margins glabrous and hyaline; umbel rays 4-10 (-11); flowers maroon or golden yellow.

7 Flowers golden yellow . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Thaspium trifoliatum var. aureum
7 Flowers dark maroon . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Thaspium trifoliatum var. trifoliatum
Thaspium barbinode (Michaux) Nuttall. Mt, Pd, Cp (GA, NC, SC, VA): moist forests; common. April-May; July-August. NY and Ontario west to MN, south to panhandle FL and OK. The hispid, purple-tinged leaf sheath is a good additional character for this species. [= RAB, G, K, MC, S, W, Z; = Th. barbinode var. barbinode - F, Y]

Thaspium pinnatifidum (Buckley) A. Gray. Mt (GA, NC): forests and woodlands over calcareous rock, such as limestone, dolostone, or calcareous siltstone); rare (GA Rare, NC Rare). May-June; June-July. KY south to w. NC, e TN (Chester, Wofford, \& Kral 1997), and $n$. AL. The report from VA is of unknown documentation. The distribution and rarity of this plant is complicated because of confusion with Th. chapmanii. [= RAB, F, G, K, MC, S, W, Y, Z]

Thaspium trifoliatum (Linnaeus) A. Gray var. aureum (Linnaeus) Britton. Mt, Pd, Cp (NC, SC, VA), \{provinces (GA)\}: moist forests; uncommon (rare in Coastal Plain). April-May; July-August. NY west to MN, south to SC, AL, AR, and se. KS. Various workers have differed on the characters used to separate two varieties in $T$. trifoliatum. RAB and C separate the two strictly on petal color; F, however, allows var. aureum to sometimes have purple petals, seeming to regard the critical differences to be var. aureum's generally more robust size and larger fruits ( 4.5 mm long vs. $3-4 \mathrm{~mm}$ long). It is presently not clear how two varieties should be separated, or, indeed, if varieties are warranted. Though the ranges overlap, var. aureum is generally more northern and western, var. trifoliatum more southern and eastern. [= K, S, Y; = T. trifoliatum var. flavum Blake -- RAB, F, MC, W, Z; <T. trifoliatum -- G]

Thaspium trifoliatum (Linnaeus) A. Gray var. trifoliatum. Mt, Pd, Cp (NC, SC, VA), \{provinces (GA)\}: moist forests; common (rare in Coastal Plain). April-May; July-August. NJ, PA, and MO, south to panhandle FL and LA. [= RAB, F, K, MC, S, W, Y, Z; <T. trifoliatum -- G]

Thaspium chapmanii (Coulter \& Rose) Small. Mt (GA): S. OH south to FL. [= T. barbinode var. angustifolium Coulter \& Rose -- F; > Th. barbinode var. angustifolium - Y; < Th. pinnatifidum, in part; > Th. barbinode var. chapmanii Coulter \& Rose - Y] \{add to key, etc.\}

Torilis Adanson (Hedge-parsley, Bur-parsley)
A genus of about 15 species, herbs, temperate, of the Old World. References: Mathias \& Constance (1945)=MC.
1 Rays reduced or absent, < 5 mm long, the inflorescence therefore compact, appearing like a head; inflorescences opposite the leaves, on peduncles $0-1(-2) \mathrm{cm}$ long; mericarps dimorphic, one with spines, the other tuberculate
T. nodosa

1 Rays and pedicels well-developed, > 5 mm long, the inflorescence therefore open, distinctly and obviously an umbel;
inflorescences opposite the leaves and terminal, on peduncles (1-) 3-16 cm long; mericarps monomorphic, both with spines.
2 Involucral bracts 0-1; fruits 3-4 mm long (not including the spines); spines straight or nearly so, with a minute hook at the
$\qquad$
2 Involucral bracts $>2$, generally 1 per ray; fruits 2-2.5 mm long (not including the spines); spines curved, not hooked at the tip
T. japonica

* Torilis arvensis (Hudson) Link, Spreading Bur-parsley, Field Hedge-parsley. Mt (GA, NC, VA), Cp (GA, SC, VA), Pd (GA, NC, $S C, V A$ ): roadsides, fields, disturbed areas; uncommon, introduced from Europe. May-June. [= RAB, C, MC, W; T. japonica -- F, G, misapplied; T. arvensis ssp. arvensis - K]
* Torilis japonica (Houttuyn) Augustin de Candolle. (VA): , introduced from Eurasia, is naturalized south to se. PA and VA. [= K, MC; T. anthriscus (Linnaeus) Gmelin]
* Torilis nodosa (Linnaeus) Gaertner, Knotted Bur-parsley. Cp (GA?, NC, SC): disturbed areas; rare, introduced from Mediterranean Europe. May. [= RAB, G, K, MC, S]

Trepocarpus Nuttall ex Augustin de Candolle
A monotypic genus, an herb, temperate, of se. United States. References: Mathias \& Constance (1945)=MC.

Trepocarpus aethusae Nuttall ex Augustin de Candolle. Pd (SC), ?? (GA): rich moist forests, sometimes weedy in disturbed soils; rare (GA Rare). May-June. C. SC south to panhandle FL and AL, west to e. TX, north in the interior to w. TN, w. KY, AR, and se. OK. Nelson (1993) states that despite "something of a reputation as a rarity," Trepocarpus is "a reasonably successful weed." [= RAB, C, GW, K, MC]

Zizia W.D.J. Koch (Golden-Alexanders)
A genus of about 4 species, herbs, temperate, of North America. References: Mathias \& Constance (1945)=MC; Cooperrider (1985) $=$ Z.
[see combined key to Thaspium and Zizia under Thaspium]
Zizia aptera (A. Gray) Fernald, Heartleaf Golden-Alexanders. Mt, Pd, Cp (GA, NC, SC, VA): moist forests, openings, and
woodland edges; common (rare in Coastal Plain). April-May; July-August. NY west to British Columbia, south to GA, panhandle FL, MO, and CO. [= RAB, F, G, GW, K, MC, W, Z; < Z. aptera var. aptera -- C; = Z. cordata W.D.J. Koch ex Augustin de Candolle -- S]

Zizia aurea (Linnaeus) W.D.J. Koch, Common Golden-Alexanders. Mt, Pd, Cp (GA, NC, SC, VA): moist forests; common (rare in Coastal Plain). April-May; June-July. New Brunswick west to Saskatchewan, south to sw. GA, panhandle FL, and e. TX. [= RAB, F, G, GW, K, MC, S, W, Z]

Zizia trifoliata (Michaux) Fernald, Mountain Golden-Alexanders. Mt, Pd, Cp (GA, NC, SC, VA): moist forests, woodlands, and woodland borders; common (rare in Coastal Plain). April-May; July-August. VA and WV west to AR, south to n. peninsular and panhandle FL. [= RAB, F, G, GW, K, MC, W; > Z. trifoliata - MC, in a narrower sense; > Z. bebbii (Coulter \& Rose) Britton -- S; > Z. latifolia Small -- MC, S]

## APOCYNACEAE (Dogbane Family)

As here circumscribed including the Asclepiadaceae, a family of about 480 genera and about 4800 species, lianas, shrubs, herbs, and trees, widespread in tropical and temperate areas. There appears to be overwhelming evidence favoring the combination of the Asclepiadaceae into the Apocynaceae; see, for instance, Rosatti (1989), Sennblad \& Bremer (1996), and many others. References: Rosatti (1989); Liede (1997a).

## Key to the tribe Asclepiadeae

1 Stem erect or spreading, never twining or climbing
Asclepias
1 Stem climbing, trailing, or sprawling, vinelike.
2 Leaves linear; [of brackish marshes and coastal hammocks] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Cynanchum
2 Leaves ovate and cordate; [of various habitats, sometimes maritime]. 3 Plants in flower.
4 Petals white . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Cynanchum laeve 4 Petals brown, yellow, yellow-green, cream, or maroon.

5 Corolla lobes glabrous on the outer surface, very stiff in texture; carpels smooth and angled . Gonolobus 5 Corolla lobes glandular-puberulent on the outer surface, herbaceous in texture; carpels muricate Matelea 3 Plants in fruit.

6 Follicles muricate
Matelea
6 Follicles smooth and angled.
7 Leaves deeply cordate, tapering steadily to an acuminate apex . . . . . . . . . . . . . . . . Cynanchum laeve
7 Leaves cordate, broadly rounded, tapering abruptly to an acute, obtuse, or apiculate apex... Gonolobus

## Ampelamus Rafinesque (Sandvine)

(see Cynanchum)

## Amsonia Walter (Blue-stars)

A genus of about 20 species, herbs, of temperate North America and Japan. References: Woodson (1928)=Z.
1 Corolla glabrous on the outer surface; stem pubescent (A. ciliata) or glabrous (A. rigida); [of the Coastal Plain from se. and sc. NC southwards].
2 Leaves elliptic; [of seasonally flooded depression wetlands and moist pinelands] . . . . . . . . . . . . . . . . . . . . . . . A. rigida
2 Leaves linear to lanceolate; [of dry, sandy habitats, such as sandhills].
3 Leaves strongly heteromorphic, the lower leaves lanceolate, 4-10 mm wide (mostly 4-15× as long as wide), the upper about 1 mm wide; inflorescence barely held above the foliage $\qquad$ A. ciliata var. ciliata

3 Leaves slightly or not at all heteromorphic, the lower leaves linear, 1-3 mm wide (mostly 15-30× as long as wide), the upper less than 1 mm wide; inflorescence usually held well above the foliage . . . . . . . . . . . A. ciliata var. tenuifolia
1 Corolla pubescent on the outer surface; stem glabrous; [more widespread in our area].
4 Leaf blades ovate to oblong-lanceolate, 3-6 cm wide
A. tabernaemontana var. tabernaemontana

4 Leaf blades lanceolate to linear-lanceolate, 1-3 cm wide.
5 Inflorescence dense, many-flowered; leaves pubescent (glabrate in age) ... [A. tabernaemontana var. gattingeri]
5 Inflorescence loose, few-flowered; leaves glabrous, glaucous beneath ...... A. tabernaemontana var. salicifolia
Amsonia ciliata Walter var. ciliata, Broadleaf Sandhills Blue-stars. Cp (GA, NC, SC): sandhills; uncommon (rare in NC). April; September-October. Se. NC south to n. FL, west to AL. [= K, S, Z; < A. ciliata -- RAB]

Amsonia ciliata Walter var. tenuifolia (Rafinesque) Woodson, Threadleaf Sandhills Blue-stars. Cp (GA, NC, SC): sandhills; uncommon (rare in NC). April; September-October. Se. and sc. NC south to FL, west to AL. [=K; <A. ciliata -- RAB; = A. ciliata var. filifolia Wood -- F, G, S; = A. ciliata var. tenuifolium -- Z, misspelling]

Amsonia rigida Shuttleworth ex Small, Stiff Bluestar, Pond Bluestar. Cp (GA): seasonally flooded depression wetlands and moist pinelands; uncommon. S. GA to n . peninsular FL , west to s . MS. [= GW, K, S, Z]

Amsonia tabernaemontana Walter var. salicifolia (Pursh) Woodson, Willowleaf Blue-stars. Mt (GA, NC, SC), Pd, Cp (NC, SC, VA): floodplain forests, moist, rich slope forests; common (uncommon in VA). April; August-September. Se. VA west to s. IN, IL, and MO, south to GA and TX. The two varieties, while strikingly different in their extreme expressions, have nearly the same
distribution and do intergrade; they may not be worthy of recognition. [= RAB, G, K, Z; < A. tabernaemontana -- C, GW, W; < A. salicifolia Pursh -- S, in part (also see var. gattingeri]

Amsonia tabernaemontana Walter var. tabernaemontana, Wideleaf Blue-stars. Mt (GA, NC, SC), Pd, Cp (GA, NC, SC, VA): floodplain forests, moist, rich slope forests; common (uncommon in VA, uncommon in Mountains). April; August-September. Se. VA west to s. IL, MO, and KA, south to GA, LA, and e. OK. [= RAB, G, K, Z; < A. tabernaemontana -- C, GW, W; = A. amsonia (Linnaeus) Britton -- S]

Amsonia Iudoviciana Vail, Louisiana Bluestar. Pd (GA): open woodlands around outcrops of Lithonia granitic gneiss; rare (GA Special Concern). Not native or naturalized in SC, contrary to Kartesz (1999). [= GW, K, S] \{not yet keyed; add synonymy\}

Amsonia tabernaemontana Walter var. gattingeri Woodson. Mt (GA): \{habitat\}; rare. IL, MO, and se. KS south to ne. TX, and apparently disjunct in the Interior Low Plateau of sc. KY, c. TN (Chester, Wofford, \& Kral 1997), and in n. GA. Kartesz (1999) shows a more restricted distribution, with this taxon endemic to TN and KY. [ $=\mathrm{K}, \mathrm{Z} ;<\operatorname{A}$. tabernaemontana -- C; C . salicifolia Pursh -- S, in part] \{add synonymy\}

## Angadenia Miers

A genus of 2 species, of Florida and the West Indies.

* Angadenia berteroi (Alphonse de Candolle) Miers, Pineland Golden-trumpet, Lice-root. Cp (NC): disturbed, acid, peaty soil; rare, introduced from subtropical FL. Presumably introduced via cattle at an agricultural experiment station near Wenona, Washington County, NC (Hayes 1946). The species has probably not persisted in our area. [= K; Rhabdadenia corallicola Small -S]

## Apocynum Linnaeus

A genus of about 12 species, herbs, of temperate e. and c. Asia and North America.

Apocynum androsaemifolium Linnaeus. [= K]
Apocynum cannabinum Linnaeus. [= K]
Apocynum $\times$ floribundum Greene (pro sp.) [A. androsaemifolium $\times$ cannabinum]. [= K]
Apocynum sibiricum var. cordigerum in Kent County, MD (Steury, Tyndall, \& Cooley 1996).

## Asclepias Linnaeus (Milkweed)

A genus of about 100 species, herbs, temperate and tropical, of North and Central America. References: Woodson (1954)=Z.

## Key A -- milkweeds with clear sap and alternate leaves

1 Leaves linear to lanceolate, hastate at the base; leaf margins usually crisped; [of sandhills of the fall-line Sandhills and middle Coastal Plain of se. VA southwards] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. Auberosa ssp. rolfsii
1 Leaves obovate to oblanceolate, cuneate at the base; leaf margins usually flat; [widespread in our area]
A. tuberosa ssp. tuberosa

Key B -- milkweeds with milky sap, with linear leaves opposite, subopposite, or whorled

1 Leaves either mostly in whorls of 3-6 (sometimes some nodes with merely opposite leaves), or subopposite (the leaves more-or-less paired but separated by $0.5-3 \mathrm{~mm}$ ); corolla whitish or greenish, usually suffused with rose-purple (especially at the tips of the corolla lobes).
2 Leaves mostly in whorls of 3-6 (sometimes some nodes with merely opposite leaves); leaves 1.5-7 cm long, 1-2 mm wide; seeds ca. 5 mm long, the coma ca. 2.5 cm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. verticillata
2 Leaves subopposite (the leaves more-or-less paired but separated by 0.5-3 mm ); leaves (3-) 5-18 cm long, (1-) 2-10 mm wide; seeds ca. $7-11 \mathrm{~mm}$ long, the coma $3-5 \mathrm{~cm}$ long; [of Coastal Plain pinelands].
3 Umbel 1, terminal; corona 5-7 mm in diameter; horns present, about as long as the hood; hoods ca. 2-4 mm long,

3 Umbels 1-4, terminal and from upper nodes; corona 2-3 mm in diameter; horns absent; hoods ca. 2 mm long, surpassed by the anther heads; [either of wet pinelands of the Coastal Plain or dry glades or woodlands].
4 Pedicels with spreading hairs; umbels 2-10, each with up to 30-100 flowers; leaves minutely scabrous; [of dry glades or woodlands, known from the Mountains of nw. GA, e. TN, w. WV westward] . . . . . . . . . . . . A. hirtella
4 Pedicels with incurved hairs; umbels 1-6, each with 10-30 flowers; leaves glabrous or nearly so; [of wet pinelands of the Coastal Plain]
A. Iongifolia

1 Leaves opposite; corolla as above, or creamy yellow, purple, or orange-red
5 Leaves 2.5-4.5 cm long, puberulent beneath, sessile; corolla lobes erect, creamy yellow to dull or greenish white, 7-10 mm long; plant 1-4 dm tall; [of dryish pinelands of the Coastal Plain]
A. pedicellata

5 Leaves $5-20 \mathrm{~cm}$ long, glabrous or glabrate beneath (rarely puberulent), sessile to petiolate; corolla lobes reflexed, either orange-red or usually with at least some purple (rarely merely whitish or greenish), 3-7 mm long (except 8-11 mm long in the orange-red A. lanceolata); plant 1-15 dm tall; [collectively of various habitats].
6 Leaves with petioles $1-10 \mathrm{~mm}$ long; leaves $5-15 \mathrm{~mm}$ wide; plants $5-15 \mathrm{dm}$ tall
7 Petiole 4-10 mm long; corolla pink (rarely white), the lobes $3-5.5 \mathrm{~mm}$ long; hoods 1-2 mm long; horns longer than the hoods; [mostly of the Mountains and Piedmont] . . . . . . . . . . . . . . . . . . A. incarnata var. incarnata
7 Petiole 1-3 mm long; corolla orange-red, the lobes $8-11 \mathrm{~mm}$ long; hoods $5-6 \mathrm{~mm}$ long; horns slightly shorter than the hoods; [of the Coastal Plain]
A. lanceolata

6 Leaves with petioles $0-1 \mathrm{~mm}$ long; leaves $1-7 \mathrm{~mm}$ wide; plants $1-7 \mathrm{dm}$ tall.
8 Leaves 1-2 mm wide; each hood with 2 erect, acuminate, marginal teeth on the inner side (adjoining the anther heads)
A. cinerea

8 Leaves 3-7 mm wide; each hood truncate, lacking prominent marginal teeth.
9 Umbel 1, terminal; corona 5-7 mm in diameter; horns present, about as long as the hood; hoods ca. 2-4 mm long, surpassing the anther heads; [of dry pinelands]
A. michauxii

9 Umbels 1-4, terminal and from upper nodes; corona 2-3 mm in diameter; horns absent; hoods ca. 2 mm long, surpassed by the anther heads; [either of wet pinelands of the Coastal Plain or dry glades or woodlands].
10 Pedicels with spreading hairs; umbels 2-10, each with up to 30-100 flowers; leaves minutely scabrous; [of dry glades or woodlands, east to nw. GA, TN, and WV]
A. hirtella

10 Pedicels with incurved hairs; umbels 1-6, each with 10-30 flowers; leaves glabrous or nearly so; [of wet pinelands of the Coastal Plain]
A. Iongifolia

## Key C -- milkweeds with milky sap, with sessile, nonlinear leaves

1 Leaves 2-5 cm long, 0.3-1.0 cm wide; corolla lobes erect, creamy yellow to greenish white, 7-10 mm long; plant 1-4 dm tall; [of dryish pinelands of the Coastal Plain of NC and SC]
A. pedicellata

1 Leaves $3-30 \mathrm{~cm}$ long, $0.5-11 \mathrm{~cm}$ wide (not simultaneously less than 5 cm long and less than 1 cm wide); corolla lobes reflexed, either orange-red, purple, pink, or green, 5-15 mm long; plant 2-10 dm tall; [collectively of various habitats, including dryish pinelands of the Coastal Plain].
2 Leaves cordate-clasping at base, 3-10 cm wide, 1-2× as long as wide; stem and leaves glabrous and usually also glaucous.
3 Plant erect, 4-10 dm tall; corolla lobes 7-11 mm long; inflorescence solitary, terminal (rarely a second from an upper node); corona $5-8 \mathrm{~mm}$ across; [widespread]
A. amplexicaulis

3 Plant prostrate or decumbent, 2-7 dm tall; corolla lobes 5-6.5 mm long; inflorescences 2-6 from upper nodes; corona $3-5 \mathrm{~mm}$ across; [of dry pinelands of the Coastal Plain]
A. humistrata

2 Leaves cuneate to rounded at base, 1-6 cm wide, (1-) 1.5-6x as long as wide; stem and leaves pubescent to glabrate.
4 Corolla lobes $12-15 \mathrm{~mm}$ long, greenish-yellow; flowers 3-6 (-8) per umbel.
A. connivens

4 Corolla lobes 6-9 mm long, reddish-purple or pale green; flowers more than 7 per umbel.
5 Leaves lanceolate, acuminate at the apex; corolla reddish purple, the lobes 7-9 mm long; [of Coastal Plain wetlands]
A. rubra

5 Leaves orbicular to oblong, rounded at the apex; corolla pale green, the lobes 6-7 mm long; [of dry habitats primarily in the Piedmont and Mountains (rarely in the Coastal Plain)]
A. viridiflora

## Key D -- milkweeds with milky sap, with petiolate, nonlinear leaves, in flower

1 Corolla greenish, either pale green or yellowish green.

3 Corona 2-3 mm across; corolla lobes pale green, 6-7 mm long; [of various provinces, primarily of the Piedmont] . . . .
A. viridiflora

3 Corona 5-9 mm across; corolla lobes yellowish green, 9-10 mm long; [strictly of the Coastal Plain, of NC and SC, and southward].
4 Hoods ca. 6 mm long, about $2 \times$ as long as the anther heads; stem and leaves densely tomentulose
A obovata
4 Hoods ca. 4 mm long, scarcely exceeding the anther heads; stem and leaves softly puberulent . . . . . . . . . . . .
A. tomentosa

1 Corolla pink, purple, or white.
5 Hoods about as long as the anther heads; horns $1.5-2 \times$ as long as the hood, exserted well beyond the hood.
6 Hood opening truncate, the hood therefore beaker-shaped; corolla lobes $8-12 \mathrm{~mm}$ long; [primarily of mesic forests of the Mountains] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. exaltata
6 Hood opening very oblique, the hood therefore scoop-shaped; corolla lobes 2.5-6 mm long; [primarily of wetlands of various provinces].
7 Plants 3-5dm tall; corolla lobes usually white (rarely slightly pink); leaves glabrous beneath; [of the Coastal Plain of SC]
A. perennis

7 Plants 5-15 dm tall; corolla lobes rose to purple (rarely white); leaves pubescent to glabrate beneath; [collectively widespread].
8 Stems and leaves sparsely pubescent to glabrescent; leaves narrow, the base obtuse to truncate, the apex long-acuminate; plants usually much branched
A. incarnata ssp. incarnata

8 Stems and leaves moderately to densely pubescent; leaves broader, the base rounded to subcordate, the apex acute to short-acuminate; plants usually relatively strict
A. incarnata ssp pulchra

5 Hoods distinctly longer than the anther heads; horns $0.5-1 \times$ as long as the hood, not conspicuously exserted beyond the hood.
9 Lower leaf surface pubescent over the surface.
10 Hood margin irregular but not with a sharp tooth; corolla purplish-rose; plants 4-10 dm tall ... A. purpurascens
10 Hood margin with a single, ascending, triangular tooth; corolla rose or greenish-white; plants (5-) 8-20 dm tall
. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. syriaca

9 Lower leaf surface glabrous to sparsely pubescent along the midvein only.
11 Hood opening very oblique, the hood therefore scoop-shaped, and also with 2 prominent lateral teeth; corolla pink to greenish (rarely white); plants 2-5 dm tall.
A. quadrifolia

11 Hood opening truncate and constricted, and lacking prominent teeth; corolla white (often pink at the "waist"); plants $3-12 \mathrm{dm}$ tall . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. variegata

Key E -- milkweeds with milky sap, with petiolate, nonlinear leaves, in fruit (or sterile)
1 Leaves subopposite . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. viridis
1 Leaves opposite (or apparently whorled in A. quadrifolia).
2 Follicle pendant; seeds without a coma; [of swamp forests of SC and southward] ........................ A. perennis
2 Follicle erect; seeds with a coma; [collectively widespread].
3 Leaf-bearing nodes 3-4, the upper and lower opposite, the middle with a whorl of 4 leaves ........ A. quadrifolia 3 Leaf-bearing nodes 3-many, all opposite.

4 Follicle slightly to strongly muricate . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. syriaca
4 Follicle smooth.
5 Lower leaf surface glabrous, or pubescent on the midrib only . . . . . . . . . . . . . . . . . . . . . . . . A. exaltata 5 Lower leaf surface pubescent.

6 Leaves lanceolate, $4-10 \times$ as long as wide.
7 Leaves coriaceous, $3-10 \mathrm{~cm}$ long, $1.5-4.5 \mathrm{~cm}$ wide; corolla pale green; [of dry upland situations] A. viridiflora

7 Leaves herbaceous, $6-15 \mathrm{~cm}$ long, $2-7 \mathrm{~cm}$ wide; corolla rose; [of moist to wetland situations].
8 Stems and leaves sparsely pubescent to glabrescent; leaves narrow, the base obtuse to truncate, the apex long-acuminate; plants usually much branched
A. incarnata ssp. incarnata

8 Stems and leaves moderately to densely pubescent; leaves broader, the base rounded to subcordate, the apex acute to short-acuminate; plants usually relatively strict
A. incarnata ssp pulchra

6 Leaves ovate to elliptic, $1.5-4 \times$ as long as wide.
9 Stem moderately to densely pubescent; plants 1.5-5 (-7) dm tall; [of xeric pinelands of the Coastal Plain of NC, SC, and southward].
10 Stem and leaves densely tomentulose; leaves mucronate . . . . . . . . . . . . . . . . A. obovata
10 Stem and leaves softly puberulent; leaves apiculate . . . . . . . . . . . . . . . . . A. tomentos
9 Stem glabrous to pubescent in lines only; plants 2-12 dm tall; [collectively of various habitats throughout our area].
11 Lower leaf surface densely puberulent; [primarily of moist to wet habitats] A. purpurascens 11 Lower leaf surface slightly pubescent; [primarily of moist to dry habitats].
12 Leaves $4-9 \mathrm{~cm}$ wide, acuminate at the apex . . . . . . . . . . . . . . . . . . . . . A. variegata

12 Leaves $1-6 \mathrm{~cm}$ wide, mostly obtuse at the apex . . . . . . . . . . . . . . . . A. viridiflora
Asclepias amplexicaulis J.E. Smith, Clasping Milkweed. Cp, Pd, Mt (GA, NC, SC, VA): dry woodlands of various types; common. May-July; June-August. NH and NY west to MN, IA, and KS, south to n. FL and e. TX. [= RAB, C, F, G, K, S, W]

Asclepias cinerea Walter, Carolina Milkweed. Cp (GA, SC): pine savannas; rare. June-July; August-September. Se. SC south to $n$. peninsular $F L$, west to panhandle FL. [= RAB, K, S]

Asclepias connivens Baldwin. Cp (GA, SC): wet pine flatwoods; common (rare in SC). July-August. Se. SC (McMillan et al. 2002) south to panhandle FL, west to Santa Rosa County, FL. [= GW, K; = Anantherix connivens (Baldwin) Feay -- S]

Asclepias exaltata Linnaeus, Tall Milkweed. Mt (GA, NC, SC, VA), Pd (VA): moist forests, slopes, and forest margins;
common (rare in VA Piedmont). June-July; August-September. ME and s. Ontario west to MN and IA, south to n. GA, e. and c. TN (Chester, Wofford, \& Kral 1997), KY, and IL. [= RAB, C, F, G, K, S, W]

Asclepias hirtella (Pennell) Woodson, Barrens Milkweed. Mt (GA): limestone glades, prairies; rare (GA Special Concern). W. WV (Mason County), KY, e. TN (Bradley County) (Chester, Wofford, \& Kral 1997), and nw. GA (Jones \& Coile 1988). It is a species of midwestern prairies and barrens that closely resembles A. longifolia. [= C, F, K; = Asclepias longifolia Michaux var. hirtella (Pennell) Farmer \& Bell; = Acerates hirtella Pennell - S]

Asclepias humistrata Walter, Fleshy Milkweed. Cp (GA, NC, SC), Pd (GA): sandhills; common. May-June; June-July. E. NC south to s. FL, west to e. LA. [= RAB, K, S]

Asclepias incarnata Linnaeus ssp. incarnata, Western Swamp Milkweed. Mt, Pd, Cp (VA): swamps, marshes; rare. JulySeptember; August-October. ME and s. Québec west to Manitoba, south to VA, s. TN (Chester, Wofford, \& Kral 1997), AR, TX, and CO, disjunct in FL, TX, NM, and UT. [= RAB, K, W; = Asclepias incarnata var. incarnata -- C, F, G, GW; = Asclepias incarnata -- S]

Asclepias incarnata Linnaeus ssp. pulchra (Ehrhart ex Willdenow) Woodson, Eastern Swamp Milkweed. Mt, Pd, Cp (GA, NC, SC, VA): marshes, bogs, swamps; common (rare in SC). July-September; August-October. Nova Scotia and ME south to e. NC, w. SC, GA, and e. TN (Chester, Wofford, \& Kral 1997). [= RAB, K, W; = Asclepias incarnata var. pulchra (Ehrhart ex Willdenow) Persoon -- C, F, G, GW; = Asclepias pulchra Ehrhart ex Willdenow -- S]

Asclepias lanceolata Walter, Few-flower Milkweed. Cp (GA, NC, SC, VA): swamps, fresh to slightly brackish marshes, wet pine savannas; uncommon (rare in VA) (VA Watch List). June-August; August-September. NJ south to s. peninsular FL, west to e. TX. [= RAB, C, GW, K, S; > Asclepias lanceolata var. lanceolata - F, G; > Asclepias lanceolata var. paupercula (Michaux) Fernald -- F, G]

Asclepias longifolia Michaux, Savanna Milkweed. Cp (GA, NC, SC, VA): wet pine savannas; uncommon (NC Watch List, VA Rare). May-June; June-July. DE south to s. FL, west to e. TX. [= RAB, C, F, GW, K; = Acerates longifolia (Michaux) Elliott -- G; Acerates floridana (Lamarck) A.S. Hitchcock -- S]

Asclepias michauxii Decaisne, Michaux's Milkweed. Cp (GA, SC): pine savannas; uncommon. May. S. SC south to peninsular FL, west to e. LA. [= RAB, K, S]

Asclepias obovata Elliott, Pineland Milkweed. Cp (GA, SC): sandhills; uncommon. June-September. Se. SC south to panhandle FL, west to AR and TX. [= RAB, K, S]

Asclepias pedicellata Walter, Stalked Milkweed, Savanna Milkweed. Cp (GA, NC, SC): dry pine savannas; rare (GA Special Concern, NC Rare, SC Rare). July-August. Se. NC south to s. FL. This species generally occurs in small populations of widely scattered individuals; populations of more than 50 individuals are rare. [= RAB, GW, K; Podostigma pedicellata (Walter) Vail -- S]

Asclepias perennis Walter, Smoothseed Milkweed, Swampforest Milkweed. Cp (GA, SC): swamp forests; rare. JuneAugust; August-September. E. SC south to peninsular FL, west to e. TX, north in the interior to s. IN and s. IL. [= RAB, C, F, G, GW, K, S]

Asclepias purpurascens Linnaeus, Purple Milkweed. Mt, Pd (NC, VA), Cp (VA): openings in moist bottomlands and swamp forests, perhaps mostly on soils derived from mafic soils; rare (GA Special Concern, NC Watch List). June. NH and s. Ontario west to WI, IA, and KS, south to NC, nw. TN (Chester, Wofford, \& Kral 1997), KY, AR, and OK. [= RAB, C, F, G, K, S, W]

Asclepias quadrifolia Jacquin, Fourleaf Milkweed. Mt (GA, NC, SC, VA), Pd (NC, SC, VA): moist to dryish forests and forest margins, most common on mafic and calcareous substrates; common. May-June; August-September. NH and NY west to IN, south to NC, n. GA, n. AL, and c. TN; also from w. IL west to MO, south to AR and OK. [= RAB, C, F, G, K, S, W]

Asclepias rubra Linnaeus, Red Milkweed. Cp (GA, NC, SC, VA), Pd (GA, VA): pocosin ecotones, wet pine savannas, sandhill seeps, seepage swamps; uncommon (GA Special Concern, VA Rare). June-July; July-September. Se. NY (Long Island), se. PA, and NJ south to wc. GA, west to e. TX. A. laurifolia is alleged to differ in sessile, cordate-clasping leaf bases (vs. petioled and rounded), purplish-pink flowers (rather than orange-red), and other characters (see Small 1933); it may warrant recognition and needs additional study. [= RAB, C, F, G, GW, K; > A. rubra - S, in a narrow sense; > A. laurifolia Michaux - S; > A. rubra var. rubra; > A. rubra var. laurifolia (Michaux) Harper]

Asclepias syriaca Linnaeus, Common Milkweed. Mt, Pd (NC, SC, VA), Cp (NC, VA): pastures, roadsides, disturbed areas; common (rare in Coastal Plain of NC, rare in SC). June-August; July-September. New Brunswick and ME west to s. Manitoba and ND, south to SC, GA, c. TN (Chester, Wofford, \& Kral 1997), AR, OK, and KS. This species is apparently expanding its range southwards; see Wyatt et al. (1993) and Wyatt (1996) for discussion. [= RAB, C, K, S, W; Asclepias syriaca var. syriaca -- F, G]

Asclepias tomentosa Elliott, Sandhills Milkweed. Cp (NC, SC): sandhills; uncommon (NC Watch List). June; July. Sc. NC south to s. FL, west to c. TX. [= RAB, K; Asclepias aceratoides M.A. Curtis - S]

Asclepias tuberosa Linnaeus ssp. rolfsii (Britton ex Vail) Woodson, Sandhills Butterfly-weed. Cp (GA, NC, SC, VA): sandhills; uncommon. May-August; August-September. Se. VA south to s. FL, west to s. MS. The first occurrence in Virginia is discussed by Belden et al. (2004). [= RAB, K; = Asclepias rolfsii Britton ex Vail -- S]

Asclepias tuberosa Linnaeus ssp. tuberosa, Common Butterfly-weed. Mt, Pd, Cp (GA, NC, SC, VA): woodland margins, roadsides, pastures; common. May-August; August-September. S. NH west to OH, south to panhandle FL and e. TX. [= RAB, G, K; = Asclepias tuberosa var. tuberosa -- C; Asclepias tuberosa -- F, S, W; Asclepias decumbens Linnaeus - S]

Asclepias variegata Linnaeus, White Milkweed. Cp, Pd, Mt (GA, NC, SC, VA): upland forests and woodlands; common (uncommon in VA Mountains). May-June; July-September. CT west to OH, s. IN, s. IL, se. MO, and se. OK, south to panhandle FL, LA, and e. TX. [= RAB, C, F, G, K, W; = Biventraria variegata (Linnaeus) Small -- S]

Asclepias verticillata Linnaeus, Whorled Milkweed. Mt, Pd, Cp (GA, NC, SC, VA): barrens, thin soils of rock outcrops (especially mafic rocks), thin woodlands, sandhills; uncommon. June-September; September-October. E. MA west to ND and Manitoba, south to s. FL, TX, NM, and AZ. [= RAB, C, F, G, K, S, W]

Asclepias viridiflora Rafinesque, Green Milkweed. Pd, Cp (GA, NC, SC, VA), Mt (GA, VA): open woodlands, woodland edges, barrens, glades, especially over mafic or calcareous rocks, and also in disturbed areas; uncommon. June-August; AugustSeptember. CT west to s. Ontario, Manitoba, ND, and MT, south to NC, SC, GA, AL, LA, TX, n. Mexico, NM, and AZ. [= RAB, C, F, K, W; > Asclepias viridiflora var. viridiflora - F; > Asclepias viridiflora var. lanceolata (Ives) Torrey - F; = Acerates viridiflora (Rafinesque) Pursh ex Eaton -- G, S]

Asclepias viridis Walter. Cp (GA, SC), Mt (GA): \{habitats\}; rare. S. SC south to s. FL, west to TX; and from OH, w. WV, and

KY west to NE, south to se. TN, c. TN (Chester, Wofford, \& Kral 1997), nw. GA, c. AL, c. MS, AR, TX, and OK. [= K; = Asclepiodora viridis (Walter) A. Gray -- S]

* Asclepias curassavica Linnaeus is cultivated as an ornamental and is sometimes slightly persistent. Kartesz (1999) reports it for TN. [= K] \{not yet keyed; add synonymy\}

Asclepias tuberosa Linnaeus ssp. interior Woodson, Midwestern Butterfly-weed. East to MS, TN, KY, WV (Kartesz 1999). [= K; = A. tuberosa Linnaeus var. interior (Woodson) Shinners - C] \{not yet keyed; add synonymy

Asclepias viridula Chapman, Southern Milkweed. Cp (GA): wet longleaf pine savannas and flatwoods, seepage slopes, pitcherplant bogs; rare. April-July. GA and AL south to FL. See Chafin (2000) for additional information. [= GW, K, S] \{not yet keyed; add synonymy\}

Catharanthus G. Don (Rosy-periwinkle)
A genus of about 8 species, herbs, 7 endemic to Madagascar and 1 endemic to India. References: van Bergen (1996)=Z; Snoeijer (1996).

* Catharanthus roseus (Linnaeus) G. Don, Rosy-periwinkle, Madagascar Periwinkle, Cayenne Jasmine. Cp (GA, NC, SC): disturbed areas, persistent after cultivation or as a waif or "throwout" after cultivation; rare, introduced from Madagascar, now a pantropical weed. May-October. C. roseus is the source of a powerful anti-leukemia drug. [= K, S, Z; = Vinca rosea Linnaeus -RAB]

## Cynanchum Linnaeus (Swallow-wort)

A genus of about 400 species, vines and lianas, primarily of tropical and warm temperate portions of the New World and Old World. Ampelamus was retained as a genus by Liede (1997a), but later results suggest that it is not distinct from some other portions of Cynanchum (Liede \& Täuber 2002). However, Cynanchum itself is polyphyletic and will probably be broken up; further taxonomic and nomenclatural changes are likely. C. laeve will probably remain in Cynanchum s.s. (which is primarily Old World in distribution), while our other two species will likely be transferred to another genus. References: Liede (1997b); Liede \& Meve (1997); Liede (1997a); Krings (2001)=Z; Liede \& Täuber (2002).

Cynanchum angustifolium Persoon, Swallow-wort. Cp (GA, NC, SC): coastal hammocks, edges of marshes, generally or always on barrier islands; uncommon. June-July; July-October. E. NC (Dare County) south to s. FL, west to TX, and in the Bahamas and West Indies. [= GW, K; C. palustre (Pursh) Heller -- RAB; Lyonia palustris (Pursh) Small - S]

Cynanchum laeve (Michaux) Persoon, Sandvine. Cp (GA, NC, SC), Pd (SC, VA), Mt (VA): bottomlands and disturbed areas; uncommon. July-August; October. Widespread (but rather scattered and irregular) in e. North America, from se. PA and KS south to sw. GA, w. FL, and c. TX. [= RAB, GW, K, W; = Ampelamus laevis (Michaux) Krings -- Z; = Ampelamus albidus (Nuttall) Britton C, F, G; = Gonolobus laevis Michaux -- S]

Cynanchum scoparium Nuttall, Leafless Swallowwort. Cp (GA, SC): coastal hammocks; rare (SC Rare). Se. SC south to FL, west to s. MS. Liede (1997b) indicates that this species will likely be transferred to Orthosia Decaisne in Candolle, a large group primarily of the Caribbean, Central America and $n$. South America, but she refrains from the new combination pending further studies. [= RAB, K; = Amphistelma scoparia (Nuttall) Small -- S]

## Gonolobus Michaux (Anglepod)

A genus of about 100 species, vines, primarily tropical. Liede (1997a), Lipow \& Wyatt (1998), and others recognize Gonolobus as separate from Matelea. References: Rosatti (1989)=Z; Lipow \& Wyatt (1998)=Y; Drapalik (1969)=X; Reveal \& Barrie (1992); Krings \& Xiang (2004).

Gonolobus suberosus (Linnaeus) R. Brown, Common Anglepod. Cp, Pd (GA, NC, SC, VA), Mt (GA, NC): mesic to wet forests and thickets; uncommon. June-August; September-November. Se. VA south to FL and west to TX, north in the interior to KY, s. MO, and s. IL. Rosatti (1989) and Drapalik (1969) have expressed considerable doubt about whether two species should be recognized; their view, supporting the recognition of a single species in our area, is followed here for now. However, a study by Krings \& Xiang (2004) suggests that 2 entities can be circumscribed, perhaps best at the varietal level. Drapalik (1969) considered the basionym "suberosa" as not applicable to Matelea of North America; Reveal \& Barrie (1992) lectotypified the name, resulting in it applying to our material. It has priority over "gonocarpus." [=F; Gonolobus gonocarpus (Walter) Perry -- Z; Matelea suberosa (Linnaeus) Shinners -- RAB, C, W; Matelea gonocarpa (Walter) Shinners -- RAB, C, W; Gonolobus gonocarpus -- F, G, in a more narrow sense; Matelea gonocarpos (Walter) Shinners -- K; Vincetoxicum gonocarpos Walter -- S; Vincetoxicum suberosum (Linnaeus) Britton -- S, misapplied; Matelea gonocarpa - X; Gonolobus suberosus (Linnaeus) R. Brown -- F, Y, misapplied; Matelea gonocarpa - Z; Gonolobus gonocarpus -- Z]

## Matelea Aublet (Spinypod)

A genus of about 180 species, vines, primarily tropical and restricted to the New World. References: Drapalik (1969)=Z.
1 Plant a prostrate herb, usually not twining, with stems 0.2-0.6 (-1.1 m) long at maturity; leaf blades 2-4 (-6) cm long; cymes sessile; flowers 2-5 per inflorescence, averaging 3-4; [of xeric sandhills, from e. GA southwards] . . . . . . . . . . . . . M. pubiflora
1 Plant a twining herbaceous vine, with stems 1-2 m long at maturity; leaf blades 7-27 cm long; cymes borne on peduncles; flowers 2-53 per inflorescence, averaging 9-19 (except $M$. alabamensis, with 1-12 flowers per inflorescence, averaging 4-5); [of various habitats, but more mesic, collectively widespread in our area].
2 Inflorescence with 1-12 flowers, averaging 4-5; corolla light green, reticulated with darker green; corona disc-shaped, lacking 5 pairs of appendages; [of mesic slopes of s. GA southwards and westwards] . . . . . . . . . . . . M. Mlabamensis
2 Inflorescence with 2-53 flowers, averaging 9-19; corolla white, yellow, rose, or maroon (or greenish and reticulate in $M$. flavidula); corona cup-shaped, with 5 pairs of upright appendages alternating with 5 corona lobes; [collectively widespread].
3 Corolla lobes in a horizontal plane or slightly reflexed; flower buds ovoid, $<1.5 \times$ as long as wide; corolla lobes 1.5 $2.6 \times$ as long as wide.
4 Corolla dark maroon (rarely maroon-yellow or yellow), not reticulate with darker veins; paired corona appendages always higher than the alternating corona lobes . . . . . . . . . . . . . . . . . . . . . . . . . . M. carolinensis
4 Corolla green, green-yellow, or yellow (rarely rosy or olive-maroon), reticulate with darker green veins; paired corona appendages about as high as the alternating corona lobes . . . . . . . . . . . . . . . . . . . . . . M. flavidula
3 Corolla lobes ascending; flower buds conical, $>2 \times$ as long as wide; corolla lobes 2.4-6.2× as long as wide.
5 Corolla white (or fading or drying cream); corona 2.2-2.7 mm in diameter, cream or creamy-yellow; [of sw. GA westwards] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . M. baldwyniana
5 Corolla rose or maroon (rarely cream); corona 2.6-4.0 mm in diameter, rose to dark maroon (rarely green, cream, or orange); [primarily of the Mountains and Piedmont].
6 Corolla lobes 2.4-3.6 (-4.0)× as long as wide, the widest part above the sinus; corolla dark maroon
M. decipiens

6 Corolla lobes (3.2-) 4.0-6.2× as long as wide, the widest part at the sinus; corolla rose to light maroon (rarely dark maroon, green, or cream) . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . M. obliqua

Matelea alabamensis (Vail) Woodson, Alabama Milkvine, Alabama Spinypod. Cp (GA): open forests on river bluffs, mesic margins of sandridges; rare (GA Threatened). April-June. Sw. and apparently se. GA, Panhandle FL, and s. AL. [= K, Z; Cyclodon alabamense (Vail) Small - S]

Matelea baldwyniana (Sweet) Woodson, White Spinypod. Cp (GA): dry to mesic bluffs over calcareous rocks; rare? Panhandle FL and sw. GA west to MO, AR, and OK. Drapalik (1969) discusses the probability that the name M. baldwyniana is based on material of M. flavidula. [= K, Z; Odontostephana baldwiniana (Sweet) Alexander - S]

Matelea carolinensis (Jacquin) Woodson, Carolina Spinypod. Pd, Cp (GA, NC, VA), Mt (GA, VA): moist to dry, nutrient-rich forests; common (uncommon in VA Piedmont, rare in VA Mountains). April-June; July-October. DE, MD, KY, and s. MO south to GA and MS. [= RAB, C, K, W; Gonolobus carolinensis (Jacquin) R. Brown ex J.A. Schultes -- F, G; Odontostephana carolinensis (Jacquin) Alexander -- S]

Matelea decipiens (Alexander) Woodson, Deceptive Spinypod. Pd (GA, NC, VA), Cp (NC): woodlands and thickets, generally over mafic (in the Piedmont) or calcareous rocks (in the Coastal Plain); rare (NC Rare, VA Rare). April-June; August-October. VA south to nc. GA, AL, and e. TX, north in the interior to s. IL and MO. [= RAB, C, K; Gonolobus decipiens (Alexander) Perry -- F, G; Odontostephana decipiens Alexander -- S]

Matelea flavidula (Chapman) Woodson, Yellow Spinypod. Cp (SC), Pd? (NC?): moist, nutrient-rich forests; rare (NC Watch List). May-June; August-October. E. NC (?) and e. SC south to panhandle FL, apparently rare throughout its range. [= RAB, K; Odontostephana flavidula (Chapman) Alexander -- S]

Matelea obliqua (Jacquin) Woodson, Northern Spinypod, Limerock Milkvine. Mt (GA, NC, VA), Pd (VA): in forests, woodlands, or thickets over calcareous rocks; uncommon (GA Special Concern, NC Watch List). June; August-November. PA west to OH, IN, and MO, south to w. NC, nw. GA (Jones \& Coile 1988), and TN. [= RAB, C, K, W; Gonolobus obliquus (Jacquin) R. Brown ex J.A. Schultes -- F, G; G. shortii A. Gray -- F; Odontostephana obliqua (Jacquin) Alexander -- S; O. shortii (A. Gray) Alexander -- S]

Matelea pubiflora (Dcne.) Woodson, Trailing Milkvine. Cp (GA): sand ridges, sandhills; rare (GA Rare). E. GA (Jones \& Coile 1988) south to ne. FL (Wunderlin 1998). [= K, Z; Edisonia pubiflora (Dcne.) Small -- S]

Nerium Linnaeus (Oleander)
A monotypic genus, a shrub, of Mediterranean Europe.

* Nerium oleander Linnaeus, Oleander. Cp (GA, NC, SC): frequently cultivated, especially on barrier islands (because of its salt resistance), sometimes persistent; rare, introduced from Mediterranean Europe. [= K, S]

Periploca Linnaeus (Silkvine)

* Periploca graeca Linnaeus, Silkvine, is sometimes cultivated and escaped or persistent; it is reported for various states
adjacent to our area, as in Knox County, TN (Chester, Wofford, \& Kral 1997). [= K]

## Trachelospermum Lemaire (Climbing Dogbane)

A genus of about 20 species, vines, of se. Asia (India to Japan), except the single species of se. United States.
Identification notes: Sometimes mistaken at a glance for Gelsemium (both woody vines with opposite lanceolate leaves), but the milky sap of Trachelospermum provides an immediate identifying characteristic.

Trachelospermum difforme (Walter) A. Gray, Climbing Dogbane. Cp, Pd (GA, NC, SC, VA): bottomlands, swamp forests, marshes; common (uncommon in VA Piedmont). May-July; July-September. DE south to $n$. FL, west to e. TX, north in the interior to MO and IN. See Krings (2003) for a discussion of nomenclature. [= RAB, C, F, G, GW, K, S]

Vinca Linnaeus (Vinca, Periwinkle)
A genus of 7 species of Europe, n. Africa, and c. Asia.
1 Leaves ovate, broadest near the base, cordate or subcordate-rounded at the base; leaf margins ciliate; flowers 3-5 cm across

1 Leaves lanceolate or elliptic, broadest near the middle, rounded to cuneate at the base; leaf margins not ciliate; flowers 2-3 cm across . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . V. $\operatorname{minor}$

* Vinca major Linnaeus, Greater Periwinkle. Cp, Pd, Mt (GA, NC, SC, VA): disturbed areas, suburban woodlands, around old house sites, persistent and spreading from cultivation; uncommon, introduced from Europe. Late February-May; June-July. [= RAB, C, F, G, K, S, W]
* Vinca minor Linnaeus, Common Periwinkle. Pd, Cp, Mt (GA, NC, SC, VA): disturbed areas, around old house sites and especially old cemeteries, persistent and spreading from cultivation; common, introduced from Europe. April-May; June-July. [= RAB, C, F, G, K, S, W]

## AQUIFOLIACEAE (Holly Family)

A monogeneric family of about 500 species, nearly cosmopolitan.

## Ilex Linnaeus (Holly, Winterberry, Gallberry)

A genus of about 500 species, mostly trees and shrubs, cosmopolitan and widespread in tropical and temperate areas, especially Asia and America. The genus Nemopanthus is clearly best subsumed into llex. References: Godfrey (1988)=Y; Krakow (1989)=Z; Powell et al. (2000)=X; Wunderlin \& Poppleton (1977).

Identification notes: Some of our species can be superficially similar to various shrubs and trees of the Rosaceae, in their alternate toothed leaves borne on spur shoots.

1 Leaves coriaceous, evergreen.
2 Leaves with well-developed apical (and usually also) marginal spines 2-6 mm long.
3 Flowers in 1 -few-flowered axillary cymes, on growth of the same year; [native tree of a wide variety of habitats] ....
......................................................................................... . I. opaca var. opaca
3 Flowers in axillary clusters, on branches of the previous year; [alien shrub, rarely naturalized, especially in suburban areas]
I. cornuta

2 Leaves with margins either entire, crenate, serrate, or with marginal spinose prickles less than 1 mm long (the apex
sometimes mucronate, but not stiff and spinose).
4 Leaves crenate from base to apex, $0.5-4.5 \mathrm{~cm}$ long; calyx and corolla 4-lobed.
$5 \quad$ Fruits black; [alien shrub, rarely naturalized, especially in suburban areas]
I. crenata

5 Fruits red or yellow; [native shrub of the Coastal Plain, sometimes planted and naturalized] . . . . . . I. vomitoria
4 Leaves entire, crenate (if so, only beyond the midpoint), serrate, or with marginal spinose prickles, 2-10 cm long; calyx and corolla 4-lobed or 5-9-lobed; fruits red, yellow, or black.
6 Fruits black; calyx and corolla 5-9-lobed; leaves crenate near the tip or with a few marginal spinose prickles, or entire, with dark punctate dots beneath.
7 Leaves $1.5-3 \times$ as long as wide, with a few, irregularly spaced, marginal spinose prickles (or commonly entire), generally about $2-3 \mathrm{~cm}$ wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . l. coriacea
7 Leaves $3-4 \times$ as long as wide, crenate in the apical $1 / 2$ to $1 / 3$ (or rarely entire), generally about 1 cm wide (almost never more than 2 cm wide) . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . I. glabra
6 Fruits red or yellow; calyx and corolla 4-lobed; leaves entire (or with spinose serrations), lacking dark punctate dots beneath.
8 Leaves oblanceolate, oblong, or elliptic, $3-12 \mathrm{~cm}$ long, (8-) $15-40 \mathrm{~mm}$ wide, $2-4 \times$ as long as wide; petioles
(3-) 5-15 mm long; leaf apex acute, obtuse, or rounded; branchlets strongly ascending, most of them forming an angle of less than 45 degrees to the branch
l. cassine var. cassine

8 Leaves lanceolate to narrowly oblong, 2-4 cm long, 3-8 mm wide, 3-7× as long as wide; petioles 1-3 (-5) mm long; leaf apex acute to acuminate; branchlets ascending to spreading, most of them forming angles greater than 45 degrees to the branch, and often at right angles
I. myrtifolia

1 Leaves membranous, deciduous
9 Leaves entire, or nearly so; [of moist to wet sites, from WV northwards] . . . . . . . . . . . . . . . . . . . . . . . . . . . . [I. mucronata]
9 Leaves toothed; [collectively widespread in our area].
10 Leaves oblanceolate or obovate, broadest above the middle, 8-30 (-45) mm wide, narrowly cuneate basally, mostly $2-3 \times$ as long as wide.
11 Pedicels of fruits and pistillate flowers 2-6 mm long; pedicels of staminate flowers (2-) 4-8 (-16) mm long; leaves mostly gray green, often revolute, especially towards the base; pubescence of the lower leaf surface tomentose, primarily on or near the midrib; leaf margins rarely ciliate.
12 Leaves $2-4.8 \mathrm{~cm}$ long, $0.6-1.5 \mathrm{~cm}$ wide; fruits $4-5 \mathrm{~mm}$ in diameter; sepals usually ciliate; [plant apparently endemic to the Suwanee River drainage of sc. GA and e. panhandle FL] . . . . . . I. decidua var. curtissii
12 Leaves 4.5-8.5 (-10) cm long, 1.5-3 cm wide; fruits (4-) 5-8 (-9) mm in diameter; sepals not ciliate; [plant widespread in our area, in the Coastal Plain, Piedmont, and rarely Mountains of our area]
I. decidua var. decidua

11 Pedicels of fruits and pistillate flowers (5.5-) 10-30 mm long; pedicels of staminate flowers (10-) 15-25 mm long; leaves rarely revolute; pubescence of the lower leaf surface strigose, distributed on the surface; leaf margins often ciliate.
13 Upper leaf surface with trichomes throughout; sepals ciliate; leaf blades entire to shallowly crenate . . . . .
I. cuthbertii

13 Upper leaf surface glabrous, or with trichomes confined to the veins or their vicinity; sepals eciliate; leaf blades crenate to distinctly serrate I. Iongipes

10 Leaves elliptic or ovate, broadest near the middle, (10-) $20-55 \mathrm{~mm}$ wide, rounded to broadly cuneate basally, mostly $1-2.5 \times$ as long as wide.
14 Veins on undersurface of leaf blades reticulate, defining areoles; fruit surface dull; fruiting pedicels 6-14 mm long (averaging about 10 mm ); [of blackwater floodplains and clay-based Carolina bays of the Coastal Plain] . .

14 Veins on undersurface of leaf blades obscure, not defining areoles; fruit surface shiny; fruiting pedicels either (8) $10-30 \mathrm{~mm}$ long or $2-9 \mathrm{~mm}$ long (averaging either less than 6 mm or more than 15 mm long); [collectively of various habitats, widespread in our area].
15 Fruiting pedicels (8-) 10-30 mm long; fruit (7-) 8-12 mm in diameter, bright cherry-red; [of bogs and very moist forests of the Mountains]
15 Fruiting pedicels 2-9 mm long; fruit 5-9 (-12) mm in diameter, red to orange; [collectively of various habitats, widespread in our area].
16 Nutlets (5-) 6-8 per fruit, smooth on the back; staminate flower clusters on peduncles 2-6 mm long; pistillate flowers with entire corolla lobes; flowers mostly in axils of leaves on normal shoots.
17 Sepals glabrous (in flower or fruit), acute . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . I. laevigata
17 Sepals ciliate (in flower or fruit), obtuse I. verticillata

16 Nutlets 4-5 per fruit, with striate ridges on the curved back; staminate flower clusters sessile or very short-peduncled ( $0-2 \mathrm{~mm}$ long); pistillate flowers with ciliate corolla lobes; flowers mostly in axils of leaves on lateral short-shoots.
18 Leaves 2-9 (-10.5) cm long, elliptic to broadly ovate, often nearly round, the apex abruptly to gradually acuminate, the marginal teeth usually inconspicuous; petioles of mature leaves usually less than 1 cm long; fruits $5-9 \mathrm{~mm}$ in diameter; plant a shrub to 6 m tall; [of the Coastal Plain, Piedmont, and Mountains].
I. ambigua

18 Leaves 6-16 cm long (the largest, at least more than 8 cm long), narrowly to broadly ovate, the apex long acuminate to attenuate, the marginal teeth rather coarse; petioles of mature leaves usually more than 1 cm long; fruits $9-12 \mathrm{~mm}$ in diameter; plant shrub or small tree to 10 m tall; [of the Mountains and upper Piedmont]
I. montana

## Auxiliary Key to Deciduous Ilex of Moist to Wet Habitats of the Mountains

## [Note: trichotomous lead]

1 Fruits bright cherry-red, broader than long, (7-) 8-12 mm in diameter, borne on stalks 9-20 mm long, primarily in the axils of leaves on spur shoots; bark of 2-3 year old twigs usually light tan; calyx (persistent on fruit) $4(-5)$ lobed; nutlets 4 ( -5 ) per fruit, with bony white longitudinal striations on the back, the furrows between the striations very shallow if developed at all; petiole with a deeply $U$ - to $V$-shaped channel on its upper side (made by the decurrent leaf edges), with dark ascending trichomes in the channel; leaves variable, but mostly $3-6 \mathrm{~cm}$ wide and about $1.5 \times$ as long as wide, usually abruptly short-acuminate; [plant of bogs, seepages, streambanks, and (rarely) moist forests, mostly at high elevations]
I. collina

1 Fruits duller red, longer than broad, 5-8 mm in diameter, borne on stalks 1-6 mm long, primarily in the axils of leaves on spur shoots; bark of 2-3 year old twigs usually brown, gray, or purplish; calyx (persistent on fruit) 4-6 lobed; nutlets 4-6 per fruit, with longitudinal ridges, the furrows between the ridges about as deep as the distance between the ridges; petiole with U-shaped channel on its upper side, with white appressed trichomes in the channel; leaves variable, but mostly 3-7 cm wide and about $2 \times$ as long, usually long-acuminate; [plant of moist forests and (rarely) bog edges].
I. montana

1 Fruits duller red, longer than broad, 5-7 mm in diameter, borne on stalks 1-6 mm long, primarily in the axils of leaves on normal
shoots with elongate internodes; bark of 2-3 year old twigs usually brown, gray, or purplish; calyx (persistent on fruit) (4-) 5-6 lobed; nutlets (4-) 5-6 per fruit, smooth and unmarked on the back; petiole nearly terete in X-section (or very shallowly channeled on the upper surface); leaves variable, but mostly $2-3.5(-5) \mathrm{cm}$ wide and about $2 \times$ as long, usually merely acute; [plant of bogs and other wetlands]
I. verticillata

Ilex ambigua (Michaux) Torrey, Carolina Holly. Cp, Pd, Mt (GA, NC, SC): sandy upland forests, dry slope forests, rarely in pocosin ecotones in the fall-line sandhills region; uncommon (NC Watch List). April-June; August-September. Ne. NC, se. TN, n. AR, and se. OK south to c. peninsular FL, s. MS, and se. TX; disjunct in the Sierra Madre Oriental and Chiapas, Mexico. The various taxa that have been distinguished in this complex may have some merit, though a detailed study by Krakow (1989) did not show a clear basis for their recognition. I. buswellii Small, strictly of xeric habitats of the Coastal Plain from se. NC southwards, has the larger leaves 2-3.5 (-4) cm long and 0.7-1.7 (-2.5) cm wide. I. ambigua (sensu stricto) is distributed in the Coastal Plain, Piedmont and low Mountains, and has more Coastal Plain and has eaves 3-9 (-10.5) cm long and 1.7-6 cm wide. I. beadlei of the low Mountains and Piedmont has leaves $7-9(-10.5) \mathrm{cm}$ long and $2-6 \mathrm{~cm}$ wide. $[=K, Z ;=I$. ambigua var. ambigua $-\mathrm{RAB}, \mathrm{W}, \mathrm{Y} ;>\mathrm{I}$. montana var. mollis (A. Gray) Britton -- C, F; > I. montana var. beadlei (W.W. Ashe) Fernald -- G; > I. ambigua -- S; > I. beadlei W.W. Ashe - S; > I. buswellii Small - S; > I. ambigua (Michaux) Torrey var. monticola (A. Gray) Wunderlin \& Poppleton -- Y, misapplied; > I. beadlei var. Iaevis W.W. Ashe; > I. caroliniana Trelease ex Small; > I. mollis A. Gray]

Ilex amelanchier M.A.Curtis ex Chapman, Sarvis Holly. Cp (GA, NC, SC): banks of blackwater creeks and rivers, clay-based Carolina bays; rare (GA Special Concern, NC Rare, SC Rare). April-May; October-November. A Southeastern Coastal Plain endemic: se. NC south to the FL Panhandle and west to se. LA (reports from se. VA appear to be based on confusion of material). The fruits are sometimes persistent until the following spring; the species is perhaps most conspicuous in the winter, when the dull red fruits can be easily seen. [= RAB, C, F, G, GW, K, S, Y, Z]

Ilex cassine Linnaeus var. cassine, Dahoon, Cassena. Cp (GA, NC, SC): blackwater stream swamps, pocosins, nearly always in very acid peaty or sandy sites; rare (NC Watch List). May-June; October-November. Primarily a Southeastern Coastal Plain endemic: se. NC south to FL and west to se. TX; also in Cuba and Mexico. I. cassine var. cassine in our area is uniformly rather narrow-leaved, in contrast to further south. Some populations in our area show intergradation with or poor differentiation from I. myrtifolia, lending some credibility to their treatment as varieties. Var. latifolia Aiton occurs in FL. [= K; < I. cassine var. cassine -RAB; < I. cassine -- GW, S, Y]

Ilex collina Alexander, Long-stalked Holly. Mt (NC, VA): in peats of bogs and seepages, on banks of cold, high elevation streams (less commonly on moist, rocky slopes in northern hardwood forests or mixed spruce-hardwood forests) at moderate to high elevations (1100-1800m); rare (NC Threatened, VA Endangered). May-June; (August-) September-October. A Southern Appalachian endemic: e. and c. WV, sw. VA, w. NC, and e. TN (Sevier County) (Boetsch \& Nielsen 2003). The affinities of this species are with Ilex montana and I. verticillata, not with Ilex (Nemopanthus) mucronata (Baas 1984). See Clark (1974) and Boetsch \& Nielsen (2003) for additional information about this species. I. collina often occurs with or in close proximity to the similar I. montana and I. verticillata; the long fruiting pedicels will separate fruiting plants readily. [=K; = Nemopanthus collinus (Alexander) R.C. Clark -- C, W; < I. longipes -- F, G]

Ilex coriacea (Pursh) Chapman, Big Gallberry, Sweet Gallberry. Cp (GA, NC, SC, VA), Pd (GA): pocosins, more restricted to wet, peaty sites than I. glabra; common (VA Rare). April-May; September-October. A Southeastern Coastal Plain endemic: se. VA south to FL and west to e. TX. [= RAB, C, F, G, GW, K, S, Y]

* Ilex cornuta Lindley, Chinese Holly, Burford Holly. Pd (NC): escaped into forests in suburban areas; rare, native of China. [= K]
* Ilex crenata Thunberg, Japanese Holly. Mt, Pd (NC): escaped into forests in suburban areas; rare, native of Japan. [= K]

Ilex cuthbertii Small, Cuthbert Holly. Cp, Pd (GA, SC): upland circumneutral woodlands and forests; rare (GA Special Concern). Endemic to an area along the Fall Line in SC and adjacent GA (Krakow 1989). Perhaps best treated as a variety of $I$. longipes, but the combination has not yet been made. [ $=\mathrm{K} ;><1$. cuthbertii -S (as to type, not as to range); = I. longipes var. cuthbertii (Small) G.A. Krakow, in prep. -- Z]

Ilex decidua Walter var. curtissii Fernald, Suwanee Possum-haw, Curtiss's Holly. Cp (GA): floodplains and moist forests in the Suwanee River drainage; rare. Mid-March-mid-April; September-October. Apparently endemic to the Suwannee River drainage of s. GA and n. FL. [= Z; < I. decidua - GW, K, Y; = I. curtissii (Fernald) Small - S]

Ilex decidua Walter var. decidua, Possum-haw. Pd, Cp (GA, NC, SC, VA), Mt (GA): floodplain forests, less commonly on mesic (or even dry), upland slopes; common. March-May; September-October. MD south to panhandle FL, west to TX on the Coastal Plain, extending also to adjacent provinces (the Piedmont and rarely Mountains in our area), and extending north in the interior to c. TN, w. KY, s. IL, c. MO, se. KS, and e. OK; also disjunct (as a variety) in the Sierra Madre Oriental of e. Mexico. The Mexican material was recognized by Krakow (1989) at the varietal level, but has not been formally named; it is known from a single collection from Nuevo Leon, Mexico. [= Z; <I. decidua var. decidua -- RAB; <I. decidua -- C, F, G, GW, K; > I. decidua var. decidua -- Y (also including I. cuthbertii)]

Ilex glabra (Linnaeus) A. Gray, Little Gallberry, Inkberry. Cp (GA, NC, SC, VA), Pd (GA, NC): savannas, pine flatwoods, pocosin margins, swamps, primarily in wetlands, but extending upslope even into sandhills; common (rare in lower Piedmont). MayJune; September-November. Nova Scotia and ME south to FL, west to TX. [= RAB, C, F, G, GW, K, S, Y]

Ilex laevigata (Pursh) A. Gray, Smooth Winterberry. Cp (NC, SC, VA): pocosins, other wet, acidic sites, such as in small blackwater stream swamps; uncommon. April-May; September-October. ME and NY south to SC, mostly near the coast. [= RAB, C, F, G, GW, K, S]

Ilex longipes Chapman ex Trelease, Georgia Holly, Chapman's Holly. Pd (GA, NC, SC), Mt (GA): upland forests; rare (NC Rare). April-May; September-October. Sc. NC, sc. TN (Chester, Wofford, \& Kral 1997), and wc. AR south to panhandle FL, s. MS, and se. TX. [= GW, K, S; = I. decidua var. Iongipes (Chapman ex Trelease) Ahles -- RAB, Y; < I. longipes -- F, G (apparently also including I. collina); = I. longipes var. longipes -- Z]

Ilex montana Torrey \& A. Gray ex A. Gray, Mountain Holly. Mt (GA, NC, SC, VA), Pd (NC, VA): mesic forests, rarely bogs or bog edges; common (uncommon in upper Piedmont). April-June; August-September. W. MA and w. NY south to $n$. GA and $n$. AL, essentially an Appalachian endemic. The range of this species is sometimes stated or shown as broader, extending into the Coastal

Plain in our area, and as far south as n. FL, LA, and e. TX, but these reports are based on misidentifications, primarily of $I$. beadlei, but also of $I$. ambigua. $[=\mathrm{K}, \mathrm{Z} ;=I$. ambigua var. montana (Torrey \& A. Gray ex A. Gray) Ahles -- RAB; = I. montana var. montana -C, F, G; = I. monticola A. Gray -- S; = I. ambigua var. monticola (A. Gray) Wunderlin \& Poppleton -- W]

Ilex myrtifolia Walter, Myrtle Holly. Cp (GA, NC, SC): limesink (doline) ponds, wet savannas; uncommon. May-June; October-November. A Southeastern Coastal Plain endemic: se. NC south to FL and west to e. LA. See I. cassine for comments about these two taxa. [= GW, K, S, Y; = I. cassine var. myrtifolia (Walter) Sargent -- RAB]

Ilex opaca Aiton var. opaca, American Holly, Christmas Holly. Cp, Pd, Mt (GA, NC, SC, VA): in a wide variety of forests, ranging from xeric to wetland; common. April-June; September-October. Var. opaca is widespread in the southeastern United States, ranging north (mostly near the coast from MD north) to MA. This is our only species that becomes a medium to large tree. Var. arenicola (Ashe) Ashe is endemic to xeric sands of sand pine scrub in c. peninsular FL. [= GW, K, Y; <I. opaca -- RAB, C, F, G, W; = I. opaca -- S]

Ilex verticillata (Linnaeus) A. Gray, Winterberry. Mt, Pd, Cp (GA, NC, SC, VA): bogs, pocosins, swampy forests; common. April-May; September-November. Widespread in e. North America. [= RAB, GW, K, S, W, Y; > I. verticillata var. padifolia (Willdenow) Torrey \& A. Gray ex S. Watson -- C, F, G; > I. verticillata var. verticillata - C, F, G]

Ilex vomitoria Aiton, Yaupon. $\mathrm{Cp}(\mathrm{GA}, \mathrm{NC}, \mathrm{SC}, \mathrm{VA}), \mathrm{Pd}(\mathrm{GA})$ : maritime forests, other dry sandy forests; common in the outer Coastal Plain, uncommon in VA, rare elsewhere, where probably introduced (VA Watch List). March-May; October-November. Widespread in the Southeastern United States, primarily on the Coastal Plain, from e. VA (from Northampton County south) south to FL and west to se. TX. I. vomitoria from the Deep South often has much smaller leaves than plants in our area. In NC and VA, yaupon is nearly restricted to maritime habitats, on the barrier islands and in a narrow band on the mainland, in forests with substantial maritime influence. I. vomitoria is increasingly popular as an ornamental shrub. [= RAB, C, F, G, GW, K, S, Y]

Ilex mucronata (Linnaeus) M. Powell, V. Savolainen, \& S. Andrews approaches our area in n. WV (and has sometimes been alleged to occur in VA, as by F), where it occurs in bogs and boggy, high elevation forests. It can be separated vegetatively from other hollies in the mountain regions of w. VA (I. montana, I. collina, I. opaca, and I. verticillata) by its smaller, narrower, entire (or nearly so) leaves, $2-5(-6) \mathrm{cm}$ long, $1-2.5 \mathrm{~cm}$ wide. Doubts as to the distinctiveness of Nemopanthus from Ilex have now been unequivocally answered (Powell et al. 2000; Manen, Boulter, \& Naciri-Graven 2002). [= X; = Nemopanthus mucronatus (Linnaeus) Trelease -- C, F, G, K]

## Nemopanthus Rafinesque

(see Ilex)

## ARALIACEAE (Ginseng Family)

A family of about 47 genera and 1325 species, trees, shrubs, vines, and rarely herbs, mainly tropical in distribution. Hydrocotyle is more closely related to Araliaceae than to Apiaceae, and is transferred here (Chandler \& Plunkett 2003). References: Graham (1966); Smith (1944).

1 Plant a woody vine; [tribe Schefflereae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Hedera
1 Plant an herb, shrub, or small tree.
2 Leaves peltate or cordate; plant a rhizomatous, creeping herb . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Hydrocotyle
2 Leaves compound with 3-many leaflets, herbaceous, deciduous; plant an herb, shrub or small tree; [tribe Aralieae].
3 Leaves 2-3x compound, at least the final order of division pinnate; leaves either 1 from a subterranean stem or 2many, alternate on an aboveground stem; inflorescence compound, consisting of (2-) 3-many umbels, either on a separate peduncle from the rhizome or in a terminal panicle or raceme; fruit purple or black.............. Aralia
3 Leaves $1 \times$ palmately compound, leaflets $3-7$; leaves $3-5$ in a whorl at the summit of the stem (Panax) or many, clustered on spur shoots (Eleutherococcus); inflorescence of a single, simple umbel borne terminally on the stem; fruit red to yellow (Panax) or black (Eleutherococcus).
4 Plant a shrub, with prickles; fruit black
[Eleutherococcus]
4 Plant an herb, lacking prickles; fruit red or yellow
Panax

## Aralia Linnaeus (Aralia)

A genus of about 30-40 species, herbs, shrubs, vines, and trees, primarily of e. North America, e. Asia, and se. Asia. Wen (1998) has suggested that $A$. nudicaulis may need to be removed from the genus Aralia in order to maintain both Aralia and Panax as monophyletic genera. References: Smith (1982)=Z; Wen et al. (1998); Wen (1993); Wen (1998); Smith (1944)=Y.

1 Plant a shrub or small tree, 3-6 (-10) m tall, definitely woody; stem armed throughout with prickles, those on the stem stout, broad-based, and distributed to the summit of the stem; leaves usually armed with prickles on the axes and the main veins; [section Dimorphanthus].
A. spinosa

1 Plant an acaulescent herb or stout, suffruticose herb, not at all to somewhat woody at the base; stem unarmed (or in A. hispida bristly with thin prickles on the lower stem only); leaves unarmed.
2 Plant an acaulescent herb, the solitary leaf and scapose inflorescence arising from a subterranean rhizome; inflorescence a raceme of (2-) 3 (-7) umbels; [section Nanae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. nudicaulis
2 Plant a caulescent herb, the leaves several and alternate, the inflorescence terminal on the leafy stem; inflorescence a raceme or panicle of (2-) 5-many umbels.
3 Stem bristly towards its base; inflorescence a raceme or weak panicle of (2-) 5-25 umbels; [section Hispidae] . . . . .

Aralia hispida Ventenat, Bristly Sarsaparilla. Mt (NC?, VA): rocky woodlands, cliffs, and clearings, primarily over acidic rocks (such as quartzite, granite, and sandstone); rare (NC Watch List, VA Rare). June-August. Labrador and Newfoundland west to Manitoba, south to w. VA, w. NC (?), WV, OH, IN, IL, and MN. This species appears to be strongly dependent on disturbance, such as fire, appearing in great numbers following fire where previously rare or apparently absent. F and $Y$ credit this species to $w$. NC; the documentation is not known to me, and the species was not treated by RAB. Doug Rayner (pers. com. 2002) reports a site record of it in Polk County, NC. [= C, F, G, K, S, W, Y, Z]

Aralia nudicaulis Linnaeus, Wild Sarsaparilla. Mt (GA, NC, SC, VA), Pd (NC, VA), Cp (VA): upland forests and woodlands, rocky places, most typically in rather dry places, such as ridgetop forests; common (uncommon in Piedmont, rare in Coastal Plain) (GA Special Concern). May-July. Labrador and Newfoundland west to British Columbia, south to e. VA, c. NC, ne. GA, w. TN, IL, MO, NE, CO, and ID. [= RAB, C, F, G, K, S, W, Y, Z]

Aralia racemosa Linnaeus ssp. racemosa, Spikenard, Hungry-root. Mt (GA, NC, SC, VA), Pd (NC, VA), Cp (VA): rich woodlands, trail margins and roadsides; uncommon (rare in Coastal Plain, locally common in Mountains of far sw. VA). JuneAugust. Ssp. racemosa ranges from New Brunswick and Québec west to MN and SD, south to NC, n. GA, AL, MS, MO, and e. KS; ssp. bicrenata Welsh \& Atwood occurs in AZ, NM, TX, and n. Mexico. [= K; <A. racemosa -- RAB, C, F, G, S, W, Y, Z]

Aralia spinosa Linnaeus, Devil's-walking-stick, Hercules's-club, Prickly-ash. Cp, Pd, Mt (GA, NC, SC, VA): disturbed pocosins and bottomlands, disturbed areas, moist to dry forests and woodlands; common. June-September. NJ west to s. IN, IL, and IA, south to FL and e. TX. Smith (1982) discusses the juvenile (prickly) and adult (unarmed) leaf phases of A. spinosa. [= RAB, C, F, G, GW, K, S, W, Y, Z]

## Eleutherococcus Maximowicz (Fiveleaf Aralia)

* Eleutherococcus pentaphyllus (Siebold \& Zuccarini) Nakai, Fiveleaf Aralia, is reported as introduced and apparently naturalized in WV (Randolph County), and scattered locations in PA (Rhoads \& Klein 1993). [= K; = Acanthopanax sieboldianus Makino]

## Hedera Linnaeus (Ivy)

A genus of $5-10$ species, vines, distributed from Mediterranean Europe west to e. Asia. References: Graham (1966)=Y; Stace (1997)=Z; Staff of the Bailey Hortorium (1976)=X; Ackerfield \& Wen (2002)=Q.

Identification notes: The leaves of Hedera are dimorphic, sometimes confusing observers; "juvenile" leaves (those of the sterile branches) are about as wide as long and (in H. helix) palmately 3-5-lobed, those of the fertile branches (uncommonly seen and much less familiar) are obovate or elliptic.

1 Trichomes scale-like, 0.1-0.4 mm, those on the leaves, petioles, and young stems with rays fused basally for $1 / 4$ to $1 / 2$ their length; juvenile leaves orbicular, little or not at all lobed, the larger $15-25 \mathrm{~cm}$ wide H. colchica

1 Trichomes stellate, $0.5-1.0 \mathrm{~mm}$, those on the leaves, petioles, and young stems with rays fused basally for less than $1 / 8$ their length; juvenile leaves slightly to deeply lobed, the larger 5-15 cm wide.
2 Hairs of young stems, leaves, and petioles whitish, the rays erect (at a right angle to the leaf surface); juvenile leaves usually less than 8 cm wide, usually dark green and often also marbled with white, often lobed more than $1 / 2$ the way to the base; [often strongly climbing]
H. helix var. helix

2 Hairs of young stems, leaves, and petioles yellowish-brown to rusty-brown, the rays not erect (parallel to the leaf surface); juvenile leaves often more than 8 cm wide, usually medium green (rarely also marbled with white), usually lobed less than $1 / 2$ the way to the base; [usually not climbing]
H. hibernica

* Hedera colchica (K. Koch) K. Koch, Persian Ivy. Pd (NC), Cp (SC): persistent after cultivation, perhaps not naturalized; rare, introduced from the Caucasus. [= K, Q, X, Z]
* Hedera helix Linnaeus var. helix, Common Ivy, English Ivy. Cp, Pd, Mt (GA, NC, SC, VA): persistent, established, and spreading around old home sites, in suburban woodlands and waste areas; uncommon, native of Europe. June-July. Var. helix is diploid, $n=24$. Hundreds of cultivars, varying greatly in habit and leaf size, lobing, and marbling are grown; see for instance, Staff of the Bailey Hortorium (1976) for a partial listing and brief descriptions. [=X, Y; < H. helix -- RAB, C, F, G, K, S, W; = H. helix ssp. helix -- Q, Z]
* Hedera hibernica Carr., Atlantic Ivy, Irish Ivy. Pd (NC, SC): persistent, established, and spreading around old home sites, in suburban woodlands and waste areas; uncommon, native of Europe. June-July. Var. hibernica is tetraploid, $n=48 .[=Q ;=H . h e l i x$ Linnaeus var. hibernica (Kirchner) Jaeger - X, Y; < H. helix-- RAB, C, F, G, K, S, W; = H. helix ssp. hibernica (Kirchner) D. McClint. -- Z]

## Hydrocotyle Linnaeus (Water-pennywort)

A genus of about 130 species, herbs, cosmopolitan (especially Australia). Molecular analyses have clarified that the affinities of Hydrocotyle lie with the Araliaceae rather than the Apiaceae (Downie et al. 1998; Chandler \& Plunkett 2004). References: Mathiuas \& Constance (1945)=MC.

1 Leaves not peltate, a sinus extending to the attachment of the petiole.
2 Central leaf lobe notably more distinct than the other lobes (the sinuses on either side extending $1 / 3$ to $3 / 4$ of the way to the petiolar attachment); stems and petioles fleshy . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . H. ranunculoides
2 Central leaf lobe not more distinct than the other lobes (the sinuses on either side extending $1 / 10$ to $1 / 4$ the way to the petiolar attachment); stems and petioles filiform.
3 Fruiting umbels on peduncles 1-3 mm long; leaves 10-50 mm wide; [native of bogs, spray cliffs, and other wetlands]
H. americana

3 Fruiting umbels on peduncles $9-24 \mathrm{~mm}$ long; leaves $5-30 \mathrm{~mm}$ wide; [alien of lawns and other disturbed habitats].
4 Leaves 5-lobed, 15-30 mm wide ........................................................... . . H. bowlesioides
4 Leaves 7-lobed, 5-13 mm wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . H. sibthorpioides
1 Leaves peltate, lacking a sinus extending to the attachment of the petiole.
4 Inflorescence umbellate; leaves 1-4 (-7) cm wide
H. umbellata

4 Inflorescence verticillate or umbellate-verticillate (when first developing sometimes appearing merely umbellate); leaves 115 cm wide.
5 Inflorescence verticillate, all the flowers borne sessile or on pedicels on the unbranched inflorescence axis; leaves 16 cm wide.
6 Flowers and fruits pedicellate, the pedicels $1-10 \mathrm{~mm}$ long

## H. prolifera

6 Flowers and fruits sessile or subsessile

## H. verticillata

5 Inflorescence compound, the main inflorescence axis with nodes which produce verticels or umbels of pedicellate flowers, the inflorescence nodes also producing branches which themselves produce verticels or umbels of flowers; leaves (1-) $4-15 \mathrm{~cm}$ wide
H. bonariensis

Hydrocotyle americana Linnaeus, American Water-pennywort. Mt (NC, VA), Pd (VA): bogs, marshes, seepages, cliffs and ledges where wet by seepage or spray from waterfalls, sometimes roadside ditches; uncommon, rare south of VA (NC Watch List, SC Rare). June-September. Widespread in ne. North America, south to w. NC, SC, e. and c. TN, and IN. [= RAB, C, G, GW, K, MC, S, W]

Hydrocotyle bonariensis Comm. ex Lamarck, Dune Water-pennywort. Cp (GA, NC, SC, VA): dunes and moist sandy areas; uncommon, rare in VA (VA Rare). April-September. Widespread in South and Central America, north in North America to the Southeastern Coastal Plain, VA to FL and TX. [= RAB, GW, K, MC, S]

* Hydrocotyle bowlesioides Mathias \& Constance. Cp (GA): lawns; rare, introduced from South America. See Anderson (1983) for discussion of the species' occurrence in Thomasville, Thomas Co. GA. [=K, MC; = H. sibthorpioides Lamarck var. oedipoda O. Deg. \& Greenw.]

Hydrocotyle prolifera Kellogg. Cp (GA, NC, SC, VA): swamp forests, pools; uncommon. May-July. Widespread in North, Central, and South America. [= K; = H. verticillata Thunberg var. triradiata (A. Rich.) Fernald - RAB, C, G, GW, MC; < H. verticillata var. verticillata -- F, more broadly circumscribed; > H. australis Coulter \& Rose -- S; > H. canbyi Coulter \& Rose -- S]

Hydrocotyle ranunculoides Linnaeus f., Swamp Water-pennywort. Cp (GA, NC, SC, VA), Mt, Pd (VA): stagnant to (less commonly) swiftly flowing waters of swamps pools, backwaters, blackwater streams; common. April-July. Widespread in North, Central, and South America. [= RAB, C, F, G, GW, K, MC, S, W]

* Hydrocotyle sibthorpioides Lamarck, Lawn Water-pennywort. Pd, Cp (GA, NC, VA): lawns; rare, introduced from Asia and Africa. March-September. Apparently becoming more common as a lawn weed. [= RAB, C, F, G, K, MC]

Hydrocotyle umbellata Linnaeus, Marsh Water-pennywort. Cp, Pd (GA, NC, SC, VA): moist areas; common (rare in lower Piedmont only). April-September. Widespread in North, Central, and South America. [= RAB, C, F, G, GW, K, MC, S]

Hydrocotyle verticillata Thunberg. Cp (GA, NC, SC, VA), Pd (GA, SC): swamp forests, pools; uncommon. May-July. Widespread in North, Central, and South America. [=S; = H. verticillata var. verticillata -- RAB, C, G, GW, K, MC; <H. verticillata var. verticillata -- F, more broadly circumscribed]

## Panax Linnaeus (Ginseng)

Panax is a genus of ca. 14 species, herbs, 12 of e. Asia and 2 of e. North America. Wen \& Zimmer (1996) and Choi \& Wen (2000) studied the phylogeny of Panax using molecular techniques. P. trifolius does not appear to be closely related to any of the other species, and is interpreted as a basal component of the genus. $P$. quinquefolius is most closely related to $P$. ginseng C.A. Meyer and P. japonicus C.A. Meyer. References: Smith (1944)=Z; Wen \& Zimmer (1996), Choi \& Wen (2000).

1 Leaflets (3-) 5, petiolulate, the petiolules (0.7-) 1.2 .5 cm long; larger leaflets $6-15 \mathrm{~cm}$ long, $3.5-7 \mathrm{~cm}$ wide, mostly about $2 \times$ as long as wide, the apex acuminate; fruit bright red when ripe $P$. quinquefolius
1 Leaflets $3(-5)$, sessile or subsessile; larger leaflets $4-8 \mathrm{~cm}$ long, $0.5-2.5 \mathrm{~cm}$ wide, mostly about $3 \times$ as long as wide, the apex obtuse to acute; fruit yellow-green when ripe
P. trifolius

Panax quinquefolius Linnaeus, Ginseng, Sang, American Ginseng. Mt, Pd (GA, NC, SC, VA), Cp (GA, NC, VA): cove forests, mesic hardwood forests, generally in nutrient-rich forests though tending to avoid the richest coves; uncommon (GA Special Concern, NC Watch List/Special Concern, SC Rare, VA Watch List/Threatened). May-June; August-October. Québec west to MN and SD, south to e. VA, e. NC, nc. SC, GA, c. AL, LA, and OK. P. quinquefolius is gathered in quantity throughout its range for the herbal trade; most of the North American harvest is shipped to China, where it is prized for medicinal uses. Dried roots command prices in excess of $\$ 500$ per kilogram; in our area, "sang" is a multimillion dollar industry. Formerly abundant and occurring in large populations, $P$. quinquefolius has been reduced in most of its range to small populations of scattered individuals, a classic example of a "predator-prey" relationship. Collection and trade in ginseng is monitored and regulated in most states. In NC, it is illegal for ginseng dealers to buy ginseng from collectors before September; this allows the plants to mature fruits prior to collection.

Schlessman (1985) discusses the floral biology of $P$. quinquefolius. [= RAB, C, F, G, K, S, W, Z]
Panax trifolius Linnaeus, Dwarf Ginseng. Mt (GA, NC, VA), Pd (NC, VA), Cp (VA): cove forests, bottomland forests, other nutrient-rich forests; uncommon, rare south of VA (GA Special Concern, NC Rare). April-June; August-October. Nova Scotia and Québec west to MN, south to PA, e. VA, c. NC, nc. GA, ec. TN, IN, and IA. [= RAB, C, F, G, K, S, W, Z]

## ARISTOLOCHIACEAE (Birthwort Family)

A family of about 6-12 genera and 600 species, vines, shrubs, and herbs, of tropical, subtropical, and warm temperate regions. References: Barringer \& Whittemore in FNA (1997); Neinhuis et al. (2005); Huber in Kubitzki, Rohwer, \& Bittrich (1993).

1 Acaulescent herb; calyx tube straight, radially symmetrical; stamens 12; [subfamily Asaroideae].
2 Leaves deciduous, pubescent, paired . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Asarum . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . .

1 Twining vine or caulescent herb; calyx tube bent, bilaterally symmetrical; stamens 6; [subfamily Aristolochioideae, tribe
Aristochieae].
3 Woody, twining vine; leaves 8-35 cm wide; [subtribe Isotrematinae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Isotrema
3 Low, erect or ascending herb; leaves $0.7-6.5 \mathrm{~cm}$ wide.
4 Leaf blade as wide as long, or wider than long; leaf venation palmate; [subtribe Aristolochiinae] .... [Aristolochia]
4 Leaf blade narrower than long; leaf venation pinnate; [subtribe Isotrematinae] . . . . . . . . . . . . . . . . . . . . . . Endodeca

## Aristolochia Linnaeus (Birthwort)

(see Endodeca and Isotrema)

A genus of about 300 species, herbs and vines, once Endodeca, Isotrema, and Pararistolochia are excluded (Huber in Kubitzki 1993). References: Barringer in FNA (1997); Kelly \& González (2003); Huber in Kubitzki, Rohwer, \& Bittrich (1993).

Aristolochia clematitis Linnaeus, Birthwort, native of Europe, is naturalized in se. PA (Rhoads \& Klein 1993) and MD (Barringer in FNA 1997). [= C, FNA, K]

## Asarum Linnaeus (Wild Ginger)

(see Hexastylis)

See Hexastylis for discussion of generic limits. References: Whittemore, Mesler, \& Lu in FNA (1997); Huber in Kubitzki, Rohwer, \& Bittrich (1993).

1 Calyx lobes $10-35 \mathrm{~mm}$ long, spreading to ascending from the base, acuminate to caudate, the tubular tips $4-20 \mathrm{~mm}$ long . . . .
A. canadense var. canadense

1 Calyx lobes 5-10 (-12) mm long, strongly reflexed, often more-or-less appressed back against the calyx tube, acute or acuminate, the tubular tips $0-4 \mathrm{~mm}$ long

Asarum canadense Linnaeus var. canadense, Common Wild Ginger. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): rich deciduous forests in circumneutral soils; common (uncommon in Piedmont in NC and SC, uncommon in VA Coastal Plain, rare in Coastal Plain in NC and SC). April-May. New Brunswick and Québec west to MN, south to NC, AL, and n. LA. The varieties have often been ignored, but have some merit; they deserve further attention. A. canadense Linnaeus var. acuminatum Ashe is alleged to differ in having long-caudate calyx lobes $15-35 \mathrm{~mm}$ long (vs. $10-25 \mathrm{~mm}$ long), the tubular portion $10-20 \mathrm{~mm}$ long (vs. $4-10 \mathrm{~mm}$ long. [= C, G; < A. canadense -- RAB, FNA, K, W; > A. canadense Linnaeus var. acuminatum Ashe - F; > A. canadense var. ambiguum (Bicknell) Farwell -- F ; > A. canadense var. canadense -F , in a narrower sense; $>A$. canadense -- S , in the narrow sense; > A. acuminatum (Ashe) Bicknell -- S; > A. rubrocinctum Peattie -- S]

Asarum canadense Linnaeus var. reflexum (Bicknell) B.L. Robinson. Mt (NC, VA?): rich deciduous forests in circumneutral soils; rare? April-May. CT west to s. Manitoba, south to w. NC, KY, and MO. [= C, F, G; < A. canadense -- RAB, FNA, K, W; = A. reflexum Bicknell -- S]

## Endodeca Rafinesque 1828 (Turpentine-root)

A genus of 2 (or more?) species, of eastern and sc. North America. This genus is morphologically distinctive within Aristolochia (in the broad sense), and basal to the remainder of that genus (Neinhuis et al. 2005). References: Barringer in FNA (1997); Kelly \& González (2003); Huber in Kubitzki, Rohwer, \& Bittrich (1993).

Endodeca serpentaria (Linnaeus) Rafinesque, Turpentine-root, Virginia Snakeroot. Pd, Cp, Mt (GA, NC, SC, VA): dry to mesic forests, perhaps more restricted to mesic situations over acidic substrate, ranging into drier situations over calcareous or mafic substrates; common. May-June; June-July. CT and NY west to IL, MI, and MO, south to FL and TX. The tremendous variation in this species needs further study. Plants with sparingly pubescent, thin-textured, linear to lanceolate leaves have been called Aristolochia hastata. Plants with broadly ovate, densely pubescent leaves have been called Aristolochia convolvulacea. These may represent merely morphologic extremes of a polymorphic complex; alternatively, some taxonomic recognition of such plants as distinct from A. serpentaria may be warranted. [= Aristolochia serpentaria Linnaeus -- RAB, C, FNA, G, K, W; > A.
serpentaria var. hastata (Nuttall) Duchartre -- F; > A. serpentaria var. serpentaria - F; > A. hastata Nuttall -- S; A. convolvulacea Small -- S; > A. serpentaria - S, more narrowly circumscribed]

## Hexastylis Rafinesque (Heartleaf)

A genus of 10 species, herbs, of se. North America. Barringer (1993) and Kelly $(1997,1998)$ have recently employed a broad definition of Asarum, including Hexastylis. Over the last half-century various students of the group (emphasizing a range of fields of evidence) have arrayed themselves for and against the recognition of Hexastylis as a genus distinct from Asarum. A cladistic analysis (Kelly 1997, 1998) showed distinctive clades which could be interpreted as evidence for the recognition of Hexastylis (including the Asian Heterotropa), though the author preferred to recognize 2 subgenera. I choose here to follow the more traditional (at least in our area) separation of Hexastylis from Asarum, until and unless stronger evidence is presented for their combination. Electrophoretic and morphologic studies currently in progress validate the taxonomy presented, insofar as results are available ( $R$. Wyatt, pers. comm.). References: Whittemore \& Gaddy in FNA (1997); Gaddy (1987a)=Z; Blomquist (1957)=Y; Barringer (1993)=X; Gaddy (1987b); Gaddy (1986); Gaddy in Wofford (1989); Sugawara (1987); Huber in Kubitzki, Rohwer, \& Bittrich (1993). Key adapted from FNA, Gaddy in Wofford (1989), and Gaddy (1987a).

Identification notes: A difficult genus, Hexastylis is made more frustrating by the fact that nearly all diagnostic features relate to the shape and size of the fleshy and brittle calyx -- characters which are difficult to describe and are largely lost when specimens are pressed. The difficulty of identifying herbarium specimens has sometimes been (apparently) used as a justification for reducing (often drastically, as in C) the number of taxa recognized. To those familiar with this genus in the field, however, the taxa here recognized form geographically distinctive populations. Size and (to a lesser degree) shape of individual flowers show considerable variation and can be altered by environmental factors; individual flowers or plants can be difficult to identify if taken out of context. Populations, however, are readily identifiable. The photograph (Figure 1) in Gaddy (1987a) of the flowers of all species other than $H$. arifolia and $H$. speciosa is highly recommended as an aid to identification.

1 Style extension bifid to stigma; leaves triangular to ovate-sagittate or subhastate, portions of the sides of nearly all leaves straight or concave; leaves mottled, the paler areas between the veins.
2 Calyx abruptly contracted near the middle, the lower portion narrowly cuplike, abruptly expanded into a much broader upper half; calyx tube with internal raised reticulations; calyx lobes spreading; [endemic near Montgomery, AL]

2 Calyx gradually contracted to a smooth waist just below the calyx lobes; calyx tube smooth internally; calyx lobes spreading or erect; [collectively widespread in our area].
3 Calyx lobes erect, $2-4 \mathrm{~mm}$ long, $2-4 \mathrm{~mm}$ wide at base; [of the Mountains westwards] . . . . . . . H. arifolia var. ruthii 3 Calyx lobes spreading, 2.5-8 mm long, 3-9 mm wide at base; [of the Coastal Plain, Piedmont, and eastern Mountains].
4 Calyx tube 13-18 mm long, 6-10 mm wide; [of the Coastal Plain, Piedmont, and Mountains of s. VA, NC, SC, GA, and westwards through AL and MS to se. LA] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . H. arifolia var. arifolia 4 Calyx tube 20-25 mm long, 10-12 mm wide; [of the lower Gulf Coastal Plain, of sw. GA, FL Panhandle, s. AL, s. MS, and se. LA] H. arifolia var. callifolia

1 Style extension notched or divided at the apex, not bifid to the stigma; leaves rounded, with cordate base, all portions of the sides of the leaves convex; leaves mottled or unmottled, if mottled, the paler areas along the veins.
5 Inner surface of calyx lobes pilose with whitish hairs; plant rhizomatous, the rhizomes long-creeping . . . . . . . . H. Iewisii
5 Inner surface of calyx lobes puberulent; plant clumped or short-creeping.
6 Calyx tube cylindrical to narrowly cylindro-urceolate.
7 Calyx tube cylindrical to narrowly cylindro-urceolate; calyx lobes 2-4 mm long, erect to slightly spreading
7 Calyx tube cylindrical, calyx lobes 4-15 mm long, moderately spreading to reflexed. 8 Calyx tube longer than wide.

9 Calyx tube 7-14 mm wide; calyx lobes 6-17 mm wide . . . . . . . . . . . . . . . . . . . . . . . . H. heterophylla 9 Calyx tube 4-7 mm wide; calyx lobes 4-7 mm wide . . . . . . . . . . . . . . . . . . . . . . . . . . . H. naniflora 8 Calyx tube about as wide as long (at widest point) or wider than long, flared. 10 Tube about as wide as long; opening width less than the lobe length.. H. heterophylla 10 Tube wider at flare than long; opening width greater than the lobe length
H. minor

6 Calyx tube broadly urceolate-campanulate or rhombic-ovate (broadest near the middle).
11 Calyx tube urceolate-campanulate; calyx lobes $10-22 \mathrm{~mm}$ wide at base. 12 Leaves scattered along the length of the rhizome; [of Coastal Plain and lower Piedmont of GA and AL] .. H. shuttleworthii var. harperi

12 Leaves clustered at the tip of the rhizome; [of the Mountains and upper Piedmont of VA, NC, SC, and GA] 11 Calyx tube rhombic-ovate (broadest near the middle); calyx lobes $3-8 \mathrm{~mm}$ wide at base.

13 Internal ridged reticulation a close network raised $1.5-2 \mathrm{~mm}$
H. rhombiformis

13 Internal ridged reticulation an open network raised less than 1 mm or absent . . . . . . . . . . H. contracta
Hexastylis arifolia (Michaux) Small var. arifolia, Little Brown Jug, Arrowleaf Heartleaf. Pd, Cp, Mt (GA, NC, SC, VA): dry to mesic deciduous forests; common (VA Watch List). March-May. Se. VA, sw. VA, se. TN, and n. AL south to Panhandle FL, s. MS, and se. LA, primarily on the Coastal Plain and Piedmont. [= C, FNA, K, W, Y, Z; < H. arifolia -- RAB; Asarum arifolium Michaux -- F; = H. arifolia -- G, S; = Asarum arifolium var. arifolium -- X]

Hexastylis arifolia (Michaux) Small var. callifolia (Small) Blomquist. Cp (GA): mesic forests; rare. March-May. Sw. GA west to se. LA, in the lower Gulf Coastal Plain. [= FNA, K, Y, Z; = H. callifolia (Small) Small - S; = Asarum callifolium Small; =Asarum arifolium Michaux var. callifolium (Small) Barringer - X]

Hexastylis arifolia (Michaux) Small var. ruthii (Ashe) Blomquist, Appalachian Little Brown Jug. Mt (GA, NC, VA): upland forests, ultramafic outcrop barrens; uncommon (VA Watch List). March-June. A Southern Appalachian endemic: sw. VA, se. KY, w. NC, e. TN, n. AL, and n. GA. Perhaps warranting species status. At the Buck Creek olivine barren (Clay County, NC) this species carpets several hundred hectares, in association with Packera paupercula var. appalachiana, Thalictrum macrostylum, and Sporobolus heterolepis. [= C, FNA, K, W, Y, Z; < H. arifolia -- RAB; = Asarum ruthii Ashe -- F; = H. ruthii (Ashe) Small -- G, S; = Asarum arifolium var. ruthii (Ashe) Barringer -- X]

Hexastylis contracta Blomquist, Mountain Heartleaf. Mt (NC): on acidic soils in deciduous forests with Kalmia latifolia and Rhododendron maximum; rare (US Species of Concern, NC Endangered). May-June. Endemic to the Cumberland Plateau of TN (Chester, Wofford, \& Kral 1997) and KY, with a few disjunct populations in the Blue Ridge of NC. [= RAB, FNA, K, W, Y, Z; <H. virginica -- C, in part; < Asarum contractum (Blomquist) Barringer - X (also see H. rhombiformis)]

Hexastylis heterophylla (Ashe) Small, Variable-leaf Heartleaf. Mt (GA, NC, SC, VA), Pd (NC, SC, VA): slopes and bluffs in xeric to mesic forests, usually associated with Kalmia latifolia; common. March-June. A broad Southern Appalachian endemic: w. VA and WV south through e. KY, ne. TN, and w. NC to nw. SC, n. GA, and n. AL. [= RAB, FNA, K, S, W, Y, Z; < H. virginicum -- C; < Asarum virginicum Linnaeus -- F, G, in part]

Hexastylis lewisii (Fernald) Blomquist \& Oosting, Lewis's Heartleaf. Pd, Cp (NC, VA): upland forests (pine or oak), pocosin ecotones; rare (NC Rare, VA Watch List). April-May. Endemic to the Piedmont of VA and the Piedmont and Coastal Plain of NC. [= RAB, FNA, K, Y, Z; < H. shuttleworthii -- C; = Asarum lewisii Fernald -- F]

Hexastylis minor (Ashe) Blomquist, Little Heartleaf. Pd (NC, SC, VA), Mt (VA), Cp (NC): upland or moist forests, pocosin margins; common (VA Watch List). February-May. Endemic to the Piedmont and adjacent Coastal Plain and Mountains of nc. VA, NC, and nc. SC. The pocosin ecotone plants of the Sandhills are under study by Gaddy and may be recognized as a separate taxon. [= RAB, FNA, K, W, Z; <Asarum virginicum Linnaeus -- F; = Asarum minus Ashe; = Hexastylis minus - Y, a grammatical error]

Hexastylis naniflora Blomquist, Dwarf-flower Heartleaf. Pd (NC, SC): acidic, sandy loam on bluffs and ravines in deciduous forests, frequently associated with Kalmia latifolia; rare (US Threatened, NC Endangered, SC Rare). March-June. Endemic to the upper Piedmont of s. NC and n. SC. [= RAB, FNA, K, W, Y, Z; < H. virginica -- C]

Hexastylis rhombiformis Gaddy, French Broad Heartleaf. Mt (NC, SC): in deciduous forests on sandy river bluffs or in ravines with Kalmia latifolia and Rhododendron maximum; rare (US Species of Concern, NC Rare). Late March-June. Endemic to the southern Blue Ridge of NC and SC, known only from Henderson, Polk, Buncombe, and Transylvania counties. Following Gaddy's (1986) naming of this species, Barringer (1993) considered the species merely a form of Asarum contractum, but electrophoretic and morphologic studies indicate that it is distinct from H. contracta, and more closely related to $H$. virginica (Murrell et al. 1998; R. Wyatt, pers. comm.). [= FNA, K, W, Z; < Asarum contractum (Blomquist) Barringer - X]

Hexastylis shuttleworthii (Britten \& Baker f.) Small var. harperi Gaddy, Harper's Heartleaf. Cp, Pd (GA): bogs, acid hammocks; rare (GA Special Concern). C. GA, c. AL, and ne. MS, south and west of (and allopatric from) var. shuttleworthii (Gaddy 1987b); it approaches SC and should be sought there. [= FNA, K, Z; = Asarum shuttleworthii Britten \& Baker f. var. harperi (Gaddy) Barringer - X]

Hexastylis shuttleworthii (Britten \& Baker f.) Small var. shuttleworthii, Large-flower Heartleaf. Mt (GA, NC, SC, VA), Pd (GA, VA): acidic soils in deciduous and deciduous-coniferous forests, often along creeks under Rhododendron maximum; uncommon (VA Rare). May-July. Endemic to the Southern Appalachians: w. VA south through w. NC and e. TN to nw. SC, n. GA, and ne. AL. [= FNA, K, Z; < H. shuttleworthii -- RAB, G, S, W, Y; < H. shuttleworthii -- C (also see H. lewisii); <Asarum shuttleworthii Britten \& Baker -- F; = Asarum shuttleworthii var. shuttleworthii -- X]

Hexastylis virginica (Linnaeus) Small, Virginia Heartleaf. Cp (NC, SC, VA), Pd (NC, VA), Mt (GA, NC, VA): upland forests; common (uncommon in Mountains). April-June. A relatively widespread species, occurring throughout NC and VA, extending west into WV, e. KY, and ne. TN (Chester, Wofford, \& Kral 1997). H. memmingeri, a doubtful taxon close to H. virginica, with the calyx very small (less than 1.5 cm long), narrowly cylindro-urceolate, and the calyx lobes very short (ca. 2 mm long) will key here. Gaddy does not recognize it, considering it a small form of $H$. virginica, but it may warrant varietal rank. It is known from NC, VA, and WV, in the Piedmont and Mountains. [= RAB, FNA, K, S, W, Y, Z; < H. virginica -- C (also see H. contracta, H. heterophylla, and H. naniflora); < Asarum virginicum Linnaeus -- F (see also H. heterophylla and H. minor); > Asarum memmingeri Ashe -- F; < H. virginica -- G; > H. memmingeri (Ashe) Small -- S]

Hexastylis speciosa R.M. Harper is endemic to a small area in central AL (Autauga, Chilton, and Elmore counties, north of Montgomery). [= FNA, K, S, Y, Z; = Asarum speciosum (R.M. Harper) Barringer - X]

## Isotrema Rafinesque 1819 (Dutchman's-pipe)

A genus of about 50 species, of temperate and tropical Asia, se. North America, and Central America. References: Barringer in FNA (1997); Kelly \& González (2003); Huber in Kubitzki, Rohwer, \& Bittrich (1993).

1 Plant nearly glabrous; leaves abruptly pointed; calyx purple . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. macrophylla
1 Plant soft pubescent; leaves blunt; calyx yellowish . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. tomentosa
Isotrema macrophylla (Lamarck) C.F. Reed, Pipevine, Dutchman's-pipe. Mt (GA, NC, SC, VA): cove forests and other mesic mountain forests; common. May-June; August-September. A southern-central Appalachian endemic: sw. PA to c. TN and n. GA. [= Aristolochia macrophylla Lamarck -- RAB, C, FNA, K, S, W; = A. durior Hill -- F, G]

Isotrema tomentosa (Sims) C.F. Reed, Woolly Dutchman's-pipe, Pipevine. Cp (GA, SC), Mt* (NC*): floodplain forests,
disturbed areas; uncommon, native in GA and SC, apparently introduced only in NC (SC Rare). S. IN, s. MO, and se. OK, south to sw. GA, Panhandle FL, and TX. FNA also reports that it is escaped in VA. [= Aristolochia tomentosa Sims - RAB, C, F, FNA, G, GW, K, S]

## ASCLEPIADACEAE <br> (see APOCYNACEAE)

## ASTERACEAE or COMPOSITAE (Aster Family)

A family of about 1500-1600 genera and 20,000-25,000 species, shrubs, herbs, trees, and vines, cosmopolitan. References: Cronquist (1980)=SE throughout family treatment.

## Acanthospermum Schrank (Paraguay Bur)

A genus of about 6 species, herbs, of tropical America. References: Cronquist (1980)=SE.
1 Stems prostrate and rooting at the nodes; bur slightly compressed, strongly ribbed . . . . . . . . . . . . . . . . . . . . . . . . . A. australe
1 Stems erect; bur obviously compressed, obscurely ribbed
2 Leaves 2-10 cm long, sessile or subsessile; bur with prickles on all surface . . . . . . . . . . . . . . . . . . . . . . . . . A. hispidum
2 Leaves 1-3.5 cm long, petiolate, the petiole 4-18 mm long; bur unarmed or nearly so on the side faces ...... A. humile

* Acanthospermum australe (Loefling) Kuntze, Paraguay Bur, Sheep Bur. Cp (GA, NC, SC, VA), Pd (GA, NC, SC), Mt (SC): disturbed areas; common (rare in VA), introduced from South America. May-November. [= RAB, C, F, G, K, S, SE]
* Acanthospermum hispidum Augustin de Candolle. Cp (GA, SC): disturbed areas, gardens; uncommon, introduced from n. South America. July-November. First reported from South Carolina by Hill \& Horn (1997). [= K, S, SE]
* Acanthospermum humile (Sw.) Augustin de Candolle, Low Starbur. Cp (SC): disturbed areas; rare, introduced from the West Indies. Reported for SC by Nelson (2003). [= K, S, SE; = Melampodium humile Sw.]

#### Abstract

Achillea Linnaeus (Yarrow) A genus of about 115 species, herbs, primarily Eurasian. References: Cronquist (1980)=SE; Arriagada \& Miller (1997)=Z.

Achillea millefolium Linnaeus var. occidentalis Augustin de Candolle, American Yarrow, American Thousandleaf. \{Mt, Pd, Cp (GA, NC, SC, VA): need sorting of varieties\}. [= K; < A. millefolium - RAB; = A. millefolium ssp. lanulosa (Nuttall) Piper - C; = A. lanulosa Nuttall - F, Z]

* Achillea millefolium Linnaeus var. millefolium, European Yarrow, European Thousandleaf. \{Mt, Pd, Cp (GA, NC, SC, VA): need sorting of varieties $\}$ Introduced primarily in northern North America. [ $=\mathrm{K} ;<$ A. millefolium -RAB ; $=$ A. millefolium ssp . millefolium - $\mathrm{C} ;=\mathrm{A}$. millefolium $-\mathrm{F}, \mathrm{Z}]$
* Achillea ptarmica Linnaeus, Sneezeweed, Sneezewort, is naturalized south to WV and scattered sites in PA (Rhoads \& Klein 1993). [= C, F, K, Z]

## Acmella L.C. Richard ex Persoon (Spotflower)

A genus of about 30 species, herbs, primarily of tropical distribution. References: Jansen (1985)=Z; Cronquist (1980) $=$ SE.

1 Heads radiate.
2 Leaves linear to lanceolate; petioles $2-4.5 \mathrm{~mm}$ long; outer series of phyllaries narrowly to broadly ovate, the apex acute
$\qquad$
2 Leaves narrowly to broadly ovate; petioles (3-) $5-43 \mathrm{~mm}$ long; outer series of phyllaries lanceolate, the apex acuminate .

* Acmella pusilla (Hooker \& Arnott) R.K. Jansen, Argentine Spotflower. Cp (GA, NC, SC): disturbed areas (especially around old seaports); rare, native of South America. May-September. Known from scattered locations in the se. United States (NC, SC, GA, FL), associated with old seaports, such as Wilmington, NC and Savannah, GA, and perhaps not well-established. [=K, Z]

Acmella repens (Walter) L.C. Richard in Persoon, Creeping Spotflower. Cp (GA, NC, SC), Pd (NC, SC): roadsides, streambanks, other moist, open, habitats; rare (NC Watch List). July-October. Ranging from se. NC south to s. FL, west to e. TX, north in the Mississippi Embayment to w. TN and s. MO. Jansen (1985) treats this as var. repens of A. oppositifolia, the typic var. oppositifolia widely distributed from c. Mexico south through Central America into n . South America, stating that var. repens "can be easily separated from var. oppositifolia by its lanceolate, acuminate phyllaries and short double hairs on the achene margins." Jansen also states that "four factors have caused extreme difficulties in delimiting taxa at the specific and infraspecific level within this group: very close morphological similarity; polyploidy; hybridization, especially between different ploidy levels; and asexual
reproduction." In his more statistical taxonomic analyses, his var. repens ( 4 X , and the only taxon out of 39 native to North America) separates rather well from A. oppositifolia ( $2 \mathrm{X}-6 \mathrm{X}$ ). Given the morphological distinctiveness and substantial allopatry of the two taxa, I prefer not to associate this taxon as a variety of the complex A. oppositifolia. [Spilanthes americana (Mutis ex Linnaeus f.) Hieronymus var. repens (Walter) A.H. Moore -- RAB, F; Spilanthes americana -- C, G, GW, S, SE; = Acmella oppositifolia (Lamarck) R.K. Jansen var. repens (Walter) R.K. Jansen -- K, Z]

## Ageratina Spach (Milk-poison, White Snakeroot)

A genus of about 290 species, American. The separation of Ageratina from Eupatorium is controversial, but now appears clearly warranted, on morphological, karyological, and molecular grounds. References: Nesom in FNA (in prep.); Clewell \& Wooten (1971)=Z; Cronquist (1980)=SE. Key based in part on $Z$ and SE.

1 Leaves subcoriaceous in texture; leaves crenate or crenate-serrate; leaf blades 3-7 (-10) cm long, 2-5 cm wide; [primarily of xeric or submesic sites].
2 Larger leaf blades $>5 \times$ as long as the petiole; leaf margins crenate; corolla lobes densely long-pubescent; achenes glabrous; [widespread in our area]. A. aromatica

2 Larger leaf blades (1-) $2-4 \times$ as long as the petiole; leaf margins crenate, dentate, or incised; corolla lobes glabrous or sparsely short-pubescent; achenes usually short-pubescent, at least near the apex; [of e. GA southwards] . . . A. jucunda
1 Leaves membranaceous in texture; leaves serrate or coarsely dentate; leaf blades 6-18 cm long, 3-12 cm wide (at least the larger on a given plant usually more 8 cm long); [primarily of mesic sites].
3 Leaves delicately membranaceous, coarsely dentate; larger leaf blades 1.0-1.4× as long as the petiole; [of seepage and waterfall splash zones associated with sandstone rockhouses and cliff bases]
[A. Iuciae-brauniae]
3 Leaves membranaceous, of a "typical" herbaceous character, coarsely serrate; larger leaf blades 1.4-5× as long as the petiole; [of a wide variety of mesic habitats, especially moist forests and forest openings].
4 Phyllaries mostly $3-5 \mathrm{~mm}$ long, acute (to obtuse); heads with (9-) 12-25 flowers; leaves deltoid to ovate (the base generally broadly cuneate); heads arranged in open corymbs; [widespread in our area] . A. altissima var. altissima 4 Phyllaries mostly $5-7 \mathrm{~mm}$ long, cuspidate-acuminate; heads with (15-) 20-34 flowers; leaves generally deltoid (the base generally subcordate or truncate); heads arranged in dense corymbs; [of moderate to high elevation forests and openings, in the Mountains and upper Piedmont]
A. altissima var roanensis

Ageratina altissima King \& H.E. Robinson var. altissima, Common White Snakeroot, Common Milk-poison. Mt, Pd, Cp (GA, NC, SC, VA): moist forests, such as cove forests; common (uncommon in Coastal Plain). Late July-October. A. altissima var. altissima ranges from Québec west to se. ND, south to Panhandle Florida and c. TX. Var. angustata (A. Gray) Clewell \& Wooten ranges from IL and e. KS south to LA and c. TX. This species has been shown to be the cause of the "milk sickness" of pioneer days; the plants contain a poison which is transmissable to humans through cow milk. [= FNA, K; < Eupatorium rugosum Houttuyn -- RAB, G, W; = Eupatorium rugosum Houttuyn var. rugosum -- C, F, SE; > E. rugosum var. chlorolepis Fernald -- F; > E. rugosum var. tomentellum (B.L. Robinson) Blake -- F; = Eupatorium urticifolium Reichard -- S ; $<$ A. altissima var. altissima (also see A. luciaebrauniae) -- Z]

Ageratina altissima King \& H.E. Robinson var. roanensis (Small) Clewell \& Wooten, Appalachian White Snakeroot, Appalachian Milk-poison. Mt (GA, NC, SC, VA): moist forests, often abundant at high elevations; common. August-October. This variety is endemic to moderate to high elevations of the Southern Appalachians, from nw. VA south to w. SC, n. GA, e. TN, e. KY, and probably nw. AL. [= FNA, K, Z; < Eupatorium rugosum Houttuyn -- RAB, G, W; = Eupatorium rugosum var. roanense (Small) Fernald -- C, SE; = Eupatorium roanensis Small -- S]

Ageratina aromatica (Linnaeus) Spach, Small-leaved White Snakeroot, Wild-hoarhound. Cp, Pd, Mt (GA, NC, SC, VA): woodlands and forests, usually xeric, and often fire-maintained, also woodland edges; common (uncommon in Piedmont and Mountains). Late August-October. Widespread in e. North America. Two varieties have been delineated, both of them occurring in our area. Var. incisa (A. Gray) C.F. Reed is described as differing from var. aromatica in having the leaves cuneate (vs. truncate to rounded), acuminate (vs. acute), sharply toothed (vs. bluntly toothed, thin in texture (vs. thick), and the petioles slender and 0.5-2 cm long (vs. less slender and $0.1-1.5 \mathrm{~cm}$ ). It is supposed to be Southeastern in range, from se. VA south to FL, on the Coastal Plain. The validity of this variety needs further assessment. [= FNA, Z; = Eupatorium aromaticum Linnaeus -- RAB, C, G, SE, W; > Eupatorium aromaticum var. aromaticum -- F; > Eupatorium aromaticum var. incisum A. Gray -- F; > A. aromatica var. aromatica K; > A. aromatica var. incisa (Gray) C.F. Reed -- K; > Eupatorium latidens Small -- S; > Eupatorium aromaticum Linnaeus - S, in a more narrow sense]

Ageratina jucunda (Greene) Clewell \& Wooten. Cp (GA): sandhills, dry pinelands, and subxeric hardwood forests; uncommon. Se. GA south to FL. [= FNA, K, Z; = Eupatorium jucundum Greene -- S, SE]

Ageratina luciae-brauniae (Fernald) King \& H.E. Robinson, Rockhouse White Snakeroot, is endemic to the Cumberland Plateau of ne. TN (Chester, Wofford, \& Kral 1997) and se. KY, where it occurs at the base of sandstone cliffs (usually overhanging) in seepage or splash. It might conceivably occur at the base of cliffs in sw. VA or nw. NC. Although considered by Clewell \& Wooten (1971) as mere aberrant plants, Wofford (1976) determined that A. luciae-brauniae is a species. [= FNA, K; = Eupatorium luciae-brauniae Fernald -- C, SE; < A. altissima var. altissima -- Z]

Ageratum Linnaeus (Ageratum, Flossflower, Pussyfoot)
A genus of about 44 species, herbs, of tropical America. References: Cronquist (1980)=SE. Key based in part on SE.
1 Involucre glabrous to sparsely pubescent with non-glandular hairs; largest leaves rounded to truncate at the baseA. conyzoides

1 Involucre stipitate-glandular and sparsely pubescent with non-glandular hairs; largest leaves truncate to cordate at the base .

## A. houstonianum

* Ageratum conyzoides Linnaeus, Ageratum. Cp (NC): disturbed areas; rare, introduced from the New World tropics. JulyAugust. [= K, S, SE]
* Ageratum houstonianum P. Miller, Ageratum. Cp (NC, SC): disturbed areas; rare, introduced from the New World tropics. July-August. [= K, S, SE]

Amblyolepis Augustin de Candolle (Huisache-daisy)

## References:

* Amblyolepis setigera Augustin de Candolle. Cp (SC): wool-combing mill waif (Nesom 2004d); rare, introduced from TXMexico. [= K] \{add synonymy\}

#### Abstract

Ambrosia Linnaeus (Ragweed) A genus of about 43 species, herbs, cosmopolitan. References: Cronquist (1980)=SE.

Ambrosia artemisiifolia Linnaeus. [= RAB, SE; > A. artemisiifolia Linnaeus var. elatior (Linnaeus) Descourtils - K; > A. artemisiifolia Linnaeus var. paniculata (Michaux) Blank - K; > A. artemisiifolia Linnaeus var. artemisiifolia - K]

Ambrosia bidentata Michaux. Pd (VA); \{GA, NC, SC, VA\}: mafic woodlands; uncommon. Widely scattered throughout TN, east to e. TN (Chester, Wofford, \& Kral 1997) and in nw. GA (Jones \& Coile 1988). [= RAB, K, SE]

Ambrosia psilostachya Augustin de Candolle, Perennial Ragweed. Cp (NC, SC), Pd (VA), \{GA\}: loamy sandy soil of flats and slight depressions in periodically burned longleaf pine uplands, also in disturbed areas. Recorded from Anson, Hoke, Jones, Moore, Richmond, and Scotland cos. NC, and Aiken, Georgetown, and Kershaw cos. SC. Primarily western and midwestern, but scattered along eastern seaboard states (ME, NH, NY, NC, SC, GA, FL). Apparently first collected in VA in 2000. [= RAB, K, SE; A. rugelii Rydberg - RAB]

Ambrosia sp. 1.
Ambrosia trifida Linnaeus var. trifida. Mt, Pd, $\mathrm{Cp}(\mathrm{GA})\{\mathrm{NC}, \mathrm{SC}, \mathrm{VA}\}$ : [= K; A. trifida - RAB, SE, infraspecific taxa not distinguished]

## Ampelaster Nesom (Climbing-aster)

A monotypic genus, a vining shrub, of se. North America. References: Nesom (2000b); Nesom (1994)=X; Cronquist (1980)=SE.
Ampelaster carolinianus (Walter) Nesom, Climbing Aster. Cp (GA, NC, SC): swamps, thickets, marshes, streambanks; uncommon (NC Rare). Late September-October. Se. NC south to s. FL. Grown horticulturally. [= K, X; Aster carolinianus Walter -RAB, GW, S, SE; = Virgulus carolinianus (Walter) Reveal \& Keener; = Symphyotrichum carolinianum (Walter) Wunderlin \& B.F. Hansen]

## Amphiachyris (Alphonse de Candolle) Nuttal

A genus of 2 species, herbs, of sc. North America. References: Nesom (2000b); Cronquist (1980)=SE.
Amphiachyris dracunculoides (Augustin de Candolle) Nuttall, Broom Snakeroot. Mt (VA), Cp (SC): disturbed areas over calcareous rocks, wool-combing mill waif (Nesom 2004d); rare, presumably adventive from further west. August-September. This species is common and weedy in disturbed cedar glade habitats in the Nashville Basin of c. TN, where apparently native (Chester, Wofford, \& Kral 1997). [= K, S; = Gutierrezia dracunculoides (Augustin de Candolle) Blake -- F, G, SE; = Xanthocephalum dracunculoides (Augustin de Candolle) Shinners]

## Anaphalis Augustin de Candolle (Pearly-everlasting)

A genus of about 35 to 110 species, herbs, of tropical and temperate areas, with a center of diversity in Asia. References: Arriagada (1998) $=$ Z; Cronquist (1980) $=$ SE.

Anaphalis margaritacea (Linnaeus) Bentham \& Hooker f., Pearly-everlasting. Mt (NC, VA): dry open places, probably persistent from cultivation in NC, seemingly native in VA; rare (VA Rare). July-September. Interruptedly circumboreal, in North America ranging from Newfoundland west to AK, south to NC, MO, NM, and CA. Very abundant and weedy in large parts of northern and western North America, sometimes grown for ornament (especially dried arrangements) in our area. [= C, G, K, S, SE, W, Z; > A. margaritacea var. angustior (Miquel) Nakai -- F; > A. margaritacea var. intercedens Hara -- F]

## Antennaria Gaertner (Pussytoes)

A genus of about 70 species, herbs, of temperate and subtropical areas. Of our species, A. neglecta, A. solitaria, A. virginica, and A. plantaginifolia are sexual diploids. A. parlinii is is of multiple hybrid origin, includes sexual and asexual populations, and is derived from A. plantaginifolia, A. solitaria, and A. racemosa. A. howellii is strictly asexual, and is derived from A. plantaginifolia, $A$. racemosa, $A$. virginica, and $A$. neglecta (Bayer 1985). For reasons discussed in Bayer \& Stebbins (1982) and parallel to those applied in this work to allopolyploid taxa in Eupatorium, the treatment of Bayer (1985) and Bayer \& Stebbins $(1993,1982)$ is preferable to Cronquist's treatments, used in most of the floras covering or approaching our area. Much remains to be learned about the relative habitats and distributions of the various taxa in our area. References: Bayer \& Stebbins (1993)=Z; Bayer \& Stebbins (1982)=Y; Arriagada (1998)=X; Cronquist (1980)=SE; Bayer (1985); Bayer \& Stebbins (1987); Bayer (1984). Key closely adapted from $\mathrm{Z}, \mathrm{Y}$.

## Flowering stalks with 1 head

A. solitaria

1 Flowering stalks with 2 or more heads.
2 Basal leaves prominently 3-7-nerved, mostly more than 1.5 cm wide.
3 Pistillate involucres $5-7 \mathrm{~mm}$ high; pistillate corollas $3-4 \mathrm{~mm}$ high; staminate corollas $2-3.5 \mathrm{~mm}$ high; basal leaves tomentose on the upper surface; young stolons mostly ascending; staminate and pistillate plants equally common .
A. plantaginifolia

3 Pistillate involucres $7-10 \mathrm{~mm}$ high; pistillate corollas 4-7 mm high; staminate corollas $3.5-5 \mathrm{~mm}$ high; basal leaves tomentose or glabrous on the upper surface; young stolons mostly decumbent; sexual and apomictic populations present.
4 Basal leaves glabrous or nearly so on the upper surface (even when young); summit of young cauline stem usually with purple glandular hairs
A. parlinii ssp. parlinii

4 Basal leaves tomentose on the upper surface (becoming glabrate in age); summit of young cauline stem usually glandless
A. parlinii ssp. fallax

2 Basal leaves prominently 1-nerved (sometimes with 2 additional obscure veins), mostly less than 1.5 cm wide.
$5 \quad$ Young and mature basal leaves glabrous on the upper surface; phyllary tips whitish; flags (flat scarious appendages similar to the tips of phyllaries on the tip of the leaf) present on the upper cauline leaves; species apomictic, populations consisting of pistillate plants only
A. howellii ssp. canadensis

5 Young basal leaves pubescent on the upper surface, mature leaves either remaining pubescent or becoming glabrous with age; phyllary tips white, ivory, to light brown; flags present or absent on the upper cauline leaves; species apomictic or sexual.
6 Largest basal leaves less than 6.0 mm wide and less than 20 mm long; pistillate involucres $4.5-7 \mathrm{~mm}$ high; species sexual, populations consisting of both pistillate and staminate plants; [of shale barrens from w. VA northward and westward] A. virginica

6 Largest basal leaves more than 6.0 mm wide and more than 20 mm long; pistillate involucres $7-10 \mathrm{~mm}$ high; species apomictic or sexual; [collectively of various habitats and more widespread].
$7 \quad$ Middle and upper cauline leaves tipped with flags; mature basal leaves glabrous, young basal leaves pubescent, glabrescent with age; species sexual, populations consisting of both pistillate and staminate plants
A. neglecta

7 Middle and upper cauline leaves blunt or with subulate tips (only those leaves immediately around the corymb with flags); mature and young basal leaves pubescent; species apomictic, populations consisting of pistillate plants only.
8 Basal leaves spatulate, with a distinct petiole; stolons mostly 5-8 cm long, with leaves along the stolon almost equal in size to those of the terminal rosette . . . . . . . . . . A. howellii ssp. neodioica
8 Basal leaves oblanceolate, lacking a distinct petiole; stolons mostly 8-12 cm long, with leaves along the stolon smaller than those of the terminal rosette
A. howellii ssp. petaloidea

Antennaria howellii Greene ssp. canadensis (Greene) Bayer. Mt (VA): dry woodlands; rare? [=K, Z; A. neglecta Greene var. canadensis (Greene) Cronquist -- C; A. canadensis Greene -- F; A. neglecta Greene var. randii (Fernald) Cronquist -- G, SE; A. neodioica Greene ssp. canadensis (Greene) Bayer \& Stebbins -- Y]

Antennaria howellii Greene ssp. neodioica (Greene) Bayer. Mt, Pd (NC, VA): dry woodlands. [= K, Z; A. neglecta Greene var. neodioica (Greene) Cronquist -- C; A. neodioica Greene var. neodioica -- F; A. neodioica Greene var. attenuata Fernald -- F; A. neglecta Greene var. attenuata (Fernald) Cronquist -- G, SE; A. neodioica Greene ssp. neodioica -- Y]

Antennaria howellii Greene ssp. petaloidea (Fernald) Bayer, Field Pussytoes. Mt (NC, VA): dry woodlands; rare (NC Watch List, VA Watch List). March-May. Northeastern, south irregularly to the Southern Appalachians. [= K, Z; A. neglecta Greene var. petaloidea (Fernald) Cronquist) -- C; A. petaloidea Fernald var. petaloidea -- F; A. neglecta Greene var. neglecta -- G, SE; A. neodioca Greene ssp. petaloidea (Fernald) Bayer \& Stebbins -- W]

Antennaria neglecta Greene, Field Pussytoes. Pd (NC, VA), Mt (VA): dry woodlands and fields. [=F, K, X, Y, Z; A. neglecta Greene var. neglecta -- C, G, SE]

Antennaria parlinii Fernald ssp. fallax (Greene) Bayer \& Stebbins, Big-head Pussytoes. Pd, Cp, Mt (NC, VA), \{GA, SC\}: dry woodlands; common. Late March-early May. Widespread in e. North America. [=K, X, Z; A. plantaginifolia (Linnaeus) Richardson var. ambigens (Greene) Cronquist -- RAB, C, G, SE; A. fallax Greene var. calophylla (Greene) Fernald -- F; A. calophylla Greene -S; A. fallax Greene -- S; < A. parlinii -- W]

Antennaria parlinii Fernald ssp. parlinii, Parlin's Pussytoes. Mt, Pd, Cp? (NC, VA), \{GA\}: woodlands, roadbanks; common. Late March-early May. Widespread in e. North America. [= K, X, Z; A. plantaginifolia (Linnaeus) Richardson var. arnoglossa (Greene) Cronquist -- RAB, G, SE; A. plantaginifolia var. parlinii (Fernald) Cronquist -- C; A. parlinii Fernald var. parlinii -- F; A. parlinii var. arnoglossa (Greene) Fernald -- F; < A. parlinii -- W]

Antennaria plantaginifolia (Linnaeus) Richardson, Plantain Pussytoes. Pd, Mt, Cp (NC, VA), \{GA, SC\}: dry woodlands; common. Late March-early May. Widespread in e. North America. [=K, S, W, X, Z; A. plantaginifolia var. plantaginifolia -- RAB, C, F, G, SE; A. plantaginifolia var. petiolata (Fernald) Heller -- F; A. caroliniana Rydberg -- S]

Antennaria solitaria Rydberg, Southern Single-head Pussytoes. Pd, Mt, Cp (NC, VA), \{GA, SC $\}$ : forests and woodlands, often mesic; uncommon. Late March-early May. Ranging from VA, WV, sw. PA, and s. IN south to GA and LA. [= RAB, C, F, G, K, S, SE, W, X, Z]

Antennaria virginica Stebbins, Shale-barren Pussytoes. Mt, Pd (VA): shale barrens and other dry, rocky habitats; uncommon. Ranging from c. PA and w. VA west to OH. [= C, F, K, W, Y, Z; A. virginica var. argillicola Stebbins -- F; A. neglecta Greene var. argillicola (Stebbins) Cronquist -- G, SE]

## Anthemis Linnaeus (Chamomille)

(also see Chamaemelum)
A genus of about 210 species, herbs, mainly Eurasian. References: Cronquist (1980)=SE; Arriagada \& Miller (1997)=Z. Key adapted from C.

| 1 | Rays yellow | A. tinctoria |
| :---: | :---: | :---: |
| 1 | Rays white. |  |
|  | 2 Rays sterile and usually neutral; receptacle chaffy only toward the middle | A. cotula |
|  | 2 Rays pistillate and fertile; receptacle chaffy throughout. |  |
|  | 3 Achenes not tuberculate; leaves not glandular-punctate beneath | A. arvensis |
|  | 3 Achenes tuberculate; leaves glandular-punctate beneath | undiramea |

* Anthemis arvensis Linnaeus, Corn Chamomille. Mt, Pd, Cp (GA, NC, SC, VA): roadsides, disturbed areas; common. Late April-July. Var. agrestis differs from var. arvensis in having chaff shorter than the disk flowers; both varieties apparently occur in our area. [= RAB, C, F, G, K, S, SE, W, Z; A. arvensis var. agrestis (Wallroth) Augustin de Candolle -- F, K]
* Anthemis cotula Linnaeus, Mayweed, Stinking Chamomille, Mayweed, Dog-fennel. Mt, Pd, Cp (GA, NC, SC, VA): roadsides, disturbed areas; uncommon. May-July. [= RAB, C, F, G, K, SE, W, Z; Maruta cotula (Linnaeus) Augustin de Candolle -- S]
* Anthemis secundiramea Bivona-Bernardi. Cp (VA): railroad embankment; rare, introduced from Mediterranean Europe, probably not established. [= C, F, K, SE]
* Anthemis tinctoria Linnaeus, Yellow Chamomile, Golden Marguerite. Pd (VA): disturbed areas; rare, introduced from Europe. June-September. [= C, F, G, K, Z]

## Arctium Linnaeus (Burdock)

A genus of about 11 species, herbs, of the temperate Old World. References: Cronquist (1980)=SE.

* Arctium lappa Linnaeus, Great Burdock. Mt (NC): introduced from Eurasia. July-November. [= RAB, C, F, K, SE]
* Arctium minus Bernhardi, Common Burdock. Mt (GA, NC, SC), Pd (NC, VA), Cp (SC, VA): introduced from Eurasia. Late June-November. [= RAB, C, F, K, SE, W; A. minus ssp. minus]
* Arctium tomentosum P. Miller, Cotton Burdock. Pd (SC): introduced from Eurasia. May-November. [= C, F, K, SE; A. nemorosum Lejeune \& Courtois -- RAB, misapplied]
* Arctium vulgare (Hill) Evans. \{VA\} [=K; A. nemorosum Lejeune \& Courtois -- F; A. minus Bernhardi ssp. nemorosum (Lejeune \& Courtois) Syme]

Arctotis (African-daisy)

* Arctotis stoechadifolia Berg., African-daisy, in SC. \{specimen at NCU\} [= K]

## Arnica Linnaeus (Arnica)

A genus of about 32 species, herbs, north temperate, boreal, and arctic. References: Cronquist (1980)=SE.
Arnica acaulis (Walter) Britton, Sterns, \& Poggenburg, Leopard's-bane, Southeastern Arnica. Cp, Pd (GA, NC, SC, VA): pine savannas, sandhills, clayey or sandy woodlands; common (uncommon in sandhills). Late March-early June. Ranging from DE and se. PA (where on serpentine) south to panhandle FL, on the Coastal Plain and lower Piedmont. [= RAB, C, F, G, GW, K, S, SE; Doronicum acaule Walter]

Arnoglossum H.E. Robinson (Indian-plantain)
A genus of about 7 species, herbs, of e. North America. References: Cronquist (1980)=SE; Anderson (1998)=Z; Barkley (1999)=Y; Kral \& Godfrey (1958) $=\mathrm{X}$; Ward (2004c) $=$ Q; Harper (1905) $=\mathrm{V}$; Pippen (1978) $=\mathrm{U}$; Robinson (1974).

1 Larger leaves palmately veined, cordate at the base, either strongly toothed or lobed.
2 Leaves glaucous beneath; stem glaucous and terete (or slightly striate)
A. atriplicifolium

2 Leaves green beneath; stem green and conspicuously grooved . . . . . . . . . . . . . . . . . . . . . . . . . . . A. muehlenbergii
1 Larger leaves parallel-veined (the primary veins parallel and converging towards the leaf apex), lanceolate to elliptic-lanceolate, cuneate at the base, entire to remotely toothed (usually fewer than 10 teeth per leaf).
3 Phyllaries not wing-keeled; stem terete.
4 Basal and lower cauline leaves linear to lanceolate, green to slightly glaucous below; plants 0.5-2.5 m tall; [usually of pine savannas, se. NC south to FL, west to e. TX].
A. ovatum var. lanceolatum

4 Basal and lower cauline leaves ovate to ovate-lanceolate, glaucoius beneath; plants 1.5-2.5 m tall; [usually of shaded, moist to bottomland habitats] . . . . . . . . .
3 Phyllaries wing-keeled; stem strongly angled or sulcate.
5 Basal and low-cauline leaves truncate or subcordate at the base; larger leaves irregularly angulate-lobed or toothed, often somewhat hastate at the base; corolla usually pale lavender . . . . . . . . . . . . . . . . . . . . . . . . A. diversifolium
5 Basal and low-cauline leaves cuneate at the base; larger leaves entire or with at most a few irregular teeth, not at all hastate; corolla creamy yellow.
6 Corollas mostly $8-10 \mathrm{~mm}$ long; leaves usually with $7-9$ main parallel veins
[A. plantagineum]
6 Corollas mostly $6-7 \mathrm{~mm}$ long; leaves usually with 3-5 main parallel veins
A. sulcatum

Arnoglossum atriplicifolium (Linnaeus) H.E. Robinson, Pale Indian-plantain. Mt, Pd, Cp (GA, NC, SC, VA): mesic forests, woodland edges, clearings; common. June-October. The species is widespread in e. North America. [= K, Y, Z; = Cacalia atriplicifolia Linnaeus -- RAB, C, F, G, SE, U, W; = Mesadenia atriplicifolia (Linnaeus) Rafinesque -- S]

Arnoglossum diversifolium (Torrey \& A. Gray) H.E. Robinson, Variable-leaf Indian-plantain. Cp (GA): calcareous swamps; rare (GA Threatened). Sw. GA and Panhandle FL, west to s. AL; disjunct in nw. peninsular FL. May-August; July-September. [= GW, K, Y, Z; = Mesadenia diversifolia (Torrey \& A. Gray) Greene -- S; = Cacalia diversifolia Torrey \& A. Gray -- SE, U, X]

Arnoglossum muehlenbergii (Schultz-Bipontinus) H.E. Robinson, Great Indian-plantain. Mt (GA, NC, VA): cove forests, other mesic forests; common (VA Rare). June-October. The very large, reniform leaves (sometimes up to 80 cm across) are conspicuous in rich cove forests. The species is widespread in e. North America, south to n. GA (Jones \& Coile 1988). [=K; = Cacalia muhlenbergii (Schultz-Bipontius) Fernald -- RAB, C, F, G, SE, V, W; = Mesadenia reniformis Rafinesque -- S; = Arnoglossum reniforme (Hooker) H.E. Robinson -- Y, Z]

Arnoglossum ovatum (Walter) H.E. Robinson var. lanceolatum (Nuttall) D.B. Ward, Savanna Indian-plantain. Cp (GA, NC, SC): wet savannas, especially over coquina limestone ("marl"); rare (NC Rare). Late July-October. Se. NC to FL, west to e. TX. [= Q; < Arnoglossum ovatum - K, Y, Z; = Cacalia lanceolata Nuttall -- RAB; < Cacalia ovata Walter -- GW, SE, U; = Mesadenia lanceolata (Nuttall) Rafinesque -- S ; > Mesadenia lanceolata var. lanceolata - V; > Mesadenia lanceolata var. virescens Harper -- V; = Cacalia lanceolata var. lanceolata - X]

Arnoglossum ovatum (Walter) H.E. Robinson var. ovatum, Broadleaf Indian-plantain. Cp, Pd (GA): bottomlands, bay forests, moist or wet forests; uncommon. Late July-October. E. GA west to e. LA. The division of this taxon into two taxa (species or varieties) may have merit. [= Q; < Arnoglossum ovatum -- K, Y, Z; < Cacalia ovata Walter -- GW, SE, U; = Mesadenia elliottii Harper -- S; = Cacalia lanceolata var. elliottii (Shinners) Kral \& Godfrey - X]

Arnoglossum sulcatum (Fernald) H.E. Robinson, Grooved-stem Indian-plantain. Cp (GA): bottomland forests; rare (GA Special Concern). Sw. GA and Panhandle FL west to s. AL. [= GW, K, Y, Z; = Mesadenia sulcata (Fernald) Harper -- S; = Cacalia sulcata Fernald -- SE, X]

Arnoglossum plantagineum Rafinesque has been reported for sc. SC, in the unpublished flora of the Savannah River Site by Batson, Angerman, and Jones. It is known definitely from the Nashville Basin of c. TN (Chester, Wofford, \& Kral 1997). [=K, Y, Z; = Cacalia tuberosa Nuttall -- G; = Mesadenia tuberosa (Nuttall) Britton -- S; = Cacalia plantaginea (Rafinesque) Shinners -- SE, U]

## Artemisia Linnaeus (Wormwood, Mugwort, Sage)

If defined to include the segregate Seriphidium, a genus of about 500 species, shrubs and herbs, north temperate, boreal, and arctic. References: Ling Yeou-Ruenn (1995)=Z; Cronquist (1980)=SE; Arriagada \& Miller (1997)=Y. Key based primarily on C.

1 Disk flowers sterile, with abortive ovaries; plant not aromatic when fresh; [subgenus Dracunculus, section Dracunculus].
2 Plants pubescent; plants multi-stemmed perennials, to 6 dm tall; involucre $3-4 \mathrm{~mm}$ high, 3-5 mm wide, mostly with 23-50 flowers
A. campestris

2 Plants glabrous or subglabrous; plants single-stemmed biennials or short-lived perennials, often over 10 dm tall; involucre 2-3 mm high, 2-3 mm wide, mostly with 14-25 flowers
A. caudata

1 Disk flowers fertile, with normal ovaries; plant variously aromatic or not when fresh; [subgenus Artemisia].
3 Receptacle bearing dense long hairs between the flowers; plant strongly aromatic when fresh; [subgenus Artemisia, section Absinthium] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . .
Receptacle not pubescent; plant variously aromatic or not when fresh.
4 Leaves green, essentially glabrous on the lower surface; annuals or biennials from a taproot; plants lacking nonflowering shoots; [subgenus Artemisia, section Abrotanum].
5 Inflorescence obviously paniculate, the branches evident, the heads on slender peduncles; involucres 1-2 mm high and $1-2 \mathrm{~mm}$ wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. annua
5 Inflorescence spike-like, the heads crowded and hiding the branches; involucres 2-3 mm high, 2-3 mm wide.
A. biennis var. biennis

4 Leaves tomentose on the lower surface, densely so in many species; perennials from a branched rhizome or woody
caudex; plants with nonflowering shoots.
6 Principal leaves 2-3-pinnatifid, the terminal segments $<1.5 \mathrm{~mm}$ wide; plant a shrub or suffrutescent herb; [subgenus Artemisia, section Abrotanum].

| 7 | Leaves green above, 3-6 cm long | A. abrotanum |
| :---: | :---: | :---: |
| 7 | Leaves white-tomentose above, 1-3 cm long | [A. pontica] |

6 Principal leaves entire to 2-pinnatifid, the terminal segments $>2 \mathrm{~mm}$ wide; plant an herb (sometimes somewhat woody at the base); [subgenus Artemisia, section Artemisia].
8 Involucres 6-10 mm high; disk corollas 3.2-4 mm long
A. stelleriana

8 Involucres 2-5-5 mm high; disk corollas 1-3 mm long.
9 Leaves 2-pinnatifid; leaves with 1-2 stipule-like lobes at the base . . . . . . . . . . . . . . . . A. vulgaris
9 Leaves entire to 1-pinnatifid; leaves lacking stipule-like lobes at the base.
10 Leaves glabrate above; leaves lobed (rarely entire)
A. Iudoviciana

10 Leaves persistently pubescent above; leaves entire (rarely a few of the lower leaves lobed
[A. gnaphalodes]

* Artemisia abrotanum Linnaeus, Southernwood. Pd? (NC): disturbed areas; rare, introduced from Eurasia. August-

September. [= C, F, G, K, S, SE, Y, Z]

* Artemisia absinthium Linnaeus, Common Wormwood, Absinthium, Absinthe. Pd? (NC): disturbed areas; rare, introduced
from Europe. July-September. [= C, F, G, K, S, SE, Y, Z; > A. absinthium var. insipida Stechmann]
* Artemisia annua Linnaeus, Sweet Wormwood, Annual Mugwort. Cp (SC, VA), Pd, Mt (VA): roadsides, disturbed areas, woolcombing waste (Nesom 2004d); uncommon, introduced from Asia and e. Europe. August-November. [= C, F, G, K, S, SE, Y, Z]
* Artemisia campestris Linnaeus, Field Wormwood. Cp (SC): disturbed areas; rare, introduced from Eurasia. July-September. [= S, Z; A. campestris Linnaeus ssp. campestris -- C, G, Y; A. campestris ssp. borealis (Pallas) Hall \& Clements var. borealis - K; Oligosporus campestris (Linnaeus) Cassini ssp. campestris]
*? Artemisia caudata Michaux. Cp (SC): sandy woodlands; rare, probably introduced from western United States. SeptemberOctober. [= RAB, F, S, Z; A. campestris Linnaeus ssp. caudata (Michaux) Hall \& Clements -- K, SE, Y; A. caudata var. calvens Lunell -- F; Oligosporus caudatus (Michaux) Poljakov; Oligosporus campestris (Linnaeus) Cassini ssp. caudatus (Michaux) W.A. Weber]
* Artemisia Iudoviciana Nuttall, White Sage, Prairie Sage. Pd (NC, SC, VA), Cp (NC, VA), Mt (VA), \{GA\}: roadsides, disturbed areas; common, introduced from western North America. Late August-November. [= RAB, Z; A. Iudoviciana var. ludoviciana -- C, F, G, SE; A. Iudoviciana ssp. Iudoviciana -- K]
* Artemisia stelleriana Besser, Beach Wormwood, Dusty Miller, Hoary Mugwort. Cp (NC, VA): sandy roadsides, dunes; rare, introduced from Japan and ne. Asia. May-September. This plant is reported (with documenting photograph) as naturalized and spreading in Nags Head (Dare County, NC) (Graetz 1973). [= C, F, G, K, SE, Z; = A. stellerana - Y, orthographic variant] * Artemisia vulgaris Linnaeus, Mugwort, Felon Herb. Cp, Pd (GA, NC, SC, VA), Mt (GA, NC, VA): roadsides, pastures, disturbed areas; common, introduced from Eurasia. Late August-November. [= RAB, C, S, SE, Y, Z; A. vulgaris var. vulgaris -- F, K ]
* Artemisia biennis Willdenow var. biennis, Biennial Wormwood. Cp (SC): waste area around wool-combing mills; rare, introduced from the w. United States. Reported by Nesom (2004d); also reported to be naturalized as far east as TN and WV (Hardy County). [= C, K] \{add synonymy\}

Artemisia gnaphalodes Nuttall is reported to be naturalized as far east and south as $N J$ and DE. It may occur in our area as well. [A. Iudoviciana var. Iudoviciana -- C, F, G, SE, in part; A. Iudoviciana ssp. Iudoviciana -- K, in part; A. Iudoviciana Nuttall var. gnaphalodes (Nuttall) Torrey \& A. Gray; A. Iudoviciana var. latifolia (Besser) Torrey \& A. Gray]

* Artemisia pontica Linnaeus, native of Europe, is naturalized at least as far south as DE and se. PA (Rhoads \& Klein 1993). It may occur in our area. [= C, K]

> Aster Linnaeus (Aster)
> (see also Ampelaster, Doellingeria, Eurybia, Ionactis, Oclemena, Sericocarpus, Symphyotrichum)

It is now abundantly clear that the traditional, broad circumscription of Aster, as a genus of some 250 species of North America and Eurasia, is untenable. All of our native asters have affinities elsewhere than with Old World Aster; most are now placed in Symphyotrichum and Eurybia, with fewer species in Ampelaster, Doellingeria, lonactis, Oclemena, and Sericocarpus. These changes will undoubtedly cause uproar. It may be worth noting for those that consider the dissolution of Aster as radical, that most of the segregate genera were recognized in the $19^{\text {th }}$ century, and many have been widely recognized for much of the time since. For instance, Sericocarpus and Doellingeria were both segregated from Aster in the early 1830's, and were frequently recognized as distinct, including by Small (1903, 1913, 1933); Sericocarpus was in fact usually regarded as a good genus until sunk by Cronquist. References: Semple \& Brouillet (1980a, 1980b); Jones (1980a, 1980b); Brouillet \& Semple (1981); Reveal \& Keener (1981); Jones \& Young (1983); Jones (1984); Semple, Chmielewski \& Lane (1989); Nesom (1993a, 1993b, 1994a, 1994b, 2000b); Semple, Heard, \& Xiang (1996); Noyes \& Rieseberg (1999); R. Jones (1983)=Z; Lamboy (1987)=Y; Nesom (1994)=X; Semple, Heard, \& Xiang (1996); Cronquist (1980)=SE; R. Jones (1992); Lamboy (1992); Nesom (1997); Xiang \& Semple (1996).

* Aster tataricus Linnaeus f., Tartarian Aster. Pd (NC, VA), Mt (GA, VA), Mt (VA): frequently cultivated, sometimes persisting or weakly spreading; rare, introduced from Eurasia. September-November. [= RAB, C, G, K, SE, W, X]

## Astranthium Nuttall

A genus of about 11 species, herbs, of sc. North America and Mexico. References: Cronquist (1980)=SE; \{DeJong 1965\}; Nesom (2000b).

Astranthium integrifolium (Michaux) Nuttall var. integrifolium. Mt (GA): limestone glades; rare (GA Special Concern). KY, MO, and OK south to GA and MS (Kartesz 1999). East to c. TN, se. TN (Chester, Wofford, \& Kral 1997), and nw. GA (Jones \& Coile 1988). Reported for NC by Kartesz (1999). \{investigate\} [= C; A. integrifolium ssp. integrifolium -- K; < A. integrifolium -- F, G, SE]

Baccharis Linnaeus (Silverling, High-tide Bush, Mullet Bush, Groundsel Tree)
A genus of about 400 species, shrubs, of tropical, subtropical, and warm temperate America. References: Nesom (2000b); Cronquist (1980)=SE. Key based in part on SE.

1 Leaves linear, 1-3 mm wide, entire ................................................................... . . . . . . angustifolia
1 Leaves obovate, oblanceolate, or elliptic, the larger more than 7 mm wide and generally coarsely toothed towards the tip.
2 Leaves entire, spatulate-obovate, 1.5-3 (-3.5) cm long (including the petiole) . . . . . . . . . . . . . . . . . . . . . . . . . [B. dioica]
2 Leaves (at least the larger) with coarse teeth and $>3.5 \mathrm{~cm}$ long (including the petiole).
3 Heads in glomerules of 2-3, most of the heads sessile (a few pedunculate), the glomerules scattered along leafy branches in the axils of well-developed leaves; involucres $5-10 \mathrm{~mm}$ high, the phyllaries not resinous; [strictly of the outer Coastal Plain, not spread inland as a weed] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . B. glomeruliflora
3 Heads in glomerules of 2-3, most of the heads pedunculate (a few sessile), the glomerules grouped into terminal paniculiform inflorescences; involucres 5-6 mm high, the phyllaries usually resinous; [of the outer Coastal Plain and also spread extensively inland as a weed]
B. halimifolia

Baccharis angustifolia Michaux, False-willow. Cp (GA, NC, SC): interdune swales, wet hammocks, marsh edges; rare (NC Watch List). September-October. Ranging from ne. NC (Dare County) south to s. FL, west to LA; Bahamas. [= RAB, GW, K, S, SE]

Baccharis glomeruliflora Persoon. Cp (GA, NC, SC): wet hammocks, marsh edges, interdune swales; rare (NC Rare). October-November. Ranging from se. NC (Brunswick County) south to s. FL, west to MS; West Indies. [= RAB, GW, K, S, SE]

Baccharis halimifolia Linnaeus, Silverling, High-tide Bush, Mullet Bush, Groundsel Tree. Cp, Pd (GA, NC, SC, VA), Mt (NC, SC): fresh and brackish marshes, marsh borders, hammocks, moist abused land, roadsides, ditches, old fields, and a wide variety of disturbed areas; common (rare in Mountains and VA Piedmont). September-October. Ranging from se. MA south to s. FL, west to TX, AR, and OK; West Indies. [= RAB, C, F, G, GW, K, S, SE]

Baccharis dioica Vahl. Dunes and shores. S. AL; s. FL; West Indies. [= K, S, SE]

## Balduina Nuttall (Honeycomb-head, Balduina)

A genus of 3 species, herbs, of se. North America. References: Parker \& Jones (1975)=Z; Cronquist (1980)=SE.
Identification notes: The common name alludes to the honeycomb-like texture of the receptacle, made up of connected receptacular bractlets which surround the achenes. This condition is diagnostic of the genus, and can be seen even when the plant is in flower by stripping the flowers from the receptacle. Superficially, the perennial species resemble some Helenium (particularly $H$. pinnatifidum and $H$. vernale), but these bloom months earlier. The punctate leaves are very distinctive.

1 Plant an annual or biennial; leaves primarily cauline, stem much branched
B. angustifolia

1 Plant a perennial; leaves primarily basal, stem unbranched or with only a few branches.
2 Disk corollas purple; basal leaves linear-spatulate, (7-) ca. 14 (-32) cm long, 0.4-1 cm wide; stem base reddish
2 Disk corollas yellow; basal leaves spatulate, (5-) ca. $7.5(-11) \mathrm{cm}$ long, $0.5-1.3 \mathrm{~cm}$ wide; stem base greenish . B. uniflora
Balduina angustifolia (Pursh) B.L. Robinson. Cp (GA): sandhills and other dry, sandy soils; common. GA south to s. FL, west to s. MS; it should be sought in s. SC. [= K, Z; = Actinospermum angustifolium (Pursh) Torrey \& A. Gray -- S]

Balduina atropurpurea Harper, Bog Honeycomb-head, Purple Honeycomb-head, Purple Balduina. Cp (GA, NC, SC): peaty seepage bogs and wet pine savannas; rare (US Species of Concern, GA Rare, NC Rare, SC Rare). Late August-early November; October-December. A southeastern Coastal Plain endemic, very rare and disjunct in se. NC and nc. SC (where not recently seen), primarily in ne. to sc. GA and ne. FL. [= RAB, GW, K, SE, Z; = Endorima atropurpurea (Harper) Small -- S]

Balduina uniflora Nuttall, Savanna Honeycomb-head, Yellow Balduina. Cp (GA, NC, SC): wet pine savannas and pine flatwoods; uncommon (SC Rare). Late July-September. A southeastern Coastal Plain endemic: se. NC and immediately adjacent ne. SC, apparently absent from much of SC, from extreme s. SC south to ne. FL, FL panhandle, and west to e. LA. [= RAB, GW, K, SE, Z; = Endorima uniflora (Nuttall) Rafinesque -- S]

Balsamita P. Miller

* Balsamita major Desfontaines, Costmary, is introduced south to PA (Rhoads \& Klein 1993), MD (Kartesz 1999), and DE
(Kartesz 1999). [= K; Chrysanthemum balsamita (Linnaeus) Baill. -- C; Tanacetum balsamita Linnaeus]

## Bellis Linnaeus (English Daisy)

A genus of about 8 species, herbs, of Europe. References: Nesom (2000b); Cronquist (1980)=SE.

* Bellis perennis Linnaeus, English Daisy. Mt (NC, VA), Pd, Cp (VA): lawns, grassy roadsides; rare, introduced from Europe. April-May. [= RAB, C, F, G, K, SE]

Berlandiera Augustin de Candolle (Green-eyes)
A genus of 4 species, herbs, of $s$. North America and Mexico. References: Cronquist (1980)=SE; Nesom \& Turner (1998)=Z.
Berlandiera pumila (Michaux) Nuttall var. pumila, Eastern Green-eyes. Cp (GA, SC): sandhills, disturbed sandy areas; common. Late May-November. Var. pumila ranges from nc. SC south to n. FL, west to s. AL; w. LA to c. TX. Var. scabrella Nesom \& Turner is endemic to w. LA and e. TX. [= RAB, K, S, SE]

## Bidens Linnaeus (Beggar-ticks, Bur-marigold)

A genus of about 240 species, herbs, cosmopolitan. Recent molecular studies suggest that the relationship between Bidens and Coreopsis is complex, and that changes in taxonomy will be needed to more accurately reflect relationships (Kim et al. 1999; Crawford \& Mort 2005). References: Cronquist (1980)=SE; Sherff \& Alexander (1955)=Z.

Bidens alba (Linnaeus) Augustin de Candolle var. radiata (Schultz Bipontinus) Ballard ex T.E. Melchert. Cp (GA, NC, SC): \{or is this B. pilosa Linnaeus??\} [= K; B. pilosa Linnaeus -- RAB, S, SE; B. pilosa Linnaeus var. radiata Schultz Bipontinus - Z]

* Bidens aristosa (Michaux) Britton, Midwestern Tickseed-sunflower. Cp, Pd (NC, SC, VA), Mt (GA, NC, SC): [=RAB, C, G, GW, S, SE, W; B. aristosa var. aristosa -- F, S, Z; B. aristosa var. fritcheyi Fernald -- F, Z; B. aristosa var. mutica (A. Gray) Gattinger -- F, S, Z; B. aristosa -- K, in part only (also see B. polylepis)]

Bidens bipinnata Linnaeus, Spanish Needles. $\mathrm{Cp}, \mathrm{Pd}, \mathrm{Mt}(\mathrm{GA}, \mathrm{NC}, \mathrm{SC}, \mathrm{VA})$ : [=RAB, C, F, G, K, S, SE, W; B. bipinnata var. bipinnata - Z]

Bidens cernua Linnaeus, Bur-marigold. Mt (GA, NC, VA), Pd (VA), Cp (GA, VA): [=RAB, C, F, G, GW, K, S, SE, W; B. cernua var. cernua -- F, Z; B. cernua var. elliptica Wiegand -- F; B. cernua var. integra Wiegand -- F]

Bidens comosa (A. Gray) Wiegand, Strawstem Beggar-ticks. [= C, F, G, S; B. tripartita -- RAB, K, in part]
Bidens connata Muhlenberg, Purplestem Beggar-ticks. Mt (GA), ? (NC?): South to NC according to $C$ and S; included in $B$. tripartita by RAB. [= C, G, K, S; B. connata var. anomala Farwell -- F, Z; B. connata var. connata -- F, Z; B. connata var. fallax (Warnstorf) Sherff -- F, Z; B. connata var. petiolata (Nuttall) Farwell -- F, Z]

Bidens coronata (Linnaeus) Britton, Northern Tickseed-sunflower. Cp (GA, NC, VA): [=RAB, C, F, G, GW, K, S, SE; B. coronata var. coronata -- F, Z; B. coronata var. brachyodonta Fernald -- F; B. coronata var. trichosperma (Michaux) Fernald -- F] Bidens discoidea (Torrey \& A. Gray) Britton, Few-bracted Beggar-ticks. Cp, Pd (GA, NC, SC, VA), Mt (GA, VA): [= RAB, C, F, G, GW, K, S, SE, W, Z]

Bidens frondosa Linnaeus, Devil's Beggar-ticks. Cp, Pd, Mt (GA, NC, SC, VA): [= RAB, C, G, GW, K, S, SE, W; B. frondosa var. frondosa -- F, Z; B. frondosa var. anomala Porter - Z]

Bidens laevis (Linnaeus) Britton, Sterns, \& Poggenburg, Showy Bur-marigold. Cp (GA, NC, SC, VA), Pd (NC, VA), Mt (VA): [= RAB, C, F, G, GW, K, S, SE, W, Z; B. nashii Small -- S]

Bidens mitis (Michaux) Sherff, Coastal Plain Tickseed-sunflower. Cp (GA, NC, SC), Pd (GA), Mt (NC): [= RAB, C, F, G, GW, K, SE, W, Z; B. mitis var. leptophylla (Nuttall) Small -- S; B. mitis var. mitis - S]

* Bidens pilosa Linnaeus. Cp (GA?, NC?, SC): waste areas near wool-combing mill; rare, introduced from tropical America. Also reported for NC Kartesz (1999). Known from ballast in se. PA (Rhoads \& Klein 1993). [= K; B. odorata Cavanilles; B. pilosa var. pilosa-Z; B. pilosa Linnaeus var. bimucronata (Turczaninov) Schultz Bipontinus]
* Bidens polylepis Blake, Ozark Tickseed-sunflower. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): [= RAB, C, G, GW, SE, W; B. polylepis var. polylepis -- F, Z; B. polylepis var. retrorsa Sherff -- F, Z; B. aristosa -- K, in part]
* Bidens tripartita Linnaeus. \{combined distribution of comosa, connata, and tripartita: Mt (GA, NC, SC, VA), Pd (NC, SC, VA), $C p(V A):\}[=F, G, W, Z ; B$. tripartita -- K, in part (also see B. comosa); B. tripartita -- RAB, GW, in part (also see B. connata and B. comosa)]

Bidens vulgata Greene, Tall Beggar-ticks. Mt (NC, SC, VA), Pd (NC, VA), Cp (VA): [= RAB, C, G, GW, K, S, SE, W; B. vulgata var. vulgata -- $F, Z]$

Bidens beckii Torrey ex Sprengel, Water-marigold, Water Beggar-ticks. South to c. PA and NJ. This species is sometimes treated in the monotypic genus Megalodonta; this is contradicted by molecular evidence, which shows B. beckii as a component of Bidens (Ganders 2000). [= C, G; Megalodonta beckii (Torrey ex Sprengel) Greene -- F, K; Megalodonta beckii var. beckii - Z] Bidens bidentoides (Nuttall) Britton occurs on tidal shores and mudflats from NY south to se. PA and e. MD. [= C, F, G, K; B. mariana Blake -- F; B. bidentoides var. bidentoides - Z; B. bidentoides var. mariana - Z]

A genus of 2 species (one with 2 varieties), herbs, of se. North America. References: Anderson (1970)=Z; Cronquist (1980)=SE; Nesom (2000b).

1 Basal leaves 4-14 mm wide; plants cespitose, or weakly rhizomatous; [of wet pine savannas] ........ B. nudata var. nudata
1 Basal leaves 1-2 mm wide; plants strongly rhizomatous and colonial; [of dry clayey or rocky places] . . . . . . . . . [B. nuttallii]
Bigelowia nudata (Michaux) Augustin de Candolle var. nudata, Rayless-goldenrod. Cp (GA, NC, SC): savannas, pine flatwoods, pocosin edges; common. August-October. A Southeastern Coastal Plain species: var. nudata ranges from e. NC south to n . FL and west to LA. Var. australis (L.C. Anderson) Shinners [= ssp. australis L.C. Anderson] occurs in c. and s. FL; it differs in its narrower leaves ( $2-4.5 \mathrm{~mm}$ wide vs. $4-15 \mathrm{~mm}$ ) and larger heads (involucre 6-7.5 mm tall vs. 4.5-6 mm). [= SE; Bigelowia nudata ssp. nudata -- GW, K, Z; Chondrophora nudata (Michaux) Britton -- RAB, S]

Bigelowia nuttallii (Michaux) Augustin de Candolle. Cp, Pd (GA): prairies, sandstone glades, Altamaha Grit glades, and roadbanks; rare. September-October. Ec. GA (Jones \& Coile 1988, Bridges \& Orzell 1989) and w. FL west to e. TX. [= GW, K, SE, Z; Chondrophora virgata -- S, misapplied]

## Boltonia L'Héritier de Brutelle (Doll's-daisy)

A genus of about 6-7 species, herbs, of e. and c. North America. References: Morgan (1966)=Z; Anderson (1987)=Y; Cronquist (1980)=SE; Nesom (2000b).

1 Inflorescence branches leafy, some at least of the bracts along the inflorescence branches more than 1 cm long.
2 Phyllaries linear-subulate, outer series less than 0.5 mm wide; mature nutlets narrowly obovate, (0.6-) 0.8-0.9 (-1.0) mm wide; achene wings 0.05-0.1 (-0.2) mm wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . B. caroliniana
2 Phyllaries not linear-subulate, outer series more than 0.5 mm wide; mature nutlets broadly obovate, averaging $1.8-2.5 \times$ as long as wide (not including the broader wings); achene wings (0.1-) $0.2-0.5 \mathrm{~mm}$ wide.
3 Inflorescence narrow and few-headed (usually less than 30), branches loosely ascending .......... B. asteroides 3 Inflorescence broad and flat-topped or diffusely paniculate, heads numerous (usually more than 30) B. latisquama
1 Inflorescence branches merely subulate-bracteate, the bracts less than 1 cm long.
4 Inflorescence narrow with loosely acsending branches, heads few (usually less than 30) ................ . . . asteroides
4 Inflorescence diffusely paniculate, heads numerous (usually more than 30).
5 Phyllaries spatulate-obovate or obovate, the apex obtuse or cuspidate
B. Iatisquama

5 Phyllaries not obovate or obovate-spatulate, the apex not obtuse or cuspidate
B. diffusa

Boltonia asteroides (Linnaeus) L'Héritier de Brutelle, Eastern Doll's-daisy. Cp (NC, SC, VA), Mt (NC): marshes, ditches; common, rare in Mountains (VA Watch List). August-October. Ranging from NJ south to panhandle FL, west to MS and LA, mostly on the Coastal Plain, but with a few disjunct occurrences inland, such as Henderson County, NC. [=RAB, W, Y; B. asteroides var. asteroides -- C, F, G, K, SE, Z; B. asteroides var. glastifolia (Hill) Fernald -- F; Boltonia -- GW, species not distinguished]

Boltonia caroliniana (Walter) Fernald, Carolina Doll's-daisy. Cp (NC, SC, VA), Pd (NC, SC), Mt (VA): bottomlands, ditches, roadsides, prairies; common (GA Special Concern, VA Rare). August-October. Ranging from se. VA south to s. SC, primarily on the Coastal Plain and Piedmont. [= C, F, G, K, SE, Y; B. caroliniana -- RAB, in part only (also see B. diffusa var. diffusa); B. ravenelii Fernald \& Griscom -- F; Boltonia -- GW, species not distinguished; B. diffusa var. caroliniana -- Z]

Boltonia diffusa Elliott var. diffusa, Southern Doll's-daisy. Cp (SC): clay-based Carolina bays; rare. August-October. Ranging from se. SC south to s. FL, west to e. TX, inland in the interior to c. TN, s. IL, s. MO, AR, and se. OK; disjunct in the Bahamas (Mangrove Cay of Andros Island). [=K, Z; B. caroliniana -- RAB, in part; B. diffusa -- C, G, SE, Y, infraspecific taxa not distinguished; Boltonia -- GW, species not distinguished]

Boltonia latisquama A. Gray, Midwestern Doll's-daisy. $\mathrm{Cp}(\mathrm{NC})$ : ditches; rare, introduced from mw. United States. AugustOctober. [= F; B. latisquama var. recognita Fernald \& Griscom -- F; B. asteroides (Linnaeus) L'Héritier de Brutelle var. latisquama (A. Gray) Cronquist -- C, G, SE, Z; B. asteroides var. recognita (Fernald \& Griscom) Cronquist -- C, K, G; Boltonia -- GW, species not distinguished]

Boltonia sp. 1, Valley Doll's-daisy. Mt (VA): sinkhole ponds; rare. This new species is under study, occurring in Augusta Co. VA and Ridge and Valley wetlands in NJ (J. Townsend, pers. comm.). Material from Augusta Co. VA (Maple Flats ponds) has been previously interpreted as $B$. asteroides, but appears to be more similar to $B$. caroliniana, but appears not to match that taxon either. \{not yet keyed\}

## Borrichia Adanson (Seaside Oxeye)

A genus of 2 species, shrubs, of se. United States and West Indies. References: Cronquist (1980)=SE.
Borrichia frutescens (Linnaeus) Augustin de Candolle, Seaside Oxeye. Cp (GA, NC, SC, VA): salt and brackish marshes; common. May-September. DC and e. VA south to FL, west to TX and Mexico; also in Bermuda. This species often forms nearly pure stands of many hectares, conspicuous from the fleshy, gray leaves. [= RAB, C, F, G, K, SE]

A genus of about 110 species, herbs and shrubs, primarily of sw. North America, Central America, and South America. Kuhnia appears to be a part of Brickellia (King \& Robinson 1987; Shinners 1971). References: Cronquist (1980)=SE; Shinners (1971)=Z; Shinners (1946)=Y; Turner (1989)=X.

1 Leaves rounded at base; upper stem leaves reduced in size but similar in sahpe to the lower leaves; pappus purplish, of ca. 40 bristles; [of s. GA south] $\qquad$ B. cordifolia

1 Leaves cuneate at base; upper stem leaves (at least) linear-lanceolate; pappus whitish, of 20-25 bristles; [widespread in our area]
B. eupatorioides var. eupatorioides

Brickellia cordifolia Elliott, Flyr's False-boneset. Cp (GA): mesic pine-hardwood or oak-hickory woods of upland hammocks; rare (GA Special Concern). Late August-late October. Sw. GA (Jones \& Coile 1988) and AL south to n. FL. [= K, SE; Coleosanthus cordifolius (Elliott) Kuntze -- S]

Brickellia eupatorioides (Linnaeus) Shinners var. eupatorioides, Eastern False-boneset. Mt, Pd, Cp (GA, NC, SC, VA): dry slopes, shale barrens, dry woodlands, thickets; common (uncommon in Mountains, uncommon in VA Piedmont, rare in VA Coastal Plain). June-October. Ranging from NJ west to IN, south to FL and se. TX. In addition to var. eupatorioides, B. eupatorioides includes several other varieties, of more southern or western distribution. Var. floridana (R.W. Long) B.L. Turner [= B. mosieri Small] has all leaves linear and is apparently restricted to s. FL; previous references to its occurrence further north (as by SE) are based on narrow-leaved forms of B. eupatorioides var. eupatorioides. Var. texana (Shinners) Shinners [= var. ozarkana (Shinners) Shinners] has the outer phyllaries prolonged into setae, nearly or fully as long as the inner phyllaries, and should be considered a possibility for our area, in dry open habitats with prairie or midwestern affinities. Var. corymbulosa (Torrey \& Gray) Shinners ranges as far east as KY and has larger heads than var. eupatorioides ( $9-15 \mathrm{~mm}$ high, with mostly $15-35$ florets, vs. $7-11 \mathrm{~mm}$ high, with mostly 6-15 florets). [= K, X, Z; Kuhnia eupatorioides Linnaeus -- RAB, S, W; Kuhnia eupatorioides var. eupatorioides -- C, F, G, SE; Kuhnia eupatorioides var. pyramidalis Rafinesque - Y]

Brintonia Greene 1895 (Brintonia)

A monotypic genus, though sometimes combined with Solidago. References: Nesom (1993).
Brintonia discoidea (Elliott) Greene, Brintonia. Cp (GA): rich bluff forests; rare (GA Watch List). A Southeastern Coastal Plain endemic: sw. GA west to LA. [= S, SE; = Solidago discoidea Elliott -- K]

## Cacalia

(see Arnoglossum, Hasteola, Rugelia)

## Calotis R. Browne

* Calotis cuneifolia R. Browne. Cp (SC): waste areas near wool-combing mill; rare, introduced from Australia. Reported by
Nesom $(2004 \mathrm{~d}) .[=\mathrm{K}]$

## Calyptocarpus Lessing (Straggler-daisy, Lawnflower)

A genus of 3 species, herbs, of sw. North America south to Central America. References: Sherff \& Alexander (1955)=Z; Cronquist (1980)=SE.

* Calyptocarpus vialis Lessing, Straggler-daisy, Lawnflower. Cp (GA, SC): disturbed areas, lawns; rare, introduced from tropical America. [=K, S, SE, Z]

## Carduus Linnaeus (Plumeless Thistle) (also see Cirsium)

A genus of about 90 species, herbs, of temperate Old World. References: Cronquist (1980)=SE.

|  | Phyllaries 2-8 mm |
| :---: | :---: |
| 1 | Phyllaries 1-2 mm wide; heads erect. |
|  | 2 Involucre 14-20 mm high, 25-35 mm across (excluding the flowers); leaves glabrate to glabrous beneath; plants very spiny; stem tough <br> C. acanthoide |
|  | 2 Involucre 12-17 mm high, 15-20 (-25) mm across (excluding the flowers); leaves cottony-tomentose beneath, at least when young; plants not very spiny; stem brittle <br> C. cris |
|  | Carduus acanthoides Linnaeus, Plumeless Thistle. Mt (NC, VA), Pd, Cp (VA): disturbed areas, pastures; common (rare in |
|  | introduced from Eurasia. June-October. [= RAB, C, F, G, K, SE, W] |
|  | Carduus crispus Linnaeus, Welted Thistle. Cp (VA): disturbed areas, naturalized around large ports; rare, introduced from |
|  | June-September. [= C, F, |

* Carduus nutans Linnaeus ssp. macrolepis (Peterm.) Kazmi, Musk Thistle, Nodding Thistle. Mt (VA), Pd (GA, NC, VA), Cp (SC, VA): disturbed areas; uncommon (rare in NC and SC), introduced from Eurasia. Late May-November. [= K; < C. nutans -RAB, C, F, G, SE, W]
* Carduus pycnocephalus Linnaeus, Italian Plumeless-thistle. Cp (SC): waste areas around wool-combing mill; rare, introduced from n. Africa and w, asia. Reported by Nesom (2004d). [= K] \{not yet keyed\}
* Carduus tenuiflorus W. Curtis, known from ballast collections from se. PA from 1877-1879 (Rhoads \& Klein 1993) and from NJ (Kartesz 1999). [= K] \{not keyed\}

## Carphephorus Cassini

A genus of 7 species, herbs, endemic to the Southeastern Coastal Plain of North America. The merger of Trilisa and Litrisa into Carphephorus has been recently questioned (Schmidt \& Schilling 2000). The only species not occurring in our area is C. carnosus (Small) James (of c. peninsular FL). No area in the range of the genus has more than five of the seven species, and only se. SC and immeditaely adjacent GA has more than four. References: Correa \& Wilbur (1969)=Z; DeLaney, Bissett, \& Weidenhamer (1999) $=\mathrm{Y}$; Orzell \& Bridges (2002)=X; Cronquist (1980)=SE.

1 Stem glabrous or nearly so, the pubescence (if present) short and appressed; basal leaf surfaces glabrous; inflorescence corymbiform.
2 Stem leaves few, most of the stem exposed; basal leaves $4-20 \mathrm{~cm}$ long, $0.5-2.5 \mathrm{~cm}$ wide, dull, minutely punctate-pitted, fairly thick in texture, but not succulent; stems 1-5 dm tall, (1-) 2-5 per plant . . . . . . . . . . . . . . . . . . . . . . . C. bellidifolius
2 Stem leaves numerous, densely clothing the stem at least below; basal leaves $9-50 \mathrm{~cm}$ long, 2-10 cm wide, shiny, succulent; stems 6-20 dm tall, 1 per plant . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. odoratissimus var. odoratissimus
1 Stem conspicuously spreading hirsute, at least on the lower part of the stem; basal leaf surfaces conspicuously pubescent to glabrous; inflorescence corymbiform or thyrsoid-paniculate.
3 Leaves linear, the widest $1-3 \mathrm{~mm}$ wide; [of sw. GA west through the East Gulf Caostal Plain] ......... C. pseudoliatris
3 Leaves oblancolate, the widest $7-40 \mathrm{~mm}$ wide; [collectively widespread in the Coastal Plain of our area].
4 Inflorescence thyrsoid-paniculate; flowers 4-10 per head; basal leaves glabrous, minutely and inconspicuously punctate, lacking resin droplets; phyllaries in 2-3 series, scarcely overlapping . . . . . . . . . . . . . . . . . C. paniculatus 4 Inflorescence corymbiform; flowers 15-30 per head; leaves generally conspicuously pubescent (sometimes glabrate or with a few long hairs on the upper surface), not punctate, copiously beset with resin droplets; phyllaries in 3-6 series, closely imbricate.
5 Phyllaries glabrous on the back; phyllaries subacute to rounded, entire to erose; phyllaries mostly 15-20
C. corymbosus

5 Phyllaries viscid-pubescent on the back; phyllaries acute to subacute, entire and often callus-tipped; phyllaries 20-40
C. tomentosus

Carphephorus bellidifolius (Michaux) Torrey \& A. Gray, Sandhill Chaffhead. Cp (GA, NC, SC, VA): xeric sandy forests and woodlands, primarily in sandhills; common (GA Special Concern, VA Rare). August-October. A Southeastern Coastal Plain endemic: se. VA to extreme e. GA. The leaf apices are generally blunt, giving the leaves a nearly spatulate shape. Of our species of Carphephorus, C. bellidifolius occupies the driest habitats; it often occurs with the other species, however. [= RAB, C, F, G, K, S, SE, Z]

Carphephorus corymbosus (Nuttall) Torrey \& A. Gray. Cp (GA, SC): wet flatwoods; rare. August-October. A southern Atlantic Coastal Plain endemic: se. SC south to FL. This species was reported for as far north as NC by Small (1933). Correa \& Wilbur (1969) considered the northern limit of the species to be e. GA, but it is now known from Jasper County, SC. [= RAB, K, S, SE, Y, Z]

Carphephorus odoratissimus (J.F. Gmelin) Herbert var. odoratissimus, Deer's-tongue, Vanilla-leaf. Cp (GA, NC, SC): moist to mesic savannas and flatwoods; uncommon. Late July-October; September-November. A Southeastern Coastal Plain endemic: se. NC south to s. FL and west to e. LA; var. odoratissimus extends throught this range escept for southern peninsular FL. C. odoratissimus has the largest leaves of our species of Carphephorus; its leaves are normally wider than 3 cm , and have a very wide and prominent midrib, usually purple towards the base of the leaf and white towards the tip. This species contains coumarin and gives off a pleasant vanilla odor when drying; it is gathered from the wild and used as a supplementary flavoring in cigarettes. See DeLaney, Bissett, \& Weidenhamer (1999), Ward (2001), and Orzell \& Bridges (2002) for discussion of a southern Florida taxon related to C. odoratissimus, probably best treated as C. odoratissimus var. subtropicanus (DeLaney. N. Bissett, \& Weidenhamer) Wunderlin \& B.F. Hansen. [= X; < C. odoratissimus -- GW, K, SE, Z; = C. odoratissimus - Y, in the narrow sense; < Trilisa odoratissima (J.F. Gmelin) Cassini -- RAB, S]

Carphephorus paniculatus (J.F. Gmelin) Herbert. Cp (GA, NC, SC): savannas and flatwoods; common. August-October; September-November. A Southeastern Coastal Plain endemic: se. NC south to c. peninsular FL, and west to the FL Panhandle and s . AL. The leaves of this species are reminiscent of $C$. odoratissimus, but are narrower, (0.5-) 1-3 (-4) cm wide (vs. 1-6 (-11) cm wide in C. odoratissimus). Sterile C. paniculatus can be mistaken for glabrate C. tomentosus, which has shorter and broader leaves. [= GW, K, SE, Y, Z; = Trilisa paniculata (J.F. Gmelin) Cassini -- RAB, S]

Carphephorus pseudoliatris Cassini, Lavender Lady. Cp (GA): seepage bogs, savannas, wet to moist pinelands; rare (GA Special Concern). A West Gulf Coastal Plain endemic: sw. GA and FL Panhandle west to e. LA. [= GW, K, S, SE, Y, Z]

Carphephorus tomentosus (Michaux) Torrey \& A. Gray. Cp (GA, NC, SC, VA): savannas, flatwoods, and sandhills; common (VA Rare). August-October. A southern Atlantic Coastal Plain endemic: se. VA south to s. GA, C. tomentosus is highly variable in its pubescence, ranging from glabrate to densely hirsute. [= RAB, C, G, GW, K, S, SE, Z; > C. tomentosus var. tomentosus - F; > C. tomentosus var. walteri (Elliott) Fernald -- F]

## Carthamus Linnaeus (Distaff-thistle)

* Carthamus baeticus (Boiss. \& Reut.) Lara. Cp (SC): waste area around wool-combing mill; rare, introduced from s. Europe and n. Africa. Reported by Nesom (2004d). [= C. lanatus Linnaeus ssp. baeticus (Boiss. \& Reut.) Nyman - K] \{add synonymy\}

Centaurea Linnaeus (Star-thistle, Knapweed)<br>(see also Cnicus)

\{needs rework\}

A genus of about 500 species, herbs, primarily Old World. References: Cronquist (1980)=SE. Key adapted from C and SE.

1 Phyllaries evidently spine-tipped.
2 Leaf bases not decurrent on the stem, the stem merely angled; pappus absent
C. calcitrapa

2 Leaf bases decurrent on the stem as wings; pappus present in at least the central flowers in the head.
3 Larger spines of the middle and outer phyllaries 5-9 mm long; marginal and central flowers of the head with pappus

3 Larger spines of the middle and outer phyllaries 11-22 mm long; marginal flowers of the head lacking pappus
Phyllaries not spine-tipped.
4 Leaves pinnatifid, with narrow lobes . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. biebersteinii
4 Leaves entire or toothed, the larger sometimes with a few basal lobes.
5 Leaves less than 1 cm wide; plant an annual, flowering April-June
C. cyanus

5 Leaves (at least the larger and lower) more than 1 cm wide; plant a perennial, flowering June-October.
$6 \quad$ Scarious tips of the phyllaries tan to dark brown, those of the middle and outer bracts irregularly lacerate, those of the inner bracts expanded and often strongly bifid; marginal flowers generally enlarged and ray-like C.jacea 6 Scarious tips of the phyllaries blackish at least in part, those of the middle and outer bracts regularly pectinate, those of the inner bracts neither expanded nor notably bifid; marginal flowers either enlarged and ray-like (in $C$. nigrescens and C. $\times$ pratensis) or not (in C. nigra).
7 Scarious tips of the phyllaries 1-3 mm long; heads relatively narrow (usually longer than broad); marginal flowers enlarged and ray-like
C. nigrescens

7 Scarious tips of the phyllaries (3-) 4-6 mm long; heads relatively broad (usually broader than long); marginal flowers either enlarged and ray-like (in C. ×pratensis) or not (in C. nigra).
8 Marginal flowers not enlarged and ray-like . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. nigra
8 Marginal flowers enlarged and ray-like . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. . .pratensis

* Centaurea biebersteinii Augustin de Candolle, Spotted Knapweed, Bushy Knapweed. Mt, Pd (NC, SC, VA), Cp (VA): roadsides, disturbed areas; common (rare in SC), introduced from Europe. Late June-November. [= K; C. maculosa Lamarck -RAB, C, F, G, SE, W, misapplied]
* Centaurea calcitrapa Linnaeus, Purple Star-thistle, Caltrops. Mt, Cp (VA): roadsides, disturbed areas; rare, introduced from Europe. June-September. [= C, F, G, K, S, SE]
* Centaurea cyanus Linnaeus, Cornflower, Batchelor's-buttons. Cp, Pd (GA, NC, SC, VA), Mt (NC, SC, VA): roadsides, disturbed areas; common, introduced from Mediterranean Europe. April-June. [= RAB, C, F, G, K, S, SE, W]
* Centaurea jacea Linnaeus, Brown Knapweed. Mt (VA): roadsides, disturbed areas; rare (locally common), introduced from Europe. June-September. This species is increasing rapidly in the VA Ridge and Valley. [= C, F, G, K, SE; Jacea pratensis Lamarck]
* Centaurea melitensis Linnaeus, Maltese Star-thistle. Cp (SC): waste areas near wool-combing mill, roadsides, disturbed areas; rare, introduced from Mediterranean Europe. June-September. [= C, F, G, K, S, SE]
* Centaurea nigra Linnaeus, Black Knapweed, Spanish-buttons. Mt (VA): roadsides, disturbed areas; rare, introduced from Europe. July-October. [= C, F, G, K, SE]
* Centaurea nigrescens Willdenow, Short-fringed Knapweed. Mt, Pd (VA): roadsides, disturbed areas; rare (locally common), introduced from Europe. July-October. This species is increasing rapidly in n. VA Piedmont. [= F, K; C. dubia Suter -- C, SE, W; C. vochinensis Bernhardi ex Reichenbach -- F; C. dubia ssp. vochinensis (Berhardi ex Reichenbach) Hayek -- G]
* Centaurea $\times$ pratensis Thuillier. Mt, Pd (VA): roadsides, disturbed areas; rare, introduced from Europe. July-October. [= C; C. nigra var. radiata Augustin de Candolle -- F]
* Centaurea solstitialis Linnaeus, Barnaby's-thistle, Yellow Star-thistle. Mt, Pd (VA), Cp (NC, SC): roadsides, disturbed areas; rare, introduced from Mediterranean Europe. June-August. First reported for South Carolina by Hill \& Horn (1997). [= RAB, C, F, G, K, S, SE]
* Centaurea americana Nuttall, American Basket-flower. Cp (SC): waste ground around wool-combing mills; rare, introduced from further west (Nesom 2004d). [= K] \{not yet keyed; add synonymy\}
* Centaurea diffusa Lamarck, introduced in Davidson County, TN (Chester, Wofford, \& Kral 1997). [= C, K; Acosta diffusa (Lamarck) Soják]
* Chaetopappa asteroides (Nuttall) Augustin de Candolle var. asteroides. Cp (SC): waste areas near wool-combing mills; rare, introduced from sc. United States. Reported by Nesom (2004d). [= K]

## Chamaemelum P. Miller (Chamomile)

A genus of about 6 species, herbs, of Eurasia. References: Cronquist (1980)=SE
1 Rays white with a yellow base; plant an annual . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Ch. mixtum
1 Rays white; plant a perennial . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Ch. nobile

1 Rays white; plant a perennial Ch. nobile

* Chamaemelum mixtum (Linnaeus) Allioni. Pd (NC): disturbed areas; rare, introduced from Europe. [= K; Anthemis mixta Linnaeus -- C, F, G, SE; = Ormenis mixta (Linnaeus) Dumortier -- S]
* Chamaemelum nobile (Linnaeus) Allioni, Garden Chamomile. Pd (NC): persistent from cultivation in gardens; rare, introduced from Europe. [= K; = Anthemis nobilis Linnaeus -- C, F, G, S, SE]

## Chaptalia Ventenat (Sunbonnets)

A genus of about 60 species, herbs, of warm temperate, subtropical, and tropical America. The remainder of the genus is distributed in the West Indies, Central America, and South America. References: Vuilleumier (1969)=Z; Nesom (1995)=Y; Cronquist (1980) $=$ SE .

Identification notes: The basal leaves are distinctive, the undersurface permanently and tightly white floccose, the upper surface floccose when young but glabrate in age, and the margins with obscure denticulations.

Chaptalia tomentosa Ventenat, Sunbonnets, Pineland Daisy, Night-nodding Bog-dandelion. Cp (GA, NC, SC): savannas, sandhill seeps, pine flatwoods; common. February-May. A Southeastern Coastal Plain endemic: e. NC south s. FL and west to e. TX. [= RAB, GW, K, S, SE, Y, Z]

## Chevreulia \{auth.\}

* Chevreulia sarmentosa (Persoon) Blake. Cp (SC): waste area near wool-combing mill; rare, introduced from s. South America. Reported for SC by Nesom (2004d).

Chondrilla Linnaeus (Skeleton-weed)
A genus of about 25 species, herbs, of temperate Eurasia. References: Cronquist (1980)=SE.

* Chondrilla juncea Linnaeus, Skeleton-weed, Gum-succory. Pd (GA, VA), Cp, Mt (VA): cultivated fieelds, disturbed areas, roadsides; rare, introduced from Eurasia. June-August. [= C, F, G, K, SE]

Chondrophora
(see Bigelowia)

Chromolaena Augustin de Candolle

Chromolaena ivifolia (Linnaeus) King \& Robinson, Ivy-leaf Thoroughwort, in pariries and fields, east to AL, FL, MS (Woods, Diamond, \& Searcy 2003; Kartesz 1999). [= K; = Osmia ivaefolia (Linnaeus) Small - S; = Eupatorium ivaefolium - SE, orthographic variant; = Eupatorium ivifolium Linnaeus]

Chrysanthemum Linnaeus (Chrysanthemum)
(also see Balsamita, Dendranthema, Leucanthemum, and Tanacetum)
If circumscribed narrowly, a genus of 3 species, herbs, of $n$. Africa and Europe. References: Cronquist (1980)=SE; Arriagada \& Miller (1997)=Z.

* Chrysanthemum segetum Linnaeus, Corn Marigold, Corn Chrysanthemum. Pd (NC): disturbed areas, trash heaps, field edges; commonly cultivated, rarely escaped, persistent, or as a waif, introduced from Eurasia. April-May. [= RAB, C, F, G, K, S, SE]

## Chrysogonum Linnaeus (Green-and-gold)

A genus of 1 species (with varieties), herbs, of se. North America. References: Nesom (2001b)=Z; Cronquist (1980)=SE. Key based on Nesom (2001b).

1 Plants occurring individually, not producing stolons; earliest flowering stems leafless, later flowering stems leafy; leafy flowering stems mostly 15-35 (-50) cm high; [of e. VA, sc. PA, and se. OH south to se. NC, nc. SC, nw. NC, and sw. VA]

Ch. virginianum var. virginianum
1 Plants colonial, forming mats by stolons; flowering stems leafless or leafy; leafy flowering stems (if present) $15-25 \mathrm{~cm}$ high; [of ne. SC, sc, NC, nw. NC, ne. TN. and se. KY southwards].
2 Earliest flowering stems leafless, mostly 2-10 cm high; later flowering stems leafy $15-25 \mathrm{~cm}$ high; longest stolon internodes 2-6 cm long; [of ne. SC, sc. NC, nw. NC, ne. TN. and se. KY south to e. GA, c. GA, and ec. AL.].

Ch. virginianum var brevistolon
2 Earliest flowering stems leafless, 2-10 cm high; later flowering stems leafless as well, 2-10 cm high; longest stolon internodes $12-60 \mathrm{~cm}$ long; [of sc. and sw. GA west to e. LA]

Ch. virginianum var. australe
Chrysogonum virginianum Linnaeus var. australe (Alexander ex Small) Ahles, Gulf Coast Green-and-gold. Cp (GA): moist to fairly dry woodlands and forests; uncommon. Late March-early June. A Gulf Coastal Plain endemic: sc. and sw. GA west to e. LA. [= Z; < Ch. virginianum var. australe - RAB, K, SE, W, in part only (also see var. brevistolon); < Ch. australe Alexander ex Small - S, in part (also see var. brevistolon)]

Chrysogonum virginianum Linnaeus var. brevistolon Nesom, Carolina Green-and-gold. Pd (GA, NC, SC), Cp (GA, SC), Mt (GA, NC, SC, VA?): moist to fairly dry woodlands and forests; common. Late March-early June. Ne. SC, sc. NC, nw. NC, ne. TN. and se. KY south to e. GA, c. GA, and ec. AL. Tentatively reported for Russell Co. VA (Ludwig, pers. comm. 2005). [= Z; < Ch. virginianum var. australe - RAB, K, SE, W, in part; < Ch. australe Alexander ex Small - S, in part]

Chrysogonum virginianum Linnaeus var. virginianum, Northern Green-and-gold, Virginia Green-and-gold. Cp (NC, SC, VA): Pd (NC, VA), Mt (VA): moist to fairly dry woodlands and forests; common. Late March-early June. E. VA, sc. PA, and se. OH south to se. NC, nc. SC, nw. NC, and sw. VA. [= RAB, C, K, SE, W, Z; = Ch. virginianum - S, in the narrow sense]

## Chrysoma Nuttall (Woody Goldenrod)

A monotypic genus, a shrub, of se. North America. References: Nesom (2000b); Cronquist (1980)=SE.
Chrysoma pauciflosculosa (Michaux) Greene, Woody Goldenrod. Cp (GA, NC, SC): xeric sands of very barren, open, whitesand sandhills, in our area primarily on fluvial dunes, and less commonly in the fall-line Sandhills; rare (NC Endangered, SC Rare). Late July-October. S. NC south to n. FL and west to s. MS (very rare in GA, SC, and NC). Chrysoma has a growth habit unlike any other shrub in our flora. From a trunk-like base, numerous branches ascend, forming a flat-topped shrub 3-5 dm tall. Each branch has a cluster of evergreen leaves restricted to its terminal few cm , the internodes very short (a few mm at most). In summer, some of the woody branches produce terminal, deciduous, flowering branches, which elongate rapidly, the leaves widely spaced, reaching a height of a meter or more. Following flowering and fruiting, the deciduous branches die back to the summit of the woody branches. The leaves are gray-green, rather thick-textured, and finely reticulate, the reticulations giving an appearance rather like snakeskin. The midrib is prominent below, almost invisible on the upper surface. Godfrey (1988) has an excellent drawing and description of this distinctive shrub. [= K, S, SE; = Solidago pauciflosculosa Michaux -- RAB; = Chrysoma solidaginoides Nuttall]

Chrysopsis (Nuttall) Elliott<br>(also see Heterotheca and Pityopsis)

A genus of about 10 species, herbs, of se. North America, Mexico, and the Bahamas. This remains a difficult and rather poorly understood group. The appropriate taxonomic status of many of the entities remains unclear; for the moment, I am recognizing a number of entities at the specific level that should perhaps be recognized at lower taxonomic levels; in some cases, the appropriate nomenclatural combinations are not already available. References: Semple (1981)=Z; Harms (1974)=Y; Semple (1996)=X; Cronquist (1980)=SE; Nesom (2000b); DeLaney, Wunderlin, \& Semple (2003). Key adapted from Semple (1981).

1 Stem, leaves, and phyllaries sparsely to densely pubescent with spreading non-glandular hairs as well has having minutely glandular pubescence; plants taprooted annuals; [section Bradburia] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Ch. pilos
1 Stems, leaves, and phyllaries various but lacking spreading non-glandular hairs; biennial or perennial, either fibrous-rooted or with a mostly short and quickly disintegrating taproot; [section Chrysopsis].
2 Peduncles and phyllaries glabrous or the outer phyllaries basally with a few stipitate glands; achenes usually with raised yellow-red translucent ribs.
3 Stems erect; leaf margins serrate-ciliate, the surfaces sparsely pubescent to glabrous; all phyllaries glabrous . . . . . [Ch. hyssopifolia]
3 Stems decumbent to ascending; leaf margins entire, either eciliate and glabrous, or sometimes ciliate with glabrate to sparsely woolly surfaces; phyllaries either glabrous and glandular punctate or the outer basally stipitate-glandular.
4 Stem leaves glabrous and eciliate (but rosette leaves densely woolly), lower stem leaves absent at flowering; outer phyllaries with a few stipitate glands basally, the involucre otherwise glabrous
[Ch. cruiseana]

4 Stem leaves eciliate or ciliate, the surfaces glabrate to sparsely woolly, the hairs often only or mostly near the margin, lower stem leaves usually present at flowering; phyllaries glabrous, glandular-punctate

Ch. trichophylla
2 Peduncles and phyllaries evidently stipitate-glandular or woolly-hairy, or both; achenes with or without raised yellow-red translucent ribs.
5 Upper stem leaves woolly-hairy; not stipitate-glandular; peduncles and involucres sparsely pubescent to woolly, sometimes stipitate-glandular as well.
6 Stems decumbent; inflorescence loosely corymbose-cymose, buds not nodding; peduncles stipitate-glandular or not, ligules $7-12 \mathrm{~mm}$ long; achenes sparsely to moderately strigose, usually with raised yellow-red translucent ribs; [Virginia to Florida] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Ch. gossypina
6 Stems decumbent to ascending; inflorescence corymbose, buds nodding; peduncles densely stipitate-glandular, ligules $10-15 \mathrm{~mm}$ long; achenes densely strigose, lacking raised yellow-red translucent ribs; [barrier islands of western Florida Panhandle]
[Ch. godfreyi]
5 Upper stem leaves arachnid to glabrate or densely stipitate-glandular; peduncles and involucres stipitate-glandular but otherwise glabrous.
7 Upper stem leaves lacking stipitate glands, either arachnid to glabrate, or woolly
Ch. mariana
7 Upper stem leaves densely stipitate-glandular, not woolly.
8 Stems decumbent to ascending; leaves lanceolate; inflorescence compactly corymbose; involucres 9-12 mm long; phyllaries acute to attenuate; ligules 10-15 mm long . . . . . . . . . . . . . . . . . . . . . . [Ch. godfreyi]
8 Stems erect; leaves linear-elliptic; inflorescence open flat-topped corymbose; involucres 6-9 mm long; phyllaries obtuse; ligules $6-8 \mathrm{~mm}$ long

Ch. scabrella
Chrysopsis gossypina (Michaux) Elliott. Cp (GA, NC, SC, VA): sandhills, coastal dunes, other dry sandy places; common (VA Rare). September-October. Se. VA south to c. peninsular FL and sw. GA. [Chrysopsis gossypina ssp. gossypina -- K, Z; < Heterotheca gossypina (Michaux) Shinners -- RAB (also including Ch. pilosa); Ch. gossypina -- C, G, SE, in part; Ch. Iongii Fernald -- F; ? Ch. arenicola Alexander -- S; Ch. decumbens Chapman - S; Ch. pilosa -- S, misapplied; Heterotheca gossypina (Michaux) Shinners -- Y, in part]

Chrysopsis mariana (Linnaeus) Elliott. Cp, Pd, Mt (GA, NC, SC, VA): dry forests and woodlands, roadsides, other dry habitats; common. Late June-October. Ranging from se. NY west to se. OH, c. KY, w. TN, south to c. peninsular FL and se. TX. [= C, F, G, K, S, SE, W, Z; Heterotheca mariana (Linnaeus) Shinners -- RAB, Y; Chrysopsis mariana var. macradenia Fernald -- F]

Chrysopsis pilosa Nuttall. Cp (GA?, NC, SC, VA): sandy roadsides; rare, introduced from a primary, native range from s. MO and se. KS, south to TX. [= F, G, K, SE, Z; < Heterotheca gossypina (Michaux) Shinners -- RAB; = Heterotheca pilosa (Nuttall) Shinners -- Y; = Bradburia pilosa (Nuttall) Semple - X]

* Chrysopsis scabrella Torrey \& A. Gray. Cp (NC?, SC): sandy roadsides; rare, presumably introduced from FL (but possibly native and disjunct). [= K, SE, S, Z; Heterotheca scabrella (Torrey \& A. Gray) Harms -- Y]

Chrysopsis trichophylla (Nuttall) Elliott. Cp (GA?, NC, SC): sandhills, sandy roadsides, coastal dunes; rare (NC Watch List). The taxon treated by many authors as Ch. trichophylla was reduced to a form by Semple (1981), as Ch. gossypina ssp. gossypina f. trichophylla (Nuttall) Semple. He suggests, though, that varietal status may be warranted. Plants in SC previously identified as Ch. cruiseana are referrable to Ch. trichophylla. [= S, SE; = Heterotheca trichophylla (Nuttall) Shinners -- RAB; < Chrysopsis gossypina ssp. gossypina -- K, Z; < Ch. gossypina -- C, G, SE; ? Ch. arenicola Alexander -- S; Ch. pilosa -- S, misapplied; < Heterotheca gossypina (Michaux) Shinners -- Y]

Chrysopsis cruiseana Dress. Coastal sand dunes, FL panhandle and s. AL. October-December. [Chrysopsis gossypina (Michaux) Elliott ssp. cruiseana (Dress) Semple - K, Z]

Chrysopsis godfreyi Semple. Coastal sand dunes, FL panhandle and s. AL. November-December. Plants with densely stipitate-glandular, non-woolly upper stem leaves have been treated as forma viridis (Semple 1981). [= K, Z]

Chrysopsis hyssopifolia Nuttall. Dry sands, FL peninsula west to FL panhandle, s. AL, s. MS, and se. LA. October-December. [= S, SE; Chrysopsis gossypina (Michaux) Elliott ssp. hyssopifolia (Nuttall) Semple - K, Z; Chrysopsis gigantea Small - S; Heterotheca hyssopifolia (Nuttall) Harms - Y]

## Cichorium Linnaeus (Chicory)

A genus of 7 species, herbs, of Europe and n. Africa. References: Cronquist (1980)=SE; Kiers (1999)=Z.

* Cichorium intybus Linnaeus, Chicory, Succory, Blue-sailors. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): roadsides, fencerows, vacant lots, disturbed areas; common, introduced from Europe. Late May-November. The dried roasted root is used as a flavoring or substitute for coffee. [= RAB, C, F, G, K, S, SE, W, Z]
* Cichorium endivia Linnaeus, Endive, from Mediterranean Europe, is a fairly familiar cultivated green. Rhoads \& Klein (1993) report it as "occasionally escaped to alluvial shores and rubbish dumps" in se. PA. [=K, Z] \{not keyed\}

Cirsium P. Miller (Thistle)
A genus of about 250 species, herbs, north temperate. References: Cronquist (1980)=SE. Key adapted in part from SE.
1 Plant colonial from creeping rhizomes; heads 13-20 (-25) mm high; phyllaries all lacking spine tips, or the outermost tipped with spines less than 1 mm long; plant perennial; [alien weeds, generally in altered habitats].

## 2 Leaves shallowly undulate-lobed, with only a few fine marginal prickles <br> C. arvense var. arvense

2 Leaves strongly sinuate-pinnatifid, with numerous well-developed marginal prickles $\qquad$ C. arvense var. horridum

1 Plant not colonial; heads $25-50 \mathrm{~mm}$ high (as small as $15-25 \mathrm{~mm}$ in C. carolinianum, C. nuttallii, C. muticum, and C.
virginianum); phyllaries mostly spine-tipped, with at least some of the spines more than 1 mm long (except sometimes mostly or entirely spine free in C. muticum); plant biennial (to weakly perennial); [native (except C. vulgare), in natural or some species also in disturbed habitats].
3 Leaves decurrent onto the stem below, the decurrency extending as a wing at least several cm down the stem, and often to the leaf below; leaves scabrous-hispid above; phyllaries lacking a glutinous dorsal ridge; [alien weed] . . . . C. vulgare
3 Leaves not decurrent as a conspicuous wing, or the decurrency extending less than 1 cm (sometimes more decurrent in C. lecontei); leaves not scabrous-hispid above; [native, sometimes in disturbed habitats].

4 Phyllaries lacking spine tips (the outermost sometimes with a weak spine-tip to 0.5 mm long); leaves deeply lobed, to 55 cm long and 20 cm wide
C. muticum

4 Phyllaries (at least the outer and middle) with well-developed spine-tips more than 1 mm long; leaves lobed or merely toothed, generally less than 30 cm long and 10 cm wide (except in C. altissimus).
5 Heads immediately subtended by several spiny-toothed leaves (appearing as a leafy involucre); flowers yellow, white, or purple.
6 Margin of the phyllaries shortly scabrous or scabrous-ciliolate, the barbs about 0.1 mm long (the outer phyllaries sometimes with longer barbs); leaves arachnoid beneath; plants relatively coarse and often branched; [of the Coastal Plain and Piedmont] . . . . . . . . . . . . . . . . . . . . C. horridulum var. horridulum
6 Margin of the phyllaries ciliate, the barbs 0.3-0.5 mm long; leaves glabrescent beneath; plants relatively small and unbranched; [of the Coastal Plain]
C. horridulum var. vittatum

5 Heads pedunculate (rarely with 1 or 2 reduced leaves below); flowers pink, purple, lavender, or white.
7 Lower surface of the leaves densely white-tomentose beneath, this persistent and entirely obscuring the green surface.
8 Heads 15-25 mm high; plants 4-15 dm tall; larger leaves less than 5 cm wide.
9 Cauline leaves mostly 10-25; plants flowering April-June; [of dry soils of the Piedmont] . . . . . . .

9 Cauline leaves mostly 30-70; plants flowering August-October; [of moist to dry soils of the Coastal Plain (and rarely the lower Piedmont in association with other Coastal Plain species, such as Pinus palustris)]
C. virginianum

8 Heads 25-35 mm high; plants 10-40 dm tall; larger leaves usually more than 5 cm wide
10 Leaves toothed or shallowly lobed
C. altis simum

10 Leaves deeply pinnatifid . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. discolor
7 Lower surface of the leaves thinly and loosely white-tomentose beneath, this sloughing off in age, the green surface visible through the tomentum except on very small, young leaves.
11 Heads $15-25 \mathrm{~mm}$ high; plants $5-35 \mathrm{dm}$ tall, usually much branched and with numerous heads
C. nuttallii

11 Heads 25-50 mm high; plants 2-10 dm tall, usually strict or few-branched and with 1 or a few heads.
12 Heads on well-developed peduncles; [of moist to wet pinelands of the Coastal Plain from NC and SC south] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. leconte
12 Heads on short peduncles; [of various habitats, mostly inland from the Coastal Plain, or of dry pinelands of the Coastal Plain].13Plants generally with well-developed, persistent basal leaves; cauline leaves with internodes usually more than 2 cm ; [of various habitats, mostly inland from the Coastal Plain].
C. pumilum

13 Plants lacking well-developed basal leaves; cauline leaves with internodes mostly 0.5-2 cm long; [of dry pinelands of the Coastal Plain]
C. repandum

Cirsium altissimum (Linnaeus) Hill, Tall Thistle. Mt, Pd (GA, NC, SC, VA), Cp (GA): pastures, woodlands, thickets; uncommon (rare in VA) (VA Rare). September-November. MA west to ND, south to FL and TX. [= C, F, G, K, S, SE, W; Carduus altissimus Linnaeus -- RAB]

* Cirsium arvense (Linnaeus) Scopoli var. arvense, Canada Thistle, Field Thistle. Mt (VA): pastures, disturbed areas; uncommon?, introduced from Europe. July-November. [=C, G, SE; Carduus arvensis (Linnaeus) Robson -- RAB, infraspecific taxa not distinguished; Cirsium arvense var. mite Wimmer \& Grabner -- F; Cirsium arvense -- K, S, infraspecific taxa not distinguished; Cirsium arvense -- W, infraspecific taxa not distinguished; Breea arvense (Linnaeus) Lessing]
* Cirsium arvense (Linnaeus) Scopoli var. horridum Wimmer \& Grabner, Canada Thistle, Field Thistle. Mt, Cp (NC, VA), Pd (VA): pastures, disturbed areas; common (uncommon in Piedmont, rare in Coastal Plain), introduced from Europe. July-November. [= C, G, SE; Carduus arvensis (Linnaeus) Robson -- RAB, infraspecific taxa not distinguished; Cirsium arvense var. arvense -- F, misapplied; Cirsium arvense -- K, S, infraspecific taxa not distinguished; Cirsium arvense -- W, infraspecific taxa not distinguished; Breea arvense (Linnaeus) Lessing]

Cirsium carolinianum (Walter) Fernald \& Schubert, Carolina Thistle, Spring Thistle. Pd (GA, NC, SC, VA), Mt (GA): prairies, open woodlands over mafic, ultramafic, or calcareous rocks; rare (GA Special Concern, NC Rare, VA Rare). April-June (-July). Sc. VA west to s. OH and MO, south to w. SC, n. GA, AL, and TX. In our area, C. carolinianum seems to be restricted to prairies and woodlands (or maintained powerline or road rights-of-way) over circumneutral rocks and soils, in situations which were oak savannas or even prairies prior to fire suppression. [= C, F, G, K, SE, W; Carduus carolinianus Walter -- RAB; Cirsium flaccidum Small -- S; Cirsium virginianum -- S, misapplied]

Cirsium discolor (Muhlenberg ex Willdenow) Sprengel, Field Thistle. Mt (NC, SC, VA), Pd (GA, NC, VA), Cp (VA): pastures, woodlands, thickets; common. August-November. Québec west to Manitoba, south to NC, MS, LA, and KS. [= C, F, G, K, S, SE, W; Carduus discolor (Muhlenberg ex Willdenow) Nuttall -- RAB]

Cirsium horridulum Michaux var. horridulum, Common Yellow Thistle. Cp, Pd (GA, NC, SC, VA), Mt (GA, NC, SC): roadsides, woodlands, pine savannas; common (rare in VA Piedmont, rare in Mountains). Late March-early June. ME south to FL, west to TX, mostly on the Coastal Plain and adjacent provinces; also in Mexico. [= C, K, SE; Carduus spinosissimus Walter -- RAB; Cirsium horridulum -- F, G, infraspecific taxa not distinguished; Cirsium horridulum -- S , in the narrow sense]

Cirsium horridulum Michaux var. vittatum (Small) R.W. Long, Southern Yellow Thistle. Cp (GA?, NC, SC): wet pine savannas; uncommon. May-July. Se. NC south to s. peninsular FL and panhandle FL. [= K, SE; Carduus smallii (Britton) Ahles -RAB; Cirsium smallii Britton -- S; Cirsium vittatum Small -- S]

Cirsium lecontei Torrey \& A. Gray, LeConte's Thistle. Cp (GA, NC, SC): wet pine savannas; uncommon (GA Special Concern, NC Watch List). June-August. E. NC south to FL, west to LA. [= K, S, SE; Carduus lecontei (Torrey \& A. Gray) Pollard -RAB]

Cirsium muticum Michaux, Swamp Thistle. Cp (NC, SC, VA), Mt (GA, NC, VA), Pd (NC, VA): swamps, wet thickets, woodlands, seepage slopes, wet prairies, meadows; uncommon (rare in VA Piedmont and Coastal Plain) (GA Special Concern). August-November. Newfoundland west to Saskatchewan, south to DE, NC, TN, and MO, and less commonly south to FL and TX. [ $=$ C, G, K, S, SE, W; Carduus muticus (Michaux) Persoon -- RAB; Cirsium muticum var. muticum -- F]

Cirsium nuttallii Augustin de Candolle, Coastal Tall Thistle. Cp (GA, NC, SC, VA): pine savannas, roadsides, pastures; uncommon (VA Rare). June-August. Se. VA south to FL, west to LA; reported for the first time from NC (Krings, Westbrooks, \& Lloyd 2002). [= C, F, G, K, S, SE; Carduus nuttallii (Augustin de Candolle) Pollard -- RAB]

Cirsium pumilum (Nuttall) Sprengel, Pasture Thistle. Pd (NC, VA), Cp, Mt (VA): pastures, thickets, and woodlands, perhaps especially over mafic rocks; uncommon (rare in Coastal Plain). Late May-July. S. ME west to w. NY, south to DE, and w. NC. [= C, F, G, K, SE, W; Carduus pumilus Nuttall -- RAB; Cirsium odoratum (Muhlenberg ex W. Bart.) Petrak -- S]

Cirsium repandum Michaux, Sandhill Thistle. Cp (GA, NC, SC, VA): sandhills, other dry sandy habitats; common, rare in VA (VA Rare). May-July. Se. VA south to e. GA, nearly endemic to the Carolinas. Similar in distribution to Vaccinium crassifolium, Carphephorus bellidifolius, and Baptisia cinerea, which are all locally abundant endemic indicators of Carolina pinelands. [= C, G, K, S, SE; Carduus repandus (Michaux) Persoon -- RAB]

Cirsium virginianum (Linnaeus) Michaux, Virginia Thistle. Cp (GA, NC, SC, VA), Pd (NC): moist to fairly dry pine savannas; uncommon (VA Rare). August-October. S. NJ south to ne. FL, on the Coastal Plain. [= C, F, G, K, SE; Carduus virginianus Linnaeus -- RAB; Cirsium revolutum (Small) Petrak -- S]

* Cirsium vulgare (Savi) Tenore, Bull Thistle. Mt, Pd (GA, NC, SC, VA), Cp (NC, VA): meadows, pastures, and disturbed areas; common, introduced from Europe. Late June-November. [= C, F, G, K, SE, W; Carduus lanceolatus Linnaeus -- RAB; Cirsium lanceolatum (Linnaeus) Scopoli -- S, misapplied]

## Cnicus Linnaeus (Blessed-thistle)

Sometimes this genus is combined with Centaurea. References: Cronquist (1980)=SE.

* Cnicus benedictus Linnaeus, Blessed-thistle. Pd, Cp (GA, NC, SC, VA), Mt (VA): fields, roadsides, disturbed areas; uncommon, introduced from Mediterranean Europe. Late March-June. [= C, F, G, K, S, SE, W; = Centaurea benedicta (Linnaeus) Linnaeus -- RAB]

Conoclinium Augustin de Candolle (Mistflower)

## References: Schmidt \& Schilling (2000).

Conoclinium coelestinum (Linnaeus) Augustin de Candolle, Mistflower, Ageratum. Cp, Pd, Mt (GA, NC, SC, VA): moist to wet disturbed areas, especially ditches; common (uncommon in Piedmont of NC and SC, rare in Mountains), probably more common than formerly. Late July-October. NJ west to IL, c. MO, se. KS, and OK, south to s. FL and c. TX; also in Cuba, and scattered further north (as in NY, n. OH, and n. IN) probably as escapes from cultivation. See Wooten \& Clewell (1971) for further discussion of this species. Often included in Eupatorium. [= K; = Eupatorium coelestinum Linnaeus -- RAB, C, G, SE, W]

## Conyza Lessing (Horseweed)

A genus of about 60 species, herbs, shrubs, and trees, of temperate, subtropical, and tropical regions. Recent molecular studies have indicated the likely polyphyly of Conyza and its close relationship with Erigeron; the ultimate circumscription of these genera is in doubt (Nesom 2000b, Noyes 2000). References: Cronquist (1980)=SE; Nesom (2000b). Key based in part on SE.

1 Plants diffusely branched from the base and throughout; plants 1-3 dm tall [C. ramosissima]
1 Plants with a well-developed central axis, sparingly branched (unless mowed or otherwise injured); plants 1-15 dm tall. 2 Involucre 4-6 mm high, densely pubescent; pistillate flowers (50-) 70-200 or more per head . . . . . . . . . . . . C. bonariensis
2 Involucre 3-4 mm high, glabrous or very sparsely pubescent; pistillate flowers mostly 25-40 per head.
3 Stem coarsely spreading-hirsute; leaves ciliate, the larger generally with a few to many coarse teeth; phyllaries green-tipped . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. canadensis
3 Stem glabrous or with widely scattered, appressed hairs; leaves with a few cilia towards the base, generally entire; phyllaries purple-tipped . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. parva

[^1]areas; uncommon, apparently introduced from South America. April-October. Se. VA south into the tropics. [= C, K, SE; Erigeron bonariensis Linnaeus -- RAB, F; Conyza floribunda Humboldt, Bonpland, \& Kunth -- G; Leptilon bonariense (Linnaeus) Small -- S; Leptilon linifolium (Willdenow) Small -- S]

Conyza canadensis (Linnaeus) Cronquist, Common Horseweed. Pd, Cp, Mt (GA, NC, SC, VA): old fields, disturbed areas, gardens; common. July-November. S. Canada south through nearly all of the United States to tropical America. [C. canadensis (Linnaeus) Cronquist var. canadensis -- C, G, K, SE, W; Erigeron canadensis Linnaeus var. canadensis -- RAB; Erigeron canadensis -- F; Leptilon canadense (Linnaeus) Britton -- S]

Conyza parva Cronquist, Southern Horseweed. Cp, Pd, Mt (GA, NC, SC, VA): dunes, old fields, disturbed areas; common. (May-) July-December. Se. MA and CT west to s. IN, south to FL and TX, and south into tropical America. [C. canadensis (Linnaeus) Cronquist var. pusilla (Nuttall) Cronquist -- C, G, K, SE, W; Erigeron canadensis Linnaeus var. pusillus (Nuttall) Boivin -RAB; Erigeron pusillus Nuttall -- F; Leptilon pusillum (Nuttall) Britton -- S]

* Conyza floribunda Kunth is introduced in GA and westwards (Kartesz 1999). [= K] \{not yet keyed\}

Conyza ramosissima Cronquist ranges from OH west to MN, south to KY, ec. TN (Chester, Wofford, \& Kral 1997), ne. AL, LA, and TX. It occurs in weedy situations. [= C, G, K, SE; Erigeron divaricatus Michaux -- F, misapplied; Leptilon divaricatum (Michaux) Rafinesque -- S]

## Coreopsis Linnaeus (Coreopsis, Tickseed)

A genus of about 50 species, herbs, of America. Recent molecular studies suggest that the relationship between Bidens and Coreopsis (as traditionally circumscribed) is complex, and that changes in taxonomy will be needed to more accurately reflect relationships (Kim et al. 1999; Crawford \& Mort 2005). References: Smith (1976)=Z; Sherff \& Alexander (1955)=Y; Cronquist (1980)=SE. Key adapted from Y and Z .

1 Disk flowers with 4 corolla lobes and 4 anthers; ray flowers usually apically 3-lobed.
2 Leaves pinnately or bipinnately lobed into linear segments or narrowly lanceolate segments; [section Calliopsis]
C. tinctoria var. tinctoria

2 Leaves simple or with 1-2 auriculate lobes at the base; [section Eublepharis].
3 All of the major cauline leaves opposite.
4 Ray flowers pink (white); plant rhizomatous . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. rosea
4 Ray flowers yellow; plant fibrous-rooted.
5 Leaf blades elliptic to ovate, the margins ciliolate (especially near and on the petiole), the surfaces often pubescent as well
C. integrifolia

5 Leaf blades linear to oblanceolate, the margins glabrous, the surface glabrous . . . . . . . . . . . C. linifolia
3 Some (at least) of the major cauline leaves alternate, especially the lowermost several.
6 Ray flowers pink; leaves juncoid (linear-terete).
C. nudata

6 Ray flowers yellow; leaves with an expanded blade.
$7 \quad$ Lower leaves clearly showing tiny dark dots when backlit (dried material sometimes ambiguous); lowermost stem leaves alternate, the middle and upper leaves of the stem usually opposite; heads (ray tip to ray tip) mostly $2.5-4.0 \mathrm{~cm}$ across C. Iinifolia

7 Lower leaves lacking numerous tiny dark dots when backlit; stem leaves alternate (upper bracteal leaves in or near the inflorescence sometimes opposite); heads (ray tip to ray tip) mostly 3.5-6.0 cm across. 8 Basal leaves often absent at flowering; stem leaves well-developed, gradually reduced upwards, many (10-30 nodes below the inflorescence) . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. helianthoides 8 Basal leaves present at flowering; stem leaves strongly reduced upwards, relatively few (3-9 nodes below the inflorescence).
$9 \quad$ Larger stem leaves usually with basal auricles; plant glaucous; flowering late May-July (rarely also September); achene wing on each side $0.75-1.0 \times$ as wide as the achene body . . C. falcata
9 Larger stem leaves without basal auricles; plant green; flowering August-October; achene wing on each side $1 / 4$ to $1 / 2$ as wide as the achene body
C. gladiata

1 Disk flowers with 5 corolla lobes and 5 anthers; ray flowers apically entire, or with (2-) 4-5 teeth.
10 All of the leaves simple or the plant with a mixture of simple leaves and leaves with 1-2 (-4) basal auricles or leaflets, these distinctly smaller than the terminal lobe or leaflet.
11 Leaves all simple, 4-12 cm wide, the margins coarsely serrate (some of the lower leaves sometimes pinnately lacerate basally); [section Silphidium]
C. Iatifolia

11 Leaves simple, usually (but not always) some of the leaves on a plant with basal auricles or lobes, the leaf blades (or terminal leaflets) $0.5-3.5 \mathrm{~cm}$ wide, the margins entire; [section Coreopsis].
12 Stems with 1-5 (-8) nodes between the first node more than 1 cm above the basal leaves and the first head.
13 Plants spreading by elongate stolons; leaf blades (or terminal leaflets) 1-2.2× as long as wide . . . . . . . . .
C. auriculata

13 Plants lacking stolons; leaf blades (or terminal leaflets) $3 \times$ or more as long as wide (basal leaves sometimes broader)
C. lanceolata

12 Stems with (5-) 6-12 nodes between the first node more than 1 cm above the basal leaves and the first head.
14 Leaf blades (or terminal leaflets) more or less broadly elliptical, ca. 1.5-4 cm wide, acute; stem (and often also the leaves) rather densely hairy (to glabrate) . . . . . . . . . . . . . . . . . C. pubescens var. pubescens
14 Leaf blades (or terminal leaflets) narrowly elliptical to oblanceolate, ca. 0.6-2 cm wide, acuminate; stem and leaves glabrous . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. pubescens var. robusta

10 Most or all of the leaves deeply lobed or dissected into distinct leaflets or divisions, the leaflets or divisions 3-20 or more, if only 3 , then the lateral leaflets nearly or fully as large and well-developed as the terminal.
15 Leaves sessile or with a short subpetiolar base less than 2 mm long, the initial division of the leaves palmate into 3 leaflets (these sometimes further divided), giving the 2 opposite leaves the superficial appearance of a whorl of 6 leaves; [section Gyrophyllum].
16 Leaves palmately 3-foliolate (rarely simple or 3-foliolate with the middle leaflet 2-or 3-lobed), the total number of leaflets or divisions thus $3(-5)$, the middle leaflet of median leaves $5-30 \mathrm{~mm}$ wide.
17 Leaf blades rather densely short-pubescent; outer phyllaries rather densely short-pubescent; middle leaflet of median leaves 10-30 mm wide; leaflets herbaceous . . . . . . . . . . . . . . . . . . . . . . . . C. major var. major
17 Leaf blades slightly short-pubescent to glabrous; outer phyllaries slightly short-pubescent to glabrous; middle leaflet of median leaves $5-10(-12) \mathrm{mm}$ wide; leaflets subcoriaceous and stiff . C. major var. rigida 16 Leaves palmately compound, the leaflets simple to lobed or pinnatifid, the total number of leaflets or divisions (3-) $5-25$, the middle leaflet of median leaves $0.5-7 \mathrm{~mm}$ wide.
18 Leaflets usually lobed (rarely simple), the total number of leaflets or divisions (3-) 5-11 (-15) per leaf, the segments of median leaves (1.5-) 2-7 (-9) mm wide
C. delphiniifolia

18 Leaflets pinnatifid, the total number of leaflets or divisions 11-25 or more per leaf, the segments of median leaves $0.2-1.2 \mathrm{~mm}$ wide
C. verticillata

15 Leaves, at least the lower, distinctly petioled on petioles $5-50 \mathrm{~mm}$ or more long.
19 Ray flowers not toothed terminally (or rarely with a few with inconspicuous and irregular teeth); mid-cauline leaves palmately 3 -foliolate, the terminal leaflet sometimes again 3-5-foliolate (sometimes giving an appearance of a pinnately 5-7-foliolate leaf), the leaflets $6-35 \mathrm{~mm}$ wide, $3-15 \times$ as long as wide; [section Gyrophyllum]
C. tripteris

19 Ray flowers apically with (2-) 4-5 teeth; mid-cauline leaves pinnately 5-11-foliolate, the leaflets either 3-15 mm wide and about $1-3 \times$ as long as wide, or $0.5-2 \mathrm{~mm}$ wide and more than $20 \times$ as long as wide; [section Coreopsis].
20 Disk flowers reddish; ray flowers usually with a basal red mark; leaflets of mid-cauline leaves 3-15 mm wide and about $1-3 \times$ as long as wide
C. basalis

20 Disk flowers yellow; ray flowers yellow; leaflets of mid-cauline leaves $0.5-6(-10) \mathrm{mm}$ wide and more than $10 \times$ as long as wide.
21 Achene wings fimbriate; [of granitic outcrops of the Piedmont of GA and AL]
C. grandiflora var. saxicola

21 Achene wings entire; [collectively more widespread].
22 Divisions of the midstem and upper cauline leaves with 1-3 divisions; plants reclining; flowering late June-July; [of dolomite glades in c. AL] . . . . . . . . . . . . . . . . [C. grandiflora var. inclinata]
22 Divisions of the midstem and upper cauline leaves with $>5$ divisions; plants erect; flowering Maylate June; [of granite outcrops and disturbed areas].23Larger divisions of midstem and upper stem leaves 2-6 (-10) mm wide
C. grandiflora var. grandiflora 23 Larger divisions of midstem and upper stem leaves $0.5-1.5 \mathrm{~mm}$ wide;
C. grandiflora var. harveyana

Coreopsis auriculata Linnaeus, Lobed Coreopsis. Pd, Cp, Mt (GA, NC, SC, VA): moist slopes and woodlands; common (rare in Coastal Plain and Mountains). April-June. Ranging from s. VA and KY south to MS, AL, and GA. [= RAB, C, F, G, K, S, SE, W, Y, Z]

* Coreopsis basalis (A. Dietrich) Blake, Texas Coreopsis. Cp (GA, NC, SC), Pd (GA): sandy roadsides and fields; common, introduced from farther west. May-July. Probably native only to e. TX, now distributed across the Coastal Plain from TX east to FL and north to NC. [= RAB, C, F, G, K, SE, Z; C. basalis var. basalis - Y]

Coreopsis delphiniifolia Lamarck, Larkspur Coreopsis. Cp (GA, SC, VA), Pd (GA, NC, SC), Mt (GA): dry woodlands; uncommon (rare north of GA). May-July. The species ranges from se. VA and s. NC south to c. GA, and se. TN (Polk County) (Chester, Wofford, \& Kral 1997), and reputedly AL. Smith (1976) indicates that the species is an allopolyploid derivative (at $4 x, 6 x$, and 8 x ) of $C$. major, C. tripteris, and C. verticillata. Its range extends south well beyond the range of $C$. verticillata. $[=\mathrm{K} ;<C$. major var. stellata -- RAB, in part only; = C. delphinifolia -- F, G, S, SE (an orthographic variant); > C. delphinifolia var. delphinifolia - Y; > C. delphinifolia var. chlooidea Sherff - Y; C. major Walter var. linearis Small -Y ; = C. $\times$ delphiniifolia -- Z]

Coreopsis falcata Boynton, Pool Coreopsis. Cp (GA, NC, SC, VA): peat bogs, very wet savannas, ditches and borrow pits in savannas; common (VA Rare). May-July (rarely later, perhaps in response to growing season fire). The species is endemic to the Coastal Plain of se. VA (City of Chesapeake), e. NC, e. SC, and e. GA. First reported for VA by Wieboldt et al. (1998). It should not be included (as by Cronquist in C and SE) in C. gladiata; the two species are distinctive in ecological preferences, morphology, phenology, and distribution. [= RAB, GW, K, S, Y, Z; < C. gladiata var. gladiata -- C, SE]

Coreopsis gladiata Walter, Swamp Coreopsis. Cp (GA, NC, SC): swamp forests; rare (SC Rare). August-October. Ranging from se. NC south to c. FL and west to s. MS. See C. helianthoides and C. linifolia for further discussion of the taxonomy of this group of species. [= RAB, S, Z; < C. gladiata var. gladiata -- C, G, SE (see also C. falcata); < C. gladiata -- GW, K (also see C. helianthoides); C. gladiata - Y, in a narrow sense; C. longifolia Small var. longifolia - Y; C. Iongifolia Small var. godfreyi Sherff - Y]

Coreopsis grandiflora Hogg ex Sweet var. grandiflora, Large-flowered Coreopsis. Pd (GA, SC): in thin soils of rock outcrops, especially granitic flatrocks; rare. Late May-late June. Var. grandiflora ranges from c. GA and w. SC west to e. TX and e. OK, very scattered in distribution; it differs from var. harveyana in having the leaf divisions 2-6 mm wide (vs. 0.5-2 mm wide). [= F, K, Z; < C. grandiflora -- RAB, G, S, W; < C. grandiflora var. grandiflora -- C, SE (also see var. harveyana); > C. grandiflora var. grandiflora - Y, in a narrower sense; > C. grandiflora var. pilosa Sherff - Y]

* Coreopsis grandiflora Hogg ex Sweet var. harveyana (A. Gray) Sherff, Large-flowered Coreopsis. Cp (GA, NC, SC, VA), Pd, Mt (NC, SC, VA): disturbed areas; rare, introduced from farther west. Late May-late June. As treated by Smith (1976), the species
consists of 4 varieties. Var. harveyana is the most abundant variety, probably originally endemic to AR, n. LA, ne. TX, OK, e. KS, and s. and C. MO, but now scattered eastwards to IN, NC, and SC. Var. longipes (Hooker) Torrey \& Gray is endemic to e. TX. See Crawford \& Smith (1984) for additional discussion of the varieties. [= F, K, Y, Z; < C. grandiflora -- RAB, G, S, W; < C. grandiflora var. grandiflora -- C, SE]

Coreopsis grandiflora Hogg ex Sweet var. saxicola (Alexander) E.B. Smith, Stone Mountain Coreopsis. Pd (GA): granitic outcrops; uncommon. As interpreted by Smith (1976) and Cronquist (1980), this variety is endemic to granite outcrops in c. GA and ec. AL and to sandstone outcrops in nc. AR; the AR plants, differing in morphology, phenology, karyotype, and distribution, may well warrant separate status. [=K, SE, Z; = C. saxicola Alexander - S; > C. saxicola var. saxicola $-\mathrm{Y} ;$ > C. saxicola var. duncanii Sherff - Y]

Coreopsis helianthoides Beadle, Beadle's Coreopsis. Cp (GA, NC, SC), Mt (NC), Pd (GA): swamp forests, swamp edges, and bogs; rare. September-October. Se. NC south to c. and w. FL and west to s. MS, with a disjunct occurrence in sw. NC. The validity of this taxon is controversial. Smith (1976) includes it in C. gladiata, considering it merely a pubescent form. Cronquist (in SE) regards it as distinct at the species level, despite his serious over-lumping of all its close relatives into a single species with two varieties: C. gladiata var. gladiata (including C. falcata and C. gladiata), and var. linifolia (including C. oniscicarpa and C. linifolia). [= RAB, S, SE, Y, Z; < H. gladiata -- GW, K]

Coreopsis integrifolia Poiret, Chipola Dye-flower. Cp (GA, SC): banks and floodplains of small blackwater streams (especially over limestone), edges of swamp forests bordering longleaf pinelands or bordering brackish marshes; rare (GA Special Concern). July-November. Se. SC south to the Panhandle of Florida, apparently uncommon throughout its range. It is related to $C$. helianthoides and C. linifolia; the leaves are cauline and opposite, the petioles are ciliate. [= GW, K, S, SE, Y, Z]

Coreopsis lanceolata Linnaeus, Longstalk Coreopsis. Cp, Pd, Mt (GA, NC, SC, VA)): disturbed areas; common (rare in Mountains). April-June. Ranging from s. MA, MI and WI south to n. FL, e. TX, and NM. Often spread from cultivation, its original range obscure. [= RAB, C, K, S, SE, W, Z; C. lanceolata var. lanceolata - Y; C. lanceolata var. villosa Michaux -- F, G, Y; C. heterogyna Fernald -- F; C. crassifolia Aiton -- S]

Coreopsis latifolia Michaux, Broadleaf Coreopsis. Mt (GA, NC, SC): in rich, moist, cove forests and slopes at medium elevations, primarily from 500 m in the Blue Ridge Escarpment to nearly 1500 m ; rare, though often locally abundant (GA Special Concern, NC Rare, SC Rare). (July-) August-September. This species is treated by Smith (1976) in a monotypic section (Section Silphidium) of Coreopsis, and, indeed, it does not closely resemble our other species. Smith (1976) considered it a primitive species, with its closest relatives in Mexico, and all of his attempts to hybridize it with other Southeastern Coreopsis failed. C. latifolia is a Southern Appalachian endemic, ranging from sw. NC and se. TN (Polk County) (Chester, Wofford, \& Kral 1997) south into nw. SC and ne. GA. Flowering appears to be triggered by canopy tree-fall light gaps. It often occurs with Helianthus glaucophyllus. [= RAB, K, S, SE, W, Y, Z; = Leiodon latifolius (Michaux) Shuttleworth]

Coreopsis linifolia Nuttall, Savanna Coreopsis. Cp (GA, NC, SC, VA), Mt (NC): savannas, sandhill seeps, sandhill-pocosin ecotones, bogs; common, rare in Mountains (VA Rare). August-October. Basal rosettes of this species are abundant in wet savannas and can be distinguished readily by the distinctive leaves: very long-petiolate, about 1 cm across, the pinnate venation very neat (the main lateral veins straight and parallel to the other laterals on the same side of the leaf), with small dark dots when backlit, and very thick (ca. 1 mm ) and stiff in texture. The proper taxonomic treatment of this taxon and its relatives remains unclear. Smith (1976) interpreted C. linifolia to range from se. VA south and west along the Coastal Plain to e. TX (with a few inland disjunctions) and to consist of two chromosome races, a diploid Gulf Coast race (w. FL to se. TX) and a tetraploid Atlantic Coast race (s. GA to se. VA), "not differing sufficiently morphologically to justify nomenclatural recognition." Fernald, however, named $C$. oniscicarpa (the tetraploid) based on morphologic characters. Given the existence of morphologic characters, the failure of Smith's attempted hybridizations of the two "races," his speculation that the tetraploid could be an allotetraploid (though likely an autotetraploid), and the allopatric ranges of the two races, specific recognition is plausible. Further study is needed. Cronquist (in C, G, SE) does not recognize C. oniscicarpa as distinct from C. linifolia, and reduces C. linifolia (sensu lato) to a variety of $C$. gladiata, also including C. falcata in the typic variety of $C$. gladiata. The abundant morphologic, phenologic, and ecologic differences between C. gladiata, C. linifolia, and C. falcata render such an approach undesirable. [= GW, K, W, Y, Z; C. angustifolia Aiton -RAB, possibly misapplied; C. gladiata var. linifolia (Nuttall) Cronquist -- C, G, SE; C. oniscicarpa Fernald -- F; C. oniscicarpa var. simulans Fernald -- F]

Coreopsis major Walter var. major, Woodland Coreopsis. Pd, Mt (GA, NC, SC, VA): woodlands; rare. May-July. Ranging from w. VA s. OH, and KY south to SC, GA, w. FL, s. AL, and s. MS. How to treat the "Coreopsis major complex" (here including C. major var. major, C. major var. rigida, C. delphiniifolia, and C. verticillata) is not clear. The group apparently includes diploids and a variety of allopolyploids and autopolyploids (at various ploidies) variously derived from C. major var. major and C. verticillata. [= RAB, C, F, G, SE, W, Y; < C. major -- K, S, Z]

Coreopsis major Walter var. rigida (Nuttall) F.E.Boynton, Stiffleaf Coreopsis. Mt, Pd, Cp (GA, NC, SC, VA?): dry woodlands and forests; common. June-August. Ranging from VA, WV, and KY south to w. FL, s. AL, s. MS, and se. LA. The recognition of varieties is problematic and controversial. [= C, SE, Y (in a broader sense, including var. stellata); C. major var. stellata (Nuttall) B.L. Robinson -- RAB, F, G, Y; C. major var. rigida - F, Y, in a narrow sense; < C. major -- K, S, Z]

Coreopsis nudata Nuttall. Cp (GA): seasonally flooded pineland depressions, either herbaceous-dominated or under a canopy of Taxodium ascendens; uncommon. E. GA (in close proximity to SC) south to n. FL and west to e. LA. [= GW, K, S, SE, Y, Z]

Coreopsis pubescens Elliott var. pubescens, Common Hairy Coreopsis. Mt (NC, VA), Pd (GA, NC), Cp (NC): forests, woodlands, and rock outcrops; common, rare in Piedmont and Coastal Plain (VA Watch List). July-September. The species as a whole is largely centered in the Southern Appalachians and Ozarks-Ouachitas, with scattered outlying occurrences; var. pubescens has essentially the range of the species, from s. VA, s. KY, s. IL, and s. MO south to nw. FL, MS, and LA. Var. robusta, of the Southern Appalachians, is discussed below. A third variety, var. debilis (Sherff) E.B. Smith, ranges from c. TN south through AL and ne. MS to w. FL, s. AL, s. MS, and se. LA; it has very narrow leaf blades or terminal leaflets. [=F, GW, K, Y, Z; < C. pubescens -RAB, C, G, S, SE, W]

Coreopsis pubescens Elliott var. robusta Gray ex Eames, Mountain Hairy Coreopsis. Mt (GA, NC, SC, VA), Pd, Cp (NC): rocky slopes, glades, edges of rock outcrops; common, rare in Piedmont and, where probably not native, Coastal Plain, (VA Watch List). July-September. Var. robusta is a Southern Appalachian endemic, known from sw. VA, w. NC, nw. SC, n. GA, e. TN, and c.

AL. [= F, GW, K, Y, Z; < C. pubescens -- RAB, C, G, S, SE, W]
Coreopsis rosea Nuttall. Cp (GA, SC): upland depression ponds in the Inner Coastal Plain, drawdown zones on banks of blackwater rivers in the Outer Coastal Plain; rare (SC Rare). July-September. Ranging in the Coastal Plain of s. Nova Scotia, MA, RI, NY (Long Island), NJ, DE, MD, SC, and GA, where it occurs on shores with fluctuating water levels, primarily on Coastal Plain pond shores, but also on river banks. It occurs in Horry County, SC, in the drawdown zone on the banks of the Waccamaw River; it should be sought in NC. It is immediately distinguishable from all our species by its pink to white ray flowers (vs. yellow, or yellow and red). Another pink-rayed species, C. nudata Nuttall, ranges in the Coastal Plain from GA west to e. LA and has linear, terete, "juncoid" leaves. [= GW, K, S, SE, Y, Z]

* Coreopsis tinctoria Nuttall var. tinctoria, Calliopsis, Plains Coreopsis. Pd, Cp, Mt (GA, NC, SC, VA): roadsides and other disturbed places: uncommon, probably introduced from farther west. Var. tinctoria was apparently widespread in the Great Plains, now distributed nearly throughout North America. Var. similis (Boynton) H.M. Parker ex E.B. Smith is endemic to s. TX and adjacent Tamaulipas and Nuevo Leon. [= C, K, Y, Z; <C. tinctoria -- RAB, G, GW, S, SE, W; C. cardaminefolia (Augustin de Candolle) Torrey \& A. Gray -- RAB, S, Y; C. stenophylla Boynton - Y]

Coreopsis tripteris Linnaeus, Tall Coreopsis. Pd, Mt (GA, NC, SC, VA), Cp (GA, NC, VA): rich, moist woodlands and woodland borders, primarily over calcareous or mafic rocks or on nutrient-rich alluvium; uncommon. July-early September. Widespread in e. North America, from MA, s. Ontario, and WI south to FL and TX. [= RAB, C, G, GW, K, S, SE, W, Z; C. tripteris var. deamii Standley -- F; C. tripteris var. smithii Sherff -- F, Y; C. tripteris var. tripteris - F, Y]

Coreopsis verticillata Linnaeus, Threadleaf Coreopsis. Pd, Cp, Mt (NC, SC, VA): dry sandy, rocky, or clayey woodlands and woodland borders; common (uncommon in Coastal Plain and Mountains). May-July. Smith (1976) indicates that the species consists of two chromosome races, a diploid, ranging in the Piedmont and Mountains from c. SC and NC north to ne. WV, and s. MD, and an allotetraploid, limited to the Coastal Plain of ne. NC and se. VA. The finely-divided leaves are attractive and the plant is cultivated horticulturally; scattered occurrences outside the ranges indicated above are escapes from cultivation. [= RAB, C, F, G, K, S, SE, W, Y, Z]

Coreopsis grandiflora Hogg ex Sweet var. inclinata J. Allison, Ketona Tickseed, Ketona Coreopsis, is endemic to dolomitic Ketona glades of c. AL (Allison \& Stevens 2001).

Coreopsis leavenworthii Torrey \& Gray. AL and FL. [= K; C. leavenworthii vars. - Y] \{not yet keyed; add synonymy\}
Coreopsis pubescens Elliott var. debilis (Sherff) E.B. Smith. GA and FL west to LA. [= GW, K, Z; C. pubescens -- S, SE, infraspecific taxa not distinguished; C. corninsularis Sherff - Y; C. debilis Sherff - Y] \{not yet keyed\}

Coreopsis pulchra F.E. Boynton, Lookout Mountain Coreopsis. Nw. GA and ne. AL. [= K, S, SE, Y, Z] \{not yet keyed\}
Coreopsis tinctoria Nuttall var. atkinsoniana (Douglas ex Lindley) H.M. Parker ex E.B. Smith. Mt (GA): roadsides; rare, apparently introduced eastwards in nw. GA from a distribution in the w. North America. [= K; C. atkinsoniana Douglas ex Lindley $\mathrm{Y}]$ \{not yet keyed; add synonymy]

## Cosmos Cavanilles (Cosmos)

A genus of about 26 species, of tropical, subtropical, and warm temperate America. References: Cronquist (1980)=SE; Sherff \& Alexander (1955)=Z.
1 Rays pink or white; ultimate leaf segments mostly ca. 1 mm wide or less
C. bipinnatus

1 Rays orange, yellow, or red; ultimate leaf segments mostly more than 2 mm wide
C. sulphureus

* Cosmos bipinnatus Cavanilles, Common Cosmos. Cp, Pd (NC, SC, VA), Mt (NC): garden edges, roadsides, disturbed areas; commonly cultivated, rarely escaped, introduced from Mexico. August-November. [= RAB, C, F, G, K, S, SE; C. bipinnatus var. bipinnatus - Z]
* Cosmos sulphureus Cavanilles, Orange Cosmos. Cp (GA, NC, SC, VA): garden edges, roadsides, disturbed areas; commonly cultivated, rarely escaped, introduced from tropical America. August-November. [= C, F, G, K, S, SE; C. sulphureus var. sulphureus - Z]

Cotula Linnaeus (Brassbuttons)

* Cotula australis (Sieber) Hooker f. Cp (SC): waste area around wool-combing mill; rare, introduced from Australia and New Zealand. Reported for SC by Nesom (2004d). [= K]

A genus of about 200 species, herbs, of the Northern Hemisphere, South America, and southern Africa. References: Cronquist (1980) $=$ SE. Key adapted from C and SE.

1 Achenes with a distinct narrow beak . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. vesicaria ssp. taraxacifolia
1 Achenes narrowed towards the summit, but not distinctly beaked.
2 Mature achenes dark brown; inner surface of inner phyllaries pubescent . . . . . . . . . . . . . . . . . . . . . . . . . C. tectorum
2 Mature achenes pale; inner surface of inner phyllaries glabrous.
3 Involucre 5-8 mm tall, pubescent; achenes 1.5-2.5 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. capillaris
3 Involucre 8-12 mm tall, glabrous; achenes 4-6 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. pulchra

* Crepis capillaris (Linnaeus) Wallroth. Mt, Pd (NC, VA): pastures, roadsides, disturbed areas; common in Mountains, rare in Piedmont, introduced from Eurasia. May-November. [= RAB, C, F, G, K, SE, W]
* Crepis pulchra Linnaeus. Pd (GA, NC, SC, VA), Mt, Cp (NC, SC, VA): roadsides, fields, disturbed areas; common in

Piedmont, rare in Mountains and Coastal Plain, introduced from Eurasia. Late April-July. [= RAB, C, F, G, K, SE, W]

* Crepis tectorum Linnaeus. Mt (NC): disturbed areas; rare, perhaps not established, introduced from Europe. June-July. [= C, F, G, K, S]

Crepis vesicaria Linnaeus ssp. taraxacifolia (Thuillier) Thellung. Mt (NC): lawns; rare, introduced from Mediterranean and w. Europe. Late May-July. [= RAB, C, K, SE; Crepis vesicaria Linnaeus ssp. haenseleri (Boiss. ex Augustin de Candolle) P.D. Sell]

* Crepis setosa Haller f. is reported for Polk County, TN by Chester, Wofford, \& Kral (1997) and from s. PA by Rhoads \& Klein (1993). [= C, K] \{not yet keyed\}

## Croptilon Rafinesque (Scratch-daisy)

A genus of 3 species, herbs, of s. North America. References: Smith (1981); Correll \& Johnston (1970); Cronquist (1980)=SE; Nesom (2000b).

Croptilon divaricatum (Nuttall) Rafinesque, Scratch-daisy. Cp, Pd, Mt (GA, NC, SC, VA): sandy soils of fields, roadsides, and sandhill woodlands; common (VA Watch List). August-November. Se. VA south to FL and west to c. TX, inland to se. OK and s. AR. [= K; = Haplopappus divaricatus (Nuttall) A. Gray -- RAB, C, F, G, SE, W; = Isopappus divaricatus (Nuttall) Torrey \& Gray -S]

Dendranthema (Augustin de Candolle) Des Moulins (Chrysanthemum)
A genus of about 37 species, of Eurasia.

* Dendranthema $\times$ grandiflorum Kitam. [D. indicum $\times$ japonicum], Garden Chrysanthemum, is naturalized as far south as se. PA (Rhoads \& Klein 1993). [Dendranthema morifolium (Ramat.) Tzvelev; Chrysanthemum morifolium Ramat.]

## Dittrichia W. Greuter

* Dittrichia graveolens (Linnaeus) W. Greuter. Cp (SC): waste area around wool-combing mill; rare, native of Meditteranean Europe, but quite possibly introduced into SC by wool from Australia (Nesom 2004d). [= K] \{add to synonymy\}

## Doellingeria Nees 1832 (Flat-topped Aster)

A genus of about 7 species, herbs, of e. North America and e. Asia. This group of species has long been recognized as distinctive, sometimes given status as the genus Doellingeria (first by Nees in 1832), or as subgenus Doellingeria of Aster. Nesom (1993d) argues that Doellingeria should be separated from Aster, as its affinities seem to be at least as strongly to Solidago and its relatives, an assertion supported by molecular evidence (Noyes \& Rieseberg 1999). References: Nesom (1993d)=Z; Cronquist (1980)=SE; Nesom (2000b).

1 Disk flowers 4-14 per head; ray flowers 2-7 per head; leaves mostly 1.5-4× as long as wide; [of sandhill ecotones and streamhead pocosins of the Coastal Plain (primarily fall-line sandhills) from sc. NC southwards] . . . . . . . D. sericocarpoides 1 Disk flowers 16-40 per head; ray flowers 5-14 per head; leaves 2-6x as long as wide; [collectively widespread in our area].

2 Plants with stems solitary or several from a crown, to 11 dm tall; leaves mostly 2-4 (-5)× as long as wide . . . . . D. infirma
2 Plants with stems scattered from creeping rhizomes (forming clonal patches), to 20 dm tall; leaves mostly $4-6 \times$ as long as wide
D. umbellata

Doellingeria infirma (Michaux) E. Greene, Appalachian Flat-topped White Aster. Mt, Pd (GA, NC, SC, VA, Cp (NC, VA): woodland borders, dry or dry-mesic woodlands; common. Late June-September. MA west to KY, south to SC, GA, AL, and wc. TN. [ $=$ K, S, Z; = Aster infirmus Michaux -- RAB, C, G, SE, W; Doellingeria humilis (Willdenow) Britton -- S, in part]

Doellingeria sericocarpoides Small, Pocosin Flat-topped Aster. Cp (GA, NC, SC): sandhill ecotones and streamhead pocosins; uncommon. Late July-October. Sc. NC south to panhandle FL, west to AR, OK, and TX. [= K, S, Z; = Aster sericocarpoides (Small) K. Schumann -- SE; = A. umbellatus P. Miller var. brevisquamus Fernald -- RAB, misapplied; = A. umbellatus var. latifolius A. Gray -- GW; < Doellingeria humilis (Willdenow) Britton -- S, in part, misapplied]

Doellingeria umbellata (P. Miller) Nees, Tall Flat-topped White Aster. Mt (GA, NC, SC, VA), Pd (GA, NC, VA), Cp (VA): wet meadows, pastures, bogs, marshes, stream floodplains, roadbanks, to at least 1900 m ; common (rare in Coastal Plain). AugustSeptember. Newfoundland west to MN, south to e. VA, w. NC, nw. SC (P. McMillan pers.comm. 2002), n. GA, ne. AL, TN, and KY. [= S, Z; = Aster umbellatus P. Miller -- C, G, SE, W; = A. umbellatus var. umbellatus -- RAB, GW; > Doellingeria umbellata var. umbellata - K]

## Dracopis Cassini (Coneflower)

*? Dracopis amplexicaulis (Vahl) Cassini. Cp (SC), Pd (GA): disturbed areas, waste areas near wool-combing mill; rare, introduced at least in part in our area. Native to prairie-like areas and calcareous bottomlands from GA (?) and AL west to KS and TX; reported for nc. GA (Jones \& Coile 1988) and introduced in SC (Nesom 2004d). [= K, SE; = Rudbeckia amplexicaulis Vahl -- F]

## Dyssodia Cavanilles

* Dyssodia papposa (Ventenat) A.S. Hitchcock. Cp (SC): waste areas near wool-combing mill; rare, introduced from c. and sw. North America. Reported for SC by Nesom (2004d). [= K]

## Echinacea Moench (Purple Coneflower)

A genus of 4-9 species, herbs, endemic to e. and c. North America. There has been considerable medicinal use of extracts from many of the species, and collection of plants from the wild to meet the demand of the herbal trade has extirpated many populations, particularly in c. United States. Foster (1991) presents a lengthy and detailed discussion of medicinal uses of Echinacea, along with considerable information on the biology, conservation needs, taxonomy, and nomenclatural history of the genus. Binns, Baum, \& Arnason (2002) provide no rationale for their approach of recognizing the same number of taxa as McGregor, but treating them as 4 species and 10 varieties; the entities seem to me to be distinct at the specific level. References: Baskin, Snyder, \& Baskin (1993)=Z; Foster (1991)=Y; Cronquist (1980)=SE; Binns, Baum, and Arnason (2002)=X; McKeown (1999); Gaddy (1990); McGregor (1968).

1 Leaves lanceolate to ovate, the larger more than 5 cm wide, the stem leaves well-developed, though smaller than the basal. 2 Leaves glabrous on both sides, or scabrous above; chaffy bracts (pales) ca. 9 mm long, the awns about a fourth as long as the body of the pales and with incurved tips; rays $3.5-8 \mathrm{~cm}$ long, strongly drooping .................. . E. Iaevigata
2 Leaves pubescent or scabrous on both sides; chaffy bracts (pales) 10-13 mm long, the awns about half as long as the body of the pales and with straight tips; rays $2.5-5.5 \mathrm{~cm}$ long, horizontal to slightly drooping . . . . . . . . . . . . . E. purpure
1 Leaves lanceolate to linear, the larger less than 5 cm wide, stem leaves few and poorly developed, the basal leaves
predominant.
3 Rays curved upwards, medium pink, 2.5-3.2 cm long; [endemic to calcareous glades in c. TN ]
[E. tennesseensis]
3 Rays horizontal to drooping, pale pink, 4-9 cm long; [widely scattered in our area].

Echinacea laevigata (C.L. Boynton \& Beadle) Blake, Smooth Purple Coneflower. Pd (NC, VA), Mt (GA, SC, VA), Cp (SC): open woodlands and glades over mafic or calcareous rocks, such as diabase, limestone, and dolostone, rarely in oak-pine savannas of the upper Coastal Plain over circumneutral clay sediments; rare (US Endangered, GA Endangered, NC Endangered, SC Rare, VA Rare). Late May-July. The species is an eastern sibling of $E$. purpurea. In NC, this attractive, medicinal plant is now limited to a few populations in Durham, Granville, and Rockingham counties. Extensive populations occur over Elbrook Dolomite in Montgomery, VA. Populations of this species in sandy soils of the Coastal Plain of SC have been variously interpreted as native or introduced (Nelson \& Kelly 1997). [= RAB, C, F, K, SE, W, X, Y; = E. purpurea var. laevigata (C.L. Boynton \& Beadle) Cronquist -G]
*? Echinacea pallida (Nuttall) Nuttall, Pale Purple Coneflower. Pd (GA, NC?, VA), Mt (VA), Cp (GA): roadsides; rare, apparently introduced from c. US (GA Special Concern, NC Watch List). June-July. Some at least of the eastern populations considered to be E. pallida are actually the closely related E. simulata R. L. McGregor; additional herbarium work is needed to determine the relative distributions of these two, presumably introduced, species in our area.\} [= RAB, F, G, K, W, Y, Z; < E. pallida var. pallida -- C, SE, in part; < E. pallida var. pallida - X]

Echinacea purpurea (Linnaeus) Moench, Eastern Purple Coneflower. Mt, Pd (NC): open woodlands, roadsides, perhaps at least some of the occurrences spread from cultivation; rare (NC Rare). [= RAB, C, F, K, SE, W, X, Y; = E. purpurea var. purpurea -G]

Echinacea simulata R.L. McGregor, Prairie Purple Coneflower. Mt (GA!, VA*?), Pd (NC!, VA*?), Cp (NC!): prairies, roadsides; rare, apparently introduced from c. US (GA Special Concern, NC Watch List). June-July. Some at least of the eastern populations considered to be E. pallida are actually the closely related E. simulata R. L. McGregor; additional herbarium work is needed to determine the relative distributions of these two, presumably introduced, species in our area.\} GA native populations (Floyd Co.) are E. simulata. [ $=\mathrm{K}, \mathrm{Y}, \mathrm{Z} ;<\mathrm{E}$. pallida var. pallida -- C, SE, in part; = E. pallida (Nuttall) Nuttall var. simulata (McGregor) Binns, B.R. Baum, \& Arnason - X]

Echinacea tennesseensis (Beadle) Small is endemic to calcareous glades of the Nashville Basin of c. TN (Davidson, Rutherford, \& Wilson counties) (Chester, Wofford, \& Kral 1997). [=K, S, Y, Z; < E. pallida (Nuttall) Nuttall var. angustifolia (Augustin de Candolle) Cronquist -- SE; = E. pallida (Nuttall) Nuttall var. tenneseensis (Beadle) Binns, B.R. Baum, \& Arnason - X; = E. angustifolia Augustin de Candolle var. tennesseensis (Beadle) Blake]

Echinops Linnaeus (Globe-thistle)

A genus of about 120 species, herbs, of temperate and subtropical Europe, Asia, and Africa.

* Echinops sphaerocephalus Linnaeus, Globe-thistle, is introduced as far south as se. PA (Rhoads \& Klein 1993). Reported for VA by Kartesz (1999). \{investigate\} [= C, K]

## Eclipta Linnaeus

A genus of 4 species, herbs, of temperate, subtropical, and tropical regions. References: Cronquist (1980)=SE.
Eclipta prostrata (Linnaeus) Linnaeus, Yerba-de-tajo. Cp, Pd, Mt (GA, NC, SC, VA): moist or wet disturbed areas, ditches, shores, disturbed bottomlands; common (uncommon in Mountains). June-November. MA west to WI, south to FL and TX, and into the tropics. [= C, K; E. alba (Linnaeus) Hasskarl -- RAB, F, G, GW, SE, W; Verbesina alba Linnaeus -- S]

## Elephantopus Linnaeus (Elephant's-foot)

A genus of about 30 species, of tropical, subtropical, and warm temperate regions. References: Jones (1982)=Z; Cronquist (1980) $=$ SE .

Identification notes: The acaulescent species are easily and often confused with Vernonia acaulis, especially when sterile. Vernonia has leaves scabrous above and sparsely pilose to glabrate beneath; Elephantopus has leaves sparely pilose above, densely pilose or tomentose below. Vernonia leaves tend to have a more acute apex, and the veins above are more strikingly differentiated in their color (white or pink) from the adjacent leaf tissue. When in flower, the presence of subtending foliose bracts below the compound glomerule of heads in Elephantopus (versus the absence of foliose bracts below the simple head in Vernonia) is diagnostic.

1 Leaves cauline, the stem with well-developed leaves over 10 cm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . E. carolinianus
1 Leaves basal, the stem scapose or with a few bracteal leaves much smaller than the basal, usually less than 5 cm long.
2 Longest phyllaries $10-13 \mathrm{~mm}$ long; basal leaves $5.5-10.5 \mathrm{~cm}$ wide, usually at least some on a plant more than 7 cm wide; leaves pubescent on the midrib below with spreading or reflexed hairs; [of the Coastal Plain, Piedmont, and rarely the Mountains] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . E. tomentosus
2 Longest phyllaries 6-9 mm long; basal leaves $1.5-7.5 \mathrm{~cm}$ wide, rarely any on a plant more than 7 cm wide; leaves pubescent on the midrib below with appressed or spreading hairs; [of the Coastal Plain, and rarely the lower Piedmont]. 3 Phyllaries densely villous with long white hairs, the punctate glands obscured; [of e. SC southwards] ..... E. elatus 3 Phyllaries punctate-glandular, also sparsely pubescent with short hairs; [widespread in our area] ...... E. nudatus

Elephantopus carolinianus Raeuschel, Leafy Elephant's-foot. Cp, Pd, Mt (GA, NC, SC, VA): mesic to dry forests and woodlands; common. August-November. NJ west to KS, south to FL and TX; West Indies. [= RAB, C, F, G, GW, K, S, SE, Z]

Elephantopus elatus Bertoloni, Southern Elephant's-foot. Cp (GA, SC): pine barrens; rare. Late August-September. E. SC south to FL, west to LA, on the Coastal Plain. [= RAB, K, S, SE, Z]

Elephantopus nudatus A. Gray. Cp (GA, NC, SC, VA), Pd (NC, SC, VA): woodlands and woodland borders, usually fairly dry; common (rare in Piedmont, lower Piedmont only). Late July-September. DE south to FL, west to TX and AR, primarily on the Coastal Plain; south into n. South America. [= RAB, C, F, G, GW, K, S, SE, Z]

Elephantopus tomentosus Linnaeus. Cp, Pd (GA, NC, SC, VA), Mt (GA, NC, SC): woodlands and woodland borders, usually fairly dry; common (rare in Mountains). August-November. MD south to FL, west to TX, north in the interior to w. NC, KY, and south to Chiapas, Mexico. [= RAB, C, F, G, K, S, SE, Z]

## Emilia Cassini (Tasselflower)

A genus of about 100 species, of the Old World. References: Cronquist (1980)=SE.

* Emilia sonchifolia (Linnaeus) Augustin de Candolle var. sonchifolia, Tasselflower. Pd (GA), Cp? (SC): disturbed areas, introduced from the Old World tropics. The occurrence of this species in SC was first reported by Nelson \& Kelly (1997); it is unclear how well established Emilia is in our area. [= K; <E. sonchifolia -- S, SE]

## Erechtites Rafinesque (Fireweed)

A genus of about 15 species, American. References: Cronquist (1980)=SE. Key based in part on C.
1 Denuded receptacle $5-8 \mathrm{~mm}$ wide; achenes $2-3 \mathrm{~mm}$ long, with $10-12$ ribs 1 Denuded receptacle $9-12 \mathrm{~mm}$ wide; achenes $4-5 \mathrm{~mm}$ long, with $16-20$ ribs [E. hieracifolia var. megalocarpa]

Erechtites hieracifolia (Linnaeus) Rafinesque ex Augustin de Candolle var. hieracifolia, Fireweed. Cp, Pd, Mt (GA, NC, SC, VA): in disturbed soil in nearly all habitats except the extremely xeric, present in most parts of the modern (beat-up) landscape at least as seedlings, liable to turn up at the smallest disturbance (such as small tree-fall tip-up mounds or campfires, even in large natural areas), most abundant in areas extensively disturbed or scarified by timber-harvest, bulldozing, or severe fire; common. Late July-November. Ranging from Newfoundland west to Saskatchewan, south to s. FL and e. TX; West Indies; tropical America.

Ecologically filling something of the same role in the south as the other (unrelated) "fireweed" in the north, Epilobium angustifolium. The only other species in our area as adept at appearing (seemingly from nowhere) at small soil disturbances in forests are Phytolacca americana and the moss Atrichum angustatum (Brid.) BSG. [= C, G, K, SE; < E. hieracifolia -- RAB, GW, S, W; > E. hieracifolia var. hieracifolia -- F; >E. hieracifolia var. intermedia Fernald -- F; >E. hieracifolia var. praealta (Rafinesque) Fernald -- F]

Erechtites hieracifolia (Linnaeus) Rafinesque ex Augustin de Candolle var. megalocarpa (Fernald) Cronquist, perhaps better treated at the species level as as E. megalocarpa Fernald, is known from coastal marshes (brackish or salty) from MA to NJ and should be sought in our area, especially in VA. [= C, G, K; = E. megalocarpa Fernald -- F]

Erigeron Linnaeus (Daisy Fleabane)
(also see Conyza)
A genus of about 150 species, nearly cosmopolitan. References: Cronquist (1980)=SE; Allison \& Stevens (2001)=Z. Key adapted from those references.

1 Stem leaves sessile; pappus of the pistillate (ray) flowers consisting only of a few short, slender scales, less than 1 mm long (visible at 20×); annual or perennial (rarely biennial).
2 Stem leaves many, mostly toothed, the larger more than 1 cm wide; pubescence of the mid-stem long and spreading .... E. annuus

2 Stem leaves few, mostly entire, the larger usually less than 1 cm wide; pubescence of the mid-stem usually short and appressed.
3 Plants annual (rarely biennial); [of various, often weedy, habitats].
4 Involucre 2-3 mm high; inflorescence diffuse, with few and very small leaves, the peduncles often flexuous; [primarily of the Coastal Plain]
E. strigosus var. beyrichii

4 Involucre (2.5-) 3-4 mm high; inflorescence not diffuse, or if so, with more and larger leaves; [plants widespread in our area, primarily of the Piedmont and Mountains south of VA] . . . . . . . . . . . E. strigosus var. strigosus 3 Plants perennial; [plants of shallow soil over calcareous rock].

5 Rosette leaves oblanceolate to narrowly obovate or spatulate, more than 3.8 mm wide; cauline leaves glabrous (but ciliate) except along the midvein; [of limestone glades of c. TN, nw. GA, and n. AL]
E. strigosus var. calcicola 5 Rosette leaves linear-oblanceolate, less than 3.5 mm wide; cauline leaves sparsely to moderately strigillose; [of dolostone glades of Bibb Co. AL] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [E. strigosus var. dolomiticola]
1 Stem leaves relatively large and clasping, or small and sessile (in E. vernus); pappus of the pistillate (ray) flowers of elongate capillary bristles (sometimes also with scales); plants biennial or perennial.
6 Stem leaves not clasping; basal leaves fleshy; rays 25-40, white, 0.5-1.3 mm wide; [of moist to wet habitats of the Coastal Plain]
E. vernus

6 Stem leaves clasping; basal leaves herbaceous; rays 50-400, pink, blue, purplish, or white, either 0.3-0.5 (in $E$. philadelphicus var. philadelphicus, E. quercifolius, and E. tenuis) or 0.8-1.2 mm wide (in E. pulchellus var. pulchellus); [of more general distribution and habitat].

8 Involucre 4-6 mm high; rays 150-400, white to deep pink, $5-10 \mathrm{~mm}$ long
E. philadelphicus var. philadelphicus

8 Involucre 2.5-4 mm high; rays 60-250, blue-lavender (rarely white to pink), 2.5-5 (-6) mm long.
9 Pappus simple; stem spreading pubescent throughout (or appressed pubescent in the upper third only); rays 100-250 . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . E. quercifolius
9 Pappus double, with short outer setae in addition to the long slender bristles; stem appressed pubescent in at least the upper half; rays 60-120
E. tenuis

Erigeron annuus (Linnaeus) Persoon, Annual Fleabane. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): roadsides, disturbed areas; common (rare in Coastal Plain of SC). May-October. Newfoundland west to Manitoba, south to FL and TX (and beyond). [= RAB , C, F, S, SE, W; E. annuus var. annuus -- G]

Erigeron philadelphicus Linnaeus var. philadelphicus, Philadelphia-daisy. Mt, Pd, Cp (GA, NC, SC, VA): roadsides, meadows, disturbed areas; common (uncommon in NC, SC, and VA Coastal Plain). April-June. Newfoundland west to British Columbia, south to FL and TX. Var. scaturicola Fernald, of bluffs along the James River in VA, seems to be merely an extreme form. Other varieties [var. glaber Henry and var. provancheri (Victorin \& Rouss.) Boivin] may have more merit. [= K; >E. philadelphicus -- RAB, C, F, G, GW, S, SE, W; > E. philadelphicus var. philadelphicus - F; > E. philadelphicus var. scaturicola Fernald -- F]

Erigeron pulchellus Michaux var. pulchellus, Robin's-plantain. Mt, Pd, Cp (GA, NC, SC, VA): moist slopes, coves, limestone bluffs, trail margins, roadbanks; common (uncommon in Coastal Plain). April-early June. ME west to MN, south to GA and TX. In addition to the widespread var. pulchellus, E. pulchellus has two additional local varieties, var. brauniae Fernald, of ne. KY and s. OH, and var. tolsteadii Cronquist, of se. MN. [= C, F, G, K, SE; < E. pulchellus -- RAB, GW, S, W]

Erigeron quercifolius Lamarck, Oak-leaved Fleabane. Cp (GA, NC, SC, VA): sandy roadsides, disturbed areas; common, rare in VA (VA Watch List). April-June. Se. VA south to FL, west to TX, north in the interior to TN; Bahamas. [= RAB, C, F, G, K, S, SE]

Erigeron strigosus Muhlenberg ex Willdenow var. beyrichii (Fischer \& C.A. Meyer) Torrey \& A. Gray ex A. Gray, Coastal Rough Fleabane. Cp (GA, NC, SC, VA): roadsides, disturbed areas; open woodlands; common? (VA Watch List). Late April-

October? S. NJ, south to FL, west to TX. In addition to the two varieties in our area, a third variety, var. septentrionalis (Fernald \& Wiegand) Fernald, occurs further north. [= C, F, G, K, SE, Z; < E. strigosus -- RAB; < E. ramosus (Walter) Britton, Sterns, \& Poggenburg -- S]

Erigeron strigosus Muhlenberg ex Willdenow var. calcicola J. Allison, Cedar Glade Daisy Fleabane. Mt (GA): limestone glades; rare (GA Special Concern). A bunching perennial, is known from the central basin of TN (Allison \& Stevens 2001), nw. GA (GANHP) and n. AL. [= Z]

Erigeron strigosus Muhlenberg ex Willdenow var. strigosus, Common Rough Fleabane. Mt, Pd, Cp (GA, NC, SC, VA): roadsides, disturbed areas; open woodlands; common. Late April-October. Nova Scotia west to WA, south to GA and MO. [= C, F, G, K, SE, Z; < E. strigosus -- RAB, W; < E. ramosus (Walter) Britton, Sterns, \& Poggenburg -- S; Stenactis strigosa (Muhlenberg ex Willdenow) Augustin de Candolle]

* Erigeron tenuis Torrey \& A. Gray, Midwestern Fleabane. Mt (NC): old field; rare, introduced from the s. Midwest. reported for our area by Nesom (1980). [= K, SE]

Erigeron vernus (Linnaeus) Torrey \& A. Gray, Whitetop Fleabane. Cp (GA, NC, SC, VA): wet savannas, seepages, interdunal swales; common (rare in Virginia) (VA Rare). Late March-June. E. VA south to s. FL, west to LA. [= RAB, C, F, G, GW, K, S, SE]

Erigeron pulchellus Michaux var. brauniae Fernald occurs in WV, KY, MD, and OH (Kartesz 1999). [= K] \{not yet keyed\} Erigeron strigosus Muhlenberg ex Willdenow var. dolomiticola J. Allison, Cahaba Daisy Fleabane, a bunching perennial, is known from calcareous Ketona glades in Bibb County, AL (Allison \& Stevens 2001). [= Z]

Eupatoriadelphus King \& H.E. Robinson (Joe-pye-weed)
(see Eutrochium)

Eupatorium Linnaeus (Eupatorium, Thoroughwort, Joe-Pye-Weed, Dog-fennel)
(also see Ageratina, Chromolaena, Conoclinium, Eutrochium, Fleischmannia)
A genus of about 40 species, herbs, of e. North America and Eurasia (after the exclusion of Ageratina, Chromolaena, Conoclinium, Eupatoriadelphus, Fleischmannia, and other genera). I have differed considerably from Cronquist's treatments, as for instance in SE, regarding the rank at which to recognize taxonomic entities in Eupatorium. In the Southeastern United States, Eupatorium is a reticulately evolved complex, including diploids, triploids, and tetraploids; derivatives of hybridization produce sterile pollen but in some cases reproduce vigorously via agamospermous production of seeds. In some cases, these entities form separate populations from their presumed parental species, with distinctive ranges and habitats and more-or-less distinctive morphology. Cronquist treats morphologically highly distinctive entities, such as E. pinnatifidum, as full species, while stating that they are "not long-persistent." He treats morphologically more subtle entities as varieties of one of the two presumed parental species, such as $E$. album var. vaseyi ("very probably derived by hybridization of $E$. album var. album and $E$. sessilifolium"). Other entities, difficult to distinguish morphologically from another species, he does not recognize, as for instance $E$. saltuense, included as a synonym under $E$. altissimum (" $E$. saltuense may reflect hybridization between $E$. altissimum and some other species such as $E$. album, or possibly between $E$. hyssopifolium and $E$. album"].

A species concept that stresses ecological, biological, and distributional independence seems preferable. When plants of a putative hybrid occur in substantial populations, reproducing independently of one or both alleged parents, and in geographically and/or ecologically distinctive situations they should be treated as a separate species. Only field observations and studies can provide the necessary information. I have seen no evidence that $E$. xpinnatifidum (though morphologically strikingly distinctive) occurs independent of its parents; thus I treat it as a hybrid (see below). E. vaseyi regularly occurs without one or both of its presumed parents, forms fertile achenes, occurs in large populations, and (in NC) is distributionally more limited than its presumed parents (Sullivan 1978). Biologically, it is best treated as an allopolyploid species; its treatment as a variety leads to conceptual and nomenclatural problems (reflected in the synonymy above): of which species should it be a variety? Sullivan (1978) considered that $E$. saltuense was derived from hybridization of $E$. album and $E$. lecheifolium ( $=$ hyssopifolium), but found it to be a triploid, growing in association with triploid (and pollen-sterile) E. lecheifolium. She concluded that "the origin of $E$. saltuense through hybridization could have occurred in the ancient past when diploids of $E$. lecheifolium were more prevalent." In addition to its postulated "ancient origin," E. saltuense appears to occur in NC in habitats different from any of its variously alleged parents; for these reasons it seems best to treat $E$. saltuense as an allopolyploid species as well. Species in our flora believed to be of allopolyploid derivation include E. anomalum, E. cordigerum, E. godfreyanum, E. linearifolium, E. mohrii, E. pubescens, E. saltuense, E. torreyanum, and $E$. vaseyi. References: Siripun \& Schilling in FNA (in prep.); Cronquist (1980)=SE; Godfrey \& Wooten (1981)=GW; Cronquist (1991)=C; Godfrey (1949). The key adapted from those references.

1 Leaves generally in whorls of 3-7 (very rarely all of them opposite), most of them more than 2 cm wide; involucre 6.5-9 mm high, the flowers pale pink to purple . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [see Eupatoriadelphus]
1 Leaves generally opposite, sometimes in whorls of 3-4 (if so the leaves usually less than 2 cm wide), or some of them alternate; involucre mostly 2-6 mm high, the flowers mostly white, rarely blue (rarely the involucre 6-11 mm high, then the flowers white).

Leaves pinnate or pinnatifid, divided into linear or capillary segments, 0-5 mm wide . . . . . . . . . . . . . . . . . . . . . . . . Key A 2 Leaves simple, generally over 5 mm wide.

3 Flowers 9-70 per head, white, purplish-pink, or blue . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Key B
3 Flowers (3-) 5 ( -7 ) per head, white . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Key C

## Key A -- leaves pinnatifid or pinnate into linear or capillary segments (Dog-fennels)

1 Stem glabrous throughout, or short-pubescent in the lower portion only; inflorescence paniculate, the panicle branches recurved, the heads secundly arranged . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . E. Ieptophyllum
1 Stem pubescent throughout, generally conspicuously so; inflorescence paniculate, the branches not recurved, the heads not secund.
2 Leaves bright green, glabrous, sparsely glandular-punctate, segments of the basal leaves 1-1.5 mm wide, segments of the upper leaves $0.2-0.5 \mathrm{~mm}$ wide
E. capillifolium

2 Leaves grayish-green, pubescent, densely glandular-punctate, segments of the basal leaves 2-5 mm wide, segments of the upper leaves $1-2.5 \mathrm{~mm}$ wide
E. compositifolium

Key B -- leaves simple, flowers 9-70 per head, white, purplish-pink, or blue
1 Flowers blue or purplish-pink; leaves deltoid-ovate, $1-3 \times$ as long as wide, the base often truncate or cordate, on petioles $0.5-8$ cm long.
2 Flowers blue, mostly 35-70 per head; receptacle conic . . . . . . . . . . . . . . . . . . . . . . . [see Conoclinium coelestinum]
2 Flowers purplish-pink, mostly (13-) 18-24 per head; receptacle flat . . . . . . . . . . . . . . . [see Fleischmannia incarnata]
1 Flowers white; leaves narrowly lanceolate, lanceolate, or elliptic, $2-8 \times$ as long as wide, the base either cuneate or fused,
sessile or on petioles $0-4 \mathrm{~cm}$ long.
3 Leaves with petioles $1-4 \mathrm{~cm}$ long
E. serotinum

3 Leaves sessile, or with the bases fused.
4 Leaf bases fused ...................
E. perfoliatum

4 Leaf bases tapering to a cuneate base
E. resinosum

## Key C -- leaves simple, flowers usually 5 per head, white

1 Phyllaries acuminate to attenuate.
2 Larger leaves 0.2-1.3 cm wide; stems puberulent; involucre $3.5-7 \mathrm{~mm}$ high.
3 Rhizome absent to less than 2 cm long; leaves usually reflexed-spreading to spreading-ascending, the larger (5-) 613 mm wide; leaf margins and surfaces moderately to densely strigose; involucre $5-8 \mathrm{~mm}$ long; pappus (3.3-) 3.9-5.0 mm long; corolla:pappus length ratio 0.63-0.89; mature achene 2.2-3.5 mm long E. leucolepis

3 Rhizome 2-20 cm long; leaves usually ascending to erect-recurved, the larger 2-4.5 mm wide; leaf margins and adaxial surface glabrous to sparsely strigose; involucre 3.5-5.5 mm long; pappus 2.7-4.1 mm long; corolla:pappus length ratio 0.83-1.00; mature achene $1.6-2.3 \mathrm{~mm}$ long
E. species 1

2 Larger leaves 1.5-3 (-4) cm wide; stems villous to puberulent; involucre 8-11 mm high.
4 Leaves pubescent, the pubescence short to long; phyllaries generally attenuate (rarely acuminate); leaves (2.5-) 3-6× as long as wide; leaf apices obtuse; teeth obtuse or rounded $\qquad$ E. album var. album

4 Leaves sparsely pubescent to nearly glabrous, the pubescence generally short; phyllaries generally acuminate, sometimes abruptly so; leaves $2-4 \times$ as long as wide; leaf apices acute to acuminate; teeth sharp
E. vaseyi

## 1 Phyllaries acute to obtuse.

5 Leaf bases broadly cuneate, truncate, or subcordate, the leaves generally distinctly broadest near the base.
6 Leaves (2.5-) 3-6 (-7)× as long as wide; plants glabrous below the inflorescence.
7 Leaves subcoriaceous, the larger ones $8-18 \mathrm{~cm}$ long, $3-6 \mathrm{~cm}$ wide, averaging about $3 \times$ as long as wide
E. sessilifolium var. brittonianum 7 Leaves membranaceous, the larger ones $9-18 \mathrm{~cm}$ long, $2-4 \mathrm{~cm}$ wide, averaging about $5 \times$ as long as wide

6 Leaves 1-3 (-3.5)× as long as wide; plants pubescent below the inflorescence.
8 Leaves pinnately veined
E. godfreyanum

8 Leaves 3 -veined from the base or just above it.
9 Leaves averaging (1.5) 2-2.5x as long as wide, usually with a purple border; upper leaves and main inflorescence branches often alternate
E. pilosum

9 Leaves averaging $1-2 \times$ as long as wide, usually lacking a purple border; upper leaves and main inflorescence branches usually all opposite.
10 Leaf base broadly rounded, cordate-clasping; leaves very densely pubescent, the pubescence often harsh; larger leaves usually 4-10 cm long; principal pair of lateral veins diverging from the midrib 2-10 mm above the base of the leaf; toothing of leaf often irregular and coarse $\qquad$ E. cordigerum

10 Leaf base cuneate, broadly cuneate, rounded, or cordate (but not clasping); leaves densely to sparsely pubescent; larger leaves usually $2-6 \mathrm{~cm}$ long; principal pair of lateral veins diverging at the base or $2-10 \mathrm{~mm}$ above the base of the leaf; toothing of leaf regular and relatively fine.
11 Leaves mostly 1-1.5 (-1.7)× as long as wide, tending to be obtuse (the apex usually $90{ }^{\circ}$ or more), the teeth generally rounded (the 2 sides of each tooth usually distinctly convex-curved, the end of the tooth therefore rounded), the principal pair of lateral veins diverging directly from the base of the midrib the tooth therefore triangular), the principal pair of lateral veins diverging 2-10 mm above the
base of the midrib.
12 Leaves broadly cuneate to broadly rounded, thin in texture, the pubescence rather soft and long (and also often sparse), the leaf blade not twisted at base, not borne in a vertical plane, up to 10 cm long and 6.5 cm wide $\qquad$ E. pubescens

12 Leaves distinctly cuneate, firm in texture, the pubescence rather harsh and short, the leaf blade twisted at the base, thus borne in a vertical plane, up to 5.5 cm long and 3 cm wide .
E. scabridum

5 Leaf bases narrowly cuneate, the leaves generally broadest near the middle or towards the tip.
13 Plants from conspicuously tuberous-thickened (ca. 1 cm in diameter) horizontal rhizomes; leaves deflexed, spreading, or ascending.
14 Leaves 15-30 mm wide, spreading or ascending . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . E. anomalum 14 Leaves 2-12 mm wide, deflexed to erect-ascending.

15 Leaves erect-ascending, 2-5.5 mm wide; pappus 4.0-5.4 mm long . . . . . . . . . . . . E. species $\mathbf{1} \times \mathrm{mohrii}$ 15 Leaves deflexed to spreading, 3-12 mm wide; pappus $2.5-3 \mathrm{~mm}$ long.

16 Stems 3-6 (-7) dm tall, often erectly branching from near the base; involucres $3-4 \mathrm{~mm}$ high, the bracts with rounded apices
E. recurvans

16 Stems (6-) 10-15 dm tall, not branching near the base; involucres $5-7 \mathrm{~mm}$ high, at least some of the inner bracts with acute apices
E. mohrii

13 Plants from crowns or caudices; leaves usually spreading or ascending (not deflexed).
17 Plants generally with numerous branches from at or near the base, the axillary shoots of the lower internodes elongating; leaves 2-5 cm long, oblanceolate.
18 Leaves broadly oblanceolate, $5-15 \mathrm{~mm}$ wide, crenate or serrate in the upper half ...... E. glaucescens 18 Leaves narrowly oblanceolate, 3-8 mm wide, entire or remotely serrate apically . . . . . . . E. linearifolium
17 Plants generally simple below the middle, the axillary shoots of the lower nodes not elongating (except in response to injury of the main stem); leaves 3-12 cm long, lanceolate or linear.
19 Leaves mostly $6-40 \times$ as long as wide, the larger ones usually less than 10 mm wide, ranging from 1-12 mm wide, whorled or opposite (rarely alternate above).
20 Leaves linear to narrowly lanceolate, the principal leaves $2-7 \mathrm{~cm}$ long, 1-5 mm wide, 10-40x as long as wide, entire to obscurely toothed, the leaves mostly in whorls of 3 or $4 \ldots \ldots$. E. hyssopifolium
20 Leaves lanceolate, the principal leaves $5-12 \mathrm{~cm}$ long, $5-10(-12) \mathrm{mm}$ wide, $6-15 \times$ as long as wide, conspicuously and divergently toothed, the leaves mostly opposite or in whorls of 3 . E. torreyanum
19 Leaves mostly $2.5-7 \times$ as long as wide, the larger ones more than 10 mm wide, ranging from $8-30 \mathrm{~mm}$ wide, opposite, alternate, or whorled.
21 Involucre 2.5-4 mm high; leaves obtuse to acute, elliptic to elliptic-oblanceolate, the 2 main lateral veins separating from the midrib about 1 cm above the base; leaves commonly 3 per node

21 Involucre 4.5-7 mm high; leaves acute to attenuate-acuminate, lanceolate, the 2 main lateral veins separating from the midvein at the base; leaves rarely 3 per node.
22 Leaf surfaces glandular-punctate, densely long-puberulent on the surfaces and veins, the hairs fairly long and curling or twisted (as seen with at least $10 \times$ ); stem densely puberulent; leaves entire to serrate, the teeth varying from obscure to sharp, generally about 1 mm long (measured on the side towards the leaf apex), rarely to 3 mm long, generally forward-pointing; leaves acuminate to acute, the terminal portion not strongly attenuated, and about as likely to have teeth as the rest of the margin
E. altissimum

22 Leaf surfaces densely glandular-punctate, sparsely puberulent (mainly on the veins), the hairs short; stem sparsely puberulent; leaves serrate to pinnatifid, the teeth often 1-5 mm long (measured on the side towards the leaf apex), often salient or divergent; leaves attenuate-acuminate, the terminal $1 / 3$ extended and generally entire

Eupatorium album Linnaeus var. album, White-bracted Thoroughwort. Cp, Pd, Mt (GA, NC, SC, VA): dry woodlands; common (rare in Mountains, uncommon in Piedmont). Late June-September. The species is widespread in southeastern North America, north to CT, KY, and AR. Var. glandulosum is alleged to differ from var. album in having the involucre with copious dark glands (vs. glandless or nearly so). The distinction is dubious; variation seems essentially continuous in our area, with frequent intermediates, and there seems to be little correlation between morphology and habitat/range. [=C, FNA, SE, W; < E. album - RAB, K, S; > E. album var. album - F, G; > E. album var. glandulosum (Michaux) Augustin de Candolle -- F, G]

Eupatorium altissimum Linnaeus, Tall Thoroughwort. Pd (GA, NC, VA), Mt (GA, VA): woodlands, old fields, woodland borders, and openings over mafic rocks (such as diabase) or calcareous rocks (such as limestone and calcareous sandstone); rare south of VA (NC Watch List). Late August-October. Widespread in e. North America, primarily in the midwest, especially on limestone substrates, and uncommon east of the mountains. [= RAB, F, G, S, W; <E. altissimum -- C, FNA, K, SE (also see E. saltuense)]

Eupatorium anomalum Nash, Anomalous Eupatorium. Cp (GA, NC): moist savannas; rare (NC Watch List). AugustOctober. Like E. mohrii, E. anomalum is believed to be a triploid and tetraploid, apomictic derivative of the hybrid $E$. recurvans $\times$ rotundifolium; it is more widespread than E. recurvans sensu stricto. Se. NC south to FL and west to s. AL. Inasmuch as it is now a separate lineage (as evidenced by a distinct distribution, more-or-less recognizable morphology, and phenologic separation), treatment as a separate taxon seems warranted. [=FNA, GW, K, SE; < E. recurvans -- RAB; <E. anomalum -- S (also see E. mohrii)]

Eupatorium capillifolium (Lamarck) Small, Common Dog-fennel. Cp, Pd (GA, NC, SC, VA), Mt (GA, NC, SC): disturbed soils; common (uncommon in Mountains). Middle September-November. Widespread in Southeastern United States, north to NJ.

This species, like $E$. compositifolium, is an excellent indicator of soil disturbance. [=C,F,FNA, G, GW, K, S, SE, W; = E. capillifolium var. capillifolium -- RAB]

Eupatorium compositifolium Walter, Coastal Dog-fennel, Yankee-weed. Cp, Pd (GA, NC, SC, VA): sandy disturbed areas; common. September-December. Widespread in the Coastal Plain of the Southeastern United States, from s. VA south to FL and west to TX. This species, like E. capillifolium, is an excellent indicator of soil disturbance. At its northern limit, in se. VA, this species occurs on riverbanks, in the seasonally exposed drawdown zone (Fleming \& Ludwig 1996). [= RAB, FNA, GW, K, S, SE, W]

Eupatorium cordigerum (Fernald) Fernald, Clasping Roundleaf Eupatorium. \{NC, SC, VA\} \{The distribution, abundance, and phenology in our area of $E$. cordigerum are somewhat obscure\}. (VA Watch List). VA, NC, and SC west to AR and MS. This taxon is considered by R.K. Godfrey to be a derivative of the hybrid E. perfoliatum $\times$ rotundifolium. [= $F$; $>E$. rotundifolium var. ovatum -RAB, $G$ (also see $E$. pubescens); = E. rotundifolium var. cordigerum Fernald $-\mathrm{C}, \mathrm{K}, \mathrm{SE} ;=E . \times$ cordigerum (Fernald) Fernald $-\mathrm{FNA} ;$ $<E$. rotundifolium -- GW; <E. pubescens -- S]

Eupatorium glaucescens Elliott, Wedgeleaf Eupatorium, Broadleaf Bushy Eupatorium. Cp (GA, NC, SC, VA): sandhills, dry sandy woodlands; common, rare in VA (VA Rare). Late July-October. Widespread in the Southeastern Coastal Plain, ranging from se. VA south to FL and west to MS. The name E. cuneifolium must be rejected on nomenclatural grounds (Gandhi \& Thomas 1991). [ $E$. cuneifolium -- RAB, C, G, SE, in part only (also see E. linearifolium); E. cuneifolium var. cuneifolium -- F; E. glaucescens - K, in part only (also see E. linearifolium); E. cuneifolium Willdenow -- S; E. linearifolium Walter - FNA, in part]

Eupatorium godfreyanum Cronquist, Godfrey's Eupatorium. Pd (GA, NC, VA), Mt (NC, VA), Cp (VA): dry woodlands; common (uncommon in VA Coastal Plain, rare south of VA) (GA Special Concern, NC Rare). July-September; August-October. NJ, MD, and WV south through VA to nc. NC and TN, reaching its greatest abundance in wc. VA. See Cronquist (1985) for additional information and illustrations. [= C, FNA, K; E. sessilifolium var. vaseyi (Porter) Fernald \& Griscom -- RAB, misapplied in part (also see E. vaseyi); E. sessilifolium var. vaseyi (Porter) Fernald \& Griscom -- F, misapplied; ? E. vaseyi Porter -- G; E. sessilifolium -- SE, in part only]

Eupatorium hyssopifolium Linnaeus, Hyssopleaf Eupatorium. Cp, Pd, Mt (GA, NC, SC, VA): roadbanks, pastures, fields, disturbed areas, dry woodlands; common (rare in Mountains). Late July-October. MA south to GA and west to TN and LA. [=S; E. hyssopifolium var. hyssopifolium -- C, F, FNA, G, K, SE, W; < E. hyssopifolium -- RAB (also see E. torreyanum); E. hyssopifolium var. calcaratum Fernald \& Schubert -- F, K; E. lecheifolium Greene -- S]

Eupatorium leptophyllum Augustin de Candolle, Limesink Dog-fennel. Cp (GA, NC, SC): limesink depression ponds (dolines) in the outer Coastal Plain and clay-based Carolina bays in the inner Coastal Plain; rare (NC Rare). September-November A Southeastern Coastal Plain endemic, ranging from se. NC south to FL and west to s. GA and s. AL; also in the Bahamas and Cuba. [= FNA, GW, K, S, SE; = E. capillifolium var. leptophyllum (Augustin de Candolle) Ahles -- RAB]

Eupatorium leucolepis (Augustin de Candolle) Torrey \& Gray, Savanna Eupatorium. Cp (GA, NC, SC, VA), Pd, Mt (VA): savannas, seepage bogs, depression ponds; common, uncommon in VA, rare in Piedmont and Mountains. August-October. Primarily of the Southeastern Coastal Plain, ranging from NY south to FL and west to LA; disjunct in Coffee County, TN (Chester, Wofford, \& Kral 1997). This species is often confused with members of the E. recurvans-mohrii-anomalum complex (primarily consisting of $E$. mohrii in our area). The following differences are useful: E. leucolepis has phyllaries acuminate to attenuate (vs. acute to obtuse), leaves of the uppermost nodes below the inflorescence opposite, or rarely the uppermost 1-2 nodes subopposite (vs. leaves of the uppermost 2-15 nodes below the inflorescence alternate), and leaves generally longitudinally folded (vs. generally planar). The plants formerly called E. leucolepis var. novae-angliae Fernald and endemic to freshwater pondshores in MA and RI apparently represent a distinct allopolyploid species (not yet named) and should not be treated as a variety of $E$. leucolepis. [= RAB, GW, S, SE, W; E. leucolepis var. leucolepis -- C, F, FNA, G, K]

Eupatorium linearifolium Walter, Narrowleaf Bushy Eupatorium. Cp (GA, NC, SC, VA): sandhills; uncommon (VA Watch List). Late July-October. A Southeastern Coastal Plain species, ranging from se. VA south to FL and west to LA. The appropriate treatment of this taxon is unclear; it may be a derivative of the hybrid E. cuneifolium $\times$ hyssopifolium. $[=F$; E.cuneifolium $--\mathrm{RAB}, \mathrm{C}$, G, SE, in part; E. hyssopifolium var. linearifolium (Walter) Fernald -- K; E. tortifolium Chapman -- S; E. linearifolium - FNA, in part]

Eupatorium mohrii Greene, Mohr's Eupatorium. Cp (GA, NC, SC, VA), Mt, Pd (VA): moist savannas, other wet habitats; common (rare in Mountains). August-October. Se. VA south to FL and west to TX. This is by far the most abundant of the E. recurvans-anomalum-mohrii complex in our area. Like E. anomalum, E. mohrii is believed to be a triploid and tetraploid, apomictic derivative of the hybrid $E$. recurvans $\times$ rotundifolium; it is more widespread than $E$. recurvans sensu stricto. Inasmuch as it is now a separate lineage (as evidenced by a distinct distribution, more-or-less recognizable morphology, and phenologic separation), treatment as a separate taxon seems warranted. [= GW; E. recurvans -- RAB, F, G, in part only (also see E. anomalum and E. recurvans); E. mohrii -- C, FNA, K, SE, W, in part only (also see E. recurvans); E. anomalum -- S, in part only (also see $E$. anomalum)]

Eupatorium perfoliatum Linnaeus, Boneset. Mt, Pd, Cp (GA, NC, SC, VA): marshes, swamps, bogs, wet pastures, and other wet habitats; common. August-October. Widespread in e. North America. [= RAB, FNA, GW, W; E. perfoliatum var. perfoliatum -C, F, G, K, S, SE; E. cuneatum Engelmann -- S (actually a hybrid)]

Eupatorium pilosum Walter, Ragged Eupatorium. Cp, Pd, Mt (GA, NC, SC, VA): savannas, seepage bogs in the Sandhills, bogs, other moist areas; common (uncommon in Piedmont, rare in Mountains). August-October. Ranging from MA south to FL west to KY, c. TN, and MS. This species is clearly distinct; it should not be treated as a variety of $E$. rotundifolium. [= RAB, C, F FNA, GW, K; E. verbenifolium Reichard -- S; E. rotundifolium var. saundersii (T.C. Porter) Cronquist -- G, SE, W]

Eupatorium pubescens Muhlenberg ex Willdenow, Inland Roundleaf Eupatorium. Mt (GA, NC, SC, VA), Pd, Cp (NC, SC, VA): forests and woodlands, woodland edges, roadbanks; common (uncommon in Mountains and Coastal Plain). July-September. The distribution, abundance, and phenology of $E$. pubescens in our area need additional study. Where growing together, $E$. pubescens apparently flowers about a month earlier than E. rotundifolium. Primarily in the Appalachians and adjacent provinces, ranging from ME south to $n$. GA and $n$. AL. This taxon appears to be a stabilized polyploid complex originating from hybridization of E. rotundifolium and (perhaps) E. sessilifolium; in that it now functions as a more-or-less independent evolutionary lineage, with distinctive morphology, habitat, and distribution, it is here treated as a species. [= F; E. rotundifolium var. ovatum (Bigelow) Torrey -RAB, in part (also see E. cordigerum); E. rotundifolium var. ovatum (Bigelow) Torrey -- C, FNA, G, K, SE, W; E. rotundifolium -- GW, the infraspecific taxa not distinguished; E. pubescens -- S (also see E. cordigerum); E. rotundifolium Linnaeus ssp. ovatum (Bigelow)

## Montgomery \& Fairbrothers]

Eupatorium recurvans Small, Recurved Eupatorium. Cp (GA, NC, SC): moist savannas; rare (NC Watch List). AugustOctober. A Southeastern Coastal Plain endemic, ranging from GA and FL north to se. NC. The diploid sexual E. recurvans (sensu stricto) is rare in our area; GW gives its range as se. and sc. GA and FL. E. mohrii is believed to be a triploid and tetraploid, apomictic derivative of the hybrid E. recurvans $\times$ rotundifolium; it is more widespread. [= GW, S; E. recurvans -- RAB, in part only (also see E. anomalum and E. mohrii); E. mohrii -- C, FNA, K, SE, in part]

Eupatorium resinosum Torrey ex Augustin de Candolle, Resinous Boneset, Pinebarren Eupatorium. Cp (NC, SC): seepage bogs, beaver ponds, frequently burned streamhead pocosins, in the Sandhills and inner Coastal Plain of sc. NC; rare (US Species of Concern, NC Endangered, SC Rare). August-October. A "bimodal endemic," known from the NJ, DE, and (formerly) NY, thence disjunct to the Sandhills and upper Coastal Plain of NC. [= RAB, C, FNA, G, GW, K, SE; E. resinosum var. resinosum -- F]

Eupatorium rotundifolium Linnaeus, Common Roundleaf Eupatorium. Cp, Pd, Mt (GA, NC, SC, VA): savannas, seepage bogs, woodlands; common (uncommon in Piedmont, rare in Mountains). August-October. Widespread in e. North America. [= F, S; E. rotundifolium var. rotundifolium -- RAB, C, FNA, G, K, SE, W; E. rotundifolium -- GW, in part (also see E. pubescens and E. cordigerum); E. rotundifolium Linnaeus ssp. rotundifolium]

Eupatorium saltuense Fernald, Tall Boneset, Pasture Eupatorium. Pd (NC, VA), Cp (VA): upland forests, woodland borders, marsh edges; uncommon, rare in NC (NC Watch List). August-October. Known from e. VA and NC. Considered by some to be a hybrid of $E$. album and $E$. altissimum. [= RAB, F, G; <E. altissimum -- C, FNA, K]

Eupatorium scabridum Elliott, Roughleaf Eupatorium. Cp (GA, SC): savannas, wet pinelands; uncommon. Late JulyOctober. Ranging from SC south to $n$. FL, west to AR, LA, and OK. This plant is believed to be an allopolyploid derivative of the hybrid $E$. rotundifolium $\times$ semiserratum. In some areas it apparently consists only of short-lived diploids, but in others (according to GW especially in SC, AR and LA) to occur as populations of polyploid apomicts. It resembles E. rotundifolium, but has cuneate leaves with a less prominent pair of lateral veins, narrower leaves, and is more likely to have 3 -whorled leaves (as $E$. semiserratum often does). [= GW, S; = E. rotundifolium var. scabridum (Elliott) A. Gray -- FNA, K, SE]

Eupatorium semiserratum Augustin de Candolle. Cp (GA, NC, SC, VA): swamp forests, seepage bogs, savannas, claybased Carolina bays, other wetlands; uncommon. Late July-October. Widespread in Southeastern United States, primarily on the Coastal Plain; disjunct in sc. TN. This species often has 3 leaves per node; most similar species rarely or never have whorled leaves. [= RAB, C, FNA, G, GW, K, S, SE; = E. cuneifolium var. semiserratum (Augustin de Candolle) Fernald \& Griscom -- F]

Eupatorium serotinum Michaux, Late Eupatorium. Cp, Pd, Mt (GA, NC, SC, VA): interdune swales, fields, open forests, powerline rights-of-way, tidal marshes; common. Late August-October. Widespread in e. North America. This species was apparently largely or strictly coastal in our area, but has spread inland rapidly along corridors of disturbance, somewhat similarly to Baccharis halimifolia. [= RAB, C, F, FNA, G, GW, K, S, SE, W]

Eupatorium sessilifolium Linnaeus var. brittonianum Porter, Britton's Eupatorium. Mt (NC): circumneutral soils of woodlands at moderate elevation; rare (NC Watch List). August; September. Fairly widespread in ne. North America, south to NJ, PA, MD, NC, KY, and MO. The only collection from NC known to me is from Cedar Cliff, Buncombe County, in 1897. I provisionally disagree with Cronquist's equation of this taxon with E.godfreyanum. [ $=\mathrm{F}, \mathrm{K} ;<E$. sessilifolium var. sessilifolium -- RAB ; < E. sessilifolium -- C, FNA, G, S, SE, W]

Eupatorium sessilifolium Linnaeus var. sessilifolium, Sessile-leaf Eupatorium. Pd, Mt (GA, NC, VA), Cp (VA): open upland woodlands and woodland borders; common (uncommon in VA Piedmont, rare in VA Coastal Plain). July-October. Fairly widespread in e. North America, south to GA, AL, and MO. [= F, K; E. sessilifolium var. sessilifolium -- RAB (also see var. brittonianum); < E. sessilifolium -- C, FNA, G, S, SE, W]

Eupatorium species 1. Cp ( $\mathrm{NC}, \mathrm{SC}$ ): cypress savannas, clay-based bays, and small depressions ponds; rare (NC Rare list). A Cape Fear Arch endemic, ranging from the se. Coastal Plain and Sandhills of NC, to ne. Coastal Plain of SC. [included in concept of $E$. leucolepis by earlier authors]

Eupatorium torreyanum Short \& Peter, Torrey's Eupatorium. Pd, Mt, Cp (GA, NC, SC, VA): dry woodlands, marshes; common (rare in Mountains). Late July-October. Ranging from NY south to n . FL and west to OH, TN, and LA. SE considers this taxon a "well-marked variety," "probably originated through hybridization between $E$. hyssopifolium and some other species, but now a stable entity." The other parent is postulated by Sullivan (1978) to be E. semiserratum. For reasons stated in the comments before the species accounts, the taxon is here treated as a species. [ $=\mathrm{S} ;=E$. hyssopifolium var. laciniatum Gray -- C, F, FNA, G, K, SE, W; < E. hyssopifolium -- RAB]

Eupatorium vaseyi T.C. Porter, Vasey's Eupatorium. Mt (GA, NC, VA), Pd (NC, VA): moist to dry woodlands and openings; uncommon, rare in upper Piedmont (VA Watch List). July-October. Ranging from VA and MD south to se. TN (Chester, Wofford, \& Kral 1997), n . GA, and n . AL. This species is apparently a tetraploid derivative of $E$. album $\times$ sessilifolium. It is sometimes treated as a variety of $E$. album, but seems better regarded as a species of hybrid origin. [ $E$. album var. vaseyi -- RAB, W, in part only (also see E. godfreyanum); E. album var. vaseyi (T.C. Porter) Cronquist -- C, FNA, SE; E. album var. monardifolium (Fernald) -- F; ? E. vaseyi-- G; E. sessilifolium var. vaseyi (Porter) Fernald \& Griscomb -- K; E. fernaldii Godfrey]

Eupatorium album Linnaeus var. subvenosum A. Gray. DC, DE, NJ, NY. [= C, F, FNA, SE] \{not yet keyed; add to synonymy\} * Eupatorium cannabinum Linnaeus. Cp (VA): disturbed areas; rare, perhaps merely a waif or garden remnant, introduced from Europe. The only documentation for VA is an 1899 specimen from Fairfax County. [= FNA, K] \{not yet keyed\}

Eupatorium lancifolium (Torrey \& Gray) Small. Prairies, open woodlands. AL west to s. AR and TX. [= FNA, GW, K, S, SE; E. semiserratum Augustin de Candolle var. lancifolium Torrey \& Gray] \{not yet keyed\}

Eupatorium petaloideum Britton, Showy White Thoroughwort. Cp (GA): sandhills, scrub, dryish pinelands; uncommon? GA south to FL, west to s. MS. [= FNA, S; <E. album Linnaeus var. album - SE; = E. album var. petaloideum (Britton) Godfrey ex D.B. Ward] \{not yet keyed\}

Eupatorium $\times$ pinnatifidum Elliott, ranges north to VA. It is variously considered a species (as by S), a species of hybrid origin (as by SE), or a hybrid (as by GW and K). The parents are variously listed as E.capillifolium $\times$ perfoliatum (as by $K$ ) or $E$. capillifolium or compositifolium $\times$ perfoliatum (as by GW and SE). I have seen the plant in Pender County, NC, where it appears to be a first-generation hybrid, growing with E. capillifolium and E. perfoliatum. Until and unless additional evidence appears that it reproduces itself and exists in independent populations I am inclined to treat it as a hybrid rather than a species of hybrid origin. It is
recognizable by its pinnatifid or bipinnatifid leaves (the segments broader than in the dog-fennels) and its corymbose-paniculate inflorescence. [= FNA, K; = E. pinnatifidum Elliott - GW, SE] \{not keyed\}

## Eurybia (Cassini) S.F. Gray

References: Nesom (1994b)=X; Lamboy (1992, 1988). Key based in part on SE.

1 Basal and lower cauline leaves both distinctly petioled and with a cordate or subcordate blade; ["Aster section Biotia"].
2 Outer phyllaries squarrose-reflexed; rhizomes short or absent, the plants not forming extensive clonal colonies; [of rich slopes and bottomlands of the lower Piedmont of NC, SC, GA, and AL].
3 Involucre >11 mm tall; phyllaries acute to acuminate at the apex; phyllaries squarrose in life, often only the innermost squarrose in dried specimens, the reflexed portion with a distinct hyaline margin; [of the lower Piedmont of GA and AL]
E. jonesiae

3 Involucre < 10 mm high; phyllaries acute, obtuse, or rounded the apex; phyllaries squarrose in life, generally remaining so in dried specimens, the reflexed portion herbaceous with a narrow hyaline margin or none at all; [of the lower Piedmont of s. NC and SC]
E. mirabilis

2 Outer phyllaries appressed (or slightly and irregularly spreading); rhizomes long, the plants forming extensive clonal colonies; [of various habitats and distribution].
4 Ray flowers purplish or bluish; branches of the inflorescence glandular-pubescent . . . . . . . . . . . . . E. macrophylla
4 Ray flowers white; branches of the inflorescence not glandular-pubescent.
5 Plants with basal leaves on well-developed shoots separate from the flowering shoots . . . . . . . . . . E. schreberi
5 Plants without basal leaves on well-developed shoots separate from the flowering shoots.
6 Longest peduncle in inflorescence more than 1.5 cm long; involucre more than 6.5 mm tall; rays mostly more than 13 mm long; [mostly of high mountain forests, primarily over 1200 m in elevation]
E. chlorolepis

6 Longest peduncle in inflorescence less than 1.5 cm long; involucre less than 6.5 mm tall; rays mostly less than 14 mm long; [mostly of lower elevation forests, primarily below 1200 m in elevation . . . E. divaricata
1 Basal and lower cauline leaves not as above.
7 Leaves linear, up to about 10 mm wide; leaves strongly basally disposed.
8 Inflorescence elongate (spike-like or raceme-like).
9 Stem spreading-hairy throughout; rays white or pinkish . . . . . . . . . . . . . . . . . . . . . . . . . . . E. eryngiifolia
9 Stem glabrous (or short-hairy above); rays deep lavender or purple . . . . . . . . . . . . . . . . . . E. hemisphaerica
8 Inflorescence flat-topped (corymbiform).
10 Pappus fine, the bristles not thickened above; ray flowers often <15; [of the Piedmont and low mountains of GA, SC, and possibly sw. NC].
E. avita

10 Pappus coarse, the larger bristles thickened above (clavellate-flattened); ray flowers often >15.
11 Phyllaries tapering gradually to a spinulose tip; heads broadly hemispheric, with very numerous disk flowers; [of sw. GA and adjacent FL] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . E. eryngiifolia
11 Phyllaries with parallel margins for most of their length; heads campanulate-hemispheric, with fewer disk flowers; [of ne. NC south to se. GA] .
E. paludosa

7 Leaves broader, the largest on a plant over 15 mm wide; leaves somewhat basally disposed, the lowermost sometimes withering before flowering.
12 Leaves obviously veined beneath, usually toothed, hairy on the undersurface.
13 Larger leaves <2.5 (-3) cm wide; [of w. VA, WV, northwards] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . E. radula 13 Larger leaves 4.6 cm wide; [of the Cumberland Plateau of KY and $n$. TN] [E. saxicastellii]
12 Leaves very obscurely veined beneath, entire or nearly so, glabrous on the undersurface.
14 Rays $9-14$; rays $5-15 \mathrm{~mm}$ long
E. compacta

14 Rays 15-35; rays $10-25 \mathrm{~mm}$ long.
15 Phyllaries glandular-pubescent on the back and also glandular-ciliate; involucre 8-16 mm high
E. spectabilis

15 Phyllaries slightly or mot at all glandular-pubescent on the back (sometimes glandular-ciliate); involucre 712 mm high
E. surculosa

Eurybia avita (Alexander) Nesom, Alexander's Rock Aster. Pd (GA, SC), Mt (NC?): in shallow soils on granitic flatrocks and granitic domes where moist from seasonal seepage; rare (GA Special Concern, NC Rare, SC Rare). Upper Piedmont endemic: w. SC (or sw NC?) to wc. GA. [= K, X; = Aster avitus Alexander -- SE, W]

Eurybia chlorolepis (Burgess) Nesom, Blue Ridge White Heart-leaved Aster. Mt (GA, NC, SC, VA): northern hardwood forests, spruce-fir forests; common (VA Watch List). August-October. A Southern Appalachian endemic: sw. VA south through w. NC and e. TN to nw. SC and n. GA (Lamboy 1992). Lamboy (1992) has shown that Eurybia chlorolepis is a species distinct from Eurybia divaricata. E. chlorolepis is tetraploid (2n=36); E. divaricatus is diploid. [=K, X; = Aster chlorolepis Burgess $-\mathrm{G}, \mathrm{S} ;=$ Aster divaricatus Linnaeus var. chlorolepis (Burgess) Ahles -- RAB, C, SE, W; <Aster divaricatus -- F]

Eurybia compacta Nesom, Slender Aster. Cp (GA, NC, SC, VA): pine savannas: common (rare in GA). Late July-October. An Atlantic Coastal Plain endemic: NJ to e. GA. [= K, X; = Aster gracilis Nuttall -- RAB, C, F, G, S, SE]

Eurybia divaricata (Linnaeus) Nesom, Common White Heart-leaved Aster. Mt, Pd (GA, NC, SC, VA), Cp (NC, VA): moist to fairly dry forests and woodlands; common. August-October. N. NH west to s. Ontario, sw. Québec, and n. OH, south to e. NC, c. SC, n. GA, and c. AL. The many species described by Burgess and here treated as synonyms may deserve further assessment; see $S$ for details. E. divaricata is diploid $(2 n=18)$. [= K, X; = Aster divaricatus Linnaeus -- G, S, Y; = Aster divaricatus var.
divaricatus -- RAB, C, SE, W; < Aster divaricatus -- F (also see Eurybia chlorolepis); > Aster boykinii Burgess - S; > Aster castaneus Burgess -- S ; $>$ Aster excavatus Burgess -- $\mathrm{S} ;>$ Aster flexilis Burgess -- S ; $>$ Aster stillettiformis Burgess -- ; $>$ Aster tenebrosus Burgess -- S]

Eurybia eryngiifolia (Torrey \& A. Gray) Nesom, Eryngo-leaved Aster. Cp (GA): pine savannas; rare (GA Special Concern). East Gulf Coastal Plain endemic: sw. GA and Panhandle FL west to AL. [= K, X; Aster eryngiifolius Torrey \& A. Gray -- S, SE]

Eurybia hemispherica (Alexander) Nesom, Prairie Grass-leaved Aster. Mt, Cp? (GA): glades, barrens, rocky woodlands; uncommon. E. TN west to MO, south to nw. GA, se. GA, and FL Panhandle. [= K, X; = Aster hemisphericus Alexander -- C, SE; = Aster paludosus Aiton ssp. hemisphericus (Alexander) Cronquist -- G; = Aster hemisphaericus -- W, orthographic variant]

Eurybia jonesiae (Lamboy) Nesom, Piedmont Big-leaved Aster. Pd (GA): moist forests; rare (GA Watch List). AugustOctober. Endemic to the Piedmont: e. GA west to e. AL (Lee Co.). [= K, X; = Aster jonesiae Lamboy; =Aster commixtus (Nees) Kuntze -- S, misapplied; < Aster commixtus (Nees) Kuntze -- SE, misapplied, in part]

Eurybia macrophylla (Linnaeus) Cassini, Big-leaved Aster. Mt (GA, NC, SC, VA), Pd (VA): moist to dryish forests, in NC mostly at moderate to high elevations, particularly in red oak forests on ridgetops; common (rare in Piedmont). Late JulySeptember. New Brunswick and Québec west to MN, south to PA, MD, VA, NC, ne. GA, e. TN, and IN. Aster macrophyllus var. ianthinus [= Aster multiformis] is sometimes recognized. It is alleged to differ in having the stipitate glands of the pedicels with minute heads (vs. broadly capitate), the leaves thin in texture and only slightly scabrous (vs. thick in texture and strongly scabrous). Many other varieties have been recognized by $F$ and $K$, with ranges apparently north of our area; see $F$ for a key. E. macrophylla is octoploid (2n=72). [= K, X; = Aster macrophyllus Linnaeus -- RAB, C, G, SE, W, Y; > Aster macrophyllus var. macrophyllus - F; > Aster macrophyllus var. ianthinus (Burgess) Fernald -- F ; > Aster macrophyllus - S ; $>$ Aster multiformis Burgess -- S ; $>$ Aster riciniatus Burgess -- S]

Eurybia mirabilis (Torrey \& A. Gray) Nesom, Piedmont Aster. Pd (NC, SC): nutrient-rich bottomlands and moist slopes in the lower Piedmont; rare (US Species of Concern, NC Rare). July-September. Endemic to the lower Piedmont of NC and SC. The related $E$. jonesiae Lamboy is endemic to GA and AL. [= K, X; = Aster mirabilis Torrey \& A. Gray -- S; < Aster commixtus (Nees) Kuntze -- RAB, SE, misapplied]

Eurybia paludosa (Aiton) Nesom, Savannah Grass-leaved Aster. Cp (GA, NC, SC): wet savannas, sandhill / pocosin ectones; common. July-October. An Atlantic Coastal Plain endemic: ne. NC south to se. GA. [= K, X; = Aster paludosus Aiton -RAB , C, GW, SE; = Aster paludosus ssp. paludosus -- G]

Eurybia radula (Aiton) Nesom, Low Rough Aster. Mt (VA): \{habitat\}; rare (VA Rare). Newfoundland and Labrador south to DE, MD, WV, and w. VA. [= K, X; = Aster radula Aiton -- C, G, SE, W]

Eurybia schreberi (Nees) Nees, Schreber's Aster. Mt, Pd (VA): mesic forests and seepage slopes; uncommon. AugustOctober. NH west to WI, south to DE, MD, c. and w. VA, ne. TN (Chester, Wofford, \& Kral 1997), AL, and KY. E. schreberi is hexaploid (2n=54). [=K, X; = Aster schreberi Nees -- C, G, SE, W, Y; > Aster schreberi - F; > Aster glomeratus (Bernhart ex Nees) Burgess -- F]

Eurybia spectabilis (Aiton) Nesom, Low Showy Aster. Cp (NC, SC, VA), Pd (NC): pine barrens, dry road banks; rare (NC Watch List, SC Rare, VA Watch List). August-October. Coastal Plain (and rarely adjacent provinces) from MA south to SC; disjunct in AL. [= K, X; = Aster spectabilis Aiton -- RAB, C, SE; > Aster spectabilis Aiton var. cinerascens Blake -- G; > Aster spectabilis Aiton var. spectabilis - G; > Aster spectabilis var. suffultus Fernald -- K; > Aster smallii Alexander -- S; > Aster spectabilis -- S]

Eurybia surculosa (Michaux) Nesom, Creeping Aster. Mt (NC, SC, VA), Cp? (GA, SC): rock outcrops, glades, rocky woodlands; uncommon (VA Rare). Late August-October. A Southern Appalachian endemic: se. KY and w. VA south to w. NC, e. TN, nw. SC, and n. GA. \{and supposedly disjunct in se. SC and e. GA in the Outer Coastal Plain - investigate\} $[=K, X ;=A s t e r$ surculosus Michaux -- RAB, C, G, S, SE, W]

Eurybia saxicastellii (J.J.N. Campbell \& Medley) Nesom, Rockcastle Wood-aster. Endemic to the Cumberland Plateau region of KY and n. TN (Scott County, TN) (Chester, Wofford, \& Kral 1997). [= K, X; = Aster saxicastellii J.J.N. Campbell \& Medley -- C]

## Euthamia (Nuttall) Cassini 1825 (Flat-topped Goldenrod)

A genus of about $8-10$ species, herbs, of e. North America. There are a number of serious problems remaining in our knowledge of Euthamia. Most serious is the issue of the circumscription of "hirtipes," considered by Fernald to be a hybrid of "minor" and "graminifolia var. nuttallii," by Sieren to be a species endemic to NC-SC-VA, by Taylor and Taylor to be a variety ranging from se. VA south to FL and west to LA, and by GW to be equivalent to E. tenuifolia. The second most serious is the question of the validity of 2 taxa in the "minor"-"tenuifolia" complex. GW, SE, RAB, F, G, and Clewell recognize 2 species. C recognizes 2 varieties. K, S, and Sieren recognize a single species. The third (relatively trivial) problem is whether varieties are worth recognizing in E.graminifolia. References: Sieren (1981)=Z; Taylor \& Taylor (1983)=Y; Johnson (1995)=X; Cronquist (1980)=SE.

1 Larger leaves 3-7 cm long, 1-3 (-4) mm wide, 1-3-nerved; axillary leaf fascicles usually many; punctae on leaves many, conspicuous.
4 Disc flowers 3-4 (-5) per head; ray flowers 7-11 (-13) per head; total flowers per head usually 11-15; larger leaves 1-2.5 mm wide, 1 (-3)-veined; involucres 3.5-4.5 mm high . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . E. minor
4 Disc flowers 5-7 (-9) per head; ray flowers (8-) 10-16 per head; total flowers per head usually 17-21; larger leaves 2-3 (-4) mm wide, (1-) 3-veined; involucres 4.5-6 mm high . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . E. tenuifolia
1 Larger leaves 4-13 cm long, 3-10 (-12) mm wide, 3-5-nerved; axillary leaf fascicles absent to few; punctae on leaves few and inconspicuous to many and conspicuous.
2 Heads mostly pedunculate; larger leaves 4-8 cm long, 3-5 mm wide; leaf surfaces moderately hirtellous; disc flowers 3-5 per head; ray flowers 7-12 per head
E. hirtipes

2 Heads mostly sessile or subsessile; larger leaves 4-13 cm long, 3-12 mm wide; leaf surfaces moderately to densely hirtellous; disc flowers (4-) 5-7 (-13) per head; ray flowers (11-) 17-22 (-35) per head.

Leaf surfaces glabrous; largest leaves 5-7 (-9) mm wide
Leaf surfaces hirtellous; largest leaves $7-12 \mathrm{~mm}$ wide
E. graminifolia var. graminifolia
E. graminifolia var. nuttallii

Euthamia graminifolia (Linnaeus) Nuttall var. graminifolia. Mt, Pd?, Cp? (VA): moist to dry weedy situations, moist soils of bottomlands; uncommon (VA Watch List). August-September. Québec west to Ontario, south to VA, WV, IL, IA, and SD. [= C, X, Y, Z; Solidago graminifolia (Linnaeus) Salisbury -- RAB, infraspecific taxa not distinguished; Solidago graminifolia var. graminifolia -F, G; E. graminifolia var. graminifolia - K, in part only; E. graminifolia - S, SE, W, infraspecific taxa not distinguished]

Euthamia graminifolia (Linnaeus) Nuttall var. nuttallii (Greene) W. Stone. Mt (NC, VA), Pd, Cp (VA): moist to dry weedy situations, moist soils of bottomlands, bog margins; common, rare south of VA (NC Watch List). August-September. Newfoundland west to MN, south to e. VA, w. NC, KY, TN, and MO. A South Carolina report (Hill \& Horn 1997) probably belongs here. [= C, X, Y, Z; Solidago graminifolia (Linnaeus) Salisbury -- RAB, infraspecific taxa not distinguished; Solidago graminifolia var. nuttallii (Greene) Fernald -- F, G; Solidago graminifolia var. polycephala Fernald -- F; E. graminifolia - S, SE, W, infraspecific taxa not distinguished; E. graminifolia var. graminifolia - K, in part only; E. fastigiata Bush]

Euthamia hirtipes (Fernald) Sieren, Marsh Flat-topped Goldenrod. Cp (NC, SC, VA): marshes, marsh edges, wet hammocks; uncommon (VA Watch List). September-December. Se. VA south to se. SC (or perhaps west to s. LA). [= Z; Solidago tenuifolia Pursh -- RAB, in part; Euthamia $\times$ hirtipes (Fernald) Sieren (pro sp.) -- C; Solidago $\times$ hirtipes Fernald -- F; Solidago gymnospermoides (Greene) Fernald -- F, G, misapplied as to our plants; Solidago leptocephala Torrey \& A. Gray -- F, misapplied as to our plants; $E$. tenuifolia -- GW, in part; E. graminifolia (Linnaeus) Nuttall var. hirtipes (Fernald) C. \& J. Taylor -- K, X, Y]

Euthamia minor (Michaux) Greene. Cp (NC, SC, VA): pine savannas, ditches, pastures; common. September-November. MD south to FL, west to LA. [= GW, SE; Solidago microcephala (Nuttall) Bush -- RAB, F, G; E. tenuifolia (Pursh) Nuttall var. microcephala Nuttall -- C; E. minor -- S, in part only (also see E. tenuifolia); E. tenuifolia -- W, Z, in part; E. caroliniana (Linnaeus) Greene ex Porter \& Britton -- K, X, in part]

Euthamia tenuifolia (Pursh) Nuttall. Cp (NC, SC, VA): pine savannas, moist forests; uncommon. September-November. Nova Scotia south to n. FL. Reveal (1991) argues that the name E. caroliniana (Linnaeus) E. Greene ex Porter \& Britton should be taken up for this taxon. [= SE; Solidago tenuifolia Pursh -- RAB, in part; E. tenuifolia var. tenuifolia -- C; Solidago tenuifolia var. tenuifolia -- F; Solidago tenuifolia -- G; E. tenuifolia -- GW, in part only (also see E. hirtipes); E. minor -- S, in part; E. tenuifolia -- W, Z, in part only (also see E. minor); E. caroliniana (Linnaeus) Greene ex Porter \& Britton -- K, X, in part]

Euthamia gymnospermoides Greene, east to sc. TN (Chester, Wofford, \& Kral 1997). [= K] \{add synonymy; not yet keyed\}
Euthamia leptocephala (Torrey \& A. Gray) Greene, east to sc. TN (Chester, Wofford, \& Kral 1997). [= K] \{add synonymy; not yet keyed\}

Eutrochium Rafinesque (Joe-pye-weed)
The much debated separation of Eutrochium (Eupatoriadelphus) from Eupatorium has been supported by Schmidt \& Schilling (2000). Lamont (2004) makes the necessary combinations under the oldest available generic name, Eutrochium Rafinesque. References: Lamont (2004)=X; Schmidt \& Schilling (2000)=Y; Lamont (1995)=Z.

1 Flowers (4-) 6-9 (-12) per head; leaves more or less 3-nerved from the base, rather abruptly contracted to the short petiole, thick in texture, 5-12 (-15) cm long, strongly resin-dotted beneath; leaves in whorls of (2-) avg. 3-4 (-5); stem generally purple-speckled (sometimes uniformly purple); [primarily of the Coastal Plain] . . . . . . . . . . . . . . . . . . . . . . . . . . . . E. dubium
1 Flowers either (8-) 9-22 or 4-7 per head; leaves generally pinnately veined (rarely with a tendency to be 3-nerved), usually cuneate and less abruptly contracted to the petiole, thick or thin in texture, 6-35 cm long, weakly or not at all resin-dotted beneath (except often strongly resin-dotted in E. maculatum); leaves in whorls of (2-) 3-7; stem purple-speckled, purple at the nodes, purple throughout, or green; [collectively widespread in our area].
2 Flowers (8-) 9-22 per head; leaves mostly in whorls of (3-) avg. 4-5 (-6), 6-20 cm long; inflorescence more or less flattopped; stem usually speckled with purple (rarely evenly purplish) $\qquad$ E. maculatum var. maculatum

2 Flowers 4-7 per head; leaves in whorls of (2-) 3-7, 8-35 cm long; inflorescence rounded; stem usually purple throughout, purple at the nodes, or lacking purplish pigment.
3 Stem hollow (with a large central cavity), purple throughout, strongly glaucous when fresh; flowers bright pink-purple; leaves in whorls of (3-) avg. $5(-7)$; leaves mostly $3.5-5.5 \times$ as long as broad
E. fistulosum

3 Stem solid (rarely with a slender central cavity), dark purple at the nodes or greenish purple throughout, not glaucous or only slightly so when fresh; flowers pale pink-purple; leaves in whorls of (2-) avg. 3-4 (-5); leaves mostly $2-4 \times$ as long as broad.
4 Stem persistently glandular-pubescent throughout; lower surface of leaves glandular-pubescent; leaves mostly $2-2.5 \times$ as long as wide; stem greenish-purple (or evenly purple); [of the Mountains] . . . . . . . . . . . . . . E. steelei
4 Stem glandular-puberulent in the inflorescence, glabrous below the inflorescence; lower surface of leaves with few, sessile resin dots; leaves mostly $2.5-4 \times$ as long as broad; stem greenish, often dark purple at the nodes, particularly when sun-grown; [widespread in our area]
E. purpureum var. purpureum

Eutrochium dubium (Willdenow ex Poiret) E.E. Lamont, Three-nerved Joe-pye-weed. Cp (NC, SC, VA), Pd (NC, SC), Mt (NC): swamp forests, pocosins, other wet, acidic habitats; common (uncommon in Piedmont). July-October. Nova Scotia, s. ME, and NH south to se. SC, on or near the Coastal Plain. [= X; = Eupatoriadelphus dubius (Willdenow ex Poiret) King \& H.E. Robinson -- GW, Y; = Eupatorium dubium Willdenow ex Poiret -- RAB, C, F, G, K, SE, W, Z; = Eupatorium purpureum -- S, misapplied]

Eutrochium fistulosum (Barratt) E.E. Lamont, Hollow-stem Joe-pye-weed. Mt, Pd, Cp (GA, NC, SC, VA): moist forests, marshes, ditches; common (uncommon in Coastal Plain). July-October. S. ME, NY, IL, and MO, south to c. peninsular FL and e. TX. [= X; = Eupatoriadelphus fistulosus (Barratt) King \& H.E. Robinson -- GW, Y; Eupatorium fistulosum Barratt - RAB, C, F, G, K,

## SE, W, Z; = Eupatorium maculatum -- S, misapplied]

Eutrochium maculatum (Linnaeus) E.E. Lamont var. maculatum, Spotted Joe-pye-weed. Mt (NC, VA), Pd (VA): marl fens, wet calcareous meadows, cove forests, grassy balds; uncommon, rare in VA (VA Rare). Late July-October. The species is widespread across $n$. North America. Newfoundland, ME, Québec, Ontario, and MN, south to PA, OH, n. KY, c. IL, and c. IA, and in the Mountains south to e. WV, w. VA, and w. NC. Var. bruneri (A. Gray) E.E. Lamont is more western; var. foliosum (Fernald) E.E. Lamont, is more northern. Further investigation is needed of the peculiar and implausible change in habitat of this species, from calcareous wetlands in c. VA northwards, to mesic high elevation slopes and forests (in acidic to very acidic soils) from sw. VA southwards. Such a change is suggestive of the presence of an unrecognized, cryptic taxon in the Southern Appalachians. [= X; Eupatorium maculatum Linnaeus var. maculatum -- F, G, K, SE; Eupatorium maculatum var. foliosum (Fernald) Wiegand; Eupatorium maculatum -- RAB, W, infraspecific taxa not distinguished; Eupatorium maculatum ssp. maculatum var. maculatum -- C, Z; Eupatoriadelphus maculatus -- Y]

Eutrochium purpureum (Linnaeus) E.E. Lamont var. purpureum, Purple-node Joe-pye-weed. Mt, Pd, Cp (GA, NC, SC, VA): upland, usually mesic forests; common (rare in Coastal Plain). July-October. NH west to se. MN, IA, and e. NE, south to SC, GA, panhandle FL, n. LA, and e. OK; var. holzingeri (Rydberg) E.E. Lamont, differing in having the lower leaf surface densely and persistently pubescent (vs. glabrous or nearly so) is found in the Midwest (Lamont 1990). Eupatorium purpureum var. amoenum is smaller, more slender, with narrower leaves which are nearly glabrous below; it is probably only a form. [= X; Eupatorium purpureum Linnaeus var. purpureum - K, Z; E. purpureum -- RAB, C, F, SE, W, infraspecific taxa not distinguished; Eupatorium purpureum var. amoenum (Pursh) Gray-- G; Eupatorium purpureum var. purpureum - G; Eupatorium trifoliatum Linnaeus -- S]

Eutrochium steelei (E. Lamont) E.E. Lamont, Appalachian Joe-pye-weed, Steele's Joe-pye-weed. Mt (NC, VA): cove hardwood and northern hardwood forests, up to at least 1600 m ; uncommon (NC Watch List). July-October. A Southern Appalachian endemic: e. KY and w. VA south w. NC and e. TN. [= X; = Eupatoriadelphus steelei (E. Lamont) G.J. Schmidt \& Schilling - Y; = Eupatorium steelei E.E. Lamont - Z]

## Evax Gaertner <br> (see Filago)

## Facelis Cassini

A genus of 3 species, herbs, of South America. References: Arriagada (1998)=Z; Cronquist (1980)=SE; Anderberg (1991)=Y.

* Facelis retusa (Lamarck) Schultz-Bipontinus. Cp, Pd (GA, NC, SC), Mt (SC): fields, roadsides, disturbed areas; common, introduced from s. South America. Late April-June. [= RAB, K, SE, Y, Z; F. apiculata Cassini -- S]

## Filago Linnaeus (Cotton-rose, Herba Impia, Rabbit-tobacco)

A genus of about 40 species, herbs, of Eurasia, North America, and n. Africa. Arriagada (1998) favors the inclusion of Evax in Filago. References: Arriagada (1998) $=$ Z; Cronquist (1980) $=$ SE; Anderberg (1991) $=$ Y.

1 Inner flowers of the head with a well-developed capillary pappus; heads woolly, but not so densely and completely as to hide the phyllaries . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . F. vulgaris
1 All flowers of the head lacking a pappus of capillary bristles; heads completely surrounded by wool, the phyllaries hidden.
2 Receptacular bracts mostly 2.5-3.5 mm long; glomerules of heads with numerous small leaves whose tips protrude conspicuously from between the heads; achenes usually sharp-edged, lenticular in cross-section . . . . . . . . . F. prolifera
2 Receptacular bracts mostly less than 2 mm long; glomerules of heads with numerous small leaves about as long as the heads; achenes usually blunt-edged, elliptic in cross-section . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . F. verna

* Filago prolifera (Nuttall ex Augustin de Candolle) Britton, Cotton-rose, Bighead Pygmy-cudweed. Cp (SC): disturbed areas, waste areas around wool-combing mill; rare, introduced from farther south and west (Nesom 2004d). [= Y, Z; = Evax prolifera Nuttall ex Augustin de Candolle -- K, SE]
* Filago verna (Rafinesque) Rafinesque, Cotton-rose, Poverty-weed. Pd (GA), Cp (SC): disturbed areas, waste areas around wool-combing mill; rare, introduced from farther south and west (Nesom 2004d). [= Y, Z; Evax verna Rafinesqu`e var. verna -- K; Filaginopsis nivea Small -- S; E. multicaulis Augustin de Candolle -- SE; Filago verna (Rafinesque) Rafinesque -- Z]
* Filago vulgaris Lamarck, Herba Impia. Pd (NC, VA), Mt, Cp (VA): disturbed areas; uncommon, introduced from Europe. May-September. [= K, Y; F. germanica - RAB, C, F, G, SE, Z; Gifola germanica Dumortier -- S]

## Flaveria de Jussieu

* Flaveria trinervia (Sprengel) C. Mohr. Cp (SC), \{VA\}: waste areas around wool-combing mill; rare, introduced from sw. United States (Nesom 2004d). [= K]

## References: Wooten \& Clewell (1971)=Z; Schultz \& Schilling (2000).

Fleischmannia incarnata (Walter) King \& H.E. Robinson, Pink Thoroughwort, Pink Eupatorium. Pd, Mt, Cp (GA, NC, SC, VA): nutrient-rich, moist to dry, forests and woodlands over diabase, limestone, coquina limestone, or other basic rocks, or on rich alluvium; rare (NC Rare, VA Rare). Late August-October. Se. VA west to WV, s. OH, s. IN, s. IL, s. MO, and e. OK, south to w. peninsular FL, s. TX, and e. Mexico, the distribution rather curiously fragmented. See Wooten \& Clewell (1971) for further information about this species. [= K, Z; = Eupatorium incarnatum Walter -- RAB, C, F, G, S, SE, W]

## Gaillardia Fougeroux (Blanket-flower, Gaillardia, Fire-wheels)

A genus of about 30 species, herbs, of temperate North America and South America. References: Cronquist (1980)=SE; Turner et al. (2003).

Gaillardia aestivalis (Walter) H. Rock var. aestivalis, Sandhills Gaillardia. Cp (GA, NC, SC), Mt? (GA?): sandhills, disturbed sandy soils; rare (NC Rare). July-October. Sc. NC south to FL, west to TX. The occurrence in nw. GA reported in Jones \& Coile (1988) is odd. [ $=\mathrm{K}, \mathrm{SE} ;<\mathrm{G}$. aestivalis -- RAB; G. lanceolata Michaux var. lanceolata -- G; G. lanceolata -- S]

Gaillardia pulchella Fougeroux var. drummondii (Hooker) B.L. Turner, Beach Blanket-flower. Cp (GA, NC, SC): sandy flats behind the dunes; common. April-December. E. NC south to FL, west to TX. [= G. pulchella Fougeroux var. picta (Sweet) A. Gray -- K; < G. pulchella -- RAB, C, F, G, SE; = G. picta Sweet -- S]

* Gaillardia pulchella Fougeroux var. pulchella, Common Blanket-flower. Cp, Pd (GA, NC, SC, VA): disturbed areas, persistent after cultivation; rare, introduced from further south and west. April-September. [=K; < G. pulchella -- RAB, C, F, G, SE; = G. drummondii (Hooker) Augustin de Candolle -- S, misapplied]

## Galinsoga Ruiz \& Pavón (Peruvian-daisy, Quickweed)

A genus of about 13 species, herbs, of temperate and subtropical Central America and South America. References: Cronquist (1980) $=$ SE .

1 Rays 0-1.5 (-2) mm long, lacking pappus scales (or with vestigial scales); outer phyllaries 2-4, with scarious margins; inner bracts deeply 3-lobed; pappus scales of the disk flowers not awn-tipped; stem usually glabrous or sparsely pubescent with appressed (rarely spreading) hairs; gland-tipped hairs of the peduncles less than 0.5 mm long; teeth of leaf margin obscure, broadly rounded or reduced to thickened bumps . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . G. parviflora
1 Rays 2-3 mm long, with pappus scales about as long as the corolla tube; outer phyllaries 1-2, with green herbaceous margins; inner bracts usually entire; pappus scales of the disk flowers awn-tipped; stem usually moderately pubescent with long, spreading hairs; gland-tipped hairs of the peduncles 0.5 mm or more long; teeth of leaf margins usually well developed, acute
G. quadriradiata

* Galinsoga parviflora Cavanilles, Lesser Peruvian-daisy. Mt (NC, SC, VA), Pd, Cp (VA): disturbed areas, roadsides, barnyards; uncommon, introduced from Central and South America. May-October. [= C, F, G, K, S, SE, W]
* Galinsoga quadriradiata Ruiz \& Pavón, Common Peruvian-daisy. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): disturbed areas, roadsides, barnyards; uncommon, introduced from Central and South America. May-October. A serious weed, especially in the cooler climates of the Mountains; Small (1933) described it as "a particularly pestiferous weed of such rapid growth and seeding as to make eradication extremely difficult." Fortunately, it does not seem especially prone to invade undisturbed areas. [= C, K, SE, W; G. ciliata (Rafinesque) Blake -- RAB, F, G, S; G. caracasana (Augustin de Candolle) Schultz-Bipontinus -- F, G; G. bicolorata St. John \& White -- F, G]

## Gamochaeta Weddell (Cudweed, Everlasting)

A genus of about 52 species, herbs, cosmopolitan. Gamochaeta is more closely related to other genera than it is to Gnaphalium. References: Nesom in FNA (in prep.); Nesom (1990)=Z; Arriagada (1998)=Y; Nesom (2004b, 2004c)=X; Cronquist (1980)=SE; Pruski \& Nesom (2004). Key adapted from FNA, X, and Z.

1Leaves concolored or weakly bicolored (abaxial and adaxial faces +/- equally greenish to gray-greenish, indument usually loosely tomentose or arachnose, sometimes subpannose).

2 Involucres 2.5-3 mm high, seated in tomentum; capitulescence initially cylindric and uninterrupted, at least distally, the main axis obscured by clustered heads; phyllaries in 3-4 (-5) series, the outer and middle ovate-lanceolate with narrowly to broadly acute apices, the outer $1 / 3-1 / 2$ as long as the inner, none with purplish color; flowering May-July .. G. antillana
2 Involucres 3-3.5 mm high, lightly arachnose only at the base if at all; capitulescence interrupted at least distally, the main axis visible up to the terminal heads; phyllaries in 5-7 series, the outer and middle ovate-triangular with sharply acute-
acuminate apices, the outer $1 / 2-2 / 3$ as long as the inner, at least the innermost commonly tinged with purple at the sterome-lamina junction; flowering (February-) March-May (sometimes later because of moisture or disturbance).
G. calviceps

1 Leaves strongly to weakly bicolored with greenish glabrescent upper surfaces; leaves spatulate-obovate to oblanceolate; basal leaves present at flowering.

3 Basal and proximal cauline leaves usually withering before anthesis (clusters of smaller leaves usually present in cauline axils); stems erect or ascending; plants (30--) $50--85 \mathrm{~cm}$; apices of inner phyllaries acute-acuminate; flowering mostly Jul--AugG. simplicicaulis
3 Basal and proximal cauline leaves present or not at anthesis; stems erect to decumbent-ascending; plants mostly 10--50 cm ; apices of inner phyllaries acute to obtuse, rounded, or blunt; flowering mostly Apr--Jun(--Jul in G. calviceps).

## G. pensylvanica

3G. simplicicaulis
3
4G. coarctata
4
5G. chionesthes
5
6G. argyrinea
6G. purpurea

2 Phyllaries completely glabrous, the outermost broadly ovate, usually with an obtuse apex $\qquad$ G. americana

2 Phyllaries (the outer at least) densely to lightly woolly at their bases, the outermost ovate-triangular, with an acute to acute-acuminate apex.
3 Cauline leaves obovate-spatulate, weakly bicolored; inflorescence usually interrupted; outer phyllaries ovatetriangular, with acuminate-apiculate apices; inner phyllaries $3.0-3.5 \mathrm{~mm}$ long, not apiculate; receptacles deeply concave or crateriform . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . G. pensylva Cauline leaves mostly oblanceolate, strongly bicolored; inflorescence usually continuous; outer phyllaries ovatetriangular with an acute apex; inner phyllaries (3.5-) 4.0-5.0 mm long, usually with a minute but distinctly keeled apiculum; receptacles concave, but not deeply so . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . G. purpurea

Gamochaeta antillana (Urban) Anderberg. \{GA, NC, SC, VA\} [=X; < G. falcata - Z]

* Gamochaeta argentina Cabrera. Cp (SC): waste areas near wool-combing mill; rare, perhaps merely a waif, introduced from Argentina and Uruguay. See Nesom (2004d).

Gamochaeta argyrinea Nesom. Cp, Pd (GA, NC, SC, VA), Mt (GA, NC, SC): [= X]
Gamochaeta calviceps (Fernald) Cabrera. \{GA, NC, SC, VA\} [=X; < G. falcata - Z]

* Gamochaeta chionesthes Nesom. Cp (GA, NC, SC), Pd (GA): [= X]
* Gamochaeta coarctata (Willdenow) Kerguélen. Cp(GA, NC, SC, VA), Pd (GA, NC, SC): [=X; < Gamochaeta americana (P. Miller) Weddell - K, Y, Z, misapplied; Gnaphalium purpureum Linnaeus var. americanum (P. Miller) Klatt -- RAB; Gnaphalium spicatum Lamarck]
* Gamochaeta pensylvanica (Willdenow) Cabrera, Pennsylvanica Everlasting. Cp (GA, NC, SC, VA), Pd (GA, NC, SC), Mt (GA?, NC): fields, roadsides, pastures, disturbed areas; common. March-July. PA south to FL, west to TX, mostly on the Coastal Plain, and widespread in South America and elsewhere. [ $=\mathrm{K}, \mathrm{X}, \mathrm{Z}$; Gnaphalium purpureum Linnaeus var. spathulatum (Lamarck) Baker -- RAB; Gnaphalium purpureum Linnaeus var. purpureum -- C, G, SE, in part only (also including G. purpurea \& G. americana); Gnaphalium peregrinum Fernald -- F; Gnaphalium spathulatum Lamarck -- S; Gnaphalium purpureum Linnaeus -- W, in part (also including Gamochaeta falcata \& G. purpurea)]

Gamochaeta purpurea (Linnaeus) Cabrera. Mt, Pd, Cp (GA, NC, SC, VA): [= X]

* Gamochaeta simplicicaulis (Willdenow ex Sprengel) Cabrera, Cp (GA, NC, SC): Reported for NC, SC, and GA by Nesom (1999, 2000d, 2004b). [= X]

## \{OLD treatment below\}

* Gamochaeta americana (P. Miller) Weddell, American Everlasting. Cp (NC, SC): sandy roadsides and disturbed places; common. Late June-August. Apparently introduced from tropical America. [=K, Y, Z; Gnaphalium purpureum Linnaeus var. americanum (P. Miller) Klatt -- RAB; Gnaphalium purpureum Linnaeus var. purpureum -- SE, in part only (also including Gamochaeta purpurea \& G. pensylvanica)]

Gamochaeta falcata (Lamarck) Cabrera, Narrowleaf Purple Everlasting. Cp, Pd, Mt (NC, SC, VA): fields, roadsides, pastures, disturbed areas; common. April-July. VA south to FL and west to TX, also in CA and AZ (where likely not native), and widespread in tropical America. [=K, Z; Gnaphalium purpureum Linnaeus var. falcatum (Lamarck) Torrey \& A. Gray -- RAB, C, G, SE; Gnaphalium calviceps Fernald -- F; Gnaphalium falcatum Lamarck -- S; Gnaphalium purpureum Linnaeus -- W, in part (also including Gamochaeta pensylvanica \& G. purpurea)]

Gamochaeta pensylvanica (Willdenow) Cabrera, Pennsylvanica Everlasting. Cp (GA, NC, SC, VA), Pd (GA, NC, SC), Mt (GA?, NC): fields, roadsides, pastures, disturbed areas; common. March-July. PA south to FL, west to TX, mostly on the Coastal Plain, and widespread in South America and elsewhere. [=K, Z; Gnaphalium purpureum Linnaeus var. spathulatum (Lamarck) Baker -- RAB; Gnaphalium purpureum Linnaeus var. purpureum -- C, G, SE, in part only (also including G. purpurea \& G.
americana); Gnaphalium peregrinum Fernald -- F; Gnaphalium spathulatum Lamarck -- S; Gnaphalium purpureum Linnaeus -- W, in part (also including Gamochaeta falcata \& G. purpurea)]

Gamochaeta purpurea (Linnaeus) Cabrera, Spoonleaf Purple Everlasting. Cp, Pd, Mt (NC, SC, VA): fields, roadsides, pastures, disturbed areas; common. Late March-early July. ME west to MI, south to FL and e. TX; apparently disjunct in CA and OR, adventive in w. US, Mexico, South America, and elsewhere. [= K, Y, Z; Gnaphalium purpureum Linnaeus var. purpureum -RAB; Gnaphalium purpureum Linnaeus var. purpureum -- C, G, SE, in part only (also including Gamochaeta americana \& G. pensylvanica); Gnaphalium purpureum Linnaeus -- F, S; Gnaphalium purpureum Linnaeus -- W, in part (also including Gamochaeta falcata \& G. pensylvanica)]

Gnaphalium Linnaeus (Cudweed, Rabbit Tobacco) (also see Gamochaeta and Pseudognaphalium)

References: Anderberg (1991)=Z.
1 Involucre 2-3 mm high; plants to 2.5 dm tall; inflorescence of many, small, axillary and terminal clusters overtopped by subtending leaves Gn. uliginosum
1 Involucre 4-7 mm high; plants generally well over 2.5 dm tall; inflorescence terminal, usually elongate
[see Pseudognaphalium]

Gnaphalium uliginosum Linnaeus, Low Cudweed. Mt (VA): high elevation openings, especially in ruts or mud-puddles, rocky places; rare, possibly introduced in North America (VA Rare). July-October. Newfoundland west to British Columbia, south to VA, WV, OH, IN, MN, CO, UT, and OR. [= C, F, G, K, S, SE, Z]

Grindelia Willdenow (Gum-plant, Tarweed, Rosinweed, Gumweed)
A genus of about 55 species, herbs and shrubs, of w. North America and South America. References: Cronquist (1980)=SE.
1 Phyllaries loose (but not squarrose), only slightly imbricate . . . . . . . . . . . . . . . . . . . . . . . . . . G. lanceolata var. lanceolata

1 Phyllaries squarrose-reflexed, strongly imbricate . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . G. squarrosa var. squarrosa

* Grindelia lanceolata Nuttall var. lanceolata. Mt (VA), Cp (SC): disturbed areas, waste areas around wool-combing mill; rare, presumably introduced from farther west. this species is regarded as native as far east as the Nashville Basin of c. TN and scattered localities in the Ridge and Valley Province of e. TN (Chester, Wofford, \& Kral 1997). [= C, K; < G. lanceolata -- F, G, SE, infraspecific taxa not distinguished]
* Grindelia squarrosa (Pursh) Dunal var. squarrosa, Curly-top Gumweed. Mt, Pd (VA): disturbed areas; rare, introduced from farther west. Other varieties are adventive eastwards, and might be expected in our area. [= C, F, G, K, SE]

Guizotia Cassini (Niger-seed)
A genus of 6 species, herbs, of Africa. references: Sherff \& Alexander (1955)=Z.

* Guizotia abysinica (Linnaeus f.) Cassini, Niger-seed, Niger-thistle, Ramtilla. Cp, Pd (VA): disturbed areas; rare, introduced from Africa. September-October. [= C, F, G, K; G. abyssinica - Z, orthographic variant]

Gutierrezia Lagasca y Segura

* Gutierrezia sarothrae (Pursh) Britton \& Rusby. Cp (SC): waste areas around wool-combing mill; rare, perhaps merely a waif, introduced from w. North America. See Nesom (2004d). [= K; = Xanthocephalum sarothrae (Pursh) Shinners]
* Gutierrezia texana (Augustin de Candolle) Torrey \& A. Gray var. texana. Cp (SC): waste areas around wool-combing mill; rare, perhaps merely a waif, introduced from sc. North America. See Nesom (2004d). [=K; = Xanthocephalum texanum (Augustin de Candolle) Shinners]

## Gymnostyles Antoine Laurent de Jussieu

A genus of several species, herbs, of South America. Perhaps better included in Soliva. References: Cronquist (1980)=SE; Arriagada \& Miller (1997)=Z.

* Gymnostyles stolonifera (Brotero) Tutin. Cp (GA, SC): lawns, roadsides, moist open areas; uncommon, introduced from South America. March-April. [=K; Soliva nasturtiifolia (Antoine Laurent de Jussieu) Augustin de Candolle -- RAB, misapplied; Gymnostyles nasturtiifolia Antoine Laurent de Jussieu -- S, misapplied; = Soliva stolonifera (Brot.) Loureiro -- SE, Z]

Hartwrightia floridana A. Gray ex S. Watson, Hartwrightia. Cp (GA): seepages and wet pinelands; rare (GA Threatened). July-September. Se. GA south to c. peninsular FL. [= K, S, SE]

## Hasteola Rafinesque (Sweet Indian-plantain)

A genus of 2 species, herbs, of e. North America. H. suaveolens and the FL endemic, H. robertiorum L.C. Anderson, form a genus "not closely related" to our other cacalioids, Arnoglossum and Rugelia (Anderson 1994). This genus has been known as Synosma, but Anderson (1994) demonstrates that Hasteola has nomenclatural priority. References: Anderson (1994)=Z; Cronquist (1980)=SE; Pippen (1978)=Y; Barkley (1999).

Hasteola suaveolens (Linnaeus) Pojarkova, Sweet Indian-plantain. Mt (NC, VA), Pd (VA): sandy bottomlands and riverbanks; rare (NC Rare, VA Rare). Though rather widespread in e. North America, ranging from CT, NY n. OH, n. IN, c. WI and se. MN, south to $n$. VA, sw. VA, sw. NC, wc. TN (Chester, Wofford, \& Kral 1997), and se. MO, it appears to be rare through much of its range. This species has not been seen in NC in recent years. [=K, Z; = Cacalia suaveolens Linnaeus -- RAB, C, F, G, GW, SE, W, Y; = Synosma suaveolens (Linnaeus) Rafinesque ex Britton -- S]

## Helenium Linnaeus (Sneezeweed, Bitterweed)

A genus of about 40 species, herbs, of America. References: Bierner (1989); Bierner (1972); Rock (1957); Knox (1987); Cronquist (1980)=SE.

1 Plant a taprooted annual; stem leaves very numerous, 0.5-2 (-4) mm wide, not decurrent on the stem or branches
H. amarum var amarum

1 Plant a fibrous-rooted perennial; stem leaves few to numerous, at least the larger more than 4 mm wide.
2 Disk flowers with lobes brown, red, or purple.
3 Disk flowers 5 -lobed and with 5 stamens . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . H. brevifolium
3 Disk flowers predominately 4-lobed and with 4 stamens . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . H. flexuosum
2 Disk flowers with lobes yellow.
4 Ray flowers bearing a pistil and style, mostly fertile.
5 Leaves not basally disposed, the basal leaves usually absent at flowering (if present, mostly less than 2 cm long), the stem leaves not progressively reduced upwards; pappus scales brownish, 0.3-1.2 mm long (usually less than 1 mm long); upper cauline leaves serrate (rarely entire), mostly oblanceolate, usually broadest near the midpoint or beyond it, with conspicuous lateral veins apparent on the lower surface

5 Leaves basally disposed, the basal rosette usually present at flowering, the basal leaves more than 4 cm long, larger than the progressively smaller stem leaves; pappus scales white-hyaline, 0.9-1.9 mm long (usually more than 1 mm long); upper cauline leaves entire, lanceolate, usually broadest at or near the base and rather evenly tapered to the apex, lacking conspicuous lateral veins
H. virginicum

4 Ray flowers lacking a pistil and style, sterile.
5 Midstem leaves barely decurrent on the stem, the decurrency less than 0.5 cm ; basal leaves often pinnatifid (less commonly merely dentate, repand, or entire), the lower portion of the leaf not contracted so as to be petiolate in form; achene pubescent on the ribs; peduncle pubescent; basal leaves (3.0-) 4.5-8.0 (-19.0) cm long, $0.3-1.1 \mathrm{~cm}$ wide, averaging ca. $7-10 \times$ as long as wide
H. pinnatifidum

5 Midstem leaves decurrent on the stem, the decurrency more than 2 cm , and usually extending to the next leaf down; basal leaves usually repand or entire (rarely somewhat lobed or pinnatifid), the lower portion narrowed into a petiolate form which enlarges at its base to more-or-less clasp the stem; achene glabrous, or pubescent on the ribs; peduncle pubescent or glabrous; basal leaves averaging narrower or broader in shape (see below). 6 Peduncle pubescent to tomentose or lanose between the uppermost leaf and the head; achene pubescent on the ribs; heads 1-4 per plant; basal leaves (2.5-) 4.0-10.5 (-18.0) cm long, (0.8-) 1.2-2.0 (-2.5) cm wide, averaging ca. $4-6 \times$ as long as wide
H. brevifolium

6 Peduncle glabrous or glabrate between the uppermost leaf and the head; achene glabrous; heads 1 per plant; basal leaves (3.0-) 6.5-17.0 (-25.0) cm long, (0.4-) 0.6-1.0 (-1.5) cm wide, averaging ca. 10-15× as long as wide
H. vernale

* Helenium amarum (Rafinesque) H. Rock var. amarum, Bitterweed. Cp, Pd, Mt (GA, NC, SC, VA): roadsides, overgrazed pastures, urban areas; common, apparently introduced from further west. May-December. Now widespread in e. North America. Bierner (1989) discusses the taxonomy of section Amarum, consisting only of the 2 varieties of H . amarum. Var. amarum is widespread; var. badium (A. Gray ex S. Watson) Waterfall, distinguished in part by its purple disk flowers, occurs in OK, TX, and Mexico. The plant has a very bitter taste and is generally avoided by grazing animals, a point noted by Rafinesque in his original description (in 1817): "the whole plant is odoriferous and intensely bitter, it gives an abominable taste to the milk of the cows that feed on it in summer." Overgrazed areas come to be dominated by H. amarum. In areas where it is frequently mowed, H . amarum appears to evolve a genotype capable of flowering and fruiting when only a few cm tall. [= C, K; H. tenuifolium Nuttall $--\mathrm{F}, \mathrm{S} ;<\mathrm{H}$. amarum -- RAB, G, SE, W]

Helenium autumnale Linnaeus var. autumnale, Common Sneezeweed. Mt, Pd, Cp (GA, NC, SC, VA): moist pastures, forests, woodlands, forest edges; common. September-October. Widespread in North America, from Québec west to British Columbia, south to FL and AZ. Like $H$ amarum, $H$. autumnale is bitter and unpalatable to grazing animals, becoming more
abundant in pastures. [= C, G, K, SE; < H. autumnale -- RAB; H. autumnale var. parviflorum (Nuttall) Fernald -- F, K; H. latifolium P. Miller -- S; H. parviflorum Nuttall -- S; < H. autumnale -- GW, W (also including H. virginicum)]

Helenium brevifolium (Nuttall) A. Wood. Cp (GA, NC, VA), Mt (NC, VA), Pd (GA, NC, VA): seepage bogs; rare (GA Special Concern, NC Rare, SC Rare, VA Rare). May-June. H. brevifolium has a peculiar distribution, reaching its greatest abundance on the Gulf Coastal Plain, from panhandle FL west to e. LA, and occurring at widely scattered disjunct sites in c. and n. AL, w. GA, c. and w. NC, ec. TN (Chester, Wofford, \& Kral 1997), and sw. and se. VA. [= RAB, C, G, GW, K, SE, W; >H. brevifolium - F, S; H. curtisii A. Gray -- F, S]

Helenium flexuosum Rafinesque, Southern Sneezweed. Cp, Pd, Mt (GA, NC, SC, VA): moist pastures, moist forests, riverbanks; common. May-August. S. ME west to MN, south to c. peninsular FL and TX. [= RAB, C, G, GW, K, SE, W; H. nudiflorum Nuttall -- F, S; H. polyphyllum Small -- S]

Helenium pinnatifidum (Nuttall) Rydberg. Cp (GA, NC, SC): wet savannas and adjacent ditches; rare (NC Rare, SC Rare). April-May. A Southeastern Coastal Plain endemic: se. NC south to s. FL, west to panhandle FL, sw. GA, and s. AL. [= RAB, GW, K, SE; H. vernale -- S, misapplied]

Helenium vernale Walter. Cp (GA, NC, SC): wet savannas and adjacent ditches; rare (NC Proposed Endangered). AprilMay. A Southeastern Coastal Plain endemic: se. NC south to panhandle FL and west to e. LA. [= RAB, GW, K, SE; Helenium helenium (Nuttall) Small -- S]

Helenium virginicum S.F. Blake, Virginia Sneezeweed. Mt (VA): seasonal sinkhole ponds and clearings where such ponds once occurred; rare (US Species of Concern, VA Endangered). July-September. H. virginicum is endemic to bimodally endemic in VA (Augusta and Rockingham counties, VA, where a series of sinkhole ponds (dolines) on acid colluvium support numerous Coastal Plain disjuncts) and MO. See Knox (1987) for a comparison of this narrow endemic and H. autumnale. Knox (1997) presents a study of the demography and habitat of $H$. virginicum. [= C, F, G, K, SE; < H. autumnale -- GW, W]

* Helenium amarum (Rafinesque) H. Rock var. badium (A. Gray ex S. Watson) Waterfall. Cp (SC): waste areas around woolcombing mill; rare, perhaps only a waif, introduced from OK and TX. May-June. See Nesom (2004d). [= K; H. amarum -- SE, infraspecific taxa not distinguished] \{not yet keyed; add synonymy\}
* Helenium elegans Augustin de Candolle var. elegans. Cp (SC): waste areas around wool-combing mill; rare, perhaps only a waif, introduced from LA, OK, and TX. May. See Nesom (2004d). [= K] \{not yet keyed; add synonymy\}
* Helenium microcephalum Augustin de Candolle var. microcephalum. Cp (SC): waste areas around wool-combing mills; rare, perhaps only a waif, introduced from OK, TX, NM, and CO. May-July. See Nesom (2004d). [= K] \{not yet keyed; add synonymy\}
* Helenium quadridentatum Labill. Reported for SC by Kartesz (1999); also east to AL (SE). \{investigate\} [= K, SE]

## Helianthus Linnaeus (Sunflower)

A genus of about 50 species, herbs, of North America. References: Schilling in FNA (in prep); Heiser et al. (1969); Cronquist (1980) $=$ SE; Schilling et al. (1998). Key adapted from FNA, SE, RAB, and Heiser et al. (1969).

## Key A - sunflowers with basally disposed leaves

1 Disk flowers yellow.
2 Basal leaves $13-30 \mathrm{~cm}$ long, $0.7-2.0 \mathrm{~cm}$ wide; leaves $10-20 \times$ as long as wide, glabrous . . . . . . . . . . . . . . H. Iongifolius
2 Basal leaves 6-15 cm long, 2-8 cm wide; leaves $1.5-5 \times$ as long as wide, scabrous or hirsute (rarely glabrous)
H. occidentalis var. dowellianus

1 Disk flowers red or purple (at least in part).
3 Basal leaves $6-20 \mathrm{~cm}$ long; lower several pairs of stem leaves up to $1 / 2$ as long and wide as the basal leaves.
4 Trichomes on the leaf abaxial midrib more than 1 mm long; lower stem with a few pairs of leaves (<8 nodes below the capitulescence), these strongly reduced upwards; leaf blades (1.3-) 1.7-2.5 (-3)× as long as wide; petiole often more than $1 / 3$ as long as the blade, broadly winged towards the blade; plants to 2 m tall; nonflowering stems usually absent; [widespread in our area]
H. atrorubens

4 Trichomes on the leaf abaxial midrib 1 mm long or less; lower stem leafy, often to above the middle (>8 nodes below the capitulescence); leaf blades 1-1.7 ( -2 ) $\times$ as long as wide; petiole usually less than $1 / 3$ as long as the blade, narrowly winged towards the blade; plants to 3 m tall; nonflowering stems usually present; [west of our area]

3 Basal leaves 4-15 cm long; lower several pairs of stem leaves often less than $1 / 2$ as long and wide as the basal leaves. 5 Basal leaves (1.6-) 2-5x as long as wide; ray flowers present, typically 1.5-3.5 cm long; [of wet savannas and bogs]

5 Basal leaves1-1.5x as long as wide; ray flowers none, or present but less than 1 cm long; [of dry savannas and sandhills] H. radula

## Key $B$ - annual sunflowers

## Key C-perennial sunflowers with leafy stems and red disk flowers

1 Leaf blades long and narrow, linear or lanceolate and usually $>10 \times$ as long as wide.
2 Stems glabrous and glaucous; leaf margins not revolute . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [H. salicifolius]
2 Stems pubescent; leaf margins often revolute.
3 Plants short, less than 1.5 m tall; leaves less than 1 cm wide; rhizomes lacking or poorly developed
H. angustifolius

3 Plants robust, more than 1.5 m tall; leaves more than 1 cm wide; rhizomes well developed . . . . . . . . . H. simulans
1 Leaf blades shorter and broader, lanceolate, lance-ovate, deltoid, deltoid-ovate and usually $<5 \times$ as long as wide.
4 Phyllaries $1.5-3 \mathrm{~mm}$ broad, lanceolate
H. floridanus

4 Phyllaries 3-5 mm broad, oblong, ovate, or obovate.
5 Abaxial surfaces of leaves and ligules lacking subsessile glandular trichomes; leaves usually broadly ovate to orbicular and with a petiole more than 1 cm long [H. silphioides]
5 Abaxial surfaces of leaves and ligules with subsessile glandular trichomes; leaves usually lanceolate to lance-ovate or rhombic-ovate and with a petiole usually not more than 1 cm long.
6 Phyllaries oblong-lanceolate, apex acuminate, abaxially usually pubescent
H. laetiflorus

6 Phyllaries elliptical to oblong-ovate, apex acute, abaxially glabrate
H. pauciflorus ssp. pauciflorus

## Key $D$ - perennial sunflowers with leafy stems and yellow disk flowers

1 Stems below the capitulescence glabrous or nearly so, sometimes glaucous.

8 Leaves sessile, rounded to cordate at base, and trinerved, with the 2 lateral veins diverging from the midrib at the very base of the leaf
H. divaricatus

8 Leaves sessile to petiolate, but narrowing gradually to base and triplinerved, the 2 lateral veins diverging from the midrib above the base of the blade.
9 Anther appendages yellow.
10 Leave blade lanceolate to lance-ovate, sessile to petiolate but the petiole usually less than $1 / 4$ as long as the blade; phyllaries not conspicuously graduated and imbricate, usually loose and spreading
H. grosseserratus

10 Leaf blade ovate to elliptic, with a distinct petiole usually more than 2 cm long and $1 / 2$ as long as blade or longer; phyllaries conspicuously graduated and imbricate, usually appressed, not exceeding disk ...................... H. occidentalis var. dowellianus
9 Anther appendages dark or reddish-brown.
11 Plants producing abundant tubers; leaves subsessile, the petioles less than 1 cm long; [endemic to the Piedmont of NC and SC] . . . . . . . . . . . . . . . . . . . . . . . . . H. schweinitz
11 Plants rhizomatous, but not producing tubers; leaves petiolate, the petioles 1-5 cm long; [collectively widespread in our area].
12 Phyllaries equal to or slightly exceeding disk, apex acute; leaves moderately serrate to entire, with a petiole 1-3 cm long, and abaxially with usually abundant subsessile glandular trichomes ("resin dots")
H. strumosus

12 Longer phyllaries usually exceeding disk by $1 / 2$ their length or more, apex acuminate; larger leaves moderately to conspicuously serrate, with a petiole 2-5 cm long, and abaxially with usually relatively few subsessile glandular trichomes . . H. decapetalus 1 Stems pubescent throughout, not glaucous.

13 Leaves sessile and cordate, mostly or all opposite . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . H. mollis
13 Leaves petiolate or sessile, but not cordate, and alternate or opposite.
14 Phyllaries attenuate, conspicuously exceeding the disk in length and reflexed, apically with numerous subsessile glandular trichomes ("resin dots"); leaf bases often convex, the basically ovate or lance-ovate blade joined to a broadly winged and gradually narrowed petiole . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . H. resinosus
14 Phyllaries acute to attenuate, but not reflexed, subsessile glandular trichomes present or absent; leaf bases usually attenuate to truncate or rounded, the blade lance-linear or lanceolate, or if ovate or lance-ovate either sessile or with a petiole that is at most narrowly winged.
15 Leaves conduplicate and entire, usually with only a single prominent main vein; inflorescence when well developed spiciform or racemose
H. maximilianii

15 Leaves not conduplicate, entire or serrate, triplinerved (with a prominent lateral pair of veins near the base); inflorescence not spiciform or racemose.
16 Phyllaries conspicuously graduated and imbricate, usually appressed.
17 Leaf blades lanceolate to ovate, 1-5 cm long and usually less than $1 / 2$ as long as blade; anther appendages with dark pigment; cypselae $4-5 \mathrm{~mm}$, usually sterile . . . . . . . . . . . . . . . . . . H. laetiflorus
17 Leaf blades ovate to elliptic, petiole distinct, more than 2 cm and usually $1 / 2$ as long as blade or longer; anther appendages yellow; cypselae $3-4 \mathrm{~mm}$ long, fertile . . . . . . H. occidentalis var. dowellianus
16 Phyllaries not conspicuously graduated and imbricate, usually loose or spreading.
18 Leaves with a prominent petiole 2 cm or more long, blades lance-ovate to ovate and more than 5 cm broad; cypselae 5-7 mm long; tubers produced late in growing season
H. tuberosus

18 Leaves sessile or with a short petiole usually less than 2 cm long; blades linear to lanceolate, less than 4.5 cm broad; cypselae $3-5 \mathrm{~cm}$ long; tubers present or absent.
19 Leaves truncate to broadly rounded at base, shortly but distinctly petiolate . . . . . . H. hirsutus 19 Leaves cuneate, gradually narrowing to base, sessile to petiolate.

20 Ligules lacking subsessile glandular trichomes; leaves not strongly revolute . H. giganteus
20 Ligules abaxially with subsessile glandular trichomes ("resin dots"); leaves usually revolute.
21 Heads relatively small, the disks usually less than 15 mm across; tubers present ..
21 Heads larger, the disks (at least the larger) more than 15 mm across; tubers absent.
22 Leaves conspicuously undulate, lanceolate to elliptical to ovate and rarely more than 5 x as long as broad; outer phyllaries often obtuse . . . . . . . . H. floridanu
22 Leaves not conspicuously undulate, linear to lanceolate and more than $5 x$ as long as broad; outer phyllaries acute to slightly acuminate.
23 Plants short, less than 1.5 m tall; leaves less than 1 cm wide; rhizomes lacking or poorly developed
H. angustifolius

23 Plants robust, more than 1.5 m tall; leaves more than 1 cm wide; rhizomes well developed.
H. simulans

Helianthus agrestis Pollard, Southeastern Sunflower. Cp (GA): mucky areas in pine flatwoods; rare (GA Special Concern). August-December. S. GA and FL peninsula. [= FNA, GW, K, S, SE]

Helianthus angustifolius Linnaeus, Narrowleaf Sunflower. Cp, Mt, Pd (GA, NC, SC, VA): savannas, ditches, marshes, other wet habitats; common (uncommon in Piedmont, rare in Mountains). (July-) September-October (-frost). Primarily Coastal Plain, from Long Island, NY south to FL and west to $T X$, irregularly inland to $O H$, $I N$, and MO. This plant is very showy when in flower on roadsides, especially in October. [= RAB, C, FNA, G, GW, K, S, SE, W; H. angustifolius var. angustifolius - F; H. angustifolius var. planifolius Fernald -- F]

* Helianthus annuus Linnaeus, Common Sunflower. Cp (GA, NC, SC, VA), Pd, Mt (NC, SC, VA): disturbed areas, often cultivated in gardens, sometimes cultivated in fields; uncommon, introduced from the Plains states. June-October. This is the sunflower grown for its seeds. [= RAB, C, F, FNA, G, K, S, SE, W]
* Helianthus argophyllus Torrey \& A. Gray, Silverleaf Sunflower. Cp (NC): disturbed sandy soil on a barrier island and adjacent dunes; rare, introduced from TX. July-October. Native to s. TX. Heiser et al. (1969) noted a collection from NC, but stated their uncertainty as to its establishment. H. argophyllus is well-established near Captain Charlie's on Bald Head Island, Brunswick County, where it has apparently persisted and spread over the last 30 years (at least). [= F, FNA, K, S, SE]

Helianthus atrorubens Linnaeus, Appalachian Sunflower. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): dry soils of rocky, sandy, or clayey woodlands and roadbanks; common (uncommon in VA Mountains). Late July-October. VA west to w. TN, and south to c. GA, AL, and se. LA. Related to the Ozarkean H. silphioides Nuttall. [= RAB, C, FNA, G, K, SE, W; H. atrorubens var. alsodes Fernald -- F; H. atrorubens var. atrorubens - F; H. atrorubens -- S (defined more broadly, including H. silphioides Nuttall)]

* Helianthus debilis Nuttall ssp. cucumerifolius (Torrey \& A. Gray) Heiser, Cucumber-leaf Sunflower. Cp (GA, NC, SC, VA): sandy soils of fields and roadsides; common (rare in VA), introduced from the Gulf Coast states. May-August. [= FNA, K; H. debilis var. cucumerifolius (Torrey \& A. Gray) A. Gray -- RAB, C, F; H. cucumerifolius Torrey \& A. Gray -- G, S; H. debilis ssp. cucumerifolius (Torrey \& A. Gray) Heiser var. cucumerifolius (Torrey \& A. Gray) A. Gray -- SE]

Helianthus debilis Nuttall ssp. tardiflorus Heiser. Cp (GA): sandy beaches, dry pinelands; uncommon. March-September. GA, FL, AL, and MS. [= FNA, K; H. debilis - S; H. debilis ssp. cucumerifolius (Torrey \& Gray) Heiser var. tardiflorus (Heiser) Cronquist - SE]

Helianthus decapetalus Linnaeus, Forest Sunflower. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): mesic woodlands and forests; common (rare in Coastal Plain). July-October. ME and Québec west to WI and IA, and south to GA and MO. [= RAB, C, F, FNA, G, K, S, SE, W; H. trachelifolius P. Miller -- F]

Helianthus divaricatus Linnaeus, Spreading Sunflower. Pd, Mt, Cp (GA, NC, SC, VA): mesic to dry woodlands and forests, forest edges; common (rare in Coastal Plain). June-August. Nearly throughout e. United States and adjacent Canada. [= RAB, C, FNA, G, K, S, SE, W; H. divaricatus var. angustifolius Kuntze -- F; H. divaricatus var. divaricatus - F]

Helianthus eggertii Small, Eggert's Sunflower. Pd (SC): diabase barrens; rare. C. TN (Chester, Wofford, \& Kral 1997), sc. KY, and n. AL; apparently disjunct in nc. SC (McMillan pers. comm. 2003, specimen at CLEMS), though there is controversy about the identity. [= FNA, K, S, SE]

Helianthus floridanus A. Gray ex Chapman, Florida Sunflower. Cp (GA, NC, SC): wet savannas and pocosin edges; rare (NC Watch List). September-October. A Southeastern Coastal Plain species, ranging from se. NC south to FL and west to se LA. [= RAB, FNA, GW, K, S, SE]

Helianthus giganteus Linnaeus, Tuberous Sunflower, Swamp Sunflower. Pd (NC, SC, VA), Mt (GA, NC, VA), Cp (NC, VA): bog edges, moist thickets, ditches; uncommon. Late July-October. New Brunswick and ME west to MN, south to n. SC, n. GA, e. and c. TN, c. KY, n. IN, n. IL, and WI. [= RAB, C, F, FNA, G, GW, K, S, SE, W; H. alienus E.E. Watson -- S; H. validus E.E. Watson -- S]

Helianthus glaucophyllus D.M. Smith, Whiteleaf Sunflower. Mt (NC, SC), Pd (SC): moist forests, woodlands, and woodland edges, at medium elevations, mostly from 1000-1500m (but sometimes lower), generally flowering only when in a canopy gap (as caused by a tree-fall) or along banks of narrow roads; rare (NC Watch List, SC Rare). July-September. A narrow Southern Appalachian endemic: w. NC, nw. SC, and ne. TN (Chester, Wofford, \& Kral 1997). First reported for South Carolina by Hill \& Horn (1997). [= RAB, FNA, K, SE, W]

* Helianthus grosseserratus Martens, Sawtooth Sunflower. Pd (GA, NC, VA), Mt, Cp (VA): disturbed areas; rare, introduced from farther west. The original range of this species was apparently centered in OH, IN, IL, IA, and MO, but it is obscured by its subsequent spread. Reported for NC by Matthews \& Mellichamp (1989). [= C, F, FNA, G, K, W; H. grosse-serratus -- S, SE (an orthographic variant)]

Helianthus heterophyllus Nuttall, Savanna Sunflower. Cp (GA, NC, SC): wet savannas, seepage bogs; uncommon (GA Special Concern). August-October. A Southeastern Coastal Plain endemic: se. NC south to n. FL and west to se LA. [= RAB, FNA, GW, K, S, SE]

Helianthus hirsutus Rafinesque, Hairy Sunflower. Mt, Pd (GA, NC, SC, VA), Cp (SC): woodlands and other sunny or semisunny habitats; uncommon (VA Watch List). July-October. PA and MN, south to $n$ FL and TX. [= RAB, C, FNA, G, K, S, SE, W; H. hirsutus var. hirsutus - F; H. hirsutus var. trachyphyllus Torrey \& Gray - F; H. hirsutus var. stenophyllus Torrey \& Gray - F]

* Helianthus laetiflorus Persoon. Cp, Pd (NC, SC, VA), Mt (VA): disturbed areas; uncommon, introduced from farther west. Late July-September. Widely scattered in e. and c. North America, believed to be a derivative of the hybrid of $H$. pauciflorus Nuttall ssp. subrhomboideus (Rydberg) O. Spring \& E. Schilling and H. tuberosus. [ = RAB, G, S, SE; H. ×laetiflorus Persoon (pro sp.) -- C, FNA, K; H. laetiflorus var. laetiflorus -- F]

Helianthus laevigatus Torrey \& A. Gray, Shale-barren Sunflower, Smooth Sunflower. Mt (NC, VA), Pd (NC, SC, VA): on dry, rocky or shaly soils, on roadbanks, powerline rights-of-way, open woodlands, in the Carolinas nearly limited to the Carolina Slate Belt; common, rare south of VA (NC Rare, SC Rare). September-October. The primary range of $H$. laevigatus is in the mountains of c. and w. VA and e. WV, from whence it is disjunct to a few areas in NC and SC, most notably the Carolina Slate Belt in Stanly County, NC. [= RAB, C, F, FNA, G, K, S, SE, W; H. reindutus (Steele) E.E. Watson -- S]

Helianthus longifolius Pursh, Longleaf Sunflower. Mt (GA, NC*), Pd, Cp (GA): sandstone and granite glades and woodlands; rare (NC Watch List). August-October. This species is apparently rare, occurring in ne. AL, n. GA (introduced in sw. NC). [= RAB, FNA, K, S, SE]

* Helianthus maximilianii Schräder, Maximilian Sunflower. Pd, Mt (NC, SC, VA), Cp (NC, VA): moist roadsides and disturbed areas; rare (becoming common), introduced from farther west. September-October. Manitoba and MI west to British Columbia and south to TX; introduced in the East. [= C, SE, W; H. maximiliani -- RAB, F, FNA, G, K, S, orthographic variant]

Helianthus microcephalus Torrey \& A. Gray, Small-headed Sunflower. Pd, Mt (GA, NC, SC, VA), Cp (GA, NC, SC): dry woodlands and roadbanks; common (uncommon in Coastal Plain, rare in much of VA). August-October. NJ west to MN, south to nw. FL and se. LA. [= RAB, C, F, FNA, G, K, S, SE, W]

* Helianthus mollis Lamarck, Ashy Sunflower. Cp (NC, SC, VA), Pd, Mt (GA, NC, VA): disturbed places; rare, introduced from
farther west (VA Watch List). July-September. Apparently native of the Midwest, centered in IN, IL, MO, AR, c. TN, and w. KY, its original distribution obscured by its subsequent spread. \{perhaps native in nw. GA?\} [= RAB, C, FNA, G, K, S, SE, W; H. mollis var. cordatus S. Watson -- F; H. mollis var. mollis - F]

Helianthus occidentalis Riddell var. dowellianus (M.A. Curtis) Torrey \& A. Gray, Naked-stem Sunflower. Mt (GA, NC, VA), Pd (VA): rocky or sandy flood-scoured riversides; rare (NC Rare, VA Rare). August-October. MD and DC west to MN, and south to w. NC, n. GA, w. FL, and TX. Ssp. occidentalis occupies most of the range of the species. Ssp. plantagineus (Torrey \& Gray) Shinners occurs in sw LA, se. TX, and AR. Var. dowellianus Torrey \& Gray, of uncertain status (if valid, then usually treated as a variety under ssp. occidentalis), occurs in the Appalachian portion of the range. The species has been collected only twice in NC, the type collection of $H$. dowellianus M.A. Curtis, from "near Franklin, Macon Co.," and in 1897, near Asheville, Buncombe County ("sandy bottoms along the French Broad River near Biltmore"). GAHP reports H. occidentalis as a rare species in the state, from "limestone glades and barrens, rocky or cherty soils" (GAHP 2003); it is uncertain what variety is represented. [=C, F, SE; H. occidentalis ssp. occidentalis -- FNA, K; H. occidentalis -- RAB, G, S, W, infraspecific taxa not distinguished; H. occidentalis var. dowellianus Torrey \& A. Gray -- C, F, SE; H. dowellianus M.A. Curtis]

* Helianthus pauciflorus Nuttall ssp. pauciflorus, Stiff Sunflower. Pd (GA), \{VA\}: disturbed areas; rare, introduced from midwestern United States. July-September. Reported for VA by Fernald (1950) under the name H. laetiflorus var. rigidus and for nc. GA by Jones \& Coile (1988) under the name H. rigidus (Cassini) Desf. [= FNA, K; H. pauciflorus var. pauciflorus - C; $H$. laetiflorus var. rigidus (Cassini) Fernald - F; H. rigidus (Cassini) Desfontaines - S; H. rigidus var. rigidus - SE]
* Helianthus petiolaris Nuttall ssp. petiolaris, Plains Sunflower. Cp (NC, SC, VA): disturbed areas in sandy soil; rare, introduced from the Great Plains, where it is native. May-August. [= FNA, K; < H. petiolaris -- RAB, F, G, S; = H. petiolaris var. petiolaris -- C, SE]

Helianthus porteri (A. Gray) Pruski, Confederate Daisy. Pd (GA, NC*, SC): in shallow soils over granite on low-elevation granite domes or flatrocks; uncommon, native in GA and SC, introduced and vigorously established in NC (SC Rare). AugustSeptember. A Piedmont endemic: SC south to GA and AL. The species, often treated in Viguiera, is well-established on Rocky Face Mountain, Alexander County, NC, where it was introduced as part of a ecological experiment. See Pruski (1998) and Schilling et al. (1998) for discussion of the reasons for treating this species in Helianthus. [= FNA, K; = Viguiera porteri (A. Gray) Blake -- S, SE]

Helianthus radula (Pursh) Torrey \& A. Gray, Roundleaf Sunflower, Rayless Sunflower. Cp (GA, SC): sandhills, dryish savannas, and dry pine flatwoods; rare. Late August-October. Ranging from s. SC south to c. FL and west to se. LA. It is readily distinguishable from all other species by its rosette of orbicular to nearly round leaves, borne flat against the ground. [= RAB, FNA, GW, K, S, SE]

Helianthus resinosus Small, Resinous Sunflower. Pd, Mt, Cp (GA, NC, SC): woodlands, thickets, roadsides; uncommon. June-October. Nc. and w. NC south to w. FL and west to MS. Listed for VA by F; documentation unknown. [= FNA, K, S, SE, W; H. tomentosus Michaux -- RAB, F, S, misapplied]

Helianthus schweinitzii Torrey \& A. Gray, Schweinitz's Sunflower. Pd (NC, SC): clayey soils of woodlands and roadsides, in areas formerly with post oak-blackjack oak savannas, xeric oak-pine woodlands, or "Piedmont prairies," now primarily on mowed road or powerline rights-of-way; rare (US Endangered, NC Endangered, SC Rare). Late August-October. The range is limited to the Piedmont of NC and SC, primarily within 100 km of Charlotte, NC. Some earlier reports (as in Heiser et al. 1969) of occurrences in se. NC, e. SC, and c. SC are based on misidentifications. See Matthews, Barden, \& Matthews (1997) for an informative discussion about this species. [= RAB, FNA, K, S, SE]

Helianthus simulans E . Watson. Cp, Pd (GA, SC): wet soils, ditches, roadsides; rare. October-November. SC west to LA. [= FNA, GW, K, S, SE]

Helianthus smithii Heiser, Smith's Sunflower. Mt (GA): dry forests and woodlands; rare (GA Special Concern). AugustSeptember. Known from n. GA, e. AL, and se. TN. It has small heads (like H. microcephalus, H. laevigatus, H. schweinitzii), the leaves narrowly lanceolate and subsessile (like $H$. schweinitzii or $H$. laevigatus), the leaves resin-dotted below (like $H$. microcephalus), but nearly glabrous. It may be a hybrid derivative of $H$. microcephalus and $H$. strumosus. [= FNA, K; < $H$. microcephalus -- C, SE]

Helianthus strumosus Linnaeus, Roughleaf Sunflower. Mt, Pd, Cp (GA, NC, SC, VA): woodlands and roadsides; common (rare in Coastal Plain). Late July-September. ME, MN, and KA south to FL and TX. [= RAB, C, F, FNA, G, K, S, SE, W; H. montanus E.E. Watson - S; H. saxicolus -- S]

* Helianthus tuberosus Linnaeus, Jerusalem Artichoke. Mt, Pd, Cp (GA, NC, SC, VA): disturbed areas, cultivated in gardens for the edible tubers; common, introduced from farther west. July-October. [= RAB, C, FNA, K, S, SE, W; H. tuberosus var. tuberosus -- F, G]

Helianthus verticillatus Small, Whorled Sunflower. Mt (GA): wet calcareous prairies; rare (GA Special Concern). AugustOctober. Nw. GA, ne. AL, and sc. TN. This taxon is a species, not a hybrid; its morphological characteristics alone (with its unique whorled leaves) make hybrid status implausible. See Matthews et al. (2002) for additional information. [= FNA, S; = H. xverticillatus E.E. Watson (prosp.) -- K; = "a hybrid of H. angustifolius with either H. eggertii or H. grosseserratus"- C, SE]

* Helianthus salicifolius A. Dietr. is reported for MD by Kartesz (1999). Not in our area in FNA. [= C, F, FNA, G, K, SE] \{not keyed\}

Helianthus silphioides Nuttall, widespread in TN, including east to se. TN (Chester, Wofford, \& Kral 1997). [= C, F, FNA, K, SE; $H$. atrorubens Linnaeus var. pubescens Kuntze] \{add synonymy\}

## Heliomeris Nuttall

* Heliomeris multiflora (Nuttall) Blake var. multiflora. Cp (SC): waste areas around wool-combing mill; rare, perhaps only a waif, introduced from western United States and Mexico. May. [ = K] \{not yet keyed\}

## Heliopsis Persoon (Sunflower-everlasting, Oxeye)

A genus of about 15 species, herbs, of America. References: Fisher (1957)=Z; Cronquist (1980)=SE. Key adapted in part from $Z$.
1 Plants 3-8 dm tall; larger leaves on a plant generally 3-8 cm long; heads 1 (-3) per plant; rays 6-10 (-13) per head; rays 1-2 (2.4) cm long; [of the Coastal Plain] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . H. helianthoides var. gracilis

1 Plants (4-) 8-15 dm tall; larger leaves on a plant generally $7-15 \mathrm{~cm}$ long; heads (1-) 3-8 per plant; rays (8-) 10-16 per head; rays (1.5-) 2-4 cm long; [widespread in our area, rare in the Coastal Plain].

2 Leaves smooth on both sides (or slightly scabrous above); leaves 4.5-6.0 cm wide; stem glabrous and glaucous below, slightly scabrous above . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . H. helianthoides var. helianthoide
2 Leaves scabrous on both sides; leaves 3.0-3.5 cm wide; stem generally scabrous ...... [H. helianthoides var. scabra]
Heliopsis helianthoides (Linnaeus) Sweet var. gracilis (Nuttall) Gandhi \& Thomas, Coastal Plain Sunflower-everlasting, Coastal Plain Oxeye. Cp (GA, SC): moist calcareous forests; rare. April-July; May-July. A Southeastern Coastal Plain endemic: se. SC (Berkeley, Dorchester, and Charleston counties) south to GA (Jones \& Coile 1988) and west to LA (Thomas \& Allen 1996). [= K; H. minor (Hooker) C. Mohr - S; H. gracilis Nuttall - Z]

Heliopsis helianthoides (Linnaeus) Sweet var. helianthoides, Eastern Sunflower-everlasting, Eastern Oxeye. Mt, Pd (GA, NC, SC, VA), Cp (VA): forests, woodlands, woodland borders; common (rare in Coastal Plain). May-October. Québec to British Columbia, south to GA and NM. [= C, F, K, SE; H. helianthoides -- RAB, infraspecific taxa not distinguished; $H$. helianthoides var. solidaginoides (Linnaeus) Fernald -- F; H. helianthoides -- S, in the narrow sense; H. helianthoides ssp. helianthoides -- Z]

Heliopsis helianthoides (Linnaeus) Sweet var. scabra (Dunal) Fernald, Western Sunflower-everlasting, Western Oxeye. Pd (VA): forests, woodlands, woodland borders; rare? May-October. This taxon has been ascribed to our area by various authors; its distribution in our area needs confirmation. [= C, F, K, SE; H. helianthoides -- RAB, infraspecific taxa not distinguished; H. scabra Dunal -- S; H. helianthoides ssp. scabra (Dunal) Fisher -- Z]

## Heterotheca Cassini (Camphorweed, Golden-aster)

(also see Chrysopsis and Pityopsis)
A genus of about 25 species, herbs, of s. North America. References: Wagenknecht (1960)=Z; Semple (1996)=Y; Gandhi \& Thomas (1980)=X; Semple (2004)= Q; Cronquist (1980)=SE; Semple (1983). Key adapted in part from Z and X.

1 Ray flowers with pappus; perennial, from creeping rhizomes; upper and lower leaves cuneate to a sessile base H. camporum var glandulis im

1 Ray flowers without pappus; annual or biennial, taprooted; upper leaves rounded to clasping at the sessile base, lower leaves (deciduous by late in the season) petiolate.
2 Plants erect, 0.5-2 m tall; leaves hirsute-pilose on both sides or scabrous above; phyllaries moderately hirsute and glandular on the back; [of a variety of weedy habitats, mainly inland] . . . . . . . . . . . . . . . . . . . . . H. latifolia var. latifolia
2 Plants erect or decumbent, 0.3-1 m tall; leaves scabrous on both sides or only beneath; phyllaries densely hirsute and glandular on the back; [of coastal dunes]
H. subaxillaris

* Heterotheca camporum (Greene) Shinners var. glandulissimum Semple, Nashville Camphorweed. Mt (GA, NC, VA), Pd, (GA, NC), Cp (NC): roadsides, disturbed areas; rare, introduced from c. TN. This variety is apparently native in the Nashville Basin of Tennessee. [= K, Y; Chrysopsis camporum Greene var. glandulissima (Semple) Cronquist -- C; Chrysopsis camporum -- F, SE, W; Chrysopsis villosa (Pursh) Nuttall var. camporum (Greene) Cronquist -- G]
* Heterotheca latifolia Buckley var. Iatifolia, Common Camphorweed. Pd (GA, NC, SC, VA), Cp (NC, SC, VA), Mt (NC, SC): roadsides, disturbed areas; common, introduced from the sc. United States and adjacent Mexico. [=Y; = H. subaxillaris (Lamarck) Britton \& Rusby var. latifolia (Buckley) Gandhi \& Thomas -- X; < H. subaxillaris -- RAB, C, F, G, K, S, SE, W; H. latifolia var. Iatifolia -- Z; H. subaxillaris (Lamarck) Britton \& Rusby ssp. latifolia (Buckley) Semple - Q]

Heterotheca subaxillaris (Lamarck) Britton \& Rusby, Dune Camphorweed. Cp (GA, NC, SC, VA), Pd (GA): coastal dunes and sand-flats; common. July-October (-December). NJ south to FL, west to TX and Mexico, along the coast. This taxon is apparently native in our area, and is a conspicuous component of the flora of ocean dunes. [= Y; H. subaxillaris (Lamarck) Britton \& Rusby var. subaxillaris -- X, Z; < H. subaxillaris -- RAB, C, F, G, K, S, SE (also see H. latifolia); H. subaxillaris var. subaxillaris -- Z; $H$. subaxillaris ssp. subaxillaris $-Q$ ]

## Hieracium Linnaeus (Hawkweed, King-devil)

A genus of 100-200 (or many more) species, herbs, primariy temperate. Hieracium is a complicated genus, with many apomictic races sometimes recognized as taxa. Sometimes separated into Hieracium and Pilosella. References: Cronquist (1980)=SE. Key adapted from C .

1 Leaves primarily cauline, the largest leaves definitely on the stem, basal leaves usually absent.
2 Leaves nearly glabrous, or with a few long hairs on the lower surface; upper stem glabrous H. paniculatum

2 Leaves setose, with long hairs on the upper and lower surfaces; upper stem stipitate-glandular $\qquad$ H. scabrum

1 Leaves primarily basal, the largest leaves basal, leaves in some species extending onto the lower portion of the stem.
3 Plants stoloniferous; [aliens of weedy habitats, especially pastures, roadsides, and lawns]; [Pilosella].

* Hieracium aurantiacum Linnaeus, Orange Hawkweed, Devil's-paintbrush, Orange King-devil, Fox-and-cubs. Mt (NC, VA), Pd (VA): pastures, roadsides; rare, introduced from Europe. May-July. [= RAB, F, G, K, SE, W; Pilosella aurantiaca (Linnaeus) F. Schultz \& Schultz-Bipontinus]
* Hieracium caespitosum Dumortier, Yellow King-devil, Yellow Fox-and-cubs. Mt (GA, NC, SC, VA), Pd (NC, VA), Cp (VA): pastures, fields, roadsides; common, introduced from Europe. May-July. [= C, K, SE, W; H. pratense Tausch -- RAB, F, G; Pilosella caespitosa (Dumortier) Sell \& C. West]
* Hieracium flagellare Willdenow, Whiplash Hawkweed. Mt? (VA): roadsides; rare, introduced from Europe. Considered to derive from hybridization between H. caespitosum Dumortier and H. pilosella Linnaeus. [= C, F, SE; H. xflagellare Willdenow (pro sp.) var. flagellare -- K; Pilosella flagellaris (Willdenow) Sell \& C. West]
* Hieracium floribundum Wimmer \& Grabowski, Glaucous Hawkweed. Mt, Pd (VA): roadsides, pastures; rare, introduced from Europe. Considered to derive from hybridization between H. caespitosum Dumortier and H. lactucella Wallroth. [= C, F, G; H. xfloribundum Wimmer \& Grabowski (pro sp.) -- K; Pilosella floribunda (Wimmer \& Grabowski) Arvet-Touvet]

Hieracium gronovii Linnaeus, Beaked Hawkweed. Cp, Pd, Mt (GA, NC, SC, VA): sandhills, dry forests, woodland margins, roadsides; common. July-November. MA west to s. Ontario and KS, south to c. peninsular FL and TX. [= RAB, C, F, G, K, S, SE, W]

Hieracium marianum Willdenow, Maryland Hawkweed. Cp, Pd, Mt (NC, SC, VA): dry forests, woodland margins, roadsides; common. May-November. NH west to OH , south to FL and MS. Considered to derive from hybridization between $H$. gronovii Linnaeus and H. venosum Linnaeus. [= F, K, S; H. ×marianum Willdenow (pro sp.) -- RAB, C, SE]

Hieracium megacephalon Nash, Bigheaded Hawkweed. Cp (GA): dry sandy soils of pinelands and hammocks; uncommon. S. GA south to s. FL. [= K, S; H. megacephalum - SE, orthographic variant; H. argyraeum Small - S]

Hieracium paniculatum Linnaeus, Leafy Hawkweed. Mt (GA, NC, SC, VA), Pd (NC, VA): dry to mesic forests, especially along dirt roads; common. July-October. Nova Scoia and Québec west to MN, south to w. NC, n. GA, and OH. The leafy stem and lack of basal leaves of $H$. paniculatum readily distinguish it from our other species of Hieracium. In fact, it often puzzles the inexperienced botanist, who may overlook the possibility that this plant is a Hieracium! The milky sap and obscure teeth on the leaves are good corroborative characters. [= RAB, C, F, G, K, S, SE, W]

* Hieracium pilosella Linnaeus, Mouse-ear Hawkweed. Mt (GA, NC, VA), Pd (NC, VA), Cp (VA): pastures, roadsides, disturbed areas; uncommon, introduced from Europe. May-July. [= RAB, C, G, SE, W; H. pilosella var. pilosella -- F, K; Pilosella officinarum F. Schultz \& Schultz-Bipontinus]
* Hieracium piloselloides Villars, Glaucous King-devil. Mt (GA, NC, SC, VA), Pd, Cp (VA): fields, pastures, roadsides, rare,
introduced from Europe. May-September. [= C, K; H. florentinum Allioni -- RAB, F, G, SE, W; Pilosella piloselloides (Villars) Soják]

Hieracium scabrum Michaux, Rough Hawkweed. Mt (GA, NC, SC, VA), Pd (NC, VA), Cp (VA): dry forests, woodland margins, roadsides; common (GA Special Concern). July-November. Nova Scotia and Québec west to MN, south to VA, n. GA, KY, and MO. [= RAB, C, G, S, SE, W; H. scabrum var. scabrum -- F, K]

Hieracium traillii Greene, Shale-barren Hawkweed. Mt, Pd? (VA): shale barrens and dry shaley woodlands, other xeric woodlands; uncommon. Sc. PA south to w. VA and e. WV. [= C, F, G, SE, W; H. greenii Porter \& Britton -- K, S, a preoccupied name]

Hieracium venosum Linnaeus, Veiny Hawkweed. Mt, Pd, Cp (GA, NC, SC, VA): dry forests, woodland margins, roadsides; common. April-July. NY west to MI, south to GA, AL, and TN; apparently disjunct in FL. [=RAB, C, G, S, SE, W; H. venosum var. venosum -- F, K; H. venosum var. nudicaule (Michaux) Farwell -- F, K]

Hieracium longipilum Torrey ranges east to TN and KY. [= K]
Many of our species hybridize, and some of the species listed above are apparently hybrid derivatives. I prefer to treat taxa such as H. marianum as species (even if hybridization-derived) because they occur independently of the parental taxa. Hybrids of native species known in our area include:

```
H. gronovii }\timesH\mathrm{ . paniculatum [H. xalleghaniense Britton (pro sp.)]
H.gronovii }\timesH\mathrm{ . venosum
H. paniculatum }\timesH\mathrm{ . scabrum
H. paniculatum }\timesH.\mathrm{ venosum [H. ×scribneri Small (pro sp.); H. scribneri - K]
H. scabrum }\timesH\mathrm{ . venosum
```

Hymenopappus L'Héritier (Woolly-white)
A genus of about 14 species, herbs, of s. North America. References: Cronquist (1980)=SE.
Hymenopappus scabiosaeus L'Héritier var. scabiosaeus. Cp (GA, SC): turkey oak sandhills and adjacent sandy fields; rare. Sc. SC south to $n$. peninsular FL, west to $A R$, MO, and OK, and north in the interior to n . IN, c. and s. IL, and se. MO. Var. corymbosus (Torrey \& A. Gray) B.L. Turner is distributed in the s. Great Plains and adjacent areas, from NE south to TX and Coahuila, Mexico. [= C, K, SE; H. scabiosaeus -- RAB, F, G, S, infraspecific taxa not distinguished]

## Hymenoxys Cassini

* Hymenoxys odorata Augustin de Candolle. Cp (SC): waste areas around wool-combing mill; rare, perhaps only a waif, native of sw. United States. See Nesom (2004d). [= K]

## Hypochaeris Linnaeus (Cat's-ear)

A genus of about 60 species, herbs, of South America, Europe, Asia, and $n$. Africa. The spelling of the genus name is now resolved in favor of Hypochaeris. References: Cronquist (1980)=SE.

1 Stem with at least a few well-developed leaves, clasping and similar to the basal; pappus of one length, all long and plumose. 2 Flowers yellow; middle and outer phyllaries hispid; heads usually $5-8 \mathrm{~mm}$ across at anthesis, the involucre campanulate .

2 Flowers white; middle and outer phyllaries glabrous or puberulent; heads usually 2-4 mm wide at anthesis, the involucre cylindric . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . H. microcephala var. albiflor
1 Stem naked, or only with few and very small bracts; pappus of two lengths, the outer short and barbellate, the inner long and plumose.
2 Plants glabrous or apparently so; plants mostly annual
H. glabra
2 Plants conspicuously pubescent, as on the hispid leaves; plants mostly perennial . . . . . . . . . . . . . . . . . . . . H. radicata

* Hypochaeris brasiliensis (Less.) Grisebach var. tweediei (Hooker \& Arnott) Baker, Brazilian Cat's-ear. Cp (GA, NC, SC), Pd (GA, SC), Mt (SC): roadsides, fields, other disturbed places; common, introduced from South America. Late April-July. More common in the NC Coastal Plain than shown in RAB (common in Duplin, Sampson, and Wayne cos.) (A.J. Bullard, pers. comm. 2003). [= K, SE; Hypochoeris elata (Weddell) Grisebach -- RAB, misapplied]
* Hypochaeris glabra Linnaeus, Smooth Cat's-ear. Cp (GA, NC, SC), Pd (NC, SC): roadsides, fields, disturbed areas; common (rare in NC), introduced from Europe. Late March-July. [= K, S; Hypochoeris glabra -- RAB, C, SE, orthographic variant] * Hypochaeris microcephala (Schultz-Bipontinus) Cabrera var. albiflora (Kuntze) Cabrera. Cp (GA): disturbed areas; rare, introduced from South America. This species has been found as a naturalized introduction at Fort Pulaski (Chatham County, GA) (T. Govus, pers. comm.). [= K, SE]
* Hypochaeris radicata Linnaeus, Spotted Cat's-ear. Cp, Pd, Mt (GA, NC, SC, VA): roadsides, fields, disturbed areas; common, introduced from Eurasia. April-July (or later). [=G, K, S; Hypochoeris radicata -- RAB, C, F, SE, orthographic variant]

## Inula Linnaeus (Elecampane)

A genus of about 90 species, of temperate and subtropical Old World. References: Arriagada (1998)=Z; Cronquist (1980)=SE.
Inula helenium Linnaeus, Elecampane. Mt (NC, VA), Pd (VA): disturbed areas; rare, introduced from Europe. May-July. [= RAB, C, F, G, K, S, SE, W, Z]

## Ionactis (Stiff-leaved Aster)

A genus of 5 species, herbs, of North America. Ionactis has usually been included in Aster, but differs in many characters and is more closely related to Heterotheca (Nesom \& Leary 1992). References: Nesom \& Leary (1992)=Z; Cronquist (1980)=SE.

Ionactis Iinariifolia (Linnaeus) Greene, Stiff-leaved Aster. Cp, Pd, Mt (GA, NC, SC, VA): dry savannas, sandhills, pine flatwoods, prairie-like openings, glades, and barrens, high elevation rock outcrops and glades, to at least 1450 m , dry roadbanks, woodland edges, rocky woodlands; common. Late September-November. ME and Québec west to WI, south to n. FL and TX. There appears to be substantial variation in I. linariifolius, with montane (and northern) populations having considerably longer and broader leaves than Coastal Plain (and southern) populations; additional study is needed. $[=\mathrm{Z}$; $=I$. linariifolius -K K, S , orthographic variant; = Aster linariifolius Linnaeus -- RAB, C, G, SE, W]

## Iva Linnaeus (Marsh-elder)

A genus of about 15 species, shrubs and herbs, of North America and West Indies. References: Cronquist (1980)=SE; Jackson (1960).

1 Plants annual, not fleshy, more-or-less pubescent (at least in the inflorescence); [of inland wetlands or disturbed areas]. 2 Leaves 0.5-3 mm wide, linear; staminate flowers usually 4-6 per head; [mostly of clay-based Carolina bays] .

> I. microcephala

2 Leaves 20-70 mm wide, ovate; staminate flowers usually 8-16 (-20) per head; [mostly of disturbed ground]. 3 Heads subtended by bracts (other than the phyllaries); phyllaries 3-5 ..................... I. annua var. annua 3 Heads lacking bracts (other than the phyllaries); phyllaries 5 I. xanthifolia

1 Plants perennial, fleshy, glabrous; [of maritime situations, such as brackish marshes, marsh edges, or ocean dunes].
4 Leaves alternate; leaves $1.5-4.5(-6.0) \mathrm{cm}$ long, $0.4-1.0(-1.5) \mathrm{cm}$ wide, 1-3 mm thick when fresh, mostly untoothed; involucres $4-7 \mathrm{~mm}$ high; [mostly of dunes and the upper beach] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . I. imbricata
4 Leaves opposite (alternate above or in the inflorescence); leaves $4-10 \mathrm{~cm}$ long, $0.7-4.0 \mathrm{~cm}$ wide, $0.5-1 \mathrm{~mm}$ thick when fresh, usually toothed; involucres $2-4 \mathrm{~mm}$ high; [mostly of marshes, marsh edges, and wet hammocks].
$5 \quad$ Larger leaves $4-7(-8.5) \mathrm{cm}$ long, $0.7-1.5(-2.1) \mathrm{cm}$ wide, $4-10 \times$ as long as wide, subentire or with 1-8 (rarely more) teeth on each side; [of $N J$ south throughout our area] . . . . . . . . . . . . . . . . . . . . . . . . . I. frutescens var. frutescens
5 Larger leaves $6-10 \mathrm{~cm}$ long, $2.0-4.0 \mathrm{~cm}$ wide, $1.5-4 \times$ as long as wide, usually with $8-17$ teeth on each side; [of $n$. NC northwards]
I. frutescens var. oraria

* Iva annua Linnaeus var. annua, Sumpweed, Rough Marsh-elder. Cp (GA, NC, SC, VA), Pd (NC, SC, VA): fields, disturbed places; rare, introduced (by native Americans) from further west. September-November. This species was apparently an important crop of native Americans. An extinct variety, var. macrocarpa (Blake) R.C. Jackson [I. ciliata var. macrocarpa Blake], known only from archeological remains, is almost certainly a cultivated form, selected for its large seeds. [= K; < I. annua -- RAB, C, GW, SE, W; I. ciliata Willdenow -- F, S; I. ciliata Willdenow var. ciliata -- G]

Iva frutescens Linnaeus var. frutescens, Southern Maritime Marsh-elder. Cp (GA, NC, SC, VA): brackish marshes and marsh edges, normally on the back side of barrier islands; common. Late August-November. NJ south to FL, west to TX. See $I$. frutescens var. oraria for discussion of the two taxa. [= C, F, G, SE; I. frutescens ssp. frutescens -- GW, K; I. frutescens -- RAB, S]

Iva frutescens Linnaeus var. oraria (Bartlett) Fernald \& Griscom, Northern Maritime Marsh-elder. Cp (NC, VA): brackish marshes and marsh edges, normally on the back side of barrier islands; uncommon (NC Watch List). Late August-November. Nova Scotia south to Dare County, NC. The two varieties are morphologically distinct, except in the zone of overlap (NJ south to Dare County, NC), where intermediates will be encountered. Even in the zone of overlap, though, most plants are readily identified to variety. There might be some merit in considering these taxa species, with limited hybridization in a small portion of their total distributions. [= C, F, G, SE; I. frutescens ssp. oraria (Bartlett) R.C. Jackson -- K; I. oraria Bartlett]

Iva imbricata Walter, Dune Marsh-elder. Cp (GA, NC, SC, VA): dunes, upper beach, island-end flats; common (VA Rare). Late August-November. Se. VA south to FL, west to LA; also in the Bahamas and Cuba. This plant is often the most oceanward perennial plant, often the first perennial to colonize the upper beach or incipient dunes on island-end flats, where it occurs with such upper beach annuals as Chamaesyce polygonifolia, Ch. bombensis, Cakilel edentula, and Amaranthus pumilus. [= RAB, C, F, G, K, S, SE]

Iva microcephala Nuttall, Small-headed Marsh-elder. Cp (GA, NC, SC): clay-based Carolina bays; rare (NC Rare). September-October. C. NC south to s. peninsular FL, west to se. AL. A seed-banking annual, occurring in extremely variable populations in the variable hydrologic conditions of Carolina bays. [= RAB, GW, K, S, SE]

* Iva xanthifolia Nuttall, Big Marsh-elder. Mt (VA), Cp (SC): disturbed areas, waste areas near wool-combing mills; rare, introduced from w. North America. August-October. See Nesom (2004d). [= C, F, G, K, SE]

Iva annua Linnaeus var. caudata (Small) R.C. Jackson occurs east to TN and KY. [= K; = I. caudata Small] \{not yet keyed; add synonymy\}

* Iva axillaris Pursh. Cp (SC): waste areas around wool-combing mill; rare, perhaps onlya waif, introduced from w. United States. See Nesom (2004d). [= K]

Ixeris (Cassini) Cassini

A genus of $15-20$ species, herbs, of e. and se. Asia.

* Ixeris stolonifera A. Gray, Creeping Lettuce, is introduced from e. Asia and established as a weed in lawns, gardens, and plant nurseries in se. PA (Rhoads \& Klein 1993) and NY (Long Island). [= C, K; = Lactuca stolonifera (A. Gray) Maximowicz -- F]

## Jamesianthus Blake \& Sherff (Warbonnet)

Jamesianthus alabamensis Blake \& Sherff, Alabama Warbonnet. Mt (GA): streambanks over limestone or other calcareous rocks; rare (GA Special Concern). Endemic to stream banks in c. AL and wc. GA. The opposite leaves are squared off at the base in a distinctive manner. [= K, SE]

Krigia Schreber (Cynthia, Dwarf-dandelion)
A genus of 7 species, herbs, of North America. References: Kim \& Turner (1992)=Z; Cronquist (1980)=SE; Chambers (2004)=Y.
1 Phyllaries erect at maturity, $2-4 \times$ as long as wide; pappus absent; plant a leafy-stemmed winter annual . . . . . . . K. cespitosa
1 Phyllaries reflexed at maturity, $3-8 \times$ as long as broad; pappus present, consisting of 5 or more scales and 5 or more bristles; plant a scapose, subscapose, or leafy-stemmed perennial or a scapose or subscapose winter annual.

Pappus of 5 scales and 5 bristles; plant a winter annual; stem leafless or leafy at the base only ........... K. virginica Pappus of $15-40$ scales and 15-40 bristles; plant a perennial; stem leafless, leafy at the base only, or with many leaves extending up the stem.
3 Stems leafless, the peduncles terminal; perennial from ovoid tubers, with long slender stolons which form new plants or tubers; pappus bristles (5.0-) 5.3-7.7 (-10.0) mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . K. dandelion
3 Stems leafy, at least at the base, the peduncles axillary; perennials from stout creeping rhizomes or short caudices, not bearing tubers; pappus bristles 4.0-7.0 mm long.
4 Peduncles usually 1 per leaf axil; leaves linear-lanceolate, the larger 1-12 mm wide; perennial from an underground rhizome (to 5 mm in diameter), larger plants with an extensive rootmat and multiple stems ...... . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . K. montana
4 Peduncles usually 2 per leaf axil; leaves oblanceolate, the larger 15-45 mm wide; solitary-stemmed perennial from a short caudex
K. biflora var. biflora

Krigia biflora (Walter) S.F. Blake var. biflora, Orange Dwarf-dandelion. Mt (GA, NC, VA), Pd (GA, NC): rich, moist forests; rare (NC Watch List). Late May-early July. Var. biflora ranges from MA s. Ontario and MN south to GA, AL, MS, AR, and e. OK; the smaller var. viridis (Standley) Kim occurs in CO, AZ, and NM. [= K, Z; < K. biflora -- RAB, C, F, G, SE, W; Cynthia virginica (Linnaeus) D. Don -- S]

Krigia cespitosa (Rafinesque) K.L. Chambers var. cespitosa, Opposite-leaf Dwarf-dandelion. Cp, Pd (GA, NC, SC, VA), Mt (GA): fields, roadsides, disturbed places; common (rare in VA) (VA Watch List). Late March-early June. S. VA and NE south to FL and TX. K. cespitosa var. gracilis (Augustin de Candolle) K.L. Chambers occurs in TX. [= Y; K. cespitosa -- GW, Z, infraspecific taxa not distinguished; K. oppositifolia Rafinesque -- RAB, C, G, SE, W; Serinia oppositifolia (Rafinesque) Kuntze -- F, S; K. caespitosa - K, orthographic variant]

Krigia dandelion (Linnaeus) Nuttall, Colonial Dwarf-dandelion. Pd, Cp (GA, NC, SC, VA): rocky woodlands, roadsides, disturbed areas; common (rare in Coastal Plain). April-May. NJ, IL, and KA, south to FL and ne. TX. [= RAB, C, F, G, GW, K, SE, W, Z; = Cynthia dandelion (Linnaeus) Augustin de Candolle -- S]

Krigia montana (Michaux) Nuttall, Mountain Dwarf-dandelion. Mt (GA, NC, SC): cliffs and rock outcrops at medium to high elevations; uncommon (NC Watch List, SC Rare). May-September. A Southern Appalachian endemic: w. NC, e. TN, nw. SC, and ne. GA. [= RAB, K, SE, W, Z; = Cynthia montana (Michaux) Standley -- S]

Krigia virginica (Linnaeus) Willdenow, Virginia Dwarf-dandelion. Cp, Pd, Mt (GA, NC, SC, VA): rocky woodlands, roadsides, disturbed areas; common. Late March-early June. ME west to MN, south to FL and c. TX. [= RAB, C, F, G, GW, K, S, SE, W, Z]

The natural hexaploid hybrid Krigia $\times$ shinnersiana K.L. Chambers [K. biflora $\times$ montana] is documented from the Craggy Mountains, Buncombe County, NC (Chambers 2004; Kim \& Turner 1992).

## Kuhnia

(see Brickellia)

## (also see Ixeris)

A genus of about 75 species, herbs, nearly cosmopolitan (especialy north temperate). References: Cronquist (1980)=SE.

```
    Lactuca biennis (Moench) Fernald, Tall Blue Lettuce. {NC, VA} [= RAB, C, F, K, SE]

```

## Lapsana Linnaeus (Nipplewort)

A genus of about 9 species, herbs, of temperate Old World. References: Cronquist (1980)=SE.

* Lapsana communis Linnaeus, Nipplewort. Mt (NC, VA), Pd, Cp (VA): fields, forests, disturbed areas; uncommon (rare in NC and VA Coastal Plain), introduced from Europe. June-August. \{In GA - Castanea 1998\} [= RAB, C, F, G, K, SE, W]

Leontodon Linnaeus (Hawkbit)

A genus of about 50 species, herbs, primarily of temperate Eurasia. References: Cronquist (1980)=SE.

1 Pappus of the outer flowers of the head of plumose bristles; heads (solitary-) several; scapes usually scaly-bracted above . .

* Leontodon autumnalis Linnaeus var. autumnalis, Fall-dandelion. Cp (VA): roadsides, fields; rare, introduced from Europe. June-October. [= C, F, G; L. autumnalis -- C, SE, infraspecific taxa not distinguished; L. autumnalis ssp. autumnalis -- K]
* Leontodon taraxacoides (Vill.) Mérat ssp. taraxacoides, Little Hawkbit. Cp (VA), Mt (NC): roadsides, fields; rare, introduced
from Europe. July-October. [= K; L. taraxacoides - C, W, infraspecific taxa not distinguished; L. nudicaulis (Linnaeus) Banks ex Schinz \& R. Keller -- RAB, apparently misapplied; L. leysseri (Wallr.) G. Beck -- F, G]
* Leontodon hirtus Linnaeus, Rough Hawkbit. \{DC (Kartesz 1999) - investigate\} [= K]
* Leontodon hispidus ssp. hispidus, Bristly Hawkibit. \{MD (Kartesz 1999) - investiaget\} [= K]

## Leucanthemum P. Miller (Oxeye Daisy)

A genus of about 35 species, herbs, of Eurasia. References: Cronquist (1980)=SE; Arriagada \& Miller (1997)=Z.

[^2]A genus of 40-50 species, herbs, of e. and c. North America. References: Nesom in FNA (in prep.); Gaiser (1946)=Z; Cronquist (1980)=SE; Stucky \& Pyne (1990); Godfrey (1948)=Y; Stucky (1991); Stucky (1992); Mayfield (2002). Key adapted in large part from FNA.

1 Pappus plumose, the barbels mostly 0.5-1.0 mm long.
2 Inner phyllaries with apices prolonged, loosely spreading, slightly dilated, and petaloid (white to yellow, pink, or purplish); heads $3-5 \mathrm{~mm}$ in diameter, with 4-6 flowers per head; corolla lobes glabrous within; [of the Coastal Plain from SC southwards].
3 Heads sessile; petaloid phyllary apices lavender, pink, or magenta, recurved, the petaloid portion short relative to the green phyllary bases
L. elegans var. elegans

3 Heads pedunculate on short peduncles; petaloid phyllary apices light yellow or cream (rarely pale lavender),
divergent with tips ascending, the petaloid portion elongate relative to the green phyllary bases
L. elegans var. kralii

2 Inner phyllaries not prominently petaloid; heads 10-20 mm in diameter, with 10-60 flowers per head; corolla lobes coarsely hairy within; [collectively widespread].
4 Phyllaries not regularly imbricate, the outer usually as long or longer than the inner . . L. squarrosa var. squarrosa
4 Phyllaries regularly imbricate, graduated in length, erect to spreading or reflexing.
5 Stems and leaves usually glabrous; inner phyllaries usually apically rounded to truncate, apiculate, all essentially erect and appressed, usually with a narrow hyaline border . . . . . . . . . . . . . . . . . L. cylindracea
5 Stems and leaves hirsute to hirsute-pilose; inner phyllaries apically acute-acuminate, all usually spreading to reflexed on the distal $1 / 3$ (outer) to $1 / 5$ (inner), usually without a hyaline border . . . . . . . . . . . . . . [L. hirsuta]
1 Pappus barbellate, the barbels 0.1-0.3 (-0.4) mm long.
6 Heads mostly $1-7(-10)$ in a subcorymbiform arrangement; [of Bibb Co., AL] . . . . . . . . . . . . . . . . . . . [L. oligocephala]
6 Heads usually more than 10 in a spiciform or racemiform arrangement; [collectively widespread]. 7 Leaves $3-5$-veined.

8 Basal and lower cauline leaves (2-) 4-8 mm wide, cauline usually abruptly reduced in size at ca. midstem, continuing distally as linear, bract-like leaves; heads in a densely (- to loosely) spiciform arrangement; involucres 7-9 mm, purplish to greenish; florets 5-6 (-8) per head; [mainly of the Coastal Plain] $\qquad$
 a densely to loosely spiciform arrangement; involucres (7-) 8-11 mm, usually greenish; florets (4-) 6-8 (-12) per head; [of the Mountains and Piedmont]
L. spicata var. spicata

## 7 Leaves 1 -veined.

9 Mid and inner phyllaries either apically acute or rounded-retuse and minutely involute-cuspidate to apiculate. 10 Stems glabrous.

11 Phyllaries apically usually rounded-retuse and minutely involute-cuspidate to apiculate; corolla tubes glabrous within.
12 Stems and basal leaves glabrous; basal leaves mostly arising from congested nodes at very base of plant, (1-) 2-6 (-9) mm wide, abruptly reduced in size distally, surfaces minutely white-dotted by stomates, not glandular-punctate . . . . . . . . . . . . . . . . . . . . . . L. laevigata
12 Stems and basal leaves glabrous to very sparsely pilose, leaves usually with a few, spreading cilia near insertion; basal and lower cauline leaves arising from numerous, separated nodes on proximal part of stem, 1-2 (-2.5) mm wide and relatively even-sized, surfaces glandular-punctate

11 Phyllaries apically acute; corolla tubes pilose within.
13 Heads often in a secund arrangement; involucres 11-15 mm; phyllaries obovate; florets 3-6 L. pauciflora

13 Heads in a secund arrangement or not; involucres (6-) 7-9 mm; phyllaries ovate-triangular to generally oblong; florets 4-10 (-12).
14 Heads densely arranged, on internodes 1-2 (-5) mm long, often secund; phyllary apex sharply acuminate-acute, distinctly involute, lamina relatively thin, glands consistently present and superficial at least on proximal portion; florets 4-7 (-9); basal and lower cauline leaves $2-5 \mathrm{~mm}$ wide, gradually reduced in length distally . . . . . . . . . . . . . . . . . . . L. cokeri
14 Heads loosely arranged, on internodes 6-15 (-20) mm long, not secund; phyllary apex sharply acute to obtuse-angled with a thickened apiculum, not markedly involute, lamina relatively thick, usually with evidently sunken punctate glands, without superficial glands; florets 7-10 (-12); basal and lower cauline leaves 4-9 (-12) mm wide, quickly reduced in width and length distally
L. virgata

10 Stems hirtellous with spreading to slightly deflexed hairs or variously puberulent to hirsute.
15 Stems hirsute to puberulent to pilose-puberulent or strigose-puberulent . . . . . . . . . . . . . . L. gracilis 15 Stems hirtellous with spreading to slightly deflexed hairs.

16 Heads sessile, relatively crowded in a cylindric arrangement, rigidly ascending, appressed to the rachis and to each other, densely overlapping L. chapmanii

16 Heads sessile to short-pedunculate, in a relatively loose, spiciform, racemoid, or paniculate, commonly secund arrangement
L. pauciflora

9 Mid and inner phyllaries apically rounded, not rounded-retuse or cuspidate to apiculate.
17 Stems glabrous (rarely sparsely to moderately pilose in L. pilosa).
18 Involucres 5-7 (-9) mm; florets 4-5 (-6); corolla tubes glabrous within; pappus bristles usually about

Flora of the Carolinas, Virginia, and Georgia, Working Draft of 10 June 2005 -- ASTERACEAE
half the length of corolla tubes
L. microcephala

18 Involucres 6-10 mm; florets (6-) 7-13 (-17); corolla tubes internally pilose (glabrous in L. ligulistylis);
pappus bristles as long as the corolla tubes (shorter in some populations of $L$. helleri).
19 Stems 15-55 cm; leaves and phyllaries weakly or not at all punctate; pappus bristles 1/3-2/3 to equal the corolla tube length; montane . L. helleri
19 Stems 40-120 cm; leaves and phyllaries distinctly punctate-glandular to weakly punctate; pappus bristles equal the corolla tube length; coastal plain and piedmont.
20 Stems glabrous; heads loosely arranged, on internodes (2-) 5-10 (-14) mm; peduncles 0-2 (-7) mm; involucres 6-8 mm; phyllaries in 3-4 (-5) series . . . . . . . . . . . . . . . L. elegantula
20 Stems glabrous to sparsely or moderately pilose; heads densely arranged, on internodes
(1-) 2-5 (-7) mm; peduncles 0-10 (-17, -80 in proximal part of capitulescence) mm ; involucres (7-) 8-10 mm, phyllaries in (3-) 4-5 (-6) series L. pilosa

17 Stems puberulent to strigose.
21 Involucres 2.5-7 mm wide; florets 3-12.
22 Stems and peduncles puberulent to pilose-puberulent or strigose-puberulent; heads usually on ascending peduncles $2-10(-12) \mathrm{mm}$; involucres $2.5-4(-5) \mathrm{mm}$ wide; phyllaries apically rounded or obtuse to acute or acuminate; florets 3-6 (-9)
L. gracilis

22 Stems and peduncles stiffly short-strigose with closely ascending hairs; heads on divergent, arcuate-ascending peduncles $10-25(-30) \mathrm{mm}$; involucres $5-7 \mathrm{~mm}$ wide; phyllaries apically rounded to nearly flat; florets 7-12
L. patens

21 Involucres 13-22 (-25) mm wide or (6-) 8-15 mm wide (L. squarrulosa); florets 11-80.
23 Heads usually on peduncles usually $8-50 \mathrm{~mm}$ (rarely subsessile); phyllaries erect, not reflexing; florets ca. 30-80 (19-33 in L. scariosa); corolla tubes glabrous or pilose within.
24 Leaves or leafy bracts 8-20 (-25) below the heads, cauline usually abruptly reduced above the basal; florets 19-33; [plants of the Central and Southern Appalachians] . . . L. scariosa
24 Leaves or leafy bracts 20-85 below the heads, usually continuing relatively even-sized upwards above the basal; florets ca. 30-80; plants of WV and PA northwards]
[L. novae-angliae var. nieuwlandii]
23 Heads usually sessile, less commonly subsessile on peduncles $1-8 \mathrm{~mm}$ (rarely more); at least outer phyllaries usually reflexing; florets 11-26 (-30); corolla tubes pilose within.
25 Phyllaries glabrous, bullate, with broad, conspicuous, often erose to lacerate or irregular, hyaline border . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . L. Laspera
25 Phyllaries glabrous to puberulent or puberulent-hirtellous, essentially flat (not bullate), without hyaline border or border narrow and inconspicuous
L. squarrulosa

Liatris aspera Michaux, Rough Blazing-star. Mt (GA, NC, VA), Pd (GA, NC?), Cp (GA), \{SC\}: prairies, barrens, glades; rare (NC Rare, VA Rare). August-September (-October). Ontario and ND south to FL and TX. [= RAB, FNA, SE; Liatris aspera Michaux var. intermedia (Lunell) Gaiser -- K, Y; Laciniaria aspera (Michaux) Greene var. aspera - S; Liatris spheroidea Michaux - K; Laciniaria aspera (Michaux) Greene var. spheroidea (Michaux) Alexander - S]

Liatris chapmanii Torrey \& A. Gray, Chapman's Blazing-star. Cp (GA): xeric sands of scrub; rare (GA Special Concern). August-October. Sw. GA, s. AL, south to FL. [= FNA, K, SE; =Laciniaria chapmanii (Torrey \& A. Gray) Kuntze - S] \{add synonymy\}

Liatris cokeri Pyne \& Stucky, Sandhills Blazing-star. Cp (NC, SC): sandhills; common. (August-) September-October. Sc. and se. NC south to nc. SC. [= FNA, K; <Liatris regimontis (Small) K. Schumann -- RAB, K, SE, Y, in part, and misapplied]

Liatris cylindracea Michaux, Barrelhead Blazing-star. Mt (GA): limestone galdes, prairies; rare. July-September. NY, Ontario, and MN south to se. TN (Ridge and Valley) (Chester, Wofford, \& Kral 1997) and c. AL (Bibb County), and OK. [= FNA, K, SE] \{add synonymy\}

Liatris elegans (Walter) Michaux var. elegans, Common Elegant Blazing-star. Cp (GA, SC): sandhills; common. SC south to FL, west to TX. See Mayfield (2002) for discussion of infraspecific taxa in this species. [= FNA; <Liatris elegans -- RAB, SE, Z, infraspecific taxa not distinguished; <L. elegans var. elegans - K; >Liatris elegans var. flabellata (Small) Gaiser -- K, Z; <Laciniaria elegans (Walter) Kuntze - S; >Laciniaria flabellata Small - S]

Liatris elegans (Walter) Michaux var. kralii Mayfield. Kral’s Elegant Blazing-star. Cp (GA, SC): sandhills; rare. Se. SC (Allendale Co.) south to n. FL and west to s. MS. See Mayfield (2002) for discussion of infraspecific taxa in this species. [= FNA, K; <Liatris elegans -- SE, Z, infraspecific taxa not distinguished; <Laciniaria elegans (Walter) Kuntze - S, infraspecific taxa not distinguished]

Liatris elegantula (Greene) K. Schumann. Cp (GA): sandhills; rare? August-October (-November). GA south to FL, west to MS. [= FNA; Liatris graminifolia Willdenow var. elegantula (Greene) Gaiser; Laciniaria elegantula Greene; <Liatris graminifolia, in part] \{add synonymy\}

Liatris gracilis Pursh, Slender Blazing-star. Cp (GA, SC): sandhills, dry pine flatwoods; uncommon. (July-) August-October (November). SC south to FL, west to MS. [= RAB, FNA, K, SE; <Laciniaria laxa Small - S; <Laciniaria gracilis (Pursh) Kuntze - S]

Liatris helleri T.C. Porter, Heller's Blazing-star. Mt (NC, VA): high elevation rock outcrops, sometimes on ledges of precipitous cliffs, rocky openings in heath balds, shale barrens; rare (US Threatened, NC Threatened). July-mid September. E. WV and w. VA south to w. NC. [= FNA; >Liatris helleri T.C. Porter - RAB, K, SE, Y, Z, in a narrower sense; >Liatris turgida Gaiser RAB, K, SE, Y, Z; >Laciniaria helleri (Porter) Porter ex Heller - S; Laciniaria pilosa (Aiton) Heller - S, misapplied]

Liatris laevigata (Nuttall) Small, Smooth Blazing-star. Cp (GA): longleaf pine sandhills, scrub; rare (GA Special Concern). August-October (-November). Se. GA (Charlton County) south to peninsular FL. [= FNA; Liatris tenuifolia Nuttall var. quadriflora Chapman -- K; <Laciniaria tenuifolia (Nuttall) Kuntze - S, in part]

Liatris microcephala (Small) K. Schumann, Small-head Blazing-star. Mt, Pd (GA, NC, SC): outcrops of acidic rocks (sandstone, granite, gneiss); rare (NC Rare). August-October. w. NC and KY south to w. SC, n. and c. GA, and n. AL. [= RAB,

FNA, K, SE, Y, Z; =Laciniaria microcephala Small - S]
Liatris patens Nesom \& Kral, Georgia Blazing-star. Cp (GA, SC): longleaf pine sandhills and dry flatwoods; uncommon. Late August-early November. SC south to FL. See Kral \& Nesom (2003) for detailed information. [= FNA]

Liatris pauciflora Pursh, Few-flower Blazing-star. Cp (GA): xeric sands of scrub; rare (GA Special Concern). AugustOctober. GA (Tatnall Co.) south to FL; alleged by Small (1933) to extend to SC. [Liatris pauciflora -- K, SE, in part only (also see L. secunda); Laciniaria pauciflora (Pursh) Kuntze - S; Liatris pauciflora var. pauciflora - FNA]

Liatris pilosa (Aiton) Willdenow. Pd, Cp (NC) \{GA, SC, VA\}: sandhills, pine barrens, fields, roadbanks; common. (August-) September-October (-November). NJ, DE, and PA south to SC. [= FNA, K; Liatris graminifolia Willdenow -- RAB, SE, in part only (also see Liatris virgata); Liatris graminifolia var. typica -- Y, Z; Liatris graminifolia var. dubia (Barton) A. Gray - Y; Liatris pilosa (Aiton) Willdenow - K; Laciniaria graminifolia (Walter) Kuntze - S]

Liatris scariosa (Linnaeus) Willdenow, Northern Blazing-star. Mt (NC, VA): shale barrens, dry rock outcrops, roadbanks; rare? (NC Watch List). August-September (-October). PA, MD, and WV south to NC and TN. [= L. scariosa var. scariosa - FNA, K, Z; Liatris scariosa var. scariosa -- SE, in part only (also see var. virginiana); <Liatris scariosa -- RAB, in a broader sense; Laciniaria scariosa (Linnaeus) Hill - S, in part (also see Liatris squarrulosa); Liatris scariosa var. virginiana (Lunell) Gaiser - Y, Z]

Liatris secunda Elliott, Sandhill Blazing-star. Cp (GA, NC, SC): sandhills; rare (GA Special Concern, NC Watch List). August-September (-October). s. NC south to FL, west to AL. [= RAB, Y; Liatris pauciflora Pursh -- K, SE, in part; Laciniaria secunda (Elliott) Small - S; L. pauciflora Pursh var. secunda (Elliott) D.B. Ward - FNA]

Liatris spicata (Linnaeus) Willdenow var. resinosa (Nuttall) Gaiser. Cp (GA, NC, SC, VA), Pd, Mt (NC), \{GA, NC, SC, VA\}: bogs, wet pine savannas, seepages; common. (July-) August-October (-November). NJ south to FL, west to LA. [= RAB, FNA, K, Y, Z; Liatris spicata -- SE, infraspecific taxa not distinguished; Laciniaria spicata (Linnaeus) Kuntze - S, infraspecific taxa not distinguished]

Liatris spicata (Linnaeus) Willdenow var. spicata, Florist's Gayfeather. Mt, Pd (NC) \{GA, NC, VA\}: prairies, roadsides, seepages, bogs, grassy balds; common. July-September. MA, Ontario, and MI, south to GA, AL, MS, and AR. [= RAB, FNA, K; Liatris spicata var. typica - Y, Z; Liatris spicata -- SE, infraspecific taxa not distinguished; Laciniaria spicata (Linnaeus) Kuntze - S, infraspecific taxa not distinguished]

Liatris squarrosa (Linnaeus) Michaux var. squarrosa. Pd, Cp, Mt (GA, NC, SC) \{VA\}: [=FNA, K, SE; L. squarrosa var. gracilenta Gaiser -- Y, Z; L. squarrosa -- RAB, infraspecific taxa not distinguished; Laciniaria squarrosa (Linnaeus) Hill - S, in part; Liatris squarrosa var. typica Gaiser - Y, Z]

Liatris squarrulosa Michaux. Mt, Pd, Cp (GA, NC, SC) \{VA\}: diabase barrens, other glades and barrens, prairies, open woodlands; rare (NC Rare, VA Watch List). August-October (-November). WV, KY, IL, and MO south to GA, AL, and TX. Highly variable and needing additional study to determine if multiple taxa should be recognized. [= FNA; Liatris earlei (Greene) Schumann -- RAB, Y; Liatris squarrulosa -- K, SE; Laciniaria ruthii Alexander - S; Laciniaria shortii Alexander - S; Liatris scariosa var. squarrulosa -- Y, Z; Liatris earlei (Greene) K. Schumann - Z]

Liatris tenuifolia Nuttall. $\mathrm{Cp}(\mathrm{GA}, \mathrm{SC})$ : longleaf pine sandhills; common. August-November. SC south to FL, west to AL . [= RAB, FNA; Liatris tenuifolia Nuttall var. tenuifolia -- K, SE; Laciniaria tenuifolia (Nuttall) Kuntze - S, in part (also see Liatris laevigata)]

Liatris virgata Nuttall. Mt (GA, NC, SC, VA), Pd (GA, NC), Cp (NC, SC): open woods, roadbanks; common. (July-) AugustOctober (-November). GA, NC, SC, VA. [= FNA, K; Liatris graminifolia -- RAB, SE, in part, infraspecific taxa not distinguished; Liatris graminifolia var. smallii (Britton) Fernald \& Griscom -- Y, Z; Liatris regimontis (Small) K. Schumann - Y, in part; Laciniaria regimontis Small - S; Laciniaria smallii Britton - S; L. graminifolia var. virgata (Nuttall) Fernald]

Liatris hirsuta Rydberg. East to MS. [= FNA] \{add to synoynymy\}
Liatris oligocephala J. Allison, Cahaba Blazing-star, Cahaba Torch. Dolomitic Ketona glades. Bibb County, c. AL (Allison \& Stevens 2001). June-July (-August). [= FNA]

Liatris novae-angliae (Lunell) Shinners var. nieuwlandii Lunell. Prairies, glades, woodlands. [Liatris scariosa (Linnaeus) Willdenow var. nieuwlandii (Lunell) E.G. Voss -- FNA, K; Laciniaria scariosa (Linnaeus) Hill - S, in part] \{add synonymy\}

## Ligularia Cassini

* Ligularia dentata (A. Gray) Hara is introduced and established in MD. [= K; Senecio clivorum Maximowicz - C]

Lygodesmia D. Don (Rush Pink, Skeletonweed)
A genus of about 7 species, herbs, of w. and s. North America. References: Tomb (1980) $=$ Z; Cronquist (1980) $=$ SE.
Lygodesmia aphylla (Nuttall) Torrey \& A. Gray, Flowering Straws, Rose-rush. Cp (GA): xeric sandhills; uncommon. C. GA south to s. FL and west to c. Panhandle FL. [= K, S, SE, Z]

## Madia Molina (Tarweed)

A genus of about 18 species, of w. North America and Chile. References: Cronquist (1980)=SE.

* Madia sativa Molina, Tarweed, introduced from Chile, south to se. PA. [= K; M. capitata Nuttall; > M. sativa var. sativa -- SE; > M. sativa var. congesta Torrey \& A. Gray -- SE]

## Marshallia Schreber (Barbara's-buttons)

Marshallia is endemic to the southeastern United States, the 11 taxa ranging collectively from sc. VA, sw. PA, WV, s. KY, s. MO, and c. OK, south to c. peninsular FL, and sw. TX. Watson, Jansen, \& Estes (1991) consider Marshallia to be most closely related to predominantly southwestern genera Palafoxia, Bahia, and Galinsoga, in the tribe Heliantheae. References: Channell (1957)=Z; Watson \& Estes (1990)=Y; Cronquist (1980)=SE; Watson, Elisens, \& Estes (1991); Watson, Jansen, \& Estes (1991); Beadle \& Boynton (1901)=X.

1 Leaves not basally disposed, the 10-25 stem leaves all about the same size; plants glabrous throughout; plants colonial by persistent rhizomes; internodes 10-25 (and leaves $2-5 \times$ as long as wide)
M. trinervia

1 Leaves basally disposed, either all of the leaves below the midpoint of the stem, or the upper leaves markedly smaller than the lower stem and basal leaves (the basal leaves sometimes withered); plants pubescent at least below the heads; plants producing lateral offsets which are separated from the parent in less than a year; internodes 1-12 (and leaves 3-15× as long as wide) or 10-35 (and leaves $8-15 \times$ as long as wide).
2 Phyllaries with acuminate-subulate tips; receptacular bracts with acuminate-subulate tips; plants usually with 2 or more heads; plants flowering late July-mid October.
3 Lower stem leaves (and basal leaves) erect, narrowly lanceolate to linear-lanceolate, with attenuate or longacuminate apices, relatively thick in texture, the 2-4 lateral nerves (parallel to the midnerve) prominent; caudex with fibrous remnants of the previous year's leaves (if not burned off); phyllaries thick, ovate-attenuate; [of NC, SC, and extreme e. GA] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . M. graminifolia
3 Lower stem leaves (and basal leaves) spreading, oblanceolate or spatulate, with rounded or obtuse apices, relatively thin in texture, the 2 lateral nerves (parallel to the midnerve) often obscure; caudex lacking fibrous remnants of the previous year's leaves; phyllaries thin, linear-subulate; [of e. GA southwards]
M. tenuifolia

2 Phyllaries with rounded to acute apices; receptacular bracts slightly to strongly broadened or clavate-thickened just below the acute to obtuse apex; plants with 1 head; plants flowering in late April-July.
4 Leafy portion of the stem $0-20(-30) \mathrm{cm}$ long, the naked peduncle 1.5-10× (or more) as long as the leafy portion of the stem; stem leaves (if present) not reduced upwards, the uppermost more than $1 / 2$ as long and wide as the largest leaves on the plant; basal leaves obovate to oblanceolate, the apex obtuse to rounded (often emarginate); outer welldeveloped phyllaries with obtuse to rounded apex; plants flowering late April-May (-early June).
5 Plant with 3-10 leaves on the lower stem, extending (5-) 8-20 (-30) cm up the stem; pappus scales (0.5-) 1.0-1.5 mm long; plant (2-) 3-5 (-7) dm tall; [of the Piedmont from sc. VA southwards] . . . . . M. obovata var. obovata 5 Plant scapose (all of the leaves basal) or nearly scapose, with 1-5 leaves extending 1-5 (-10) cm up the stem; pappus scales (1.0-) 1.5-2.5 (-3.0) mm long; plant (0.5-) 1.5-3.5 (-5.0) dm tall; [of the Coastal Plain from NC southwards] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . M. Mbovata var. scaposa
4 Leafy portion of the stem $23-50 \mathrm{~cm}$ long, the naked peduncle $0.4-1.2 \times$ as long as the leafy portion of the stem; stem leaves reduced upwards, the uppermost less than $1 / 3$ as long and wide as the largest leaves on the plant; basal leaves obovate to oblanceolate, the apex obtuse to acute or acuminate; outer well-developed phyllaries with acute to obtuse apex; plants flowering late June-July.
6 Basal and lower cauline leaves (2-) 3-13 (-20) cm long (including the petiole), (5-) 10-20 (-30) mm wide, averaging about $6 \times$ as long as wide (including the petiole), the apex obtuse to rounded; pappus scales ca. 2 mm long; plants (2-) 3-5 (-8.5) dm tall; achenes without resin-dots between the ridges; [of the Mountains] M. grandiflora

6 Basal and lower cauline leaves (8-) 15-25 (-32) cm long (including the petiole), (3-) 7-12 (-15) mm wide, averaging about $10 \times$ as long as wide (including the petiole), the apex acute to acuminate; pappus scales ca. 1.2 mm long; plants (4-) 6-9 (-10) dm tall; achenes with copious resin-dots between the ridges; [of the Piedmont] . .
M. species 1

Marshallia graminifolia (Walter) Small, Grassleaf Barbara's-buttons. Cp (GA, NC, SC): pine savannas; common. Late Julymid October. Ne. NC south to se. SC, and rarely to e. GA (Emanuel County) (Sorrie 1998b). Closely related to M. tenuifolia Rafinesque, which ranges from e. GA south to $c$. peninsular FL, west to e. TX. M. tenuifolia differs in having a well-developed horizontal rosette of thin-textured spatulate leaves, which do not leave fibrous remains (vs. with firm, ascending, linear-lanceolate basal leaves, which leave fibrous remains). [= RAB, GW, SE, Z; = M. graminifolia var. graminifolia -- K, X; < M. laciniaroides Small S; < M. williamsonii Small -- S; M. graminifolia var. lacinarioides (Small) Beadle \& F.E. Boynton - X, in part; M. graminifolia ssp. graminifolia -- Y]

Marshallia grandiflora Beadle \& F.E. Boynton, Appalachian Barbara's-buttons, Large-flowered Barbara's-buttons. Mt (NC): bog margins, dry slopes over mafic rocks; rare (US Species of Concern, NC Rare). June-July. Sw. PA south to sw. NC, e. TN (Cumberland Plateau) (Chester, Wofford, \& Kral 1997), and se. KY. [= C, F, G, K, S, SE, W, X, Y, Z; < M. grandiflora -- RAB, in part only (also see M. species 1)]

Marshallia obovata (Walter) Beadle \& F.W. Boynton var. obovata, Piedmont Barbara's-buttons, Spoon-leaved Barbara'sbuttons. Pd (GA, NC, SC, VA), Cp (GA): clay flats, woodland borders, dry woodlands; common, rare north of NC (VA Rare). Late April-May (-early June). Sc. VA south to se. TN (Chester, Wofford, \& Kral 1997), sw. GA, panhandle FL, and c. AL, primarily in the Piedmont. [= RAB, C, G, K, SE, Y, Z; = M. obovata var. platyphylla (M.A. Curtis) Beadle \& F.E. Boynton -- F, X; <M. obovata -- S, W, infraspecific taxa not distinguished]

Marshallia obovata (Walter) Beadle \& F.W. Boynton var. scaposa Channell. Cp (GA, NC, SC): pine savannas; common. Late April-May. E. NC south to se. AL, in the Coastal Plain. [= RAB, K, SE, Y, Z; = M. obovata var. obovata -- F, X, misapplied; < M. obovata -- S, infraspecific taxa not distinguished]

Marshallia species 1, Oak Barrens Barbara's-buttons. Pd (NC, VA): diabase barrens and fire-maintained woodlands over greenstone; rare (NC Rare, VA Rare). Late June-July; August-September. This species is known from three extant and one extirpated population, in Granville County, NC and Halifax Co. VA, where associated with numerous rare and disjunct taxa of prairie
or barren affinities: Oligoneuron album, O. rigidum var. glabratum, Symphyotrichum depauperatum, Echinacea laevigata, Silphium terebinthinaceum, Baptisia australis var. aberrans, Linum sulcatum var. sulcatum, Carex meadii, Eryngium yuccifolium var. yuccifolium, Scutellaria leonardii, Lithospermum canescens, and others. [< M. grandiflora -- RAB, in part]

Marshallia tenuifolia Rafinesque. Cp (GA): pine savannas; common. E. GA south to c. peninsular FL, west to e. TX. See M. graminifolia for additional discussion. [= GW, SE, Z; = M. graminifolia (Walter) Small var. cynanthera (Elliott) Beadle \& F.E. Boynton -- K, X; = M. graminifolia - S, misapplied; = M. graminifolia (Walter) Small ssp. tenuifolia (Rafinesque) L. Watson - Y]

Marshallia trinervia (Walter) Trelease, Colonial Barbara's-buttons, Broadleaf Barbara's-buttons. Mt (GA, NC, VA?), Pd (GA), Cp? (SC?): moist rocky streambanks and in calcareous clays; rare (GA Special Concern, NC Rare, VA Watch List). July. E. SC (?), sw. NC, and sc. TN, south to s. AL and s. MS (Sorrie \& Leonard 1999). Reported for VA by C; documentation is unknown. [= RAB, C, F, G, K, S, SE, W, X, Y, Z]

Marshallia mohrii Beadle \& F.E. Boynton, Coosa Barbara's-buttons. Mt (GA): sandstone, limestone, and dolostone glades; rare (US threatened, GA Threatened). Nw. GA and n. and c. AL. It somewhat resembles M. grandiflora, but typically has 2-10 heads per plant (or solitary in depauperate individuals). [= K, S, SE, X, Y, Z] \{not yet keyed\}

Marshallia ramosa Beadle \& F.E. Boynton, Pineland Barbara's-buttons, Southern Barbara's-buttons. Cp (GA): pinelands, Altamaha Grit outcrops, woodlands over ultramafic rocks; rare (GA Rare). Coastal Plain from e. GA south to panhandle FL. It somewhat resembles M. graminifolia in its linear leaves, but differs in the phyllaries acute (vs. subulate-acuminate), and flowering period (late May-June vs. July-mid-October). [= K, S, SE, X, Y, Z] \{not yet keyed\}

## Matricaria Linnaeus (Mayweed) <br> [see also Tripleurospermum]

A genus of about 7 species, herbs, of Eurasia and $n$. Africa. References: Cronquist (1980)=SE; Arriagada \& Miller (1997)=Z.

1 Heads discoid (lacking rays); plant pineapple-scented; disc flowers 4-lobed . . . . . . . . . . . . . . . . . . . . . . . . . . . M. discoidea
1 Heads with evident white rays (very rarely lacking rays); plant chamomile-scented; disc flowers 5-lobed ......... M. recutita

* Matricaria discoidea Augustin de Candolle, Pineapple-weed. Mt (NC, VA): barnyards, pastures, roadsides; uncommon, introduced from w. North America. June-November. [= K, Z; = M. matricarioides (Less.) T.C. Porter -- RAB, C, F, G, SE, illegitimate name; Lepidotheca suaveolens (Pursh) Nuttall; Chamomilla suaveolens (Pursh) Rydberg]
* Matricaria recutita Linnaeus, False Chamomille, Scented Mayweed. Cp (VA), \{NC, SC\}: roadsides; rare, introduced from Europe. July-September. [= C, K, Z; = M. chamomilla Linnaeus -- F, G, SE, misapplied; = Chamomilla recutita (Linnaeus) Rauschert]

Other species (also alien) approach our area from the north: M. maritima Linnaeus and M. perforata Mérat, Scentless Chamomille.

## Megalodonta Greene <br> (see Bidens)

## Melanthera Rohr

A genus of about 35 species, herbs, of tropical and subtropical areas. References: Cronquist (1980)=SE; Wagner \& Robinson (2001) $=$ Z

Melanthera nivea (Linnaeus) Small. Cp (GA, SC): calcareous outcrops, sandy woodlands; uncommon. June-October. E. SC south to FL, west to LA; also widespread in the West Indies and northern South America (Colombia, Ecuador, Peru, and Venezuela). [= K, SE, Z; M. hastata Michaux -- RAB, S]

## Mikania Willdenow (Climbing Hempweed)

A genus of about 430 species, primarily pantropical in distribution, but with extensions into temperate areas (Holmes 1995). References: Cronquist (1980)=SE.

1 Involucre 6.5-8 mm; achenes 3.5-4.5 mm long; pubescence of the stems, leaves, and involucres spreading; [of GA southwards] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . M. cordifolia 1 Involucre 4-5.5 (-6) mm high; achenes 1.5-2.5 (-2.7) mm long; pubescence of the stems, leaves, and involucres puberulent or nearly smooth; [widespread in our area]

Mikania cordifolia (Linnaeus f.) Willdenow, Heartleaf Climbing Hempweed. Cp (GA): bottomland hardwood forests, mesic hammocks near the coast; rare (GA Special Concern). S. GA south to s. FL, west to s. LA. [= K, S, SE]

Mikania scandens (Linnaeus) Willdenow, Climbing Hempweed. Cp, Pd, Mt (GA, NC, SC, VA): marshes, swamp forests, wet thickets; common (rare in Mountains). July-October. ME to s. Ontario, south to s. FL and e. TX, south into the tropics. [= RAB, C, F, G, GW, K, S, SE, W; > M. scandens var. pubescens (Nuttall) Torrey \& A. Gray -- F; M. scandens var. scandens - F]

Oclemena E.L. Greene (Aster, Nodding-aster)
There now appears to be strong evidence (morphologic and molecular) and something approaching a consensus for the recognition of Oclemena as distinct from Aster. It appears that Oclemena is most closely related to lonactis, and that these two genera are more closely related to Solidago and Heterotheca than to Aster (in a narrower sense). The inclusion of Oclemena reticulata here is not yet fully certain. References: Nesom (1994)=Z; Semple, Heard, \& Xiang (1996)=Y; Cronquist (1980)=SE; Nesom (1997).

1 Leaves obovate, acuminate at the tip, thin in texture; [of the Mountains] . . . . . . . . . . . . . ................. . O. acuminata
1 Leaves narrowly elliptic, coriaceous in texture; [of the Coastal Plain, from se. SC southwards] . . . . . . . . . . . . . . . O. reticulata

Oclemena acuminata (Michaux) Greene, Whorled Aster, Whorled Nodding-aster. Mt (GA, NC, VA): spruce-fir forests, northern hardwood forests, mountain seepages and streambanks, other cool, moist situations; common. July-September. Newfoundland and Québec south to w. NC, ne. GA, and e. TN. [= K, Y, Z; = Aster acuminatus -- RAB, C, F, G, SE, W]

Oclemena reticulata (Pursh) Nesom, Pine-barren Aster. Cp (GA, SC): wet pine flatwoods; uncommon. Late April-early June. Se. SC south through e. GA to s. FL. [= K, Z; = Aster reticulatus Pursh -- RAB, GW, SE; = Doellingeria reticulata (Pursh) Greene -S]

Oclemena nemoralis (Aiton) Greene, Bog Nodding-aster, occurs south to PA, MD, DE, and NJ. [= K, Z; = Aster nemoralis Aiton-C, F, G] \{not yet keyed\}

## Oligoneuron Small 1903 (Prairie-goldenrod)

A genus of 6 species, herbs, of North America. There now seems to be a consensus regarding the close affinities of the species here treated as Oligoneuron album (formerly Solidago ptarmicoides, Aster ptarmicoides, or Unamia alba) and Oligoneuron rigidum. The two have recently been treated as members of Solidago section Corymbosae Torrey \& A. Gray [= section Oligoneuron] (Zhang 1996). Nesom's elevation of this section to generic status is not universally accepted and needs further corroboration, but seems provisionally to be well-founded. Our two species co-occur at a remarkable diabase barren in Granville County, NC, with other disjunct species of midwestern or prairie affinities, such as Silphium terebinthinaceum. Our two species are known to hybridize when growing together in other parts of their range; the hybrid, Oligoneuron $\times$ lutescens (Lindley ex Augustin de Candolle) Nesom [Solidago x/utescens (Lindley ex Augustin de Candolle) Boivin] should be sought. References: Nesom (1993b)=Z; Heard \& Semple (1988) $=$ Y; Brouillet \& Semple (1981)=X; Cronquist (1980)=SE; Braun (1942).

1 Rays white; pappus bristles clavellate-thickened; larger leaves $8-20 \mathrm{~cm}$ long, 0.4-1.0 cm wide, ca. $15-20 \times$ as long as wide, acuminate, usually serrate with a few salient teeth on either side, with 3 parallel veins . . . . . . . . . . . . . . . . . . . . . O. album
1 Rays yellow; pappus bristles not clavellate-thickened; larger leaves $10-25 \mathrm{~cm}$ long, $4-10 \mathrm{~cm}$ wide, ca. $2-8 \times$ as long as wide, acute to obtuse, serrate to crenate with numerous teeth (sometimes the teeth very obscure), with many pinnate-netted veins.
2 Larger leaves 1-2 cm wide, longitudinally folded; [of wet prairies and fens] . . . . . . . . . . . . . . . . . . . . . . . . . . . O. riddellii
2 Larger leaves 3-10 cm wide, flat; [of dry prairies and woodlands].
3 Outer series of phyllaries glabrous on the back (glabrous to short-ciliate on the margin); leaf undersurface glabrous to somewhat hispid ( $0-20$ hairs per $\mathrm{mm}^{2}$ ) (the margins and midrib beneath often more densely pubescent); stems glabrous to somewhat hispid ( $0-25$ hairs per $\mathrm{mm}^{2}$ ) . . . . . . . . . . . . . . . . . . . . . . . . O. rigidum var. glabratum
3 Outer series of phyllaries pubescent on the back (short-ciliate on the margin); leaf undersurface hispid (7-50 hairs per $\mathrm{mm}^{2}$ ); stems glabrous to somewhat hispid (10-70 hairs per $\mathrm{mm}^{2}$ ) O. rigidum var. rigidum

Oligoneuron album (Nuttall) Nesom, White Prairie-goldenrod, Upland White Aster. Mt (GA), Pd (NC, SC): prairie-like barrens over mafic, ultramafic, or calcareous rock, serpentine woodlands, prairies; rare (GA Watch List, NC Endangered). August-October. VT and NY west to Saskatchewan, south to e. TN (Rhea and Roane counties in the Ridge and Valley) (Chester, Wofford, \& Kral 1997), nw. GA, AR, and CO; disjunct in nc. NC and nc. SC. [= K, Z; = Solidago ptarmicoides (Nees) Boivin -- C, SE, W, X; = Aster ptarmicoides (Nees) Torrey \& A. Gray -- F, G, S; = Unamia alba (Nuttall) Rydberg; > Aster ptarmicoides var. georgianus A. Gray (referring to plants of se. US); = Solidago asteroides Semple, superfluous name]

Oligoneuron riddellii (Frank ex Riddell) Rydberg, Riddell's Goldenrod. Mt (GA, VA?): wet, calcareous prairies; rare (GA Special Concern, VA Watch List). Ontario and Manitoba south to w. VA, GA, AR, and KS. The specimen from Fort Monroe ("Fortress Monroe, Va." - Fernald 1950) is accurately identified. [= K, Z; = Solidago riddellii Frank ex Riddell - C, F, G]

Oligoneuron rigidum (Linnaeus) Small var. glabratum (E.L. Braun) Nesom, Southeastern Bold Goldenrod. Pd (GA, NC, SC, VA), Mt (NC), Cp (GA): glades, barrens, and prairie-like areas, over mafic (such as diabase) or calcareous (such as calcareous shale) rocks, and in adjacent disturbed areas, such as roadbanks and powerline rights-of-way; rare (NC Rare, SC Rare, VA Rare). August-October. Sc. VA, se. TN, c. OH, and e. MO south to c. SC, sw. GA, and e. TX. This taxon (variously treated as a species, subspecies, or variety) is rare and scattered throughout its range, restricted to prairie-like situations. Var. glabratum is apparently strictly diploid. [= K, Z; < Solidago rigida Linnaeus -- RAB, W; = Solidago rigida var. glabrata E.L. Braun -- C, G, SE; = Solidago jacksonii (Kuntze) Fernald -- $\mathrm{F} ;=$ Solidago rigida ssp. glabrata (E.L. Braun) Heard \& Semple -- Y; = Oligoneuron jacksonii (Kuntze) Small -- S]

Oligoneuron rigidum (Linnaeus) Small var. rigidum, Midwestern Bold Goldenrod. Mt, Pd (NC, VA): glades, barrens, and prairie-like areas, over mafic or calcareous rocks; rare (NC Rare, SC Rare, VA Rare). August-October. RI and MA west to NY, s. Ontario, MI, WI, s. MN and c. NE, south to c. VA, sc. NC, w. NC, sc. TN, c. AR, and se. TX. Var. rigidum is generally rare and restricted to relictual prairie-like situations east of $\mathrm{MI}, \mathrm{IN}, \mathrm{IL}, \mathrm{MO}$, and OK. Var. rigidum is tetraploid through most of its range, including (apparently) all of our area. A third variety, var. humilis (T.C. Porter) Nesom, is more northern and western, ranging from Ontario west to Alberta, south to MI, IN, IL, MO, OK, n. TX, and NM. [= K, Z; < Solidago rigida Linnaeus -- RAB, W; = Solidago
rigida var. rigida -- $\mathrm{C}, \mathrm{G}, \mathrm{SE}$; = Solidago rigida -- F , in the narrow sense; = Solidago rigida ssp. rigida -- Y ; = Oligoneuron grandiflorus (Rafinesque) Small -- S]

Onopordum Linnaeus (Scotch Thistle, Cotton-thistle)

A genus of about 60 species, herbs, of the Mediterranean region and w. Asia. References: Cronquist (1980)=SE.

* Onopordum acanthium Linnaeus, Scotch Thistle, Cotton-thistle. Mt (VA): disturbed areas; rare, introduced from Europe. July-October. [= C, F, G, K, S, SE]

Packera Á. \& D. Löve (Ragwort)

These species have usually been considered part of Senecio, and have often been given informal status as "the Aureoid group". According to recent interpretations, this group warrants generic status, as Packera (Bremer 1994, Barkley in press). References: Barkley (1962)=Z; Cronquist (1980)=SE; Barkley (1999)=Y; Barkley (1978)=X; Bremer (1994); Barkley et al. (in press); Mahoney \& Kowal (in press).

1 Plant an annual (rarely a biennial); leaf with lateral lobes broadly rounded, resembling the terminal lobe; [of wet soil of swamps and wet fields] P. glabella

1 Plant a perennial (rarely a biennial); leaf with lateral lobes absent, or distinctly narrower than the terminal lobe; [of dry to mesic soils, but not generally as above].
2 Principal leaves (especially the basal) 2-3-pinnatifid, the segments mostly 1-3 mm wide ............... P. millefolium
2 Principal leaves entire, toothed, or irregularly and raggedly 1-pinnatifid
3 Plants densely tomentose or floccose when young, remaining visibly tomentose throughout the growing season on the leaves (these appearing grayish because of the persistent tomentum); basal leaves entire, obscurely crenate, or serrate (rarely lobed).
4 Basal leaves (including petioles) mostly 10-25 cm long, held in a vertical posture; [of the Coastal Plain and Piedmont of NC, SC, and VA, and Mountains of SC] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. tomentos 4 Basal leaves (including petioles) mostly $3-10 \mathrm{~cm}$ long, arching or prostrate; [of the Mountains of NC and VA].

5 Tomentum of leaf blades very fine and tight; [of shale barrens and woodlands] . . . . . . P. antennariifolia
5 Tomentum of leaf blades coarser, looser; [of calcareous, mafic, or ultramafic cliffs, barrens, and woodlands]
P. plattensis

3 Plants glabrate to sparsely floccose when young, becoming glabrous to glabrate later in the growing season, though some species with some persistent floccose tomentum near the base or in the leaf axils (the leaves appearing green); basal leaves serrate or lobed.
6 Basal leaves ovate, orbicular, or reniform, the blade $0.8-2 \times$ as long as wide; leaf blades cordate, truncate, or abruptly narrowed at the base.
7 Basal leaves reniform, strongly cordate at the base . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. aurea 7 Basal leaves obovate to orbicular, truncate or abruptly narrowed at the base .............. P. obovata
6 Basal leaves oblanceolate, narrowly elliptic, the blade $2-8 x$ as long as wide; leaf blades cuneate at the base (truncate in P. schweinitziana); plants usually not forming clonal patches by stolons or widely creeping rhizomes.
8 Basal leaves with truncate bases (typically oblique truncate); [of high elevation grassy balds]
P. schweinitziana

8 Basal leaves cuneate at the base; [collectively widespread and of various habitats].
9 Heads many, generally 20-100; basal leaves (including petioles) up to 30 cm long and 3.5 cm wide
$P$. anonyma
9 Heads few, generally 5-20; basal leaves (including petioles) up to 12 cm long and 2 cm wide $P$. paupercula vars. and $P$. crawfordii

Packera anonyma (Wood) W.A. Weber \& Á. Löve, Appalachian Ragwort, Small's Ragwort. Mt, Pd, Cp (GA, NC, SC, VA): rock outcrops, roadsides, woodlands; disturbed areas; common. May-early June. S. PA and KY, south to n. FL and c. MS. [= K, Y; = Senecio anonymus Wood -- C, SE, X; = Senecio smallii Britton -- RAB, F, G, S]

Packera antennariifolia (Britton) W.A. Weber \& Á. Löve, Shalebarren Ragwort. Mt (VA): shale barrens and shale woodlands; rare. April-June. Sc. PA and w. MD south to w. VA and e. WV. [= K, Y; = Senecio antennariifolius Britton -- C, F, G, SE]

Packera aurea (Linnaeus) Á. \& D. Löve, Golden Ragwort, Heartleaf Ragwort. Mt (GA, NC, SC, VA), Pd (NC, SC, VA), Cp (VA): moist forests, bottomlands, bogs, stream banks; common. Late March-June. Labrador west to MN, south to NC, ne. SC, n. GA, n. AL, and c. AR; disjunct in Panhandle FL. This species is variable, and some of the moe striking variants have been named; some may well warrant formal taxonomic recognition, but additional study is needed. $[=\mathrm{K}, \mathrm{Y}$; Senecio aureus Linnaeus -- RAB, C, G, GW, SE, X; > Senecio aureus var. aureus -- F; > Senecio aureus var. intercursus Fernald -- F; > Senecio aureus var. gracilis (Pursh) Hooker -- F; > S. aureus - S, in a narrower sense; > Senecio gracilis Pursh -- S]

Packera crawfordii (Britton) A.M. Mahoney \& R.R. Kowal ined. Mt, Cp (NC): bogs and fens; rare. [< Senecio pauperculus Michaux -- RAB, C, G, GW, S, SE, X, in part; = Senecio crawfordii (Britton) G.W. \& G.R. Douglas -- F]

Packera glabella (Poiret) C. Jeffrey, Butterweed, Smooth Ragwort, Yellowtop. Cp (GA, NC, SC), Pd (GA, SC), Mt (GA): swamp forests, bottomland forests, cleared areas in bottomlands, often in mucky soils; common. March-early June. E. NC south to s. FL, west to e. TX, north in the interior to OH, MO, and SD. [= K, Y; = Senecio glabellus Poiret -- RAB, C, F, G, GW, S, SE, X]

Packera millefolium (Torrey \& A. Gray) W.A. Weber \& Á. Löve, Blue Ridge Ragwort, Yarrowleaf Ragwort. Mt (GA, NC, SC, VA): granitic domes, cliffs, and rocky woodlands, over granite, gneiss, schist, and amphibolite, and in calcareous glades (in sw. VA); rare (GA Threatened, NC Threatened, SC Rare, VA Rare). Late April-early June. Endemic to sw. NC, nw. SC, and ne. GA; disjunct in sw. VA. The hybrid with Packera anonyma [= Senecio $\times$ memmingeri Britton (prosp.)] occurs with the parents. [Senecio millefolium Torrey \& A. Gray -- RAB, C, F, K, S, SE, X; Packera millefolia - K, Y, orthographic variant]

Packera obovata (Muhlenberg ex Willdenow) W.A. Weber \& Á. Löve, Roundleaf Ragwort, Running Ragwort. Mt, Pd (GA, NC, SC, VA), Cp (GA, VA): nutrient rich forests and woodlands (dry or moist), usually over calcareous or mafic rocks; common, uncommon in NC and SC (NC Watch List). April-June. VT west to KS, south to n . FL and TX. [= K, Y; = Senecio obovatus Muhlenberg ex Willdenow -- RAB, C, S, SE, X; > Senecio obovatus var. obovatus -- F, G; > Senecio obovatus var. elliottii (Torrey \& A. Gray) Fernald -- F, G; > Senecio obovatus var. rotundus Britton -- F; > Senecio obovatus - S, in a narrower sense; > Senecio rotundus (Britton) Small -- S]

Packera paupercula (Michaux) Á. \& D. Löve, Balsam Ragwort, Northern Meadow Groundsel. Mt (GA, NC, VA), Pd, Cp (NC, VA): thickets, meadows, glades, generally over circumneutral soils derived from calcareous or mafic rocks; rare (GA Special Concern, NC Rare, VA Rare). April-May. Labrador west to AK, south to GA, AL, and OR. Mahoney (1998) suggests that this species, as broadly defined, is a complex set of populations, many apparently warranting taxonomic recognition. [< Packera paupercula (Michaux) Á. \& D. Löve -- K, X, Y, in part; < Senecio pauperculus Michaux -- RAB, C, G, GW, S, SE, in part; > Senecio pauperculus var. pauperculus -- F; > Senecio pauperculus var. balsamitae (Muhlenberg ex Willdenow) Fernald -- F; > Senecio pauperculus var. praelongus (Greenman) House -- F]

Packera plattensis (Nuttall) W.A. Weber \& Á. Löve, Prairie Ragwort. Mt (NC, VA): glades, cliffs, barrens, over mafic ultramafic, or calcareous rocks; uncommon, rare in NC (NC Rare). VT west to Saskatchewan, south to w. VA, w. NC, e. TN, nc. TN $\mathrm{OH}, \mathrm{IN}, \mathrm{LA}$, and TX. [ $<\mathrm{K}, \mathrm{Y}$, misapplied to our material; < Senecio plattensis Nuttall -- C, F, G, SE, X, misapplied to our material; = Packera paupercula (Michaux) Á. \& D. Löve var. appalachiana A.M. Mahoney \& R.R. Kowal in ed.]

Packera schweinitziana (Nuttall) W.A. Weber \& Á. Löve, New England Ragwort. Mt (NC): grassy balds (in deep soil), at high elevations, in our area generally over metagabbro or amphibolite; rare (NC Endangered). May-July. Nova Scotia and Québec south to n . NY; disjunct to a few locations in w. NC and e. TN, notably on grassy balds on Roan Mountain, Snake Mountain, Rich Mountain, and Big Bald. [= K; = Senecio schweinitzianus Nuttall -- C, SE, X; = Senecio robbinsii Oakes ex Rusby -- RAB, F, G, S; = Packera schweinitzianus -- Y, orthographic variant]

Packera tomentosa (Michaux) C. Jeffrey, Woolly Ragwort. Cp, Pd (GA, NC, SC, VA), Mt (SC): sandy roadsides, sandy woodlands and forests, granitic flatrocks, granitic domes; common. April-early June. S. NJ south to FL, west to TX, primarily on the Coastal Plain, but extending inland in the Piedmont and Mountains in thin sandy soils around rock outcrops, and as a roadside weed. [= K, Y; = Senecio tomentosus Michaux -- RAB, C, F, G, GW, S, SE, X; > Senecio tomentosus - S, in a narrower sense; > Senecio alabamensis Britton -- S]

## Palafoxia Lagasca y Segura (Palafoxia)

A genus of about 12 species, shrubs and herbs, of s. North America and Mexico. References: Turner \& Morris (1976)=Z; Cronquist (1980) $=$ SE .

1 Annual herb to 6 dm tall; flowers $5-15$ per head . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [P. callosa]
1 Perennial herb or shrub; flowerrs 15-30 per head . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. integrifolia
Palafoxia integrifolia (Nuttall) Torrey \& A. Gray, Coastal Plain Palafoxia. Cp (GA): sandhills; rare (GA Special Concern). Sc. GA south to FL. [= K, SE, Z; Polypteris integrifolia Nuttall - S]

Palafoxia callosa (Nuttall) Torrey \& A. Gray. Prairies. MS west to OK and TX. [= K, SE] \{add synonymy\}

Panphalea Lagasca y Segura

A genus of 9 species, herbs, of South America. References: Pruski (2004).

* Panphalea heterophylla Lessing. Cp (SC): waste areas around wool-combing mill; rare, perhaps merely a waif. April. See Pruski (2004) and Nesom (2004d).

## Parthenium Linnaeus (Wild Quinine)

A genus of about 16 species, herbs and shrubs, of North America and the West Indies. I have here only partly followed Mears (1975) treatment. It has not met with general acceptance, and it does not seem to me to be a fully satisfactory explanation of the variation within the genus. Morphologically and ecologically, $P$. auriculatum seems worthy of specific status, and I have not followed Mears's reduction of it to varietal status. P. integrifolium var. henryanum, var. mabryanum, and var. integrifolium serve to describe real patterns of variation, but are disturbingly confluent morphologically, ecologically, and geographically. P. radfordii, the only taxon in the complex recognized at species level by Mears, is striking in its vegetative characters, but it is almost certainly nothing but a form of $P$. integrifolium var. mabryanum; its consistent occurrence in mixed populations makes one wonder if it could be a single-gene character. It is here treated as a form. References: Mears (1975)=Z; Cronquist (1980)=SE.

1 Leaves pinnatifid to bipinnatifid, the primary sinuses extending 9/10 or more of the way to the midrib; leaves thin in texture;

1 Leaves toothed (pinnatifid in forms of $P$. integrifolium var. mabryanum, the sinuses extending up to $3 / 4$ of the way to the midrib); leaves somewhat thick in texture; pappus of 2-3 weak awns; [native perennials].
2 Stems with coarse, spreading pubescence 1-3 mm long; cauline leaves all auriculate-clasping, the upper cauline leaves sessile and auriculate-clasping, the lower cauline leaves with winged petioles, the wings expanded at the base; blades of basal leaves 11-18 (-20) cm long, $5-8 \mathrm{~cm}$ wide P. auriculatum

2 Stems glabrous or with short, appressed pubescence $0-1 \mathrm{~mm}$ long; cauline leaves only rarely auriculate-clasping, the upper cauline leaves sessile or petiolate, the lower cauline leaves petiolate, the petioles winged or not; blades of basal leaves (4-) 6-21 (-27) cm long, (1.4-) 2-12 (-13.5) cm wide.
3 Most inflorescences with more than 100 heads; basal leaf petioles winged to the base or not
$P$. integrifolium var. integrifolium
3 Most inflorescences with fewer than 100 heads; basal leaf petioles not winged to the base, or the wings very narrow (less than 1 mm wide).
4 Blades of basal leaves linear-lanceolate to ovate-lanceolate, (6-) 7-12 (-13.5) cm long, (1.4-) 2-4 (-4.5 cm) wide, sometimes undulately lobed throughout their length; heads (30) 40-75 (-85) per inflorescence
$P$. integrifolium var. mabryanum
4 Blades of basal leaves ovate-lanceolate, (4-) 6-12 (-20) cm long, (3-) 4-8 (-9.5) cm wide; heads (18-) 90-180 (400) per inflorescence . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. integrifolium var. integrifolium

Parthenium auriculatum Britton, Glade Wild Quinine. Pd, Mt (NC, VA): in shallow, xeric, circumneutral soil of glades, barrens, and woodlands, over calcareous rocks (such as dolostone) or mafic rocks (such as diabase); uncommon, rare in NC (NC Rare). Mid May-August. Ne. WV south to c. NC and n. AL, west to c. TN. As indicated by the confusion over its taxonomy, the relationships and appropriate taxonomic treatment of this taxon are unclear. It is clearly a close relative of the Ozarkian P. hispidum Rafinesque, and perhaps not readily distinguished from it; some, at least, of our material has creeping rhizomes and heads over 7 mm in diameter, supposed to be distinguishing features of $P$. hispidum. [= C, G, K, SE; = P. integrifolium var. auriculatum (Britton) Cornelius ex Cronquist -- RAB, Z ; = $P$. hispidum Raf. var. a uriculatum (Britton) Rollins -- F ; < $P$. hispidum Rafinesque -- W ; < $P$. integrifolium -- S]

* Parthenium hysterophorus Linnaeus, Santa Maria, Feverfew. Pd (VA): disturbed areas; rare, introduced from tropical America, including the West Indies. July-November. [= C, F, G, K, S, SE]

Parthenium integrifolium Linnaeus var. integrifolium, Common Wild Quinine. Pd, Mt (GA, NC, SC, VA), Cp (NC, SC, VA): various dryish habitats, mainly open or sparsely wooded; common. Late May-August. VA west to MN, south to SC, GA, ne. MS, and nw. AR. Var. henryanum Mears appears to be merely a form of var. integrifolium. $[=K$; < P. integrifolium $-\mathrm{RAB}, \mathrm{C}, \mathrm{F}, \mathrm{G}, \mathrm{S}$, SE, W; >P. integrifolium var. integrifolium - Z; >P. integrifolium var. henryanum Mears - Z]

Parthenium integrifolium Linnaeus var. mabryanum Mears, Mabry's Wild Quinine. Cp, Pd (NC, SC, VA): sandhills and other dry soils, in forest openings or woodlands; uncommon (VA Watch List). Late May-November (blooming strongly in response to fire). Nc. SC, e. NC, and se. VA, barely extending into the e. Piedmont of NC in dry sandy soils around granitic flatrocks or in (formerly) fire-maintained communities. Var. mabryanum is the characteristic variety of $P$. integrifolium in the Sandhills of NC. Mears named a new species, $P$. radfordii Mears, to accomodate sinuate-lobed Parthenium from the fall-line sandhills of NC and SC, which he also believed to be later-blooming (August-November) than other Parthenium. Extensive observations in the Sandhills of NC show that " $P$. radfordii" consistently co-occurs in mixed populations with $P$. integrifolium var. mabryanum, and that flowering is triggered by fire. Sinuate-lobed plants are best considered a form of var. mabryanum. [=K; < P. integrifolium -- RAB, C, F, G, S, SE, W; > P. integrifolium var. mabryanum - Z; > P. radfordii Mears -- Z]

Peripleura (N.T. Burbidge) Nesom

* Peripleura arida (N.T. Burbidge) Nesom. Cp (SC): waste areas around wool-combing mill; rare, perhaps only a waif, native of Australia. See Nesom (2004d). [Vittadinia arida N.T. Burbidge]

## Petasites P. Miller

* Petasites hybridus (Linnaeus) P.G. Gaertner, B. Meyer, \& Scherbius, Butterbur, Butterfly-dock, is introduced and naturalizing south to DE, WV, and se. PA. [= K]

## Phoebanthus Blake

Phoebanthus tenuifolius (Torrey \& A. Gray) Blake. S. AL and Panhandle FL. [= K, SE; = Ph. tenuifolia - S, orthographic variant]

## Picris Linnaeus (Bitterweed, Oxtongue)

A genus of about 40 species, of the Old World, particularly the Mediterranean region. References: Cronquist (1980)=SE.

[^3]* Picris echioides Linnaeus, Bristly Oxtongue. Cp (VA?): disturbed areas; rare, introduced from Europe. July-September. Reported from DC; uncertain whether documented from our area. [= C, F, G, K, SE]
* Picris hieracioides Linnaeus ssp. hieracioides, Hawkweed Oxtongue, Cat's-ear. Mt (NC), Cp (VA): disturbed areas; rare, introduced from Europe. May-October. [=K; P. hieracioides - RAB, C, F, G, SE, W, infraspecific taxa not distinguished]

## Pityopsis Nuttall (Grass-leaved Goldenaster) (contributed by Bruce A. Sorrie)

A genus of about 8 species (and numerous infraspecific taxa), herbs, of se. North America south to Central America. Pityopsis is taxonomically and nomenclaturally a difficult genus. The problems include nomenclatural issues involving typification and application (and frequently misapplication) of a plethora of names at specific and varietal level, disagreement over whether to include Pityopsis within an inclusive Chrysopsis, whether then to include Chrysopsis within an even more inclusive Heterotheca, and differences in species concepts in a morphologically and cytologically diverse group. References: Semple \& Bowers (1985)=Z; Ward (2004c) $=\mathrm{Y}$; Cronquist (1980)=SE.

1 Basal leaves shorter than the stem leaves; middle and upper stem leaves similar in size to one another.
2 Leaves and stem glabrate, not silky pubescent, 0.8-1.5 mm wide; [of the fall line Sandhills, from sc. NC southwards]
2 Leaves and stems silky pubescent, 2-5 mm wide; [of se. TN, or of s. NJ northwards].
[plants of sandy places, from s. NJ northwards] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [P. falcata]
3 [plants of river-scoured rocky riverbanks in se. TN] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [P. ruthii]

1 Basal leaves much longer than the stem leaves; stem leaves strongly reduced upwards, the upper stem leaves much smaller than middle stem leaves.
4 Heads fewer than 10; cauline leaves few, generally 2-7; [of sw. GA westwards and southwards]
P. oligantha

4 Heads more than 10; cauline leaves many; [collectively widespread in our area].
$5 \quad$ Peduncles and upper stem densely glandular-hairy (stipitate-glandular); phyllaries densely glandular-hairy; involucres 4.5-8 mm high; lower leaves less than 10 mm wide.

6 All stem leaves silky pubescent; [widespread in our area] $\qquad$ P. aspera var. adenolepis 6 Lower leaves silky pubescent, the mid to upper stem leaves glabrate and evidently stipitate glandular along the margins; [of sc. GA south into panhandle FL] P. aspera var. aspera

5 Peduncles and upper stem eglandular to sparsely glandular; phyllaries eglandular, or the inner phyllaries sparsely to densely glandular, at least distally; involucres $5-12 \mathrm{~mm}$ high; lower leaves up to 20 mm wide.
7 Involucres 8-12 mm high, with more than 30 disk flowers . . . . . . . . . . . . . . . . . . . P. graminifolia var. Iatifolia 7 Involucres $5-8 \mathrm{~mm}$ high, with fewer than 30 disk flowers.

8 Inner phyllaries densely stipitate-glandular, at least distally . . . . . . . . . P. graminifolia var. graminifolia
8 Inner phyllaries eglandular to sparsely glandular
P. graminifolia var. tenuifolia

Pityopsis aspera (Shuttleworth ex Small) Small var. adenolepis (Fernald) Semple \& Bowers. Pd, Cp (GA, NC, SC, VA), Mt (GA, NC, SC): dry woodlands, forests, and disturbed places, apparently in the Mountains only in the Escarpment; common. Late June-October. E. and c. VA south to n . FL and west to s . MS. Var. adenolepis includes 2 chromosome numbers ( $2 \mathrm{n}=18$ and 36 ), which "account, in part, for the range of variation in involucre, floret, and fruit size" (Semple \& Bowers 1985). [=K, Z; Heterotheca adenolepis (Fernald) Ahles -- RAB; Heterotheca graminifolia (Michaux) Shinners -- RAB, misapplied; Chrysopsis graminifolia (Michaux) Elliott var. aspera (Shuttleworth ex Small) A. Gray -- C, G, SE, W; Chrysopsis graminifolia (Michaux) Elliott -- F, misapplied; P. adenolepis (Fernald) Semple; Pityopsis aspera -- S, infraspecific taxa not distinguished; Heterotheca aspera (Shuttleworth ex Small) Shinners]

Pityopsis aspera (Shuttleworth ex Small) Small var. aspera. Cp (GA): sandhills, dry flatwoods; common. Sc. GA south to n. (panhandle) FL. [=K, Z; Pityopsis aspera -- S, infraspecific taxa not distinguished; Chrysopsis graminifolia (Michaux) Elliott var. aspera (Shuttleworth ex Small) A. Gray -- SE]

Pityopsis graminifolia (Michaux) Nuttall var. graminifolia. Cp (GA, NC, SC): sandhills; uncommon. July-October. As interpreted here, $P$. graminifolia includes 5 varieties "that intergrade and hybridize, when the ploidy level is the same" (Semple \& Bowers 1985). Two do not reach our area, being restricted to peninsular FL: var. aequilifolia Bowers \& Semple and the hexaploid $(2 n=54)$ var. tracyi (Small) Semple. Var. graminifolia ranges from se. NC south to c. peninsular FL, and west to e. LA; in our area it is known only from the outer Coastal Plain. [= K, Z; Heterotheca nervosa (Willdenow) Shinners var. microcephala (Small) Shinners ex Ahles -- RAB, in part; Chrysopsis graminifolia (Michaux) Elliott var. graminifolia -- C; Pityopsis microcephala (Small) Small -- S, in part; Chrysopsis graminifolia (Michaux) Elliott var. microcephala (Small) Cronquist -- SE, in part]

Pityopsis graminifolia (Michaux) Nuttall var. latifolia Fernald. Cp, Mt, Pd (GA, NC, SC, VA): sandhills, dry woodlands and forests (such as ridgetop pine/heath communities in the Mountains), roadbanks; common (rare in VA Piedmont and Mountains). June-October. Var. latifolia is the most widely distributed variety of $P$. graminifolia, ranging from DE, s. OH, and c. AR south to s. FL and e. TX; Bahamas; and in Mexico (Tamaulipas, Vera Cruz, Oaxaca, Chiapas) and Central America (Belize, Guatemala, Honduras). [= K, Z; Heterotheca nervosa (Willdenow ) Shinners var. nervosa -- RAB; Heterotheca correllii (Fernald) Ahles -- RAB; Chrysopsis graminifolia (Michaux) Elliott var. latifolia Fernald -- C, W; Chrysopsis nervosa (Willdenow) Fernald var. nervosa -- F; Chrysopsis graminifolia (Michaux) Elliott -- G; Chrysopsis nervosa var. virgata Fernald -- F; Chrysopsis nervosa var. stenolepis Fernald -- F; Pityopsis graminifolia -- S, sensu stricto, misapplied; Chrysopsis graminifolia (Michaux) Elliott var. graminifolia -- SE, misapplied; Heterotheca graminifolia (Michaux) Shinners]

Pityopsis graminifolia (Michaux) Nuttall var. tenuifolia (Torrey) Semple \& Bowers. Cp (GA, NC, SC, VA): sandhills, sandy woodlands, savannas, pine flatwoods; common. July-October. Var. tenuifolia ranges from se. NC south to s. FL and west to e. TX (north inland to c. AR and e. OK); apparently disjunct in se. VA. [= K, Z; Heterotheca nervosa (Willdenow) Shinners var.
microcephala (Small) Shinners ex Ahles -- RAB, in part (see also P. graminifolia var. graminifolia); Pityopsis microcephala (Small) Small -- S, in part (see also P. graminifolia var. graminifolia); Chrysopsis graminifolia (Michaux) Elliott var. microcephala (Small) Cronquist -- SE, in part (see also P. graminifolia var. graminifolia); P. nervosa var. nervosa - Y]

Pityopsis oligantha (Chapman ex Torrey \& A. Gray) Small, Narrow-leaved Goldenaster. Cp (GA): wet flatwoods and pitcherplant bogs; rare (GA Special Concern). GA and FL west to LA. In sw. GA (GANHP, Jones \& Coile 1988). [= K, S, Z; Chrysopsis oligantha Chapman ex Torrey \& A. Gray - SE; Heterotheca oligantha (Chapman ex Torrey \& A. Gray) Harms]

Pityopsis pinifolia (Elliott) Nuttall, Sandhill Goldenaster. Cp (GA, NC, SC): sandhills, sandy roadsides; locally common (GA Threatened). August-October. This species is locally abundant (and often weedy) but very local in distribution, limited to (apparently) scattered counties in the Sandhills (rarely middle Coastal Plain) of s. NC, SC, GA, and c. AL. [= K, S, Z; Heterotheca pinifolia (Elliott) Ahles -- RAB; Chrysopsis pinifolia Elliott -- SE]

Pityopsis falcata (Pursh) Nuttall, ranging from se. MA south through RI, CT, and NY (Long Island) to s. NJ. [= K, Z; Chrysopsis falcata (Pursh) Elliott -- C, F, G]

Pityopsis graminifolia (Michaux) Nuttall var. tracyi (Small) Semple. AL and FL. [= K] \{not yet keyed\}
Pityopsis ruthii (Small) Small is a narrow endemic, restricted to rocks within the flood zone of the Hiwassee and Ocoee rivers, Polk County, TN. It should be sought in adjacent sw. NC. [= K, S, Z; Chrysopsis ruthii Small -- SE; Heterotheca ruthii (Small) V.L. Harms]

## Pluchea Cassini (Marsh-fleabane)

A genus of about 40 species, herbs and shrubs, of tropical, subtopical, and warm temperate regions. References: Godfrey (1952) $=$ Z, $\operatorname{Nesom}(1989,2004 a)=Y$; Arriagada (1998) $=X$; Cronquist (1980) $=$ SE.

1 Leaves sessile, and either rounded, truncate, or clasping at the base; [section Amplectifolium].
2 Corollas pink or purple; heads 4-6 mm high, 5-9 mm wide; phyllaries usually arachnoid and commonly also with dense, thick, viscid hairs; outer phyllaries acuminate; nutlets black, 0.5-1 mm long, densely pubescent; [flowering June-July] ..

2 Corollas creamy white; heads $6-10 \mathrm{~mm}$ high, $6-12 \mathrm{~mm}$ wide; phyllaries thinly arachnoid, with sessile glands; outer phyllaries obtuse or obtuse-apiculate; nutlets pinkish, ca. 1 mm long, pubescent on the angles; [flowering late JulyOctober].
3 Plants 3-11 dm tall; inner phyllaries 4-6 mm long; [widespread in our area] . . . . . . . . . . . . . . P. foetida var. foetida 3 Plants 9-25 dm tall; inner phyllaries 6-7 mm long; [of the Coastal Plain of SC southwards] . P. foetida var. imbricata 1 Leaves petiolate or narrowly cuneate at the base; [section Pluchea].

4 Phyllaries glandular on the outer surface (the outer bracts also somewhat pubescent); inflorescence paniculiform, the lateral branches not reaching or exceeding the central branches; plants to 20 dm tall; [in freshwater habitats, widespread in the Coastal Plain and Piedmont] . P. camphorata
4 Phyllaries short-pubescent with several-celled glandular-tipped hairs; inflorescence more-or-less cymiform and flattopped, some of the lower lateral branches elongate and reaching or exceeding the central branches; plants to $10(-15)$ dm tall; [mainly in salty or brackish habitats, restricted to the outer Coastal Plain].
5 Involucre 4-5.5 (-7) mm high, 4-7 (-9) mm across the disk; plants 4-10 (-15) dm tall; [of VA southwards] P. odorata var. odorata 5 Involucre 5.5-7 mm high, 5-9 mm across the disk; plants 3-6 dm tall; [of NC northwards] P. odorata var. succulenta

Pluchea camphorata (Linnaeus) Augustin de Candolle, Camphorweed, Camphor Pluchea. Cp, Pd (GA, NC, SC, VA), Mt (GA): bottomland sloughs, clay flatwoods, other freshwater wetlands; common. August-October. DE and MD south to n . FL, west to TX and OK, north in the interior to s. OH and e. KS. [= RAB, C, F, G, GW, K, SE, X, Y; P. petiolata Cassini -- S]

Pluchea foetida (Linnaeus) Augustin de Candolle var. foetida, Stinking Fleabane. Cp (GA, NC, SC, VA): seasonally wet areas, ditches, various other freshwater wetlands; common. Late July-October. S. NJ south to peninsular FL, west to e. TX; West Indies (?). [= K; P. foetida -- RAB, C, F, G, GW, SE, X, Y, infraspecific taxa not distinguished; P. foetida -- S; P. tenuifolia Small -- S]

Pluchea foetida (Linnaeus) Augustin de Candolle var. imbricata Kearney. Cp (GA?, SC?): freshwater wetlands; rare. Late July-October. SC south to panhandle FL. The validity and distribution of this taxon need additional study. [=K; P. foetida -- RAB, C, GW, SE, X, Y, infraspecific taxa not distinguished; P. imbricata (Kearney) Nash -- S]

Pluchea odorata (Linnaeus) Cassini var. odorata, Southern Saltmarsh Fleabane. Cp (GA, NC, SC, VA): salt and brackish marshes; common. August-October. VA south to FL, west to TX, also in w. United States, Central America, and South America. [= C, K, SE; < P. purpurascens (Swartz) Augustin de Candolle -- RAB; P. purpurascens (Swartz) Augustin de Candolle var. purpurascens -- $\mathrm{F}, \mathrm{G}$; < P. odorata -- GW, X, Y; P. camphorata -- S , misapplied]

Pluchea odorata (Linnaeus) Cassini var. succulenta (Fernald) Cronquist, Northern Saltmarsh Fleabane. Cp (NC, VA): salt and brackish marshes; common. August-October. MA south to NC, and possibly further south. The validity and distribution of this taxon need additional study. [= C, K, SE; < P. purpurascens (Swartz) Augustin de Candolle -- RAB; P. purpurascens (Swartz) Augustin de Candolle var. succulenta Fernald -- F, G; < P. odorata -- GW, X, Y]

Pluchea rosea Godfrey, Marsh Fleabane. Cp (GA, NC, SC): wet savannas, natural ponds, ditches; common. June-July. E. NC south to s. FL, west to se. TX; West Indies. Godfrey (1952) recognized 2 varieties of $P$. rosea, var. rosea of se. United States and var. mexicana Godfrey of gypsum plains in San Luis Potosí, Mexico. Nesom (1989) recognized the latter taxon at the species level, P. mexicana (Godfrey) Nesom. [= RAB, K, X, Y; P. rosea var. rosea -- GW, SE]

A genus of 2 species, herbs, of e. North America. References: Wells (1965); Cronquist (1980)=SE.

1 Stem obviously and usually densely pubescent; achenes 3 -ribbed . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. canadensis
1 Stem glabrous or nearly so (except sometimes in the inflorescence); achenes 4-6-ribbed . . . . . . . . . . . . . . . . . . P. Iaevigata
Polymnia canadensis Linnaeus, White-flowered Leafcup. Mt (GA, NC, VA), Pd (VA): moist forests, particularly over calcareous rocks; common, rare in NC, uncommon in VA Piedmont (NC Watch List). July-October. VT and Ontario west to MN, south to NC, nw. GA, AL, and AR. [= RAB, C, F, G, K, S, SE, W; P. radiata (A. Gray) Small -- S]

Polymnia laevigata Beadle, Tennessee Leafcup. Mt (GA): bouldery slopes; rare (GA Special Concern). W., c., and se. TN (Chester, Wofford, \& Kral 1997), AL, panhandle FL, nw. GA, and MO. [= K, S, SE]

Prenanthes Linnaeus (Rattlesnake-root)

A genus of about 30 species, herbs, of north temperate parts of the New and Old World. References: Johnson (1980)=Z; Fusiak \& Schilling (1984)=Y; Cronquist (1980)=SE. Key adapted from C and SE, in part.

Identification notes: The species cannot be reliably identified in sterile condition. "Principal phyllaries" are the inner, welldeveloped, excluding the few smaller and poorly-developed outer phyllaries.

1 Principal phyllaries 12-15; flowers mostly 20-35 per head; [of north and west of our area] . . . . . . . . . . . . . . . . . [P. crepidinea]
1 Principal phyllaries 4-10; flowers mostly 4-19 per head; [collectively widespread in our area].
2 Phyllaries glabrous or with few cilia or inconspicuous fine short pubescence at the tip.
3 Principal phyllaries (4-) 5 (-6); flowers 4-6 per head . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. P. altissima
3 Principal phyllaries 7-10); flowers 8-15 per head.
4 Inflorescences narrow and elongate (virgate); flowers pink to purple ........................ P. autumnalis
4 Inflorescences open, corymbiform to paniculiform, with some elongate branches; flowers white, cream, yellowish, pink, or purple.
5 Pappus cinnamon-brown . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. alba 5 Pappus straw-colored to light brown . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. $\boldsymbol{\text { trifoliolata }}$
2 Phyllaries evidently (though sometimes sparsely) pubescent with long coarse hairs (1.5-3 mm long).
6 Inflorescence corymbiform to paniculiform, many of the branches well-developed.
$7 \quad$ Phyllaries densely setose; leaves usually merely toothed, or shallowly lobed . . . . . . . . . . . . . . . . . . P. barbata
7 Phyllaries sparsely setose; principal leaves usually evidently lobed . . . . . . . . . . . . . . . . . . . . . P. serpentaria
6 Inflorescence cylindric, thyrsoid, the branches very short.
8 Heads nodding; principal phyllaries 4-7 (-9); flowers 5-8 (-13) per head; [of the Southern Appalachians]
$P$. roanensis
8 Heads ascending or nearly erect; principal phyllaries (6-) 8 (-10); flowers (8-) 11-14 (-19) per head; [west or north of our area].
9 Stem and leaves rough-hairy; flowers creamy yellow . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [P. aspera]
9 Stem and leaves glabrous; flowers usually purplish . . . . . . . . . . . . . . . [ [P. racemosa var. racemosa]
Prenanthes alba Linnaeus, Northern Rattlesnake-root. Mt (NC, VA), Pd (VA), Cp? (VA?): forests; uncommon (rare south of VA) (NC Watch List). August-November. ME west to Manitoba, south to ne. NC, w. NC, WV, and MO. Reported for GA (GANHP). reports of $P$. alba from the Coastal Plain of NC and perhaps VA are based on $P$. alba ssp. pallida, which is invalidly published; additionally, specimens attributed to this taxon are appear to be attributable to $P$. trifoliolata. [= C, F, G, K, SE, W, Z; P. alba ssp. alba -- RAB; Nabalus albus (Linnaeus) Hooker -- S]

Prenanthes altissima Linnaeus, Tall Rattlesnake-root. Mt, Pd, Cp (GA, NC, SC, VA): forests; common (uncommon in Coastal Plain). August-November. Newfoundland west to MI, south to GA, LA, and AR. [= RAB, G, K, W, Y, Z; P. altissima var. altissima -- C, F, SE; Nabalus altissimus (Linnaus) Hooker -- S]

Prenanthes autumnalis Walter, Slender Rattlesnake-root. Cp (GA, NC, SC, VA): pocosins, pine savannas, forest edges; common. September-November. NJ south to n. FL, a Southeastern Coastal Plain endemic. [= RAB, C, F, G, K, SE, Z; Nabalus virgatus (Michaux) Augustin de Candolle -- S]

Prenanthes barbata (Torrey \& A. Gray) Milstead, Barbed Rattlesnake-root, Flatwoods Rattlesnake-root. Mt (GA): limestone glades and barrens; rare (GA Special Concern). C. TN (Western Highland Rim) (Chester, Wofford, \& Kral 1997), nw. GA, and n. AL west to se. AR, e. TX and w. LA. [= K, SE; Nabalus integrifolius Cassini - S, in part]

Prenanthes roanensis (Chickering) Chickering, Roan Rattlesnake-root, Appalachian Rattlesnake-root. Mt (NC, VA): mountain forests, grassy balds, at high elevations; uncommon (NC Rare, VA Rare). August-October. Sw. VA south to w. NC and e. TN. Fusiak \& Schilling (1984) studied $P$. roanensis and related species. Additional characters (other than those explicitly used in the key above) useful in separating $P$. roanensis from $P$. altissima are: phyllary tips usually black (vs. usually green), flowers 5-8 per head (vs. 4-6), and inflorescence usually narrow and thyrsoid (vs. usually conspicuosly branched). [= RAB, C, K, SE, W, Y, Z; P. cylindrica (Small) Braun -- G; Nabalus roanensis Chickering -- S; Nabalus cylindricus Small -- S]

Prenanthes serpentaria Pursh, Lion's-foot, Gall-of-the-earth. Cp, Pd, Mt (GA, NC, SC, VA): forests; common (uncommon in Coastal Plain). August-October. MA south to GA, FL, MS. [= RAB, C, F, G, K, SE, W, Y, Z; Nabalus serpentarius (Pursh) Hooker -S; Nabalus integrifolius Cassini -- S, in part (also see Prenanthes barbata)]

Prenanthes trifoliolata (Cassini) Fernald, Gall-of-the-earth. Mt (GA, NC, VA), Cp (NC, SC, VA), Pd (VA): forests; common
(rare in Coastal Plain). August-November. Newfoundland south to e. NC, n. GA, and TN. [= RAB, C, G, K, SE, W, Z; P. alba ssp. pallida Milstead -- RAB, not validly published; P. trifoliolata var. trifoliolata -- F; Nabalus trifoliatus -- S, orthographic variant; Nabalus trifoliolatus Cassini]

Prenanthes aspera Michaux, Rough Rattlesnake-root. A midwestern species, east to c. TN, KY, OH, and PA. [= C, F, G, K, SE; Nabalus asper -- S, ortographic variant; Nabalus asperus (Michaux) Torrey \& A. Gray]

Prenanthes crepidinea Michaux, Midwestern Rattlesnake-root. A midwestern species, ranging east to NY, sw. PA, e. WV, and c. TN (Western Highland Rim) (Chester, Wofford, \& Kral 1997). [= C, F, G, K, SE; Nabalus crepidineus (Michaux) Augustin de Candolle -- S]

Prenanthes racemosa Michaux var. racemosa, Glaucous Rattlesnake-root. A northern species, ranging south to NJ and w. PA. [= C, K; P. racemosa -- F, infraspecific taxa not distinguished; P. racemosa ssp. racemosa -- G]

## Pseudognaphalium Kirpichnikov (Rabbit-tobacco)

References: Mahler (1975)=Z; Arriagada (1998)=Y; Cronquist (1980)=SE; Nesom (2001a)=X; Anderberg (1991). Key based, in part, on SE.

1 Involucre 2-3 mm high; plants to 2.5 dm tall; inflorescence of many, small, axillary and terminal clusters overtopped by subtending leaves [see Gnaphalium uliginosum]
1 Involucre 4-7 mm high; plants generally well over 2.5 dm tall; inflorescence terminal, usually elongate.
2 Leaves distinctly (but shortly) decurrent and adnate-auriculate on the stem.
3 Upper surface of the leaves coarsely glandular-hairy . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Ps. macounii
3 Upper surface of the leaves loosely tomentose, not glandular . . . . . . . . . . . . . . . . . . . . . . . . . . . . Ps. stramineum
2 Leaves sessile, not decurrent or adnate-auriculate.
4 Stem white-woolly or arachnoid with matted white hairs, the stem surface generally obscured (sometimes glandularpubescent at the base of the stem only) $\qquad$ Ps. obtusifolium
4 Stem glandular-pubescent or glandular-puberulent, the hairs at right angles to the stem, the stem surface plainly visible.
5 Stems glandular-villous, the stipitate glands (0.1-) $0.3-1.0 \mathrm{~mm}$ high, prominently variable in height on any portion of the stem, with a stalk broadened toward the base and about equal the gland width; pistillate florets 83-107, bisexual florets $9-15$; leaves mostly oblong-lanceolate, $2.5-7 \mathrm{~cm}$ long, $4-20 \mathrm{~mm}$ wide, $4-8$ times longer than wide; plant $4-10 \mathrm{dm}$ tall Ps. helleri
5 Stems glandular-puberulent, the stipitate glands $0.1-0.2 \mathrm{~mm}$ high, relatively even in height on any portion of the stem, with a filiform stalk of even width and narrower than the gland width; pistillate florets 47-78, bisexual florets (7-) 11-20; leaves linear to linear-lanceolate or linear-oblanceolate, 1.5-5.5 cm long, $1.5-10 \mathrm{~mm}$ wide, 6-10 times longer than wide; plant 3-7 dm tall . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Ps. micradenium

Pseudognaphalium helleri (Britton) A. Anderberg, Heller's Rabbit Tobacco. Pd, Cp (NC, SC, VA): dry woodlands and openings (especially over over mafic rocks), sandhills; rare (NC Rare, VA Rare). September-October. Sc. VA south to s. AL, west to AR, LA, and ne. TX. [= X; = Gnaphalium helleri Britton var. helleri -- Z; < Gnaphalium helleri -- RAB, C, G, S, SE, W, Y (also see Ps. micradenium); = Gnaphalium obtusifolium var. helleri (Britton) Blake -- $\mathrm{F} ;=$ Pseudognaphalium helleri (Britton) A. Anderberg ssp. helleri-K]

Pseudognaphalium macounii (Greene) Kartesz, Clammy Cudweed, Winged Cudweed. Mt (VA): dry fields, pastures, and woodland edges at high elevations; rare (VA Rare). July-September. Québec west to British Columbia, south to w. VA, WV, TN, and Mexico. [= K; Gnaphalium macounii Greene - C, F, S; Gnaphalium viscosum -- SE, Y, misapplied?; Pseudognaphalium viscosum (Kunth) W.A. Weber, misapplied]

Pseudognaphalium micradenium (Weatherby) Nesom, Small Rabbit Tobacco. Pd, Cp, Mt (NC, SC, VA): dry woodlands and openings; rare (NC Rare, VA Rare). September-October. Se. ME west to WI, south to e. SC, c. GA, se. TN, and s. MO. Nesom (2001a) discusses the distinctiveness of this taxon and its treatment as a species, rather than variety. [=X; = Gnaphalium helleri Britton var. micradenium (Weatherby) Mahler -- Z; < Gnaphalium helleri -- RAB, C, G, S, SE, W; = Gnaphalium obtusifolium var. micradenium Weatherby -- F, Y; = Pseudognaphalium helleri (Britton) A. Anderberg ssp. micradenium (Weatherby) Kartesz - K]

Pseudognaphalium obtusifolium (Linnaeus) Hilliard \& Burtt, Fragrant Rabbit Tobacco. Mt, Pd, Cp (NC, SC, VA): openings, woodlands, coastal dunes, sandy pinelands. disturbed areas; common. August-October. Newfoundland west to Ontario, south to FL and TX. [= X; Gnaphalium obtusifolium Linnaeus -- RAB, S, SE, W; G. obtusifolium var. obtusifolium -- F; Gnaphalium obtusifolium Linnaeus var. praecox Fernald - F; Gnaphalium obtusifolium var. obtusifolium-- C, G, Y, in a narrower sense; Pseudognaphalium obtusifolium ssp. obtusifolium - K; Gnaphalium polycephalum Michaux; Pseudognaphalium obtusifolium ssp. praecox (Fernald) Kartesz - K]

* Pseudognaphalium stramineum (Kunth) A. Anderberg. Cp (NC, SC, VA), Pd (NC, SC): sandy fields, roadsides, disturbed places; uncommon, introduced from TX south through Mexico and into South America. Late May-August. [=K; Gnaphalium stramineum Kunth -- C; G. chilense Sprengel -- RAB, SE, Y]

## Pterocaulon Elliott (Blackroot)

A genus of about 18 species, herbs, of tropical, subtropical, and warm temperate America, and of Oceania and se. Asia. References: Arriagada (1998)=Z; Cronquist (1980)=SE.

Identification notes: Pterocaulon is an unmistakable plant, the stems and leaf undersurfaces creamy-white floccose-tomentose, the leaf bases decurrent down the stem, the heads in oblong, terminal spikes, the tip nodding before anthesis.

Pterocaulon pycnostachyum (Michaux) Elliott, Blackroot, Wingstem. Cp (GA, NC, SC): sandhills, dry pinelands, pine flatwoods; common. May-June. Se. NC south to s. FL and west to s. AL. [= RAB, GW, K, SE, Z; P. undulatum (Walter) C. Mohr -$\mathrm{S}]$

Pyrrhopappus Augustin de Candolle (False-dandelion)
A genus of about 3 species, herbs, of North America. References: Cronquist (1980)=SE.

Pyrrhopappus carolinianus (Walter) Augustin de Candolle, False-dandelion. Cp, Pd, Mt (GA, NC, SC, VA): dry and moist forests, roadsides, meadows, fields; common (uncommon in NC and SC Mountains, rare in VA Mountains). March-June (and sometimes later). DE, se. PA, and MD south to FL, west to IL, MO, and TX. [= RAB, C, F, G, K, SE, W; P. carolinianus var. georgianus (Shinners) Ahles -- RAB, SE; Sitilias caroliniana (Walter) Rafinesque -- S; Pyrrhopappus georgianus Shinners]

## Ratibida Rafinesque (Prairie Coneflower)

A genus of about 7 species, herbs, of North America. References: Richards (1968) $=$ Z; Cronquist (1980)=SE. Key adapted from SE.

1 Disks columnar, 2-4.5× as long as thick; plant a tap-rooted perennial; rays less than $2(-2.5 \mathrm{~cm}$ long; achenes ciliate and winged, crowned by a pappus consisting of 1 or more awn-teeth $R$. columnifera
1 Disks ellipsoid-globular, 1-1.6× as long as thick; plant a fibrous-rooted perennial from a woody rhizome or caudex; rays 2.5-3.5 $(-4.5) \mathrm{cm}$ long; achenes smooth, lacking a pappus
R. pinnata

* Ratibida columnifera (Nuttall) Wooton \& Standley, Columnar Prairie Coneflower. Cp (NC, SC): established around nurseries or plantings, waste areas near wool-combing mills; rare, introduced from further west. May-August. Ontario west to Alberta, south to c. TN (Chester, Wofford, \& Kral 1997), TX, Mexico, and AZ; introduced at scattered sites elsewhere. [= C, F, G, K, SE, Z; R. columnaris (Sims) D. Don -- S]

Ratibida pinnata (Ventenat) Barnhart, Globular Prairie Coneflower, Grey-headed Coneflower. Mt (GA), Pd (SC): prairie-like glades and oak savannas over gabbro (usually in Iredell soils) or calcareous rocks; rare (SC Rare). June-August. S. Ontario west to MN and SD, south to w. PA, e. TN, nw. GA, w. FL, MS, and OK; disjunct in nc. SC. A characteristic plant of midwestern prairies and limestone glades, remarkably disjunct to "Piedmont prairie" remnants in SC (Nelson 1993). [= C, F, G, K, S, SE, W, Z]

## Rudbeckia Linnaeus (Yellow Coneflower, Black-eyed Susan)

A genus of about 15 species, herbs, of North America. References: Cronquist (1980)=SE; Perdue (1957)=Z.
Identification notes: This treatment needs considerable additional work in the herbarium, and will likely be substantially modified.
Rudbeckia auriculata (Perdue) Kral, Swamp Black-eyed Susan. Cp (GA): pitcherplant bogs, wet roadsides and powerline rights-of-way, seepages; rare (GA Special Concern). Sw. GA and Panhandle FL west to c. and s. AL. See Diamond \& Boyd (2004) for detailed information. [= K; R. fulgida Aiton var. auriculata Perdue]

Rudbeckia fulgida Aiton var. fulgida, Common Eastern Coneflower. [= C, G, K, SE; R. fulgida -- RAB, GW, W, infraspecific taxa not distinguished; R. fulgida Aiton -- F; R. fulgida var. palustris (Eggert ex C.L. Boynton \& Beadle) Perdue -- K, Z; R. fulgida -S , in a narrow sense; R. acuminata C.L. Boynton \& Beadle -- $\mathrm{S} ;$ R. foliosa C.L. Boynton \& Beadle -- S ; R. spathulata Michaux -- F, S; R. truncata Small -- S]

Rudbeckia fulgida Aiton var. speciosa (Wendroth) Perdue. (GA Special Concern). [=C,K, Z; R. fulgida var. sullivantii (C.L. Boynton \& Beadle) Cronquist - G, SE; R. fulgida -- RAB, GW, W, infraspecific taxa not distinguished; R. speciosa Wenderoth var. sullivantii (C.L. Boynton \& Beadle) B.L. Robinson -- F; R. sullivantii C.L. Boynton \& Beadle -- S]

Rudbeckia fulgida Aiton var. umbrosa (C.L. Boynton \& Beadle) Cronquist, Appalachian Coneflower. [= G, K, SE, Z; R. fulgida -- RAB, GW, W, infraspecific taxa not distinguished; R. umbrosa C.L. Boynton \& Beadle -- F, S; R. chapmanii C.L. Boynton \& Beadle -- S]

Rudbeckia grandiflora (Sweet) Augustin de Candolle var. grandiflora, Largeflower Coneflower. Mt (GA): limestone glades and barrens; rare (GA Special Concern). Nw. GA (Jones \& Coile 1988). [= K, SE, Z]

Rudbeckia heliopsidis Torrey \& A. Gray, Sunfacing Coneflower, Pineywoods Coneflower. Cp (NC, VA, Mt (GA): limestone or sandstone streambanks and barrens, pinelands, roadsides; rare (US Species of Concern, GA Special Concern, NC Endangered, VA Rare). In nw. GA (Jones \& Coile 1988). [= RAB, C, F, G, K, S, SE, W, Z]

Rudbeckia hirta Linnaeus var. angustifolia (T.V. Moore) Perdue, Coastal Plain Black-eyed Susan. Cp (SC): [=K, SE, Z; > R. hirta -- RAB, infraspecific taxa not distinguished; R. divergens T.V Moore -- S]

Rudbeckia hirta Linnaeus var. hirta, Woodland Black-eyed Susan. [= C, K, SE, Z; R. hirta -- RAB, G, W, infraspecific taxa not distinguished; R. hirta var. hirta -- F; R. hirta var. brittonii (Small) Fernald -- F; R. hirta -- S , in a narrow sense; R. amplectens T.V. Moore -- S; R. brittonii Small -- S; R. monticola Small -- S]

Rudbeckia hirta Linnaeus var. pulcherrima Farwell, Weedy Black-eyed Susan. [= C, K, SE; R. hirta -- RAB, G, W,
infraspecific taxa not distinguished; $R$. serotina Nuttall var. serotina -- F; R. serotina var. corymbifera (Fernald) Fernald \& Schubert -F; R. serotina var. sericea (T.V. Moore) Fernald \& Schubert -- F; R. longipes T.V. Moore -- S; R. sericea T.V. Moore -- S; > R. hirta var. corymbifera Fernald - Z; > R. hirta var. pulcherrima - Z, in a narrower sense]

Rudbeckia laciniata Linnaeus var. digitata (Miller) Fiori, Coastal Plain Cutleaf Coneflower. Cp (NC, SC, VA): [= C, F, K, SE; < R. laciniata -- RAB, GW, W, infraspecific taxa not distinguished; < R. laciniata var. laciniata -- G, in part; R. heterophylla Torrey \& A. Gray -- S]

Rudbeckia laciniata Linnaeus var. humilis A. Gray, Blue Ridge Cutleaf Coneflower. Mt (NC, SC?, VA): seeps, bog edges, brookbanks (VA Watch List). [= C, F, G, K, SE; < R. laciniata -- RAB, GW, W, infraspecific taxa not distinguished; < R. laciniata -- S, in part]

Rudbeckia laciniata Linnaeus var. Iaciniata, Common Cutleaf Coneflower, Goldenglow. Cp, Pd, Mt (NC, SC, VA): [= C, F, K, SE; < R. laciniata -- RAB, GW, W, infraspecific taxa not distinguished; R. laciniata var. hortensia Bailey -- F; < R. laciniata var. laciniata -- G, in part (also see var. digitata); <R. laciniata -- S , in part]

Rudbeckia mollis Elliott, Woolly Coneflower. [= RAB, K, S, SE, Z]
Rudbeckia mohrii A. Gray. ec. GA (Jones \& Coile 1988). [= K, SE]
Rudbeckia nitida Nuttall, St. John's Black-eyed Susan. Cp (GA): wet pine savannas; rare. e. GA (Jones \& Coile 1988). [= K; R. nitida var. nitida -- SE]

Rudbeckia triloba Linnaeus var. beadlei (Small) Fernald, Chauncey’s Coneflower. (US Species of Concern, VA Rare). [< R. triloba var. beadlei - F; < R. triloba var. pinnatiloba Torrey \& A. Gray -- C, G, K, SE, Z, defined broadly to include " $R$. beadlei"; < $R$. triloba -- RAB, W, infraspecific taxa not distinguished; = R. beadlei Small -- S]

Rudbeckia triloba Linnaeus var. rupestris (Chickering) A. Gray, Blue Ridge Three-lobed Coneflower. [= F, K, SE, Z; R. triloba -- RAB, W, infraspecific taxa not distinguished; = R. rupestris Chickering -- S]

Rudbeckia triloba Linnaeus var. triloba, Common Three-lobed Coneflower. [= C, F, G, K, SE; < R. triloba -- RAB, W, infraspecific taxa not distinguished; = R. triloba -- S , in a narrow sense]

Rudbeckia laciniata Linnaeus var. bipinnata Perdue, south to MD. [= K]

* Rudbeckia maxima Nuttall is reported for SC by Kartesz (1999). \{investigate\} [= K]

Rudbeckia subtomentosa Pursh. nc. TN (Chester, Wofford, \& Kral 1997). Alleged to be in NC too (Kartesz 1999). \{investigate\} [= K, SE, Z]

Rudbeckia triloba Linnaeus var. pinnatiloba Torrey \& A. Gray, Pinnate-leaf Coneflower. S. AL and Panhandle FL. [ $<$ R. triloba var. pinnatiloba Torrey \& A. Gray -- C, G, K, SE, Z, defined broadly to include "R. beadlei"; = R. pinnatiloba (Torrey \& A. Gray) Beadle - S] \{add synonymy, etc.\}

## Rugelia Rafinesque (Rugelia, Rugel's Ragwort)

A monotypic genus, an herb, endemic to the Great Smoky Mountains of w. North Carolina and e. Tennessee. Treated variously as Senecio or Cacalia in most recent North American floras (see synonymy), this species is anomalous in both and is best treated as a monotypic genus (Bremer 1994). References: Bremer (1994)=Z; Barkley (1999)=Y; Pippen (1978)=X; Cronquist (1980)=SE.

Rugelia nudicaulis Shuttleworth ex Chapman, Rugelia, Rugel's Ragwort. Mt (NC): high elevation forests and openings, primarily in spruce-fir forests, but extending in places downslope into northern hardwood forests; rare (US Species of Concern, NC Threatened). June-August. The genus and species is endemic to the Great Smoky Mountains of w. NC and e. TN, all known populations within Great Smoky Mountains National Park. Where it occurs, it is usually locally abundant, often even the dominant herb. The basal rosettes are evergreen, and are conspicuous in all seasons. [=K, Y, Z; = Senecio rugelia Gray $-\mathrm{RAB}, \mathrm{S} ;=$ Cacalia rugelia (Gray) Barkley \& Cronquist -- SE, W, X]

## Santolina Linnaeus

A genus of about 18 species, shrubs, of the Mediterranean region.

* Santolina chamaecyparissus Linnaeus, Holy-flax, Lavender-cotton, Cypress Lavender-cotton. Cp, Mt (NC): disturbed areas; rare, introduced from Mediterranean Europe. This species is introduced in e. and w. NC (Fox, Godfrey, \& Blomquist 1952) and in GA. Graetz (1973) recommended it for planting in barrier island areas of the Carolinas. [= C, K]

> Sclerolepis Cassini (Sclerolepis)

A monotypic genus, an herb, of e. North America. References: Cronquist (1980)=SE
Sclerolepis uniflora (Walter) Britton, Sterns, \& Poggenburg, Sclerolepis. Cp (GA, NC, SC, VA): in shallow water (later sometimes stranded on shore by dropping water levels) of clay-based Carolina bays, natural lake shores, blackwater stream shores and swamps, in seepage wetlands including sea-level fens; uncommon (VA Rare). May-August; July-October. NH south to c. FL, west to sw. AL (very rare north of NC); disjunct in se. LA (Smith, pers. comm.). Vegetatively, Sclerolepis is reminiscent of an underwater lonactis linariifolius! [= RAB, C, F, G, GW, K, SE]

A genus of 3 species, herbs, of the Mediterranean region.
1[S. hispanicus]
1S. maculatus

* Scolymus maculatus Linnaeus, Golden Thistle. Cp (NC): on ballast at seaports (formerly); rare, introduced from Europe. Small states that Scolymus "has been found on ballast on the seacoast of N.C."; the site was likely the port of Wilmington. [= K, S]
* Scolymus hispanicus Linnaeus, Golden Thistle, Spanish Oyster-plant, introduced on ballast in se. PA (Rhoads \& Klein 1993). [= K]

## Senecio Linnaeus (Ragwort, Groundsel) <br> (see also Ligularia, Packera, Rugelia)

A genus of very uncertain circumscription, if treated broadly with as many as 1500-2000 species, trees, shrubs, herbs, and vines. The trend is to divide Senecio into smaller, more natural genera. Most species of "Senecio" in our flora are not part of even a broadly defined core group, and have been transferred to Packera and Rugelia. References: Bremer (1994); Cronquist (1980)=SE; Barkley (1999)=Z; Barkley (1978)=Y.

1Perennial from a well-developed caudex.

2S. erucifolius
2S. jacobaea
1 Annual from fibrous roots [section Annui].
3Calyculate bracts consp[icuous and black-tipped; involucral bracts ca. 21
S. vulgaris 3

4[S. sylvaticus]
4[S. viscosus]

* Senecio vulgaris Linnaeus, Common Groundsel. Pd (GA, NC, SC, VA), Cp, Mt (NC, SC, VA): roadsides, fields, disturbed areas; uncommon, introduced from Eurasia. March-June. [= RAB, C, F, G, K, S, SE, W, Y, Z]
* Senecio erucifolius Linnaeus. Introduced south to se. PA. [= K, Y]
* Senecio jacobaea Linnaeus, Stinking Willie, Tansy Ragwort. Introduced south to se. PA. [= C, K, Y]
* Senecio sylvaticus Linnaeus, Woodland Groundsel. Introduced south to se. PA. [= C, K, Y]
* Senecio viscosus Linnaeus, Sticky Groundsel. Introduced south to se. and sc. PA. [= C, K, Y]

## Sericocarpus Nees (White-topped Aster)

A genus of 5 species, herbs, of North America. This group of species, traditionally treated as Sericocarpus, was transferred to Aster by Cronquist, a treatment followed by most (but not all) recent floristic works. It now appears, based on morphological and molecular studies, that the traditional treatment as a separate genus is far superior. Nesom (1993a) argues that a variety of characters indicate that Sericocarpus is more closely allied to Solidago, Euthamia, Bigelowia, Chrysoma, and Gutierrezia than it is to Aster. Noyes \& Rieseberg (1999) provide strong support for this contention, based on molecular evidence. See Nesom (1993a), Jones (1980), Semple \& Brouillet (1980), and Noyes \& Rieseberg (1999) for further discussion about the affinities of this group. References: Nesom (1993a)=Z; Cronquist (1980)=SE.

1 Leaves basally disposed, leaves of the basal rosette much larger than the cauline leaves; leaves (at least the basal) toothed
S. asteroides

1 Leaves cauline, basal rosette lacking, the mid-cauline leaves the largest; leaves entire (or with 1-2 teeth in S. tortifolius).
2 Leaves (2-) 4-8 cm long, 0.2-1.2 cm wide, linear to oblanceolate, 6-12× as long as wide, not twisted at the base (the leaf blade in a more-or-less horizontal plane); leaves glabrous (but with a ciliate margin), glandular-punctate; involucres glabrous $\qquad$ Leaves $1.5-4 \mathrm{~cm}$ long into a more-or-less vertical plane); leaves puberulent, glandular-punctate, and with prominent resin globules (at $10 \times$ magnification); involucres puberulent
S. tortifolius

Sericocarpus asteroides (Linnaeus) Britton, Sterns, \& Poggenburg, Toothed White-topped Aster. Cp, Pd, Mt (GA, NC, SC, VA): dry woodlands, thin soils around rock outcrops, sandhills, dry pinelands; common. June-July. ME and VT west to OH, south to e. TN, GA, and AL. Coastal Plain populations are rhizomatous, while inland populations are not; some taxonomic distinction may be warranted (Nesom, pers. comm.). [= F, K, S, Z; = Aster paternus Cronquist -- RAB, C, G, SE, W]

Sericocarpus linifolius (Linnaeus) Britton, Sterns, \& Poggenburg, Narrow-leaf White-topped Aster. Cp, Pd, Mt (GA, NC, SC, VA): dry woodlands, sandhills; common, rare in VA Mountains. June-July. MA west to s. IN, south to GA and LA. [= F, K, S, Z; =

## Aster solidagineus Michaux -- RAB, C, G, SE, W]

Sericocarpus tortifolius (Michaux) Nees, Twisted-leaf White-topped Aster. Cp (GA, NC, SC): dry to mesic sandhills; common. August-October. E. NC south to s. FL, west to LA, more or less restricted to the Coastal Plain. [= K, Z; = Aster tortifolius Michaux -- RAB, SE, W; = Sericocarpus bifoliatus (Walter) Porter -- S]

## Silphium Linnaeus (Rosinweed)

A genus of 20-30 species, herbs, of e. North America. References: Sweeney (1970)=Z; Perry (1937)=Y; Clevinger in FNA (in prep.); Clevinger (2004)=X; Cronquist (1980)=SE; Cruden (1962); Medley (1989); Steyermark (1951).

Identification notes: The number of ray flowers per head is a useful taxonomic character in Silphium; since only ray flowers are fertile, the number of ray flowers can also be determined by the number of achenes in freshly fruiting material. The key and taxonomic treatment is provisional.
 AL]
[S. glutinosum]

15 Plants mostly 15-20 dm tall, with usually 9-12 nodes below the inflorescence; stems and leaves; glandular hairs of the stems and leaves about as long as the eglandular hairs; rays (17-) 19-23 (-33) per head; [of chalk in c. AL]
[S. perplexum]
14 Stems, leaves, and phyllaries not stipitate-glandular, either smooth, scabrous, or hispid.
16 Leaves both strictly opposite throughout and clasping the stem.
17 Ray flowers 12-22 per head; phyllary surfaces scabrous, hirsute, or hispid
[S. integrifolium var. integrifolium]
17 Ray flowers 20-36 (or more) per head; phyllary surfaces glabrous . . . . [S. integrifolium var. laeve]
16 Leaves alternate, opposite, whorled, or combinations of those states (if strictly opposite then not clasping the stem).
18 Ray flowers 20-30 per head (or more) . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [S. radula] 18 Ray flowers 12-20 per head.

19 Leaf surfaces glabrous.
20 Cauline leaves predominately whorled in whorls of $3 \ldots$. . . asteriscus var. trifoliatum
20 Cauline leaves opposite . . . . . . . . . . . . . . . . . . . . . . . . . . . S. asteriscus var. latifolium
19 Leaf surfaces scabrous to hispid.
21 Basal leaves persistent at flowering . . . . . . . . . . . . . . . . . S. asteriscus var. simpsonii
21 Basal leaves caducous at flowering.
22 Paleae stipitate-glandular ............................ . S. asteriscus var. dentatum

22 Paleae eglanduar, scabrous to puberulent .......... S. asteriscus var. asteriscus
Silphium asteriscus Linnaeus var. asteriscus. $\{\mathrm{Mt}, \mathrm{Pd}, \mathrm{Cp}(\mathrm{GA}, \mathrm{NC}, \mathrm{SC}, \mathrm{VA})\}$ [ $=\mathrm{C}, \mathrm{FNA}, \mathrm{K}, \mathrm{SE}$; S. asteriscus -- F , in a broad sense; S. asteriscus -- S, Y, in a narrow sense; S. asteriscus var. scabrum Nuttall --SE; S. scaberrimum Elliott -- S; S. gatesii C. Mohr - Y]

Silphium asteriscus Linnaeus var. dentatum (Elliott) Chapman. Cp, Pd (SC) \{GA, NC\}: [= FNA; Silphium asteriscus Linnaeus var. angustatum A. Gray - K, SE; S. nodum Small -- S; S. asteriscus Linnaeus var. laevicaule DC - K; S. elliottii Small -S; S. incisum Greene -- S; S. dentatum Elliott -- F, SE; S. dentatum var. dentatum - Y; S. dentatum var. angustatum (A. Gray) L.M. Perry - Y]

Silphium asteriscus Linnaeus var. latifolium (A. Gray) J.A. Clevinger. \{Cp, Pd, Mt GA, NC, SC, VA\}: [=FNA; Silphium trifoliatum Linnaus var. latifolium A. Gray -- C, F, K, SE, Y; S. laevigatum Pursh -- RAB; S. confertifolium Small -- S, SE, Y; S. glabrum Eggert ex Small -- S]

Silphium asteriscus Linnaeus var. simpsonii (Greene) J.A. Clevinger. Cp (GA, SC): [= FNA, X; S. simpsonii Greene - K; S. gracile A. Gray - S, SE; S. simpsonii var. simpsonii - Y]

Silphium asteriscus Linnaeus var. trifoliatum (Linnaeus) J.A. Clevinger. Pd (NC, SC, VA), Mt, Cp (NC, VA): [= FNA; Silphium trifoliatum Linnaeus var. trifoliatum -- C, F, K, SE, Y; S. trifoliatum -- RAB, in a narrow sense; S. atropurpureum Retz. ex Willdenow -- F, Y]

Silphium compositum Michaux var. compositum. Cp (GA, NC, SC, VA), Pd (NC, SC, VA), Mt (NC, SC): sandhills, other xeric forests; common. May-September. Perhaps worth dividing further into two taxa: S. compositum sensu stricto, restricted to the Coastal Plain and extreme lower Piedmont, and distributed from se VA through the Carolina Coastal Plain to extreme e. GA, a distribution very similar to those of Carphephorus bellidifolius, Cirsium repandum, and Vaccinium crassifolium; and S. collinum Greene, with less deeply lobed leaves, and distributed from se. and sc. VA, nc. NC, sw. NC and ne. AL south to sc. SC, c. GA, and ec. AL. [= K, Y; C. compositum -- F, S, in a narrow sense; S. compositum var. compositum -- RAB, in part; S. orae Small -- S; S. compositum -- C, FNA, SE, in part; S. compositum ssp. compositum -- Z; S. collinum Greene]

Silphium compositum Michaux var. ovatifolium Torrey \& A. Gray. Cp (GA, SC): sandhills; rare. May-September. Distributed from se. SC south to c. peninsular FL and FL Panhandle. [= K; Silphium ovatifolium (Torrey \& A. Gray) Small - S, Y; S. ovatifolium (Torrey \& A. Gray) Small -- S; S. compositum -- FNA, SE, in part; S. compositum ssp. ovatifolium (Torrey \& A. Gray) Sweeney \& Fisher -- Z]

Silphium compositum Michaux var. venosum (Small) Kartesz \& Gandhi. Cp (NC, SC), Pd (SC): sandhills, xeric forests. May-September. Distributed from se. NC south to se. GA and FL Panhandle. [= K; Silphium venosum Small -- S, Y; S. compositum var. compositum -- RAB, in part; S. lapsuum Small -- S; S. venosum Small -- S; S. compositum -- FNA, SE, in part; S. compositum ssp. venosum (Small) Sweeney \& Fisher -- Z]

Silphium connatum Linnaeus, Virginia Cup-plant. Mt, Pd (NC, VA): floodplain forests and openings; uncommon. uneAugust. [= RAB, F, Y; S. perfoliatum var. connatum (Linnaeus) Cronquist -- C, FNA, K, SE]

Silphium mohrii Small, Shaggy Rosinweed. Mt (GA): prairies; rare. Endemic to c., sc., and se. TN (Chester, Wofford, \& Kral 1997) south to nw. GA (Jones \& Coile 1988) and nc. AL. [= C, FNA, K, Y]

Silphium perfoliatum Linnaeus, Common Cup-plant. Mt (NC, VA), Pd (NC): June-August. [= RAB, F, S, Y; S. perfoliatum var. perfoliatum -- C, FNA, K, SE]

Silphium pinnatifidum Elliott. Mt (GA): limestone glades and woodlands; rare. C. and se. TN south to nw. GA and AL. [= K, S, SE; S. terebinthinaceum Jacquin var. pinnatifidum (Elliott) A. Gray -- F, FNA, Y; S. chickamaugense Canby]

Silphium radula Nuttall. Mt (GA): rocky hardwood forests; rare (GA Rare). East to nw. GA (Jones \& Coile 1988). [= K, SE; S. asperrimum Hooker -- Y, misapplied; S. gatesii Mohr -- Y?]

Silphium reniforme Rafinesque ex Nuttall. Mt, Pd (NC, SC, VA): dry forests; uncommon. This species ranges from $w$. and sc. VA and e. TN, south to c. SC, c. GA, and e. AL. Plants with shallowly lobed leaves, with nearly the same distribution as typical S. reniforme, have been variously interpreted. [= S; S. compositum Michaux var. reniforme (Rafinesque ex Nuttall) Torrey \& A. Gray -- RAB, F, K, Y; S. compositum -- C, FNA, SE, in part; S. compositum ssp. reniforme (Rafinesque ex Nuttall) Sweeney \& Fisher -- Z]

Silphium terebinthinaceum Jacquin, Prairie-dock. Mt (VA), Pd (NC, SC): mafic glades, barrens, woodlands, and roadsides (NC, SC), calcareous glades, barrens, and woodlands (VA); rare. S. rumicifolium Small refers to plants of limestone in the Ridge and Valley province of e. TN and extreme sw. VA, alleged to differ from S. terebinthinaceum in the leaf bases cuneate at the base
(vs. cordate or truncate), smaller leaf blades (only to 15 cm long), smaller plants (to 8 dm tall vs. to 30 dm tall), and outer phyllaries broader than long (vs. longer than broad). The distinction of var. luciae-brauniae Steyermark, with leaf blades glabrous above vs. scabrous, is dubious and needs additional study. [= RAB, K, S, SE; S. terebinthinaceum var. terebinthinaceum -- F, FNA, Y, in a broader sense; S. terebinthinaceum var. luciae-brauniae Steyermark -- K; S. rumicifolium Small -- S, Y; S. terebinthinaceum var. lucy-brauniae -- orthographic variant]

Silphium brachiatum Gattinger, Cumberland Rosinweed. Endemic to sc. and se. TN (Chester, Wofford, \& Kral 1997) and n. AL. And GA? [=F, FNA, K, S, SE, Y]

Silphium glutinosum J. Allison, Sticky Rosinweed, is known from calcareous Ketona glades in Bibb County, c. AL (Allison \& Stevens 2001). [= FNA]

Silphium integrifolium Michaux var. integrifolium, Prairie Rosinweed, east to c. TN. [= C, F, FNA, K, SE; S. integrifolium var.
deamii L.M. Perry -- F; S. integrifolium var. integrifolium - Y; S. integrifolium var. gattingeri L.M. Perry -- K, Y]
Silphium integrifolium Michaux var. laeve Torrey \& A. Gray. MO west to NE, south to OK; disjunct in c. TN. [= C, FNA, K, SE; S. speciosum Nuttall -- F, Y]

Silphium laciniatum Linnaeus var. robinsonii L.M. Perry, Compass-plant, east to c. AL, wc. TN (Chester, Wofford, \& Kral 1997), and c. KY. [= F, K, Y; S. laciniatum -- C, FNA, SE, infraspecific taxa not distinguished]

Silphium perplexum J. Allison, Old Cahaba Rosinweed, is known from c. AL (Allison \& Stevens 2001). [= FNA]
Silphium wasiotense M. Medley, Appalachian Rosinweed. E. KY and ne. TN (Risk \& Wyrick 1996, Chester, Wofford, \& Kral 1997). [= C, FNA, K; S. wasiotensis, orthographic variant]

Silybum Adanson (Milk-thistle)

A genus of 2 species, herbs, of the Mediterranean region. References: Cronquist (1980)=SE.

* Silybum marianum (Linnaeus) Gaertner, Milk-thistle. Pd (VA): disturbed areas; rare, introduced from s. Europe. May-July. [= C, F, G, K, SE; Mariana mariana (Linnaeus) Hill -- S]

## Smallanthus Mackenzie ex Small (Bearsfoot)

A genus of about 20 species, of tropical, subtropical, and warm temperate America. Robinson (1978) describes the morphological and karyological differences warranting recognition of Smallanthus as a genus separate from Polymnia. References: Robinson (1978) $=$ Z; Cronquist (1980) $=$ SE .

Smallanthus uvedalius (Linnaeus) Mackenzie ex Small, Bearsfoot, Leafcup. Mt, Pd, Cp (GA, NC, SC, VA): moist forests and disturbed places; common. July-October. Ranging from NY and IL south to FL and TX. [= K, S, Z; Polymnia uvedalia Linnaeus -RAB, C, G, SE, W; Polymnia uvedalia var. densipilis Blake -- F, G; Polymnia uvedalia var. floridana Blake -- F]

Solidago Linnaeus (Goldenrod)
(also see Brintonia, Chrysoma, Euthamia, and Oligoneuron)
A genus of 80-100 species, herbs, primarily North American, but with a few species in South America, Macaronesia, and Eurasia. References: Semple \& Cook in FNA (in prep.); Nesom (1990); Cronquist (1980)=SE; Morton (1973, 1974); Zhang (1996); Cook \& Semple (2004). Key adapted in part from various sources, especially SE.

Solidago subsection Solidago: plumosa, racemosa, randii, spithamaea
Solidago subsection Albigula: bicolor, erecta, hispida var. hispida, puberula var. puberula, puberula var. pulverulenta, roanensis, speciosa var. speciosa, squarrosa, villosicarpa
Solidago subsection Glomeruliflorae: caesia, curtisii, flaccidifolia, flexicaulis, glomerata, lancifolia
Solidago subsection Argutae: arguta var. arguta, arguta var. boottii, arguta var. caroliniana, brachyphylla, buckleyi, harrisii, patula var. patula, patula var. strictula, sphacelata, tarda, verna
Solidago subsection Junceae: juncea, pinetorum
Solidago subsection Maritimae: austrina, gracillima, perlonga, pulchra, sempervirens var. mexicana, sempervirens var.
sempervirens, simulans, stricta, uliginosa var. uliginosa
Solidago subsection Thyrsiflorae: petiolaris
Solidago subsection Venosae: auriculata, latissimifolia, leavenworthii, odora var. odora, rugosa var. aspera, rugosa var. celtidifolia, rugosa var. rugosa, rugosa var. sphagnophila, rugosa var. villosa, ulmifolia var. ulmifolia
Solidago subsection Triplinervae: altissima, canadensis var. gilvocanescens, canadensis var. hargeri, fistulosa, gigantea var. gigantea, S. gigantea var. serotina, rupestris, tortifolia
Solidago subsection Nemorales: nemoralis var. haleana, nemoralis var. nemoralis, radula var. radula

Identification notes: Only fragments of the key are complete at this time. Several related genera readily mistaken for Solidago are included here as keying failsafes.

1 Inflorescence corymbiform, flat-topped or broadly rounded and about as broad as long or broader $\qquad$
1 Inflorescence a panicle, raceme, thyrse, usually longer than broad, or with either the central branch well-developed and elongate, or with numerous branches elongate and more-or-less secund heads.

2 Leaves basally disposed, the basal and lower cauline leaves larger, petiolate, and usually persistent, the middle and upper cauline leaves smaller and less petiolate $\qquad$
2 Leaves chiefly cauline, the basal and lower cauline leaves (when not early withering) the same size as or smaller than the middle and upper cauline leaves.
3 Inflorescence predominantly axillary, with well-developed leaves in at least the lower part of the inflorescence Key C
3 Inflorescence a well-developed panicle . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Key D

## Key A -- goldenrods with corymbiform inflorescences

## Key B -- goldenrods with basally disposed leaves

Inflorescence of axillary clusters, or a terminal simple or compound thyrse, the heads not notably secund. Inflorescence terminal and paniculate, the heads typically notably secund.

## Key C -- goldenrods with cauline leaves and axillary inflorescences

1 Outer phyllaries with squarrose tips; achenes glabrous at maturity; leaves entire or obscurely few-toothed.
2 Leaves oblanceolate-obovate, often short acuminate at the apex; mid-cauline leaves $8-14 \mathrm{~cm}$ long, $18-40 \mathrm{~mm}$ wide, the margins sharply serrate on at least the upper $2 / 3$ [ [subsection Argutae] S. buckleyi

2 Leaves narrowly to broadly elliptic (or less commonly slightly oblanceolate), acute at the apex; mid-cauline leaves 3-8 (10) cm long, $8-25 \mathrm{~mm}$ wide, margins entire to shallowly serrate on only the upper $1 / 2$ to $2 / 3$; [subsection Thyrsiflorae] ...

1 Outer phyllaries with appressed tips; achenes persistently pubescent; leaves generally many- and sharp-toothed; [subsection Glomeruliflorae].
3 Stem terete, glaucous . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. caesia
4 Lower midstem leaves narrowly lanceolate, $5-15 \mathrm{~cm}$ long, $0.8-3 \mathrm{~cm}$ wide; stems strongly arching; [plants widespread in our area] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. caesia var. caesia
4 Lower midstem leaves broadly lanceolate to rhombic, 5-9 cm long, 1.3-2.4 cm wide; stems weakly arching; [plants of the Gulf Coastal Plain of GA westwards] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. caesia var. zedia
3 Stem striate-angled, green.
5 Leaves $1-3(-3.5) \times$ as long as wide.
6 Leaves (2.2-) 2.5-3 (-3.5)× as long as wide, cuneate to a sessile base; teeth of the leaf margins not notably elongate and narrow, mostly 1-2 (-3) mm long measured on the upper side . . . . . . . . . . . . . . . S. flaccidifolia
6 Leaves 1-2.2 (-2.5)× as long as wide, abruptly contracted to a winged petiole; teeth of the leaf margins elongate and narrow, acuminate, mostly (2-) 3-8 mm long measured on the upper side
S. flexicaulis

5 Leaves $3-10 \times$ as long as wide.

7 Involucre 4.5-7 mm high; phyllaries 1-1.5 mm wide.
S. Iancifolia
S. glomerata
[S. albopilosa]

## Key to S. stricta and close relatives [subsection Maritimae, in part]

Warning to users: there are other entities which need to be included here! [S. sempervirens, S. uliginosa, S. simulans, S. perlonga?]

[^4]per head; pappus (3.0-) 3.5-4.5 (-5.0) mm long.
2 Leaf margins tending to become smooth on the upper stem; panicle branches usually stiffly erect; pappus 4.0-4.5 (-5.0) mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. stricta
2 Leaf margins scabrous (or at least tuberculate) throughout; panicle branches often spreading-erect with recurved-secund tips; pappus less than or equal to 4.0 mm long.
3 Pappus 2.2-2.8 mm long; ray flowers 2-4; disk flowers 6-8; [of the inner Coastal Plain and lower Piedmont] .......
3 Pappus (3.0-) 3.5-4.0 mm long; ray flowers 3-7; disk flowers 9-13; [of the Coastal Plain] . . . . . . . . . . . . S. gracillima

## Key to the S. arguta complex

1 Plant with filiform stolons (less than $2 / 3$ the diameter of the lower stem) present, in addition to the rhizome or woody caudex; involucres 4.5-7 mm high (and basal or lower cauline leaves 6-12 cm wide; see below); disc corollas 4.0-5.0 mm long; plants hexaploid (pollen averaging 19.6-22.0 $\mu$ in diameter); [mostly of the Coastal Plain] S. tarda

1 Plant lacking filiform stolons, rhizomes (if present) more than $1 / 2$ as thick as the lower stem; involucres 3-5 mm high (except in S. arguta ssp. pseudoyadkinensis, which has basal and lower cauline leaves mostly 1-2.5 cm wide); disc corollas $2.5-4.5 \mathrm{~mm}$ long; plants diploid or tetraploid (pollen averaging 15.1-20.1 $\mu$ in diameter); [collectively widespread].
2 Involucres more-or-less cylindrical, mostly less than 2.5 mm wide; leaves coriaceus; bases of the blades of the basal rosette and lower cauline leaves usually truncate; achenes pubescent; [of rocky woodlands and barrens of w. VA, w. WV, and w. MD] S. harrisii

2 Involucres campanulate, more than 2.5 mm wide; leaves chartaceous; bases of the blades of the basal rosettes and lower cauline leaves attenuate to widely cuneate (rarely truncate); achenes glabrous or pubescent; [of various habitats other than shale barrens].
3 Basal rosette and lower cauline leaves narrowly elliptic, usually less than 5 cm wide, the bases long-attenuate; teeth of fresh leaves twisted . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. arguta ssp. pseudoyadkinensis
3 Basal rosette and lower cauline leaves usually broadly elliptic to ovate, more than 5 cm wide, the bases longattenuate to widely cuneate; teeth of fresh leaves never twisted.
4 Leaf midvein strigose or minutely strigose on the lower surface (especially so on leaves of the lower stem)... .
S. arguta ssp. boottii

4 Leaf midvein glabrous on the lower surface.
5 Achenes glabrous or glabrate (hairs present on the upper $1 / 4$ only, if at all) . . . . . . S. arguta ssp. arguta
5 Achenes pubescent, the upper $1 / 2$ or more of the achene covered with trichomes
S. arguta ssp. caroliniana
\{add S. faucibus\}

## Key [B.1] to the S. simplex complex [subsection Solidago]

1 Achenes glabrous (even when young); flowering plants (3-) 4-10 (-13) dm tall; inflorescence broadly cylindrical, averaging 5-6 cm in diameter; [of rocky, flood-scoured riversides, known only from the Yadkin River in sc. NC]
1 Achenes pubescent (even at maturity); flowering plants 1.5-6 (-8.5) dm tall; inflorescence narrowly cylindrical, averaging 2-4 cm in diameter.
2 Lower cauline leaves $7-15 \times$ as long as wide, (2.5-) 4.6-9.4 (-11.2) cm long, (2-) 3-9 (-17) mm wide, generally obscurely toothed; [of rocky, flood-scoured riversides, known in our area only from n. VA] ......................... S. racemosa
2 Lower cauline leaves $3-8 \times$ as long as wide, (4.2-) 6.2-11.3 (-15.9) cm long, (5-) 10-22 (-31) mm wide, generally sharply toothed; [of cliffs and barrens, primarily over mafic rocks, known in our area only from w. VA]
S. randii

Solidago altissima Linnaeus, Tall Goldenrod. [= F, G, K; S. canadensis Linnaeus var. scabra Torrey \& Gray -- C, G, K, SE; S. altissima Linnaeus -- RAB, GW, in a broad sense (including S. canadensis vars. and S. rupestris); S. hirsutissima P. Miller -- S; S. canadensis -- W, infraspecific taxa not distinguished; S. altissima ssp. altissima - FNA]

Solidago arguta Aiton var. arguta, Forest Goldenrod. Cp, Pd, Mt (NC, VA): woodlands, woodland borders, road margins; uncommon (NC Watch List). ME and s. Ontario west to MO, south to NC and TN. A possible new taxon in the S arguta complex has been found in w. VA, e. WV, e. KY, nw. SC, and is under study by Tom Wieboldt (Wieboldt, pers. comm.). [= K; S. arguta ssp. arguta -- C, SE, W; S. arguta -- RAB, infraspecific taxa not distinguished (and also including S. tarda and S. vaseyi); S. arguta -- F, G, $S$ (narrow sense)]

Solidago arguta Aiton var. boottii (Hooker) Palmer \& Steyermark, Boott's Goldenrod. Cp (GA, SC): dry open woodlands, dry slopes, often in sandy or rocky soils; rare (VA Watch List). C. SC south to s. AL, west to LA, AR, and s. MO, most common in the Ozarks. [= K, SE; S. arguta -- RAB, infraspecific taxa not distinguished (and also including S. tarda and S. vaseyi); S. boottii -- F, S; S. strigosa -- F, G, S; S. arguta Aiton ssp. boottii (Hooker) G. Morton]

Solidago arguta Aiton var. caroliniana A. Gray, Vasey's Goldenrod. Cp, Mt, Pd (NC, SC, VA): forests, woodlands, grassy balds; common. WV west to c. TN and s. MO, south to ne. FL, panhandle FL, s. MS, and c. AR. The distinction between ssp. caroliniana and ssp. pseudoyadkinensis seems problematic. [=C, K, SE, W; S. arguta -- RAB, in part; S. yadkinensis (Porter) Small -- F, S, misapplied; S. boottii Hooker var. caroliniana (A. Gray) Cronquist -- G, in part only; S. vaseyi (A. Gray) Heller; S. arguta ssp. australis, nomen nudum; S. arguta Aiton ssp. pseudoyadkinensis G. Morton; S. boottii var. caroliniana -- G, in part only (also see S. vaseyi); S. pseudoyadkinensis, nomen nudum; S. arguta Aiton ssp. caroliniana (A. Gray) G. Morton]

Solidago auriculata Shuttleworth ex Blake, Eared Goldenrod. Pd (SC): rocky forest over circumneutral rocks; rare (SC Rare). sc. TN (Chester, Wofford, \& Kral 1997). [= K, SE; S. notabilis Mackenzie -- RAB, S]

Solidago austrina Small. sc. TN (Chester, Wofford, \& Kral 1997). [= F, G, S; S. stricta -- RAB, in part; S. gracillima -- K, SE, in part]

Solidago bicolor Linnaeus, Silverrod, White Goldenrod. Mt (NC, SC, VA), Pd, Cp (NC, VA): woodlands, roadbanks, pastures; common (rare in SC) (SC Rare). [= RAB, C, F, G, K, S, SE, W; S. bicolor var. ovalis -- F]

Solidago brachyphylla Chapman. Cp (GA, SC), Pd (GA): [= K, S, SE]
Solidago buckleyi Torrey \& A. Gray, Buckley's Goldenrod. [= F, G, K, S, SE; S. petiolaris -- RAB, in part]
Solidago caesia Linnaeus var. caesia, Axillary Goldenrod. Pd, Cp (NC, SC, VA), Mt (VA): moist forested slopes; common. [S. caesia-C, G, K, S, SE, W, infraspecific taxa not distinguished; S. caesia -- RAB, F, in part (see also S. flaccidifolia) and infraspecific taxa not distinguished]

Solidago caesia Linnaeus var. zedia R.E. Cook \& Semple, Gulf Coast Axillary Goldenrod. Cp (GA): moist forests; uncommon. GA and Panhandle FL west to LA and AR. [S. caesia - K, S, SE, infraspecific taxa not distinguished] * Solidago canadensis Linnaeus var. gilvocanescens Rydberg, Great Plains Common Goldenrod. (VA). [=C, F, G, K; S. pruinosa Greene -- G; S. canadensis -- S, W, infraspecific taxa not distinguished; S. altissima L. ssp. gilvocanescens (Rydberg) Semple - FNA]

Solidago canadensis Linnaeus var. hargeri Fernald, Harger's Common Goldenrod. (NC, VA). [= C, F, K, SE; S. canadensis var. canadensis -- G, in part; S. canadensis -- S, W, infraspecific taxa not distinguished]

Solidago curtisii Torrey \& A. Gray, Curtis's Goldenrod. Mt (NC, SC, VA), Pd (VA): moist forested slopes, and rarely in mafic woodlands in the Piedmont of VA; common. Var. curtisii, with stem glabrous or slightly puberulent in the inflorescence, and var. pubens (M.A. Curtis) A. Gray, with stem densely puberulent, are sometimes distinguished. They do not appear to be worthy of taxonomic recognition. The reduction of $S$. curtisii to a variety of $S$. caesia is clearly not warranted. [ $=$ RAB, C, F, G, K, SE, W; S. curtisii var. pubens (M.A. Curtis) A. Gray -- RAB, F, G; S. caesia Linnaeus var. curtisii (Torrey \& A. Gray) Wood; S. curtisii -- S, in the narrow sense; S. pubens M.A. Curtis -- S]

Solidago erecta Pursh. Mt, Pd, Cp (NC, SC, VA): woodlands, old fields, woodland borders, grassy balds; common (rare in Coastal Plain of NC and SC). [= RAB, C, F, G, K, S, SE, W; S. speciosa Nuttall var. erecta (Pursh) MacMillan]

Solidago faucibus Wieboldt, Gorge Goldenrod. Mt (SC, VA): moist forests. See Wieboldt \& Semple (2003) for additional information. Late August-October. [= FNA] [Arguta group]

Solidago fistulosa P. Miller, Hairy Pineywoods Goldenrod. Cp (NC, SC, VA): pocosins, swamp forests, wet savannas, wet pine flatwoods, maritime forests; common. [= RAB, C, F, G, GW, K, S, SE]

Solidago flaccidifolia Small, Appalachian Goldenrod. Mt (NC, SC, VA): mountain slopes; uncommon (VA Watch List). [= C, G, K, SE, W; S. caesia -- RAB, F, in part; S. latissimifolia -- S, misapplied; S. curtisii Torrey \& A. Gray var. flaccidifolia (Small) R.E. Cook \& Semple; S. caesia Linnaeus var. paniculata A. Gray]

Solidago flexicaulis Linnaeus, Zigzag Goldenrod. Mt, Pd (NC, SC, VA), Cp (VA): moist wooded slopes, especially over calcareous or mafic rocks; common (rare in VA Coastal Plain, uncommon south of VA). [= RAB, C, F, G, K, S, SE, W]

Solidago gigantea Aiton var. gigantea, Smooth Goldenrod. [= F, G, SE; S. gigantea -- RAB, C, GW, K, W, infraspecific taxa not distinguished]

Solidago gigantea Aiton var. serotina (Kuntze) Cronquist. [= G, SE; S. gigantea -- RAB, C, GW, K, W, infraspecific taxa not distinguished; S. gigantea var. leiophylla Fernald -- F; S. serotina -- S]

Solidago glomerata Michaux, Skunk Goldenrod. Mt (NC): restricted to high elevation situations, including grassy balds, rock outcrops, heath balds, northern hardwood forests, and spruce-fir forests; common. A narrow Southern Appalachian endemic, restricted to $w$. NC and e. TN, perhaps reaching its northern limit on Elk Knob (Watauga County, NC). The basal rosettes are evergreen, and are a conspicuous component of the winter flora at high elevations. The plants have a distinctive skunky odor, easily smelled without touching or bruising the plant. [= RAB, K, S, SE, W]

Solidago gracillima Torrey \& A. Gray, Southern Bog Goldenrod, Graceful Goldenrod. Cp (GA, NC, SC, VA?): wet pine savannas, seepage bogs; rare (NC Rare, VA Rare). September-October. Se. NC (and possibly VA) south to n. FL, west to s. AL. Several distinct entities appear to have been referred to this taxon; the number of entities, and the appropriate names to apply to them, are presently obscure. The names S. perlonga Fernald, S. austrina Small, and S. simulans Fernald have been synonymized under $S$. gracillima (as by SE). SE refers material from WV and high elevation granitic domes of sw. NC (S. simulans) to $S$. gracillima, a treatment which is not phytogeographically credible. Much further research is needed. [= RAB, K, S, W?; S. gracillima -- C, K, SE, in part only (also see variously S. simulans, S. perlonga, and S. austrina); S. stricta -- RAB, in part; S. stricta Aiton ssp. gracillima (Torrey \& A. Gray) Semple - FNA]

Solidago harrisii Steele, Shale-barren Goldenrod. Mt, Pd (VA): limestone, dolostone, greenstone, shale, and calcareous siltstone woodlands, barrens, and cliffs; uncommon (rare in Piedmont). W. MD south to e. WV and w. VA. [= F, S, W; S. arguta Aiton var. harrisii (Steele) Cronquist -- C, K, SE; S. boottii var. boottii -- G, in part]

Solidago hispida Muhlenberg ex Willdenow var. hispida, Hairy Goldenrod. Mt, Pd (VA): dry rocky forests and woodland edges; rare (VA Watch List). Widespread in e. and c. TN (Chester, Wofford, \& Kral 1997) and in nw. GA (Jones \& Coile 1988). Also reported for NC and SC by Kartesz (1999). [= F, G, K; S. hispida -- C, S, SE, W, infraspecific taxa not distinguished]

Solidago juncea Aiton, Early Goldenrod. Mt, Pd (NC, SC, VA): meadows, pastures, roadbanks, woodland borders; common. [= RAB, C, F, G, K, S, SE, W; S. juncea var. neobohemica Fernald -- F, K; S. juncea var. ramosa Porter \& Britton -- G]

Solidago kralii Semple, Kral's Goldenrod. Cp (GA, SC): longleaf pine sandhills; rare. August-September. See Semple (2003) for additional information. [= FNA]

Solidago lancifolia (Torrey \& A. Gray) Chapman, Lanceleaf Goldenrod. Mt (NC, VA): mountain slopes, mostly at high elevations; rare (NC Watch List, VA Rare). [= C, S, SE, W; S. curtisii -- RAB, in part; S. caesia var. curtisii -- K, in part]

Solidago latissimifolia P. Miller, Coastal Swamp Goldenrod. Cp (GA, NC, SC, VA): pocosins, swamp forests, sandhill seepages, sandhill-pocosin ecotones; uncommon (VA Rare). [= K; S. elliottii Torrey \& A. Gray -- RAB, C, F, G, GW, S, SE; S. elliottii var. ascendens Fernald -- F; S. elliottii var. pedicellata Fernald -- F]

Solidago leavenworthii Torrey \& A. Gray, Leavenworth's Goldenrod. Cp (GA, NC, SC): wet pine savannas, wet pine flatwoods, marshes; uncommon (NC Rare). [= RAB, GW, K, S, SE]

Solidago nemoralis Aiton var. haleana Fernald, Southern Gray Goldenrod. (VA Watch List). [= C, G, SE; S. nemoralis --

RAB, S, W, infraspecific taxa not distinguished; S. nemoralis var. nemoralis - K, in a broad sense]
Solidago nemoralis Aiton var. nemoralis, Northern Gray Goldenrod. [= C, G, SE; S. nemoralis -- RAB, S, W, infraspecific taxa not distinguished; S. nemoralis var. nemoralis - K, in a broad sense]

Solidago odora Aiton var. chapmanii (A. Gray) Chapman, Chapman's Goldenrod. Cp (GA): sandhills; rare. GA and FL. [= K, SE; S. chapmanii A. Gray - S; S. odora ssp. chapmanii (A. Gray) Semple - FNA]

Solidago odora Aiton var. odora, Licorice Goldenrod. Cp, Pd, Mt (NC, SC, VA): dry forests and woodlands, notably dry pinelands, such as sandhills, of the Coastal Plain; common (uncommon in Mountains). [= C, K, SE; S. odora -- RAB, F, G, W,infraspecific taxa not distinguished; S. odora -- S, narrow sense; S. odora ssp. odora - FNA]

Solidago patula Muhlenberg ex Willdenow var. patula, Northern Roughleaf Goldenrod. Mt (NC, SC, VA), Pd (NC, VA): bogs, seepages over mafic rocks, grassy balds (as Whitetop Mountain); uncommon. [= RAB, C, F, G, K, SE; S. rigida -- S, misapplied; S. patula -- GW, infraspecific taxa not distinguished; S. patula -- W; S. patula ssp. patula - FNA]

Solidago patula Muhlenberg ex Willdenow var. strictula Torrey \& A. Gray, Southern Roughleaf Goldenrod. Cp (NC, SC), Pd (VA): streamhead pocosins, sandhill seepages, swamp edges; uncommon (NC Watch List, VA Rare). Perhaps better treated as $S$. salicina. [= RAB, C, F, G, K, SE; S. salicina Elliott -- F, S; S. patula -- GW, infraspecific taxa not distinguished; S. patula ssp. strictula (Torrey \& A. Gray) J.C. Semple - FNA]

Solidago perlonga Fernald. [= F; S. gracillima -- K, SE, in part]
Solidago petiolaris Aiton. Cp, Pd (NC, SC), Mt (NC): upland forests and woodlands; uncommon (rare in Mountains). [S. petiolaris -- RAB, W, infraspecific taxa not distinguished (and also including S. buckleyi); S. petiolaris var. petiolaris -- C, F, K, SE; S. petiolaris -- G, narrow sense; S. milleriana Mackenzie -- S]

Solidago pinetorum Small, Pineywoods Goldenrod. Cp, Pd (NC, SC, VA), Mt (NC, VA): dry woodlands, woodland borders, roadbanks, dry pinelands; common (rare in VA Mountains). [= RAB, C, F, G, K, S, SE, W]

Solidago plumosa Small, Yadkin River Goldenrod. Pd (NC): in crevices of outcrops in rocky, flood-scoured riverbanks; rare (US Species of Concern, NC Rare). Known only from the type locality, the gorge of the Yadkin River in c. NC. Most of the population was probably lost by construction of two hydropower dams, one at each of the two ends of the gorge, and the flooding of the intervening area. This species is related to the more northern S. racemosa. [= FNA, K, S, SE]

Solidago porteri Small, Porter's Goldenrod. (GA): upland forests; rare (GA Rare) . [= K, S, SE]
Solidago puberula Nuttall var. puberula. Mt (NC, SC, VA), Pd (NC, VA), Cp? (NC): bogs, wet meadows, and wet pastures, in dry acid soils in VA; uncommon (NC Watch List). [= RAB, C, F, G, K, SE; S. puberula -- S, narrow sense; S. puberula -- W]

Solidago puberula Nuttall var. pulverulenta (Nuttall) Chapman. Cp (NC, SC, VA): savannas, streamhead pocosins, swamps, seepages in pinelands, and disturbed areas; common. [= RAB, C, F, G, K, SE; S. pulverulenta Nuttall -- S]

Solidago pulchra Small, Carolina Goldenrod. Cp (NC): wet pine savannas, seepage bogs; rare (US Species of Concern, NC Endangered). July-September. Apparently endemic to a small part of the Coastal Plain of se. NC, where locally common in the few wet savannas remaining (as, for instance, Green Swamp, Brunswick County, Holly Shelter Game Land, Pender County, Camp Lejeune Marine Corps Base, Onslow County, and Croatan National Forest, Carteret County, NC). There is no question of the distinctness of this species from S. stricta and S. gracillima. Once learned, the basal leaves are recognizable at a glance, the petiole very long (often twice as long as the leaf blade), the venation finely netted, the margins smooth and entire, the tip usually acute and prominently mucronate. Even following fire, sterile rosettes typically outnumber flowering plants 100 to 1 . [= K, S, SE; S. stricta -- RAB, GW, in part]

Solidago racemosa Greene, Sticky Goldenrod. Pd (VA): rocky, flood-scoured riversides; rare (VA Rare). south to the Cumberland Plateau of KY and ne. TN (Churchill \& Schell 1992, Chester, Wofford, \& Kral 1997). [S. simplex Kunth ssp. randii (Porter) Ringius var. racemosa (Greene) Ringius -- C, K; S. racemosa Greene var. racemosa -- F; S. spathulata Augustin de Candolle ssp. randii (Porter) Cronquist var. racemosa (Greene) Cronquist -- G, SE]

Solidago radula Nuttall var. radula, Rough Goldenrod. Pd (NC, SC): dry woodlands over mafic rocks; rare (NC Rare). [= K; S. radula -- RAB, C, G, S, SE, W, infraspecific taxa not distinguished]

Solidago randii (Porter) Britton, Rand's Goldenrod. Mt (VA): cliffs and barrens, primarily over mafic rocks (such as greenstone and hornblende); rare (VA Watch List). [= F; S. simplex ssp. randii (Porter) Ringius var. monticola (Porter) Ringius -- C; S. maxonii Pollard -- F; S. spathulata Augustin de Candolle ssp. randii (Porter) Cronquist var. randii -- G; S. simplex Kunth ssp. randii (Porter) Ringius var. randii -- K]

Solidago roanensis Porter, Roan Mountain Goldenrod. Mt (NC, SC, VA), Pd (NC, SC): forests, woodlands, roadbanks; common (rare in upper Piedmont). [=RAB, C, F, G, K, S, SE, W; S. roanensis var. monticola (Torrey \& A. Gray) Fernald -- F]

Solidago rugosa P. Miller var. aspera (Aiton) Fernald. [= F; S. rugosa ssp. aspera -- C, G, K, SE, W, in part; S. rugosa -- GW, infraspecific taxa not distinguished; S. altissima -- S, misapplied]

Solidago rugosa P. Miller var. celtidifolia (Small) Fernald, Hackberry-leaf Goldenrod. \{GA, NC, SC, VA\} [= RAB, F; S. rugosa ssp. aspera (Aiton) Cronquist -- C, G, K, SE, W, in part; S. rugosa -- GW, infraspecific taxa not distinguished; S. celtidifolia Small -- S]

Solidago rugosa P. Miller var. cronquistiana Semple, Cronquist's Goldenrod. Mt (GA, NC): high elevation balds and forests; uncommon. September. See Semple (2003) for additional information. [= FNA]

Solidago rugosa P. Miller var. rugosa, Wrinkle-leaf Goldenrod. [= F; S. rugosa var. rugosa -- RAB, in part (also see S. rugosa var. sphagnophila); S. rugosa ssp. rugosa var. rugosa -- C, G, K; S. rugosa -- GW, infraspecific taxa not distinguished; S. rugosa ssp. rugosa -- W, in part]

Solidago rugosa P. Miller var. sphagnophila Graves, Peat-loving Goldenrod. [= F; S. rugosa var. rugosa -- RAB, in part; S. rugosa ssp. rugosa var. sphagnophila Graves - C, G, K; S. rugosa -- GW, infraspecific taxa not distinguished; S. rugosa ssp. rugosa -- W, in part; S. aestivalis E. Bicknell]

Solidago rugosa P. Miller var. villosa (Pursh) Fernald. [= F; S. rugosa ssp. rugosa var. villosa -- C, G, K, SE; S. rugosa -GW, infraspecific taxa not distinguished; S. rugosa ssp. rugosa -- W, in part]

Solidago rupestris Rafinesque, Riverbank Goldenrod, Rock Goldenrod. Pd, Mt (VA): crevices in rocky, flood-scoured riversides; rare (VA Rare). [= C, F, K, SE; S. altissima -- RAB, in part; S. canadensis var. rupestris (Rafinesque) Porter -- G; S canadensis -- S, in part]

Solidago sempervirens Linnaeus var. mexicana (Linnaeus) Fernald, Southern Seaside Goldenrod. Cp (GA, NC, SC, VA): coastal dunes, dune slacks, maritime wet grasslands, marsh edges; common, rare in VA (VA Watch List). Late August-November (and sporadically until at least January in mild winters). [= C, F, G, GW, K, SE; S. sempervirens -- RAB, infraspecific taxa not distinguished; S. mexicana Linnaeus -- S; S. sempervirens ssp. mexicana (Linnaeus) Semple - FNA]

Solidago sempervirens Linnaeus var. sempervirens, Northern Seaside Goldenrod. Cp (VA): coastal dunes, dune slacks, maritime wet grasslands, marsh edges; common. Late August-November. [= C, F, G, K, SE; S. sempervirens Linnaeus -- S, in a narrow sense; S. sempervirens ssp. sempervirens - FNA]

Solidago simulans Fernald, Granite Dome Goldenrod, Cliffside Goldenrod. Mt (GA, NC, SC): in thin soil mats wetted by periodic seepage on granitic domes in the vicinity of Highlands, NC (Jackson and Macon counties, NC; Rabun County, GA) and in Hickory Nut Gorge (Rutherford County, NC); rare (GA Rare, NC Watch List). Endemic to sw. NC, nw. SC, and ne. GA. [= K; S. uliginosa -- RAB, in part; S. gracillima -- SE, in part]

Solidago speciosa Nuttall var. rigidiuscula Torrey \& A. Gray. Mt (GA): limestone barrens; rare (GA Special Concern). In scattered locations in TN (Chester, Wofford, \& Kral 1997) and GA (GANHP). [= K, SE]

Solidago speciosa Nuttall var. speciosa, Showy Goldenrod. Mt, Pd, Cp (NC, SC, VA): pastures, forests, woodlands, roadbanks; uncommon (rare in VA Coastal Plain). [= C, F, G, K, SE; S. speciosa -- RAB, W, infraspecific taxa not distinguished; S. conferta -- S; S. harperi Mackenzie -- S; S. speciosa ssp. speciosa - FNA]

Solidago sphacelata Rafinesque, Limestone Goldenrod, False Goldenrod. Mt, Pd (NC, VA): rock outcrops and dry rocky forests, usually over calcareous or mafic rocks; uncommon (rare in Virginia Piedmont). [= RAB, C, F, G, K, SE, W; Brachychaeta sphacelata (Rafinesque) Britton -- S]

Solidago spithamaea M.A. Curtis, Blue Ridge Goldenrod. Mt (NC): in crevices of sloping to nearly vertical outcrops of high elevation rocky summits on Grandfather Mountain, Hanging Rock Mountain, and Roan Mountain; rare (US Threatened, NC Endangered). Endemic to the three mountains named, the first two in NC, the third on the NC-TN border. S. spithamaea is a very restricted endemic, apparently related most closely to S. multiradiata Aiton and S. cutleri Fernald (sometimes included in S. multiradiata). S. multiradiata is an arctic-alpine species (with several recognized varieties) of $n$. Canada and AK, ranging south in w. North America to CA and CO. S. cutleri occurs in alpine situations on the higher peaks of ME, NH, and NY. S. spithamaea is a part of the remarkable "pseudo-alpine" flora of high elevation rocky summits in nw. NC; it typically is found with Liatris helleri, Huperzia appalachiana, Geum radiatum, Trichophorum cespitosum, Sibbaldiopsis tridentata, Polypodium appalachianum, Paronychia argyrocoma, Leiophyllum buxifolium, Zigadenus leimanthoides, Heuchera villosa, Saxifraga michauxii, Solidago glomerata, Houstonia montana, Carex misera, and C. brunnescens. [= RAB, K, S; S. spithamea -- SE, W, orthographic variant]

Solidago squarrosa Nuttall, Ragged Goldenrod, Stout Goldenrod, Squarrose Goldenrod. Mt (NC, VA), Pd (VA): upland forests; uncommon (rare south of VA and in VA Piedmont) (NC Rare). Kartesz's (1994) inclusion of this species in S. petiolaris is based on nomenclatural confusion; the two species are entirely distinct. [= RAB, C, F, G, K, S, SE, W]

Solidago stricta Aiton, Wand Goldenrod. Cp (GA, NC, SC, VA?): pine savannas, Coastal Plain bogs, pocosins; common. Late August-October. Ranging from NJ south to FL, west to TX, and in the West Indies and s. Mexico. [= C, F, G, K, SE; S. stricta -- RAB, GW, in part only (also see S. pulchra); S. petiolata P. Miller -- S, misapplied; S. stricta Aiton ssp. stricta - FNA]

Solidago tarda Mackenzie. Cp (VA): sandhills, other dry pinelands, and xeric fluvial sand ridges; rare (VA Watch List). Ranging from NJ and e. PA south to e. VA, c. and s. GA, AL, and panhandle FL, in our area primarily in the Coastal Plain; disjunct in Marion County, TN (Chester, Wofford, \& Kral 1997). [= C, S, SE; S. arguta -- RAB, in part; S. ludoviciana -- F, misapplied as to our area; S. arguta var. arguta -- K, in part]

Solidago tortifolia Elliott, Leafy Pineywoods Goldenrod. Cp (NC, SC, VA): sandhills and dry pinelands; uncommon (NC Rare, VA Rare). [= RAB, C, F, G, K, S, SE]

Solidago uliginosa Nuttall var. uliginosa, Northern Bog Goldenrod. Mt (GA?, NC, VA), Cp (VA): bogs; rare (GA Rare), NC Rare, VA Rare). Some material identified as S. uliginosa appears to actually be S. simulans and S. gracillima. [= F, G, K; S. uliginosa -- RAB, C, SE, W, infraspecific taxa not distinguished; S. uniligulata (Augustin de Candolle) Porter -- S]

Solidago ulmifolia Muhlenberg ex Willdenow var. ulmifolia, Elmleaf Goldenrod. Mt, Pd (NC, SC, VA), Cp (VA): rocky forests and woodlands, especially on mafic and calcareous substrates; common (rare south of VA and in VA Coastal Plain, where usually confined to coquina limestone) (NC Watch List). [= C, G, K, SE; S. ulmifolia -- RAB, F, S, W, infraspecific taxa not distinguished]

Solidago verna M.A. Curtis, Spring-flowering Goldenrod. Cp (NC, SC): moist pine savannas, lower slopes of sandhills, pineland roadbanks; rare (US Species of Concern, NC Endangered, SC Rare). Ranging from se. NC south to e. SC. [= RAB, K, S, SE]

Solidago villosicarpa LeBlond, Carolina Maritime Goldenrod. Cp (NC): dry-mesic and mesic hardwood forests (and related disturbed areas, in the outer Coastal Plain; rare (NC Rare). See LeBlond (2000).

Solidago albopilosa E.L. Braun, occurs in sandstone rockhouses of e. KY. See Esselman \& Crawford (1997). [= K, SE] \{add synonymy\}

Solidago arenicola B.R. Keener \& Kral, Black Warrior Goldenrod, is known from Blount Co., AL. See Keener \& Kral (2003) for additional information. \{not yet keyed\}

Solidago canadensis Linnaeus var. canadensis, Northern Common Goldenrod. See F, p. 1408. [= K, SE] \{add synonymy\}
Solidago gattingeri Chapman. c. TN (Chester, Wofford, \& Kral 1997). [= K, SE] \{add synonymy\}
Solidago missouriensis Nuttall var. fasciculata Holz. C. TN (Chester, Wofford, \& Kral 1997). [= K, SE] \{add synonymy\}
Solidago missouriensis Nuttall var. missouriensis. C. TN (Chester, Wofford, \& Kral 1997). [= K] \{add synonymy\}
Solidago shortii Torrey \& A. Gray. Endemic to nc. KY (Fleming, Jefferson, Nicholas, Robertson counties) and s. IN. See Smith et al. (2004) for detailed information. [=K] \{add synonymy\}

Solidago uliginosa Nuttall var. linoides (Torrey \& A. Gray) Fernald. South to s. PA and WV. [= K; S. uliginosa var. peracuta (Fernald) Friesner; S. purshii Porter] \{add synonymy\}

Solidago ulmifolia Muhlenberg ex Willdenow var. microphylla A. Gray. East to AL, FL. [= K] \{add synonymy\}

Soliva Ruiz \& Pavón
(also see Gymnostyles)
A genus of about 8 species, herbs, of South America. References: Cronquist (1980)=SE; Arriagada \& Miller (1997)=Z.

* Soliva sessilis Ruiz \& Pavón. Cp (GA, NC, SC, VA), Pd (GA, NC): lawns, roadsides; rare, introduced from South America. April-May. [= K, S, Z; S. pterosperma (Antoine Laurent de Jussieu) Less. -- RAB, SE]

Sonchus Linnaeus (Sow-thistle, Milk-thistle)
A genus of about 62 species, herbs, trees, and shrubs, of the Old World. References: Cronquist (1980)=SE.

* Sonchus arvensis Linnaeus ssp. uliginosus (Bieberstein) Nyman, Perennial Sow-thistle. [= K; S. arvensis - RAB, infraspecific taxa not distinguished; S. arvensis var. glabrescens (Guenth.) Grab. \& Wimm. -- C, SE]
* Sonchus asper (Linnaeus) Hill, Spinyleaf Sow-thistle, Prickly Sow-thistle. Cp, Pd, Mt (GA): [= RAB, C, K, SE]
* Sonchus oleraceus Linnaeus, Common Sow-thistle. Cp (GA, SC), Pd, Mt (GA): [= RAB, C, K, SE]
* Sonchus arvensis Linnaeus ssp. arvensis, Perennial Sow-thistle, ranges south to MD, TN, and KY (Kartesz 1999). [= K; S. arvensis - RAB, infraspecific taxa not distinguished; S. arvensis var. arvensis -- C, SE]

Stokesia L'Héritier de Brutelle (Stokesia, Stokes Aster)
A monotypic genus, an herb, of se. North America. References: Jones (1982)=Z; Cronquist (1980)=SE.
Stokesia laevis (Hill) Greene, Stokesia, Stokes Aster, Blue Stokesia. Cp (GA, SC), Pd* (NC*): native in pitcherplant bogs and moist pinelands of GA and SC, rather frequently grown as a garden plant and naturalized from cultivation at least in in NC; rare (GA Rare). Late June-August. Native from e. SC south to FL panhandle, west to LA. There seems no reason to question the validity and nativity of the early record from SC. [= RAB, K, S, SE, Z]

## Stuartina \{\}

A genus of 2 species, endemic to Australia.

* Stuartina hamata Philipson. Cp (SC): waste area near wool-combing mill; rare, introduced from Australia. See Nesom (2004d).

## Symphyotrichum Nees 1833 (American Aster)

## Warning: only a fragment complete at this time.

If circumscribed in a broad and traditional manner, a genus of about 250 species, herbs and weak vines and shrubs, of North America and Eurasia. There is currently much discussion of the generic limits and phylogeny of taxa traditionally placed in Aster, with considerable disagreement about generic limits. Some treatments would exclude Aster from our area, treating all species in other genera, the largest being Symphyotrichum. See, for instance, Semple \& Brouillet (1980a, 1980b); Jones (1980a, 1980b); Brouillet \& Semple (1981); Reveal \& Keener (1981); Jones \& Young (1983); Jones (1984); Semple, Chmielewski, \& Lane (1989); Nesom (1993a, 1993b, 1994); Semple, Heard, \& Xiang (1996); Noyes \& Rieseberg (1999). It now appears that some sections may be more closely related to other genera, and should be segregated. References: R. Jones (1983)=Z; Lamboy (1987)=Y; Nesom (1994)=X; Semple, Heard, \& Xiang (1996)=S; Cronquist (1980)=SE; Sundberg (2004); R. Jones (1992); Lamboy (1992); Nesom (1997); Xiang \& Semple (1996); Warners \& Laughlin (1999).
\{various fragments $\}$

## Key to Section Patentes

1 Involucres 8-10 (-12) mm high; disk flowers 8-10 mm long, white with purplish lobes; heads 4-5 (-6) cm across (ray tip to ray tip); plants strongly rhizomatous, forming clonal colonies with the stems mostly scattered along the rhizome (new stems typically arising at least several cm from the old ones); achenes $2.5-4.0 \mathrm{~mm}$ long, pale gray-brown, the trichomes about 0.4 mm long and distributed on and between the ribs; anthers purplish; pollen white
S. georgianum

1 Involucres 5.5-7.5 (-8.5) mm high; disk flowers 5.5-8 mm long, either white with purplish lobes or yellow; heads 3-4 ( -4.5 ) cm across (ray tip to ray tip); plants cespitose, generally with 1 or more stems arising from caudices (the new stems arising near the old); achenes $2.0-4.0 \mathrm{~mm}$ long, tan, gray, brown, dark-brown, or black, the trichomes various (see below); anthers purplish or yellow; pollen white or yellow.
2 Disk corollas yellow; cauline leaves (2-) 3-7 (-9) cm long, thick in texture, scabrous, the venation inconspicuous; anthers yellow; pollen yellow; achenes $2.0-3.5 \mathrm{~mm}$ long, the trichomes distributed on and between the ribs, mostly more than 0.4
mm long, spreading; [widespread in our area, mostly in dry, semi-sunny to sunny situations]
S. patens var. patens

2 Disk corollas white \{or perhaps also yellow??\}; cauline leaves 7.5-12.5 (-14) cm long, thin in texture, soft-pubescent, the venation apparent, rugose-veiny and wrinkled; anthers purplish; pollen white; achenes 2.5-4.0 mm long, the trichomes concentrated on the ribs, less than 0.4 mm long, appressed; [primarily of the Mountains, less commonly the Piedmont, mostly in moist, shady to semi-sunny situations]
S. phlogifolium
[from Warners \& Laughlin (1999)]
1 Stems glabrous, occasionally hispidulous in lines; stem leaves with glabrous midvein on the lower surface; rays white to pale lavender; inflorescence dense, leafy; shoots arising singly from elongate rhizome; stems 3-5 mm thick (at 20 cm above soil surface) S. firm um

1 Stems densely pubescent, usually purplish; stem leaves with pubescent midvein on the lower surface; rays lavender to purple; inflorescence widely spreading; shoots often in clumps of 2-6 stems from a persistent stout caudex; stems 5-9 mm thick (at 20 cm above soil surface)
S. puniceum var. puniceum

Symphyotrichum adnatum (Nuttall) Nesom. In sw. GA. [= K, X; Aster adnatus Nuttall -- S, SE]
Symphyotrichum bahamense (Britton) Nesom, north to GA and FL. [= K; Aster subulatus Michaux var. elongatus Bosserd;
Symphyotrichum subulatum (Michaux) Nesom var. elongatum (Bosserd) S.D. Sundberg]
Symphyotrichum concolor (Linnaeus) Nesom var. concolor, Eastern Silvery Aster. [< Symphyotrichum concolor (Linnaeus)
Nesom - K, X, infraspecific taxa not distinguished; Aster concolor Linnaeus -- RAB, C, G, S, SE, W; Virgulus concolor (Linnaeus)
Reveal \& Keener]
Symphyotrichum cordifolium (Linnaeus) Nesom. [= K; Aster cordifolius Linnaeus -- C, S, SE, W; A. cordifolius -- RAB, in part (including A. lowrieanus); Symphyotrichum cordifolium (Linnaeus) Nesom var. polycephalum (Porter) Nesom -- X; Symphyotrichum cordifolium (Linnaeus) Nesom var. racemiflorum (Fernald) Nesom -- X]

Symphyotrichum depauperatum (Fernald) Nesom, Serpentine Aster. Pd (NC): glades and barrens over mafic rocks (diabase); rare (NC Endangered). Early September-October. MD, se. PA, and nc. NC. [= K, X; Aster depauperatus Fernald -- C, F, G, SE]

Symphyotrichum divaricatum (Nuttall) Nesom. Cp (SC, VA), Pd (VA): disturbed areas, including waste areas near woolcombing mill; rare, introduced from sc. United States and Mexico. See Nesom (2000). \{distribution verified in part by specimens at NCU\} [=K, X; Aster subulatus Michaux var. Iigulatus Shinners -- SE; Aster exilis Elliott -- RAB, misapplied; Aster subulatus -GW, infraspecific taxa not distinguished; Symphyotrichum subulatum (Michaux) Nesom var. parviflorum (Nees) S.D. Sundberg]

Symphyotrichum dumosum (Linnaeus) Nesom var. dumosum, Long-stalked Aster. (NC, SC, VA). [=K, X; Aster dumosus Linnaeus var. dumosus; Aster dumosus -- RAB, C, G, GW, SE, W, infraspecific taxa not distinguished]

Symphyotrichum dumosum (Linnaeus) Nesom var. gracilipes (Wiegand) Nesom. (SC). [= K; Aster dumosus Linnaeus var. gracilipes Wiegand]

Symphyotrichum dumosum (Linnaeus) Nesom var. pergracile (Wiegand) Nesom. (NC, SC). [= K; Aster dumosus Linnaeus var. pergracile Wiegand]

Symphyotrichum dumosum (Linnaeus) Nesom var. strictior (Torrey \& A. Gray) Nesom. (NC, VA). [= K, X; Aster dumosus Linnaeus var. strictior Torrey \& A. Gray; Aster dumosus -- RAB, C, G, GW, SE, W, infraspecific taxa not distinguished]

Symphyotrichum dumosum (Linnaeus) Nesom var. subulifolium (Torrey \& A. Gray) Nesom. (NC, SC, VA). [= K, X; Aster dumosus Linnaeus var. subulifolius Torrey \& A. Gray; Aster dumosus -- RAB, C, G, GW, SE, W, infraspecific taxa not distinguished]

Symphyotrichum elliottii (Torrey \& A. Gray) Nesom, Southern Swamp Aster, Elliott's Aster. (VA Rare). [= K, X; Aster elliottii Torrey \& A. Gray -- RAB, C, G, GW, S, SE; Aster puniceus Linnaeus var. elliottii (Torrey \& A. Gray) A. G. Jones]

Symphyotrichum ericoides (Linnaeus) Nesom var. ericoides, Heath Aster, Squarrose White Aster. Mt (GA, VA): limestone glades; rare (GA Special Concern, VA Rare). [= K, X; Aster ericoides Linnaeus var. ericoides; Aster ericoides - C, SE, W, infraspecific taxa not distinguished; Aster ericoides vars. ?? -- G; Virgulus ericoides (Linnaeus) Reveal \& Keener]

Symphyotrichum ericoides (Linnaeus) Nesom var. prostratum (Kuntze) Nesom, Squarrose White Aster. (VA). [= K, X; Aster ericoides Linnaeus var. prostratus (Kuntze) Blake; Aster ericoides -- C, SE, W, infraspecific taxa not distinguished; Aster ericoides vars. ?? -- G; Virgulus ericoides (Linnaeus) Reveal \& Keener]

Symphyotrichum firmum (Nees) Nesom, Shining Aster. (NC Watch List). Included by Nesom (1997) in Symphyotrichum puniceum (Linnaeus) Nesom var. puniceum, but see Warners \& Laughlin (1999) for an analysis of differences between it and S. puniceum. [= X; Aster firmus Nees -- C; Aster puniceus -- RAB, in part; Aster puniceus Linnaeus var. firmus (Nees) Torrey \& A. Gray -- G, K; Aster lucidulus (A. Gray) Wiegand -- G, SE, W; Aster puniceus Linnaeus ssp. firmus (Nees) A.G. Jones; Symphyotrichum puniceum (Linnaeus) Löve \& Löve var. puniceum - K]

Symphyotrichum georgianum (Alexander) Nesom, Georgia Aster. Pd (GA, NC, SC): dry, rocky woodlands, woodland borders, roadbanks, powerline rights-of-way, primarily in places that formerly would have burned and likely been post oak or blackjack oak woodlands or savannas, also in thin soils around granitic flatrocks; rare (GA Special Concern, NC Proposed Threatened). Early October-mid-November; November-December. Sc. NC south to c. GA and west to c. AL; apparently disjunct on the Coastal Plain of sw. GA and e. panhandle FL. [= K, X; Aster georgianus Alexander -- S, Z; Aster patens - RAB, in part; Aster patens Aiton var. georgianus (Alexander) Cronquist -- SE; Virgulus georgianus (Alexander) Semple; Virgulus patens (Aiton) Reveal \& Keener var. georgianus (Alexander) Reveal \& Keener]

Symphyotrichum grandiflorum (Linnaeus) Nesom, Big-headed Aster. Pd (NC, SC), Cp (NC, VA): [= K, X; Aster grandiflorus Linnaeus -- RAB, C, G, S, SE, W; Virgulus grandiflorus (Linnaeus) Reveal \& Keener]

Symphyotrichum laeve (Linnaeus) Löve \& Löve var. concinnum (Willdenow) Nesom, Narrow-leaved Smooth Aster. (NC Rare, VA Watch List). [= K, X; Aster concinnus Willdenow -- C, G, S, SE; Aster laevis Linnaeus var. concinnus (Willdenow) House -- RAB, W]

Symphyotrichum laeve (Linnaeus) Löve \& Löve var. laeve, Smooth Blue Aster. mesic hardwood forests; rare (GA Special

Concern, SC Rare). [= K, X; Aster laevis Linnaeus var. laevis -- RAB, C, G, SE, W; Aster laevis -- S, narrow sense; Aster falcidens Burgess -- S]

Symphyotrichum laeve (Linnaeus) Löve \& Löve var. purpuratum (Nees) Nesom. (SC Rare). [= K, X; Aster laevis Linnaeus var. purpuratus (Nees) A. G. Jones; Aster purpuratus Nees -- S; Aster virgatus Elliott; Aster attenuatus Lindley ex Hooker -- S]

Symphyotrichum lanceolatum (Willdenow) Nesom var. interior (Wiegand) Nesom. (VA) (Kartesz 1999). South at least to s. PA (Rhoads \& Klein 1993). [= X; Aster lanceolatus Willdenow var. interior (Wiegand) Semple \& Chmielewski -- C; Aster lanceolatus ssp. lanceolatus var. interior (Wiegand) Semple \& Chmielewski -- K; Aster lanceolatus ssp. interior (Wiegand) A.G. Jones; Symphyotrichum lanceolatum (Willdenow) Nesom ssp. lanceolatum var. interior (Wiegand) Nesom - K]

Symphyotrichum lanceolatum (Willdenow) Nesom var. lanceolatum, south at least to s. PA (Rhoads \& Klein 1993). [= X; Aster lanceolatus Willdenow var. lanceolatus -- C; Aster lanceolatus ssp. lanceolatus var. lanceolatus; Aster lanceolatus ssp. lanceolatus]

Symphyotrichum lanceolatum (Willdenow) Nesom ssp. lanceolatum, Eastern Lined Aster. (NC Watch List). [= X; Aster lanceolatus Willdenow var. simplex (Willdenow) A. G. Jones -- C; Aster simplex var. simplex -- G; Aster lanceolatus ssp. lanceolatus var. lanceolatus -- K; Aster simplex Willdenow -- RAB, GW, SE; Aster lanceolatus -- W, infraspecific taxa not distinguished; Aster lanceolatus ssp. simplex (Willdenow) A.G. Jones]

Symphyotrichum lanceolatum (Willdenow) Nesom var. latifolium (Semple \& Chmielewski) Nesom. (NC, SC, VA). [= X; Aster lanceolatus Willdenow var. Iatifolius Semple \& Chmielewski; Symphyotrichum lanceolatum (Willdenow) Nesom ssp. lanceolatum var. Iatifolium (Semple \& Chmielewski) Nesom -- K] Symphyotrichum lateriflorum (Linnaeus) Löve \& Löve var. horizontale (Desfontaines) Nesom, Goblet Aster. [= K, X; Aster lateriflorus (Linnaeus) Britton var. horizontalis (Desfontaines) Farwell; Aster lateriflorus -- C, G, GW, SE, W, infraspecific taxa not distinguished]

Symphyotrichum lateriflorum (Linnaeus) Löve \& Löve var. lateriflorum, Starved Aster. [=K, X; Aster lateriflorus (Linnaeus) Britton var. lateriflorus; Aster lateriflorus -- RAB, infraspecific taxa not distinguished (and also including A. ontarionis); Aster lateriflorus -- C, G, GW, SE, W, infraspecific taxa not distinguished; Aster vimineus Lamarck, as to type -- RAB, G, GW, SE?, W; Aster lateriflorus (Linnaeus) Britton var. hirsuticaulis (Lindley ex. Augustin de Candolle) Porter; Symphyotrichum lateriflorum (Linnaeus) Löve \& Löve var. hirsuticaule (Lindley ex Augustin de Candolle) Nesom -- X] Symphyotrichum longifolium (Lamarck) Nesom. Cp (SC): [= X; Aster longifolius Lamarck] Symphyotrichum lowrieanum (Porter) Nesom. Mt (NC, VA): [= K, X; Aster lowrieanus Porter -- C, G, S, SE, W; Aster cordifolius Linnaeus -- RAB, in part; Aster cordifolius var. laevigatus Porter; Aster plumarius Burgess -- S; Aster cordifolius ssp. laevigatus (Porter) A.G. Jones]

Symphyotrichum novae-angliae (Linnaeus) Nesom, New England Aster. prairies; rare (GA Special Concern, SC Rare). [= K, Z; Aster novae-angliae Linnaeus -- RAB, C, G, GW, S, SE, W; Virgulus novae-angliae (Linnaeus) Reveal \& Keener] Symphyotrichum novi-belgii (Linnaeus) Nesom var. elodes (Torrey \& A. Gray) Nesom. [= K, X; Aster novi-belgii Linnaeus var. elodes (Torrey \& A. Gray) A. Gray; Aster novi-belgii -- RAB, C, G, GW, SE, infraspecific taxa not distinguished; Aster elodes Torrey \& A. Gray -- S]

Symphyotrichum oblongifolium (Nuttall) Nesom, Eastern Aromatic Aster, Shale-barren Aster. (NC Rare). [= K, X; Aster oblongifolius Nuttall var. angustatus Shinners -- G, SE; Aster oblongifolius -- RAB, C, S, W, infraspecific taxa not distinguished; Virgulus oblongifolius (Nuttall) Reveal \& Keener]

Symphyotrichum patens (Aiton) Nesom var. patens, Common Clasping Aster. Pd, Mt, Cp (NC, SC, VA): dry woodlands, roadsides, woodland edges, clearings, roadbanks; common. Late August-early November; October-November. Var. patens ranges from VT and NY west to PA, s. OH, s. IN, s. MO, and se. KS, south to e. GA, panhandle FL, s. AL, s. MS, s. LA, and sc. TX. Var. patentissimus (Lindley ex de Candolle) Torrey \& A. Gray is largely Ozarkian. Var. gracilis Hooker, as defined more narrowly by Z, ranges east to s. AL from a core range in LA, e. and c. TX, and OK. [= K, X; Aster patens Aiton var. patens -- C, F, G, SE, Z; Aster patens -- RAB, infraspecific taxa not distinguished (and also including Aster georgianus and Aster phlogifolius); Aster patens var. gracilis Hooker -- C, F, G, SE, misapplied as to our area (now more narrowly defined and occuring only west of our area); Aster patens -- S (in the narrow sense); Aster patens -- W, infraspecific taxa not distinguished (but not including Aster phlogifolius); Virgulus patens (Aiton) Reveal \& Keener var. patens]

Symphyotrichum phlogifolium (Muhlenberg ex Willdenow) Nesom, Appalachian Clasping Aster. Mt (GA, NC, SC, VA), Pd (NC, SC, VA): mesic, nutrient-rich mixed hardwood forests; uncommon (GA Special Concern, NC Watch List). Late August-mid October. NJ and Long Island, NY west to PA, n. OH, and e. IN south to c. VA, c. NC, w. SC, n. GA, and ne. AL, primarily in the Appalachian Mountains and adjacent provinces. [ K K, X; Aster patens - RAB, in part; Aster phlogifolius Muhlenberg ex Willdenow -- S, W, Z; Aster patens Aiton var. phlogifolius (Muhlenberg ex Willdenow) Nees -- C, F, G, SE; Virgulus patens (Aiton) Reveal \& Keener var. phlogifolius (Muhlenberg ex Willdenow) Reveal \& Keener]

Symphyotrichum pilosum (Willdenow) Nesom var. pilosum. (GA, NC, SC, VA). [=X; Aster pilosus Willdenow var. pilosus -- C, G, SE; Aster pilosus -- RAB, W, in part]

Symphyotrichum pilosum (Willdenow) Nesom var. pringlei (A. Gray) Nesom. (VA Watch List). [=K, X; Aster pilosus Willdenow var. demotus Blake -- RAB, G, SE; Aster racemosus Elliott -- RAB?; Aster pilosus var. pringlei -- C]

Symphyotrichum praealtum (Poiret) Nesom var. angustior (Wiegand) Nesom, Willow Aster, Veiny Lined Aster. Mt (VA): fen-like calcareous wetlands; rare (VA Rare). Frederick County, VA. Also reported for NC by Kartesz (1999). [= K, X; Aster praealtus Poiret var. angustior Wiegand; Aster praealtus -- C, GW, W, infraspecific taxa not distinguished; Aster praealtus var. praealtus -- G, SE, in part]

Symphyotrichum praealtum (Poiret) Nesom var. praealtum. Mt (GA, VA): moist forests over limestone, wooded fen (with Acer rubrum and Fraxinus nigra); rare (GA Special Concern, VA Rare). Giles County, VA. [= K, X; Aster praealtus Poiret var. praealtus; Aster praealtus -- C, GW, W, infraspecific taxa not distinguished; Aster praealtus var. praealtus -- G, SE, in part] Symphyotrichum pratense (Rafinesque) Nesom. Mt (GA, VA): calcareous barrens; rare (GA Rare). East to e. TN (Chester, Wofford, \& Kral 1997) and sw. VA (Ludwig 1999). [= K, X; Aster pratensis Rafinesque; Aster sericeus Ventenat var. microphyllus Augustin de Candolle; Aster sericeus -- C, SE, in part; Sympyotrichum sericeum (Ventenat) Nesom var. microphyllum (Augustin de Candolle) Wunderlin \& B.F. Hansen]

Symphyotrichum prenanthoides (Muhlenberg ex Willdenow) Nesom, Zigzag Aster. [= K, X; Aster prenanthoides Muhlenberg ex Willdenow -- RAB, C, G, S, SE, W]

Symphyotrichum priceae (Britton) Nesom. \{GA\} In c. TN (Chester, Wofford, \& Kral 1997). [= K, X; Aster priceae Britton; Aster pilosus Willdenow var. priceae (Britton) Cronquist - C, G, SE; Aster pilosus -- W, in part]

Symphyotrichum puniceum (Linnaeus) Löve \& Löve var. puniceum, Purple-stem Aster, Swamp Aster. Unresolved material from Grayson County mafic seeps. [= K, X; Aster puniceus Linnaeus -- C, GW, S, SE, W; Aster puniceus -- RAB, in part, also including Aster firmus; Aster puniceus var. puniceus -- G; Aster conduplicatus Burgess -- S; Aster puniceus ssp. puniceus] Symphyotrichum racemosum (Elliott) Nesom var. racemosum, Small White Aster. Cp (SC): [= K, X; Aster racemosus Elliott var. racemosus; Aster racemosus -- C, infraspecific taxa not distinguished; Aster vimineus -- SE, misapplied; Aster brachypholis Small -- S]

Symphyotrichum racemosum (Elliott) Nesom var. subdumosum (Wiegand) Nesom. \{in e. WV and apparently through our area judging from F\} [= X; Aster racemosus Elliott -- C, infraspecific taxa not distinguished; Aster fragilis Willdenow var. subdumosus (Wiegand) A.G. Jones -- K, misapplied; Aster vimineus Lamarck var. subdumosus Wiegand -- F]

Symphyotrichum retroflexum (Augustin de Candolle) Nesom. [= K, X; Aster retroflexus Lindley ex Augustin de Candolle -C; Aster curtisii Torrey \& A. Gray -- RAB, S, SE, W]

Symphyotrichum rhiannon Weakley \& Govus, Buck Creek Aster, Rhiannon's Aster. Mt (NC): ultramafic outcrop barren; rare. October-November. Showing some similarities to S. puniceum and S. prenanthoides, but unique in many characters and not seemingly intermediate. See Kauffman et al. (2004) for additional information.

Symphyotrichum $\times$ schistosum (Steele) Nesom, Millboro Aster. (US Species of Concern, VA Rare). [=K, X; Aster $\times$ schistosus Steele (pro sp.); Aster schistosus Steele]

Symphyotrichum sericeum (Ventenat) Nesom, Western Silvery Aster. Mt (GA, VA): limestone glades; rare (GA Rare, VA Rare). w. VA (Russell County limestone), nw. GA (Jones \& Coile 1988). [ $=\mathrm{K}, \mathrm{X}$; Aster sericeus Ventenat -- G, S; Aster sericeus Ventenat -- C, SE, in part; Virgulus sericeus (Ventenat) Reveal \& Keener; Aster phyllolepis Torrey \& A. Gray?]

Symphyotrichum shortii (Lindley) Nesom, Midwestern Blue Heart-leaved Aster, Short's Aster. (NC Rare, VA Rare). The lower stem leaves are indeed reminiscent of the leaves of Asplenium rhizophyllum (formerly known as Camptosorus), explaining Small's name for this species. [= K, X; Aster shortii Lindley -- C, G, S, SE; Aster camptosorus Small -- S]

Symphyotrichum simmondsii (Small) Nesom. Pd, Cp (SC): Also reported for NC by Kartesz (1999). [= K, X; Aster simmondsii Small]

Symphyotrichum subulatum (Michaux) Nesom. (NC, SC, VA). Reported for se. PA by Rhoads \& Klein (1993). See Sundberg (2004). [= K, X; Aster subulatus Michaux var. subulatus -- C, G, SE; A. subulatus -- RAB, GW, infraspecific taxa not distinguished; Aster subulatus var. subulatus -- C, SE, in part only; Aster subulatus Michaux var. euroauster Fernald \& Griscom]

Symphyotrichum tenuifolium (Linnaeus) Nesom var. tenuifolium. See Sundberg (2004). [= Symphyotrichum tenuifolium (Linnaeus) Nesom -- K, X, in a narrow sense; Aster tenuifolius Linnaeus -- RAB, C, G, GW, SE; Aster tenuifolius ssp. tenuifolius] Symphyotrichum undulatum (Linnaeus) Nesom. [= K, X; Aster undulatus Linnaeus -- RAB, C, G, SE, W; Aster asperifolius Burgess -- S; Aster linguiformis Burgess -- S ; Aster loriformis (Burgess) Burgess -- S ; Aster mohrii Burgess -- S ; Aster claviger Burgess -- S; Aster corrigiatus Burgess -- S; Aster gracilescens Burgess -- S; Aster proteus Burgess -- S; Aster sylvestris Burgess -S ; Aster triangularis (Burgess) Burgess -- S ; Aster truellius Burgess -- S ; Aster undulatus - S , in a narrower sense; Aster undulatus Linnaeus var. asperulus (Torrey \& A. Gray) Wood; Aster undulatus Linnaeus var. loriformis Burgess]

Symphyotrichum urophyllum (Lindley in Augustin de Candolle) Nesom. [= K, X; Aster sagittifolius Wedemeyer ex Willdenow -- RAB, C, G, S, SE, W; Aster cordifolius Linnaeus var. sagittifolius (Wedemeyer ex Willdenow) A.G. Jones; Aster urophyllus Lindley in Augustin de Candolle; Aster cordifolius Linnaeus ssp. sagittifolius (Willdenow) A.G. Jones]

Symphyotrichum walteri (Alexander) Nesom. [= K, X; Aster walteri Alexander -- S, SE; Aster squarrosus Walter -- RAB; Virgulus walteri (Alexander) Reveal \& Keener]

Symphyotrichum boreale (Torrey \& A. Gray) Löve \& Löve, Rushlike Aster, Northern Bog Aster, is reported for WV (Barbour and Fayette counties). [= K, X; Aster borealis (Torrey \& A. Gray) Prov. -- C]

Symphyotrichum chapmanii (Torrey \& Gray) Semple \& Brouillet, Chapman's Wood-aster. Endemic to Panhandle FL and s. AL. [= Eurybia chapmanii (Torrey \& Gray) Nesom - K, X; = Aster chapmanii Torrey \& Gray - S, SE]

Symphyotrichum concolor (Linnaeus) Nesom var. devestitum (S.F. Blake) Semple. Cp (GA?, SC?): Panhandle FL, maybe extending to GA, AL, and SC. See Semple (2004). [S. concolor, infraspecific taxa not distinguished; = Aster concolor Linnaeus var devestitum S.F. Blake]

Symphyotrichum drummondii (Lindley) Nesom var. drummondii, Hairy Heart-leaved Aster. In WV (Nesom 2000). [= K, X;
Aster drummondii Lindley -- C, G, SE; Aster drummondii var. drummondi] Symphyotrichum drummondii (Lindley) Nesom var. texanum (Burgess) Nesom. East to AL. [= K] \{add synonymy\} Symphyotrichum kralii Nesom. East Gulf Coastal Plain of AL and FL. See Nesom (1997); the name A. pinifolius is illegitimate. [Aster pinifolius Alexander in Small; Aster dumosus var. dumosus -- K, in part; Aster dumosus -- SE, in part] Symphyotrichum novi-belgii (Linnaeus) Nesom var. novi-belgii, New York Aster. [= K, X; Aster novi-belgii Linnaeus var. novibelgii; Aster novi-belgii -- RAB, C, G, GW, SE, infraspecific taxa not distinguished; Aster novi-belgii -- S, narrow sense] Symphyotrichum ontarione (Wiegand) Nesom var. ontarione, Bottomland Aster. In GA, west. See Nesom (1997) and Brouillet \& Labrecque (1997). [= K, X; Aster ontarionis Wiegand -- C, G, SE, W; Aster lateriflorus -- RAB, in part] Symphyotrichum oolentangiense (Riddell) Nesom var. oolentangiense. East to sw. TN (Chester, Wofford, \& Kral 1997) and AL. [ $=$ K, X; Aster oolentangiensis Riddell var. oolentangiensis; Aster oolentangiensis -- C, infraspecific taxa not distinguished; Aster oolentangiensis var. laevicaulis (Fernald) A.G. Jones; Aster azureus Lindley -- SE; ?Aster poaceus Burgess] Symphyotrichum squamatum (Sprengel) Nesom. On ballast. AL, FL. Native of South America. [= K; Aster subulatus Michaux var. australis (A. Gray) Shinners]

Notes on vegetative identification of "asters" with petioled, cordate leaves (from G. Kauffman, pers. comm., and needing additional

## work):

Eurybia divaricata and Eurybia chlorolepis: Apparently not distinguishable from one another in vegetative condition. Typically hairy on main veins on underside of leaf; main vein consistently ending in a tooth; secondary veins typically ending in sinuses; tooth 3.5-7 mm long, with abruptly pointed tip $1-2 \mathrm{~mm}$ long; petiole not winged.
Symphyotrichum urophyllum: few scattered hairs on main vein on undersides of leaves; main vein not consistently ending in a tooth; secondary veins primarily ending in teeth, with scarcely any veins ending at sinuses; tooth $0.5-2 \mathrm{~mm}$ long, with gradually tapering tip.
Symphyotrichum lowrieanum: glabrous undersides of leaves, with typically netlike venation resembling Symphyotrichum laeve; venation similar to Symphyotrichum urophyllum; teeth $2-3 \mathrm{~mm}$ long with sharply pointed tips; petiole prominently winged, with the cordate blade base more shallow than that of Symphyotrichum urophyllum.
Symphyotrichum cordifolium: similar to Symphyotrichum lowrieanum, but petiole is not or only obscurely winged; teeth intermediate between those of Symphyotrichum urophyllum and those of Eurybia divaricata and Eurybia chlorolepis.

Tagetes Linnaeus (Marigold)
A genus of about 50 species, of tropical and warm temperate America. References: Cronquist (1980)=SE.

1 Rays inconspicuous, ca. 1-2 mm long; [plant a well-established weed, primarily in the Coastal Plain] ............. . T. minuta
1 Rays showy, mostly more than 10 mm long; [plant cultivated, rarely occurring as a waif].
2 Peduncles conspicuously swollen and hollow below the flower; involucre 15-20 mm high; achenes 7-10 mm long . . . . . .
2 ............................................................................................... T. erecta
2 Peduncles not conspicuously swollen and hollow below the flower; involucre 10-15 mm high; achenes 4-7 mm long ..... T. patula

* Tagetes erecta Linnaeus, Common Marigold, African Marigold, Aztec Marigold, Big Marigold. Cp (GA, NC, SC, VA), Pd, Mt (NC, SC, VA): commonly cultivated, rarely persistent or as a waif, introduced from Mexico. July-November. [= RAB, C, F, G, K, S, SE]

Tagetes minuta Linnaeus, Muster John Henry. Cp (GA, NC, SC, VA), Pd (GA, SC): sandy fields, pecan orchards, sandy roadsides; common, introduced from South America. Late September-November. [= RAB, C, F, G, K, S, SE]

* Tagetes patula Linnaeus, French Marigold. Mt (VA), Pd, Cp (NC, SC): commonly cultivated, rarely persistent or as a waif, introduced from Mexico. July-November. [= RAB, C, G, K, SE]

## Tanacetum Linnaeus (Tansy)

A genus of about 150 species, herbs, of north temperate regions, especially the Old World. References: Cronquist (1980)=SE; Arriagada \& Miller (1997)=Z.

1 Rays present, white; leaf blades to 8 cm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . T. parthenium
1 Rays absent; leaf blades $9-20 \mathrm{~cm}$ long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . T. vulgare

* Tanacetum parthenium (Linnaeus) Schultz-Bipontinus, Feverfew. Cp (SC), Pd (NC): disturbed areas; rare, introduced from Europe. June-August. [= K, Z; = Chrysanthemum parthenium (Linnaeus) Bernhardi -- RAB, C, F, G, SE; = Matricaria parthenium Linnaeus -- S]
* Tanacetum vulgare Linnaeus, Common Tansy, Golden-buttons. Mt (NC, VA), Pd, Cp (VA), \{GA\}: uncommon, introduced from Eurasia. August-October. [= RAB, C, F, G, K, S, SE, W, Z]

Taraxacum G.H. Weber ex Wiggers (Dandelion)

A genus of about 60 species (or many more if apomictic microspecies recognized), herbs, of boreal and temperate regions.
References: Cronquist (1980)=SE.

* Taraxacum laevigatum (Willdenow) Augustin de Candolle. [= K; T. erythrospermum Andrz.]
* Taraxacum officinale G.H. Weber ex Wiggers ssp. officinale, Common Dandelion. [= K]

## Tetragonotheca Linnaeus (Squarehead)

A genus of 4 species, herbs, endemic to se. North America. The other three species in the genus occur in LA, TX, and adjacent Mexico. References: Turner \& Dawson (1980)=Z; Cronquist (1980)=SE.

Tetragonotheca helianthoides Linnaeus, Squarehead, Pineland-ginseng. Cp, Pd (GA, NC, SC, VA), Mt (GA, NC, SC): sandy woodlands, forests, roadsides; common, uncommon in NC, rare in VA (VA Rare). April-July. Se. VA and e. TN south to c. peninsular FL and s. MS. [= RAB, C, F, G, K, S, SE, W, Z]

## Tetraneuris $\}$

* Tetraneuris linearifolia (Hooker) Greene var. linearifolia. Cp (SC): waste area near wool-combing mill; rare, perhaps merely a waif, introduced from sc. United States. See Nesom (2004d). [= K; Hymenoxys linearifolia Hooker]

## Thymophylla Lagasca y Segura

* Thymophylla tenuiloba (Augustin de Candolle) Small var. tenuiloba. Cp (SC): waste area near wool-combing mill; rare, perhaps merely a waif, introduced from sc. United States. Also known as a naturalized introduction in AL, MS, and FL (Nesom 2004d). [= K; = Dyssodia tenuiloba (Augustin de Candolle) B.L. Robinson var. tenuiloba - SE]

Tragopogon Linnaeus (Goat's-beard)
A genus of about 110 species, herbs, of temperate Eurasia and the Mediterranean region. References: Voss (1996); Cronquist (1980)=SE.

1 Flowers purple; pappus brownish . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . T. porrifolius
1 Flowers yellow; pappus dingy white.
2 Peduncle obviously swollen below the flower and fruit; margins of the phyllaries green (or pale); leaf tips straight; rays pale yellow, obviously shorter than the longest phyllaries . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . T. dubius
2 Peduncle only slightly swollen below the flower and fruit; margins of the phyllaries reddish purple (rarely green); leaf tips more or less curled or curved; rays bright yellow, as long as or longer than the phyllaries . . . . . . . . . . . . . . T. pratensis

* Tragopogon dubius Scopoli, Goat's-beard. Mt, Pd (NC, VA), Cp (VA): roadsides, fields, other disturbed places; common (rare in NC), introduced from Europe. April-July. [= RAB, C, G, K, SE, W; T. major Jacquin -- F]
* Tragopogon porrifolius Linnaeus, Salsify, Vegetable-oyster. Mt (NC, VA), Pd (GA, NC, VA): roadsides, fields; rare, introduced from Europe. Late April-July. [= RAB, C, F, G, K, S, SE, W]
* Tragopogon pratensis Linnaeus, Showy Goat's-beard, Yellow Goat's-beard. Mt, Pd (VA): roadsides, fields; rare, introduced from Europe. April-August. [= C, F, G, K, S, SE, W]

## Tripleurospermum Schulz-Bipontinus

* Tripleurospermum maritima (Linnaeus) W.D.J. Koch, Scentless Chamomille. Introduced at scattered locations in eastern North America, such as AL, PA, NJ. [T. maritima ssp. maritima - K]
* Tripleurospermum perforata (Mérat) M. Lainz, Scentless Chamomille. Introduced at scattered locations in North America, such as AL and MD. [= K, Z; Matricaria perforata Mérat]

## Tussilago Linnaeus (Coltsfoot)

A monotypic genus, an herb, of Eurasia and n. Africa. References: Cronquist (1980)=SE.

* Tussilago farfara Linnaeus, Coltsfoot. Mt, Pd (NC, VA), Cp (VA): roadsides, especially gravelly or shaly roadbanks or ditches, streamside gravel bars, disturbed ground; common (uncommon in VA Piedmont and Coastal Plain, rare in NC Piedmont), introduced from Eurasia. This species has spread rapidly southward from the Northeast, where it was introduced in North America. Fernald (1950) considered its southern limit to be "New Jersey, Pennsylvania, and Ohio". Gleason (1952) extended it to WV. Strausbaugh and Core (1978) reported that the first collection in WV was actually in 1933, "migrating southwards year by year, now abundant and often conspicuous along highways, on strip-mined areas and other denuded areas, in every county of the state." First reported in NC in 1971, it is now rather common in most of the mountain counties, and is beginning to appear at scattered sites in the Piedmont. Though preferring a cool and moist climate, Tussilago seems likely to continue to increase in abundance and to spread into the Piedmont. [= C, F, G, K, SE, W]

## Uropappus Nuttall

* Uropappus lindleyi (Augustin de Candolle) Nuttall. Cp (SC): waste area near wool-combing mill; rare, perhaps merely a waif, introduced from sw. United States. See Nesom (2004d). [= K]

Verbesina Linnaeus (Crownbeard, Wingstem, Frostweed)
A genus of about 300 species, trees, shrubs, and herbs, of tropical, subtropical, and warm temperate America. References: Olsen (1979)=Z; Cronquist (1980)=SE.

1 Stem and lower leaf-surfaces grey strigose-canescent; alien annuals, 2-10 dm tall, with taproots; [section Ximenesia] .......

1 Stem and lower leaf surfaces glabrous or pubescent, but not grey strigose-canescent; native perennials, 5-40 dm tall, with fibrous or fleshy-fibrous roots.
2 Leaves opposite; rays 2-5 and yellow; achenes wingless; [section Phaethusa] . . . . . . . . . . .......... V. occidentalis
2 Leaves alternate (or typically opposite in V. aristata); rays either absent, or 1-5 and white, or 2-15 and yellow; achenes winged or wingless.
3 Heads few, 1-15 (-20), in a compact inflorescence; disk 7-16 mm wide at anthesis; rays (5-) 7-15, yellow; plants 5-12 dm tall; [section Pterophyton]
4 Leaves opposite (rarely alternate), sessile, not decurrent onto the stem; heads 3-15 (-20) in an open and nearly naked inflorescence; [of the Coastal Plain of sw. GA] $\qquad$ V. aristata

4 Leaves alternate, the bases decurrent onto the stem as wings; heads 1-10, in a compact inflorescence;
[generally of inland provinces] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . V. helianth
Heads numerous, 10-200 or more, in a dense to open inflorescence; disk 3-15 mm wide at anthesis; rays either absent, or 1-5 and white, or 2-10 and yellow; plants 10-40 dm tall.
5 Rays 1-5, white; [section Ochractinia].
6 Lower and middle leaves pinnately lobed or dissected; achenes of ray flowers glabrous; [of the outer Coastal Plain from SC southwards] V. virginica var. laciniata

6 Lower and middle leaves entire, serrate, or slightly undulate; achenes of ray flowers papillose or shortpubescent; [more widespread in our area]
5 Rays absent, or 2-10 and yellow; [section Actinomeris].
7 Rays present, 2-10, yellow; disk flowers yellow . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . V. alternifolia
7 Rays absent; disk flowers white . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . V. walteri

Verbesina alternifolia (Linnaeus) Britton ex Kearney, Common Wingstem. Mt, Pd (GA, NC, SC, VA), Cp (NC, VA): alluvial forests, marshes, floodplain pastures; common. August-September. NY and s. Ontario west to IA, south to panhandle FL and LA. [= RAB, C, G, GW, K, SE; Ridan alternifolia (Linnaeus) Britton -- S]

Verbesina aristata (Elliott) Heller, Coastal Plain Crownbeard. Cp (GA): longleaf pine sandhills, swamp margins, dry woodlands; rare. Sw. GA and FL Panhandle west to s. AL. June-August. [= K, SE; Pterophyton aristatum (Elliott) Alexander -- S] * Verbesina encelioides (Cavanilles) Bentham \& Hooker f. ex A. Gray var. encelioides, Skunk-daisy. Cp (GA, NC, SC): fields, pastures, and disturbed areas; uncommon, introduced from w. United States. May-October. [= C, SE; V. encelioides -- RAB, F, G, infraspecific taxa not distinguished; V. encelioides ssp. encelioides -- K; Ximenesia encelioides Cavanilles -- S]

Verbesina helianthoides Michaux, Ozark Crownbeard. Mt (NC), Cp? (GA?): dry woodlands over mafic rocks; rare (NC Rare). May-October. OH west to IA and KS, south to c. TN, nw. GA, n. AL, and nc. TX; disjunct in w. NC and e. GA. [= C, F, G, K, SE; Pterophyton helianthoides (Michaux) Alexander -- S]

Verbesina occidentalis (Linnaeus) Walter, Southern Crownbeard. Mt, Pd, Cp (GA, NC, SC, VA): forests, woodlands, pastures, and roadsides, especially abundant in alluvial areas or upslope over mafic or calcareous rocks; common. MD west to OH and MO, south to FL panhandle and MS. [= RAB, C, F, G, GW, K, SE; Phaethusa occidentalis (Linnaeus) Britton -- S]

Verbesina virginica Linnaeus var. laciniata (Poiret) A. Gray, Southern Frostweed. Cp (GA, NC?, SC): moist forests and thickets; rare. September-October. Ranging from e. SC (or e. NC?) south to s. FL. Olsen (1979) maps this variety as occurring in e. NC; I know of no documentation. The two varieties need additional study; specific status may be warranted. [= RAB, GW, K, SE, Z; Phaethusa laciniata (Poiret) Small -- S; V. laciniata (Poiret) Nuttall]

Verbesina virginica Linnaeus var. virginica, Common Frostweed. Mt, Pd (GA, NC, SC), Cp (GA, SC, VA): moist to dryish forests, especially over mafic or calcareous rocks, in Coastal Plain ravines in VA over coquina limestone; uncommon (VA Watch List). July-October. Sc. NC (e. VA?) west to e. KS, south to s. FL and c. TX. Populations of V. virginica from e. VA appear to be substantially disjunct from other populations of either variety. [= RAB, C, GW, K, SE, Z; V. virginica -- F, G, infraspecific taxa not distinguished; Phaethusa virginica (Linnaeus) Britton -- S]

Verbesina walteri Shinners, Walter's Wingstem. Cp (GA, SC), Pd (NC): floodplains, low moist forests; rare (NC Watch List). Late August-September. Coastal Plain of SC south to GA, west to LA; disjunct in Piedmont of NC and Ouachita Mountains of AR. [= RAB, GW, K, SE; Ridan paniculata (Walter) Small -- S]

## Vernonia Schreber (Ironweed)

A genus of about 500 species, trees, shrubs, and herbs, of tropical, subtropical, and warm temperate regions, especially America and Africa. There is considerable question whether this broad circumscription of Vernonia will prove defensible. References: Jones (1982) $=$ Z; Jones in Cronquist (1980)=SE. Key based closely on Jones in SE.

1 Basal rosette present, its leaves larger than those of the stem; [of xeric habitats of the Coastal Plain and (in NC and SC) xeric rocky habitats of the Piedmont].
2 Basal leaves 2-10 cm wide; stem leaves few, abruptly reduced upwards in size relative to the basal . . . . . . . . V. acaulis
2 Basal leaves 0.5-2.5 cm wide; stem leaves relatively many, gradually reduced upwards . . . . . . . . . . . . . V. $\times$ georgiana
1 Basal rosette absent; [collectively of a wide variety of habitats].
3 Middle cauline leaves $0.1-1.8 \mathrm{~cm}$ wide; plants $3-11 \mathrm{dm}$ tall; [of Coastal Plain pinelands].
4 Leaves auriculate at base; veins on lower surface with conspicuous long brown pubescence . . . . . . . . V. pulchella 4 Leaves attenuate at base; veins glabrous or with inconspicuous short pale pubescence.

5 Tips of the inner phyllaries acute to acuminate, 0.1-1.0 mm long . . . . . . . . . V. angustifolia var. angustifolia 5 Tips of the inner phyllaries long-acuminate, 1.4-4.8 mm long . . . . . . . . . . . . V. angustifolia var. scaberrima
3 Middle cauline leaves $1.2-7.5 \mathrm{~cm}$ wide; plants $4-35 \mathrm{dm}$ tall; [of various habitats, but not typically in Coastal Plain

```
pinelands].
6 Tips of the inner phyllaries rounded, acute, obtuse, mucronate, or short-acuminate

Vernonia pulchella Small. Cp (GA, SC): sandhills; uncommon. From se. SC (Beaufort and Jasper counties) south to se. GA. [= K, SE]

Vernonia arkansana Augustin de Candolle, Arkansas Ironweed. Intro. in se. NC. [= C, K, SE] \{not yet keyed\} Vernonia missurica Rafinesque. e. to c. TN (Chester, Wofford, \& Kral 1997). [= C, K, SE] \{not yet keyed\}

## Viguiera <br> (see Helianthus)

## Vittadinia A. Richard

* Vittadinia sulcata N. Burbidge. Cp (SC): waste area near wool-combing mill; rare, perhaps merely a waif, introduced from sw. United States. See Nesom (2004d).

## Xanthium Linnaeus (Cocklebur)

A genus of about 3 species, herbs, cosmopolitan (of somewhat uncertain original distribution). References: Cronquist (1980)=SE.
Xanthium spinosum Linnaeus, Spiny Cocklebur. Cp (SC), Pd (GA): [= RAB, C, K, SE; = Acanthoxanthium spinosum (Linnaeus) Fourreau -- S]

Xanthium strumarium Linnaeus var. canadense (P. Miller) Torrey \& A. Gray. Cp (SC): [= C, K, SE; X. strumarium var. strumarium -- RAB, misapplied]

Xanthium strumarium Linnaeus var. glabratum (Augustin de Candolle) Cronquist. [= RAB, C, K, SE]

## Youngia Cassini (Youngia)

A genus of about 40 species, herbs, of Asia. References: Cronquist (1980)=SE.

* Youngia japonica (Linnaeus) Augustin de Candolle, Asiatic Hawk's-beard, Youngia. Cp, Pd (GA, NC, SC, VA): roadsides, disturbed areas; uncommon, introduced from se. Asia. Spreading rapidly in our area. [= C, K, SE; = Crepis japonica (Linnaeus) Bentham -- RAB, F, G, S]

## Zinnia Linnaeus (Zinnia)

A genus of about 11 species, herbs, of sw. North America south to South America. References: Cronquist (1980)=SE.

* Zinnia peruviana (Linnaeus) Linnaeus, Zinnia. Cp (GA, NC, SC): disturbed areas; rare (commonly cultivated), introduced from the New World tropics. May-November. [= K, SE; Z. pauciflora Linnaeus -- S]
* Zinnia violacea Cavanilles, Garden Zinnia. Cp (GA, NC, SC): disturbed areas; rare (commonly cultivated), introduced from the New World tropics. May-November. [= K; Z. elegans Jacquin -- S, SE]

BALSAMINACEAE (Touch-me-not Family)
A family of 2 genera and 850-1000 species, primarily of the Old World tropics. References: Fischer in Kubitzki (2004).

## Impatiens Linnaeus (Jewelweed, Touch-me-not, Snapweed, Balsam)

A genus of 850-1000 species, herbs and subshrubs, primarily tropical and north temperate Old World. References: Fischer in Kubitzki (2004).

1 Stems puberulent; corolla purple, pink, or white; plants 3-6 (-8) dm tall; [cultivated alien] . . . . . . . . . . . . . . . . . . . . . I. balsamina
1 Stems glabrous; corolla yellow or orange (rarely cream or white); plant mostly 5-25 dm tall; [native].
2 Flowers orange (rarely orange-yellow or white); calyx spur (colored) 7-10 mm long, curved forward parallel to the calyx sac
2 Flowers yellow (rarely cream or white); calyx spur (colored) 4-6 mm long, at a right angle to the calyx sac ..... I. pallida

* Impatiens balsamina Linnaeus, Garden Balsam. Cp (NC, SC, VA), Mt (VA): frequently cultivated, sometimes escaped as a waif or "throw-out"; rare, introduced from s. Asia. June-November. [= RAB, C, F, G, K, S]

Impatiens capensis Meerburg, Orange Jewelweed, Orange Touch-me-not, Spotted Touch-me-not. Mt, Pd, Cp (GA, NC, SC, VA): moist forests, bottomlands, cove forests, streambanks, bogs; common (rare in Coastal Plain of GA). May-November. Newfoundland west to Saskatchewan and AK, south to SC, panhandle FL, AL, and TX. Within the portion of our area where $I$. capensis and I. pallida overlap, the two species often occur in mixed populations. I. capensis tends to have the leaf apices and crenulations more rounded than I. pallida, but the character is overlapping and variable. [= RAB, C, F, GW, K, W; =I. biflora Walter -- G, S]

Impatiens pallida Nuttall, Yellow Jewelweed, Yellow Touch-me-not, Pale Touch-me-not. Mt (GA, NC, VA), Pd (NC, VA), Cp (VA): cove forests, streambanks, seepages, moist forests, bogs, roadsides; common (rare in Piedmont of NC and Coastal Plain of VA). July-September. Nova Scotia and Québec west to Saskatchewan, south to e. VA, wc. NC, TN, WV, MO, and OK. [= RAB, C, F, G, GW, K, S, W]

## BATACEAE (Batis Family)

A monogeneric family, low shrubs, of tropical and subtropical shores of the Americas, New Guinea, the Pacific, and Australia. References: Bayer \& Appel in Kubitzki \& Bayer (2003).

Batis P. Browne 1756 (Saltwort, Beachwort, Batis)
A genus of 2 species, low shrubs, of tropical and subtropical shores of the Americas, New Guinea, the Pacific, and Australia. References: Rogers (1982); Goldblatt (1976); Bayer \& Appel in Kubitzki \& Bayer (2003).

Batis maritima Linnaeus, Saltwort, Beachwort, Batis. Cp (GA, NC?, SC): brackish marshes; rare north of GA (but locally common). June-July; October. Se. SC south to s. FL, west to TX, and in Central and South America (apparently introduced in HI). B. maritima is alleged (as by S) to occur as far north as NC, but the documentation in unknown; there is no twentieth century evidence to place Batis in NC. The only other member of the family is B. argillicola, of New Guinea and Australia. [= RAB, GW, K, S, Z]

## BEGONIACEAE (Begonia Family)

## Begonia Linnaeus (Begonia)

* Begonia cucullata Willdenow, Begonia, is introduced from South America and escaped or persistent in e. GA (Jones and Coile 1988) south to FL (Wunderlin 1998). [= K]

BERBERIDACEAE A.L. de Jussieu 1789 (Barberry Family)
As broadly defined here, a family of about 15 genera and 650 species, herbs and shrubs, of the temperate Northern Hemisphere and Andean South America. There has been much debate and study of whether the Berberidaceae shold be recognized as a broadly defined unit, or split into a variety of segregate families (such as Podophyllaceae, Epimediaceae, Nandinaceae,

Leonticaceae). Based on molecular studies, $\operatorname{Kim} \&$ Jansen $^{(1996,1998)}$ conclude that division of the Berberidaceae into segregate families is not warranted. References: Whetstone, Atkinson, \& Spaulding in FNA (1997); Stearn (2002); Kim \& Jansen (1996, 1998); Ahrendt (1961); Loconte \& Estes (1989b); Meacham (1980); Loconte in Kubitzki, Rohwer, \& Bittrich (1993).

1 Plant a shrub.

| 2 | Leaves ternately compound; [subfamily Nandinoideae] | Nandina |
| :---: | :---: | :---: |
| 2 | Leaves simple or 1-pinnately compound; [subfamily Berberideae, tribe Berberidinae]. |  |
|  | 3 Leaves simple, less than 6 cm long, fascicled on short spur shoots; stems spiny | Berberis |

#### Abstract

1 Plant an herb.

4 Leaves compound; flowers greenish or maroon; [subfamily Berberidoideae, tribe Leonticeae] . . . . . . . . . . Caulophyllum

4 Leaves simple (though parted); flowers white; [subfamily Berberideae, tribe Epimediinae].
5 Plant acaulescent; flower solitary and scapose; leaf segments 2 ; fruit a capsule . . . . . . . . . . . . ...... Jeffersonia
5 Plant caulescent; flower solitary, or cymose to umbellate, borne on a stem with leaves; leaf segments several; fruit a berry.
6 Flowers cymose or umbellate; stamens 6; berry globose, $8-12 \mathrm{~mm}$ long, $2-4$ seeded; larger leaves with only 2 clefts that extend more than halfway to the peltate center of the leaf (thus the leaf divided into 2 halves, the other sinuses shallow) Diphylleia
6 Flower solitary; stamens 12-18; berry ovoid, 25-70 mm long, many-seeded; larger leaves with 5 or more clefts that extend more than halfway to the peltate center of the leaf (thus the leaf fairly evenly divided into multiple lobes).

Podophyllum

## Berberis Linnaeus (Barberry) <br> (also see Mahonia)

A genus of at least 500 species, shrubs, of North America, South America, Asia, Europe, and $n$. Africa. References: Whittemore in FNA (1997); Loconte in Kubitzki, Rohwer, \& Bittrich (1993).
 or bifurcate).
2 Leaves with 1-9 (20) bristles on each margin, the bristles 3-6 mm apart; berries ovoid (6-9 mm long, 6-7 mm broad), 5-10 (rarely more) in an often umbellate raceme; petals notched at apex
B. canadensis

2 Leaves with 18-36 bristles on each margin, ca. 2 mm apart; berries ellipsoid ( $8-10 \mathrm{~mm}$ long, 4-5 mm broad), 10-20 in a raceme; petals obtuse at apex
B. vulgaris

Berberis canadensis P. Miller, American Barberry, Allegheny Barberry. Pd, Mt (GA, NC, SC, VA): rocky woods, forest openings, glades, usually over mafic rocks (such as diabase) or calcareous rocks (such as limestone), sometimes along fence-rows in sw. VA (presumably spread by birds); uncommon, rare south of VA and in VA Piedmont (GA Special Concern, NC Rare). April-May; September-October. A broad Southern Appalachian-Ozarkian endemic, not occurring in Canada (the epithet a misnomer): scattered and local in VA, WV, KY, TN, NC, SC, AL, GA, MO, IL, IN, and sc. PA (where apparently now extirpated). Along with $B$. vulgaris, $B$. canadensis has been subjected to organized eradication programs because of its serving as an alternate host for wheat rust (Puccinia graminis). [= RAB, C, F, FNA, G, K, S, SE, W]

* Berberis thunbergii Augustin de Candolle, Japanese Barberry. Mt (NC, SC, VA), Pd (GA, NC, VA), Cp (NC, VA): rich forests, old fields; uncommon, introduced from Japan. March-April; May-September. This species is immune to wheat rust; it is probably now the most commonly encountered barberry in our area. [= RAB, C, F, FNA, G, K, S, SE, W]
* Berberis vulgaris Linnaeus, European Barberry, Common Barberry. Mt (NC, VA): disturbed areas; rare, introduced from Europe. April; September. This species, once widely cultivated and established in North America, serves as an alternate host to wheat rust and has been subjected to eradication programs for over half a century. It may no longer occur in our area. $[=C, F$, FNA, G, K, SE]

Other species of Berberis are used horticulturally in our area. Though none appear to be established at this time, the possibility of encountering species other than the three treated above should be kept in mind. B. julianiae Schneider is especially commonly planted in hedges and landscaping.

## Caulophyllum Michaux (Blue Cohosh)

A genus of 3 species, herbs, with a relictual north temperate distribution (e. North America, e. Asia). The only other species of the genus is C. robustum Maximowicz, of e. Asia. References: Loconte in FNA (1997); Stearn (2002)=Y; Loconte \& Blackwell (1981, 1984, 1985) $=$ Z; Uttal (1985); Brett (1981); Loconte in Kubitzki, Rohwer, \& Bittrich (1993).

1 Carpels $3.5-5 \mathrm{~mm}$ long, averaging 4 mm ; style $0.8-1.5 \mathrm{~mm}$ long; sepals 6-9 mm long, usually purple; terminal leaflets (5-) 7-9 (10) cm long, (4-) 5-7.5 (-8) cm wide; main inflorescence with 4-18 flowers; first leaf 2-ternate or 3-ternate C. giganteum

1 Carpels 1.3-2.8 mm long, averaging 2 mm ; style $0.3-1.0 \mathrm{~mm}$ long; sepals $3-6.5 \mathrm{~mm}$ long, yellow, yellow-purple, or green; terminal leaflets (3-) 5-7 (-8) cm long, (2-) 3.5-6.5 (-10) cm wide; main inflorescence with 5-70 flowers; first leaf 3-ternate or 4ternate
C. thalictroides

Caulophyllum giganteum (Farwell) Loconte \& Blackwell, Northern Blue Cohosh. Mt (NC, VA): rich forests; rare (NC Rare). April-May; July-August. C. giganteum is more northern in distribution than C. thalictroides, ranging south to VA, nw. NC, ne. and nc. TN (Chester, Wofford, \& Kral 1997), and c. KY. This species blooms about 2 weeks earlier than C. thalictroides where they grow together. The combination of sympatry, morphologic distinctness, and phenologic separation of the two taxa argues for recognition at the species level. [= FNA, K, SE, W, Y, Z; < C. thalictroides -- RAB, F, G, S; = C. thalictroides var. giganteum Farwell -- C]

Caulophyllum thalictroides (Linnaeus) Michaux, Common Blue Cohosh, Green Vivian. Mt (GA, NC, SC, VA), Pd (NC, SC, VA), Cp (VA): rich forests; common (rare in Piedmont and Coastal Plain) (SC Rare). April-May; July-August. The species is widespread in e. North America, south to GA, AL, and AR. [=FNA, K, SE, W, Y, Z; < C. thalictroides -- RAB, F, G, S (also see C. giganteum); = C. thalictroides var. thalictroides -- C]

## Diphylleia Michaux (Umbrella-leaf)

A genus of 3 species, herbs, with a relictual north temperate distribution. The other two species in the genus are east Asian -- $D$. grayi F. Schmidt of Japan and Sakhalin, and D. sinensis H.L. Li of the Hubei, Shaanxi, Gansu, Sichuan, and Yunnan provinces of China. References: George in FNA (1997); Ying, Terabayashi, \& Boufford (1984)=Z; Stearn (2002)=Y; Loconte in Kubitzki, Rohwer, \& Bittrich (1993).

Diphylleia cymosa Michaux, Umbrella-leaf, Pixie-parasol. Mt (GA, NC, SC, VA): seepages and brook-banks, sometimes away from brooks or seeps in northern hardwood or cove hardwood forests (but then usually in subterranean seepage), primarily at moderate to high elevations; uncommon (SC Rare, VA Watch List). May-June; July-August. A narrow Southern Appalachian endemic: high mountains of w. NC and e. TN, extending a short distance into ne. GA, nw. SC, and sw. VA. [= RAB, C, F, FNA, G, K, S, SE, W, Y, Z]

## Jeffersonia W. Barton (Twinleaf)

A genus of 2 species, the only other species of the genus is native to e. Asia (eastern Russia, Korea, Manchuria). The closest North American relatives of Jeffersonia are Achlys and Vancouveria of the Pacific Northwest. References: George in FNA (1997); Stearn (2002) $=$ Y; Loconte \& Estes (1989b); Loconte in Kubitzki, Rohwer, \& Bittrich (1993).

Jeffersonia diphylla (Linnaeus) Persoon, Twinleaf. Mt (GA, NC, VA), Pd (VA): moist and extremely nutrient-rich forests, generally over calcareous or mafic rocks (including limestone, dolostone, amphibolite, greenstone, etc.) or very rich alluvium; uncommon, rare in NC (GA Endangered, NC Rare). March-April; May. The species is widepread in ne. United States, south to MD, NC, and AL. It is somewhat suggestive of Sanguinaria in both foliage and flower. [= RAB, C, F, FNA, G, K, S, SE, W, Y]

## Mahonia Nuttall (Mahonia, Holly-grape, Oregon Grape)

A genus of over 100 species, shrubs, of w. North America and e. Asia. Many authors favor the inclusion of Mahonia in Berberis. References: Whittemore in FNA (1997); Loconte in Kubitzki, Rohwer, \& Bittrich (1993).

1 Leaflet blades with 2-7 teeth per side, each tooth 3-8 mm long; leaflets very thick and stiff . . . . . . . . . . . . . . . . . . . . M. bealei
1 Leaflet blades with 6-13 teeth per side, each tooth 1-2 (-3) mm long; leaflets thickish, but flexible when fresh ..... M. nervosa

* Mahonia bealei (Fortune) Carrière, Chinese Mahonia, Holly-grape. Pd (GA, NC, VA), Cp (NC, VA): in deciduous forests in suburban areas, spread from plantings; rare, introduced from China. December-March; May-July. [= RAB, K, SE; = Berberis bealei Fortune -- FNA]
* Mahonia nervosa (Pursh) Nuttall. Pd (SC): disturbed areas; rare, introduced from w. North America. Introduced in SC (Hill \& Horn 1997). [= K; = Berberis nervosa -- FNA]

## Nandina Thunberg 1781 (Nandina, Sacred-bamboo)

A monotypic genus, a shrub, native of Japan, China, and India. Here treated as a monotypic genus in the Berberidaceae, Nandina seems to have only a general kinship to the Berberidaceae (see Ehdaie \& Russell 1984, Loconte \& Estes 1989b, Meacham 1980) and should likely be placed in its own monotypic family. References: Whetstone, Atkinson, \& Spaulding in FNA (1997); Ehdaie \& Russell (1984); Loconte in Kubitzki, Rohwer, \& Bittrich (1993).

* Nandina domestica Thunberg, Nandina, Sacred-bamboo. Cp (GA, NC, SC, VA), Pd (GA, NC, SC): forests and woodlands in suburban areas, commonly planted, increasingly escaping and spreading; rare, introduced from China. May-June;
October-November. Nandina has numerous cultivated forms, and is widely planted in the Piedmont and Coastal Plain of our area, especially southwards. Leaflet shape varies in cultivated forms from broadly ovate to linear. [= RAB, FNA, K, SE]

Podophyllum Linnaeus 1753 (May-apple)
A genus of 2 species (or ca. 14 if Dysosma is included), herbs, one in e. North America, the other in e. Asia. The obvious morphological kinship of Podophyllum, Diphylleia, and Hydrastis is corroborated by alkaloid chemistry. References: George in FNA
(1997); Shaw (2000, 2002)=Z; Loconte in Kubitzki, Rohwer, \& Bittrich (1993).

Podophyllum peltatum Linnaeus, May-apple, American Mandrake. Mt, Pd, Cp (GA, NC, SC, VA): rich forests, bottomlands, slopes, pastures; common. March-April; May-June. P. peltatum is widespread through most of e. United States. The ripe fruits are edible; the rest of the plant contains a variety of alkaloids, and is poisonous-medicinal. Compounds from Podophyllum are used in wart removal, and show anti-viral and anti-cancer promise. [= RAB, C, F, FNA, G, K, S, SE, W; > P. peltatum var. peltatum - Z; > P. peltatum var. annulare J.M.H. Shaw - Z]

## BETULACEAE S.F. Gray 1821 (Birch Family)

A family of 6 genera and about 150 species, primarily of subarctic to cold temperate regions of the Northern Hemisphere, but extending through Central America to $n$. South America. The two subfamilies recognized here are sometimes elevated to family status, as by Govaerts \& Frodin (1998). References: Furlow in FNA (1997); Furlow (1990)=Z; Hardin (1971)=Y; Govaerts \& Frodin (1998); Kubitzki in Kubitzki, Rohwer, \& Bittrich (1993).

1 Scales of the pistillate catkins persistent; leafy involucre absent; fruit a small winged nut; [subfamily Betuloideae].
2 Pistillate scales woody, forming a persistent conelike catkin; plant a shrub, less than 4 m tall (except A.glutinosa). Alnus
2 Pistillate scales deciduous with or soon after the fruits; plant a tree, well over 4 m tall at maturity ............. Betula
1 Scales of the pistillate catkins caducous; leafy involucre present, conspicuous; fruit an unwinged nut; [subfamily Coryloideae].
3 Nut spherical, 1-1.5 cm in diameter, closely enveloped by the involucre . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Corylus
3 Nut ovoid, 0.4-0.6 cm long, loosely or not at all enveloped by the involucre.
4 Infructescence bracts flat, 1-3 lobed, not enclosing the nut; bark gray, smooth; trunk moderately to strongly fluted; buds 4 -angled . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Carpinus 4 Infructescence bracts inflated, loosely enclosing the nut; bark brown, shreddy; trunk not fluted; buds not 4-angled Ostrya

## Alnus P. Miller 1754 (Alder)

A genus of about 25-35 species, shrubs and trees, of subarctic to warm temperate regions of the Northern Hemisphere, and in montane situations south to $n$. South America. References: Furlow in FNA (1997); Furlow (1990)=Z; Hardin (1971)=Y; Schrader \& Graves (2002)=X; Kubitzki in Kubitzki, Rohwer, \& Bittrich (1993). Key based in part on Schrader \& Graves (2002).

1 Fruit broadly winged; winter buds sessile, covered by multiple, imbricate, unequal scales; [subgenus Alnobetula]
1 Fruit narrowly winged; winter buds stalked, covered by 2-3 equal scales.
2 Pistillate catkins mostly 1-1.5 (-2) cm long, subsessile and often clustered together closely; typical leaves with 8-14 principal veins on each side of the midrib; [subgenus AInus].
3 Fruiting catkins drooping; leaves broadest at or below the middle, pale green to glaucous beneath, doubly serrate, the teeth of various sizes, usually some of them coarse; bark dark reddish-brown, shiny, with prominent light-colored lenticels
A. incana ssp. rugosa

3 Fruiting catkins erect; leaves broadest at or above the middle, green beneath, finely serrate, the teeth approximately equal in size; bark light gray or brown, with inconspicuous lenticels
A. serrulata

2 Pistillate catkins mostly $1.5-3 \mathrm{~cm}$ long, evidently pedunculate and therefore spaced; typical leaves with $5-8$ principal veins on each side of the midrib.
4 Flowering spring; plant a tree; leaves broadly rounded to slightly notched at the tip; [alien, rarely planted and possibly persistent in our area]; [subgenus AInus] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [A. glutinosa]
4 Flowering late summer or autumn; plant a shrub; leaves obtuse to short-acuminate at the tip; [native of e. MD, DE, and GA]; [subgenus Clethropsis].
5 Strobili (14-) 14.5-19 (-24) mm long, $<1.3 \times$ as long as wide; large shrub or tree 5.5-9.5 m tall, with a narrow crown; [of nw. GA] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. maritima ssp. georgiensis
5 Strobili (15.2-) 18.5-22 (-25) mm long, $>1.3 \times$ as long as wide; medium to large shrub 3.5-6 (-7.5) m tall, with a narrow to broad crown; [of s. DE and e. MD] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [A. maritima ssp. maritima]

Alnus incana (Linnaeus) Moench ssp. rugosa (Du Roi) Clausen, Speckled Alder. Mt (VA): braided streamhead seepage swamps; rare (VA Rare). May-June; July-August. A. incana is here treated as a circumpolar complex consisting of several subspecies. Ssp. incana occurs in nc. and ne. Eurasia. Ssp. rugosa occurs from nw. Canada east to the Maritime Provinces, south to MD, VA, and WV, and IL. Ssp. tenuifolia (Nuttall) Breitung occurs in w. North America, from AK south to CA and NM. [= FNA, K, Z ; > A. incana var. americana Regel -- C; > A. rugosa (Du Roi) Sprengel var. americana (Regel) Fernald -- F; = A. rugosa (Du Roi) Sprengel -- G, W, Y]

Alnus maritima (Marshall) Muhlenberg ex Nuttall ssp. georgiensis Schrader \& Graves, Georgia Alder. Mt (GA): standing water of Ridge-and-Valley spring run; rare (GA Special Concern). Endemic to a single site in Bartow County, GA. It is one of three subspecies of $A$. maritima, each endemic to a small area -- ssp. maritima of the Delmarva Peninsula of MD and DE, ssp. georgiensis Schrader \& Graves of nw. GA, and ssp. oklahomensis Schrader \& Graves of sc. OK. The closest relatives of $A$. maritima are in Asia. [= X; < A. maritima -- FNA, K]

AInus serrulata (Aiton) Willdenow, Tag Alder, Smooth Alder, Hazel Alder. Cp, Pd, Mt (GA, NC, SC, VA): streambanks, bogs, wet thickets; common. February-March; August-October. Nova Scotia west to s. Québec, MO, and OK, south to n. FL and TX. [=

RAB , C, FNA, G, GW, K, W, Y, Z; > A. serrulata var. serrulata - F; > A. serrulata var. subelliptica Fernald -- F; A. rugosa -- S, misapplied]

Alnus viridis (Villars) Lamarck \& De Candolle var. crispa (Aiton) House, Green Alder, Mountain Alder. Mt (NC): grassy balds, shrub balds, spruce-fir forests, and rock outcrops at high elevations (1600-1900m) in the Roan Mountain Massif, Mitchell and Avery counties, NC and Carter County, TN; rare (though locally common). May-June; July. Ssp. crispa has variously been considered a varietally, subspecifically, and specifically distinct from typic A. viridis. A. viridis is here treated as a circumpolar complex of 4 subspecies. Ssp. viridis occurs in montane portions of Europe. Ssp. sinuata (Regel) Á. Löve \& D. Löve occurs in w. Canada and south in the montane west to nw. United States. Ssp. fruticosa (Ruprecht) Nyman ranges from n. CA north to coastal AK, and in ne. Asia. Ssp. crispa is generally far northern, ranging across n. Canada, south to MA and c. NY, and disjunct at a few localities in PA and on the NC-TN border (Chester, Wofford, \& Kral 1997). [= C; = A. viridis (Villars) Lamarck \& De Candolle ssp. crispa (Aiton) Turrill - FNA, K, Z; = A. crispa (Aiton) Pursh -- RAB, G, W, Y; ? A. crispa var. crispa -- F; < A. alnobetula (Ehrhart) K. Koch -- S; > Alnus mitchelliana M.A. Curtis ex Gray]

* Alnus glutinosa (Linnaeus) Gaertner, Black Alder, European Alder. Sometimes cultivated, especially northwards, and naturalized at least as far south as s. PA (Rhoads \& Klein 1993); it has also been reported for Morgan County, TN (Chester, Wofford, \& Kral 1997). [= FNA, C, F, G, K; = Alnus alnus (Linnaeus) Britton]

Alnus maritima (Marshall) Muhlenberg ex Nuttall ssp. maritima, Seaside Alder, Delmarva Alder. Streambanks, ponds, shores. Endemic to six counties in the Delmarva Peninsula of MD and DE. See above for additional discussion of $A$. maritima in general. [= X; <A. maritima -- FNA, C, F, G, K]

## Betula Linnaeus 1753 (Birch)

A genus of $35-100$ species, trees, shrubs, and subshrubs, of subarctic and temperate regions of the Northern Hemisphere. Section Betula (including natives B. populifolia, B. papyrifera, and B. cordifolia) is widely distributed in the northern hemisphere. Section Costatae (including B. alleghaniensis, B. lenta, B. nigra, and B. uber) occurs in e. North America and e. Asia. References: Grant \& Thompson (1975); Furlow in FNA (1997); Furlow (1990)=Z; Hardin (1971)=Y; Järvinen et al. (2004); Govaerts \& Frodin (1998); Kubitzki in Kubitzki, Rohwer, \& Bittrich (1993).

1 Leaf blades suborbicular, the apex rounded; [section Costatae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . B. Ienta var. uber
1 Leaf blades ovate or triangular, the apex acute to acuminate.
2 Bark yellowish-gray, yellowish, pink, reddish-brown, or dark brown; samara rounded or slightly retuse at its apex, the wings making up $1 / 2$ or less of the width; fruiting peduncles sessile (peduncled in B. nigra); [section Costatae].
3 Inner bark of the twigs bitter, not aromatic; leaves cuneate at the base
B. nigra

3 Inner bark of the twigs with odor and flavor of wintergreen; leaves rounded to subcordate at the base.
4 Bark of stems $5-30 \mathrm{~cm}$ in diameter (on larger trees look up for branches) yellow or yellowish-gray, exfoliating in papery shreds (bark of larger trunks becoming platey, the plates not prominently marked horizontally by old lenticels); scales of fruiting catkins 6-13 mm long, pubescent and marginally ciliate . . . . . . B. alleghaniensis
4 Bark of stems $5-30 \mathrm{~cm}$ in diameter (on larger trees look up for branches) reddish-brown or dark brown, tight (bark of larger trunks becoming platey, the plates prominently marked horizontally by old lenticels); scales of fruiting catkins 5-7 mm long, glabrous . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . B. Ienta var. Ienta
2 Bark white to pale gray; samara strongly retuse at its apex, the wings making up over $1 / 2$ of the width; fruiting catkins peduncled; [section Betula].
5 Leaves glabrous beneath or somewhat pubescent on the veins; bark of young stems remaining tight; leaf apex longacuminate to attenuate; central lobe of infructescence scales shorter than the basal and lateral lobes.
6 Leaf apex long-acuminate, but not attenuate; infructescence scales sparsely pubescent on the outer surface; bark of mature trees creamy to bright white . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . B. pendula 6 Leaf apex attenuate-acuminate; infructescence scales densely pubescent on the outer surface; bark of mature trees grayish white
B. populifolia

5 Leaves pubescent beneath, at least on the veins; bark of young stems exfoliating; leaf apex acute to shortacuminate; central lobe of infructescence scales equal to or longer than than the basal and lateral lobes.
$7 \quad$ Twigs glabrous or slightly pubescent (and then glabrate in age); leaves cordate (rarely rounded) at the base; leaves with 9-12 lateral veins on each side of the midvein . . . . . . . . . . . . . . . . . . . . . . . . . . . . . B. cordifolia
$7 \quad$ Twigs densely pubescent; leaves cuneate to rounded (rarely truncate) basally; leaves with 6-9 lateral veins on each side of the midvein
[B. papyrifera]
Betula alleghaniensis Britton, Yellow Birch. Mt (GA, NC, SC, VA): forests at medium to high elevations, rarely at low elevations; common (SC Rare). April-May; June-August. Newfoundland west to se. Manitoba, south to DE, PA, OH, n. IN, WI, MN, and IA, and in the mountains south to w. NC, n. GA, and e. TN. [= C, FNA, S, W, Y, Z; = B. lutea Michaux f. -- RAB; B. lutea var. lutea - F, G; B. Iutea var. macrolepis Fernald -- F, G; > B. alleghaniensis var. alleghaniensis - K; > B. alleghaniensis var. macrolepis (Fernald) Brayshaw -- K]

Betula cordifolia Regel, Mountain Paper Birch. Mt (NC, VA): high elevation forests, primarily on talus of avalanche chutes, in the Black Mountains, Yancey County, NC, and on talus slopes and adjacent forests at high elevations, especially on quartzite on the western flank of the Blue Ridge, and on sandstone talus in the Ridge and Valley in VA; rare (NC Rare, VA Rare). May-August; JulySeptember. Newfoundland and e. Québec south to the mountains of NY; disjunct in n. MN, w. VA, w. NC, and e. TN (Chester, Wofford, \& Kral 1997). The question of the appropriate treatment of B. cordifolia and B. papyrifera is difficult (and still controversial). [= FNA, G, S, Y, Z; = B. papyrifera Marshall var. cordifolia (Regel) Fernald -- RAB, C, F, K, W]

Betula lenta Linnaeus var. Ienta, Sweet Birch, Cherry Birch, Black Birch, "Mahogany." Mt (GA, NC, SC, VA), Pd (NC, SC, VA): forests at low to high elevations; common (uncommon in Piedmont). March-April; June-July. S. ME west to OH, south to GA
and n . AL. This species is generally restricted elevationally in North Carolina to medium elevations and lower, but in VA it reaches higher elevations, where it can be as common as $B$. alleghaniensis. Once the primary source of methyl salicylate (wintergreen flavoring), used in medicines and confections; it is now produced synthetically. [=B. lenta -- RAB, F, FNA, G, K, S, W, Z, in a narrow sense; <B. lenta -- C, Y, in part (also including B. uber)]

Betula Ienta Linnaeus var. uber Ashe, Virginia Roundleaf Birch. Mt (VA): mountain forests in Smyth County, VA; rare (US Endangered, VA Endangered). May-June; July-August. B. lenta var. uber is related very closely to B. lenta var. lenta, and is apparently endemic to Smyth County, VA. In addition to the characters in the key, it differs from B. lenta var. lenta in having the leaves 2-6 cm long (vs. 7-15 cm long), with 4-6 pairs of lateral veins (vs. 8-12 pairs). See Mazzeo (1974), Ogle \& Mazzeo (1976), Hayden \& Hayden (1984), and McAllister \& Ashburner (2004) for additional information on this birch and its history. It does not breed "true" and should perhaps be considered a form of B. lenta. [<B. lenta Linnaeus -- C, Y, in part; Betula uber (Ashe) Fernald F, FNA, K, W, Z; = B. lenta ssp. uber (Ashe) E. Murray; = B. lenta forma uber (Ashe) McAllister \& Ashburner]

Betula nigra Linnaeus, River Birch, Red Birch. Cp, Pd, Mt (GA, NC, SC, VA): riverbanks, streambanks, floodplains, sandbars; common (uncommon in VA Mountains). March-April; May-June. NH west to se. MN and e. KS, south to FL and TX. [= RAB, C, F, FNA, G, GW, K, S, W, Y, Z] * Betula pendula Roth, European Weeping Birch, European White Birch. Mt, Pd (VA): persistent and escaping from plantings; rare, introduced from Europe. [= C, F, FNA, K]

Betula populifolia Marshall, Gray Birch, White Birch. Mt (NC*, VA): native in old fields and young forests in the Big Meadows area on greenstone (Madison \& Page counties, VA), introduced in disturbed areas; rare (native in VA, introduced only in NC) (VA Rare). May-June; June-July. Nova Scotia to s. Québec, south to s. NJ and MD, more or less disjunct in n. VA, s. Ontario, n. OH, and n. IN. [= RAB, C, F, FNA, G, K, W, Y, Z]

Betula papyrifera Marshall, Paper Birch, Canoe Birch, has sometimes been attributed to the Mountains of VA, but apparently these reports are based on B. cordifolia (see above). [= FNA, G, Y, Z; = B. papyrifera var. papyrifera -- C, F, K, W]

* Betula pubescens Ehrhart ssp. pubescens, European White Birch, Downy Birch, is reported as an introduction in e. GA (Jones \& Coile 1988) and at scattered sites throughout PA (Rhoads \& Klein 1993). [= FNA, K; = B. alba Linnaeus - C, F, G, an ambiguous name] \{not yet keyed\}

## Carpinus Linnaeus 1753 (Hornbeam, Ironwood, Muscle-tree, Water-beech, Blue-beech)

A genus of about 26 species, trees, in temperate regions of the Northern Hemisphere, extending southwards to se. Asia and Central America. The smooth gray bark gives Carpinus the names "Water-beech" and "Blue-beech", the fluted, sinewy appearance of the trunk the name "Muscle-tree", and the very hard, heavy wood the name "Ironwood." References: Furlow (1990)=Z; Hardin (1971) $=$ Y; Furlow (1987a); Furlow (1987b)=X; Furlow in FNA (1997); Govaerts \& Frodin (1998); Kubitzki in Kubitzki, Rohwer, \& Bittrich (1993).

1 Leaves narrowly ovate to oblong-ovate, $3-8.5 \mathrm{~cm}$ long, 1-4.5 cm wide, the apex acute, secondary teeth small and blunt, the lower leaf surface lacking conspicuous dark glands; bracts of the infructescence with rounded to subacute tips and few, blunt teeth; [trees primarily of the Coastal Plain and lower Piedmont] . . . . . . . . . . . . . . . . . . . . . . C. caroliniana var. caroliniana
1 Leaves ovate to elliptic, 5.8-12.5 cm long, $2.5-6.0 \mathrm{~cm}$ wide, usually abruptly narrowed to the tip (sometimes gradually tapered to a long, acuminate apex), the secondary teeth often almost as long as the primary teeth, sharp-tipped, the lower leaf surface with conspicuous dark-brown glands; bracts of the infructescence mostly sharp-tipped and bearing several sharp teeth; [trees primarily of the Mountains and Piedmont]
C. caroliniana var. virginiana

Carpinus caroliniana Walter var. caroliniana, Coastal American Hornbeam. Cp, Pd (GA, NC, SC, VA), Mt [GA, SC]: streambanks, riverbanks, bottomland forests, lower slopes, maritime forests; common. March-April; September-October. S. NJ, e. MD, and e. VA south to c. peninsular FL, west to e. TX, and north in the inland to s. MO and s. IL. The validity of 2 taxa was established by Furlow (1987a, 1987b) largely through statistical methods. The two taxa have some morphologic and phytogeographic coherence, but intergradation appears to be extensive, and individual specimens (in the herbarium) or trees (in the field) may not be readily identifiable to variety. $[=C, F ;=C$. caroliniana ssp. caroliniana -- FNA, K, X, Z; < C. caroliniana -- RAB, G, GW, S, Y]

Carpinus caroliniana Walter var. virginiana (Marshall) Fernald, Inland American Hornbeam. Mt (GA, NC, SC, VA), Pd (NC, SC, VA), Cp (VA): rich cove forests, streambanks, riverbanks, bottomland forests, lower slopes; common. March-April; SeptemberOctober. ME, Québec and s. Ontario west to MN, south to e. VA, c. NC, n. GA, n. AL, n. MS, AR, and se. OK. See above for discussion of the two varieties. [= C, F; = C. caroliniana ssp. virginiana (Marshall) Furlow -- FNA, K, W, X, Z; < C. caroliniana -RAB, G, GW, S, Y]

## Corylus Linnaeus 1753 (Hazelnut, Filbert)

A genus of about 15-18 species, shrubs and trees, of temperate regions of the Northern Hemisphere. Eurasian species of this genus, C. avellana Linnaeus and C. maxima P. Miller, are the sources of commercial filberts or hazelnuts. They are sometimes cultivated in North America, especially in the Pacific Northwest. Our wild species are also excellent eating, but wild animals, especially squirrels, usually harvest them before they are ripe. References: Furlow in FNA (1997); Kubitzki in Kubitzki, Rohwer, \& Bittrich (1993); Whitcher \& Wen (2001); Forest \& Bruneau (2000); Govaerts \& Frodin (1998).

1 Mature involucre $1.5-3 \mathrm{~cm}$ long, the lobes flattened and laciniate; young twigs and petioles stipitate-glandular; [section Corylus, subsection Corylus] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. americana
1 Mature involucre 4-7 cm long, extended into a tubular beak; young twigs and petioles villous, glandless; [section Corylus,

Corylus americana Walter, American Hazelnut, American Filbert. Mt, Pd, Cp (GA, NC, SC, VA): rocky woodlands, mesic to rich forests and thickets; common. February-March; September-October. ME west to Saskatchewan, south to GA, LA, and OK. [= RAB, C, FNA, K, S, W, Y, Z; > C. americana var. americana - F, G; > C. americana var. indehiscens Palmer \& Steyermark -- F, G]

Corylus cornuta Marshall var. cornuta, Beaked Hazelnut. Mt, Pd (GA, NC, SC, VA): dry rocky woodlands, thickets, high elevation forests and openings, seepage swamps; common. February-March; August-October. The species ranges from Newfoundland west to British Columbia, south to NJ, n. GA, e. TN (Chester, Wofford, \& Kral 1997), OH, MO, CO, and CA. Var. cornuta occupies most of that range; var. californica (A. de Candolle) Sharp [ssp. californica (A. de Candolle) E. Murray], a small tree, is far western and grades into var. cornuta. [ $\mathrm{K}, \mathrm{Z} ;<\mathrm{C}$. cornuta -- RAB, C, F, G, S, W, Y; = C. cornuta ssp. cornuta -- FNA]

## Ostrya Scopoli 1760 (Hop-hornbeam, Ironwood)

A genus of 7-9 species, trees, of temperate regions of the Northern Hemisphere. References: Furlow in FNA (1997); Govaerts \& Frodin (1998); Kubitzki in Kubitzki, Rohwer, \& Bittrich (1993).

Ostrya virginiana (P. Miller) K. Koch, American Hop-hornbeam, Ironwood. Mt, Pd, Cp (GA, NC, SC, VA): mesic to dry forests, often rocky, especially over basic rocks, reaching high elevations; common. April-May; August-October. Nova Scotia west to Manitoba, south to FL and TX. One of our heaviest and hardest woods. [= RAB, C, FNA, G, S, W, Y, Z; > O. virginiana var. lasia Fernald -- F; > O. virginiana var. virginiana - F; = O. virginiana var. virginiana -- K]

## BIGNONIACEAE (Bignonia Family)

The monophyly of the Bignoniaceae (excluding Paulownia) was confirmed by Spangler \& Olmstead (1999). References: Manning $(2000)=$ Z; Spangler \& Olmstead (1999); Fischer, Theisen, \& Lohmann in Kubitzki (2004).

## Bignonia Linnaeus 1753 (Cross-vine)

A monotypic genus, a woody vine, of Southeastern North America. References: Manning (2000)=Z; Fischer, Theisen, \& Lohmann in Kubitzki (2004).

Bignonia capreolata Linnaeus, Cross-vine. Cp, Pd, Mt (GA, NC, SC, VA): swamp forests, bottomlands, forests, woodlands; common (rare in Mountains). April-May; July-August. MD west to s. OH and s. MO, south to s. FL and e. TX. This species is absent from most of the Mountains in our area (also scarce in the Piedmont of Virginia and upper Piedmont of NC), reappearing at lower elevations on the west side of the Blue Ridge. Though primarily a species of swamp and bottomland forests, Bignonia often occurs as well in mesic or even dry forests, where it generally remains stunted (most individuals with only a few leaves) and does not flower or fruit. [= C, F, GW, K, W, Z; = Anisostichus capreolata (Linnaeus) Bureau -- RAB, G; = Anisostichus crucigera (Linnaeus) Bureau -- S]

Campsis Loureiro 1790 (Trumpet-creeper)
The only other species in the genus is the e. Asian C. grandiflora (Thunberg) K. Schumann. Wen \& Jansen (1995) estimated the age since divergence to be 24.4 million years, based on molecular divergence. References: Manning (2000)=Z; Wen \& Jansen (1995); Fischer, Theisen, \& Lohmann in Kubitzki (2004).

Campsis radicans (Linnaeus) Seemann ex Bureau, Trumpet-creeper. Cp, Pd, Mt (GA, NC, SC, VA): bottomland forests, swamp forests, fencerows, old fields, forests, thickets, disturbed areas; common. June-July; September-October. NJ west to IA, south to FL and c. TX. In the pre-Columbian landscape this plant was primarily limited to swamps and bottomlands; it has done well as a weedy colonizer of abandoned farmland, fencerows, and thickets (where particularly conspicuous on fenceposts and old tobacco barns). In swamps of the Coastal Plain it is a common liana, often with its foliage in the canopy $30-40 \mathrm{~m}$ above the ground, and with stems to 15 cm in diameter. Even when the foliage cannot be seen, Campsis is immediately recognizable by its shreddy tan or yellow bark (unlike any of our other high-climbing vines). [= RAB, C, F, G, GW, K, W, Z; = Bignonia radicans Linnaeus -- S]

## Catalpa Scopoli 1777 (Catalpa)

A genus of about 10 species, trees, of eastern North America (2 species), e. Asia (4 species), and the West Indies (4 species). References: Manning (2000)=Z; Fischer, Theisen, \& Lohmann in Kubitzki (2004).

1 Corolla 2-4 cm wide, the lower corolla lobe entire; pod 6-10 mm thick; seeds with 2 elongated wings, each wing narrowing to an acutish end, the hairs at the end appressed to one another in 2 planes, thus forming a pointed tail C. bignonioides

1 Corolla 4-6 cm wide, the lower corolla lobe notched; pod $10-15 \mathrm{~mm}$ thick; seeds with 2 elongated wings, each wing narrowing only slightly to a rounded or oblique end, the hairs at the end appressed to one another only in one plane, thus forming a flattish fringe
C. speciosa

Catalpa bignonioides Walter, Southern Catalpa. Cp (GA, NC*, SC*), Mt*, Pd* (GA, *NC*, SC*, VA*), Cp (NC, SC): bottomlands and streambanks (as a native), escaped or persistent after cultivation; uncommon, introduced from the Gulf Coastal Plain. June; October. The native range was apparently from panhandle FL west to s. MS (or LA?), on the Coastal Plain, early naturalized in a more widespread area, and now extending north to CT and MI. [= RAB, C, F, G, GW, K, W, Z; = C. catalpa (Linnaeus) Karsten -- S]

* Catalpa speciosa (Warder) Warder ex Engelmann, Northern Catalpa. Cp, Pd (GA, NC, SC, VA), Mt (NC, SC, VA): escaped or persistent after cultivation, and sometimes thoroughly naturalized; uncommon, introduced from the northern Mississippi River Embayment. May-June; July-August. S. IN and s. IL, south to w. TN and e. AR; early naturalized in a more widespread area. [= RAB, C, F, G, K, S, W, Z]
* Catalpa ovata G. Don, Chinese Catalpa, is introduced in WV, MD, and PA (Manning 2000; Kartesz 1999). [= K, Z] \{not yet keyed $\}$

## Macfadyena Alphonse de Candolle 1845 (Claw-vine)

A genus of 3-4 species, woody vines, of Mexico and the West Indies south through Central America to northern South America. References: Manning (2000)=Z; Fischer, Theisen, \& Lohmann in Kubitzki (2004).

* Macfadyena unguis-cati (Linnaeus) A.H. Gentry, Claw-vine, Cat's-claw-vine. Cp (GA, SC): cultivated and naturalized; rare, introduced from tropical America. This vine is introduced and naturalized in s. and e. GA (Jones \& Coile 1988) and is locally commonly naturalized in Charleston. [= K, Z; = Bignonia unguis-cati Linnaeus]

## BORAGINACEAE (Borage Family)

A family of about 130 genera and ca. 2500 species, herbs, shrubs, and trees, nearly cosmopolitan (Al-Shehbaz 1991). Closely related to the Hydrophyllaceae, and the two may either be combined or subfamily Heliotropioideae elevated to family status as Heliotropiaceae (Ferguson 1998; Diane, Förther, \& Hilger 2002; Hilger \& Diane 2003). References: Al-Shehbaz (1991)=Z throughout the family. Key to genera based on RAB, C, and Z.

1 Ovary slightly 2-4-lobed, or not at all lobed; style terminal or reduced to a sessile terminal stigma; [subfamily Heliotropioideae]

1 Ovary deeply 4-parted; style gynobasic; [subfamily Boraginoideae].
2 Mericarps with glochidiate prickles (like grappling hooks), these visible early in development.
3 Mericarps spreading or divergent, attached to the gynobase on the upper third of the mericarp; [tribe Cynoglosseae]
Cynoglossum
3 Mericarps erect, attached to the gynobase near the middle of the mericarp; [tribe Eritrichieae]
4 Fruiting pedicels deflexed; plant perennial or biennial
Hackelia
4 Fruiting pedicels erect-ascending; plant annual......
2 Mericarps smooth, rugose, or pitted, lacking glochidiate prickles.
5 Corolla rotate, lacking a well-developed tube, blue; [tribe Boragineae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . Borago
5 Corolla with a well-developed tube at least 3 mm long, of various colors (including blue).
6 Corolla lobes distinctly unequal, pink to blue.
7 Stamens equal in length, entirely included within the corolla tube . . . . . . . . . . . . . . . . . . . . . . . Anchusa
7 Stamens unequal in length, the longer conspicuously exserted . . . . . . . . . . . . . . . . . . . . . . . . . Echium
6 Corolla lobes equal, of various colors (including pink to blue).
8 Mericarps attached laterally to a pyramidal gynobase.
9 Corolla yellow, the tube 4-5 mm long; corolla throat lacking appendages . . . . . . . . . . . . Amsinckia
9 Corolla white (with a yellow eye), or pink to blue, the tube $6-20 \mathrm{~mm}$ long; corolla throat with appendages.
10 Corolla pink to blue (rarely white), $18-25 \mathrm{~mm}$ long; leaves elliptic or ovate; [plant a native, of moist, nutrient-rich habitats, and sometimes grown as an ornamental]

Mertensia
10 Corolla white with a yellow eye; leaves linear; [plant a rare alien, of disturbed habitats]
Plagiobothrys
8 Mericarps attached basally to a flat or broadly convex gynobase.
11 Mericarps laterally compressed, with an evident raised margin . . . . . . . . . . . . . . . . . . . . Myosotis
11 Mericarps neither laterally compressed nor with an evident thickened margin.
12 Mericarps with a prominent, toothed, basal rim .
Symphytum
12 Mericarps lacking a prominent, toothed, basal rim.
13 Corolla lobes erect or slightly spreading, acute to acuminate; style exserted
Onosmodium

13 Corolla lobes spreading, rounded; style included
14 Corolla whitish or bluish white; plant annual from a slender taproot; leaves without evident lateral veins; mericarps brown, dull, wrinkled and pitted; [plant a weedy alien] ......................... Buglossoides
4 Corolla bright yellow-orange, or greenish-white; plant perennial from a thickened, woody rhizome; mericarps white, shining, smooth or pitted; [plant a native].

Lithospermum

## Amsinckia Lehmann (Fiddleneck)

A genus of about 15 species, herbs, of western North America and western South America. References: Al-Shehbaz (1991)=Z.

* Amsinckia menziesii (Lehmann) A. Nelson \& Macbride. Pd (NC), Cp (SC): disturbed areas, waste areas near wool-combing mill; rare, introduced from w. United States. May-September. [= Z; A. hispida (Ruiz \& Pavón) I.M. Johnston -- RAB, misidentification; > A. menziesii var. menziesii - K; A. parviflora Heller -- S, misidentification; Amsinckia lycopsoides Lehmann, misidentification]

## Anchusa Linnaeus (Bugloss, Alkanet)

A genus of about 35 species, herbs, of Europe, n. Africa, and w. Asia. References: Al-Shehbaz (1991)=Z.

* Anchusa arvensis (Linnaeus) M. Bieberstein, Small Bugloss, Alkanet. Pd (NC, VA): disturbed areas, rare, introduced from Europe. [= C, K; Lycopsis arvensis Linnaeus -- F, G, S]

Borago Linnaeus (Borage)

A genus of 3 species, herbs, of Mediterranean Europe and Asia. References: Al-Shehbaz (1991)=Z.

* Borago officinalis Linnaeus, Borage. Pd (VA): disturbed areas; rare, introduced from s. Europe. [= C, F, G, K, Z]

Buglossoides Moench (Corn-gromwell)
A genus of about 7 species, herbs or shrubs, of temperate Eurasia. References: Al-Shehbaz (1991)=Z.

* Buglossoides arvensis (Linnaeus) I.M. Johnston ssp. arvensis, Corn-gromwell. Mt (NC, SC, VA), Pd, Cp (GA, NC, SC, VA): roadsides, dry disturbed areas, sandy fields; common, introduced from Eurasia. March-June. Other subspecies are not known to be naturalized in our area. [= Z; B. arvensis -- K, infraspecific taxa not distinguished; Lithospermum arvense Linnaeus -- RAB, C, F, G, S, W]

Cynoglossum Linnaeus (Comfrey)
A genus of about 75 species, herbs, of temperate regions. References: Al-Shehbaz (1991)=Z.

1 Flowering stem with leaves above the first inflorescence branch; corolla reddish-purple; [plant a biennial alien, weedy] . . . . . .

1 Flowering stem leafless above the first branch; corolla blue or white; [plant a perennial native, not weedy].
2 Nutlets 3.5-5 mm; calyx at anthesis 2-2.5 mm long; corolla 6-8 mm wide, the lobes oblong and not overlapping
2 Nutlets 5.5-9 mm; calyx at anthesis (3.0-) 3.5-4.5 mm long; corolla (8-) 10-12 mm wide, the lobes broadly rounded and more or less overlapping
C. virginianum var. virginianum

* Cynoglossum officinale Linnaeus, Garden Comfrey, Hound's-tongue. Mt (NC, VA), Pd (VA): disturbed areas, roadsides, pastures, calcareous shale barrens; common (rare south of VA), introduced from Eurasia. May-July. [= RAB, C, F, G, K, S, W, Z] Cynoglossum virginianum Linnaeus var. virginianum, Wild Comfrey. Mt, Pd, Cp (GA, NC, SC, VA): moist deciduous forests; common (rare in Coastal Plain). April-June. Var. virginianum ranges from CT west to OK, south to FL and LA. [= C, K; < C. virginianum -- $\mathrm{RAB}, \mathrm{W} ;=C$. virginianum $-\mathrm{F}, \mathrm{G}, \mathrm{Z}$, in the narrow sense; = C. virginicum -- S , orthographic error]

Cynoglossum virginianum Linnaeus var. boreale (Fernald) Cooperrider, Northern Hound's-tongue, ranges from New Brunswick west to British Columbia, south to CT, NY, c. PA, n. OH, MI, and MN. Cooperrider (1995) prefers varietal status for this taxon, stating that in OH there are numerous intermediates, while Voss (1996) and Rhoads \& Klein (1993) maintain C. boreale at the species level. [= C, K; = C. boreale -- F, G, Z]

## Echium Linnaeus (Viper's-bugloss, Blueweed)

A genus of about 60 species, herbs, widespread in the Old World. The common name is pronounced "bew-gloss," not "bug-loss," as it refers to an ox's tongue rather than the departure of insects. References: Al-Shehbaz (1991)=Z.

1 Hairs of the stem pustular-based . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [E. pustulatum]
1 Hairs of the stem not pustular-based . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . E. vulgare

* Echium vulgare Linnaeus, Viper's-bugloss, Blueweed. Mt, Pd (NC, SC, VA), Cp (VA): roadsides, dry pastures, disturbed areas; common, introduced from Mediterranean Europe. June-September. [=RAB, C, K, W; =E. vulgare var. vulgare -- $F, G ;<E$. vulgare -- Z, in the broad sense (including E. pustulatum)]
* Echium pustulatum Sibthorp \& Smith, Blue-devil, is reported by F for "N.J. to W.Va.," and by G and K as south to VA. It differs in having pustular-based hairs on the foliage. [ $=\mathrm{K} ;=E$. vulgare var. pustulatum (Sibthorp \& Smith) Coincy $-\mathrm{F}, \mathrm{G} ;<E$. vulgare -- Z , in the broad sense]

## Hackelia Opiz (Stickseed)

A genus of ca. 45 species, of north tremperate regions, Central America, and South America, especially diverse in w. North America. References: Al-Shehbaz (1991)=Z.

Hackelia virginiana (Linnaeus) I.M. Johnston, Virginia Stickseed. Mt, Pd (GA, NC, SC, VA), Cp (VA): forests and woodlands; common (rare south of VA). June-September. S. Québec west to ND, south to ne. GA (Jones \& Coile 1988), LA, and TX. [= RAB, C, F, G, K, W, Z; = Lappula virginiana (Linnaeus) Greene -- S]

Heliotropium Linnaeus (Heliotrope, Turnsole)
A genus of ca. 250 species, wodespread in tropical and temperate regions. Perhaps better placed in the family Heliotropiaceae, as it is apparently more closely related to Hydrophyllaceae than to Boraginaceae. Currently under study and taxonomic changes may be forthcoming (Hilger \& Diane 2003). References: Al-Shehbaz (1991)=Z; Hilger \& Diane 2003).

1 Flowers solitary at the ends of short branches; [of limestone habitats from nw. GA westwards]; [section Orthostachys, subsection Bracteata]
H. tenellum

1 Flowers in secund, helicoid cymes.
2 Leaves glabrous, succulent, less than 7 mm wide; [of saline coastal situations]; [section Halmyrophila]
........................................................................
Leaves pubescent, not succulent, more than 10 mm wide; [of a variety of mostly disturbed, inland situations].
3 Mericarps separating at maturity; fruit 4-lobed prior to maturation; leaves petiolate, ca. $2 \times$ as long as wide; [section Heliotropium] H. europaeum

3 Mericarps cohering in pairs at maturity; fruit 2-lobed prior to maturation; leaves petiolate or sessile to subsessile, ca. $2 \times$ to ca. $5 \times$ as long as wide.
4 Fruit tuberculate, 4-seeded; leaves sessile to subsessile, ca. $4-5 \times$ as long as wide; corolla throat and tube densely villous within; [section Heliophytum] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . H. amplexicaule
4 Fruit longitudinally ribbed, 2-seeded; leaves petiolate, ca. $2 \times$ as long as wide; corolla throat and tube glabrous within; [section Tiaridium]
H. indicum

* Heliotropium amplexicaule M. Vahl, Wild Heliotrope. Cp, Pd (GA, NC, SC, VA): disturbed areas, roadsides, fields; uncommon (rare north of SC), introduced from South America. April-September. [= RAB, C, F, G, K, Z]

Heliotropium curassavicum Linnaeus var. curassavicum, Seaside Heliotrope. Cp (GA, NC, SC, VA): edges of brackish and salt marshes, estuarine shores; rare (NC Rare). June-September. Var. curassavicum ranges from DE (and farther north as an introduction) south to the New World tropics. Considered by some authors to be introduced and naturalized in our area. Other varieties occur inland in the mw. and w. United States. [= C, K, Z; < H. curassavicum -- RAB, GW; = H. curassavicum -- F, G, in the narrow sense; = Heliotropium curassavicum ssp. curassavicum]

* Heliotropium europaeum Linnaeus, European Heliotrope. Cp (GA, NC, SC, VA), Pd (NC, VA): roadsides, disturbed areas; rare, introduced from s. Europe. June-September. [= RAB, C, F, G, K, Z]
* Heliotropium indicum Linnaeus, Turnsole. Cp, Pd (GA, NC, SC, VA): roadsides, woodland borders, swamps, ditches; uncommon, introduced from South America. July-November. [= RAB, C, F, G, GW, K, Z; = Tiaridium indicum (Linnaeus) Lehm. -S]

Heliotropium tenellum (Nuttall) Torrey, Delicate Heliotrope. Mt (GA): limestone glades and barrens; rare (GA Special Concern). East to c. TN, KY, WV, and nw. GA (Jones \& Coile 1988). [= C, F, G, K, Z; = Lithococca tenella (Nuttall) Small -- S]

## Lappula Moench (Sheepbur)

A genus of about 40 species, of Eurasia, w. North America. References: Al-Shehbaz (1991)=Z.
1 Nutlets with 1 row of marginal prickles . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . L. occidentalis var. occidentalis

1 Nutlets with 2-3 rows of marginal prickles . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [L. squarrosa]

* Lappula occidentalis (S. Watson) Greene var. occidentalis. Cp (SC): waste areas near wool-combing mill; rare, perhaps only a waif, introduced from w. North America. April-June. [= K; = L. redowskii var. redowskii - C, Z; = L. redowskii (Hornemann) Greene var. occidentalis (S. Watson) Rydberg - F, G]
* Lappula squarrosa (Retz.) Dumortier. Introduced south to MD, WV, KY, and TN. [= C, Z; L. echinata Gilibert - F, G; L. lappula (Linnaeus) Karst. - S]

## Lithospermum Linnaeus (Gromwell, Puccoon, Stoneseed)

(also see Buglossoides)
A genus of about 45 species, herbs (mostly perennials), nearly cosmopolitan. References: Cusick (1985)=Y; AI-Shehbaz (1991)=Z.
1 Corolla white or yellowish-white, the tube $4-8 \mathrm{~mm}$ long.
2 Plant with basal rosette; lower cauline leaves about equal in size to the upper cauline leaves; leaves acute to obtuse .

2 Plant lacking basal rosette; lower cauline leaves smaller than the upper cauline leaves; leaves acuminate or acute.
3 Upper stem internodes mostly $3-6 \mathrm{~cm}$ long; leaves mostly $>2 \mathrm{~cm}$ wide, acuminate . . . . . . . . . . . . . . . . L. Iatifolium
3 Upper stem internodes mostly 1-2 cm long; leaves mostly <2 cm wide, acute . . . . . . . . . . . . . . . . . [ [L. officinale]
1 Corolla yellow-orange, the tube 7-14 mm long.
4 Plant with dense, soft, appressed pubescence, the hairs usually without pustular bases; calyx lobes 6-8 mm long at maturity; nutlets 2-3 mm long; [mostly of rocky or clayey circumneutral soils of the Piedmont and Mountains]
L. canescens

4 Plant with scattered, stiff, spreading pubescence, the hairs with or without pustular bases; calyx lobes 10-15 mm long at maturity; nutlets $3.5-4.5 \mathrm{~mm}$ long; [variously of sandy acidic soils of the Coastal Plain or inland].
5 Pubescence with slender bases; mature calyx lobes flat; plants with 15-25 well-developed leaves below the inflorescence; [of sandy Coastal Plain habitats from se. VA southwards] . . . . . . . . . . . . . . . . . . . . L. caroliniense
5 Pubescence with pustular bases; mature calyx lobes strongly keeled; plants with (30-) 35-45 well-developed leaves below the inflorescence; [inland, known from west and north of our area]
[L. croceum]
Lithospermum canescens (Michaux) Lehmann, Hoary Puccoon, Indian-paint. Pd (NC, SC, VA), Mt (GA, VA), Cp? (VA): dry woodlands and glades over calcareous rocks (such as limestone, dolostone) or mafic rocks (such as diabase); uncommon (rare in NC). April-May. Ontario west to Saskatchewan, south to c. NC, nw. GA, AL, and TX. [= RAB, C, F, G, K, W, Y, Z; = Batschia canescens Michaux -- S]

Lithospermum caroliniense (Walter ex J.F. Gmelin) MacMillan, Coastal Plain Puccoon. Cp (GA, SC, VA): sandhills, dry sandy soils; common (rare north of s. SC). April-June. A Southeastern Coastal Plain endemic: se. SC south to FL, and west to TX, on the Southeastern Coastal Plain; disjunct in e. VA. The disjunction from SC to se. VA, skipping over large amounts of apparently suitable sandhill habitat in NC, is surprising. The sibling taxa L. caroliniense and L. croceum have been variously treated as distinct species, subspecies, or varieties, or as mere forms (see synonymy). They appear to be as clearly separable as L. caroliniense is from L. canescens; I regard them as allopatric species. [= F; < L. caroliniense -- RAB, G, Z; = L. caroliniense var. caroliniense -- C, K; = Batschia caroliniensis Walter ex J.F. Gmelin -- S; = L. carolinense ssp. carolinense -- Y]

Lithospermum latifolium Michaux, American Gromwell, Broadleaf Gromwell. Mt (GA, VA): dry to moist woodlands over calcareous rocks; rare (GA Special Concern). May-June. NY west to MN, south to nw. GA, s. TN and MO. [= C, F, G, K, S, W, Y, Z]

Lithospermum tuberosum Rugel ex Augustin de Candolle, Southern Stoneseed. Mt (GA, VA), Pd (GA, SC), Cp (GA): nutrient-rich forests; rare (VA Watch List). March-June. KY and TN, south to FL and LA. [= RAB, C, F, G, K, S, Z]

Lithospermum croceum Fernald ranges from Ontario west to MT, south to w. PA, n. OH, AR, OK, and CO. Reports by Kartesz (1999) for WV, KY, and TN have not been verified. [= F; = L. caroliniense (Walter ex J.F. Gmelin) MacMillan var. croceum (Fernald) Cronquist - C, K; < L. caroliniense - G, Z; = L. caroliniense ssp. croceum A.W. Cusick - Y]

* Lithospermum officinale Linnaeus, European Gromwell, is introduced from Europe and occurs at scattered localities in ne. North America, south to PA and NJ (Kartesz 1999). [= C, F, G, K, Y, Z]

## Mertensia Roth (Bluebell)

A genus of about 45 species, north temperate. References: AI-Shehbaz (1991)=Z.
Mertensia virginica (Linnaeus) Persoon ex Link, Virginia Bluebells, Virginia Cowslip. Mt (GA, NC, VA), Pd (NC, VA), Cp (VA): nutrient-rich, moist, alluvial soils of floodplain forests and thickets; common (rare south of VA) (GA Special Concern). March-June. NY west to WI, and IA, south to n. NC, nw. GA, AL, and n. AR. Pringle (2004) discusses the nomenclatural reasons for retaining the name M. virginica. [= RAB, C, F, G, K, S, W, Z; = M. pulmonarioides Roth ]

A genus of about 100 species, temperate and montane tropical. References: Al-Shehbaz (1991)=Z. Key based closely on RAB and C .

1 Calyx strigose, the hairs neither spreading nor uncinate; [mostly of moist to wet habitats].
2 Corolla limb 2-5 mm wide; mericarps distinctly surpassing the style . . . . . . . . . . . . . . . . . . . . . . . . . M. Iaxa ssp. Iaxa
2 Corolla limb 5-10 mm wide; mericarps not surpassing the style . . . . . . . . . . . . . . . . . . . . . . . . . . . . . M. scorpioides
1 Calyx with some loose or spreading, uncinate hairs; [of various habitats, mostly dry].
Corolla limb $5-8 \mathrm{~mm}$ wide; perennial
M. sylvatica

3 Corolla limb $1-4 \mathrm{~mm}$ wide; annual or biennial.
4 Calyx lobes unequal, 3 lobes shorter than the other 2; corolla white; [native, of dry or moist habitats].
5 Fruiting pedicels divergent; fruiting calyx deciduous, 3-10 mm long; inflorescence internodes usually longer than 10 mm ; mericarps 1.4-2.2 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . M. macrosperma
5 Fruiting pedicels more-or-less erect; fruiting calyx persistent, $3-5.5 \mathrm{~mm}$ long; inflorescence internodes usually shorter than 10 mm ; mericarps $1.2-1.5 \mathrm{~mm}$ long
M. verna

4 Calyx lobes equal, all 5 the same size; corolla blue (occasionally yellow or white); [alien, mostly of dry disturbed habitats].
$6 \quad$ Fruiting pedicels equaling or generally longer than the calyx
M. arvensis
$6 \quad$ Fruiting pedicels distinctly shorter than the calyx.
7 Plants floriferous from about the middle upwards; style surpassing the mericarps . . . . . . . . . M. discolor
7 Plants floriferous nearly to the base; style shorter than the mericarps . . . . . . . . . . . . . . . . . . . M. stricta

* Myosotis arvensis (Linnaeus) Hill, Field Forget-me-not, Field Scorpion-grass. Pd (NC, SC, VA), Cp (VA), Mt (NC): roadsides, fields, disturbed areas; rare, introduced from Eurasia. May-August. [= RAB, C, F, G, K, S, W, Z]
* Myosotis discolor Persoon, Yellow-and-blue Scorpion-grass, Changing Forget-me-not. Pd (GA, NC, SC, VA), Cp (VA): fields, disturbed areas, roadsides; uncommon, introduced from Europe. May-August. [= RAB, C, GW, K, Z; M. versicolor (Persoon) Sm. -- F, G]

Myosotis laxa Lehmann ssp. laxa, Smaller Forget-me-not, Tufted Forget-me-not. Mt, Pd, Cp (NC, VA): marshes, streambanks; common. May-August. The species is circumboreal, represented nearly throughout North America by ssp. laxa. The other subspecies are Eurasian. [= Z; M. Iaxa -- RAB, C, F, G, GW, K, S, W, infraspecific taxa not distinguished]

Myosotis macrosperma Engelmann, Bigseed Forget-me-not. Cp, Pd, Mt (GA, NC, SC, VA): bottomland forests and alluvial fields, probably associated with nutrient-rich soils; uncommon. April-May. MD west to MO, south to FL and TX. [= RAB, C, F, G, GW, K, S, W, Z]

* Myosotis scorpioides Linnaeus, Water Scorpion-grass. Mt (NC, VA), Pd, Cp (VA): wet meadows, streambanks; common, introduced from Europe. May-August. [= RAB, C, F, G, GW, K, W, Z; M. palustris (Linnaeus) Hill -- S]
* Myosotis stricta Link ex Roemer \& J.A. Schultes, Blue Scorpion-grass. Pd (NC, VA), Cp (VA), Mt (NC): disturbed areas; uncommon, introduced from Eurasia. April-June. [=F,K, Z; M. micrantha Pallas -- RAB, C, G, apparently misapplied]
* Myosotis sylvatica Ehrhart ex Hoffman, Garden Forget-me-not. Pd (NC): gardens, rarely persistent or found as a waif; rare, introduced from Eurasia. April-September. [= RAB, C, F, G, K, Z]

Myosotis verna Nuttall, Early Forget-me-not. Cp, Pd, Mt (GA, NC, SC, VA): dry woodlands, roadsides, disturbed areas, dry fields; common. March-July. ME west to SD, south to GA and TX; also from ID and British Columbia south to OR. [= RAB, C, F, G K, W, Z; M. virginica -- S, misapplied]

## Onosmodium Linnaeus (Marbleseed, False-gromwell)

A genus of about 7 species (or fewer species and the same number of taxa in some interpretations), perennial herbs, of North America. References: Turner (1995a)=Y; Al-Shehbaz (1991)=Z. Key based on Y, in part.

1 Corolla lobes yellow to orange; nutlet 2.0-2.8 mm long; corolla lobes either 2.5-4× as long as wide and acuminate ( 0 . virginianum) or 1.5-2× as long as wide, acute (O. decipiens).
2 [endemic to Ketona dolomite glades, Bibb County, c. AL] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [O. decipiens]
2 [widespread in our area] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . O. virginianum
1 Corolla lobes dull greenish-white; nutlet 2.5-3.0 mm long; corolla lobes 1.5-2× as long as wide, acute.
3 Leaf vestiture solely of dense appressed hairs on both surfaces (the plant appearing ashy-white) .......... [O. molle]
3 Leaf vestiture at least in part of spreading or ascending hairs.
4 Stems mostly glabrous below the inflorescence branches [O. subsetosum] 4 Stems persistently and obviously pubescent below the inflorescence branches.

5 Corolla 6-10 mm long; nutlets flared at the base O. hispidissimum

5 Corolla 11-20 mm long; nutlets tapered at the base . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . O. occidentale
Onosmodium hispidissimum Mackenzie, Eastern Prairie Marbleseed, Shaggy Marbleseed. Mt (VA): calcareous woodlands, barrens, and glades, and nearby in disturbed areas, such as older pasture edges; rare. June-July. W. NY and Ontario west to MN, south to sc. PA (Rhoads \& Klein 1993), w. VA, e. TN (Chester, Wofford, \& Kral 1997), LA, and TX. This species was attributed to NC by F and S; the documentation of these reports is not known. [=F, G, S, W; O. molle Michaux var. hispidissimum (Mackenzie) Cronquist -- C; O. hispidissimum var. macrospermum Mackenzie \& Bush -- F; O. molle Michaux ssp. hispidissimum (Mackenzie) Boivin -- K, Z; O. bejariense Alphonse de Candolle ssp. hispidissimum (Mackenzie) B.L. Turner -- Y]

Onosmodium occidentale Mackenzie. Mt (GA): open woodlands over limestone; rare (GA Special Concern). Ranges east
to e. TN (Chester, Wofford, \& Kral 1997) and nw. GA (Jones \& Coile 1988). [= F, G; O. molle Michaux var. occidentale (Mackenzie) I.M. Johnston -- C; O. molle Michaux ssp. occidentale (Mackenzie) Cochrane -- K, Z; O. molle -- S, in part; O. bejariense Alphonse de Candolle var. occidentale (Mackenzie) B.L. Turner -- Y]

Onosmodium virginianum (Linnaeus) Alphonse de Candolle, Virginia Marbleseed. Cp, Pd, Mt (GA, NC, SC, VA): sandhill woodlands, shell middens in the outer Coastal Plain, woodlands and barrens over diabase and other mafic rocks in the Piedmont and low Mountains, barrens, glades, or woodlands over calcareous rocks in the Mountains; uncommon, rare in NC and VA (NC Watch List, VA Rare). April-September. LA to FL, north to NY and MA, primarily on the Coastal Plain; the species has become very rare north of NC. It is peculiarly distributed in our area, occurring on highly acidic sands in the fall-line sandhills, but seemingly restricted to circumneutral soils derived from mafic rocks (Piedmont), calcareous rocks (Mountains), or calcareous shell (Coastal Plain) in the rest of our area. The unifying ecological factor determining its distribution may be an open, woodland condition maintained by fire. The species seems characteristically to occur in very small populations, consisting often of fewer than five plants. [= RAB, C, F, G, K, S, W, Y, Z]

Onosmodium decipiens J. Allison, Deceptive Marbleseed. Dolomitic Ketona glades. April-early May; June-August. Endemic to c. AL (Bibb County) (Allison \& Stevens 2001).

Onosmodium molle Michaux was attributed to our area (Durham County, NC) by RAB, but Baskin et al. (1983) determined that this report was based on a misidentification of a specimen of O. virginianum. O. molle apparently does not occur in our primary area, ranging in barrens of c. KY and c. TN (Chester, Wofford, \& Kral 1997), nw. AL, and disjunct in the Ozarkian Highlands of MO. [= F, G, Y; O. molle var. molle -- C; O. molle ssp. molle -- K, Z; O. molle -- S, in part only]

Onosmodium subsetosum Mackenzie \& Bush ranges east to c. and sc. TN (Chester, Wofford, \& Kral 1997). [= F, G; O. molle Michaux ssp. subsetosum (Mackenzie \& Bush) Cochrane -- K, Z; O. molle -- S, in part; O. bejariense Alphonse de Candolle var. subsetosum (Mackenzie \& Bush) B.L. Turner -- Y]

## Plagiobothrys Fischer \& C.A. Meyer (Popcorn-flower)

A genus of about 70 species, of w. North America, w. South America, e. Asia, and Australia. References: Al-Shehbaz (1991)=Z; Chambers (1989) $=\mathrm{Y}$.

* Plagiobothrys figuratus (Piper) I.M. Johnston ex M.E. Peck ssp. figuratus, Popcorn-flower. Pd (NC): fields and roadsides; rare, introduced from nw. North America. April-May. [=K, Y; = P. hirtus (Greene) I.M. Johnston var. figuratus (Piper) I.M. Johnston -- RAB, Z ; < P. hirtus -- $\mathrm{F}, \mathrm{G}$ ]

## Symphytum Linnaeus (Comfrey)

A genus of ca. 25 species, herbs, of Europe. References: Al-Shehbaz (1991)=Z.
1 Upper leaves not decurrent, or decurrent less than 1 cm below the leaf attachment; pubescence of stem in part of strong, recurved prickles (resembling miniature rose thorns).
[S. asperum]
1 Upper leaves decurrent on the stem; pubescence of the stem not of prickles ................................. S. officinale

* Symphytum officinale Linnaeus, Common Comfrey. Mt, Pd (VA): disturbed areas; uncommon, introduced from Europe. Symphytum is a traditional "medicinal herb," but recent evidence suggests that it can cause dangerous (even fatal) liver damage. [= C, F, G, K, S, Z]
* Symphytum asperum Lepechin, Prickly Comfrey, another Eurasian species, is reported by F as occurring south to MD. It may occur in our area. [= C, F, G, K, Z]

## BRASSICACEAE or CRUCIFERAE (Mustard Family)

A family of about 340 genera and 3400 species, annuals, perennials, shrubs, and rarely trees and vines, of cosmopolitan distribution (but most diverse in the temperate Northern Hemisphere). References: Rollins (1993); Al-Shehbaz (1984, 1985a, 1985b, 1986, 1987, 1988a, 1988b); Appel \& Al-Shehbaz in Kubitzki \& Bayer (2003).

## Key to fruiting crucifers

1 Fruits $<3 \times$ as long as wide, variously shaped (silicles).
2 Fruits strongly compressed at a right angle plane to that of the septum (the septum therefore much narrower than the width of the fruit) Key A
2 Fruits inflated, globular, or compressed parallel to the septum (the septum therefore about as broad as the widith of the fruit).
3 Plants glabrous, or pubescent with unbranched trichomes only $\qquad$ Key B
3 Plants pubescent, with forked, branched, or stellate trichomes (and sometimes with simple trichomes as well) ..
Key C
1 Fruits $>3 \times$ as long as wide, linear or narrowly oblong (siliques).

## Key A

1Seeds 1 per locule or 1 per silique
Iberis
Isatis
Lepidium (Cardaria, Coronopus)
1Seeds $>1$ per locule
Teesdalia
Capsella
Thlaspi
Microthlaspi
Armoracia
Paysonia
Physaria

## Key B

## Calepina

Lunaria

Key to flowering crucifers

|  | Petals white; silique $10-25 \mathrm{~mm}$ long; plants usually aquatic, rooting from numerous lower nodes; cauline leaves regularly pinnate, with the lower lateral lobes on each side well separated from one another, the rachis very slightly (if at all) winged |
| :---: | :---: |
| 1 | Petals yellow (or absent in R. sessiliflora); silique 3-15 (-20) mm long; plants of moist to wet habitats (rarely aquatic), rarely rooting from lower nodes; cauline leaves various, ranging from crenate, serrate, pinnatifid (the lobes themselves sometimes pinnatifid or lobed), the lobing often irregular, the rachis often well winged between the lobes |
| 1 | Cauline leaves cuneate or petiolate at the base, not auriculate; flowers yellow . . . . . . . . . . . . . . . . . . . . . . . . . Physaria |
| 1 | Cauline leaves expanded at the base, usually auriculate; flowers yellow or white . . . . . . . . . . . . . . . . . . . . . . . Paysonia |
|  | Plant aquatic; stem submersed or prostrate; fruit unilocular . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Neobeckia |
| 1 | Plant terrestrial; stem erect; fruit bilocular . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Armoracia |
| Thelypodieae: Warea |  |
| Brassiceae: Brassica, Cakile, Calepina, Coincya, Conringia, Diplotaxis, Eruca, Erucastrum, Raphanus, Rapistrum, Sinapis Lepidieae: Capsella, Lepidium, Microthlaspi, Teesdalia, Thlaspi |  |
|  |  |
| Alysseae: Alyssum, Berteroa, Camelina, Draba, Lobularia, Lunaria, Paysonia, Physaria |  |
| Arabideae: Arabis, Armoracia, Barbarea, Boechera, Cardamine, lodanthus, Leavenworthia, Nasturtium, Neobeckia, Rorippa, Sibara, Turritis |  |
| Hesperideae: Chorispora, Erysimum, Hesperis |  |
| Sisymbrieae: Alliaria, Arabidopsis, Descurainia, Sisymbrium |  |
|  | raya, Bunias, Iberis, Isatis, Matthiola, Moricandia, |

Alliaria Heister ex Fabricius 1759 (Garlic Mustard)
A genus of 2 species, annual or biennial herbs, of Eurasia. References: Rollins (1993)=Z; Al-Shehbaz (1988b)=Y.
Alliaria petiolata (Bieberstein) Cavara \& Grande, Garlic Mustard, Hedge Garlic. Mt (NC, VA), Pd, Cp (VA) \{GA, SC\}: moist forests in bottomlands and on slopes; common (uncommon in VA Piedmont, rare in NC and VA Coastal Plain), introduced from Europe. April-May; May-June. This species has become a noxious weed in ne. United States, invading undisturbed moist forests. Dhillion \& Anderson (1999) report on physiological characteristics that make Alliaria a successful invader in shaded situations. [= RAB, C, K, W, Y, Z; Alliaria officinalis Andrzejowski ex Bieberstein -- F, G]

## Alyssum Linnaeus 1753 (Alyssum, Madwort)

A genus of 170-190 species, herbs, of Eurasia. References: Rollins (1993)=Z; Al-Shehbaz (1987)=Y.
Alyssum alyssoides (Linnaeus) Linnaeus, Yellow Alyssum. Mt, Pd, Cp (VA): roadsides, disturbed areas, especially in dry, barren soil; uncommon, introduced from Europe. June-September. [= C, F, G, K, W, Z; A. alyssoides var. alyssoides - Y]

## Arabidopsis Heynhold (Mouse-ear Cress)

A genus of about 9 species, annual and perennial herbs, circumboreal and most diverse in Eurasia. References: Rollins (1993)=Z, Al-Shehbaz (1988a)=Y; O'Kane \& Al-Shehbaz (1997)=X; O’Kane \& Al-Shehbaz (2003); Koch, Bishop, \& Mitchell-Olds (1999); Koch \& Al-Shehbaz (2002). Key based in part on O'Kane \& Al-Shehbaz (1997).

1 Fruit strongly flattened; petals $6-10 \mathrm{~mm}$ long; [native perennial, of calcareous and mafic rock outcrops] ... A. Iyrata ssp. Iyrata 1 Fruit terete; petals $2-4 \mathrm{~mm}$ long; [alien annual, of disturbed, weedy sites] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. thaliana

Arabidopsis lyrata (Linnaeus) O’Kane \& Al-Shehbaz ssp. Iyrata, Lyreleaf Rockcress, Dwarf Rockcress. Mt (GA, NC, VA), Pd, Cp (NC, VA): rock crevices in or thin soil around calcareous or mafic rock outcrops; uncommon, rare in NC (GA Special Concern, NC Watch List). March-June; April-September. The species is widespread in n. North America and e. Asia, south in e. North America to NC, e. TN, and n. GA; ssp. lyrata is strictly North American. The GA record is an old and indefinite collection ("northern Georgia") by Vasey. [= X; < Arabis lyrata Linnaeus -- RAB, C, F, G, K, S, W, X, infraspecific taxa not distinguished; = A. lyrata var. lyrata - Y, Z]

* Arabidopsis thaliana (Linnaeus) Heynhold, Mouse-ear Cress. Cp, Pd, Mt (GA, NC, SC, VA): disturbed areas, fields, roadsides, lawns; common, introduced from Eurasia. March-May. Arabidopsis thaliana has sometimes been referred to as the white mouse of the vascular plant world, having been very extensively used as an experimental plant; a journal, the Arabidopsis Information Service, publishes annual bibliographies of studies using this plant. [= RAB, C, F, G, K, S, W, X, Y, Z]

Arabis Linnaeus 1753 (Rockcress)
(see also Arabidopsis, Boechera, Turritis)
The circumscription of Arabis is in flux; there is increasing evidence that the broad circumscription employed in most North American floras includes discordant elements. Based on molecular phylogenetic studies and morphology, Arabis in our area should be divided into 4 genera, as follows: Arabidopsis (A. lyrata); Arabis sensu stricto $(\mathrm{n}=8)(A$. hirsuta var. adpressipilis, $A$. hirsuta var. pycnocarpa, A. georgiana); Boechera Löve \& Löve ( $\mathrm{n}=7$ ) (A. canadensis, A. drummondii, A. laevigata var. burkii, A laevigata var. laevigata, A. missouriensis, A. patens, A. perstellata var. ampla, A. serotina, A. shortii); and Turritis (A. glabra var. glabra). References: Hopkins (1937)=Z; Rollins (1993)=Y; Wieboldt (1987); Al-Shehbaz (1988a)=X; Koch, Bishop, \& Mitchell-Olds (1999); Koch \& AI-Shehbaz (2002).

1 Plants matted from a branching caudex, perennial; [cultivated and rarely persistent or escaped]
[A. caucasica]
1 Plants unbranched, biennial; [native to our area].
2 Petals 6-9 mm long; siliques (4.5-) 5-7 cm long; [endemic to w. GA and AL] . . . . . . . .................. . A. georgiana
2 Petals $3-5 \mathrm{~mm}$ long; siliques $3-6 \mathrm{~cm}$ long; [collectively known from NC, TN, VA, and northwards and westwards from those states].
3 Stem pubescence primarily appressed and of 2-armed or dolabriform hairs . . . . . . . . A. hirsuta var. adpressipilis
3 Stem pubescence primarily spreading and of simple hairs .................... [A. hirsuta var. pycnocarpa]
Arabis georgiana Harper, Georgia Rockcress. Mt, Pd, Cp (GA): nutrient-rich streambanks and rock outcrops; rare (US Candidate, GA Threatened). April-May; May-early July. Endemic to $n$. and sw. GA and c. AL. It differs from our other species by the following combination of characters: fruits $5-7 \mathrm{~cm}$ long, borne appressed to ascending, leaves with bifurcate, trifurcate, or stellate hairs. See Patrick, Allison, \& Krakow (1995). [= K, Y, Z]

Arabis hirsuta (Linnaeus) Scopoli var. adpressipilis (M. Hopkins) Rollins, Slender Rockcress, Hairy Rockcress. Pd (NC), Mt (NC, VA): thin soils near outcrops of mafic or other rock weathering to nutrient-rich soils; rare (NC Rare, VA Rare). April-May; May-June. The species is circumboreal, with four varieties in North America. Var. adpressipilis ranges from OH to IL, south to AR, c. TN, and LA; disjunct east of the mountains in NC. Two additional varieties are more western: var. glabrata Torrey \& A. Gray, primarily of the Rocky Mountains, and var. eschscholtziana (Andrz.) Rollins of Alaska. [= C, F, G, X, Y; < A. hirsuta var. pycnocarpa (M. Hopkins) Rollins - K, in part only; A. ovata Michaux -- S, misapplied; = A. pycnocarpa M. Hopkins var. adpressipilis M. Hopkins -- Z]

* Arabis caucasica Willdenow, Gray Rockcress. Introduced in KY and TN (Kartesz 1999). [= K, Y; A. alpina (Linnaeus) var. albida (Stev.) Paoletti]

Arabis hirsuta (Linnaeus) Scopoli var. pycnocarpa (M. Hopkins) Rollins. Québec west to AK, south to e. and sw. PA (Rhoads \& Klein 1993), AR, and AZ, primarily west of the Blue Ridge. Reports of this taxon from GA (Fernald 1950, Kartesz 1999, Hopkins 1937) are based on material collected by A.W. Chapman near Rome, and later described as Arabis georgiana. (See discussion under A. hirsuta var. adpressipilis). [= C, F, G, X, Y; < A. hirsuta (Linnaeus) Scopoli var. pycnocarpa - K, in part only (also see var. adpressipilis); = A. pycnocarpa M. Hopkins var. typica - Z]

# Armoracia Gaertner, Meyer, \& Scherbius 1800 (Horseradish, Lake Cress) <br> (see also Neobeckia) 

A genus of 3 species, perennial herbs, of Eurasia. References: Al-Shehbaz \& Bates (1987)=Z; Rollins (1993)=Y; AI-Shehbaz (1988a) $=X$.

1 Plant aquatic; stem submersed or prostrate; fruit unilocular ..................................... [see Neobeckia aquatica]
1 Plant terrestrial; stem erect; fruit bilocular . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. rusticana

* Armoracia rusticana P. Gaertner, Meyer, \& Scherbius, Horseradish. Mt (NC): persistent after cultivation; rare, native of Europe. May-July. The root is grated to provide the condiment. [= RAB, C, G, K, X, Y, Z; A. lapathifolia Gilibert -- F; A. armoracia (Linnaeus) Britton -- S]

## Barbarea R. Brown 1812 (Winter-cress, Creasy Greens)

A genus of about 20 species, biennial and perennial herbs, semicosmopolitan. References: Al-Shehbaz (1988a)=Y; Rollins (1993) $=Z$.

1 Basal leaves with 4-10 pairs of lateral lobes; siliques 4.5-7 cm long; pedicels $1.2-1.8 \mathrm{~mm}$ thick
B. verna

1 Basal leaves with 1-4 pairs of lateral lobes; siliques $1.5-3 \mathrm{~cm}$ long; pedicels $0.5-1.0 \mathrm{~mm}$ thick B. vulgaris

* Barbarea verna (P. Miller) Ascherson, Early Winter-cress. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): fields, disturbed areas; common, introduced from Eurasia. March-June. Formerly a commonly used winter and spring green in rural parts of our area. [= RAB, C, F, G, K, W, Y, Z; Campe verna (P. Miller) Heller -- S]
* Barbarea vulgaris R. Brown, Common Winter-cress, Yellow Rocket. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): fields, disturbed areas; common, introduced from Eurasia. April-June. Additional study is needed of the various infraspecific or specific taxa recognized by some authors (particularly Europeans) in what is here considered a variable species; see Stace (1997), for instance. [= RAB, C, F, G, K, W, Y, Z; B. vulgaris var. arcuata (Opiz ex J. \& K. Presl) Fries -- RAB, F, G; Campe barbarea (Linnaeus) W. Wight ex Piper -- S; Campe stricta (Andrzejowski) W. Wight ex Piper -- S; B. vulgaris var. sylvestris Fries]

Berteroa Augustin de Candolle 1821 (Hoary Alyssum)
A genus of about 5 species, annual or perennial herbs, of Europe and the Middle East. References: Rollins (1993)=Z; Al-Shehbaz (1987) $=\mathrm{Y}$.

* Berteroa incana (Linnaeus) Augustin de Candolle, Hoary Alyssum. Pd, Mt (VA): disturbed areas; uncommon, introduced from Europe. [= C, F, G, K, Y, Z]

## Boechera Löve \& Löve 1975 (Rockcress)

Most of our native eastern North American "Arabis" are now in Boechera. References: References: Hopkins (1937)=Z; Rollins (1993)=Y; Wieboldt (1987); Al-Shehbaz (1988a)=X; AI-Shehbaz (2003)=Q; Koch, Bishop, \& Mitchell-Olds (1999); Koch \& AIShehbaz (2002).

8 Mature fruits flat, $1.5-10 \mathrm{~cm}$ long; basal leaves $2-8 \mathrm{~cm}$ long, nearly glabrous; cauline leaves $1-4 \mathrm{~cm}$ long; pubescence of the stem mostly of appressed, forked hairs.
9 Mature fruits 4-10 cm long, 1.5-2.5 mm wide, with 2 rows of seeds in each locule . . . . . . . . . [B. stricta]
$9 \quad$ Mature fruits $1.5-7 \mathrm{~cm}$ long, $0.7-1.1 \mathrm{~mm}$ wide, with 1 row of seeds in each locule [see Arabis]
7 Fruits ascending to spreading (not erect and appressed to the stem), the fruiting inflorescence more than 4 cm in diameter.
10 Cauline leaves not at all auricled or sagittate-clasping at the base.
11 Calyx 2.9-4.8 mm long; plant flowering April-May; plant unbranched or with 1-3 branches (sometimes more if the main stem damaged), the inflorescence thus a raceme or slightly paniculate; mature fruits $5.2-9.8 \mathrm{~cm}$ long; seeds with wing $0.2-0.5 \mathrm{~mm}$ wide
B. laevigata var. 1

11 Calyx 2.0-3.3 mm long; plant flowering mid-July-September; plant with numerous branches (welldeveloped plants usually with at least 10), the inflorescence thus a diffuse panicle; mature fruits $4.3-8.0 \mathrm{~cm}$ long; seeds with wing 0.1-0.2 mm wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . B. sp. 1
10 Cauline leaves auricled or sagittate-clasping at the base.
12 Mature fruits 2.5-4.5 cm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . B. patens
12 Mature fruits $5-10 \mathrm{~cm}$ long.
13 Basal leaves subentire to serrate or sinuate-serrate; petals white, to 5 mm long, equalling or slightly surpassing the sepals; longest cauline leaves usually 8-18 cm long; plant glaucous
B. laevigata var. laevigata

13 Basal leaves sharply serrate-dentate to strongly laciniate or lyrate-pinnatifid; petals creamy-white, to 8 mm long, about $2 \times$ the length of the sepals; longest cauline leaves usually 3-5 cm long; plant green or red-tinged
B. missouriensis

Boechera canadensis (Linnaeus) Al-Shehbaz, Sicklepod, Canada Rockcress. Mt, Pd (GA, NC, SC, VA), Cp (GA, VA): thin soils around rock outcrops, especially mafic or calcareous, and in dry to mesic, nutrient-rich, often rocky woodlands over mafic or calcareous rocks; uncommon (rare in Coastal Plain). May-July; June-August. Québec and ND south to FL and TX. [= Q; = Arabis canadensis Linnaeus - RAB, C, F, G, K, S, W, X, Y, Z]

Boechera laevigata (Muhlenberg ex Willdenow) AI-Shehbaz var. 1 Porter, Burk's Smooth Rockcress. Mt (NC, VA): limestone barrens, shale barrens, and other dry, rocky habitats; rare (NC Watch List). April-May. E. and c. PA south to e. WV, ne. TN, and w. NC in the sedimentary rock Appalachians. RAB assigns this variety to NC based on somewhat aberrant specimens from high elevation cove forests; these are better assigned to A. laevigata var. laevigata. Z, however cites a specimen from Hot Springs, Madison County, NC, an area with plausible habitats (dry sedimentary rock woodlands, shale barrens). [= Arabis laevigata (Muhlenberg ex Willdenow) Poiret var. burkii Porter -- C, K, W, X, Y; < A. laevigata var. burkii -- F, G, Z, in part (also see A. serotina); A. burkii (Porter) Small -- S, misapplied in part; < Boechera laevigata - Q, infraspecific taxa not distinguished]

Boechera laevigata (Muhlenberg ex Willdenow) AI-Shehbaz var. laevigata, Common Smooth Rockcress. Mt, Pd (GA, NC, SC, VA), Cp (VA): rocky woodlands and forests, rock outcrops, especially mafic or calcareous, but also on more acidic substrates, rarely also in bottomlands; common (uncommon in VA Coastal Plain). April-May; May-June. ME west to MN and SD, south to GA, AL, MS, AR, OK, and CO. Of our Arabis, A. laevigata var. laevigata is the most common, being the least limited to calcareous substrates. [= Arabis laevigata (Muhlenberg ex Willdenow) Poiret var. laevigata - RAB, C, F, G, K, W, X, Y, Z; A. laevigata var. burkii -- RAB, misapplied; A. burkii (Porter) Small -- S, misapplied in part; A. laevigata -- S ; < Boechera laevigata - Q , infraspecific taxa not distinguished]

Boechera missouriensis (Greene) Al-Shehbaz, Missouri Rockcress. Pd (GA, NC, SC): thin soil around outcrops of metamudstone, diabase, or granite; rare (GA Special Concern, NC Rare, SC Rare). April-May; May-June. ME to WI, south to KY, AR, and OK; disjunct eastwards in NC, SC, and GA. [= Q; = Arabis missouriensis Greene -- C, K, X, Y; = A. laevigata var. missouriensis -- RAB; A. missouriensis var. missouriensis -- F; A. viridis Harger var. viridis -- G, Z]

Boechera patens (Sullivant) AI-Shehbaz, Spreading Rockcress. Mt (GA, NC, VA), Pd (VA): thin soils around calcareous or dolomitic outcrops, very rarely in nutrient-rich seepage from mafic rocks; rare (GA Special Concern, NC Rare, VA Rare). May-June; June-August. Irregularly distributed, primarily in the sedimentary rock Appalachians, from se. PA, c. PA, and IN south to NC, e. TN, and AL. In NC, this species occurs over marble at Blowing Spring, Nantahala River Gorge, Swain County, at various sites over calcareous sedimentary rocks in the Hot Springs Window, near Hot Springs, Madison County, and in nutrient-rich seepage from amphibolite at Chimney Rock, Rutherford County. [= Q; = Arabis patens Sullivant -- RAB, C, F, G, K, S, W, X, Y, Z]

Boechera shortii (Fernald) Al-Shehbaz. Pd (VA): nutrient-rich alluvial and river bluff forests (along the Potomac River in our area); rare (VA Rare). April-May. NY west to MN, south to n. VA, nc. TN (Chester, Wofford, \& Kral 1997), and AR. [= Q; = Arabis shortii (Fernald) Gleason -- C, G, K, X, Y; = A. perstellata E.L. Braun var. shortii Fernald -- F; = A. dentata (Torrey) Torrey \& A. Gray -- S, Z (name preoccupied); > A. shortii var. phalacrocarpa (M. Hopkins) Steyermark]

Boechera sp. 1, Shale Barren Rockcress. Mt (VA): shale barrens; rare (US Endangered, VA Threatened). Mid-JulySeptember. Endemic to Devonian and Ordovician shales of w. VA and e. WV. Wieboldt (1987) has clarified the taxonomy of this species and A. laevigata var. burkii. Also see Porter \& Wieboldt (1991) for further discussion. [= Arabis serotina Steele -- C, K, X, Y ; included within concept of $A$. laevigata var. burkii by Z and most earlier floras]

Boechera perstellata (E.L. Braun) Al-Shehbaz is apparently endemic to KY and c. TN (Chester, Wofford, \& Kral 1997). [= Q; = Arabis perstellata -- K, Y; > Arabis perstellata E.L. Braun var. perstellata - X; > Arabis perstellata E.L. Braun var. ampla Rollins - X]

Boechera stricta (Graham) AI-Shehbaz. Labrador and AK south to NJ, DE, OH, IL, NM, AZ, and CA. [= Q; = Arabis drummondii A. Gray -- C, F, G, K, Y; > A. drummondii A. Gray var. typica - Z; = Boechera drummondii (A. Gray) Löve \& Löve, illegitimate name]

Brassica Linnaeus 1753 (Mustard, Turnip, Rape, Cabbage, Collard Greens, Kale, Broccoli, Cauliflower, Kohlrabi, Rutabaga, Bok-Choy, Chinese Cabbage, Brussels Sprouts)
(also see Erucastrum, Sinapis)
A genus of about 40 species, herbs, of the Old World. References: Rollins (1993)=Z; Al-Shehbaz (1985b)=Y. Key adapted from Z.

1 Upper cauline leaves auriculate, slightly to strongly clasping the stem[ [section Rapa].
2 Petals 10-18 mm long, dark yellow; beak of the silique usually $7-10 \mathrm{~mm}$ long; plant usually glaucous; siliques $5-10 \mathrm{~cm}$ long
2 Petals 6-10 (-11) mm long, pale yellow; beaks of the silique usually 10-15 mm long; plant usually green; siliques 3-7 cm

1 Upper cauline leaves petiolate, or sessile and cuneate.
3 Pedicels and siliques widely spreading to divaricately ascending; siliques 2-4 cm long, terete or nearly so; [section Rapa]
 Melanosinapis]

Br.juncea

* Brassica juncea (Linnaeus) Czern., Leaf Mustard, Brown Mustard, Indian Mustard, Mustard Greens, Chinese Mustard. Cp (GA, SC, VA), Mt (NC, SC, VA), Pd (SC, VA): fields, disturbed areas; uncommon, introduced from Eurasia. April-June. This species is apparently a recently derived polyploid of $B$. nigra and $B$. rapa. The seeds of this species are one source of table mustard; other components include B. nigra and Sinapis alba. [= RAB, C, G, K, W, S, Y, Z; B. japonica Thunberg -- S]
* Brassica napus Linnaeus, Rutabaga, Rape, Canola, Colza, Swede. Mt, Pd (GA, NC, SC, VA?), Cp (SC): fields, disturbed areas; rare, introduced from Eurasia. May-July. This species is apparently a recently derived polyploid of $B$. oleracea and $B$. rapa. The seeds of this species are the source of "canola" oil, the name recently coined by marketers from "Canadian" and "oil" to avoid the negative connotation of "rape." [=K, W, Y, Z; B. napus -- RAB, in part only (also see B. rapa)]
* Brassica nigra (Linnaeus) W.D.J. Koch, Black Mustard, Charlock. Cp, Pd, Mt (VA) \{NC\}: fields, disturbed areas; uncommon, introduced from Eurasia. May-August. The seeds of this species are one source of table mustard; other components include $B$. juncea and Sinapis alba. [= C, F, G, K, S, Y, Z; Sinapis nigra Linnaeus]
* Brassica rapa Linnaeus var. rapa, Turnip, Bird's-rape, Field Rape, Field Mustard, Bok-choy, Chinese Cabbage. Mt (GA, NC, SC, VA), Pd (NC, VA), Cp (NC, SC, VA): fields, disturbed areas; common, introduced from Europe. March-June. B. rapa is cultivated in a variety of forms, B. rapa var. chinensis (Linnaeus) Kitam. (Bok-choy or Pak-choi) and B. rapa var. amplexicaulis Tanaka \& Ono (Chinese Cabbage). [= K; B. rapa -- C, G, Y, Z, infraspecific taxa not distinguished; B. napus -- RAB, in part; B. campestris Linnaeus -- G, S]
* Brassica oleracea Linnaeus is commonly cultivated in our area in a variety of forms, including B. oleracea var. acephala Augustin de Candolle (Collard Greens, Kale), B. oleracea var. capitata Linnaeus (Cabbage), B. oleracea var. italica Plenck (Broccoli), B. oleracea var. botrytis Linnaeus (Cauliflower), B. oleracea var. gemmifera Zenk (Brussels Sprouts), and B. oleracea var. gongylodes Linnaeus (Kohlrabi). [= K] \{not keyed\}

## Braya Sternberg \& Hoppe 1815

A genus of about 6 species, perennial herbs, of alpine and arctic Eurasia and North America. References: Rollins (1993) $=$.
*? Braya humilis (C. A. Meyer) B.L. Robinson. (VA): rare, perhaps introduced. Ranging from boreal e. Asia and North America south to VT, MI, CO, and (probably as an introduction) VA. [= C, K, Z; B. humilis var. leiocarpa (Trautvetter) Fernald -- F, G]

Bunias Linnaeus 1753 (Warty-cabbage)

A genus of 3 species, herbs, of Eurasia. References: Rollins (1993)=Z.

1 Plant an annual; cauline leaves less than 5 cm long; siliques $10-12 \mathrm{~mm}$ long, more-or-less straight, 4 -winged, spiny; seeds $3-4$ per silique
B. erucago

1 Plant a perennial; cauline leaves more than 10 cm long; siliques $5-10 \mathrm{~mm}$ long, usually curved, not winged, verrucose; seeds 1
$\qquad$

* Bunias erucago Linnaeus, Southern Warty-cabbage. Cp? (VA): disturbed areas; rare, introduced from Europe. April-June. [ $=\mathrm{C}, \mathrm{K}, \mathrm{Z}$ ]
* Bunias orientalis Linnaeus, Warty-cabbage. Pd (VA): disturbed areas; rare, introduced from Europe. June-July. [= C, F, G, K, Z]

## Cakile P. Miller 1754 (Sea Rocket)

A genus of about 7-8 species, annual herbs, primarily of coastal North America, Europe, and North Africa. References: Rollins (1993) $=$ Z; Rodman (1974) $=$ Y; Al-Shehbaz (1985b) $=$ X.

Identification notes: The siliques of Cakile are divided near their middle by an abscission zone into two halves, each with a single seed: the upper abscises and disperses by water or wind, the lower remains attached to the parent plant. The size of the two
segments and the contour of the abscised surface remaining on the lower segment are important taxonomic characters.
1 Lower silique segment with 2 opposite lateral horns or wings on the sides prolonged upward into sharp triangular wedges, concave in between; petals lavender (rarely white), 8-14 mm long, 3-6 mm wide; most of the leaves deeply pinnatifid into 6-9 lobes . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. maritima ssp. maritima
1 Lower silique segment without lateral horns, triangular wedges absent to 1.5 mm high; petals white (rarely lavender), 4-10 mm long, $1.4-3 \mathrm{~mm}$ wide; most of the leaves with a few to many irregular teeth (or pinnatifid in C. lanceolata ssp. pseudoconstricta). 2 Infructescences usually $>20 \mathrm{~cm}$ long; [of the Gulf Coast]
[C. Ianceolata ssp. pseudoconstricta] 2 Infructescences 10-20 cm long; [collectively widespread].

3 Siliques $3-4 \mathrm{~mm}$ wide, the beak conical and acute at the apex; [of the Gulf Coast] ................ [C. constricta]
3 Siliques $5-9 \mathrm{~mm}$ wide, the beak somewhat flattened and typically rather blunt; [of the Atlantic Coast].
4 Upper fruit segment $7-15 \mathrm{~mm}$ long, 4 -angled (to weakly 8 -ribbed); articulating surface of lower fruit segment flat to concave and with $2(-6)$ small teeth projecting upward or the sides prolonged upwards into 2 opposite triangular wedges; [of NC northwards to Labrador]
C. edentula

4 Upper fruit segment 12-20 mm long, 8-ribbed; articulating surface of lower fruit segment flat (to slightly convex or concave) and without teeth; [of NC southwards to St. Lucie County, FL]
C. harperi

Cakile edentula (Bigelow) Hooker, Northeastern Sea Rocket. Cp (NC, VA): beaches, at or near the wrack line; common. May-June (-October). Labrador south to NC; introduced in various other shores around the world, including w. North America and Australia. See C. harperi for discussion of the relation between these taxa. [=RAB, S; = C. edentula var. edentula -- C, F, G; C. edentula ssp. edentula $-\mathrm{GW} ;=$ C. edentula ssp. edentula var. edentula $-\mathrm{K}, \mathrm{X}, \mathrm{Y}, \mathrm{Z}]$

Cakile harperi Small, Southeastern Sea Rocket. Cp (GA, NC, SC): beaches, at or near the wrack line; common. May-June (October). A Southeastern Coastal Plain endemic: e. NC south to the east coast of peninsular FL. Rodman (1974) and most authors since have treated C. harperi as C. edentula ssp. harperi (Small) Rodman. Rodman further treats the Great Lakes and ne. United States coastal populations (respectively) as C. edentula ssp. edentula var. lacustris Fernald and C. edentula ssp. edentula var. edentula. Rodman points out the morphologic distinctions between the three taxa, the chemical differences between "edentula" and "harperi," and the rarity or absence of intermediates in areas of pairwise overlap between the 3 entities. The geographic / morphologic pattern is not clinal, but is rather a sharp step function, with an overlap in the distribution of (and rare hybridization between) two largely distinct taxa. The few intermediates can be interpreted as hybrids or very limited and local introgression between otherwise distinct (though related) taxa. C. harperi shows greater chemical similarity to C. constricta Rodman and C. lanceolata (Willdenow) O.E. Schultz than to C. edentula, and also shows some morphologic affinities with these more southern taxa. For these reasons I prefer the simplicity of treating the three taxa as binomial species. [= RAB, $\mathrm{S} ;=\mathrm{C}$. edentula (Bigelow) Hooker ssp. harperi (Small) Rodman -- GW, K, X, Y, Z]

* Cakile maritima Scopoli ssp. maritima, European Sea Rocket. Cp (NC, VA): beaches, at or near the wrack line; uncommon, introduced from Europe. The other subspecies are also European but are apparently not introduced in our area. The NC location was on ballast at Wilmington, and is apparently not persistent. VA locations are, however, well-established. [=X, Y; <C. maritima -C, F, G, K, Z; = C. cakile (Linnaeus) Karstens - S]

Cakile constricta Rodman, Gulf Coast Sea Rocket. Beaches, coastal sands. February-October. FL, AL, MS, LA, TX. [= GW, $\mathrm{K}, \mathrm{X}, \mathrm{Y}, \mathrm{Z}]$

Cakile lanceolata (Willdenow) O.E. Schulz ssp. pseudoconstricta Rodman. Beaches, coastal sands. January-December. FL, AL, LA, TX, Tamaulipas. [= K, X, Y, Z; < C. lanceolata - GW, S]

## Calepina Adanson 1763

A monotypic genus, an annual herb, of c. and sw. Asia. References: Rollins (1993)=Z; Al-Shehbaz (1985b)=Y.

* Calepina irregularis (Asso) Thellung. Mt (NC), Pd, Cp (VA): fields, disturbed areas; rare, introduced from Eurasia. April. [= RAB, C, K, Y, Z]

## Camelina Crantz 1762 (Gold-of-pleasure, False-flax)

A genus of 6-7 species, herbs, of se. Europe and the Middle East. References: Rollins (1993)=Z; Al-Shehbaz (1987)=Y.
1 Siliques 4-7 mm long; leaves and stem rough-hairy, the stellate trichomes exceeded by simple trichomes (which are 1-2 mm long) . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. microcarpa
1 Siliques 7-12 mm long; leaves and stem glabrate to sparsely hairy, the stellate trichomes as long as the few simple trichomes
C. sativa

* Camelina microcarpa Andrzejowski ex Augustin de Candolle, Lesser Gold-of-pleasure. Pd (GA, NC, VA), Mt (NC, VA), Cp
(NC, SC, VA): fields, disturbed areas; uncommon, introduced from Eurasia. April-May. [= RAB, C, F, G, K, S, W, Y, Z]
* Camelina sativa (Linnaeus) Crantz, Gold-of-pleasure, False-flax. Pd (NC, VA): fields, disturbed areas; rare, introduced from Eurasia. April-May. [= RAB, C, F, G, S, Y, Z; > C. sativa ssp. sativa -- K]

Capsella Medikus 1792 (Shepherd's Purse)

A monotypic genus, an annual or biennial herb, of Europe. References: Rollins (1993)=Z; Al-Shehbaz (1986)=Y.

* Capsella bursa-pastoris (Linnaeus) Medikus, Common Shepherd's Purse. Cp, Pd, Mt (GA, NC, SC, VA): fields, roadsides, disturbed areas; common, introduced from Europe. March-June. C. rubella Reuter, Pink Shepherd's Purse, is sometimes distinguished (as by F, G, Stace 1997), and occurs in our area. It is alleged to be diploid (vs. tetraploid), to have pink petals 1-2 mm long (vs. white, 2-3 mm long), and lateral margins of the fruit concave (vs. straight to convex). Al-Shehbaz (1986) considered the character correlations to be poor, not warranting taxonomic recognition. [=RAB, C, F, G, K, W, Y, Z; > C. bursa-pastoris - F, G, in a narrower sense; > C. rubella Reuter -- F, G; > C. gracilis Gren. -- F; = Bursa bursa-pastoris (Linnaeus) Britton -- S]

## Cardamine Linnaeus 1753 (Bittercress, Toothwort)

A genus of about 200 species, herbs, cosmopolitan. Dentaria should apparently be included (Sweeney \& Price 2000). References: Rollins (1993)=Z; Sweeney \& Price (2001)=Y; Al-Shehbaz (1988a)=X; Sweeney \& Price (2000); Franzke et al. (1998). Key based in part on Turrill, Evans, \& Gilliam (1994) and Y.

1 Leaves palmately divided (if 1-ternate, then palmately so, the terminal leaflets on a petiolule the same length as the those of the lateral leaflets); [Dentaria].
2 Plants entirely glabrous; leaflets highly dissected with linear to filiform segments; [in our area known from Piedmont of NC and VA]
C. dissecta

2 Plants with marginal leaf trichomes and often also pubescence on the stem, inflorescence, and petioles; leaflets entire, toothed, or deeply lobed; [collectively widespread in our area].
3 Rhizome toothed, not fragile, and rarely breaking into irregular segments.
4 Trichomes of leaf margins appressed and ca. 0.1 mm long; cauline leaves usually 2 ............ C. diphylla
4 Trichomes of leaf margins erect and 0.2-0.3 mm long; cauline leaves usually $3 \ldots . . \ldots$. . . . . . . [C. maxima]
3 Rhizome toothless or only obscurely toothed, fragile and readily breaking into narrowly fusiform, oblong, or linear segments.
5 Trichomes of the leaf margin appressed and ca. 0.1 mm long; lateral leaflets of the cauline leaves typically not lobed, or shallowly and irregularly lobed . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. angustata
5 Trichomes of the leaf margin erect and ca. 0.2-0.3 mm long; lateral leaflets of the cauline leaves frequently deeply 2-lobed . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. concatenata
1 Leaves simple, pinnately lobed, or pinnately divided (if 1-ternate, then pinnately so, the terminal leaflet on a longer petiolule than those of the lateral leaflets); [Cardamine].
6 Cauline leaves simple, sometimes the lower to middle cauline leaves with 1-2 pairs of very small lateral lobes.
7 Plant from a tuberous or bulbous base, erect and generally unbranched, not stoloniferous or rooting down from upper nodes after flowering; petals $7-20 \mathrm{~mm}$ long.
8 Stem cinereous-pubescent; corolla pink to lavender, rarely white; stem leaves 2-5; silique 1-2 cm long, plus a 2-4 mm beak
C. douglassii

8 Stem glabrous; corolla white, rarely pink; stem leaves 4-12; silique 1.5-3 cm long, plus a 3-7 mm beak
C. bulbosa

7 Plant from a fibrous root system, frequently much branched from the base, some of the branches becoming stoloniferous and rooting down at the upper nodes after flowering; petals 2-10 mm long or absent.
9 Petals absent or present, if present 0.7-2 mm long; silique 5-10 (-15) mm long, plus a 0.5-1.0 mm beak, on thick pedicels 1-3 (-6) mm long
C. longii

9 Petals present, 2-10 mm long; silique $8-21 \mathrm{~mm}$ long, plus a $1-3 \mathrm{~mm}$ beak, on slender pedicels $10-20 \mathrm{~mm}$ long.
10 Petals $5-10 \mathrm{~mm}$ long, the tips spreading or ascending; anthers oblong, about 1 mm long; stylar beak of the silique $2-3 \mathrm{~mm}$; mid-cauline and upper cauline leaves cordate, often clasping around the stem or branch; basal leaves with 0-1 pairs of lateral leaflets
C. rotundifolia

10 Petals $3-5 \mathrm{~mm}$ long, the tips ascending or erect; anthers orbicular, ca. 0.3 mm across; stylar beak of the silique $1-1.5 \mathrm{~mm}$; mid-cauline and upper cauline leaves cuneate, rounded, or truncate (rarely the midcauline leaves subcordate, but not clasping); basal leaves with 1-3 pairs of lateral leaflets C. micranthera
6 Cauline leaves 1-ternate or pinnatifid (if 1-ternate, the lateral leaflets about as large as the terminal leaflet).
11 Cauline leaves with 3-5 leaflets; petals $4-10 \mathrm{~mm}$ long; plant a perennial.
12 Stem glabrous at base; lower leaves green underneath; petioles auriculate at the base, the auricles 1-5 mm long, acute to acuminate; leaves 3 ( -5 )-foliolate; siliques $22-40 \mathrm{~mm}$ long . . . . . . . . . . . . . . . . . . C. clematitis
12 Stem pubescent at base; lower leaves purple underneath; petioles not auriculate at the base; leaves 3-5foliolate; siliques $10-25 \mathrm{~mm}$ long.
13 Petals 6-9 mm long; stamens shorter than the petals by 1 mm or more; sepals $3-4 \mathrm{~mm}$ long; filaments obviously flattened . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. flagellifera var. flagellifera
13 Petals 4-6 mm long; stamens equaling to slightly exceeding the petals; sepals 2.5-3.5 mm long; filaments terete to somewhat flattened . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. flagellifera var. hugeri
11 Cauline leaves with 7 -numerous leaflets; petals 1-4 mm long or absent (8-15 mm long in $C$. pratensis var. palustris); plant an annual, biennial, or perennial.
14 Petals $8-15 \mathrm{~mm}$ long C. pratensis var. palustris

14 Petals $1-4 \mathrm{~mm}$ long or absent.
15 Cauline leaves with prolonged sagittate-auriculate bases, the 13-19 leaflets acuminate .... C. impatiens
15 Cauline leaves without basal auricles, the 5-15 (-17) leaflets mostly obtuse.

Plant with many, persistent basal leaves forming a rosette; stem bases and petioles hirsute
C. hirsuta

16 Plant with few or no basal leaves, not forming a rosette; stem bases and petioles glabrous (or sparsely hirsute).
17 Siliques <1 mm wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. debilis
17 Siliques $>1 \mathrm{~mm}$ wide.
18 Cauline leaves 2-4 cm long; terminal leaflet similar to the lateral leaflets in size and shape; leaflets neither decurrent along the rachis nor petiolulate; stem glabrous throughout
C. parviflora var. arenicola

18 Cauline leaves 4-10 cm long; terminal leaflet broader than the lateral leaflets; leaflets either decurrent along the rachis or petiolulate; stem pubescent at base.
19 Leaflets petiolulate; stems flexuous; [alien weed] . . . . . . . . . . . . . . . . . . C. flexuosa
19 Leaflets decurrent on the rachis; stems typically erect; [native] .... C. pensylvanica
Cardamine angustata O.E. Schulz, Eastern Slender Toothwort. Pd, Mt (GA, NC, SC, VA), Cp (NC, SC, VA): rich, mesic forests; common (rare in VA Mountains and VA Coastal Plain). March-April; April-May. NJ and IN south to n. GA, c. TN, and ne. MS; disjunct in the Ouachita Mountains of AR. Var. ouachitana E.B. Smith, alleged to differ from var. angustata in its non-ciliate leaves (vs. leaves with margins ciliate with antrorse trichomes 0.1 mm long), is apparently not a valid taxon. [= C, K, X, Y, Z; = C. angustata var. angustata -- RAB; = Dentaria heterophylla Nuttall -- F, G, S, W]

Cardamine bulbosa (Schreber ex Muhlenberg) Britton, Sterns, \& Poggenburg, Bulbous Bittercress. Cp, Pd, Mt (GA, NC, SC, VA): swampy forests and bogs, primarily (but not strictly) in circumneutral soils over limestone or mafic rocks; uncommon. MarchMay; April-May. Widespread in e. North America. There has been recent disagreement over the correct nomenclature of this species (Kartesz \& Gandhi 1992). [= RAB, F, G, GW, K, S, W, Z; = C. rhomboidea (Persoon) Augustin de Candolle -- C, X]

Cardamine clematitis Shuttleworth ex A. Gray, Mountain Bittercress. Mt (NC, VA): shaded brookbanks, rock outcrops with seepage, at high elevations ( 1200 m and above); rare (US Species of Concern, NC Rare, VA Rare). April-May; June-July. Endemic to the high elevation Southern Appalachians of w. NC, e. TN, and sw. VA. [= C, K, S, W, X, Z; << C. clematitis Shuttleworth ex Gray -- RAB, F, G, GW (see also C. flagellifera)]

Cardamine concatenata (Michaux) O. Schwarz, Cutleaf Toothwort. Mt, Pd, Cp (GA, NC, SC, VA): rich, mesic forests; common (uncommon in VA Coastal Plain). March-May; April-May. Widespread in e. North America. [= RAB, C, K, X, Y, Z; Dentaria laciniata Muhlenberg ex Willdenow -- G, GW, S, W; Dentaria laciniata var. laciniata - F; D. laciniata var. coalescens Fernald - F]

```
Cardamine debilis D. Don. Cp (GA): disturbed areas; rare, introduced from Europe. This species is similar to C.
``` pensylvanica and C. flexuosa and may be overlooked (Rollins 1993, Brown \& Marcus 1998). It is reported for e. GA (Jones \& Coile 1988). [= K, Z]

Cardamine diphylla (Michaux) A. Wood, Crinkleroot, Toothwort. Mt (GA, NC, VA), Pd (NC): rich, mesic forests; common. April-May; May-June. Widespread in e. North America, south to n. GA and SC. [= RAB, C, K, X, Y, Z; = Dentaria diphylla Michaux -- F, G, S, W; = Dentaria incisa Small -- S]

Cardamine dissecta (Leavenworth) Al-Shehbaz, Dissected Toothwort. Pd (NC, VA), Mt (GA): rich, mesic forests; rare (GA Special Concern, NC Rare). March-April; April-May. AI-Shehbaz (1988c) describes the range as separated into four areas: c. AL (3 counties); c. NC and sc. VA ( 6 counties); nw. GA, c. TN, and s. KY (18 counties); and se. IN, ne. KY, and s. OH (6 counties). He states that \(C\). dissecta is easily distinguished from its relatives "by its glabrous leaves that are divided into filiform to narrowly linear segments." See Al-Shehbaz (1988c) for additional discussion of the systematics, nomenclature, ecology, and distribution of this species. First reported for VA by Wieboldt et al. (1998). [= C, K, X, Y, Z; = Cardamine angustata var. multifida (Muhlenberg ex Elliott) Ahles -- RAB; Dentaria multifida Muhlenberg ex Elliott -- F, G, S, W; Dentaria furcata Small -- S; = Cardamine multifida (Muhlenberg ex Elliott) Wood]

Cardamine douglassii Britton, Limestone Bittercress, Douglass's Bittercress, Purple Cress, Pink Spring-cress. Pd (NC, VA), Cp (VA): nutrient-rich, mesic forests, especially alluvial bottomlands, and in nutrient-rich seepages, in NC in the drainages of the Neuse, Meherrin, and (rarely) Cape Fear rivers; uncommon, rare in NC (NC Rare, VA Watch List). March-April; April-May. Fairly widespread in ne. United States, south to NC, sc. TN, and MO. [= RAB, C, F, G, K, GW, X, Z]

Cardamine flagellifera O.E. Schulz var. flagellifera, Large-flowered Blue Ridge Bittercress. Mt (GA, NC, SC, VA), Pd (NC): in seepages, on streambanks, and in moist cove or bottomland forests, mainly at moderate to low elevations; uncommon (NC Watch List, SC Rare, VA Rare). March-May; June-July. C. flagellifera is endemic to the Southern Appalachians of w. NC, SC, e. TN, GA, VA, and WV, and is quite distinct from C. clematitis, as pointed out by Dudley (1974). Rollins's division of this species into two varieties (followins Small's recognition of two species) needs further evaluation. [ \(=\mathrm{K}, \mathrm{Z}\); < C. flagellifera -- \(\mathrm{C}, \mathrm{W}\), X; < Clematitis -RAB, GW; = C. flagellifera -- \(S\), in the narrow sense]

Cardamine flagellifera O.E. Schulz var. hugeri (Small) Rollins, Small-flowered Blue Ridge Bittercress. Mt, Pd (NC, VA?), Pd (NC): in seepages, on streambanks, and in moist cove or bottomland forests, mainly at moderate to low elevations; uncommon (NC Watch List, SC Rare, VA Rare). March-April; June-July. Endemic to the Southern Appalachians of NC and TN. [=K, Z; < C. flagellifera -- C, W, X; < C. clematitis -- RAB, GW; = C. hugeri Small -- S]
* Cardamine flexuosa Withering, Woodland Bittercress. Mt, Cp (NC, VA), Pd (VA): disturbed sites; rare, introduced from Europe. February-May. An allopolyploid, perhaps derived from C. hirsuta \(\times\) impatiens. [= RAB, \(F, K, X, Z]\)
* Cardamine hirsuta Linnaeus, Hairy Bittercress. Mt, Pd, Cp (GA, NC, SC, VA): disturbed areas, including fields and gardens; common, intoduced from Europe. February-May (or irregularly earlier in response to mild winter weather). [= RAB, C, F, G, GW, K, S, W, X, Z]
* Cardamine impatiens Linnaeus, Narrowleaf Bittercress. Pd (NC), Mt (VA): alluvial floodplains, in the New River drainage; rare, introduced from Europe. June-July. [= C, F, K, X, Z]

Cardamine longii Fernald, Long's Bittercress. Cp (NC, VA): tidal freshwater marshes and cypress-gum swamps; rare (NC Rare, VA Watch List). June-September. Coastal in distribution, irregularly from ME south to NC. Difficult to distinguish from
depauperate or submerged forms of C. pensylvanica with few leaflets; the short style (capsule beak) and short and thick pedicels appear to be the most reliable characteristics. [=C, F, K, X, Z]

Cardamine micranthera Rollins, Streambank Bittercress, Small-anthered Bittercress. Pd (NC, VA): sand and gravel bars in creeks, swampy floodplain woods, seepage over rocks; rare (US Endangered, NC Endangered, VA Rare). April-May; May-June. A narrow endemic, known only from Stokes County, NC and Patrick County, VA; apparently extirpated from Forsyth County, NC. The description and key in RAB are partly in error, being based on the inadequate and unrepresentative material available at the time. C. micranthera is most closely related to C. rotundifolia, but also shows some affinities to C. pensylvanica. It can be distinguished from C. rotundifolia by the characters in the key; additionally, C. micranthera does not form proliferative branches from the upper nodes, generally branching from the base in vigorous plants, or unbranched in smaller plants. It can be distinguished from \(C\). pensylvanica by its predominately simple leaves, especially those on the upper stem, the larger flowers, the petals \(3-5 \mathrm{~mm}\) long (vs. \(1.5-3 \mathrm{~mm}\) long), the fruiting pedicels thin, \(10-20 \mathrm{~mm}\) long, spreading to ascending (vs. thick, \(4-10 \mathrm{~mm}\) long, ascending). Wieboldt (1992) reasonably speculates that C. micranthera may be an in-breeding relative derived from C. rotundifolia in the Piedmont/Mountain interface. [= RAB, K, X, Z]

Cardamine parviflora Linnaeus var. arenicola (Britton) O.E. Schulz, Sand Bittercress. Mt, Pd, Cp (GA, NC, SC, VA): various habitats, primarily seasonally wet areas with shallow soil or sand, also on mafic outcrop glades, as on greenstone, diabase, and nutrient-rich granites; common. March-May. The typic variety is Eurasian; our variety is widespread in e. North America, also occurring in the Pacific Northwest. Our plant may warrant specific status. [= RAB, C, F, K, X, Z; C. parviflora -- G, GW, S, W, infraspecific taxa not distinguished; = C. arenicola Britton -- S]

Cardamine pensylvanica Muhlenberg ex Willdenow, Quaker Bittercress. Mt, Pd, Cp (GA, NC, SC, VA): various wet habitats, especially swampy depressions, streambanks, small woodland seeps; common. March-May. Widespread, ranging over most of North America. [= RAB, C, G, GW, K, S, W, X, Z; C. pensylvanica var. pensylvanica - F; C. pensylvanica var. brittoniana Farwell -F]

Cardamine pratensis Linnaeus var. palustris Wimmer \& Graebner, American Cuckoo-flower, Lady's-smock. Mt, Cp (VA): bogs and swamps; rare (VA Rare). April-July. Var. palustris ranges from Canada south to NJ, VA, OH, IN, MN, and British Columbia. The Eurasian var. pratensis, with pink (vs. white) flowers, is introduced in ne. North America and may occur in our area. These two varieties may not be distinguishable; Rollins combines var. palustris into var. pratensis. [= C, F, G; < C. pratensis var. pratensis -- K, Z]

Cardamine rotundifolia Michaux, American Bittercress, Mountain Watercress. Mt, Pd (GA?, NC, VA): seepages, streambanks, swampy depressions; rare (NC Rare). April-May; June-July. Characteristically, C. rotundifolia branches from the upper nodes while in flower, the branches rooting down and proliferating vegetatively. This species is a rather broad endemic of the Central Appalachians, ranging from PA and w. NY, west to OH and KY, south to the Mountains and upper Piedmont of NC. [= RAB, C, F, G, GW, K, S, W, X, Z]

Cardamine maxima (Nuttall) Wood, Large Toothwort ranges south to NJ, PA, OH, WV, and KY. [= K, Y, Z; = C. xmaxima-C; = Dentaria maxima Nuttall - F, G]

\section*{Cardaria Desvaux (Hoary Cress)} (see Lepidium)

\section*{Chorispora Augustin de Candolle 1821 (Chorispora)}

A genus of 11 species, herbs, of Central Asia and the Middle East. References: Rollins (1993)=Z; Al-Shehbaz (1988d)=Y.
* Chorispora tenella (Pallas) Augustin de Candolle, Chorispora, Blue Mustard, native of \(w\). Asia is well established in the \(w\). United States, and occurs at scattered locations eastwards, as in c. and w. TN (Chester, Wofford, \& Kral 1997) and s. PA (Rhoads \& Klein 1993). [= C, K, Y, Z]

Coincya Porta \& Rigo ex Rouy 1891 (Wallflower-cabbage, Coincya)
A genus of 6 species, of c. and s. Europe and n. Africa. References: Rollins (1993)=Z; Leadlay \& Heywood (1990)=Y; Al-Shehbaz (1985b) \(=\) X; Naczi \& Thieret (1996)=Q.
* Coincya monensis (Linnaeus) Greuter \& Burdet ssp. recurvata (Allioni) Leadlay, Wallflower-cabbage, Coincya. Mt (NC): roadsides; rare, introduced from Eurasia. May-July. Rollins (1961) discusses the occurrence of this species in w. NC. See Naczi \& Thieret (1996) for an excellent discussion of this species' occurrence in North America. [= K, Q; Brassica erucastrum - RAB, misapplied; Hutera cheiranthos (Villars) Gomez-Campo -- X; C. monensis ssp. recurvata var. recurvata -- Y, Z; Rhynchosinapis cheiranthos (Villars) Dandy; C. cheiranthos (Villars) Greuter \& Burdet]

\section*{Conringia Adanson 1763 (Hare's-ear Mustard)}

A genus of 6 species, herbs, of Europe and the Middle East. References: Rollins (1993)=Z; Al-Shehbaz (1985b)=Y.
* Conringia orientalis (Linnaeus) Andrzejowski, Hare's-ear Mustard, Treacle Mustard. Cp (NC), Pd (GA, NC, VA), Mt (VA): disturbed areas; rare, introduced from Eurasia. April-June. [= RAB, C, F, G, K, S, Y, Z]

\title{
Coronopus Zinn (Wart-cress, Swine-cress)
}
(see Lepidium)

Descurainia Webb \& Berthelot 1836 (Tansy-mustard, Flixweed)

A genus of ca. 40 species, primarily of North and South America. References: Rollins (1993)=Z, Al-Shehbaz (1988b)=Y; Detling (1939) \(=X\).

1 Silique 10-25 (-30) mm long, acute to acuminate, the seeds mostly in 1 row
D. sophia

1 Silique 5-10 (-13) mm long, obtuse or clavate, the seeds mostly in 2 rows.
2 Leaves densely gray-canescent; angle between fruiting pedicels and rachis ca. 75 degrees; pedicels glandular-
puberulent, 6-12 mm long; plants 2-5 dm tall; [primarily of the Coastal Plain] . . . . . . . . . . . . . . D. pinnata var. pinnata
2 Leaves glabrous or glabrescent; angle between fruiting pedicels and rachis ca. 45 degrees; pedicels glabrous, 6-16 mm long; plants 3-7 dm tall; [primarily of the Mountains and Piedmont, rarely weedy in the Coastal Plain].
3 Stems moderately to densely glandular and pubescent (but not canescent); siliques 5-10 (-12) mm long; pedicels 816 mm long
D. pinnata var. brachycarpa

3 Stems sparsely pubescent to glabrous; siliques 8-12 mm long; pedicels 6-12 mm long . . D. pinnata var. intermedia
Descurainia pinnata (Walter) Britton var. brachycarpa (Richardson) Fernald, Northeastern Tansy-mustard. Mt, Pd (VA), Cp (NC*): dry rocky openings and woodlands; rare (VA Watch List). April-June. Québec west to Mackenzie, south to VA, TN, and TX; introduced in the Coastal Plain of NC. [= C, F, G; = D. brachycarpa (Richardson) O.E. Schulz -- RAB; = D. pinnata ssp. brachycarpa (Richardson) Detling -- K, X, Y, Z; < D. pinnata -- W]

Descurainia pinnata (Walter) Britton var. intermedia (Rydberg) C.L. Hitchcock. Cp (SC): waste areas near wool-combing mills; rare, native of w. North America. Also reported for WV (Kartesz 1999). [= Descurainia pinnata ssp. intermedia (Rydberg) Detling - K, X, Y, Z; = Sophia intermedia Rydberg - S]

Descurainia pinnata (Walter) Britton var. pinnata, Southeastern Tansy-mustard. Cp (GA, NC, SC): open sandy areas, especially roadsides; common. February-May. E. NC south to FL, west to TX and OK. [= C, F, G; = D. pinnata -- RAB (in the narrow sense); = D. pinnata ssp. pinnata -- K, X, Y, Z; = Sophia pinnata (Walter) T.J. Howell -- S]
* Descurainia sophia (Linnaeus) Webb ex Prantl, Herb Sophia. Pd (GA, NC, VA), Cp (NC, SC, VA), Mt (VA): disturbed areas; rare, introduced from Eurasia. April-June. [= RAB, C, F, G, K, X, Y, Z; = Sophia sophia (Linnaeus) Britton -- S]

Diplotaxis Augustin de Candolle 1821 (Wall-rocket)
A genus of ca. 30 species, herbs, of Eurasia and Africa. References: Rollins (1993)=Z; Al-Shehbaz (1985b)=Y.
1 Leaves mostly basal or very low-cauline; plant annual or biennial; siliques lacking a stipe between the sepal scars and the base of the valves; [section Anocarpum]
D. muralis

1 Leaves mostly cauline; plant perennial, becoming somewhat woody at the base; siliques with a 0.5-2 mm stipe between the sepal scars and the base of the valves; [section Diplotaxis] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . D. tenuifolia
* Diplotaxis muralis (Linnaeus) Augustin de Candolle, Annual Wall-rocket, Sand-rocket, Stinking Wall-rocket. Cp (VA): disturbed areas; rare, introduced from Europe. June-September. The report of this species for NC by Ahles \& Radford (1959) was based on a misidentification of Coincya muralis (Naczi \& Thieret 1996). [= C, F, G, K, S, Y, Z]
* Diplotaxis tenuifolia (Linnaeus) Augustin de Candolle, Perennial Wall-rocket, Flixweed. Cp, Pd (VA): disturbed areas; rare, introduced from Europe. July-October. [= C, F, G, K, S, Y, Z]

\section*{Draba Linnaeus 1753 (Draba, Whitlow-grass)}

A genus of about 350 species, herbs, of Northern Hemisphere and Andean South America, particularly in arctic and alpine habitats. Molecular phylogenetic studies show that Erophila should be included in Draba (Koch \& AI-Shehbaz 2002). References: Rollins (1993) \(=\) Z; Al-Shehbaz (1987)=Y; Koch \& AI-Shehbaz (2002).

1 Leaves all basal; petals deeply bifid (about \(1 / 2\) way to base) . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Dr. verna
1 Leaves basal and cauline (the basal sometimes withering by fruiting); petals merely emarginate.
2 Silique twisted; petals 5-6 mm long; styles conspicuous, \(1.5-3 \mathrm{~mm}\) long; perennial; [on calcareous rock outcrops] . . . . . .

2 Silique not twisted; petals 0-5 mm long; styles absent to inconspicuous, 0-0.25 mm long; winter-annuals; [mostly in open situations in sandy or clayey soils, not over limestone].
3 Silique 1-4 mm long; leaves extending upwards into the lower branches of the inflorescence.
4 Pubescence of the lower leaves of stalked cruciform trichomes; siliques densely pubescent; fruiting branches congested, mostly less than 1 cm long and appearing almost glomerate . . . . . . . . . . . . . . . . . . . . . Dr. aprica
4 Pubescence of the lower leaves of sessile cruciform trichomes; siliques glabrous; fruiting branches elongate . .
Dr. brachycarpa
3 Silique 8-14 mm long; leaves low-cauline, not extending upwards into the lower branches of the inflorescence.
5 Inflorescence congested, the fruiting portion ca. 1.5 cm long; trichomes of the upper leaf surface simple or once-
forked; pedicels glabrous
Inflorescence not congested, the fruiting portion mostly more than 2.5 cm long; trichomes of the upper lea surface dendritic; pedicels pubescent.
6 Silique ca. 3-6x as long as wide, \(5-15 \mathrm{~mm}\) long, 1.2-2.2 (-2.8) mm wide, pubescent with simple or branched trichomes

Dr. cuneifolia var. cuneifolia
6 Silique ca. \(2 \times\) as long as wide, \(5-8 \mathrm{~mm}\) long, \(2.5-3.7 \mathrm{~mm}\) wide, pubescent with simple trichomes
Dr. platycarpa

Draba aprica Beadle, Flatrock Draba, Open-ground Whitlow-grass, Sun-loving Draba, Granite Whitlow-wort. Pd (GA, SC), Mt (GA): shallow soils around and under Juniperus virginiana on granitic flatrocks and amphibolite outcrops; rare (GA Endangered, SC Rare). March-April; April-May. Ozark highlands of AR, MO, and OK; disjunct on granitic flatrocks in SC and GA. [= RAB, G, K, S, W, Y, Z]

Draba brachycarpa Nuttall ex Torrey \& A. Gray, Short-fruited Draba. Pd, Cp (GA, NC, SC, VA), Cp (GA): granitic flatrocks, open places (fields, roadsides, woodland margins, disturbed areas); uncommon (VA Watch List). February-April; March-May. VA west to IN and KS, south to FL and TX. [= RAB, C, F, G, K, S, W, Y, Z]
*? Draba cuneifolia Nuttall ex Torrey \& A. Gray var. cuneifolia. Cp (NC, SC): waste areas around wool-combing mills, possibly other habitats; rare, perhaps introduced from further west. February-March; March-April. All three varieties are primarily distributed in sw. United States, but the species extends as a native at least as far east as \(A L\), where it occurs in prairies. \([=K, Z\); \(<D\). cuneifolia -- RAB, C, F, G, S]

Draba platycarpa Torrey \& A. Gray. Cp (SC): waste areas around wool-combing mill; rare, perhaps not established, introduced from w. North America. [= K, Z]

Draba ramosissima Desvaux, Rocktwist, Appalachian Draba. Mt (NC, VA), Pd (VA): in crevices of rock outcrops, or in dry talus slopes, over a variety of rock types (including limestone, dolostone, schist, gneiss, shale); common (rare in NC and VA Piedmont) (NC Rare). April-May; May-July. W. MD and e. WV south through w. VA and e. KY south to w. NC and e. TN. [= RAB, K, S, W, Z]

Draba reptans (Lamarck) Fernald. Pd (NC), Cp (SC): dry soil; rare (NC Rare, SC Rare). February-March; March-April. MA and Ontario west to WA, south to NC, GA, TX and CA. The few occurrences in our area seem to make little ecological or phytogeographic sense; they may represent introductions. The first collection in our area was, however, by Walter. [= RAB, K, Z; > D. reptans var. reptans -- C, F, G; < D. caroliniana Walter -- S]
* Draba verna Linnaeus, Whitlow-grass Cp (NC, SC, VA), Pd, Mt (GA, NC, SC, VA): disturbed areas, especially in dry, barren soils, including granitic flatrocks; common, introduced from Europe. February-April; March-May. [= RAB, C, K, S, W, Z; > D. verna var. verna - F, G; > D. verna var. boerhaavii van Hall -- F, G; = Erophila verna (Linnaeus) Besser]

\section*{Eruca P. Miller 1754 (Rocket-salad, Arugula)}

A monotypic genus, an annual herb, native to Mediterranean Europe. References: Rollins (1993)=Z; Al-Shehbaz (1985b)=Y.
* Eruca vesicaria (Linnaeus) Cavanilles ssp. sativa (P. Miller) Thellung, Garden Rocket, Rocket-salad, Arugula. Pd (NC): cultivated as a salad green, persistent around gardens or occurring as a waif; rare, introduced from Mediterranean Europe. [=K, Y , Z; = E. sativa P. Miller -- C, F; <E. vesicaria -- G; < E. eruca (Linnaeus) Ascherson \& Graebner -- S]

\section*{Erucastrum K.B. Presl 1826 (Dog-mustard)}

A genus of ca. 22 species, herbs, of Africa, Europe, and Arabia. References: Rollins (1993)=Z; Luken, Thieret, \& Kartesz (1993); Al-Shehbaz (1985b)=Y.
* Erucastrum gallicum (Willdenow) O.E. Schulz, Dog-mustard. Mt (NC?, SC, VA): disturbed areas; rare, introduced from Europe. April-September. Luken, Thieret, and Kartesz (1993) discuss the introduction and spread of E. gallicum in North America. While only weakly naturalized in our area, E. gallicum seems likely to increase in abundance. The report of Brassica erucastrum for NC in RAB is apparently based on material of Coincya muralis (Naczi \& Thieret (1996). [= C, F, G, K, Y, Z]

\section*{Erysimum Linnaeus 1753 (Wallflower, Treacle Mustard)}

A genus of ca. 180 species, of the Northern Hemisphere. References: Al-Shehbaz (1988d)=Y; Rollins (1993)=Z.
1 Petals 13-25 (-30) mm long, 4-11 (-13) mm wide; seeds 2-3 mm long; biennial or perennial; [native, usually in thin rocky soil] .
E. capitatum var. capitatum

1 Petals 3.5-10 mm long, less than 3 mm wide; seeds ca. 1 mm long; annual or biennial; [introduced, usually in disturbed situations].
2 Sepals 2-3.5 mm long; petals 3.5-5.5 mm long; fruits 1.2-3 cm long; pedicels slender, (6-) 8-12 (-14) mm long E. cheiranthoides

2 Sepals 4.5-5.5 mm long; petals 6-10 mm long; fruits (3-) 5-12 cm long; pedicels thick, 2-8 mm long ....... E. repandum
Erysimum capitatum (Douglas ex Hooker) E.L. Greene var. capitatum, Western Wallflower. Mt (VA): shale barrens and shale woodlands of Alleghany and Bath counties, VA; rare (VA Rare). April-July; June-August. Rollins (1993) interprets \(E\).
capitatum as including five varieties, all but the typic restricted to the Great Plains and west. Though most floras (including C, F, and G) give the impression that Erysimum is not native east of IL, MO, and AR ("rarely adventive farther east along railroads"), this taxon is native and relictual in w. VA, as well as in ec. TN (Chester, Wofford, \& Kral 1997) and e. WV (Pendleton and Grant counties). [= K, Z; E. asperum var. asperum -- C, misapplied; E. arkansanum Nuttall -- F; E. asperum -- G, misapplied; Cheirinia aspera (Nuttall) Britton -- S, misapplied; = Erysimum capitatum ssp. capitatum - Y]
* Erysimum cheiranthoides Linnaeus, Wormseed Mustard. Pd (VA), Mt (NC, VA), Cp (VA): disturbed areas; uncommon, introduced from Eurasia. June-July; July-August. [= RAB, C, F, G, K, W, Y, Z; = Cheirinia cheiranthoides (Linnaeus) Link -- S]
* Erysimum repandum Linnaeus, Treacle Mustard, Bushy Wallflower. Cp, Pd, Mt (NC, VA): disturbed areas; uncommon, introduced from Eurasia. April-May; May-July. [= RAB, C, F, G, K, Y, Z; = Cheirinia repanda (Linnaeus) Link -- S]
* Erysimum inconspicuum (S. Watson) MacM. var. inconspicuum, Shy Wallflower. South to PA and MD. [= K; < E. inconspicuum - C, Y, infraspecific taxa not distinguished] \{not yet keyed; add synonymy\}

\section*{Hesperis Linnaeus 1753 (Dame's Rocket)}

A genus of ca. 25 species, herbs, of Eurasia and n. Africa. References: Al-Shehbaz (1988d)=Y; Rollins (1993)=Z.
* Hesperis matronalis Linnaeus, Dame's Rocket. Mt (NC, VA), Pd, Cp (VA), \{GA\}: bottomlands, roadsides, moist forests; common (uncommon in Piedmont, rare in Coastal Plain), native of Europe. April-June. The flowers are white or pink. [= RAB, C, F, G, K, S, W, Y, Z]

Iberis Linnaeus 1753 (Candytuft)
A genus of ca. 40 species, herbs, of Eurasia and n. Africa. References: Rollins (1993)=Z.
* Iberis amara Linnaeus, Annual Candytuft, is reported from PA, WV, and KY (Kartesz 1999). [= C, K, Z]
* Iberis sempervirens Linnaeus, Evergreen Candytuft, is reported for NC and TN by Kartesz (1999), but the specimens he cites are from cultivated material. [=K]

\section*{lodanthus Torrey \& A. Gray 1840 (Purple Rocket)}

A monotypic genus, a perennial herb, of e. North America. References: Al-Shehbaz (1988a)=Y; Rollins (1993)=Z.
Identification notes: lodanthus pinnatifidus somewhat resembles Hesperis matronalis in overall appearance, but differs in the following ways: petals \(10-13 \mathrm{~mm}\) long (vs. 20-25 mm long), siliques \(2-4 \mathrm{~cm}\) long ( \(\mathrm{vs} .5-10 \mathrm{~cm}\) long), pubescence of the lower stem of simple trichomes (vs. branched trichomes).

Iodanthus pinnatifidus (Michaux) Steudel, Purple Rocket, is a native crucifer occurring from w. PA west to MN and IA, south through WV and e. and c. TN to AL and TX. It may occur in the westernmost parts of our area, especially in sw. VA, in rich bottomlands. [= C, F, G, K, S, Y, Z]

Isatis Linnaeus 1753 (Woad)
A genus of about 50 species, herbs, of Eurasia and \(n\). Africa. References: Rollins (1993)=Z.
* Isatis tinctoria Linnaeus, Woad. Mt, Pd (VA): disturbed areas; uncommon, introduced from Eurasia. April-June. Formerly cultivated as an important source of a blue dye. [= C, F, G, K, W, Z]

\section*{Leavenworthia Torrey 1837 (Glade Cress)}

A genus of 8 species, annual herbs, endemic to e. North America. References: Al-Shehbaz (1988a)=Y; Rollins (1993)=Z. Key adapted from Rollins (1993).

1 Petals entire, white, less than 7 mm long; leaf lobes deeply dentate, the terminal lobe only slightly larger than the larger lateral lobes
L. uniflora

1 Petals deeply to shallowly emarginate (notched at the tip), yellow, white, or lavender, 7-15 mm long; leaf lobes entire to shallowly dentate, the terminal lobe markedly larger than the largest lateral lobes.
2 Siliques conspicuously torulose (constricted between the seeds), even when young
[L. torulosa]
2 Siliques not torulose (constricted between the seeds) (or slightly so in L. stylosa).
3 Petals 7-10 mm long, shallowly emarginate; style 1-3 mm long; siliques flat; [of AL, GA, KY, and TN].
4 Petals yellow; [of AL and TN] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [L. exigua var. Iutea] 4 Petals white to pale lavender; [of KY, TN, and nw. GA].

5 Styles 2-3 mm long; sepals green; [of \(K Y\) ] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [L. exigua var. laciniata]
3 Petals 10-16 mm long, deeply emarginate; styles 2.5-7 mm long; siliques thick or flat; [of AL and TN].
6 Siliques thin, flat; styles \(1.5-5.5 \mathrm{~mm}\) long; petals white to lavender; [of n . AL].
7 Styles 2-5.5 mm long; mature siliques cuneate at the base and acute at the tip; [of Colbert, Franklin, and Lawrence counties, AL] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [L. alabamica var. alabamica]
7 Styles 1.5-2 (-3) mm long; mature siliques rounded at the basea nd at the tip; [of Morgan County, AL].
[L. alabamica var. brachystyla]
6 Siliques thick, fleshy; styles \(2.5-7 \mathrm{~mm}\) long; petals yellow, white, or lavender; [of \(n\). AL and c. TN].
8 Siliques 12-15 mm long, 3-4 mm wide; seeds slightly elongate, cleft at one side of the long axis; [of Sumner, Smith, Wilson, Davidson, Rutherford, Bedford, and Maury counties, TN] . . . . . . . . [L. stylosa]
8 Siliques 6-12 mm long, 4-5 mm wide; seeds orbicular, cleft at the basal end; [of Lawrence and Morgan counties, AL].
9 Siliques 6-10 mm long; styles 3-6 mm long; petals white to yellow, 10-13 mm long; [of Lawrence and Morgan counties, AL] .
[L. crassa var. crassa]
9 Siliques 8-12 mm long; styles 1.5-3.5 mm long; petals yellow, 9-11 mm long; [of Morgan County, AL]
[L. crassa var. elongata]
Leavenworthia exigua Rollins var. exigua, Gladecress. Mt (GA): limestone glades; rare (GA Threatened). Endemic to the Central Basin of c. TN (8 counties) (Chester, Wofford, \& Kral 1997), western Highland Rim (Decatur and Perry counties), and the Ridge and Valley of nw. GA (Walker and Catoosa counties). [= K, Y, Z]

Leavenworthia uniflora (Michaux) Britton, Gladecress. Mt (GA): limestone glades; rare (GA Special Concern). Endemic to the Central Basin of c. TN (8 counties), the Ridge and Valley of e. TN (Hamilton, Meigs, Bledsoe, and Knox counties), nw. GA (Walker and Murray counties), and c. KY (15 counties). [= C, F, G, K, S, Y, Z]

Leavenworthia alabamica Rollins var. alabamica. Endemic to \(n\). AL (Colbert, Franklin, and Lawrence counties). [=K, Y, Z]
Leavenworthia alabamica Rollins var. brachystyla Rollins. Endemic to n. AL (Morgan County). [= K, Y, Z]
Leavenworthia crassa Rollins var. crassa. Endemic to n. AL (Lawrence and Morgan counties). [= K, Y, Z]
Leavenworthia crassa Rollins var. elongata Rollins. Endemic to n. AL (Morgan County). [= K, Y, Z]
Leavenworthia exigua Rollins var. laciniata Rollins. Endemic to the Western Highland Rim and w. Knobs of c. KY (Bullitt and Jefferson counties). [= C, K, Y, Z]

Leavenworthia exigua Rollins var. lutea Rollins. Endemic to the Central Basin of \(n\). AL (Jefferson County) and c. TN (Bedford and Maury counties) (Chester, Wofford, \& Kral 1997). [= K, Y, Z]

Leavenworthia stylosa A. Gray. Endemic to the Central Basin of c. TN (Sumner, Smith, Wilson, Davidson, Rutherford, Bedford, and Maury counties) (Chester, Wofford, \& Kral 1997). [= K, S, Y, Z]

Leavenworthia torulosa A. Gray. Endemic to the Central Basin of c. TN (10 counties), the Ridge and Valley of e. TN (Bradley and Meigs counties), and the Western Highland Rim of KY (Logan, Simpson, Todd, and Warren counties). [= C, F, G, K, S, Y, Z]

\section*{Lepidium Linnaeus (Pepperwort, Peppergrass, Pepperweed)}

A genus of ca. 220 species, herbs, cosmopolitan. Al-Shehbaz, Mummenhof, \& Appel (2002) discuss the inclusion of Cardaria and Coronopus in Lepidium. References: Rollins (1993)=Z; Al-Shehbaz (1986a, 1986b)=Y; Al-Shehbaz, Mummenhof, \& Appel (2002)=X. Key based closely on Al-Shehbaz (1986b).
section Lepidium: perfoliatum, graminifolium
section Cardamon: sativum
section Lepia: campestre
section Dileptium: austrinum, densiflorum var. densiflorum, oblongum var. oblongum, virginicum var. virginicum
??: didymum, draba ssp. draba, ruderale, africanum, bonariense, lasiocarpum, schinzii

1Upper cauline leaves perfoliate or sagittate.
1

\footnotetext{
* Lepidium campestre (Linnaeus) R. Brown, Field Pepperwort, Cow Cress, Field Cress. Pd, Mt (GA, NC, VA), Cp (NC, SC, VA): disturbed areas; common, intrioduced from Europe. March-June. [= RAB, C, F, G, K, W, S, Y, Z; = Neolepia campestre (Linnaeus) W.A. Weber]
* Lepidium densiflorum Schrader var. densiflorum, Prairie Pepperweed, Green-flowered Peppergrass. \{provinces unknown\} (NC, SC, VA): disturbed areas; rare, introduced from further west. May-June. [= K, Y, Z; < L. densiflorum -- C, F, G, S] * Lepidium didymum Linnaeus, Wart-cress, Lesser Swine-cress. Cp, Pd (GA, NC, SC, VA), Mt (VA): fields, roadsides, disturbed areas; common (rare in VA Mountains), introduced from South America. [= X; = Coronopus didymus (Linnaeus) Smith -RAB, C, F, G, K, Y, Z; = Carara didyma (Linnaeus) Britton -- S]
* Lepidium draba Linnaeus ssp. draba, Hoary Cress. Cp (VA): disturbed areas; rare, introduced from Eurasia. April-August. Reported for VA by Harvill et al. (1992). Al-Shehbaz (1986) discusses 2 subspecies of L. draba (as Cardaria draba). [= X; < Cardaria draba (Linnaeus) Desvaux -- C, F, G, Z; = Cardaria draba ssp. draba -- K, Y; Lepidium draba Linnaeus]
* Lepidium perfoliatum Linnaeus, Perfoliate Pepperwort, Clasping Pepperweed, Shieldcress. Cp (NC), Pd (GA, NC) \{SC, VA\}: disturbed areas; rare, introduced from Europe. April-May. [= RAB, C, F, G, K, Y, Z]
* Lepidium ruderale Linnaeus, Narrowleaf Pepperwort, Stinking Pepperweed. Cp (NC, VA), Pd (VA): disturbed areas; rare,
}
introduced from Europe. April-June. [= RAB, C, F, G, K, S, Y, Z]
Lepidium virginicum Linnaeus var. virginicum, Poor Man's Pepper. Cp, Pd, Mt (GA, NC, SC, VA): disturbed areas; common. April-June (and sporadically later). L. virginicum var. virginicum is widespread in e. and c. North America; also introduced in various places elsewhere in the world. Rollins (1993) interprets L. virginicum as having seven additional varieties, all in western North America, Central America. [= C, G, K, Y, Z; < L. virginicum -- RAB, F, S, W]
* Lepidium africanum (Burmann f.) Augustin de Candolle, African Pepperwort. Waif around wool-combing mills in Coastal Plain of SC; there appears to be little evidence that it is established in our area. For further information and keys, see Rollins (1993) and Al-Shehbaz (1986). [= K, Y, Z]
* Lepidium austrinum Small, Southern Pepperwort. Waif around wool-combing mills in Coastal Plain of SC; there appears to be little evidence that it is established in our area. March-June. For further information and keys, see Rollins (1993) and AI-Shehbaz (1986). [= K, Y, Z]

Lepidium bonariense Linnaeus, Argentinian Pepperwort. Waif around wool-combing mills in Coastal Plain of SC; there appears to be little evidence that it is established in our area. For further information and keys, see Rollins (1993) and Al-Shehbaz (1986). [= K, Y, Z]
* Lepidium graminifolium Linnaeus, Grassleaf Pepperwort. Introduced, especially on ballast, south to MD, PA. April-June. [= K, Y, Z]

Lepidium lasiocarpum Nuttall var. lasiocarpum. Waif around wool-combing mills in Coastal Plain of SC; there appears to be little evidence that it is established in our area. March-June. For further information and keys, see Rollins (1993) and AI-Shehbaz (1986). [= K, Z; < L. lasiocarpum - Y]
* Lepidium oblongum Small var. oblongum. Waif around wool-combing mills in Coastal Plain of SC; there appears to be little evidence that it is established in our area. For further information and keys, see Rollins (1993) and Al-Shehbaz (1986). [=K, Z; < L. oblongum - Y]
* Lepidium sativum Linnaeus, Garden Cress, is reported for scattered locations in sc. and se. PA (Rhoads \& Klein 1993) and VA (K based on Massey 1961). [= K]
* Lepidium schinzii Thellung. Waif around wool-combing mills in Coastal Plain of SC; there appears to be little evidence that it is established in our area. For further information and keys, see Rollins (1993) and Al-Shehbaz (1986). [= Y, Z]
* Lepidium squamatum Forsskål, introduced at scattered locations in se. PA (Rhoads \& Klein 1993), TN, AL, and FL (K). [= X; = Coronopus squamatus (Forsskål) Ascherson -- K]

\section*{Lesquerella S. Watson 1888 (Bladderpod)}
(see Paysonia and Physaria)

\section*{Lobularia Desvaux 1815 (Sweet Alyssum)}

A genus of 4 species, herbs, of Eurasia and Macaronesia. References: Rollins (1993)=Z; Al-Shehbaz (1987)=Y.
* Lobularia maritima (Linnaeus) Desvaux, Sweet Alyssum. Pd (VA), Cp (NC, VA): disturbed areas, lawns; rare, introduced from Europe. June-November. The NC occurrences are doubtfully established, from gardens and a "lawn." [= C, F, G, K, Y, Z]

Lunaria Linnaeus 1753 (Honesty)
A genus of 3 species, biennial herbs, of Europe. References: Rollins (1993)=Z; Al-Shehbaz (1987)=Y. Key based on Z.
1 Upper cauline leaves coarsely and irregularly dentate; siliques broadly rounded at both ends; plant annual or biennial . . . . . .

1 Upper cauline leaves spinulose-dentate; siliques acute at both ends; plant perennial . . . . . . . . . . . . . . . . . . . . [L. rediviva]
* Lunaria annua Linnaeus, Annual Honesty, Silver-dollar. Cp, Pd (VA), Mt (NC, VA) \{GA\}: escaped from cultivation around gardens, not usually persistent; rare, introduced from se. Europe. April-June. [=C, F, G, K, Z]
* Lunaria rediviva Linnaeus, Perennial Honesty. Mt (VA): cultivated ornamental, perhaps persistent around gardens; rare, introduced from Europe. Reported for VA by Kartesz (1999), on the basis of a specimen at VPI. April-June. [= C, F, G, K, Z]

\section*{Matthiola R. Brown 1812 (Stock)}

A genus of about 50 species, herbs, mainly of Eurasia and Africa. References: Rollins (1993)=Z.
* Matthiola incana (Linnaeus) R. Brown, Stock. Cp (NC): disturbed dunes, sandy fields, vacant lots; rare, introduced from Europe. Reported for the Buxton area, Dare County, NC, by Burk (1961). [= K, Z]

\section*{Microthlaspi F.K. Meyer 1973 (Penny-cress)}

Mummenhoff \& Koch (1994) and Meyer \((1973,1979)\) discuss the reasons for separating Microthlaspi from Thlaspi. References:

Rollins (1993)=Z; Thieret \& Baird (1985)=Y; Mummenhoff \& Koch (1994)=X; Al-Shehbaz (186)=V.
* Microthlaspi perfoliatum (Linnaeus) F.K. Meyer, Perfoliate Penny-cress, Thoroughwort Penny-cress. Pd, Mt (NC, VA), Cp (VA): fields, disturbed areas; common (rare south of VA and in VA Coastal Plain), introduced from Europe. March-April; April-May. [= K, X; = Thlaspi perfoliatum Linnaeus -- RAB, C, F, G, V, W, Y, Z]

Moricandia Augustin de Candolle 1821
A genus of 7 species, herbs, of \(s\). Europe and \(n\). Africa. References: Rollins (1993) \(=Z\).
* Moricandia arvensis (Linnaeus) Augustin de Candolle, Purple-mistress. Pd (VA): disturbed areas; rare, introduced from Mediterranean Europe. March-May. Introduced and apparently well established in and around Richmond, VA (Rollins 1993). [= K, Z]

\section*{Nasturtium R. Brown 1812 (Watercress)}

A genus of 5 species, perennial herbs, of Eurasia, n. Africa, and North America. Al-Shehbaz \& Price (1998) summarize the reasons for separating Nasturtium from Rorippa; Franzke et al. (1998) provide corroboration based on molecular analysis. References: Rollins (1993) =Z; Stuckey (1972)=Y; Green (1962)=X; Al-Shehbaz \& Price (1998) =V; Al-Shehbaz (1988a)=Q; Franzke et al. (1998).

1 Petioles of emergent leaves lacking auricles toward the base; seeds yellowish-brown, finely reticulate, with 400-500 polygonal depressions on each side . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [N. floridanum
1 Petioles of emergent leaves auriculate toward the base; seeds reddish-brown, rather coarsely reticulate, with 25-150 (-175) polygonal depressions on each side.
2 Mature siliques 1-1.5 mm wide, terete or subterete; seeds in 1 row in each locule of the silique; seeds with (75-) 100-150 (-175) polygonal depressions on each side N. microphyllum

2 Mature siliques (1.8-) 2-3 mm wide, flattened; seeds in 2 rows in each locule of the silique; seeds with 25-50 (-60) polygonal depressions on each side . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . N. officinale
* Nasturtium microphyllum Boenninghausen ex Reichenbach, Narrow-fruited Watercress. Mt (NC, VA): streams, springs; rare, introduced from Europe. See Green (1962) for additional information. [= V; = Rorippa microphylla (Boenninghausen ex Reichenbach) Hylander ex Löve \& Löve -- C, K, Q, X, Z; < Nasturtium officinale -- RAB, G, W; = Nasturtium officinale R. Brown var. microphyllum (Boenninghausen ex Reichenbach) Thellung -- F]
* Nasturtium officinale R. Brown, Watercress. Mt, Pd, Cp (GA, NC, SC, VA): streams, springs, seepages; common (uncommon or rare south of VA), introduced from Eurasia. April-July. [= GW, V; = Rorippa nasturtium-aquaticum (Linnaeus) Hayek -- C, K, Q, X, Z; < Nasturtium officinale -- RAB, G, W (also see N. microphyllum); > Nasturtium officinale var. officinale -- F; > Nasturtium officinale var. siifolium (Reichenbach) W.D.J. Koch -- F; = Sisymbrium nasturtium-aquaticum Linnaeus -- S]

Nasturtium floridanum (AI-Shehbaz \& Rollins) AI-Shehbaz \& R.A. Price, Florida Watercress. Endemic to FL, but north to counties adjacent to se. GA. [= V; = Rorippa floridana Al-Shehbaz \& Rollins - K, Z; < Nasturtium microphyllum Boenninghausen ex Reichenbach - GW, misapplied; Nasturtium stylosum Shuttleworth ex O.E. Schulz] \{add synonymy\}

\section*{Neobeckia Greene 1896 (Lake Cress)}

A monotypic genus, an aquatic herb. References: Rollins (1993)=Z; Al-Shehbaz \& Bates (1987)=Y; Les, Anderson, \& Cleland (1995)=X; Al-Shehbaz (1988a)=Q.

Neobeckia aquatica (Eaton) Greene, Lake Cress. Cp (GA, VA): shallow water of swamps and lake margins; rare (GA Special Concern, VA Rare). VT west to MN, south to s. GA, FL, and e. TX, widely scattered and probably dispersed by waterfowl. See AIShehbaz \& Bates (1987) and Les, Anderson, \& Cleland (1995) for additional information on this interesting plant. Apparently most closely related to Rorippa. [= K, S, X; = Armoracia lacustris (A. Gray) AI-Shehbaz \& V. Bates -- C, Q, Y, Z; = Armoracia aquatica (Eaton) Wiegand -- F, G, GW; Rorippa aquatica (Eaton) Palmer \& Steyermark; Rorippa americana (A. Gray) Britton]

\section*{Paysonia O'Kane \& Al-Shehbaz 2002 (Bladderpod)}

A genus of 8-9 species, herbs, endemic to southeastern United States. O'Kane \& Al-Shehbaz (2002) clearly show that Paysonia is not a part of Lesquerella, which itself is included within Physaria. References: Rollins (1993)=Z; Rollins \& Shaw (1973)=Y; O'Kane \& AI-Shehbaz (2002)=X; AI-Shehbaz (1987)=V. Key adapted from X and Z.

1 Cauline leaves cuneate or petiolate at the base, not auriculate; flowers yellow
[see Physaria]
1 Cauline leaves expanded at the base, usually auriculate; flowers yellow or white.
2 Siliques strongly compressed parallel to the plane of the septum, orbicular; valves pubescent with a mixture of large, simple, bulbous-based trichomes and smaller branched trichomes; flowers yellow
[Paysonia lescurii]
2 Siliques not compressed, nearly globose, subglobose, pyriform, or slightly bilobed; valves glabrous or pubescent with only a single type of trichome; flowers white or yellow.

3 Flowers white; siliques pyriform, depressed globose, or slightly bilobed; septum (of the silique) perforate or nearly absent.
4 Siliques glabrous or very sparsely pubescent, subpyriform; valves (of the silique) papery, densely pubescent on the interior; styles glabrous [Paysonia perforata]
4 Siliques densely pubescent, depressed globose or slightly bilobed; valves (of the silique) glabrous on the interior; styles hirsute
[Paysonia stonensis]
3 Flowers yellow; siliques globose to subglobose; septum (of the silique) complete.
5 Siliques densely pubescent; styles pubescent (at least near base) . . . . . . . . . . . . . . . . [Paysonia densipila]
5 Siliques glabrous; styles glabrous . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [Paysonia lyrata]
Paysonia densipila (Rollins) O'Kane \& AI-Shehbaz. Endemic to an area from c. TN south to n . AL. [= X; = Lesquerella densipila Rollins -- K, V, Y, Z]

Paysonia lescurii (A. Gray) O’Kane \& Al-Shehbaz. Endemic to an area from sc. KY south through c. TN to n. AL. [= X; = Lesquerella lescurii (A. Gray) S. Watson -- K, S, V, Y, Z]

Paysonia lyrata (Rollins) O'Kane \& AI-Shehbaz. Endemic to Colbert, Franklin, and Lawrence counties, AL. [=X; = Lesquerella lyrata Rollins -- K, V, Y, Z]

Paysonia perforata (Rollins) O'Kane \& AI-Shehbaz. Endemic to Rutherford and Wilson counties, TN (Chester, Wofford, \& Kral 1997). [= X; = Lesquerella perforata Rollins - K, V, Y, Z]

Paysonia stonensis (Rollins) O'Kane \& AI-Shehbaz. Endemic to Rutherford County, TN (Chester, Wofford, \& Kral 1997). [= X; = Lesquerella stonensis Rollins -- K, V, Y, Z]

\section*{Physaria (Nuttall ex Torrey \& A. Gray) A. Gray}

A genus of about 98 herbs, of temperate North America and South America (Al-Shehbaz \& O'Kane 2002). The genus is most diverse in sw. North America. Key adapted from Rollins (1993). References: Rollins (1993)=Z; Rollins \& Shaw (1973)=Y; AIShehbaz \& O'Kane (2002)=X; Al-Shehbaz (1987)=V. Key adapted from Rollins (1993).

1 Cauline leaves cuneate or petiolate at the base, not auriculate; flowers yellow.
2 Siliques (1-) 2-2.8 mm long, sparsely pubescent on the exterior; petals 3.5-6.5 (-7.5) mm long ...... [Physaria globosa]
2 Siliques (3.5-) 4-8 mm long, glabrous on the exterior; petals \(5-8 \mathrm{~mm}\) long . . . . . . . . . . Physaria gordonii ssp. gordonii
1 Cauline leaves expanded at the base, usually auriculate; flowers yellow or white . . . . . . . . . . . . . . . . . . . . . . . [see Paysonia]
* Physaria gordonii (A. Gray) O’Kane \& Al-Shehbaz ssp. gordonii, Gordon's Bladderpod. Mt (VA): roadside; rare, introduced from further west. Rollins (1993) reports this species (identification unconfirmed) as a waif along the Blue Ridge Parkway, VA; it may not be established. [= \(\mathrm{X} ;=\) Lesquerella gordonii (A. Gray) S. Watson var. gordonii \(-\mathrm{Z} ;<\) L. gordonii \(-\mathrm{K}, \mathrm{Y}]\)

Physaria globosa (Desvaux) O'Kane \& Al-Shehbaz. Endemic to an area from Posey County, IN and allegedly also s. OH south through c. KY to c. TN. [= X; = Lesquerella globosa (Desvaux) S. Watson -- C, F, G, K, S, V, Y, Z]

Physaria gracilis (Hooker) S. Watson ssp. gracilis. TN, IL, MO, and OK south to AL, MS, LA, and TX. [= X; < Lesquerella gracilis - F, G, infraspecific taxa not distinguished; = Lesquerella gracilis (Hooker) S. Watson ssp. gracilis - K, V, Z]

\section*{Raphanus Linnaeus 1753 (Radish)}

A genus of 3 species, herbs, of the Old World. References: Rollins (1993)=Z; Al-Shehbaz (1985b)=Y.
1 Siliques moniliform (contricted between the seeds), the silique body about the same diameter for most of its length, longitudinally grooved; petals usually yellow, fading white (rarely purple); seeds 4-12 per silique ......... R. raphanistrum
1 Siliques not moniliform, the silique body tapered from its widest point below the middle to the apex, smooth or slightly longitudinally grooved; petals usually purple (rarely white); seeds 1-3 (-5) per silique

\author{
R. sativus
}
* Raphanus raphanistrum Linnaeus, Wild Radish, Jointed Charlock, White Charlock. Cp, Pd, Mt (GA, NC, SC, VA): fields, roadsides, disturbed areas; common (rare in Mountains), introduced from Mediterranean Europe. March-June (and sporadically later). Many European authors (such as Stace 1997) recognize several infraspecific taxa in \(R\). raphanistrum; their validity (and applicability in North America) is poorly known. [= RAB, C, F, G, K, W, Y, Z]
* Raphanus sativus Linnaeus, Radish, Garden Radish. Cp, Pd, Mt (GA, NC, SC, VA): persistent after cultivation or as a "throwout"; rare, introduced from Mediterranean Europe. April-June. Cultivated for at least 5000 years. [= RAB, C, F, G, K, S, W, Y, Z]

Rapistrum Crantz 1769 (Bastard-cabbage)
A genus of 2 species, herbs, of Europe. References: Rollins (1993)=Z; Al-Shehbaz (1985b)=Y.
* Rapistrum rugosum (Linnaeus) Allioni var. rugosum, Annual Bastard-cabbage. Cp (SC): waste areas around wool-combing mills; rare, introduced from Mediterranean Europe. Also naturalized at scattered sites in e. TN (Chester, Wofford, \& Kral 1997), PA (Rhoads \& Klein 1993), and elsewhere. [= G; = R. rugosum ssp. rugosum -- K, Y; < R. rugosum -- C, F, Z]

Rorippa Scopoli (Yellow Cress, Marshcress)
(also see Nasturtium)
A genus of about 75 species, herbs, cosmopolitan. The separation of Nasturtium from Rorippa is warranted (Al-Shehbaz \& Price 1998); Franzke et al. (1998) provide corroboration based on molecular analysis. References: Al-Shehbaz (1988a)=X; Rollins (1993)=Z; Stuckey (1972)=Y.

1 Plant a rhizomatous, colony-forming perennial; petals (2.0-) 2.8-6.0 mm long.
2 Stems branched at the base, decumbent to ascending; leaf sinuses not reaching the midrib, the lateral segments entire to weakly toothed; siliques \(3-6 \times\) as long as wide; [section Sinuatae]
[R. sinuata]
2 Stems branched in the upper portions, erect; leaf sinuses reaching the midrib, the lateral segments often sharply toothed; siliques \(6-15 \times\) as long as wide; [section Rorippa]
R. sylvestris

1 Plant a taprooted annual or biennial; petals 1-3.5 mm long; siliques 1-9 (-10)× as long as wide; [section Rorippa].
3 Flowers nearly sessile; petals absent; lower fruiting pedicels \(0.5-1.5 \mathrm{~mm}\) long; siliques (3-) 5.4-8.5 (-10.2) mm long, (1.4-) 1.8-2.6 (-3.3) mm wide, mostly \(3-5 \times\) as long as wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . R. sessiliflora

3 Flowers clearly pedicellate; petals present; lower fruiting pedicels more than 4 mm long; siliques 4-20 mm long, 1-15x as long as wide.
4 Siliques (5.2-) 8.5-12.5 (-20.4) mm long, (4-) 6-9 (-10)× as long as wide; leaves deeply pinnatifid, the pinnae themselves toothed, lobed or dissected; seeds \(0.4-0.5 \mathrm{~mm}\) long, 100-150 per silique ......... \(\boldsymbol{R}\). teres var. teres 4 Siliques \(2.5-9 \mathrm{~mm}\) long, \(2-5 \times\) as long as wide; leaves serrate, lobed, or pinnately dissected, the pinnae (when present) merely toothed; seeds \(0.5-0.9 \mathrm{~mm}\) long, 20-80 per silique.
5 Leaves hirsute on the lower surface; stems hirsute usually up to the terminal raceme . R. palustris var. hispida 5 Leaves glabrous on the lower surface; stems glabrous or sparsely hirsute.

6 Plants mostly 4-10 dm tall, often reddish; stems thick, mostly more than 3 mm in diameter; leaves thick-
textured; siliques \(2.5-5 \mathrm{~mm}\) long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . R. palustris var. fernaldiana
6 Plants mostly 1-4 dm tall, often purplish; stems slender, mostly less than 3 mm in diameter; leaves thintextured; siliques 4-9 mm long
[R. palustris var. palustris]

Rorippa palustris (Linnaeus) Besser var. fernaldiana (Butters \& Abbe) R. Stuckey, American Marshcress. Pd, Cp, Mt (GA, NC, SC, VA): marshes, bogs, seeps; common. May-October. ME and New Brunswick west to Saskatchewan, south to FL, TX, ID, and n . South America. [ \(=\mathrm{C}, \mathrm{Z}\); < Rorippa islandica (Oeder) Bolbás -- RAB, misapplied; = Rorippa islandica var. fernaldiana Butters \& Abbe -- F, misapplied; < Rorippa palustris -- GW, W, infraspecific taxa not distinguished; = Rorippa palustris ssp. fernaldiana (Butters \& Abbe) Jonsell -- K, X; Radicula palustris (Linnaeus) Moench -- S (in part?); Rorippa palustris ssp. glabra (O.E. Schulz) R. Stuckey var. fernaldiana (Butters \& Abbe) R. Stuckey -- Y]

Rorippa palustris (Linnaeus) Besser var. hispida (Desvaux) Rydberg. Pd (VA): moist soils; rare. Labrador to AK, south to c. VA (Amelia County), IL, NE, NM, and n. CA. AI-Shehbaz (1988a) considers reports of this taxon in the Southeast to be misidentifications of var. fernaldiana. [= C, Z; = Rorippa palustris ssp. hispida (Desv.) Jonsell -- K; = Radicula hispida (Desvaux) Heller - S; = Rorippa palustris ssp. hispida (Desvaux) Jonsell var. hispida - Y]

Rorippa sessiliflora (Nuttall ex Torrey \& A. Gray) A.S. Hitchcock, Stalkless Marshcress. Cp, Pd (NC, SC, VA): wet places, marshes, swamps; rare. April-July. MD, WV (Cusick 1994), OH, IN, IL, MN, and NE south to Panhandle FL, s. AL, LA, and c. TX. [= RAB , C , F, GW, K, W, X, Y, Z; = Radicula sessiliflora (Nuttall ex Torrey \& A. Gray) E.L. Greene -- S]

Rorippa sylvestris (Linnaeus) Besser, Creeping Yellow Cress. Pd (NC, VA), Mt, Cp (VA): lawns, disturbed moist to wet soils; rare, introduced from Eurasia. May-August. [= RAB, C, F, GW, K, W, X, Y, Z; = Radicula sylvestris (Linnaeus) Druce -- S]

Rorippa teres (Michaux) R. Stuckey var. teres. Cp (GA, NC, SC): cypress-gum ponds, marshes, swamps, ditches, disturbed wet areas; rare. March-May. Var. teres occurs from se. NC south to s. FL, west to se. OK, sw. TX, and s. Mexico; var. rollinsii R. Stuckey occurs in w. Mexico (Sinaloa). [= GW, X, Y, Z; = Rorippa walteri -- RAB; < Rorippa teres -- C, K, infraspecific taxa not distinguished; = Radicula walteri (Elliott) E.L. Greene -- S]

Rorippa palustris (Linnaeus) Besser var. palustris, European Marshcress. May-October. South in ne. North America to MD and DC. Var. palustris may be native further north (in ne. and nw. North America), but appears to be introduced in our area. [= C, Z; \(=\) Rorippa islandica var. islandica -- F, misapplied; < Rorippa palustris -- GW, W, infraspecific taxa not distinguished; = Rorippa palustris ssp. palustris -- K, X; < Radicula palustris (Linnaeus) Moench -- S (in part?); = Rorippa palustris ssp. palustris var. palustris -- Y]

Rorippa sinuata (Nuttall) A.S. Hitchcock. Native, east to w. KY. [= C, F, G, GW, K, X, Y, Z]

Sibara E.L. Greene 1896 (Sibara)
A genus of 6 species, of North America and Mexico. References: Al-Shehbaz (1988a)=Y; Rollins (1993)=Z.

Sibara virginica (Linnaeus) Rollins, Sibara. Cp, Pd (GA, NC, SC, VA), Mt (NC): disturbed areas, fields, roadsides; common. February-June. VA west to \(I N\) and KS, south to FL and TX. A native weed, presumably much more common now than formerly. [= RAB , C, F, G, K, W, Y, Z; = Arabis virginica (Linnaeus) Poiret -- S]

A genus of 7 species, herbs, of s. Europe. References: Rollins (1993)=Z; Al-Shehbaz (1985b)=Y. Key adapted from Z and C.
1 Beak of silique strongly compressed; silique densely covered with long, stiff trichomes, ca. 4 mm in diameter; pedicels slender, mostly at right angles to the rachis; seeds \(4-8\) per silique; [section Sinapis] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. alba
1 Beak of silique conical; silique glabrous or nearly so, ca. 2 mm in diameter; pedicels thick, erect to spreading; seeds 7-13 per silique; [section Ceratosinapis] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. arvensis
* Sinapis alba Linnaeus, White Mustard, Yellow Mustard. Mt, Pd (NC): disturbed areas; rare, introduced from Mediterranean Europe. April-June. The seeds of this species are one source of table mustard; other components include Brassica juncea and \(B\). nigra. [= C, K, S, Y, Z; Brassica hirta -- RAB, F, G]
* Sinapis arvensis Linnaeus, Charlock, Crunchweed, Wild Mustard. Pd (GA, NC, VA), Mt (NC), Cp (GA, NC, SC): disturbed areas; rare, introduced from Mediterranean Europe. April-July. [= C, K, S, Y, Z; Brassica kaber (Augustin de Candolle) L.C. Wheeler -- RAB, G; Brassica kaber var. pinnatifida (Stokes) L.C. Wheeler -- F]

Sisymbrium Linnaeus (Jim Hill Mustard)
References: Rollins (1993)=Z; Al-Shehbaz (1986b, 1988)=Y.
1 Silique linear, 5-10 cm long; spreading from the rachis; pedicels 5-20 mm long; petals 6-8 mm long ........ S. altissimum
1 Silique subulate, 0.8-1.5 cm long, appressed to the rachis; pedicels 1-3 mm long; petals \(3-4 \mathrm{~mm}\) long ......... . S. officinale
* Sisymbrium altissimum Linnaeus, Tumble Mustard, Jim Hill Mustard. Pd (GA, NC, SC, VA), Mt, Cp (NC, SC, VA): fields, disturbed areas; uncommon, native of Eurasia. May-June. [= RAB, C, F, G, W, Y, Z; = Norta altissima (Linnaeus) Britton -- S]
* Sisymbrium officinale (Linnaeus) Scopoli, Hedge Mustard. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): fields, pastures, barnyards, disturbed areas; common, native of Europe. [= C, K, Y, Z; > S. officinale var. leiocarpum Augustin de Candolle -- RAB, F, G, W; > S. officinale var. officinale - RAB, F, G, W; = Erysimum officinale Linnaeus -- S]
* Sisymbrium irio Linnaeus. Waif around wool-combing mills in Coastal Plain of SC; there appears to be little evidence that it is established in our area. For further information and keys, see Rollins (1993) and AI-Shehbaz (1986b). [= K, Y, Z]
* Sisymbrium loeselii Linnaeus. Waif around wool-combing mills in Coastal Plain of SC; there appears to be little evidence that it is established in our area. For further information and keys, see Rollins (1993) and AI-Shehbaz (1986b). [= K, Y, Z]
* Sisymbrium turczaninowii Sonderegger. Waif around wool-combing mills in Coastal Plain of SC; there appears to be little evidence that it is established in our area. For further information and keys, see Rollins (1993) and Al-Shehbaz (1986b). [= K, Y, Z]

\section*{Teesdalia Aiton f. 1812 (Shepherd's Cress)}

A genus of 3 species, herbs, of Europe, n. Africa, and the Middle East. References: Rollins (1993)=Z; Appel (1998); Al-Shehbaz (1986) \(=\mathrm{Y}\).
* Teesdalia nudicaulis (Linnaeus) Aiton f., Shepherd's Cress, Hedge Mustard, Bank Cress. Pd, Cp (NC) \{SC, VA\}: lawns, fields, roadsides, disturbed areas; uncommon, introduced from Europe. March-April; April-June. [= RAB, C, F, G, K, Y, Z]

\section*{Thlaspi Linnaeus 1753 (Penny-cress)}
(also see Microthlaspi)
A genus of about 5 species, as much more narrowly circumscribed, annual herbs native to Eurasia. Mummenhoff \& Koch (1994), Meyer (1973, 1979), and Koch \& Al-Shehbaz (2004) discuss the reasons for separating Microthlaspi from Thlaspi. References: Rollins (1993)=Z; Al-Shehbaz (1986) \(=\) Y.

1 Siliques \(5-8 \mathrm{~mm}\) long, \(2-4 \mathrm{~mm}\) wide; seeds brown, alveolate; lower stem with scattered long hairs; fresh plant smelling of garlic when crushed; [section Pterotropis]
T. alliaceum

1 Siliques (8-) 10-17 mm long, \(7-12 \mathrm{~mm}\) wide; seeds brown, concentrically ridged; lower stem glabrous; fresh plant not smelling of garlic when crushed; [section Thlaspi]
T. arvense
* Thlaspi alliaceum Linnaeus, Garlic Penny-cress. Pd (NC): fields, disturbed areas; rare, introduced from Europe. March-April; April-May. [= RAB, K, X, Y, Z]
* Thlaspi arvense Linnaeus, Field Penny-cress, Frenchweed. Pd, Mt, Cp (GA, NC, SC, VA): fields, disturbed areas; common (rare south of NC), introduced from Europe. March-May; April-June. [= RAB, C, F, G, K, S, W, X, Y, Z]

Turritis Linnaeus 1753 (Tower Mustard)
A monotypic genus, an annual or biennial herb, circumboreal. References: Rollins (1993)=Z; Al-Shehbaz (1988a)=Y; Koch, Bishop, \& Mitchell-OIds (1999); Koch \& AI-Shehbaz (2002).

Turritis glabra Linnaeus, Tower Mustard. Mt (NC, VA): open disturbed areas, forest edges; rare (NC Rare, VA Rare). MayJune; July-August. Circumboreal, south in North America to NC, sc. TN (Chester, Wofford, \& Kral 1997), AR, KS, NM, and CA. Possibly only an introduction in our area. [= Arabis glabra (Linnaeus) Bernhardi -- RAB, C, F, G, W; > A. glabra var. glabra - Y, Z]

Warea Nuttall 1834 (Warea, Pineland-cress)
A genus of 4 annual herbs, of se. North America. The genus is endemic to se. United States, consisting of our species and two others of peninsular FL. This is the only genus of tribe Thelypodieae in our area. References: Rollins (1993)=Z; AI-Shehbaz (1985a) \(=\mathrm{Y}\); Channell \& James (1964).

Identification notes: Warea (Brassicaceae) and Polanisia (Cleomaceae) are superficially similar. The genus is quite showy and conspicuous, reminiscent of a small Cleome because of its white to pink, clawed petals and silique borne on a long gynophore.
```

Leaves cuneate at the base; petals white to pink . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . W. cuneifolia
L Leaves rounded or slightly auriculate at the base; petals deep purple . . . . . . . . . . . . . . . . . . . . . . . . . . . W. sessilifolia
Warea cuneifolia (Muhlenberg ex Nuttall) Nuttall, Carolina Warea, Carolina Pineland-cress. Cp (GA, NC, SC): xeric white sands of sandhills, primarily in Sandhill Region; rare (NC Rare). July-September; August-September. Sc. NC south to panhandle FL and se. AL. [= RAB, K, S, Y, Z]
Warea sessilifolia Nash, Sessile-leaf Warea, Sessile-leaf Pineland-cress. Cp (GA): sandhills; rare. August-September. Panhandle FL and adjacent AL and wc. GA (Stewart County) (Sorrie 1998b). [= K, S, Y, Z]

```

BUDDLEJACEAE (Butterfly-bush Family)
(see SCROPHULARIACEAE and TETRACHONDRACEAE)
1 Plant a shrub . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [see SCROPHULARIACEAE - Buddleja]
1 Plant an herb . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [see TETRACHONDRACEAE - Polypremum]

BUXACEAE (Boxwood Family)
References: von Balthazar, Endress, \& Qiu (2000); Channell \& Wood (1987).
1 Plant a woody shrub; leaves opposite, less than 1 cm wide ..................................................... Buxus
1 Plant a suffrutescent herb; leaves alternate, \(1.5-7 \mathrm{~cm}\) wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Pachysandra

\section*{Buxus Linnaeus (Boxwood)}

A genus of about 50-90 species, shrubs, of tropical to temperate areas of Europe, Africa, West Indies, and Central America.
* Buxus sempervirens Linnaeus, Boxwood. Mt (NC, VA): persistent for decades at abandoned homesites; rare, introduced from Europe. Popular for hedges and landscaping; also cultivated in the Mountains for wreathing. [= K]

\section*{Pachysandra Michaux (Pachysandra)}

A genus of 4 species, 1 of e. North America, the other 3 of e. Asia, suffruticose herbs and shrubs. References: Robbins (1968)=Z.
1 Leaves subcoriaceous, semi-evergreen, pubescent, mottled (more apparently so at some seasons than others); [native plant of rich forests]
1 Leaves coriaceous, evergreen, glabrous, dark green; [cultivated alien plant, rarely persistent] ................. \(P\). terminalis
Pachysandra procumbens Michaux, Mountain Pachysandra, Allegheny-spurge. Pd (GA, NC, SC), Mt (GA): moist rich woods in the upper Piedmont (nearly in the Mountains); rare (GA Special Concern, NC Rare, SC Rare). March-April; July-August. C. KY south to w. NC, nw. SC, w. GA, panhandle FL (Jackson County only), AL, MS, and e. LA (on loess in the Tunica Hills). The only locations for this species in NC are in Polk County, NC, which has other notable disjunctions of species which normally occur west of the Blue Ridge (Veratrum woodii, Smilax lasioneura). Channell \& Wood (1987) refer to P. procumbens as a "nonagressive if not 'senile' species with a very low evolutionary potential." Its distribution (and, for that matter, that of the genus as a whole) appears to be relictual and to reflect a poor ability to disperse itself and colonize new territory. [= RAB, C, F, G, K, S, W, Z]
* Pachysandra terminalis Siebold \& Zuccarini, Pachysandra, Japanese-spurge. Pd (NC, VA): persistent after cultivation, and spreading vegetatively to adjacent forests; commonly cultivated, rarely persistent to naturalized, native of China and Japan. This species is a popular ground-cover, difficult to eradicate once well-established. [= RAB, C, F, G, K, Z]

A family of 2 genera and about 6 species, aquatic herbs, nearly cosmopolitan. This family is closely related to the Nymphaeaceae and may be best combined with it (Angiosperm Phylogeny Group 2003). References: Wiersema in FNA (1997); Williamson \& Schneider in Kubitzki, Rohwer, \& Bittrich (1993); Les et al. (1999).

1 Plants with all leaves floating and peltate; plants coated with a layer of transparent, mucilaginous jelly; floating peltate leaves 3.5-11 cm long, 2-6.5 cm wide; [subfamily Hydropeltoideae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Brasenia

1 Plants with submersed leaves dichotomously divided into linear segments; plants not coated with mucilaginous material; floating peltate leaves (when present) 0.6-3.0 cm long, 0.1-0.4 wide; [subfamily Cabomboideae] . . . . . . . . . . . . . . . Cabomba

\section*{Brasenia Schreber (Water-shield)}

A monotypic genus, an aquatic herb, widely distributed in tropical and temperate regions of the OLd and New World. References: Williamson \& Schneider in Kubitzki, Rohwer, \& Bittrich (1993).

Identification notes: The elliptic peltate leaves and mucilaginous petioles make Brasenia unmistakable.
Brasenia schreberi J.F. Gmelin, Water-shield, Purple Wen-dock. Cp (GA, NC, SC, VA), Pd, Mt (NC, VA): lakes, ponds, sluggish streams, floodplain oxbow ponds; common (rare in Piedmont and Mountains). June-October. Nova Scotia west to MN, south to s. FL and TX; also from British Columbia south to CA; also in tropical America and the Old World. [= RAB, C, F, FNA, G, GW, K, S, W]

\section*{Cabomba Aublet (Fanwort)}

A genus of about 5 species, aquatic herbs, tropical and temperate regions of America. References: Williamson \& Schneider in Kubitzki, Rohwer, \& Bittrich (1993).

Identification notes: Cabomba is sometimes mistaken for other, superficially somewhat similar aquatics, such as Ceratophyllum (Ceratophyllaceae), Utricularia (Lentibulariaceae), and Myriophyllum (Haloragaceae). Cabomba has the leaves opposite (rather than whorled), dichotomously divided (like Ceratophyllum), but the divisions lacking the marginal denticles of Ceratophyllum, and on a \(1-3 \mathrm{~cm}\) long petiole (vs. sessile or on a petiole \(0-2 \mathrm{~mm}\) long). Utricularia has the leaves sometimes dichotomously divided, but the divisions are usually irregular, the leaves are alternate (in most species), and bladder traps are present. Myriophyllum has the leaves pectinately rather than dichotomously divided.

Cabomba caroliniana A. Gray, Fanwort. Cp (GA, NC, SC, VA), Pd (GA, NC, VA): millponds, lakes, slow-moving streams; uncommon (rare and probably only introduced in the Piedmont). May-September. NJ west to OH, s. MI, and MO, south to FL and TX; sporadically introduced elsewhere from aquarium "throw-outs." C. caroliniana var. pulcherrima R.M. Harper, with purplish flowers and vegetative parts, occurs in the southeastern Coastal Plain; it needs further evaluation. GW imply that the purple pigmentation may be merely an environmental response to warm waters, and is not correlated with morphologic characters. [= RAB , C, F, FNA, G, GW, S; > C. caroliniana var. caroliniana - K; > C. caroliniana var. pulcherrima R.M. Harper -- K; > C. pulcherrima (R.M. Harper) Fassett]

\section*{CACTACEAE A.L. de Jussieu 1789 (Cactus Family)}

A family of about 100 genera and 1500 species, herbs, shrubs, vines, and trees, of tropical, subtropical, and temperate America (a single species occurring as well in Africa, Madagascar, and Ceylon), with centers of diversity in sw. United States-Mexico, s. South America, and West Indies. References: Parfitt \& Gibson in FNA (2003b); Barthlott \& Hunt in Kubitzki, Rohwer, \& Bittrich (1993); Anderson (2001).

\section*{Opuntia P. Miller 1754 (Prickly-pear Cactus)}

A genus of about 200 species, widespread in America, from s. Canada to Patagonia. References: Pinkava in FNA (2003b); Doyle (1990) \(=\) Z; Benson (1982) \(=\mathrm{Y}\); Barthlott \& Hunt in Kubitzki, Rohwer, \& Bittrich (1993). Key based on Y and Z.

Identification notes: new joints sometimes bear reduced leaves and have not yet developed spines; look for spines 1 or 2 joints back from the growing tip.

1 Spines absent.
2 Joints narrowly obovate, narrowly elliptic, or oblong, mostly 12-25 (-35) cm long, 7.5-10 (-20) cm broad; [of the Coastal Plain] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . O. . stricta var. stricta
2 Joints orbiculate to obovate, 5-7.5 (12.5) cm long, 4-6 (-7.5) cm broad; [widespread in our area].
3 Joints mostly 7.5-10 (-15) cm long, 5-9 (-12.5) cm broad; hypanthium with 7 or more areoles; style diameter \(<3.5\) mm ; petals \(>3 \mathrm{~cm}\) long; [plants of the Coastal Plain] . . . . . . . . . . . . . . . . . . . . . . . . O. humifusa var. austrina
3 Joints mostly 5-7.5 (-12.5) cm long, 4-6.2 (-7.5) cm broad; hypanthium with 6 or fewer areoles; style diameter > 3.5
mm ; petals < 3 cm long; [plants widespread in our area]
O. humifusa var. humifusa

1 Spines present.
4 Spines strongly and retrorsely barbed; joints slender, (2-) 3-6 (-13) cm long, 2-5 (-7) cm broad, easily detached from the plant; spines to 3.7 cm long, \(0-2\) per areole (usually some areoles on a plant with 2 well-developed spines); [of coastal dunes] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . O. \(\operatorname{O}\) pusilla
4 Spines not strongly and retrorsely barbed; joints broad, \(10-30 \mathrm{~cm}\) long, \(7.5-12.5 \mathrm{~cm}\) broad, not easily detached from the plant; spines to 7.5 cm long, \(0-2(-12)\) per areole; [of various habitats, including coastal dunes].
5 Spines (at least the larger) flattened throughout or basally, narrowly elliptic in cross-section, 0-11 per areole.
6 Spines 1-11 per areole, 1.2-4 (-6) cm long; pads 20-30 cm long, 5-12 cm broad ...... O. stricta var. dillenii
6 Spines 0 (-1 per areole only in marginal areoles), usually less than 2 cm long; pads 10-30 cm long, 7-15 (-25) cm broad . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . O. stricta var. stricta
5 Spines needle-like, not flattened, elliptic to circular in cross-section, 1-6 (-12) per areole.
7 Plants not mat-forming or prostrate, rising the height of several joints, commonly 3-20 dm tall; largest joints (7.5) 10-30 cm long, (5-) \(7.5-12.5 \mathrm{~cm}\) broad; spines gray, reddish-brown, or yellowish-brown; fruit \(5-7.5 \mathrm{~cm}\) long, 4-5 cm in diameter; [introduced, rarely spread or persistent from cultivation]
7 Plants low and mat-forming, usually prostrate and less than 3 dm tall, the joints usually in series of 3-5; largest joints \(3.8-10 \mathrm{~cm}\) long, \(4-6 \mathrm{~cm}\) broad; spines white, gray, or brown; fruit 2.5-4 cm long, 2-3 cm in diameter; [native].
8 Joints mostly \(7.5-10(-15) \mathrm{cm}\) long, \(5-9(-12.5) \mathrm{cm}\) broad; spines to 8 cm long; hypanthium with 7 or more areoles; style diameter \(<3.5 \mathrm{~mm}\); petals \(>3 \mathrm{~cm}\) long; [of the Coastal Plain] . . O. \(\boldsymbol{O}\). humifusa var. austrina
8 Joints mostly 5-7.5 (-12.5) cm long, 4-6.2 (-7.5) cm broad; spines to 3 cm long; hypanthiuym with 6 or fewer areoles; style diameter > 3.5 mm ; petals \(<3 \mathrm{~cm}\) long; [widespread in our area]
O. humifusa var. humifusa

Opuntia humifusa (Rafinesque) Rafinesque var. austrina (Small) Dress, Southern Prickly-pear. Cp (GA, SC): dunes, shell middens, and other dry sandy soils, mostly but not entirely on barrier islands; rare. Var. austrina (Small) Linnaeus Benson occurs throughout FL, and at scattered locations north to se. SC and west to se. TX. A third variety, var. ammophila (Small) L. Benson, is apparently endemic to FL, occurring in most of the state; it might occur in the southern portion of our area. It has more elongate joints than the other two varieties, the joints with a length-to-width ratio of 2-4 (vs. 1-2) and is a more erect plant, often 3-4 joints high. [=K, Y, Z; < O. humifusa var. humifusa - FNA, in a broader sense; = O. cumulicola Small -- S ; = O. compressa (Salisbury) J.F. Macbride var. austrina (Small) L. Benson]

Opuntia humifusa (Rafinesque) Rafinesque var. humifusa, Eastern Prickly-pear. Cp, Pd, Mt (GA, NC, SC, VA): dry open places, such as in thin soil around rock outcrops, sandhill forests and woodlands, dry barrens and woodlands, barrier island dunes, dry pastures; common (uncommon in Piedmont and Mountains). May-June; August-October. The only cactus widespread in e. North America, var. humifusa ranges from MA, MI, and e. IA, south to s. FL and c. TX, with some outlying stations farther west. Where growing in proximity to O. pusilla, the two species hybridize rather freely, sometimes producing hybrid swarms. See Doyle (1990) for discussion of the correct nomenclature for this taxon (O. compressa vs. O. humifusa). [ \(=\mathrm{K}, \mathrm{Y}, \mathrm{Z}\); < O. humifusa var. humifusa - FNA, in a broader sense; > O. compressa (Salisbury) J.F. Macbride var. compressa -- G; < O. compressa -- RAB; < O. humifusa (Rafinesque) Rafinesque -- C, F, W; > O. pollardii Britton \& Rose -- G, S; > O. impedita Small -- S; > O. macrarthra Gibbes -- S; > O. opuntia (Linnaeus) Karten -- S]
* Opuntia monacantha (Willdenow) Haworth, Common Prickly-pear. Cp (NC): frequently cultivated, rarely escaped or persistent; rare, native of \(n\). South America. May-June; August-October. [= FNA, K; ? O. vulgaris P. Miller -- RAB, Y]

Opuntia pusilla (Haworth) Nuttall, Dune Prickly-pear, Sand-bur Prickly-pear, Little Prickly-pear, Creeping Cactus. Cp (GA, NC, SC): dunes on barrier islands; uncommon. May-June; August-October. A Southeastern Coastal Plain endemic: NC (Dare County) south to FL and west to se. TX, nearly always within a few hundred meters of the sea. As mentioned by Small (1933) and RAB, this little coastal cactus is inconspicuous and often becomes attached by its retrorsely barbed-spines to the pants or shoes of people walking through the dunes. It can inflict painful wounds, the spines not easily removed from flesh or clothing because of the retrorse barbs. O. pusilla sometimes forms hybrid swarms with O. humifusa on coastal dunes (see Y for additional discussion). [= FNA, K, Z; = O. drummondii Graham -- RAB, S]

Opuntia stricta (Haworth) Haworth var. dillenii (Ker-Gawler) L. Benson. Cp (GA, NC?, SC): dunes on barrier islands; rare. Se. SC south to s. peninsular FL. This taxon was reported from NC by Small (1933), as O. tunoidea Gibbes. Benson (1982) and Doyle (1990) do not verify this distribution, showing var. dillenii reaching its northern limit along the coast in se. SC. [ \(=\mathrm{K}, \mathrm{Y}, \mathrm{Z}\); < O. stricta - FNA; > O. tunoidea Gibbes -- S]

Opuntia stricta (Haworth) Haworth var. stricta. Cp (GA, NC, SC, VA?): dunes, shell middens, sandhills, dry woodlands; rare. Sc. NC (Robeson County) and c. SC south to s. peninsular FL, with a single collection from Isle of Wight County, VA, mostly near the coast. Small (1933) describes the habitat of \(O\). stricta as "shell mounds, kitchenmiddens, and aboriginal village sites" and identifies it as the "the prickly-pears the early Spanish records tell us the aborigines feasted on for three months of each year and also cured, like figs, for food when out of season." [= K, Y, Z; < O. stricta - FNA; > O. stricta -- S (in the narrow sense)]

Small (1933) also reports O. cantabrigiensis Lynch from dunes near Beaufort, NC, based on a fragmentary 1930 collection accompanied by a photograph. Similar plants were apparently seen near Beaufort by Engelmann, prior to 1856. Benson (1982) refers the collection tentatively to O. lindheimeri Engelmann var. cuija (Griffiths \& Hare) L. Benson, treated in K as O . engelmannii Salm-Dyck var. cuija Griffiths \& Hare, a native of Mexico. Benson (1982) also states, however, that it could also be var. lindheimeri (primarily of TX and Mexico), or, indeed, O. tuna (Linnaeus) P. Miller (native to the West Indies). Benson (1982) failed to relocate the plant in the field in 1956, but stated there was "insufficient time for a thorough search." Unless relocated (and hope is fading for that, with the extensive destruction of maritime vegetation in the vicinity of Beaufort by construction), the identity of the plant will probably remain a mystery, as well as whether it represents a native species, an established population from aboriginal use, or a more recent introduction or adventive.

CAESALPINIACEAE (Caesalpinia Family) (see FABACEAE)

\section*{CALLITRICHACEAE (Water-starwort Family) (see PLANTAGINACEAE)}

\section*{CALYCANTHACEAE Lindley 1819 (Sweet-shrub Family)}

A family of 4 genera and about 8 species, shrubs and trees, of temperate e. China, temperate e. North America, temperate w. North America, and tropical ne. Australia. References: Nicely (1965); Wood (1958); Li et al. (2004); Kubitzki in Kubitzki, Rohwer, \& Bittrich (1993).

\section*{Calycanthus Linnaeus 1759 (Sweet-shrub, Strawberry-shrub, Carolina Allspice, Sweet Bubby-bush)}

A genus of 3-4 species, 1 (or 2) of e. North America, 1 of w. North America, and 1 of China (the latter sometimes segregated as a separate genus, Sinocalycanthus). References: Johnson in FNA (1997); Kubitzki in Kubitzki, Rohwer, \& Bittrich (1993); Nicely (1965)=Z; Ferry \& Ferry (1987)=Y

Calycanthus brockianus Ferry \& Ferry, Brock Sweetshrub. Mt (GA): moist slopes; rare. Endemic to mesic hardwood forests in GA (GA Special Concern). Its taxonomic validity is uncertain and controversial. [= C. brockiana -- K, Y, orthographic variant]

Calycanthus floridus Linnaeus var. floridus, Hairy Sweet-shrub. Mt (GA, NC, SC, VA), Pd (GA, NC, SC), Cp (GA, SC, VA): forested slopes and streambanks; uncommon (rare in NC and VA) (NC Watch List, VA Rare). April-May; August-September. MD and VA south and west to GA, nw. FL, AL, and s. MS, overall more southern and at lower elevations than var. glaucus (though with great overlap). [= RAB, FNA, GW, K, Y, Z; C. floridus -- F, S; C. mohrii Small -- S]

Calycanthus floridus Linnaeus var. glaucus (Willdenow) Torrey \& A. Gray, Smooth Sweet-shrub. Mt, Pd (GA, NC, SC, VA), Cp (GA, NC, SC): forested slopes and streambanks; common (rare in VA) (VA Rare). March-June; July-September. PA, WV, and KY, south to GA, nw. FL, ne. AL, overall more northern and montane than var. floridus (though with great overlap). [= C, FNA, K, Y; C. floridus var. laevigatus (Willdenow) Torrey \& A. Gray -- RAB, GW, Z; C. fertilis Walter -- F, G, S; C. nanus Loiseleur -- S; C. floridus var. oblongifolius (Nuttall) Boufford \& Spongberg]

\section*{CALYCERACEAE (Calycera Family)}

\section*{Acicarpha Antoine Laurent de Jussieu}

A genus of 5 species, of tropical America. References: DeVore (1991)=Z.
Acicarpha tribuloides Antoine Laurent de Jussieu. Cp (NC, SC): on ship's ballast near old port-cities; rare (probably no longer present), introduced from South America (native range Brazil, Uruguay, Paraguay, and Argentina). The NC and SC records were both collected by Gerald McCarthy in 1888; though the localities are not specified, the likely sites (based on his itinerary and what is known of the species) are Wilmington and Charleston. DeVore (1991) discusses ballast plants and the apparent failure of Acicarpha to naturalize in North America. This species has not been collected in our area (or North America) since 1888; it is here treated for historical interest and to increase the likelihood that it will be relocated, if it is, indeed, actually naturalized. [= K, S, Z]

\section*{CAMPANULACEAE (Bellflower Family)}
(also see SPHENOCLEACEAE)
A family of about 82 genera and 2000 species, mostly herbs, cosmopolitan. There is controversy about the circumscription of the family, specifically whether subfamily Lobelioideae should be recognized at the family level. References: Rosatti (1986)=Z; Eddie et al. (2003); Shulkina, Gaskin, \& Eddie (2003).

1 Corollas bilaterally symmetrical (zygomorphic); carpels 2 ; [subfamily Lobelioideae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . Lobelia
1 Corollas radially symmetrical (actinomorphic); carpels (2-) 3-5; [subfamily Campanuloideae].
2 Capsule dehiscent laterally (the pores nearly apical in Campanulastrum); flowers in spikes, racemes, or panicles; [mostly native species of various habitats (some of them weedy)]; [tribe Campanuleae].
3 Inflorescence spicate, the flowers sessile, mostly in the axils of well-developed leaves; corollas rotate and style straight . Triodanis
3 Inflorescence racemose or paniculate, the flowers pedicelled, sometimes axillary to well-developed leaves; corollas campanulate or funnelform, with a straight or curved style (Campanula) or rotate witha curved style

Campanula Linnaeus (Bellflower)
(also see Campanulastrum)
A genus of about 300 species, herbs (rarely shrubby), north tempearte, most diverse in s. Europe. References: Rosatti (1986)=Z; Shetler \& Morin (1986); Shetler (1982)=Y.

1 Stems weak and slender, reclining, 3-angled.
2 Corolla 4-10 mm long; pedicels divergent, the bractless portion \(0.4-4 \mathrm{~cm}\) long; corolla white to very pale blue

\section*{C. aparinoides var. aparinoides}

2 Corolla 5-13 mm long; pedicels ascending, the bractless portion 1-8 cm long; corolla pale blue

1 Stems more robust, erect, terete or nearly so
3 Flowers on long pedicels (generally longer than 40 mm long), the inflorescence a diffuse panicle; [native species of rock outcrops or rocky woodlands].
4 Corolla 6-8 mm long; leaves lanceolate, averaging about 1 cm wide, generally with prominent, often somewhat divergent teeth; [section Rapunculus] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. divaricata
4 Corolla 12-20 mm long; leaves (of the stem) linear, averaging less than 5 mm wide, generally lacking teeth (or the teeth minute and obscure); [section Campanula, subsection Heterophylla] . . . . . . . . . . . . . . . . . . . . C. rotundifolia
3 Flowers mostly on short pedicels (the upper less than 5 mm long), the inflorescence a raceme; [alien species usually of disturbed areas].
5 Capsules with pores in the apical half; [section Rapunculus, subsection Campanulastrum] ........ C. persicifolia
5 Capsules with pores at or near the base . . . . . . . . ............................................. C. rapunculoides

Campanula aparinoides Pursh var. aparinoides, Marsh Bellflower. Mt (GA, NC, VA), Pd, Cp (VA): bogs, marshes, wet meadows, seepage slopes over mafic or calcareous rocks; uncommon (rare in NC and VA Piedmont and VA Coastal Plain) (GA Special Concern, NC Rare). Late June-August; August-September. Widespread in ne. North America, south to nc. GA (Jones \& Coile 1988), KY, MO, and NE. [ \(=\mathrm{C}, \mathrm{G}\); < C. aparinoides -- RAB, K, W, Z; = C. aparinoides -- F, S, in the narrow sense]

Campanula divaricata Michaux, Southern Harebell, Appalachian Bellflower. Mt, Pd (GA, NC, SC, VA), Cp (NC): rock outcrops, cliffs, rocky summits, talus, up to at least 1850 m ; common (uncommon in Piedmont). July-October; SeptemberDecember. A broad endemic of the Southern and Central Appalachians: MD and KY south to AL and GA. [= RAB, C, F, G, K, W Z; C. flexuosa Michaux -- S]

Campanula persicifolia Linnaeus, Peachleaf Bellflower. Mt (NC): naturalized from gardens; rare, native of Eurasia. This species was reported by Small (1933) as "escaping from gardens" in w. NC; no specimens have been seen to document this occurrence. Additional documentation is needed to confirm this record. [= RAB, K, S; = Rapunculus persicifolius (Linnaeus) Fournier; = Neocodon persicifolius (L.) A.A.KolakovskiĬ \& L.B.Serdyukova]
* Campanula rapunculoides Linnaeus, Rampion Bellflower, Rover Bellflower. Mt (NC, VA), Pd, Cp (VA): disturbed areas; rare, introduced from Eurasia. June-August (-October). [= RAB, C, F, G, K, S, Z]

Campanula rotundifolia Linnaeus, Bluebell, Harebell, Bluebell-of-Scotland. Mt (NC, VA): limestone outcrops, high elevation rocky summits (in thin soil over amphibolite); rare (NC Rare, NC Rare). July-August; August-September. A circumboreal species, widespread and common in \(n\). North America and \(n\). Eurasia, southwards becoming rare, and generally limited to limestone in its occurrences in the Central Appalachians of WV and VA. It was added to the flora of NC in 1991. See Shetler (1982) for a detailed study of the species. [= C, F, G, K, Y, Z]

Campanula aparinoides var. grandiflora Holzinger ranges south to PA. It should be sought in our area. It has been variously treated at a species, variety, geographic phase, or form; its taxonomic status is uncertain. [= C, G; < C. aparinoides -- K; = C. uliginosa Rydberg -- F]

\section*{Campanulastrum Small (Tall Bellflower)}

A monotypic genus, a biennial herb, distinct from Campanula (Shulkina, Gaskin, \& Eddie 2003). As stated by Shetler \& Morin (1986), "Small's view [segregating Campanula americana into the monotypic genus Campanulastrum] appears to have increasing justification from palynological, cytological, and now seed evidence." References: Rosatti (1986)=Z; Shetler \& Morin (1986); Shulkina, Gaskin, \& Eddie (2003).
forests, especially over mafic or calcareous rocks; common (uncommon in Piedmont and rare in Coastal Plain) (SC Rare). Late June-September; August-October. This coarse annual or biennial is distributed nearly throughout e. North America. [=K, S; = Campanula americana Linnaeus -- RAB, C, F, G, W, Z]

\section*{Jasione Linnaeus (Sheep's-bit)}

References: Rosatti (1986)=Z.
* Jasione montana Linnaeus, Sheep's-bit. Cp (NC): disturbed areas in sandy soils; rare, introduced from Europe. JuneSeptember. [= C, F, G, K; J. montana var. montana -- Z]

\section*{Lobelia Linnaeus (Lobelia)}

References: Rosatti (1986)=Z; McVaugh (1936)=Y; Thompson \& Lammers (1997). Key based in part on Y, GW, and C.

1 Corolla bright red (faded in dried specimens) or very rarely white, 30-45 mm long . . . . . . . . . . . . . . . . . . . . . . . L. cardinalis
1 Corolla blue, purple, or white, \(10-33 \mathrm{~mm}\) long
2 Larger leaves in a basal rosette, elongate, either linear or linear-oblanceolate with an elongate petiole; [plants of wetlands, often growing in shallow water].
3 Leaves linear, fleshy, and hollow; [plants of the northern United States, rarely south to MD, PA, and NJ] . . . . . . . . . [L. dortmanna]
3 Leaves linear-oblanceolate, not hollow; [plants of the Southeastern Coastal Plain from NC (?) or GA southwards and westwards].
4 Calyx segments with small auricles at the base; pedicels with very small bracteoles at the base; filament tube (6-) 7-9 (-11) mm long; corolla tube not fenestrate; larger leaves \(10-30 \mathrm{~cm}\) long; plants (5-) 8-10 (-15) dm tall

4 Calyx segments not auriculate; pedicels lacking bracteoles; filemant tube \(3-4.5 \mathrm{~mm}\) long; corolla tube fenestrate; larger leaves 5-12 cm long; plants (4-) 5-6 (-13) dm tall . . . . . . . . . . . . . . . . . . . . . . . . L. paludosa
2 Larger leaves cauline; [plants collectively of a range of habitats].
5 Flowers relatively large, the corolla (including the hypanthium) 18-33 mm long, fenestrate.
6 Calyx with prominent leafy auricles; pedicels with bracteoles near the middle . . . L. siphilitica var. siphilitica 6 Calyx not auriculate; pedicels with bracteoles near the base (or sometimes near the middle in L. puberula).
L. amoena
L. elongata
L. georgiana
[L. brevifolia]
L. glandulosa
L. sp. 1
[L. puberula var. mineolana]
L. puberula var. puberula
L. puberula var. simulans

5 Flowers relatively small, the corolla (including the hypanthium) 7-22 mm long, not fenestrate (except XX).
15 Stem leaves very narrow, the largest on a plant 1-5 mm wide.
16 Pedicels lacking bracteoles (but with subtending bracts); plant perennial from rhizomes, the stem often spongy-thickened towards the base
L. boykinii

16 Pedicels bearing bracteoles near the base or middle (and also with subtending bracts); stems not spongythickened.
17 Bracteoles borne near the middle of the pedicel; [plants of northern wetlands, south to WV and PA] .
17 B...................................................................................... [L. kalmii]
17 Bracteoles borne at the base of the pedicel; [plants collectively widespread in our area]. 18 Lower lip of corolla pubescent inside at the base; corolla blue, lacking a white eye ... L. canbyi
18 Lower lip of the corolla glabrous; corolla blue, with a white eye . . . . . . . . . . . . . . . . L. nuttallii
15 Stem leaves broader, the largest on a plant > 10 mm wide.
19 Bracteoles borne near the middle of the pedicel . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . L. flaccidifolia
19 Bracteoles borne at the base of the pedicel.
[L. appendiculata var. appendiculata]
[L. appendiculata var. gattingeri]
L. inflata
L. spicata var. leptostachys
L. spicata var. scaposa
L. spicata var. spicata
[L. spicata var. campanulata]

Lobelia amoena Michaux. Mt (GA, NC, SC), Pd (GA): marshes, streambanks, seeps; common. Late July-October. W. NC and e. TN south to c. GA and ec. AL. Reported for VA by Kartesz (1999), supposedly on the basis of McVaugh (1936), but McVaugh does not record L. amoena for VA. [= RAB, C, GW, S, W, Y; L. amoena var. amoena -- K]

Lobelia boykinii Torrey \& A. Gray ex Alphonse de Candolle. Cp (GA, NC, SC): cypress ponds and depression meadows; rare (GA Special Concern). May-July (-August). NJ south to w. Panhandle FL, s. AL, and s. MS (Sorrie \& Leonard 1999). [= RAB, C, F, G, GW, K, S, Y]

Lobelia canbyi A. Gray. Cp (GA, NC, SC): pine savannas; uncommon. July-November. NJ to GA in the Coastal Plain; disjunct in Coffee County, TN, with other Coastal Plain plants. [= RAB, C, F, G, GW, K, S, Y]

Lobelia cardinalis Linnaeus, Cardinal Flower. Cp, Pd, Mt (GA, NC, SC, VA): streambanks, riverbanks, marshes, swamp forests; common. July-October. New Brunswick, Québec, Ontario, MN, CO, UT, and s. CA south to c. peninsular FL, TX, and south through Mexico and Central America to Colombia. See Thompson \& Lammers (1997). [= RAB, F, G, K, S, W, Y; L. cardinalis var. cardinalis -- C; L. cardinalis ssp. cardinalis -- GW; L. cardinalis ssp. cardinalis var. cardinalis ]

Lobelia elongata Small. Cp (GA, NC, SC, VA): marshes, bogs, pine savannas; common. August-October. A Southeastern Coastal Plain endemic: DE to se. GA. [= C, F, G, GW, K, S, Y; L. elongata -- RAB, in part]

Lobelia flaccidifolia Small. \(\mathrm{Cp}(\mathrm{GA})\) : depression ponds, swampy woods along rivers and streams; common. JuneSeptember. E. GA south into FL. [= GW, K, S; L. halei Small - Y]

Lobelia floridana Chapman. Cp (GA, NC?): wet pine savannas and flatwoods, depression ponds; rare. Se. GA (Jones \& Coile 1988), Panhandle FL west to LA; disjunct in se. NC? McVaugh (1936) reports this species for Wilmington, New Hanover County, NC, based on a collection by MacFarlane in 1909 (PENN). This record seems unlikely and needs confirmation; mislabeling is a possibility. [= GW, K, S, Y]

Lobelia georgiana McVaugh. Cp, Pd (GA, NC, SC, VA), Mt (NC): swamps, wet places; common. August-October. See McVaugh (1940) for an explanation of the need to replace the name L. glandulifera with L. georgiana. [= C, F, G, GW; L. elongata -RAB, in part; L. amoena Michaux var. glandulifera A. Gray -- K; L. glandulifera (A. Gray) Small -- S, Y; L. amoena -- W, infraspecific taxa not distinguished]

Lobelia glandulosa Walter. Cp (GA, NC, SC, VA?), Pd (GA, NC, SC): pine savannas, flatwoods, depression ponds; common. September-October. [= RAB, C, F, GW, K, S, W, Y]

Lobelia inflata Linnaeus. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): July-November. [= RAB, C, F, G, GW, K, S, W, Y]
Lobelia nuttallii J.A. Schultes. Cp (GA, NC, SC, VA), Mt (GA, NC, SC), Pd (NC, SC): May-November. [= RAB, C, F, G, GW, K, S, W, Y]

Lobelia paludosa Nuttall. Cp (GA): FL and se. GA (Jones \& Coile 1988). [= F, GW, K, S, Y]
Lobelia puberula Michaux var. puberula. Cp (GA, NC, SC, VA), Pd (NC, SC, VA): Late July-October. [= F, K; L. puberula -RAB, C, G, GW, S, W, Y, infraspecific taxa not distinguished]

Lobelia puberula Michaux var. simulans Fernald. Mt, Pd (GA, NC, SC, VA), Cp (GA, VA): Late July-October. [= F, K; L. puberula -- RAB, C, G, GW, S, W, infraspecific taxa not distinguished; L. puberula "form a" - Y]

Lobelia siphilitica Linnaeus var. siphilitica, Great Blue Lobelia. Mt (GA, NC, VA), Pd, Cp (VA): Late July-October. [= C, F, G, GW, K, Y; L. siphilitica -- RAB, S, W, infraspecific taxa not distinguished]

Lobelia sp. 1. \(\mathrm{Cp}(\mathrm{NC}, \mathrm{SC})\) : seepages; rare. Endemic to the Sandhills Region of NC and SC. Under study by A. Bert Pittman. ["L. batsonii" in prep.]

Lobelia spicata Lamarck var. leptostachys (Alphonse de Candolle) Mackenzie \& Bush. (GA, NC, SC, VA) Late May-August. [= C, F, G, K, Y; L. spicata -- RAB, GW, W, infraspecific taxa not distinguished; L. leptostachys Alphonse de Candolle -- S]

Lobelia spicata Lamarck var. scaposa McVaugh. (NC, SC, VA): Late May-August. [= C, F, G, K, Y; L. spicata -- RAB, GW, S, W, infraspecific taxa not distinguished]

Lobelia spicata Lamarck var. spicata. (GA, NC, SC, VA): Late May-August. [= F, G, K; L. spicata var. spicata -- C, in part only; L. spicata -- RAB, GW, S, W, infraspecific taxa not distinguished; L. bracteata Small -- S; L. spicata var. originalis - Y]

Lobelia appendiculata Alphonse de Candolle var. appendiculata. AL westwards to KS, OK, and TX. [= K; L. appendiculata GW, S, Y, in a narrow sense]

Lobelia appendiculata Alphonse de Candolle var. gattingeri (A. Gray) McVaugh. Endemic to sc. KY south through c. TN to \(n\).
AL. [= K; L. gattingeri A. Gray -- GW, S, Y]
Lobelia brevifolia Nuttall ex Alphonse de Candolle Savannas, flatwoods, and bogs, endemic to the East Gulf Coastal Plain of FL, AL, MS, and LA. [= GW, K, S, Y]

Lobelia dortmanna Linnaeus, Water Lobelia, south to NJ, MD, and PA (Kartesz 1999). [= C, F, G, K, Y]
Lobelia kalmii Linnaeus, south to WV and PA. [= C, F, G, K, Y]
Lobelia puberula Michaux var. mineolana F. Wimmer. East to AL and KY. [= K; L. puberula - C, G, GW, S, infraspecific taxa not distinguished; L. puberula "form d" - Y]

Lobelia spicata Lamarck var. campanulata McVaugh. South to MD, WV, PA. [=F, G, K, Y; L. spicata var. spicata -- C, in part; L. spicata -- RAB, GW, S, W, infraspecific taxa not distinguished]

Platycodon Alphonse de Candolle (Japanese Bellflower, Balloonflower)
A monotypic genus, an herb, of ne. Asia. References: Rosatti (1986)=Z.
* Platycodon grandiflorum (Jacquin) Alphonse de Candolle, Japanese Bellflower, Balloonflower. Cp (NC): disturbed areas; rare, introduced from e. Asia. [= RAB, K, Z]

\section*{Triodanis Rafinesque ex Greene (Venus's Looking-glass)}

A genus of 8 species, annual herbs, American and s. Europe. References: McVaugh (1945)=Z; McVaugh (1948). Key based on Z.

1 Openings of the capsule linear, 0.2-0.4 mm wide; seeds minutely tuberculate in longitudinal lines
[T. holzingeri]
1 Openings of the capsule broadle elliptic, oval, or rounded, \(0.5-1.5 \mathrm{~mm}\) wide; seeds either muriculate over the entire surface or nearly to quite smooth.
2 Pores at or very near the apex of the capsule; seeds smooth and highly polished; open (chasmogamous) corolla usually 1 (the terminal), the others usually closed (cleistogamous) . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . T. biflora
2 Pores well below the apex of the capsule (usually 1-1.5 mm below), usually about midway between apex and base; seeds muriculate or smooth and lustrous; open (chasmogamous) corollas usually several . . . . . . . . . . . . . . . . . T. perfoliata

Triodanis biflora (Ruiz \& Pavón) Greene. Cp, Pd (GA, NC, SC, VA), Mt (GA, NC, SC): roadsides, gardens, glades, disturbed areas; common (rare in Mountains). April-June. E. VA, KY, KS, AZ, and OR south to Mexico; South America. [= C, K, Z; = Specularia biflora (Ruiz \& Pavón) Fischer \& C.A. Meyer -- RAB, F, G; = T. perfoliata var. biflora (Ruiz \& Pavón) Bradley - W]

Triodanis perfoliata (Linnaeus) Nieuwland. Cp, Pd, Mt (GA, NC, SC, VA): roadsides, gardens, glades, disturbed areas; common. April-June. ME and British Columbia south to FL and Mexico; West Indies; Ecuador. [= C, K, Z; = Specularia perfoliata (Linnaeus) Alphonse de Candolle -- RAB, F, G; = T. perfoliata var. perfoliata - W]

Triodanis holzingeri McVaugh, east to TN. [=K, Z; Specularia holzingeri (McVaugh) Fernald - F]

\section*{Wahlenbergia Schrader ex Roth (Wahlenbergia)}

References: Rosatti (1986)=Z.
* Wahlenbergia marginata (Thunberg) Alphonse de Candolle. Cp (GA, NC, SC), Pd (GA): sandy soils along roadsides and in fields; common, introduced from e. Asia and Oceania. Apparently only recently introduced in se. United States, the earliest recorded date 1937 in Alachua County, FL (Rosatti 1986), but now quite common on sandy roadsides. [= RAB, K, Z]

\section*{CANNABACEAE Endl. 1827 (Hops Family)}

As circumscribed to include the Celtidaceae, a family of 14 genera and about 120 species, trees, shrubs, woody vines, herbs, and herbaceous vines, of cosmopolitan distribution. Zavada \& Kim (1996) discuss compelling reasons to recognize the Celtidaceae as a family distinct from the Ulmaceae. The distinctiveness of the Celtidaceae from the Cannabaceae and Moraceae is more questionable; and Sytsma et al. (2002) conclude that Celtidaceae should be considered a part of Cannabaceae. References: Small in FNA (1997); Kubitzki in Kubitzki, Rohwer, \& Bittrich (1993); Sherman-Broyles, Barker, \& Schulz in FNA (1997); Zavada \& Kim (1996); Todzia in Kubitzki, Rohwer, \& Bittrich (1993); Sytsma et al. (2002).

\section*{Cannabis Linnaeus 1753 (Hemp, Marijuana, Marihuana)}

A genus of 1-3 species, herbs, originally native to c. Asia. Cannabis was formerly widely cultivated nearly worldwide for the fiber hemp; it is now better known as the source of the drug marijuana. References: Small in FNA (1997); Hillig \& Mahlberg (2004); Kubitzki in Kubitzki, Rohwer, \& Bittrich (1993).
* Cannabis sativa Linnaeus, Hemp, Marijuana. Mt, Pd, Cp (GA, NC, SC, VA): disturbed areas and cultivated plots; uncommon, introduced from Asia. June-October. Though perhaps not truly naturalized or persistent, Cannabis is treated here since clandestine cultivated plots will be encountered fairly regularly by the field biologist, especially in fairly remote areas in the mountainous parts of our area. [= F, FNA, G; > C. sativa Linnaeus ssp. sativa var. sativa -- C, K]

\section*{Celtis Linnaeus 1753 (Hackberry)}

A genus of about 100 species, trees, shrubs, and woody vines, widespread in tropical, subtropical, and temperate regions worldwide. References: Todzia in Kubitzki, Rohwer, \& Bittrich (1993).

\footnotetext{
1 Branches armed with short spines
[C. iguanaea]
}

1 Branches unarmed.
2 Leaf blades mostly more than \(2 \times\) as long as wide, the tip attenuate and long-acute to long-acuminate, the base cuneate to rounded; leaf margins entire or with a few teeth on each margin; leaves glabrous or nearly so (except the margins often ciliate); [large trees, mostly of floodplains, but also in upland situations over calcareous substrates such as limestone, dolostone, and shell middens] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. Iaevigata
2 Leaf blades mostly less than \(2 \times\) as long as wide, the tip obtuse to short-acuminate, the base slightly to strongly cordate at least on one side; leaf margins entire or with a few teeth on each margin (the plant then a shrub or small tree of rocky places) or distinctly serrate with 10-35 teeth on each margin; leaves scabrous above, at least towards the tip; [shrubs to medium trees, of floodplains, moist slopes, and dry rocky woodlands, barrens, and glades].
3 Leaves 5-12 cm long, toothed well below the middle; fruit 7-14 mm long, ellipsoid or subglobose, dark orange, purple, or black, on a pedicel \(7-25 \mathrm{~mm}\) long; [small to medium trees of dry to moist habitats] . . . . . . . . . . . C. occidentalis
3 Leaves 2-8 cm long, toothed only near the tip if at all; fruit \(5-9 \mathrm{~mm}\) long, subglobose or essentially spherical, orange, red, or brown, on a pedicel \(3-13 \mathrm{~mm}\) long; [shrubs or small twisted trees of dry, rocky habitats]
C. tenuifolia

Celtis laevigata Willdenow, Southern Hackberry, Sugarberry. Cp, Pd, Mt (GA, NC, SC, VA): bottomland forests, especially on natural levees, upland calcareous forests and woodlands, shell middens; common (uncommon in the Mountains). April-May;
August-October. [= RAB, C, FNA, G, GW, W; < C. laevigata var. laevigata -- F, K; < C. laevigata var. smallii (Beadle) Sargent -- F; < C. mississippiensis Bosc -- S; < C. smallii Beadle -- S]

Celtis occidentalis Linnaeus, Northern Hackberry. Mt, Pd, Cp (GA, NC, VA): xeric to mesic glades, outcrops, barrens, woodlands, and bottomland forests, usually over calcareous substrate; common (rare in NC). April-May; August-October. [= C, FNA, G, K, S, W; = C. occidentalis var. occidentalis -- RAB, in the broad sense; < C. occidentalis var. canina (Rafinesque) Sargent -\(\mathrm{F}, \mathrm{K}\); < C. occidentalis var. occidentalis -- F; < C. occidentalis var. pumila (Pursh) A. Gray -- F]

Celtis tenuifolia Nuttall, Dwarf Hackberry, Georgia Hackberry. Mt (GA, NC, VA), Pd, Cp (GA, NC, SC, VA): xeric to mesic glades, outcrops, barrens, woodlands, often over calcareous substrate; common (uncommon in Mountains of NC). April-May; August-October. [=C, FNA, G, K, W; = C. occidentalis var. georgiana (Small) Ahles -- RAB; > C. tenuifolia var. georgiana (Small) Fernald \& Schubert -- F; > C. tenuifolia var. tenuifolia -- F; C. georgiana Small -- S]

Celtis iguanaea (Jacquin) Sargent, Iguana Hackberry. Shell-middens and calcareous coastal sites. AL, FL, West Indies, American tropics. [= K; = Momisia iguanaea (Jacquin) Rose \& Standley - S]

\section*{Humulus Linnaeus 1753 (Hops)}

A genus of 2 species, herbaceous vines, of temperate regions of the Northern Hemisphere. References: Small (1978)=Z; Small in FNA (1997); Kubitzki in Kubitzki, Rohwer, \& Bittrich (1993). Key adapted from Z.

1 Veins on lower surface of leaves armed with rigid, spinulose hairs; bracts of pistillate flowers spinulose-ciliate; most leaves 5-9 lobed
1 Veins on lower surface of leaves more or less pubescent with lax, weak hairs, but lacking rigid, spinulose hairs; bracts of pistillate flowers smooth-margined; most leaves 1-3 lobed.
2 Lower surfaces of leaves (measured on middle lobe of 4-6 cm long leaves of flowering or fruiting branches) with usually with less than 20 hairs per cm of length of midrib; glands (measured on leaves as above) fewer than 25 per 10 square mm of intervein lower leaf surface; [introduced variety, sometimes showing introgression with native varieties]
H. Iupulus var. lupulus

2 Lower surfaces of leaves (measured on middle lobe of 4-6 cm long leaves of flowering or fruiting branches) usually with more than 20 hairs per cm of length of midrib; glands (measured on leaves as above) more than 25 per 10 square mm of intervein lower leaf surface; [native varieties, though often weedy and sometimes showing introgression with var. lupulus]. 3 Lower surfaces of leaves (measured on middle lobe of \(4-6 \mathrm{~cm}\) long leaves of flowering or fruiting branches) conspicuously pubescent between the veins and on the veins, with more than 100 hairs per cm of length of midrib; smaller leaves unlobed (less commonly 3-lobed)
H. lupulus var. pubescens

3 Lower surfaces of leaves (measured on middle lobe of 4-6 cm long leaves of flowering or fruiting branches) not conspicuously pubescent, the pubescence usually limited to the veins, usually with less than 100 hairs per cm of length of midrib; smaller leaves generally 3-lobed
H. lupulus var. lupuloides
* Humulus japonicus Siebold \& Zuccarini, Japanese Hops. Mt (VA), Pd (GA, NC, SC, VA), Cp (NC, VA): disturbed areas, particularly in rich, alluvial soils, where it has become a serious weed along major VA rivers; common (rare in NC and SC), introduced from Asia, native to Japan, Taiwan, and China. June-October; July-October. [= RAB, C, F, FNA, G, K, W, Z]

Humulus lupulus Linnaeus var. Iupuloides E. Small, Northeastern Hops. Pd, Mt (VA), Cp (NC, VA): disturbed areas, particularly in rich, alluvial soils; uncommon (rare in NC and in VA Coastal Plain) (NC Watch List). July-August; September-October. Native to ne. and nc. North America (Nova Scotia and Newfoundland south to VA and NC, west to NE, MT, and Alberta). It is not clear whether its occurrence in NC is native or introduced from further north. The 3 varieties (two native and one introduced) in our area are subtly different, the differences apparently sometimes further obscured by introgressive hybridization. [= C, FNA, K, Z; < H. lupulus -- RAB, F, G, S, W]
* Humulus lupulus Linnaeus var. Iupulus, Brewer's Hops, European Hops. Pd (VA): disturbed areas; rare, introduced from Europe. July-August; September-October. The European var. lupulus is (of course) one of the key ingredients of beer. [= C, FNA, K, Z; < H. Iupulus -- RAB, F, G, S, W]

Humulus lupulus Linnaeus var. pubescens E. Small, Midwestern Hops. Mt (GA, NC, VA), Pd (NC, VA), Cp (VA): disturbed areas, particularly in rich, alluvial soils; rare (NC Watch List). July-August; September-October. This variety of the irregularly circumpolar H. lupulus is native to c. North America (NY and PA south to NC and ne. GA and west to MN, NE, KA, and AR). It is not
clear whether the few occurrences east of the Blue Ridge (including those in NC and VA) are native or adventive from further west. [= C, FNA, K, Z; < H. lupulus -- RAB, F, G, S, W]

\section*{CAPPARACEAE (Caper Family) (see CLEOMACEAE)}

\section*{CAPRIFOLIACEAE (Honeysuckle Family) (also see ADOXACEAE, DIERVILLACEAE, and LINNAEACEAE)}
\{As not here circumscribed, a family of about 13 genera and 260 species, shrubs, trees, and less typically herbs and vines, mainly north temperate and boreal.\} Circumscription of the family is controversial. Various segregate families (or reassignments) of taxa traditionally placed in the Caprifoliaceae have been proposed, including the transfer of Sambucus and Viburnum to the Adoxaceae, placement of Diervilla and Weigela in the Diervillaceae (Backlund \& Pyck 1998), placement of Abelia and Linnaea in the Linnaeaceae (Backlund \& Pyck (1998), and retention of Lonicera, Symphoricarpos, and Triosteum in a much more narrowly circumscribed Caprifoliaceae. Alternatively, all these taxa could be included in the Caprifoliaceae, along with Dipsacaceae and Valerianaceae, as a very broadly circumscribed Caprifoliaceae. References: Backlund \& Pyck (1998); Ferguson (1966a),

\section*{Lonicera Linnaeus (Honeysuckle)}

A genus of about 180 species, shrubs and vines, mainly north temperate. References: Ferguson (1966a)=Z; Rehder (1903)=Y; Green (1966).

1 Flowers in opposite 3-flowered cymules, borne in terminal clusters subtended by connate leaves; corolla red and yellow (or yellowish-orange only); twining vine or shrub with vining tendencies (in L. flava the "vininess' sometimes not apparent).
2 Corolla tube (20-) \(30-50 \mathrm{~mm}\) long; corolla lobes \(4-8 \mathrm{~mm}\) long, more or less radially symmetrical; [plants of a wide variety of habitats, primarily in the Piedmont and Coastal Plain].
3 Leaves ciliate, pubescent on the upper surface; hypanthium glandular or glabrous; stems glandular or glabrous ....
L. sempervirens var. hirsutula

3 Leaves entire, glabrous on the upper surface; hypanthium glabrous; stems glabrous
Corolla tube \(10-30 \mathrm{~mm}\) long; corolla lobes \(8-15 \mathrm{~mm}\) long, unequally divided into 2 lips (4 lobes on the upper side and one lobe on the lower side); [of ridgetops, rocky slopes, granite domes, and bogs of the Mountains, or of areas to the north or west of the primary area].
4 Leaves pubescent on the upper surface; [of moist forests, south to PA] . . . . . . . . . . . . . . . . . . . . . . . . . [L. hirsuta]
4 Leaves glabrous on the upper surface.
5 Fused leaves immediately below the inflorescence glaucous on the upper surface, rounded or emarginate; [of c. TN and other areas west and north of our primary area]
[L. reticulata]
5 Fused leaves immediately below the inflorescence green on the upper surface, pointed to mucronate.
6 Corolla tube 30-35 mm long; leaves gray beneath; [of soil mats on dome outcrops of s. NC, SC, and GA and westwards]
. . L. flava
6 Corolla tube \(15-25 \mathrm{~mm}\) long; leaves strongly white-glaucous beneath; [of rocky forests, ridgetops, and bogs of n . NC, VA, and northwards].
7 Hypanthium glabrous; leaves glabrous beneath; style glabrous to sparsely hairy
7 Hypanthium densely glandular; leaves sparsely to densely villous beneath; style hirsute
1 Flowers in peduncled pairs in the axils of leaves, not subtended by connate leaves; corolla white to pastel pink or yellow; plant an erect shrub or (L. japonica) a trailing or climbing vine.
8 Trailing or climbing vine; corolla \(30-50 \mathrm{~mm}\) long; fruit black at maturity; leaves of vigorous shoots often pinnately lobed.
8 Upright shrub; corolla \(7-25 \mathrm{~mm}\) long; fruit red or yellow at maturity; leaves unlobed.
9 Branches with solid and continuous, white pith; [native and exotic species].
10 Corolla lobes 5, nearly equal; ovaries separate, divergent; [native species of cool moist forests and bogs] . .
10 Corolla lobes fused into a 4-lobed lip and a 1-lobed lip; ovaries fused; [exotic species].
11 Branches glabrous; corolla glabrous on the exterior L. fragrantissima

11 Branches retrorsely hispid with reddish-brown hairs; corolla pilose on the exterior . . . ..... L. standishii
9 Branches hollow between the nodes, with tannish pith; [exotic species, many of them seriously invasive and likely to be encountered in natural areas].
12 Peduncles shorter than or equal to the subtending petiole; leaves ovate (broadest near the base) and distinctly long-acuminate .......................................................................... L. maackii
12 Peduncles longer than the subtending petiole; leaves elongate (broadest near the middle) and obtuse to acute (rarely short-acuminate).
13 Leaves glabrous; peduncles \(15-25 \mathrm{~mm}\) long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . L. tatarica
13 Leaves pubescent, at least on the lower surface; peduncles 5-15 mm long.

14 Corolla pink (aging to yellow), nearly glabrous on the exterior, barely bulging on one side at the base; leaves thinly pubescent beneath . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . L. \(\mathbf{L}\).bella
14 Corolla white (aging to yellow), pubescent on the exterior, distinctly bulging on one side at the base; leaves rather densely grayish-pubescent beneath.
15 Bracts and sepals ciliate, not glandular; ovary lacking glands; leaf blades broadest at or below the middle . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . L. morrowii
15 Bracts and sepals glandular; ovary glandular; leaf blades broadest beyond the middle
L. xylosteum
* Lonicera \(\times\) bella Zabel [L. morrowii \(\times\) tatarica], Pretty Honeysuckle. Pd (NC, SC): forests, woodlands, fencerows, suburban woodlands; uncommon, introduced from Eurasia. April-May. [= RAB, C, F, K, Z; = L. bella -- G; = L. tatarica \(\times\) morrowii -Y\(]\)

Lonicera canadensis Bartram ex Marshall, American Fly-honeysuckle. Mt (GA, NC, VA): shrubby mountain bogs at high elevations, bouldery northern hardwood forests, hemlock and spruce swamps; rare (GA Special Concern). May-June; June-July. South Nova Scotia to Saskatchewan, south to PA, w, NC, n. GA, OH, IN, and MN. [= RAB, C, F, G, K, W, Y, Z; = Xylosteon ciliatum Pursh -- S]

Lonicera dioica Linnaeus var. dioica. Mt (GA, NC, VA): shrubby mountain bogs at high elevations; rare (GA Special Concern\}. June-August; August-September. MA and Québec west to WI, south to NJ, NC, and IN. [= C, F, G, Z; < L. dioica -RAB, K, W; = L. dioica -- S, Y]

Lonicera dioica Linnaeus var. orientalis Gleason. Mt (NC, VA): \{habitats\}; rare. June-August; August-September. S. Ontario west to s. MI, south to w. VA and w. NC. [= C, G; < L. dioica -- RAB, K, W; < L. dioica var. glaucescens (Rydberg) Butters -F, Z; < L. glaucescens (Rydberg) Rydberg -- S, Y]

Lonicera flava Sims, Yellow Honeysuckle. Mt (GA, NC, SC), Pd (GA): in soil mats around granitic domes; uncommon. AprilMay; July-August. W. NC, KY, and MO, south to GA and AR. [= RAB, C, F, G, K, S, W, Y; > L. flava - F, S, in a narrower sense; > L. flavida Cockerell ex Rehder -- F, S; > L. flava var. flava - Z; > L. flava var. flavescens Gleason - Z]
* Lonicera fragrantissima Lindley \& Paxton, Sweet-breath-of-spring. Pd (GA, NC, VA), Cp, Mt (VA), \{SC\}: forests, woodlands, old house sites; common and invasive, introduced from China. February-early April; April-May. [= RAB, K, Y, Z; = Xylosteon fragrantissimum (Lindley \& Paxton) Small -- S]
* Lonicera japonica Thunberg, Japanese Honeysuckle. Cp, Pd, Mt (GA, NC, SC, VA): nearly ubiquitous, especially common in the Piedmont and Coastal Plain and in mesic habitats; common, introduced from e. Asia. April-June; August-October. Schweitzer \& Larson (1999) report on physiological characteristics that make L. japonica a successful invasive species. [= RAB, C, F, G, GW, K, \(\mathrm{W}, \mathrm{Z} ;>\) L. japonica var. chinensis (P.W. Watson) Baker -- F, Y; > L. japonica var. japonica - F, Y; = Nintooa japonica (Thunberg) Sweet -- S]
* Lonicera mackii (Ruprecht) Maximowicz, Amur Honeysuckle. Pd (GA, NC, SC, VA), Cp (NC, VA), Mt (GA, VA): suburban woodlands, moist forests, fencerows; common, introduced from e. Asia (Korea, China, Japan). May-June. Aggressively invasive in the vicinity of DC. [= C, K, Y, Z]
* Lonicera morrowii A. Gray, Morrow's Honeysuckle. Mt (NC, SC, VA), Pd, Cp (VA): forests, woodlands, old house sites, suburban woodlands; common, introduced from Japan. April. Seriously invasive in WV, MD, DC, and northwards; first reported for NC by Leonard (1971b) and for SC by Hill \& Horn (1997). [= C, K, W, Y; = L. morrowi -- F, G, orthographic variant]

Lonicera sempervirens Linnaeus var. hirsutula Rehder, Coral Honeysuckle. Pd (NC, VA), Mt (NC): \{habitat\}; rare. VA and NC southwest to AL. [= C, F, G, K, Y; < L. sempervirens -- RAB, GW, W, Z; < Phenianthus sempervirens (Linnaeus) Rafinesque -S]

Lonicera sempervirens Linnaeus var. sempervirens, Coral Honeysuckle. Cp, Pd, Mt (GA, NC, SC, VA): dry forests and woodlands; common. March-July (and sporadically to November); July-September. CT to OK, south to FL and TX; and more widely distributed as an escape from cultivation. [=C,F,G,K, Y; <L. sempervirens -- RAB, GW, W, Z; >L. sempervirens var. sempervirens - F; > L. sempervirens var. minor Aiton -- F; < Phenianthus sempervirens (Linnaeus) Rafinesque -- S]
* Lonicera standishii Jacques, Standish's Honeysuckle. Pd (NC): forests, woodlands, old home sites; rare but locally abundant, introduced from China. Invasive in c. NC (Uwharrie National Forest). Also reported from KY (Jones 2005), se. PA (Rhoads \& Klein 1993) and MD (Kartesz 1999). [= K, Y]
* Lonicera tatarica Linnaeus, Tartarian Honeysuckle. Pd, Cp, Mt (VA): disturbed forests; uncommon, introduced from Central Asia. [= C, F, G, K; > L. tatarica var. tatarica -- Y]
* Lonicera xylosteum Linnaeus, European Fly-honeysuckle. Mt (VA): disturbed forests; uncommon, introduced from Europe and Asia. [= C, F, G, K; > L. xylosteum var. xylosteum -- Y]

Lonicera hirsuta Eaton, Hairy Honeysuckle. Québec west to Manitoba, south to c. PA (Rhoads \& Klein 1993) and MN. [= K, Y; > L. hirsuta var. interior Gleason - C]

Lonicera reticulata Rafinesque. NY west to WI, south to TN and AR. In nc. TN (Davidson County) (Chester, Wofford, \& Kral 1997; Wofford \& Chester 2002). [= K; > L. prolifera (G. Kirchner) Booth ex Rehder var. prolifera -- C; = L. sullivantii A. Gray -Y ; = L. prolifera - Z]

\section*{Symphoricarpos Duhamel (Snowberry, Coralberry)}

A genus of about 17 species, shrubs, of North America and e. Asia. References: Jones (1940); Ferguson (1966a)=Z.
Corolla 2-4 mm long; fruits pink to purple . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. orbiculatus
1 Corolla \(5-9 \mathrm{~mm}\) long; fruits white.
2 Fruit 6-10 (-12) mm in diameter; young twigs puberulent; leaves usually pubescent beneath; shrub usually less than 1 m tall; [native] S. albus var. albus

Symphoricarpos albus (Linnaeus) Blake var. albus, Common Snowberry. Mt (VA): limestone woodlands; rare (VA Rare). Québec west to s. AK, south to w. VA, WV, MI, MN, and CA. Var. albus is the more eastern variety. [= C, F, G, K, Z; < S. albus -RAB, S, W]
* Symphoricarpos albus (Linnaeus) Blake var. laevigatus (Fernald) Blake, Pacific Snowberry. Pd (NC, VA?): disturbed areas; rare, introduced from w. North America. [= C, F, G, K, Z; < S. albus -- RAB, S, W; S. rivularis Suksdorf]

Symphoricarpos orbiculatus Moench, Coralberry. Mt, Pd (GA, NC, SC, VA), Cp (NC, VA): moist to dry forests, woodlands, and thickets, especially over mafic or calcareous rocks; common. Late July-September; September-November (and often persisting well into winter). CT west to \(I N, M N\), and \(C O\), south to \(F L, T X\), and Mexico. [= RAB, \(C, F, G, K, W, Z\); = S. symphoricarpos (Linnaeus) MacM. -- S]

Symphoricarpos occidentalis Hooker, Western Snowberry, in PA, MD, KY. \{investigate\} [= K] \{not yet keyed\}

Triosteum Linnaeus (Horse-gentian, Feverwort)
A genus of 6 species, rather woody herbs, of e. Asia (3 species) and e. North America (3 species); the 3 North American species form one clade, the 3 Asian species another (Gould \& Donoghue 2000). References: Gould \& Donoghue (2000); Ferguson (1966a) \(=\) Z.

1 Longer (nonglandular) hairs of the stem 1.5-3 mm long; corolla greenish-yellow; leaves 1.5-6 cm wide.
2 Lower leaf surface glabrous or pubescent only along the main veins; leaves averaging \(4 \times\) as long as wide \(\qquad\)
........................................................................... . T. angustifolium var. angustifolium

2 Lower leaf surface densely puberulent; leaves averaging \(2 \times\) as long as wide . . . . . . . . T. angustifolium var. eamesii
1 Longer (nonglandular) hairs of the stem 0-1.5 mm long (or with a very few longer hairs); leaves 4-15 cm wide; corolla greenishyellow to purple.
3 Most the stem hairs 1-2 mm long, mostly not gland-tipped; leaves predominantly not connate (or if 1-3 pairs connate, then only 1-2 cm wide at the joined base); style equalling or slightly shorter than the corolla (rarely exserted)
T. aurantiacum var. aurantiacum

3 Most the stem hairs 0-0.5 mm long (sometimes with a few scattered longer hairs), gland-tipped; leaves predominantly connate-perfoliate, the joined base \(3-9 \mathrm{~cm}\) wide); style exserted beyond the corolla
T. perfoliatum

Triosteum angustifolium Linnaeus var. angustifolium, Smooth Lesser Horse-gentian. \{Pd (NC, VA), Mt (GA, VA): distributional and habitat information needed for two varieties\} (GA Rare). April-May; July-August. CT west to Ontario and MO, south to NC, nw. GA (Jones \& Coile 1988), AL, and LA. [= C, F, G; < T. angustifolium -- RAB, K, S, W, Z]

Triosteum angustifolium Linnaeus var. eamesii Wiegand, Hairy Lesser Horse-gentian. \{Pd (NC, VA), Mt (VA): distributional and habitat information needed for two varieties\}. April-May; July-August. CT and NJ south to NC. [= C, F, G; < T. angustifolium -RAB, K, S, W, Z]

Triosteum aurantiacum Bicknell var. aurantiacum. Mt (GA?, NC, VA), Pd (NC, VA): woodlands and forests in circumneutral soils, particularly those over mafic or calcareous rocks; uncommon (GA Rare, NC Watch List). Late May-early June; AugustOctober. Québec west to MN, south to GA, KY, and OK; other varieties are more restricted and midwestern or northern in distribution. [= C, F, K; <T. aurantiacum -- RAB, S, W, Z; <T. perfoliatum Linnaeus var. aurantiacum (Bicknell) Wiegand -- G]

Triosteum perfoliatum Linnaeus, Perfoliate Horse-gentian. Mt (GA, NC, SC, VA), Pd (NC, SC, VA), Cp (VA): woodlands and forests in circumneutral soils, particularly those over mafic or calcareous rocks; uncommon. Late May-early June; August-October. MA west to MN, south to n. SC, n. GA (Jones \& Coile 1988), and OK. [= RAB, C, F, K, S, W, Z; T. perfoliatum var. perfoliatum -- G]

\section*{CARYOPHYLLACEAE A.L. de Jussieu (Pink Family)}

A family of about 86 genera and 2200-3000 species, herbs, shrubs, and trees, nearly cosmopolitan, but mostly Northern Hemisphere. References: Rabeler \& Hartman in FNA (2005); Bittrich in Kubitzki, Rohwer, \& Bittrich (1993).

1 Stipules present and readily apparent, scarious or hyaline.
\begin{tabular}{|c|c|c|}
\hline 2 & Fruit a utricle; seed 1 per fruit; petals absent; [subfamily Paronychioideae] & Paronychia \\
\hline 2 & Fruit a capsule; seeds 3-many per fruit; petals present; [subfamily Polycarpoideae] & Key A \\
\hline \multicolumn{3}{|l|}{Stipules absent.} \\
\hline 3 & Sepals fused into a toothed or lobed tube; [subfamily Caryophylloideae] & Key B \\
\hline 3 & Sepals distinct, or slightly fused at their bases; [subfamily Alsinoideae] & Key C \\
\hline
\end{tabular}

\section*{Key A -- Polycarpoideae}

1 Stem leaves subulate, 1-2 mm long, pectinate-fringed at the base; basal rosette leaves spatulate (usually withering quickly after overwintering; stems wiry, stiff, subdichotomously branched; [of xeric sands on the Coastal Plain from se. VA southwards]

Stipulicida
1 Stem leaves larger, mostly both longer and broader, not pectinate-fringed at the base; basal rosette present or absent; stems
either thicker, more flexuous, or not subdichotomously branched (except some Paronychia).
\begin{tabular}{|c|c|c|}
\hline & \multicolumn{2}{|l|}{Leaves appearing verticillate, 10-16 per node, filiform to linear} \\
\hline \multirow[t]{7}{*}{2} & Leaves opposite or in whorls of 4, linear to ovate or spatulate. & \\
\hline & 3 Fruit 1-seeded, an indehiscent utricle; petals absent & [Paronychia in Paronychioideae] \\
\hline & 3 Fruit many-seeded, a dehiscent capsule; petals present. & \\
\hline & 4 Leaves mostly in whorls of 4, obovate-spatulate, 2-8 mm long & Polycarpon \\
\hline & 4 Leaves opposite, linear or orbicular, 5-40 mm long. & \\
\hline & 5 Leaves orbicular-ovate; styles partly united & Drymaria \\
\hline & 5 Leaves linear; styles separate & \\
\hline
\end{tabular}

\section*{Key B -- Caryophylloideae}

1 Calyx immediately subtended by 1-3 pairs of bracts.
\begin{tabular}{|c|c|c|}
\hline 2 & Calyx 20-40-nerved & Dianthus \\
\hline 2 & Calyx 15-nerved & Petrorhagia \\
\hline \multicolumn{3}{|l|}{Calyx lacking subtending bracts.} \\
\hline 3 & Calyx lobes longer than the calyx tube, the lobes as long as or longer than the corolla lobes & Agrostemma \\
\hline \multirow[t]{5}{*}{3} & Calyx lobes shorter than the calyx tube, the lobes much shorter than the corolla lobes. & \\
\hline & 4 Styles 3-5 (-6); petals generally appendaged & Silene \\
\hline & 4 Styles 2; petals appendaged or not. & \\
\hline & 5 Calyx tubular, 20-nerved; petals appendaged & Saponaria \\
\hline & 5 Calyx ovoid, 5-nerved; petals not appendaged & . Vaccaria \\
\hline
\end{tabular}

\section*{Key C -- Alsinoideae}

1 Stem leaves subulate, 1-2 mm long, pectinate-fringed at the base; basal rosette leaves spatulate (usually withering quickly after overwintering; stems wiry, stiff, subdichotomously branched; [of xeric sands on the Coastal Plain from se. VA southwards] .

1 Stem leaves larger, mostly both longer and broader, not pectinate-fringed at the base (except Scleranthus); basal rosette present or absent; stems either thicker, more flexuous, or not subdichotomously branched.
2 Petals absent; fruit a 1-seeded, indehiscent utricle; styles 2 . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Scleranthus
2 Petals present (rarely obsolete or essentially absent); fruit a few-many seeded capsule; styles 3-5.
3 Leaves fleshy; seeds more than 3 mm long; [plants of seabeaches and dunes]
Honckenya
3 Leaves membranaceous or stiff; seeds less than 2 mm long; [plants of various habitats].
4 Styles 4-5.
5 Leaves linear-subulate, less than 2 mm wide; styles 4-5.
6 Valves or teeth of the capsule twice as many as the styles ............................. Moenchia
6 Valves or teeth of the capsule as many as the styles . . . . . . . . . . . . . . . . . . . . . . . . . . . Sagina
5 Leaves ovate, obovate, more than 4 mm wide; styles 5 .
7 Capsule cylindric, dehiscent by 10 apical teeth . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Cerastium
7 Capsule ovoid, dehiscent by 5 valves, each apically 2-cleft . . . . . . . . . . . . . . . . . . . . . Myosoton
4 Styles 3.
8 Inflorescence umbelliform; petals irregularly denticulate at apex . . . . . . . . . . . . . . . . . . . . . . Holosteum
8 Inflorescence cymose or racemiform; petals entire, notched, or deeply cleft.
9 Petals shallowly to deeply 2-cleft, notched at least \(1 / 4\) of the length, often divided nearly to the base and then appearing almost as 10 petals.
10 Capsule cylindrical, twice as long as the sepals . . . . . . . . . . . . . . . . . . . . . . . . . . . Cerastium
10 Capsule spherical or ellipsoid, as long as or slightly longer than the sepals . . . . . . . . . Stellaria
9 Petals entire, or emarginate.
11 Valves or teeth of the capsule as many as the styles . . . . . . . . . . . . . . . . . . . . . . . Minuartia
11 Valves or teeth of the capsule twice as many as the styles.
12 Seeds with an aril
Moehringia
12 Seeds lacking an aril.
13 Capsule straight; petals entire or barely emarginate \(\qquad\) . Arenaria
13 Capsule cylindrical, and often somewhat curved; petals emarginate to bifid
Cerastium

\section*{Agrostemma Linnaeus 1753 (Corncockle)}

A genus of 2 species, herbs, of temperate Eurasia. References: Bittrich in Kubitzki, Rohwer, \& Bittrich (1993).
Agrostemma githago Linnaeus var. githago, Corncockle, Purple Cockle, Corn-campion. Cp, Pd, Mt (GA, NC, SC, VA): fields, disturbed areas; common, introduced from Europe. May-July. [= FNA; < A. githago - RAB, C, F, G, K, S, W]

\section*{Arenaria Linnaeus 1753 (Sandwort)} (also see Minuartia)

A genus of about 150-210 species, herbs, of temperate and subarctic regions of the Northern Hemisphere, extending southwards to the montane tropics of South America and Africa. References: Hartman, Rabeler, \& Utech in FNA (2005); Bittrich in Kubitzki, Rohwer, \& Bittrich (1993).

1 Leaves lanceolate to oblanceolate, (7-) 15-32 mm long, 1-8 mm wide; perennial, stems to 8 dm long
A. lanuginosa var. lanuginosa

1 Leaves ovate, \(3-8 \mathrm{~mm}\) long, \(3-5 \mathrm{~mm}\) wide; annual, stems to 3 dm long.
2 Seeds 0.4-0.5 mm long; fruiting calyx 2-3 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. leptoclados
2 Seeds ca. 0.6 mm long; fruiting calyx \(3-4 \mathrm{~mm}\) long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. serpyllifolia

Arenaria lanuginosa (Michaux) Rohrbach var. lanuginosa, Spreading Sandwort. Cp (GA, NC, SC, VA): dunes, maritime forests, coquina limestone outcrops; rare (NC Watch List, VA Rare). May-July. Se. VA south to FL, west to TX, AR, and Mexico, and north in the interior to sc. TN (Chester, Wofford, \& Kral 1997). [= C, FNA; < A. lanuginosa -- RAB, F, S; = A. lanuginosa ssp. lanuginosa -- G; > A. lanuginosa ssp. lanuginosa var. lanuginosa -- K; > A. lanuginosa ssp. lanuginosa var. longepedunculata Duncan - K; Spergulastrum lanuginosum Michaux ssp. lanuginosum]
* Arenaria leptoclados (Reichenbach) Gussone, Small Thyme-leaved Sandwort, Slender Sandwort. \{GA, NC, SC, VA\} The relative ranges, habitats, and abundance of the \(A\). leptoclados and \(A\). serpyllifolia are poorly known \{additional herbarium work\}. March-June. [= S; < A. serpyllifolia -- RAB, K, W; = A. serpyllifolia Linnaeus var. tenuior Mertens \& W.D. J. Koch -- C, F, FNA, G; = A. serpyllifolia Linnaeus ssp. leptoclados (Reichenbach) Nyman]
* Arenaria serpyllifolia Linnaeus, Large Thyme-leaved Sandwort. \{GA, NC, SC, VA\} The relative ranges, habitats, and abundance of this and A. leptoclados are poorly known. March-June. [= \(\mathrm{S} ;<\mathrm{A}\). serpyllifolia -- \(\mathrm{RAB}, \mathrm{K}, \mathrm{W}\); = A. serpyllifolia var. serpyllifolia -- C, F, FNA, G; = A. serpyllifolia ssp. serpyllifolia; = A. serpyllifolia -- S]

\section*{Cerastium Linnaeus 1753 (Mouse-ear Chickweed, Mouse-ear)}

A genus of about 100 species, herbs, especially north tempearte but nearly cosmopolitan. References: Morton in FNA (2005); Bittrich in Kubitzki, Rohwer, \& Bittrich (1993); Rabeler \& Thieret (1988); Scheen et al. (2004).

1 Petals \(10-18 \mathrm{~mm}\) long, \(2-3 \times\) as long as the sepals; leaves \(2-7 \mathrm{~cm}\) long.
2 Leaf blades narrowly to broadly linear, acute or short-acuminate at tip, tapered to base; stems erect nearly whole length
2 Leaf blades narrowly lanceolate to narrowly ovate, obtuse to acute at tip, more-or-less rounded at base; stems spreading or decumbent basally, ascending-erect distally.
3 Leaf blades narrowly lanceolate, obtuse to acute, well-spaced on stem, moderately to densely pubescent with dull hairs but may be glabrate in age; plants forming small clumps C. velutinum var. velutinum 3 Leaf blades narrowly ovate, obtuse and blunt at tip, tightly spaced on stem, very densely pubescent with silvery or translucent-white permanent hairs; plants form clumps to several dm wide; [endemic to serpentine in PA-MD]
[C. velutinum var. villosissimum]
1 Petals \(3-7 \mathrm{~mm}\) long, shorter than, equalling, or up to \(1.5 \times\) as long as the sepals; leaves \(0.5-2.5 \mathrm{~cm}\) long (to 8 cm long in \(C\). nutans and C. brachypodum).
3 Perennial, matted at the base and rooting at the nodes
C. fontanum ssp. vulgare

3 Annual.
4 Sepals with long, appressed, eglandular hairs extending beyond the tip of the sepal.
5 Inflorescence an open cyme, most of the pedicels longer than the sepals ............... C. brachypetalum 5 Inflorescence a compact, cymose cluster, most of the pedicels shorter than the sepals ...... C. glomeratum 4 Sepals lacking long, appressed, eglandular hairs. 6 Styles, sepals, and petals 4; capsule teeth 8 [C. diffusum] 6 Styles, sepals, and petals 5; capsule teeth 10.

8 Bracts of the inflorescence with distinctly scarious margins; leaves mostly 0.5-1.0-(-1.5) cm long.
9 Petals equalling or surpassing the sepals; cleft in petal apex 1.0-1.5 mm deep . . . . . . . C. pumilum 9 Petals shorter than the sepals; cleft in petal apex 0.2-0.5 (-0.9) mm deep . . . C. semidecandrum 8 Bracts of the inflorescence with green margins; leaves mostly (1.0-) 1.5-8 cm long.

10 Pedicels 3-10 (-15) mm long; leaves to 3.5 cm long C. brachypodum

10 Pedicels (10-) 15-40 (-55) mm long; leaves to 8 cm long
C. nutans
* Cerastium brachypetalum Desportes, Gray Mouse-ear. Mt (NC, SC), Pd (NC, SC, VA), Cp (NC, VA): roadsides, disturbed areas; common (rare in SC), introduced from Europe. April-June. [= RAB, C, F, FNA, G, W; > C. brachypetalum ssp. brachypetalum - K; C. tetrandrum W. Curtis -- F, misidentified]

Cerastium brachypodum (Engelmann ex A. Gray) B.L. Robinson. Mt (NC, VA), Pd (SC, VA), Cp (VA): disturbed areas, roadsides; rare. April-May. IL west to Alberta and OR, south to NC, nc. GA (Jones \& Coile 1988), and AZ. This taxon is perhaps only introduced in our area from further west. [= F, FNA, K, S; = C. nutans Rafinesque var. brachypodum Engelmann ex A. Gray -RAB, G, W; < C. nutans -- C, in part]
* Cerastium fontanum Baumgartner ssp. vulgare (Hartman) Greuter \& Burdet, Common Mouse-ear. Mt, Pd, Cp (NC, SC, VA):
fields, disturbed areas; common, introduced from Europe. March-June. [= FNA, K; C. holosteoides Fries var. vulgare (Hartman) Hylander -- RAB; C. vulgatum Linnaeus -- C, S; C. vulgatum var. vulgatum -- F, G; C. vulgatum var. holosteoides (Fries) Wahlenberg -- F, G; C. vulgatum var. hirsutum Fries -- G; C. fontanum ssp. triviale (Link) Jalas -- W]
* Cerastium glomeratum Thuillier, Sticky Mouse-ear. Cp, Pd, Mt (NC, SC, VA): fields, disturbed areas; common, introduced from Europe. March-May. [= RAB, FNA, K, W; C. viscosum Linnaeus -- C, F, G, S, an ambiguous name, of uncertain application] Cerastium nutans Rafinesque. Mt, Pd (NC, SC, VA), Cp (VA): alluvial forests, bottomlands, moist forests; common. AprilMay. Nova Scotia west to Mackenzie, south to SC, GA, AZ, and OR. [= F; C. nutans var. nutans -- RAB, G, K, W; < C. nutans -- C, in part; > C. longepedunculatum Willdenow ex Britton -- S]
* Cerastium pumilum W. Curtis, Dwarf Mouse-ear. Cp (NC, VA), Pd (NC, SC, VA), Mt (NC): disturbed areas; rare, introduced from Europe. April-May. See Rabeler \& Thieret (1988) for discussions and reports. [= C, F, FNA, G, K; > C. glutinosum Fries] * Cerastium semidecandrum Linnaeus, Little Mouse-ear. Cp (NC, SC, VA), Mt, Pd (NC, VA): disturbed areas; uncommon (rare in NC), introduced from Europe. April-June. Reported for SC by Nelson \& Kelly (1997). [= RAB, C, F, FNA, G, K, S, W] * Cerastium tomentosum Linnaeus, Snow-in-summer. (NC). \{see JEMSS 1988\} This species is "cultivated and sometimes escaped" in scattered locations in PA (Rhoads \& Klein 1993). [= FNA, K]

Cerastium velutinum Rafinesque var. velutinum, Field Mouse-ear, Starry Grasswort. Pd, Mt (VA): rocky river-scour areas, other open situations; rare. April-August. [= FNA; Cerastium arvense Linnaeus var. velutinum (Rafinesque) Britton; C. arvense -- C, S, W, infraspecific taxa not distinguished; C. arvense Linnaeus var. villosum (Muhlenberg ex Darlington) Hollick \& Britton -- F, in a broad sense (also including var. velutinum); C. arvense Linnaeus var. oblongifolium (Torrey) Hollick \& Britton -- G; C. arvense Linnaeus ssp. velutinum (Rafinesque) Ugborogho var. velutinum (Rafinesque) Britton -- K]
* Cerastium arvense Linnaeus ssp. arvense. Introduced at scattered locations in ne. North America, including MD and NJ (FNA). [= FNA, K; < C. arvense - C, G; < C. arvense var. arvense - F] \{not yet keyed\} Cerastium arvense Linnaeus ssp. strictum (Linnaeus) Ugborogho, in GA, TN, KY, WV, MD, DE, and NJ, among other states (Kartesz 1999). [= FNA, K; < C. arvense - C, G; < C. arvense var. arvense - F] \{not yet keyed\} Cerastium diffusum Persoon, Sea Mouse-ear. March-April. East to KY and TN (K), though not shown for those states in FNA. [= FNA, K; C. diffusum var. diffusum -- C] \{not yet keyed\}
* Cerastium dubium (Bastard) Guépin. (VA): disturbed areas; rare, introduced from s. Europe and Asia. Introduced in scattered states in the United Sattes, including VA, KY, TN, MS (FNA). [= C, FNA, K] \{not yet keyed\} Cerastium velutinum Rafinesque var. villosissimum (Pennell) J.K. Morton. This taxon is highly restricted, found only at a few stations in the serpentine barrens of Chester County, PA, and Cecil County, MD (Gustafson et al.). [= FNA; C. arvense var. villosissimum Pennell - F, G; < C. arvense -- C, S, W, infraspecific taxa not distinguished; ? C. arvense Linnaeus ssp. velutinum (Rafinesque) Ugborogho var. villosum (Muhlenberg ex Darlington) Hollick \& Britton -- K] \{not yet keyed\}

\section*{Corrigiola Linnaeus}
* Corrigiola litoralis Linnaeus. Introduced south to MD and PA. [= K]

\section*{Dianthus Linnaeus 1753 (Pink, Carnation)}

A genus of about 300-320 species, herbs, of Eurasia and Africa. References: Rabeler \& Hartman in FNA (2005); Bittrich in Kubitzki, Rohwer, \& Bittrich (1993).
\begin{tabular}{|c|c|c|}
\hline \multirow[t]{3}{*}{} & Flow & \\
\hline & 2 Leaves 2-5 (-8) mm wide; annual or biennial; inflorescence pubescent & D. armeria \\
\hline & 2 Leaves mostly (8-) 10-20 mm wide; perennial; inflorescence glabrous & D. barbatus \\
\hline \multirow[t]{3}{*}{1} & Flowers solitary, or few, long-pedicelled; [subgenus Dianthus]. & \\
\hline & 3 Petal blade 5-9 (-10) mm long, toothed & D. deltoides \\

\hline
\end{tabular}
* Dianthus armeria Linnaeus ssp. armeria, Deptford Pink. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): fields, roadsides, pastures; common, introduced from Europe. May-September. [= FNA; < D. armeria - RAB, C, F, G, K, S, W]
* Dianthus barbatus Linnaeus ssp. barbatus, Sweet William. Pd (NC, SC), Mt (VA), \{GA\}: cultivated as an ornamental, rarely escaped to disturbed areas; rare, introduced from Europe. June-August. [= FNA; < D. barbatus - RAB, C, F, G, K]
* Dianthus deltoides Linnaeus ssp. deltoides, Maiden Pink, Meadow Pink. Pd (NC, VA): cultivated as an ornamental, rarely escaped to adjacent areas; rare, introduced from Europe. May. See Rabeler \& Thieret (1988) for additional information. [= FNA; < D. deltoides - C, F, G, K]
* Dianthus plumarius Linnaeus ssp. plumarius, Garden Pink, Grass Pink. Cp (NC), Pd (NC, SC), Mt (VA): cultivated as an ornamental, rarely escaped to disturbed areas; rare, introduced from e. Europe. June-August. [=FNA; < D. plumarius - RAB, C, F, G, K]

Other species are grown in gardens and may escape or persist.

Drymaria Willdenow ex J.A. Schultes 1819 (Drymary)

A genus of about 48 species, herbs, mostly New World (tropical to temperate), but 1 species pantropical. References: Duke
(1961) \(=\) Z; Hartman in FNA (2005); Bittrich in Kubitzki, Rohwer, \& Bittrich (1993).

Drymaria cordata (Linnaeus) Willdenow ex Schultes var. cordata, Drymary, West Indian Chickweed. Cp (GA): moist hammocks, moist disturbed areas; rare. Sc. GA south to FL south into the New World tropics; also old World tropics. Var. diandra Blume is restricted to the Old World. [= FNA; = D. cordata ssp. cordata - K, Z; < D. cordata - S]

Gypsophila Linnaeus 1754 (Baby's-breath)
A genus of about 150 species, annual and perennial herbs, of temperate Eurasia, Africa, and Australia. References: Pringle in FNA (2005).
1 Stems simple, few-branched towards the top; leaves (1-) 3-16 mm wide ..................................... G. elegans

1 Stems diffusely and repeatedly near the base and upwards; leaves \(0.2-2(-3) \mathrm{mm}\) wide ..................... [G. muralis]
* Gypsophila elegans Bieberstein, Annual baby's-breath. \(\mathrm{Cp}, \mathrm{Pd}(\mathrm{NC})\) : disturbed areas, persistent from cultivation, doubtfully established; rare, introduced. See Rabeler \& Thieret (1988) for additional information. [= C, FNA, K]
* Gypsophila muralis Linnaeus, Cushion baby's-breath. Disturbed areas, roadsides, yards, cemeteries; native of Europe, reported for various eastern ststes, including KY, TN, PA, NJ (FNA, Kartesz 1999). [= C, FNA, K]

\section*{Herniaria Linnaeus (Rupture-wort)}

A genus of about 45 species, herbs, of Eurasia, Africa, and South America. References: Thieret, Hartman, \& Rabeler in FNA (2005).
* Herniaria glabra Linnaeus, Smooth Rupture-wort, introduced south to MD, NJ, and PA (Kartesz 1999). [= FNA, K] \{add synonymy\}

Holosteum Linnaeus 1753 (Jagged Chickweed)
A genus of 3-4 species, herbs, of temperate Eurasia. References: Rabeler \& Hartman in FNA (2005); Bittrich in Kubitzki, Rohwer, \& Bittrich (1993).
* Holosteum umbellatum Linnaeus ssp. umbellatum, Jagged Chickweed. Mt, Pd (GA, NC, SC, VA), Cp (VA): fields, roadsides, lawns, other disturbed areas; common, introduced from Europe. March-May. Four additional subspecies are not known to be present in North America. [= FNA; < H. umbellatum - RAB, C, F, G, K, S, W]

\section*{Honckenya Ehrhart 1788 (Seabeach-chickweed, Sea-sandwort)}

A monotypic genus, an herb, with circumboreal distribution. References: Wagner in FNA (2005); Bittrich in Kubitzki, Rohwer, \& Bittrich (1993).

Honckenya peploides (Linnaeus) Ehrhart ssp. robusta (Fernald) Hultén, Southern Seabeach-chickweed, Southern Seasandwort. Cp (VA): seabeaches and dunes; rare (VA Rare). June-July. The species is circumboreal, in North America ranging south to e. VA. Ssp. robusta ranges from Newfoundland south to e. VA; 3 other subspecies do not occur south of Newfoundland. [= FNA, K; Honckenya peploides var. robusta (Fernald) House -- C; Arenaria peploides Linnaeus var. robusta Fernald -- F; Honkenya peploides ssp. robusta -- G (apparently misspelled)]

Lychnis Linnaeus 1753 (Campion)
(see Silene)

\section*{Minuartia Linnaeus 1753 (Sandwort)}

A genus of about 120-175 species, herbs, of the northern hemisphere (and rarely South America). References: Rabeler, Hartman, \& Utech in FNA (2005); Bittrich in Kubitzki, Rohwer, \& Bittrich (1993).

1 Sepals acute, with prominent nerves; [of calcareous or mafic barrens of VA].
2 Primary leaves with axillary fascicles of secondary leaves . . . . . . . . . . . . . . . . . . . . . . . . M. michauxii var. michauxii 2 Primary leaves lacking axillary fascicles of secondary leaves.

3 Sepals 3-nerved; seeds 0.7-0.9 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [M. muscorum]
3 Sepals 5 -nerved; seeds \(0.5-0.7 \mathrm{~mm}\) long
M. patula

1 Sepals obtuse (rarely sub-acute), nerveless or with very obscure nerves; [of various habitats].

4 Lower stem leaves closely imbricated; [of xeric sands of the Coastal Plain of NC and SC] .............. . M. caroliniana
4 Lower stem leaves not imbricate; [either of rock outcrops of the Piedmont and Mountains or of moist habitats of the Coastal Plain].
5 Stems prostrate or decumbent, leafy throughout; pedicels and sepals stipitate-glandular; [of moist habitats of the Coastal Plain] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . M. Modfreyi
5 Stems erect, leafy mostly near the base, the stem leaves few in number and reduced in size upwards; pedicels and sepals glabrous; [of rock outcrops of the Piedmont and Mountains].
6 Larger stem leaves 2-5 (-7) mm long; petals 1-7 mm long.
M. uniflora

6 Larger stem leaves (7-) 10-30 mm long; petals 4-10 mm long.
7 Leaves distinctly oblanceolate, very thin in texture, prominently veined; flowers 1-3 per stem
[M. cumberlandensis]
7 Leaves linear-lanceolate, herbaceous bu not notably thin, not prominently veined; flowers 3-many per stem.
8 Plants 10-20 cm tall, annual, not mat-forming; cymes 9-15-flowered; sepals 3-4 mm long; petals 4-6 (8) mm long; [of Piedmont and low mountain granitic flatrocks and other outcrops] . . . . . . M. glabra 8 Plants 5-10 (-15) cm tall, perennial, mat-forming; cymes 3-7-flowered; sepals 3.5-5.5 mm long; petals \(6-10 \mathrm{~mm}\) long; [of mountain peaks and Piedmont monadnocks]
M. groenlandica

Minuartia caroliniana (Walter) Mattfeld, Carolina Sandwort, Longroot. Cp (GA, NC, SC, VA): deep white sands of barren sandhills; uncommon (VA Rare). April-June. NY to panhandle FL, on the Coastal Plain. [= FNA, K; = Arenaria caroliniana Walter -RAB, C, F, G; = Sabulina caroliniana (Walter) Small -- S; = Alsinopsis caroliniana (Walter) Small; = Minuopsis caroliniana (Walter) W.A. Weber]

Minuartia glabra (Michaux) Mattfeld, Appalachian Sandwort. Pd, Mt (GA, NC, SC, VA): granitic flatrocks, other outcrops of granite, granitic gneiss, or other felsic gneisses and schists, in the mountains restricted to low or medium elevations; uncommon. April-May. ME and NH south to w. GA (Jones \& Coile 1988) and AL, primarily on the Piedmont and also in the Cumberlands (Chester, Wofford, \& Kral 1997). [= K; = Arenaria groenlandica (Retzius) Sprengel var. glabra (Michaux) Fernald -- RAB, C, F, G; = Arenaria glabra Michaux -- GW, W (sensu stricto); Sabulina glabra (Michaux) Small -- S; = Porsildia groenlandica (Retzius) Á. Löve \& D. Löve ssp. glabra (Michaux) Á. Löve \& D. Löve]

Minuartia godfreyi (Shinners) McNeill, Godfrey's Sandwort. Cp (NC, SC) \{GA\}: tidal freshwater marshes, other wetlands; rare (US Species of Concern, NC Endangered, SC Rare). April-June. Peculiarly and irregularly distributed, with isolated and scattered locations in the Coastal Plain and Mountains: wc. VA, ne. TN, e. NC, ne. SC, nc. FL, wc. AL, and se. AR. [= K; = Arenaria godfreyi Shinners -- RAB, GW, W; Sabulina uniflora -- S, misapplied; = Stellaria paludicola Fernald \& Schubert]

Minuartia groenlandica (Retzius) Ostenfeld, Mountain Sandwort, Greenland Sandwort. Mt (NC, VA), Pd (NC): low elevation rock outcrops (such as sandstone pavements in the VA Ridge and Valley) to high elevation rock outcrops in the Mountains (ascending to nearly 2000 m on Roan Mountain), also disjunct on the summits of quartzite monadnocks in the upper Piedmont (such as Pilot Mountain, Surry County, NC and Hanging Rock, Stokes County, NC); rare (NC Rare, VA Rare). May-October. Greenland, Nova Scotia, and Québec south to the higher mountains of New England and NY; disjunct in the Southern Appalachians of VA, w. NC, and e. TN. [= K; = Arenaria groenlandica (Retzius) Sprengel var. groenlandica -- RAB, C, F, G; = Sabulina groenlandica (Retzius) Small -- S; = Arenaria groenlandica (Retzius) Sprengel -- W (sensu stricto); = Porsildia groenlandica (Retzius) Á. Löve \& D. Löve ssp. groenlandica]

Minuartia michauxii (Fenzl) Farwell var. michauxii, Rock Sandwort. Mt (VA): limestone, dolostone, calcareous sandstone, and calcareous shale outcrops and barrens; uncommon. June-July. Var. michauxii ranges from NY west to MN, south to sw. VA and AR. Var. texana (B.L. Robinson) Mattfeld occurs from MO and NE south to TX. [= K; = Arenaria stricta Michaux var. stricta -C, F; < M. michauxii - FNA, infraspecific taxa not distinguished; = Arenaria stricta Michaux ssp. stricta -- G; < Sabulina stricta (Michaux) Small -- S, infraspecific taxa not distinguished; < Arenaria stricta Michaux -- W]

Minuartia patula (Michaux) Mattfeld, Lime-barren Sandwort. Mt (GA, VA), Pd (VA), Cp (GA): on rocky barrens of calcareous or mafic rocks, locally common in Lee County, VA; rare (VA Watch List). April-June. Ec. PA and w. VA west to IN and MN, south to AL and TX. [= FNA, K; = Arenaria patula Michaux var. patula -- C, G; < Arenaria patula Michaux -- F, infraspecific taxa not distinguished; < Sabulina patula (Michaux) Small -- S]

Minuartia uniflora (Walter) Mattfeld. Pd (GA, NC, SC), Cp (GA): granitic flatrocks, outcrops of Altamaha grit; rare (NC Endangered, SC Rare). April-May. S. NC south to c. GA, west to ec. AL, on the Piedmont and extending into the Coastal Plain of Georgia on Altamaha grit. M. alabamensis, named on the basis of its tiny flowers, has been shown to be a self-pollinating form of \(M\). uniflora which has arisen repeatedly and independently at various sites in the range of \(M\). uniflora. [= FNA, K; = Arenaria uniflora (Walter) Muhlenberg -- RAB; > Arenaria uniflora (Walter) Muhlenberg -- GW, W, in a narrower sense; = Sabulina brevifolia (Nuttall ex Torrey \& A. Gray) Small -- S; > Arenaria alabamensis McCormick, Bozeman, \& Spongberg -- GW, W; > M. alabamensis (McCormick, Bozeman, \& Spongberg) Wyatt]

Minuartia cumberlandensis (B.E. Wofford \& Kral) McNeill, Cumberland Sandwort, is endemic to sandstone outcrops in the Cumberland Plateau of ne. TN; it might be expected in extreme sw. VA. [= FNA, K; = Arenaria cumberlandensis B.E. Wofford \& Kral -- C]

Minuartia muscorum (Fassett) Rabeler ranges from KY and TN west to MO. [=FNA, K; = Arenaria patula Michaux var. robusta (Steyermark) Maguire - C, G; < Arenaria patula - F, infraspecific taxa not distinguished; < Sabulina patula (Michaux) Small - S; = Minuartia patula (Michaux) Mattfeld var. robusta (Steyermark) McNeill]

Moehringia Linnaeus 1753 (Grove-sandwort)
A genus of about 25 species, of temperate regions of the Northern Hemisphere. References: Rabeler \& Hartman in FNA (2005);

Bittrich in Kubitzki, Rohwer, \& Bittrich (1993).
Moehringia lateriflora (Linnaeus) Fenzl, Grove-sandwort, Blunt-leaved Sandwort. Pd (VA): rocky, disturbed areas (powerline) over mafic rocks (diabase); rare (VA Rare). May-July. Circumboreal, ranging south in North America to n. VA, e. WV (Morton et al. 2004), MO, and CA. [= FNA, K; = Arenaria lateriflora Linnaeus -- C, F, G]

\section*{Moenchia Ehrhart 1788}

A genus of 3 species, herbs, native of Europe. References: Rabeler \& Hartman in FNA (2005); Bittrich in Kubitzki, Rohwer, \& Bittrich (1993).
* Moenchia erecta (Linnaeus) P.G. Gaertner, B. Meyer, \& Scherbius ssp. erecta, Upright Chickweed. Cp (SC): disturbed areas; rare, introduced. This species was collected as a "wool alien" in Berkeley County, SC in 1958 (Rabeler 1991). [= FNA; < M. erecta - K; = Sagina erecta Linnaeus]

Myosoton Moench 1794 (Water-chickweed)
A monotypic genus, an herb, of temperate Eurasia. References: Rabeler in FNA (2005); Bittrich in Kubitzki, Rohwer, \& Bittrich (1993).
* Myosoton aquaticum (Linnaeus) Moench, Water-chickweed, Giant Chickweed, Water Mouse-ear. Mt (NC, VA), Pd, Cp (VA): marshes, streambeds; uncommon, though locally abundant (rare south of VA), introduced from Europe. June-October. [= F, FNA, K ; = Stellaria aquatica (Linnaeus) Scopoli -- RAB, C, G, GW, W; = Alsine aquatica (Linnaeus) Britton -- S]

Paronychia P. Miller 1754 (Whitlow-wort, Nailwort)
A genus of about 110 species, herbs and shrubs, nearly cosmopolitan in distribution. This genus consists mostly of plants of dry rocky or sandy habitats. References: Hartman, Thieret, \& Rabeler in FNA (2005); Chaudhri (1968)=Z, Ward (1977a, 1977b)=Y; Shinners (1962)=X; Bittrich in Kubitzki, Rohwer, \& Bittrich (1993). Key adapted from Y and Z.

Identification notes: Magnification of at least \(10 \times\) is necessary for the identification of many of the taxa.
1 Leaf surfaces with silky, appressed pubescence (usually densely so, but sometimes sparse), giving the plant a silvery appearance; flowers \(3.5-6 \mathrm{~mm}\) long, largely concealed by scarious bracts; [subgenus Paronychia] . . . . . . . . P. argyrocoma
1 Leaf surfaces glabrous or with very short pubescence (neither appressed nor silky), the plant green; flowers \(1-4 \mathrm{~mm}\) long, not concealed by scarious bracts.
2 Sepals petaloid, the tip, margins, or entire sepal whitish; perigynous zone very well developed (mostly equalling or somewhat longer than the sepals); [of the Coastal Plain, from SC southwards and westwards]; [subgenus Siphonychia]. 3 Sepals glabrous to the base; plant a cespitose perennial with ascending annual stems.

4 Stems minutely gray-puberulent
[P. erecta var. corymbosa]
4 Stems glabrous and often also glaucous [P. erecta var. erecta]
3 Sepals densely pubescent on the basal portion (glabrous above); plant a sprawling, ascending or erect annual.
5 Pubescent portion of the sepal nearly \(1 / 2\) its length; sepals broadly rounded and hooded; stem glabrous or one side with curly hairs
P. americana

5 Pubescent portion of the sepal <1/3 its length; sepals narrowed toward the apex, with a short tooth or awn; stem uniformly pubescent with retrorse hairs.
6 Stem spreading or ascending, the branching unevenly dichotomously, the flowers therefore in diffuse
cymes; glabrous portion of the sepal 0.8 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. patula
6 Stem erect, the branching symmetrical and dichotomous, the flowers therefore in weirdly geometric, tight square cymes; glabrous portion of the sepal > 1.1 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. rugelii
2 Sepals not petaloid, green, sometimes scarious-margined; perigynous zone somewhat shorter than the sepals; [of various provinces, collectively widespread in our area]; [subgenus Paronychia].
7 Sepals tipped with a distinct awn, 0.35-0.75 mm long; flowers \(2-4 \mathrm{~mm}\) long.
8 Suffrutescent perennial, at least the flowering stems ascending or erect; leaves linear-subulate, 15-25 (-30) mm long, 0.5-1 mm wide, acute; [of Mountain and Piedmont rocky areas] \(\qquad\)
8 Prostrate annual; leaves oblong-elliptic or spatulate, 3-12 (-16) mm long, 1.5-3.5 (-5) mm wide, obtuse; [of Coastal Plain sands from sc. NC southwards] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. herniarioides
7 Sepals tipped with a short cusp or mucro; flowers \(1-1.6 \mathrm{~mm}\) long.
9 Leaves with a distinctly ciliate margin; plants prostrate, the branching below the inflorescence not pseudodichotomous.
10 Plant an annual (-biennial); stems 1-4 dm long, uniformly and minutely recurved-puberulent; flowers 1.251.4 mm long, shortly ciliate to nearly glabrous; sepals ca. 1 mm long, oval-oblong, the margin ciliolate; style \(0.4-0.5 \mathrm{~mm}\) long, bifid; fruit rounded at the top
P. baldwinii ssp. baldwinii

10 Plant a perennial; stems 2-12 dm long, glabrous or minutely puberulent in longitudinal bands; flowers 1.451.55 mm long, more or less glabrous; sepals 1-1.2 mm long, oblong, with a brownish margin; style 0.35-0.4
mm long, the 2 lobes divergent-recurved at maturity; fruit narrowed to the top . . P. baldwinii ssp. riparia Leaves entirely glabrous or with a slightly ciliate-serrulate margin; plants erect, suberect, or somewhat prostrate, pseudo-dichotomously branched.
11 Style elongate, \(0.6-0.75 \mathrm{~mm}\) long; anthers \(0.25-0.3 \mathrm{~mm}\) in diameter; stipular bracts subtending the flowers narrowly lanceolate, ca. \(0.5 \times\) as long as the flowers
P. montana

11 Style short, \(0.3-0.35 \mathrm{~mm}\) long; anthers ca. 0.15 mm in diameter; stipular bracts subtending the flowers lanceolate, from much shorter than to exceeding the flowers.
12 Stems glabrous; leaves oval-elliptic, 5-25 mm long, 2-8 (-10) mm wide, obtuse (rarely sub-obtuse or acute), very thin in texture, deep-green; sepals oblong-ovate, 1-nerved, planar, the apiculate hood very short P. canadensis

12 Stems retrorsely puberulent (sometimes sparsely so); leaves oblanceolate, \(5-15 \mathrm{~mm}\) long, 2-5 mm wide, acute (rarely sub-obtuse to obtuse), firm in texture, dull brownish-green; calyx 2-3 mm long. 13 Stipular bracts subtending the flowers exceeding the flowers (calyx)
P. fastigiata var. paleacea

13 Stipular bracts subtending the flowers somewhat shorter than the flowers (calyx).
14 Sepals with a minute cusp or mucro . . . . . . . . . . . . . . . . . . . . P. fastigiata var. fastigiata
14 Sepals with a distinct white awn to 0.2 mm long . . . . . . . . . . . . P. fastigiata var. nuttallii
Paronychia americana (Nuttall) Fenzl ex Walpers, American Whitlow-wort. Cp (GA, SC): sandhills; rare (SC Rare). JuneSeptember. S. SC south to GA and s. FL. Two taxa have been questionably distinguished. Ssp. americana, with the cymes manyflowered and forming spheroidal glomerules, has the range of the species; ssp. pauciflora (Small) Chaudhri, differing in its laxer, more open cymes, is restricted to s. GA and n. FL. [= FNA, X, Y; > Paronychia americana (Nuttall) Fenzl ex Walpers ssp. americana - K, Z; > Paronychia americana (Nuttall) Fenzl ex Walpers ssp. pauciflora (Small) Chaudhri - K, Z; >P. americana -RAB, in a narrow sense; > Siphonychia americana (Nuttall) Torrey \& Gray -- S; > Siphonychia pauciflora Small - S]

Paronychia argyrocoma (Michaux) Nuttall, Silverling, Silver Whitlow-wort. Mt (GA, NC, VA), Pd (NC, VA): thin soils of rock outcrops, especially on mountain summits at medium to high elevations, disjunct to a few Piedmont monadnocks; uncommon (GA Special Concern). July-September. A characteristic component of the summit flora of Southern Appalachian peaks, P. argyrocoma occurs in the mountains of New England (ME, NH, VT, and MA), and in the Southern Appalachians of WV, VA, NC, TN, and n. GA (Jones \& Coile 1988). [= RAB, C, FNA, K, S, W; >P. argyrocoma var. argyrocoma - F, G; >P. argyrocoma var. albimontana Fernald -- F, G, Z]

Paronychia baldwinii (Torrey \& A. Gray) Fenzl ex Walpers ssp. baldwinii, Annual Dune Whitlow-wort. Cp (GA, NC, SC): dry sandy sites, woodlands or dunes; uncommon. June-October. E. NC south to FL and west to AL (and LA?), on the Coastal Plain. [= \(\mathrm{K}, \mathrm{Y}, \mathrm{Z}\); < P. baldwinii - FNA; = P. baldwinii -- RAB; = Anychiastrum baldwinii (Torrey \& Gray) Small -- S]

Paronychia baldwinii (Torrey \& A. Gray) Fenzl ex Walpers ssp. riparia (Chapman) Chaudhri, Perennial Dune Whitlow-wort. Cp (GA, NC, SC, VA): dry sandy sites, woodlands or dunes; uncommon (VA Watch List). June-October. Se. VA south to \(n\). FL (and AL?), on the Coastal Plain. Though Chaudhri (1968) and Ward (1977a and 1977b) independently reached the conclusion to reduce \(P\). riparia to a subspecies of \(P\). baldwinii, neither stated any reasons for their choice of subspecific status. I here follow the independent conclusions of Chaudhri and Ward, but the appropriate taxonomic rank remains unclear. \([=\mathrm{K}, \mathrm{Y}, \mathrm{Z}\); \(=P\). riparia Chapman -- RAB, C, F; < P. baldwinii - FNA; = Anychiastrum riparium (Chapman) Small -- S; >P. baldwinii ssp. riparia var.ciliata Chaudhri -- Z]

Paronychia canadensis (Linnaeus) Wood, Canada Whitlow-wort, Forked Chickweed. Mt (GA, NC, SC, VA), Pd, Cp (NC, SC, VA): dry rocky woods, shale barrens; uncommon (rare on the Coastal Plain). June-October. NH and s. Ontario west to MN, south to n . GA (Jones \& Coile 1988), AL, MO, and KS. This species is somewhat taller on average than \(P\). fastigiata or \(P\). montana. [= RAB , C, F, FNA, K, W, Z; = Anychia canadensis (Linnaeus) Britton, Sterns, \& Poggenburg -- S]

Paronychia fastigiata (Rafinesque) Fernald var. fastigiata, Common Forked Whitlow-wort. Mt, Pd, Cp (NC, SC, VA): dry, usually rocky, woodlands, often on thin soil around outcrop edges; uncommon. June-October. MA west to MN south to FL and TX. The three varieties of \(P\). fastigiata (though accepted by Chaudhri and many recent floras) need additional investigation to confirm their taxonomic status, habitats, and geographic ranges. [= C, F, K, Z; < P. fastigiata -- RAB, W; < P. fastigiata var. fastigiata - FNA; < Anychia polygonoides Rafinesque -- S]

Paronychia fastigiata (Rafinesque) Fernald var. nuttallii (Small) Fernald, Pennsylvania Forked Whitlow-wort. Mt (NC, VA): habitat not known; rare. June-October. NY, sc. PA, n. VA, WV, e. TN, and w. NC. [= C, F, FNA, K, Z; < P. fastigiata -- RAB, W; < Anychia polygonoides Rafinesque -- S]

Paronychia fastigiata (Rafinesque) Fernald var. paleacea Fernald, Green Forked Whitlow-wort. Mt, Pd, Cp (NC, VA): dry, mostly rocky woodlands; uncommon. June-October. NJ, DE, and PA west to IL, south to VA, NC, KY, TN, MO, and TX. [= C, F, K, Z ; < P. fastigiata -- RAB, W; < P. fastigiata var. fastigiata - FNA; <Anychia polygonoides Rafinesque -- S]

Paronychia herniarioides (Michaux) Nuttall, Michaux's Whitlow-wort. Cp (NC, SC): sandhills; rare. April-July. Sc. NC south to c. peninsular FL. The NC distribution ascribed by Small, Chaudhri, and FNA is based on the type specimen of André Michaux ("in arenosis aridis Carolinae septentrionalis"); the species has been relocated in NC (Scotland County) by Harry E. LeGrand, Jr. [= RAB, FNA, K, Y, Z; = Gastronychia herniarioides (Michaux) Small -- S]

Paronychia montana (Small) Pax \& K. Hoffmann, Shale-barren Whitlow-wort. Mt (NC, VA): dry rock outcrops and talus barrens, especially on shale barrens; uncommon. June-October. C. PA (and OH?) south through w. VA and e. WV to a few localities in NC, TN, GA, and AL. [= K, Z; < P. fastigiata -- RAB, W; = P. fastigiata var. pumila (A. Wood) Fernald -- C, F, FNA; = Anychiastrum montanum Small -- S]

Paronychia patula Shinners, Pineland Nailwort. Cp (GA): sandhills; rare (GA Special Concern). July-September. Sw. GA west to s. AL, south to c. peninsular FL. [= FNA, K, X, Y, Z; = Siphonychia diffusa Chapman - S]

Paronychia rugelii (Chapman) Shuttleworth ex Chapman, Sand-squares, Rugel's Nailwort. Cp (GA): sandhills; rare (GA Special Concern). July-October. S. GA south to c. peninsular FL. [= FNA, X, Y; > Paronychia rugelii (Chapman) Shuttleworth ex Chapman var. interior (Small) Chaudhri - K, Z; > Paronychia rugelii (Chapman) Shuttleworth ex Chapman var. rugelii - K, Z; >

\section*{Odontonychia interior Small - S; > Gibbesia rugelii (Chapman) Small - S]}

Paronychia virginica Sprengel var. virginica, Virginia Whitlow-wort. Mt (VA), Pd (GA, VA): shale barrens, rocky riversides, calcareous rock outcrops and talus, serpentine outcrops; rare (US Species of Concern, GA Special Concern, VA Rare). JuneAugust. The ranges of the two varieties are variously stated; the distinguishing characteristics and distributions are not clear. Var. virginica occurs in w. MD, w. VA, WV, GA, and AL (or allegedly also in NC, AR, OK, and TX). Var. parksii (Cory) Chaudhri occurs in TX (or also in OK). [= C, Z; < P. virginica -- F, FNA, K, W; = P. virginica ssp. virginica -- G; = \(P\). dichotoma (Linnaeus) Nuttall -- S]

Paronychia erecta (Chapman) Shinners var. corymbosa (Small) Chaudhri, Hairy Squareflower. Coastal dunes, Panhandle FL west to se. LA. March-November. [= K, Y, Z; = Odontonychia corymbosa Small-S; < Paronychia erecta - FNA, X]

Paronychia erecta (Chapman) Shinners var. erecta, Smooth Squareflower. Coastal dunes, Panhandle FL west to s. MS. March-November. [= K, Y, Z; = Odontonychia erecta (Chapman) Small - S; < Paronychia erecta - FNA, X]

\section*{Petrorhagia (Seringe) Link 1831 (Pink)}

A genus of about 28-33 species, herbs, of Eurasia. References: Rabeler \& Hartman in FNA (2005); Rabeler (1985)=Z; Bittrich in Kubitzki, Rohwer, \& Bittrich (1993). Key based on Z.

1 Flowers in capitate inflorescences (solitary in impoverished or very young plants); bracts subtending the calyx broad and long, usually completely enclosing the calyx; [section Kohlrauschia] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. prolifera
1 Flowers solitary (or in fascicles of 2-3); bracts subtending the calyx narrow and short, enclosing about \(1 / 2\) of the calyx; [section Petrorhagia] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [ [P. saxifraga]
* Petrorhagia prolifera (Linnaeus) P.W. Ball \& Heywood, Childing Pink, Proliferous Pink. Cp (SC, VA), Mt (NC, VA), Pd (GA, NC, VA): roadsides, disturbed areas; uncommon, introduced from Europe. May-September. Reported for GA by Duncan (1985). [= C, K, Z; = Dianthus prolifer Linnaeus -- F; = Tunica prolifera (Linnaeus) Scopoli -- G; = P. prolifer -- W, orthographic variant]
* Petrorhagia saxifraga (Linnaeus) Link var. saxifraga, Saxifrage Pink, is "cultivated and occasionally escaped" south to se. PA (Rhoads \& Klein 1993), s. NJ, and MD (Rabeler (1985). Rabeler (1985) reports a location from Page Co. VA, but it appears that this is persistent from cultivation. [= FNA; < P. saxifraga - C, K, Z; < Tunica saxifraga (Linnaeus) Scopoli]

Polycarpon Linnaeus 1759 (Allseed)
A genus of about 18 species, herbs, primarily of Europe, with several species in South America, and 1 cosmopolitan. References: Thieret \& Rabeler in FNA (2005); Bittrich in Kubitzki, Rohwer, \& Bittrich (1993).
* Polycarpon tetraphyllum (Linnaeus) Linnaeus ssp. tetraphyllum, Four-leaved Allseed. Cp (GA, SC): disturbed areas; rare, introduced from Europe. April-October. [= FNA, K; < Polycarpon tetraphyllum - RAB, S]

\section*{Sagina Linnaeus 1753 (Pearlwort)} [also see Moenchia]

A genus of about 25 species, herbs, mainly north temperate. References: Crow in FNA (2005); Crow (1978)=Z; Bittrich in Kubitzki, Rohwer, \& Bittrich (1993).

1 Annual, usually without a persistent rosette of leaves; flowers (4-) 5-merous; seeds 0.3-1.4 mm long; sepals erect-appressed in
\(\qquad\) 1 Perennial, usually with a persistent rosette; flowers \(4(-5)\)-merous; seeds (0.3-) 0.4 (0.5) mm long; sepals spreading in fruit ...
\(\qquad\)

Sagina decumbens (Elliott) Torrey \& A. Gray, Eastern Pearlwort. Cp, Pd, Mt (GA, NC, SC, VA): disturbed ground, fields, cracks in pavement or sidewalks; common (uncommon in Mountains). March-June. New Brunswick west to IL and MO, south to FL and TX, with adventive occurrences further west. Crow (1978) and Crow in FNA (2005) treat S. decumbens and S. occidentalis S. Watson of the Pacific Coast of North America as subspecies. They differ primarily in seed architecture. Though clearly closely related, they seem equally well (and more simply) regarded as sibling species. [= RAB, C, F, G, S, W; = S. decumbens ssp. decumbens -- FNA, K, Z]
* Sagina procumbens Linnaeus, Northern Pearlwort, Bird's-eye. Mt (NC): gravel parking lot on summit of Roan Mountain; rare, introduced from Eurasia (or, at least, ne. North America). May-September. Crow (1978) questions whether S. procumbens is native at all in the Western Hemisphere. In North America, it is concentrated in 2 main regions, from Nova Scotia and Québec south to MD, and from sw. British Columbia south to c. CA, with scattered occurrences elsewhere, such as around the Great Lakes, CO, AR, s. OH, and w. NC. Whether or not the species is native in the New World, the occurrence in NC is almost certainly adventive. [= C, FNA, G, K, Z; > S. procumbens var. procumbens - F; > S. procumbens var. compacta Lange -- F]
* Sagina japonica (Swartz) Ohwi, Japanese Pearlwort, native of e. Asia, is naturalized in se. PA (Rhoads \& Klein (1993). [= FNA, K]
* Sagina subulata (Swartz) K. Presl, Scottish Moss, native of Europe, is naturalized in VA (Kartesz 1999 based on Rhodora 1978). [= FNA, K]

\section*{Saponaria Linnaeus 1753 (Soapwort)}
(see also Vaccaria)

A genus of about 40 species, herbs, of temperate regions of Eurasia. References: Thieret \& Rabeler in FNA (2005); Bittrich in Kubitzki, Rohwer, \& Bittrich (1993).

Saponaria officinalis Linnaeus, Soapwort, Bouncing Bet. Mt, Pd, Cp (GA, NC, SC, VA): disturbed areas, fields, roadsides; common, introduced from Europe. May-October. [= RAB, C, F, FNA, G, K, S, W]

\section*{Scleranthus Linnaeus 1753 (Knawel)}

A genus of 10 species, herbs, mainly of temperate regions of the Northern Hemisphere. References: Bittrich in Kubitzki, Rohwer, \& Bittrich (1993).
* Scleranthus annuus Linnaeus, Knawel, Annual Knawel. Pd, Cp, Mt (GA, NC, SC, VA): fields, ditches, roadsides, other disturbed areas; common (uncommon in Mountains), introduced from Europe. April-October. [= RAB, C, F, G, K, W]

\section*{Silene Linnaeus 1753 (Catchfly, Campion, Fire-pink, Wild-pink)}

A genus of about 700 species, of Eurasia and North America. References: Morton in FNA (2005); Clausen (1939)=Z; Wilbur (1970b) \(=\mathrm{Y}\); Bittrich in Kubitzki, Rohwer, \& Bittrich (1993).

Silene antirrhina Linnaeus, Sleepy Catchfly, Garter-pink. Mt, Pd, Cp (NC, SC, VA), \{GA\}: fields, disturbed areas; common.

April-July. Ranging nearly throughout North America, and in Mexico and South America; introduced in Europe. [= RAB, C, F, FNA, G, K, S, W]
* Silene armeria Linnaeus, Sweet William Catchfly, None-so-pretty, Garden Catchfly. Mt, Pd (NC, VA), Cp (NC, SC, VA): disturbed areas; rare, introduced from Europe. June-October. [= RAB, C, F, G, K, W]

Silene caroliniana Walter var. caroliniana, South Carolina Wild-pink, Rock Catchfly. Pd, Cp (GA, NC, SC): in acidic, sandy, open woodlands, especially woodlands around granitic flatrocks and sandy Coastal Plain woodlands; common (rare in NC) (GA Special Concern, NC Watch List). April-July. Sc. NC south through the e. three-quarters of SC just into e. GA. See Wilbur (1970b) and Clausen (1939) for additional discussion of these infraspecific taxa in S. caroliniana. [=C, F; < S. caroliniana -- RAB, S; = S. caroliniana ssp. caroliniana -- FNA, G, K, Z; = S. caroliniana ssp. caroliniana var. caroliniana -- Y]

Silene caroliniana Walter var. pensylvanica (Michaux) Fernald, Northern Wild-pink, Sticky Catchfly. Mt, Pd (NC, VA), Cp (NC, SC, VA): open woodlands, especially calcareous; common (rare in NC) (NC Watch List). April-July. NH west to e. OH, south to VA, e., nc., and w. NC, and ne. TN (Chester, Wofford, \& Kral 1997). [= C, F, W; < S. caroliniana -- RAB, S; = S. caroliniana ssp. pensylvanica (Michaux) Clausen -- FNA, G, K, Z; = S. caroliniana ssp. caroliniana var. pensylvanica -- Y]
* Silene dichotoma Ehrhart ssp. dichotoma, Forked Catchfly. Mt (NC, VA), Pd (VA), \{GA\}: fields, disturbed areas; common, introduced from Europe. May-August. [= FNA; < S. dichotoma-RAB, C, F, G, K, S, W]
* Silene gallica Linnaeus, Small-flowered Catchfly. Cp (NC, SC, VA): sandy disturbed areas; rare, introduced from Europe. May-July. [= RAB, C, F, FNA, G, K; S. anglica Linnaeus -- S, misapplied]
* Silene latifolia Poiret, White Campion, White Cockle, Evening Lychnis. Mt, Pd, Cp (NC, SC, VA): fields, roadsides, disturbed areas; common (rare south of NC), introduced from Europe. May-July. [= C, FNA; >S. latifolia Poiret ssp. alba (P. Miller) Greuter \& Burdet - K; = Lychnis alba P. Miller -- RAB, F, G, S, W; S. pratensis (Rafinesque) Grenier \& Godron; Melandrium dioicum (Linnaeus) Cosson \& Germain]

Silene nivea (Nuttall) Muhlenberg ex Otth, Snowy Campion. Mt (GA, VA), Pd (VA): rocky or sandy flood-scoured riversides or creeksides; rare (VA Rare). June-July. NJ west to ND, south to n. VA, w. VA, s. WV, nw. GA (Jones \& Coile 1988), TN, and MO. [= C, F, FNA, G, K, W; Silene alba Muhlenberg -- S, misapplied]
* Silene noctiflora Linnaeus, Sticky Cockle, Night-flowering Catchfly, Sticky Campion. Mt, Pd, Cp (NC, VA): fields, disturbed areas; rare, introduced from Europe. June-August. [= RAB, C, F, FNA, G, K, S, W; Melandrium noctiflorum (Linnaeus) Fries]

Silene ovata Pursh, Mountain Catchfly. Mt (GA, NC, SC, VA), Cp (GA): circumneutral soils of woodlands and forests, especially over mafic or calcareous rocks, mostly at medium elevations in the mountains; rare (US Species of Concern, GA Special Concern, NC Rare, SC Rare, VA Rare). August-September. Sw. VA and KY west to AR, south to nw. GA, n. AL, and AR; disjunct in sc. and sw. GA. [= RAB, C, F, FNA, G, K, S, W]

Silene polypetala (Walter) Fernald \& Schubert, Eastern Fringed Catchfly, Fringed Campion. Cp (GA): mesic deciduous forests along streams or on lower- to mid-slopes; rare (US Endangered, GA Endangered). Mid-March-early May. C. GA south to Panhandle FL, and possibly in AL based on a C.T. Mohr specimen (see FNA). [= FNA, K; = S. baldwinii Nuttall -- S]

Silene regia Sims, Royal Catchfly. Cp (GA): prairies and calcareous woodlands and forests; rare (GA Rare). OH and e. MO south to e. TN (Chester, Wofford, \& Kral 1997), nw. and sw. GA (Jones \& Coile 1988), FL Panhandle (Jackson County), and AL. [= C, F, FNA, G, K, S]

Silene rotundifolia Nuttall, Roundleaf Fire-pink, Sandstone Fire-pink. Mt (GA, VA): sandstones cliffs, ledges, and talus, and at bases of sandstone cliffs; rare (GA, Special Concern, VA Rare). S. OH and WV south to nw. GA (Jones \& Coile 1988) and n. AL, nearly restricted to the Cumberland Plateau. [= C, F, FNA, G, K, S]

Silene stellata (Linnaeus) Aiton f., Starry Campion, Widow's-frill. Mt, Pd, Cp (NC, SC, VA): dry to mesic forests, rock outcrops; common (rare in Coastal Plain). July-September. CT west to SD, south to c. GA and TX. [= RAB, F, FNA, K, S, W; > S. stellata var. stellata - C, G; > S. stellata var. scabrella Palmer \& Steyermark -- C, G]

Silene virginica Linnaeus, Fire-pink. Mt, Pd, Cp (NC, SC, VA): woodlands, rock outcrops, crevices in cliffs, roadbanks; common (rare in Coastal Plain). April-July. NJ and NY west to s. Ontario and se. MI, south to Panhandle FL (Bay County), GA and OK. Three varieties require investigation. Var. robusta Strausbaugh \& Core, named from locations in e. WV, should be in our area, but the distinction stated in Strausbaugh \& Core (1978) ("a more vigorous plant with leaves up to 15 cm . long") needs strengthening to warrant recognition. [= RAB, C, F, FNA, G, S, W; > S. virginica var. virginica -- K; > S. virginica var. robusta Strausbaugh \& Core -- K]
* Silene vulgaris (Moench) Garcke, Bladder Campion, Maiden's-tears. Mt, Pd (NC, VA), Cp (NC, SC, VA), \{GA\}: disturbed areas; common (uncommon to rare south of VA and in VA Coastal Plain), introduced from Europe. May-August. [= C, FNA, K; S. cucubalus Wibel -- RAB, F, G, W; > S. cucubalus var. latifolia (Reichenbach) G. Beck -- F; > S. latifolia (P. Miller) Britten \& Rendle S]

Silene caroliniana Walter var. wherryi (Small) Fernald. \{VA\}: \{habitat\}; rare? VA and OH south and west to AL, KY, MO, and KS. It is most similar to var. pensylvanica in leaf shape, differing primarily from both our varieties in the dense nonglandular pubescence of the calyx tube (vs. densely glandular puberulent). [= S. caroliniana ssp. wherryi (Small) Clausen - FNA, K; = S. wherryi Small] \{add to key; add synonymy\}
* Silene coronaria (Linnaeus) Clairville, Mullein-pink, Rose Campion. Mt (GA, NC, SC, VA), Pd (NC, SC, VA), Cp (VA): disturbed areas; uncommon (rare south of VA), introduced from Europe. May-July. [= FNA; = Lychnis coronaria (Linnaeus) Desrousseaux - RAB, C, F, G, K] \{add to key\}
* Silene csereii Baumgarten, Balkan Bladder-campion. Mt (NC): habitat not known; rare, introduced from Europe. Documented for w. NC (J.K. Morton, pers.comm.). Reported in se. PA (Rhoads \& Klein 1993) and e. WV. [= FNA, K; S. cserei -- C, orthographic variant] \{add to key; add synonymy\}
* Silene dioica (Linnaeus) Clairville, Red Campion, Red Catchfly, is introduced south at least to scattered locations in s. PA (Rhoads \& Klein 1993). Reported for VA (Maguire 1950). [= C, FNA, K; = Lychnis dioica Linnaeus] \{add to key; add synonymy\} Silene flos-cuculi (Linnaeus) Clairville ssp. flos-cuculi, Ragged Robin. Native of Europe, introduced and established in ne. North America, as in MD, PA. [= FNA; Lychnis flos-cuculi Linnaeus] \{add to key; add to synonymy\}

A genus of 6 species, herbs, of temperate Eurasia and n. Patagonia. References: Hartman \& Rabeler in FNA (2005); Bittrich in Kubitzki, Rohwer, \& Bittrich (1993).

1 Wing of the seed as wide as or wider than the body of the seed; seeds smooth . . . . . . . . . . . . . . . . . . . . . . . Sp. pentandra
1 Wing of the seed narrower than the body of the fruit; seeds reticulate or papillose.
2 Seeds ornamented with white, clavate papillae; plant sparsely glandular .............. Sp. arvensis var. arvensis
2 Seeds reticulate, lacking white papillae; plant sparsely to densely glandular . . . . . . . . . . . . . Sp. arvensis var. sativum
* Spergula arvensis Linnaeus, Corn Spurrey. Cp (GA, NC, SC, VA), Pd (NC, SC, VA), Mt (VA): fields, roadsides; common, introduced from Europe. April-June. Two varieties are sometimes recognized; var. arvensis with seeds ornamented with white, clavate papillae and var. sativum with seeds reticulate and lacking papillae. Additional information is needed on the distinctiveness, range in our area, etc. of the two putative varieties. [ \(=\mathrm{RAB}, \mathrm{C}, \mathrm{FNA}, \mathrm{K}, \mathrm{S} ;>\mathrm{S}\). arvensis Linnaeus var. arvensis -- \(\mathrm{F}, \mathrm{G} ;>\mathrm{S}\). arvensis Linnaeus var. sativa (Boenninghausen) Mertens \& W.D.J. Koch]
* Spergula pentandra Linnaeus, Wingstem Spurrey. Cp (NC, VA): sandy fields; rare, introduced from Europe. April-June. [= RAB, C, F, FNA, G, K]

\section*{Spergularia (Persoon) J. \& K. Presl 1819 (Sand-spurrey)}

A genus of about 25 species, herbs, cosmopolitan. The genus is perhaps not distinct from Spergula. References: Hartman \& Rabeler in FNA (2005); Bittrich in Kubitzki, Rohwer, \& Bittrich (1993).

1 Stamens 6-10; seeds either 0.4-0.6 or 0.8-1.1 mm long; axillary leaf clusters of 2-4 leaves (or sometimes absent in Sp. media). 2 Seeds 0.8-1.1 mm long, smooth, without scupturing except for wings; leaf blades fleshy
[Sp. media]
2 Seeds 0.4-0.6 mm long, sculptured with wavy lines, not winged but with peglike papillae; leaf blades scarcely fleshy Sp. rubra
1 Stamens 1-5; seeds 0.5-0.7 (-0.8) mm long; axillary leaf clusters usually absent.
3 Seeds shiny and silvery; stipules wider than long; styles 0.3-0.4 mm long . . . . . . . . . . . . . . . . . . . . Sp. echinosperma
3 Seeds dull, not silvery; stipules longer than wide; styles \(0.4-0.7 \mathrm{~mm}\) long . . . . . . . . . . . . . . . . . . . . . . . . . . . . Sp. salina
* Spergularia echinosperma Čelakovský. Cp (GA): disturbed soils; rare, introduced from Europe. Naturalized in GA and AL (FNA). [= FNA, K]

Spergularia rubra (Linnaeus) J.\& K. Presl, Purple Sand-spurrey, Roadside Sand-spurrey. Pd (VA): disturbed areas; rare, introduced from Eurasia. May-September. [= C, F, FNA, G, K; = Tissa rubra (Linnaeus) Britton -- S]

Spergularia salina J. \& K. Presl, Saltmarsh Sand-spurrey. Cp (GA, NC, SC, VA): brackish and salt marsh flats; uncommon. June-October. Widespread on coasts of North America (from Québec south to FL, from British Columbia south to Baja California), inland along salted highways, in South America, and Eurasia. Considered by some (C, G) to be introduced only in North America, by others native (F, FNA, S). [= FNA, K; = S. marina (Linnaeus) Grisebach -- RAB, C, F, G, GW, misapplied; = Tissa marina (Linnaeus) Britton -- S, misapplied]
* Spergularia media (Linnaeus) K. Presl var. media. Known from salted highways in NY, OH, MI, and IL and salt or brackish marsh habitats in coastal NY. It has (7-) 9-10 stamens, seeds \(0.6-1.1 \mathrm{~mm}\) long, smooth and more-or-less winged, and is fleshy (vs. not fleshy). [= FNA; ? Spergularia maritima (Linnaeus) Chiovenda - K] \{add synonymy\}

Stellaria Linnaeus 1753 (Chickweed, Stitchwort, Starwort)
A genus of about 120-200 species, cosmopolitan (centered in Asia). References: Morton in FNA (2005); Bittrich in Kubitzki, Rohwer, \& Bittrich (1993).

1 Leaves narrow, usually linear, lanceolate, oblanceolate, or narrowly elliptic, the blade 3-10× as long as wide, 1.5-10 mm wide; stems prominently 4 -angled.
2 Sepals 2.5-3.5 mm long; petals 0-2.5 mm long, shorter than the sepals; seeds 0.5-0.7 mm long . . . . . . . . . . . . S. alsine
2 Sepals 3.5-9 mm long; petals 3.5-13 mm long, equalling or longer than the sepals; seeds 0.7-2.5 mm long.
3 Seeds 2-2.5 mm long; bracts of the inflorescence herbaceous; petals notched les than halfway to the base
S. holostea

3 Seeds 0.7-1.2 mm long; bracts of the inflorescence scarious; petals notched more than halfway to the base.
4 Sepals 4.5-5.5 mm long, strongly 3-nerved; seeds 0.8-1.2 mm long, coarsely tuberculate; inflorescence diffuse, many-flowered . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. graminea
4 Sepals 3.5-4.5 mm long, weakly 3-nerved; seeds 0.7-1.0 mm long, obscurely sculptured and appearing almost smooth; inflorescence more compact, fewer-flowered . . . . . . . . . . . . . . . . . . . . . . . S. Iongifolia var. Iongifolia
1 Leaves broad, usually ovate, obovate, or broadly elliptic, the blade 1-2.5× (or to \(4 \times\) ) as long as wide, \(4-30 \mathrm{~mm}\) wide (if more than \(2.5 \times\) as long as wide, then definitely over 10 mm wide); stems terete or 4 -angled.
5 Leaves long-petiolate, the petiole about as long as the blade, the blades cordate to truncate at the base; sepals 2.5-3.5 mm long, obtuse to broadly acute; seeds \(0.6-0.8 \mathrm{~mm}\) long; stem glabrous or glandular-puberulent (the pubescence not in lines).
S. prostrata

5 Leaves sessile, short-petiolate, to long-petiolate (if long petiolate, the blades cuneate), the blades rounded to cuneate at the base; sepals \(3.5-11 \mathrm{~mm}\) long, broadly acute to acuminate; seeds \(0.6-2 \mathrm{~mm}\) long; stem puberulent to short-pilose (the pubescence in vertical lines or not).
6 Leaves (1.0-) 2.5-10 cm long; seeds 1.7-2 mm long; sepals 4-11 mm long; stem pubescence in vertical lines or uniformly distributed; perennial, the stems strong and ascending to erect.
7 Sepals 7-11 mm long, acuminate, ciliate, but more-or-less glabrous on the back; [plants of the mountains of NC and VA] ..................................................................................... S. corei
7 Sepals 4-7 mm long, acute, ciliate and more-or-less pubescent on the back; [plants widespread in our area]
S. pubera

6 Leaves 0.5-2.0 (-3.0) cm long; seeds 0.6-1.4 mm long; sepals 2.1-5.2 mm long; stem pubescence always in vertical lines; annual, the stems weak and in part prostrate, the tips or vigorous growth ascending.
8 Stamens 3-8 (-10); sepals 2.7-5.2 mm long; seeds 0.8-1.4 mm long; petals usually present . . . . . . . . S. media
8 Stamens 1-3 (-5); sepals 2.1-3.6 mm long; seeds 0.6-0.9 mm long; petals usually absent . . . . . . . . S. pallida
Stellaria alsine Grimm, Bog Stitchwort, Longstalk Starwort, Bog Chickweed. Mt (NC), Pd (GA): seepages; rare (NC Rare). April-May. Circumboreal, in North America ranging south to DE, MD, w. NC, GA, FL, and LA (Rabeler \& Thieret 1988). Possibly only introduced in parts at least of our area. [= RAB, C, F, FNA, G, K, W; Stellaria uliginosa Murray]

Stellaria corei Shinners, Tennessee Starwort. Mt (NC, VA): cove forests and seepages at moderate to high elevations; rare (NC Watch List, VA Rare). April-June. W. VA, WV, and sw. PA west to OH and IN, south to w. NC, e. and c. TN, and n. AL. Cronquist (1991) reports that \(S\). corei has a chromosome number of \(2 n=60\), as opposed to \(2 n=30\) for \(S\). pubera. In mountain coves, S. corei and S. pubera sometimes grow intermixed; it seems best to treat these two related taxa as species. Both species have an interesting seasonal growth form, producing short and relatively small-leaved flowering shoots in the spring (which wither following fruiting), followed by taller, more vigorous summer shoots with larger and tougher leaves and lacking flowers, which persist until autumn. Some of the description in various manuals of differences in petiole length and leaf size and shape between the two species is obscured or complicated by these seasonal differences. More careful observation is needed. [= RAB, FNA, K, W; = S. pubera Michaux var. silvatica (Béguinot) Weatherby -- C, F; = S. silvatica (Béguinot) Maguire -- G, preoccupied; = Alsine tennesseensis (C. Mohr) Small -- S, misapplied]
* Stellaria graminea Linnaeus, Common Stitchwort, Lesser Stitchwort. Mt, Pd, Cp (NC, SC, VA): fields, roadsides, pastures, disturbed areas; common, introduced from Europe. May-August. [= RAB, C, F, FNA, G, GW, K, W; Alsine longifolia (Muhlenberg ex Willdenow) Britton -- S, misapplied]
* Stellaria holostea Linnaeus, Easter-bell, Greater Stitchwort. Cp? (NC): escaped or persistent from cultivation; rare, introduced from Europe. [= C, F, FNA, G, K]

Stellaria longifolia Muhlenberg, Longleaf Stitchwort. Mt, Pd (VA), Cp (SC): meadows, floodplain forests, freshwater tidal marshes, moist disturbed areas; uncommon. Apparently circumboreal, in North America ranging south to e. SC, w. VA, e. TN, MO, \(\mathrm{KS}, \mathrm{AZ}\), and CA. [= C, F, FNA, G, W; > S. longifolia var. longifolia -- K]

Stellaria media (Linnaeus) Villars, Common Chickweed. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): disturbed areas, gardens, fields; common, introduced from Europe. January-December. [= C ; < S. media -- RAB, W, in part only (also see S. pallida); S. media var. media -- F; S. media ssp. media -- K; Alsine media Linnaeus -- S]

Stellaria pallida (Dumortier) Piré, Lesser Chickweed. Cp (NC, SC, VA): disturbed areas, gardens, fields; common, introduced from Europe. January-December. Cronquist (1991) reports that \(S\). pallida has a chromosome number of \(2 \mathrm{n}=22\), as opposed to \(2 \mathrm{n}=\) 40-44 for S. media. [= C, FNA; S. media (Linnaeus) Villars -- RAB, W, in part; \# S. media var. glaberrima G. Beck -- F, possibly misapplied; S. apetala Ucria ex Roemer -- G, possibly misapplied; S. media ssp. pallida (Dumortier) Ascherson \& Graebner -- K; Alsine pallida Dumortier]

Stellaria prostrata Baldwin. Cp (SC, VA?): moist soil along streams; rare? March-April? Apparently ranging from VA (?) and SC south to c. peninsular FL, west to c. TX. This species has been reported repeatedly for SC and sometimes for VA as well. More information is needed about its occurrence in our area. \([=G, K ;=S\). cuspidata Willdenow ex Schlechtendahl ssp. prostrata (Baldwin) J.K. Morton - FNA; Alsine baldwinii Small -- S]

Stellaria pubera Michaux, Star Chickweed, Common Starwort, Giant Chickweed, Great Chickweed. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): bottomland forests, moist slopes, coves; common (uncommon in Coastal Plain). April-June. NJ west to IL, south to panhandle FL and AL. See S. coreifor comments. [= RAB, FNA, G, K, W; = S. pubera var. pubera -- C, F; = Alsine pubera (Michaux) Britton -- S]

Stellaria borealis Bigelow var. borealis is a native species which ranges south to Canaan Valley (Tucker County, WV) and sc. PA; it might be sought in our area in cold swamps in w. VA. It will key most closely to \(S\). alsine in the key above, but differs in having seeds smooth or weakly sculptured (vs. tuberculate) and in having the lower bracts of the inflorescence leaf-like rather than scarious. [= C; S. borealis ssp. borealis -- FNA, K; S. calycantha, misapplied] \{not yet keyed; add synonymy\}

Stellaria fontinalis (Short \& Peter) B.L. Robinson is a native species of c. TN (Chester, Wofford, \& Kral 1997) and c. KY, occurring in seepages and wet cliffs. Its generic placement has been controversial and uncertain (see synonymy). [= F, FNA, G, K; = Sagina fontinalis Short \& Peter -- C; = Alsine fontinalis (Short \& Peter) Britton -- S; = Arenaria fontinalis (Short \& Peter) Shinners; = Spergula fontinalis (Short \& Peter) Dietrich] \{not yet keyed\}
* Stellaria neglecta Weihe. Mt (NC): disturbed areas; rare, introduced from Europe. Similar to S. media and S. pallida. It has been found at scattered localities in e. North America and will presumably eventually be found in our area. It is most similar to \(S\). media (to which it will key imperfectly in the above key), but differs in the following characteristics: stamens 8-10, seeds 1.1-1.4 mm long (vs. 0.8-1.4 mm ), petals 2.5-4 mm long (vs. 1.1-3.1 mm long). [= FNA; S. media (Linnaeus) Villars - RAB, C, W, in part; < S. media var. media -F , in part; = S. media ssp. neglecta (Weihe) Murbeck -- K; = Alsine neglecta (Weihe) A. \& D. Löve] \{add to key; add synonymy\}

Stipulicida Michaux 1803 (Wire-plant)
A genus of 1-2 species, herbs, of se. North America. References: Swanson \& Rabeler in FNA (2005); Bittrich in Kubitzki, Rohwer, \& Bittrich (1993).

Stipulicida setacea Michaux var. setacea, Wire-plant. Cp (GA, NC, SC, VA): xeric sands of sandhills, dry pine flatwoods, maritime forests; common, rare in VA (VA Rare). May-August. Se. VA south to FL, west to LA. Immediately recognizable by its very wiry, dichotomously branched stems, the stem leaves reduced to subulate scales \(0.5-2 \mathrm{~mm}\) long. Often overlooked are the basal rosette of spatulate leaves, to 15 mm long and 4 mm wide. Var. lacerata James is endemic to peninsular FL. Var. filiformis (Nash) D.B. Ward, also of FL, is sometimes lumped into var. setacea. [ \(<\) S. setacea var. setacea - FNA, K (in a broader sense, including var. filiformis); <S. setacea -- RAB, C; <S. setacea - S, in a narrower sense (not including var. filiformis)]

\section*{Vaccaria von Wolf 1781 (Cow-cockle, Cow-herb)}

A genus of 1-4 species, herbs, of c. and e. Europe, Mediterranean, and temperate Asia. References: Thieret \& Rabeler in FNA (2005); Bittrich in Kubitzki, Rohwer, \& Bittrich (1993).
* Vaccaria hispanica (P. Miller) Rauschert, Cow-cockle, Cow-herb. Pd (SC): fields; rare, introduced from Europe. May-June. [= C, FNA, K; =? V. pyramidata Medikus -- RAB; = Saponaria vaccaria Linnaeus -- F; =? Vaccaria segetalis Garcke ex Ascherson -- G; = Vaccaria vaccaria (Linnaeus) Britton -- S]

CASUARINACEAE R. Brown 1814 (Casuarina Family)
A family of 4 genera and about 100 species, trees and shrubs, of Malesia, Australia, and Melanesia. References: Johnson \& Wilson in Kubitzki, Rohwer, \& Bittrich (1993).

Casuarina Rumph. ex Linnaeus 1759 (Casuarina, Beefwood, She-oak)

A genus of about 17 species, trees, tropical to warm temperate in s. Asia, Australia, and Polynesia. References: Johnson \& Wilson in Kubitzki, Rohwer, \& Bittrich (1993).
* Casuarina equisetifolia Linnaeus ssp. equisetifolia, Casuarina, Australian-pine, Horsetail Casuarina, Beach She-oak, Coastal She-oak, was reported as planted and persistent on the Outer Banks of NC by Brown (1959). It is probably not established. [= FNA; < C. equisetifolia -- K, S]

\section*{CELASTRACEAE (Bittersweet Family)}

A family of ca. 98 genera and ca. 1200 species, trees, shrubs, lianas, perennial and annual herbs, nearly cosmopolitan, especially in the tropics and subtropics. References: Brizicky (1964); Simmons in Kubitzki (2004).

1 Leaves spiny-toothed, coriaceous; [rare waif in our area] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Crossopetalum
1 Leaves entire to serrate (but not spiny-toothed), herbaceous to coriaceous; [collectively common in our area].
2 Leaves alternate; twining woody vines. \(\qquad\)
3 Leaves widely spaced, averaging less than 1 pair per cm of stem; leaves 2.5-12 cm long, (0.5-) 1-6 cm wide; [shrubs to small trees, mostly taller than 0.4 m tall, collectively in many habitats] . . . . . . . . . . . . . . . . . . . . . . . Euonymus
3 Leaves closely spaced, 2-4 pairs per cm of stem; leaves \(1.1-2.5 \mathrm{~cm}\) long, 0.2-0.6 cm wide; [shrub to 0.4 m tall, native to calcareous rock outcrops, rarely naturalized elsewhere] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Paxistima

\section*{Celastrus Linnaeus 1753 (Bittersweet)}

A genus of ca. 30 species, scandent shrubs, primarily in e. Asia, Malaysia, Oceania, Madagascar, and Central and South America. The one species native to e. North America is related to e. Asian species. References: Duncan (1969)=Z ; Simmons in Kubitzki (2004).

1 Flowers in 2-3-flowered axillary cymes; leaves mostly obovate, averaging 1.2-1.7× as long as wide . . . . . . . . . C. orbiculatus 1 Flowers in 6-many-flowered terminal panicles; leaves mostly ovate-lanceolate to elliptic, averaging \(1.8-2.6 \times\) as long as wide . . C. scandens
* Celastrus orbiculatus Thunberg, Oriental Bittersweet. Mt, Pd, Cp (GA, NC, SC, VA): thickets, roadsides, forests; common, introduced from Asia. May; August-September. C. orbiculatus, though attractive, is becoming a noxious weed in our area. The first reports of its occurrence in our area appear to be in the 1960's; it is now much more common than its native relative, C. scandens. [= RAB , C, F, K, W, Z; = C. orbiculata -- G, orthographic variant]

Celastrus scandens Linnaeus, American Bittersweet. Mt (GA, NC, SC, VA), Pd (NC, SC, VA), Cp (VA): mesic forests; common (uncommon in VA Piedmont and VA Coastal Plain, rare south of VA) (GA Special Concern, NC Watch List). May-June; August-September. Québec west to Manitoba and WY, south to w. SC, n. GA, AL, LA, and TX. [= RAB, C, F, G, K, S, W, Z]

\section*{Crossopetalum P. Browne 1756 (Christmas-berry)}

A genus of about 26 species, trees and shrubs, of the West Indies and tropical America. References: Simmons in Kubitzki (2004).
* Crossopetalum ilicifolium (Poiret) Kuntze, Holly-leaf Rhacoma, Christmas-berry. Cp (NC): disturbed, acid, peaty soil; rare, introduced from subtropical FL. Presumably introduced via cattle at an agricultural experiment station near Wenona, Washington County, NC (Hayes 1946). The species has probably not persisted in our area. [= K; = Rhacoma ilicifolia (Poiret) Trelease -- S]

\section*{Euonymus Linnaeus 1753 (Spindle-tree, Euonymus, Strawberry-bush)}

A genus of ca. 129 species, of temperate and tropical areas, trees, shrubs, and lianas. The genus name was variously spelled "Euonymus" and "Evonymus" by Linnaeus. The spelling Euonymus has been nomenclaturally "conserved." The genus is now considered to be grammatically masculine, and specific epithets therefore end in "-us." References: Voss (1985)=Z; Simmons in Kubitzki (2004). Key adapted in part from Duncan \& Duncan (in prep.).

1 Leaf undersurface with mostly erect hairs to ca. 0.2 mm long; petioles \(8-20 \mathrm{~mm}\) long; flowers 4-merous; [native]; [section Euonymus] E. atropurpureus var. atropurpureus

1 Leaf undersurface glabrous (or with some hairs on the midrib); flowers 4- or 5-merous; [introduced or native].
2 Leaves evergreen; flowers 4-merous; [introduced species, rarely naturalized]
3 Petioles of the larger leaves (8-) 11-17 mm long; trailing shrub or climbing vine . . . . . . . . E. fortunei var. radicans
3 Petioles of the larger leaves 4-7 (-8) mm long; shrub or small tree to 6 m tall.
4 Petioles of the larger leaves 6-12 mm long; leaves evergreen, rather thick in texture; inflorescence a dense, few-flowered cyme; shrub or small tree to 6 m tall. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . E. japonicus
4 Petioles of the larger leaves 4-7 (-8) mm long; leaves semi-evergreen, rather thin in texture; inflorescence a loose, many-flowered cyme; spreading shrub to 3 m tall
E. kiautschovicus

2 Leaves deciduous; flowers 4- or 5-merous; [introduced or native].
5 Petioles 5-33 mm long; flowers 4-merous; [introduced, rarely naturalized].
6 Leaf apex long-acuminate; larger leaves with teeth 6-8 per cm ........................... . . E. bungeanus
6 Leaf apex acute to short-acuminate; larger leaves \(8-11\) per cm ; [section Euonymus] ........... E. europaeus
5 Petioles \(1-5 \mathrm{~mm}\) long; flowers 4 - or 5 -merous; [native and introduced].
7 Twigs and branches with 2-4 corky wings; flowers 4-merous; capsules smooth; [introduced, rarely naturalized]; [section Melanocarya] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . E. alatus
7 Twigs and small branches lacking corky wings, terete (or nearly so); flowers 5-merous; capsules muricate; [native species]; [section Echinococcus].
8 Primary stems erect, to 20 dm tall; upper leaves widest at or below the middle; petioles mostly \(1-3 \mathrm{~mm}\) long; [widespread in our area] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . E. americanu
8 Primary stems trailing or decumbent, the tips and flowering branches ascending to \(3(-6)\) dm tall; upper leaves widest at or beyond the middle; petioles mostly 3-5 mm long; [of the Mountains] . . . . E. obovatus
* Euonymus alatus (Thunberg) Siebold, Winged Euonymus. Cp, Pd (NC, SC, VA), Mt (NC, VA): cultivated, rarely naturalized; rare, introduced from e. Asia. [= C, F, G; = Euonymus alata -- K, Z]

Euonymus americanus Linnaeus, Strawberry-bush, Heart's-a-bustin'. Mt, Pd, Cp (NC, SC, VA): forests; common. May-June; September-October. Se. NY west to s. OH and se. MO, south to n. peninsular FL and TX. A variety, var. angustifolia (Pursh) A. Wood, with narrowly lanceolate to linear leaves, has been named and occurs in our area; it is of uncertain status (Brizicky 1964). [= RAB, C, F, G, S, W; = Euonymus americana -- K]

Euonymus atropurpureus Jacquin var. atropurpureus, American Wahoo, Burning Bush. Mt (NC, SC, VA), Pd (NC, SC, VA), Cp (VA): bottomland forests, riverbanks, mostly on rich alluvial sediments, or on slopes over mafic or calcareous rocks; uncommon (rare south of VA). May; October. NY west to ND, south to panhandle FL and TX. [< Euonymus atropurpureus -- RAB, C, F, G, S, W, infraspecific taxa not distinguished; = Euonymus atropurpurea Jacquin var. atropurpurea -- K; Euonymus atropurpurea -- Z]
* Euonymus bungeanus Maximowicz, Winterberry. Cp (SC): cultivated, rarely naturalized; rare, introduced from n. China. [= Euonymus bungeanum -- K]
* Euonymus europaeus Linnaeus, European Spindle-tree. Cp (VA): cultivated, rarely naturalized; rare, introduced from Europe. [= C, F, G; = Euonymus europaea -- K, Z]
* Euonymus fortunei (Turczaninow) Handel-Mazzetti var. radicans (Siebold ex Miq.) Rehder, Wintercreeper, Chinese Spindletree. Pd (NC, SC), Mt, Cp (VA): cultivated, rarely naturalized, as in bottomlands or swamps, where sometimes climbing into the canopy; rare, introduced from China. [= K; <E.fortunei-F, G, Z]
* Euonymus japonicus Thunberg, Japanese Spindle-tree. Cp (NC, VA): disturbed areas; rare, introduced from Japan. Widely planted on the Outer Banks of NC because of its resistance to salt damage (Brown 1959). [= C; = E. japonica - K]

Euonymus kiautschovicus Loesener. Pd (NC): cultivated, rarely naturalized; rare, introduced from e. and c. China. [= Euonymus kiautschovica -- K]

Euonymus obovatus Nuttall, Running Strawberry-bush. Mt (GA, NC): cove forests, northern hardwood forests, other mesic forests, especially in boulderfields, where sometimes quite abundant locally; uncommon. May-June; September-October. W. NY
west to s. MI, south to sw. NC, ne. GA, TN, and MO. [= RAB, C, F, G, S, W; = Euonymus obovata -- K, Z]

\section*{Paxistima Rafinesque 1838 (Mountain-lover)}

A genus of 2 species, rhizomatous shrubs, of temperate North America. The only other species in the genus is \(P\). myrsinites (Pursh) Rafinesque of the Western Cordillera; its two subspecies are ssp. myrsinites, ranging from British Columbia and Alberta south to AZ and NM, and ssp. mexicana Navaro \& Blackwell of mountainous Mexico (Coahuila, Nuevo Leon, and Tamaulipas). For discussion of the long confusion and controversy over the appropriate spelling of the genus, see Navaro \& Blackwell (1990) and Uttal (1986). The first validly published spelling of the name was "Paxistima," and this spelling should be retained. References: Navaro \& Blackwell (1990)=Z; Simmons in Kubitzki (2004).

Paxistima canbyi A. Gray, Cliff-green, Canby's Mountain-lover, Ratstripper. Mt (NC*, VA): in VA on calcareous bluffs and cliffs (generally near the top of the cliffs or bluffs, rarely far below the crest), mostly on limestone and dolostone, but rarely on greenstone or shale; in NC naturalized at the site of a plant nursery and possibly also native (see discussion below); rare (US Species of Concern, NC Watch List, VA Rare). April-May; September. The species is a Central Appalachian endemic: sc. PA (Bedford County) (Rhoads \& Klein 1993), e. WV, w. VA, s. OH, e KY, ne. TN, and w. NC (where questionably native). The only collection definitely known from NC is that from an old nursery site (Hardin 1963). Navaro \& Blackwell (1990) note that "the presence of \(P\). canbyi in North Carolina was, however, noticed as long ago as 1883 by Chapman, and \(P\). canbyi is likely native to North Carolina." Small (1933) reports it from "n. NC." Casting some doubt on its native status in NC is the species' habitat: limestone ravines and bluffs, a very rare habitat in NC. [= RAB, C, K, W, Z; = Pachistima canbyi-- F (the name not validly published); = Pachystima canbyi-- \(\mathrm{G}, \mathrm{S}\) (the name not validly published)]

CELTIDACEAE (Hackberry Family)
(see CANNABACEAE)

\section*{CERATOPHYLLACEAE S.F. Gray 1821 (Hornwort Family)}

A peculiar and apparently very primitive family, of a single genus and about 6 species, aquatic herbs, of cosmopolitan distribution. The Ceratophyllaceae "may have actually arisen from early angiosperms that existed prior to the fundamental evolutionary divergence of monocots and dicots (Les 1988c; Les in Kubitzki, Rohwer, \& Bittrich 1993). References: Les in FNA (1997); Les (in prep., 1985, 1986, 1988a, 1988b, 1988c, 1989)=Z; Les in Kubitzki, Rohwer, \& Bittrich (1993). Key adapted from Les.

\section*{Ceratophyllum Linnaeus 1753 (Hornwort, Coontail)}

A genus of about 6 species, aquatic herbs, of cosmopolitan distribution. References: Les in FNA (1997); Les (1985, 1986, 1988a, 1988b, 1988c, 1989)=Z; Les in Kubitzki, Rohwer, \& Bittrich (1993). Key adapted from Les.

Identification notes: Ceratophyllum is sometimes mistaken for other, superficially somewhat similar aquatics, such as Cabomba (Cabombaceae), Utricularia (Lentibulariaceae), and Myriophyllum (Haloragaceae). Cabomba has the leaves opposite (rather than whorled), dichotomously divided (like Ceratophyllum), but the divisions lacking the marginal denticles of Ceratophyllum, and on a 1-3 cm long petiole (vs. sessile or on a petiole \(0-2 \mathrm{~mm}\) long). Utricularia has the leaves sometimes dichotomously divided, but the divisions are usually irregular, the leaves are alternate (in most species), and bladder traps are present. Myriophyllum has the leaves pectinately rather than dichotomously divided.

1 Largest leaves forking 1-2× (count branching-nodes from the base of the leaf to the tip of the most-forked division); leaves coarse-textured, stiff, the marginal denticles usually strongly raised on a broad base of green tissue; achene margin wingless, with 2 basal spines or tubercles (these rarely absent), otherwise entire (lacking marginal spines)
C. demersum

1 Largest leaves forking \(3-4 \times\) (count branching nodes from the base of the leaf to the tip of the most-forked division); leaves finetextured, flaccid, the marginal denticles not raised on a broad base of green tissue, sometimes obscure or obsolete; achene margin winged, with 2-20 lateral spines \(0.1-6.5 \mathrm{~mm}\) long (occasionally spineless), with 2 basal spines (these rarely absent). 2 Achene body (excluding the spines) \(3-4.5 \mathrm{~mm}\) long; first leaves of the plumule simple; [Coastal Plain, NC southwards] . 2 Achene body (excluding the spines) \(4.5-6 \mathrm{~mm}\) long; first leaves of the plumule forked; [widespread] . . . . . C. echinatum

Ceratophyllum australe Grisebach. Cp (GA, NC): ponds, pools, slow-moving streams; rare (NC Watch List). May-September. Se. NC south to s. FL and panhandle FL, and in the West Indies; also in s. Mexico, Central America, n. South America, with apparent disjunctions in c. South America and the Galapagos Islands. Les treats this taxon as a subspecies of the Old World C. muricatum. Because of their allopatric distribution on separate continents and relative morphological distinctiveness (as shown by Les), I prefer to recognize them at the species level. [= Ceratophyllum muricatum Chamisso ssp. australe (Grisebach) Les -- FNA, K, Z; < C. muricatum Chamisso -- GW (also see C. echinatum)]

Ceratophyllum demersum Linnaeus, Coontail. Cp (GA, NC, SC, VA), Mt (GA, VA), Pd (VA): ponds, pools, slow-moving streams; uncommon. May-September. Newfoundland west to AK, south to s. FL, TX, CA, and south through the West Indies and Central America to South America. [= RAB, C, F, FNA, G, GW, K, W, S, Z]

Ceratophyllum echinatum A. Gray in Torrey \& A. Gray. Cp (NC, SC, VA), Mt (GA, VA), Pd (VA): ponds, pools, slow-moving streams; uncommon. May-September. Newfoundland west to Ontario and n. MN, south to c. peninsular FL and e. TX; also in British

Columbia, WA, and OR. [= RAB, C, F, FNA, G, K, S, Z; <C. muricatum Chamisso -- GW (also see C. australe); = C. submersum Linnaeus var. echinatum (A. Gray) Wilmot-Dear]

\section*{CHENOPODIACEAE (Goosefoot Family)}

A family of over 100 genera and about 1450-1500 species, nearly cosmopolitan, but most diverse in subtropical and temperate regions (Judd \& Ferguson 1999). Perhaps better united with the Amaranthaceae. References: Welsh, Crompton, \& Clemants in FNA (2003b); Judd \& Ferguson (1999)=Z; Kühn in Kubitzki, Rohwer, \& Bittrich (1993).
\{Note: several of the genera below have been treated in very different ways by various authors. Complicating the situation is the pantemperate or pantropical distribution of some species, questions of application of names having priority, and the use of technical characters not readily observed on herbarium specimens. The treatments below of Salicornia, Sarcocornia, Atriplex, and Suaeda may require considerable change prior to publication\}

1 Leaves opposite, reduced to scales a few mm long, clasping and appressed against the succulent stem; flowers in groups of 3 , sunken into the stem; [subfamily Salicornioideae, tribe Salicornieae].
2 Annual from a taproot; central flower (of each group of 3) considerably longer than the 2 lateral flowers ...... Salicornia
2 Perennial from a horizontal rhizome; central flower (of each group of 3 ) slightly or not at all longer than the 2 lateral flowers
. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Sarcocornia

1 Leaves mostly or entirely alternate (the lower sometimes opposite), not reduced to appressed scales; flowers not usually grouped into groups of 3 , not sunken into the stem.
3 Fruit enclosed and concealed by paired accrescent bracteoles (these usually deltoid, diamond-shaped, or ovoid).
4 Leaves pale green to silvery green; stigmas 2; plants without basal leaves, the stems freely and rather divergently branched; [native or introduced, primarily in saline situations]; [subfamily Chenopodioideae, tribe Atripliceae]

Atriplex
4 Leaves bright green; stigmas 4-5; plants with basal leaves, the flowering stems erect, strict or with acending branches in the inflorescence; [introduced, frequently cultivated as a garden vegetable, rarely escaped]; [subfamily Chenopodioideae, tribe Atripliceae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Spinacia
3 Fruit enclosed by the persistent calyx.
5 Leaves petiolate, lanceolate or wider, the larger leaves generally toothed, not succulent or only slightly so; [subfamily Chenopodioideae].
6 Fruit dehiscent; ovary half-inferior; roots usually enlarged; [tribe Beteae] . . . . . . . . . . . . . . . . . . . . . . . . . Beta 6 Fruit indehiscent; ovary superior; roots not enlarged.

7 Fruiting calyx not winged, the lobes flat, keeled, or hooded; [tribe Chenopodieae] . . . . . . . Chenopodium 7 Fruiting calyx winged horizontally; [tribe Camphorosmeae] . . . . . . . . . . . . . . . . . . . . . . . . . . . Cycloloma
5 Leaves sessile, linear, entire, succulent or not.
8 Leaves spine-tipped; [subfamily Salsoloideae; tribe Salsoleae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Salsola 8 Leaves not spine-tipped.

9 Leaves pubescent to villous; [subfamily Chenopodioideae, tribe Camphorosmeae] . . . . . . . . . . . . Bassia 9 Leaves glabrous; [subfamily Salsoloideae, tribe Suaedeae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Suaeda

\section*{Atriplex Linnaeus 1753 (Orach)}

A genus of about 300 species, herbs and shrubs, of cosmopolitan distribution. References: Judd \& Ferguson (1999)=Z; Clemants (1992) \(=\) Y; Welsh in FNA (2003b); Kühn in Kubitzki, Rohwer, \& Bittrich (1993). Treatment based closely on Welsh in FNA (2003b)

Identification notes: There are a number of idiosyncratic characters that are used for the identification of the species of Atriplex. Many important characters are associated with the mature fruits. The fruit is closely invested by 2 bracteoles, which are variously shaped and ornamented. Mature seeds are dimorphic in most of our species, with large, brown seeds and small, black seeds. The radicle of the seeds is variously apical, lateral, or basal (which can be seen by observing the seed through the clarified bracteoles or with strong transmitted light).

1 Leaves white to gray, densely and finely scurfy, especially adaxially.
2 Seeds dimorphic, black and brown; branches not angled; [introduced, of disturbed situations]; [subgenus Atriplex, section Semibaccata]
[A. semibaccata]
2 Seeds monomorphic, brown; branches obtusely angled; [native, of coastal saline situations]; [subgenus Obione, section Obione, subsection Arenariae].
3 Fruiting bracteoles (3.5-) 4.5-7 mm long, 3.5-5.6 mm wide, longer than broad; faces with or without appendages; [of NC northwards]
A. mucronata

3 Fruiting bracteoles 2.5-4.5 mm long, 2.6-5 mm wide, as wide as or wider than long; faces with appendages; [of NC southwards]
A. pentandra

1 Leaves usually green on both surfaces, glabrous or only sparingly powdery or scurfy; [subgenus Atriplex, section Teutliopsis]. 4 Fruiting bracteoles not thickened with spongy tissue.
5 Bracteoles rhombic to diamond-shaped, broadly cuneate at the base; bracteoles usually thick and spongy (rarely not); brown seeds broadly elliptic, (1.5-) 2.1-3.0 mm wide; seed radicle lateral; [of saline coastal habitats] . A. dioica
5 Bracteoles triangular, nearly truncate across the bottom; bracteoles thin, not spongy; brown seeds round, 2.5-3.1 (-
3.7) mm wide; seed radicle subbasal; [primarily ruderal, of inland situations]Fruiting bracteoles thickened with spongy tissue, especially toward the base.
\(6 \quad\) Seeds ellipsoid, wider than long; leaves thickened in texture A. dioica
6 Seeds disc-shaped, as wide as long; leaves thin in texture.7 Lower leaves linear or ovate-lanceolate; brown seeds 2.0-2.8 mm wide; black seeds 1.5-2.0 mm wide; [of MDand PA northwards],[A. littoralis]
7 Lower leaves triangular-hastate; brown seeds \(1.0-2.5 \mathrm{~mm}\) wide; black seeds \(1.0-1.5 \mathrm{~mm}\) wide; [widespread inour area, primarily in the outer Coastal Plain]A. prostrata

Atriplex dioica Rafinesque. Cp (NC, VA?), Mt (VA): brackish flats; rare? July-frost. Newfoundland west to AK, south to NC and CA. [= FNA; = Atriplex subspicata (Nuttall) Rydberg -- K, Y; <A. littoralis Linnaeus -- C, misapplied; <A. patula Linnaeus var. littoralis (Linnaeus) A. Gray -- F, misapplied]

Atriplex mucronata Rafinesque, Seabeach Orach. Cp (NC, VA): ocean beaches, island-end flats; uncommon. July-frost. NH south to FL west to TX. This species and A. pentandra are closely related, and have been variously treated as species, subspecies, varieties, and forms. [= FNA; <A. arenaria Nuttall - RAB, C, G, GW, S, Y (also see A. pentandra); < A. cristata Humboldt and Bonpland ex Willenow - K (also see A. pentandra); < A. pentandra ssp. arenaria H.M. Hall \& Clements]
* Atriplex patula Linnaeus, Spear Orach. Pd, Mt (VA): disturbed areas, inland saline areas; rare, introduced from Eurasia. Julyfrost. [= C, FNA, K, S, Y; < A. patula Linnaeus -- RAB, W (also see A. prostrata); = A. patula var. patula -- F, G]

Atriplex pentandra (Jacquin) Standley in N.L. Britton et al., Seabeach Orach. Cp (GA, NC, SC): ocean beaches, island-end flats; uncommon. July-frost. NC to FL, west to TX; West Indies; South America. This species and A. mucronata are closely related, and have been variously treated as species, subspecies, varieties, and forms. [=FNA; <A. arenaria Nuttall - RAB, C, G, GW, S, Y (also see A. mucronata); < A. cristata Humboldt and Bonpland ex Willenow - K (also see A. mucronata); = A. pentandra ssp. pentandra]
* Atriplex prostrata Boucher ex Augustin de Candolle, Thinleaf Orach, Fat-hen. Cp (NC, SC, VA), Mt? (VA?): marsh edges, brackish flats; uncommon. July-frost. Widespread in e. North America, also in w. North America and Eurasia, usually considered to be introduced from Eurasia. \{Is Saltville VA occurrence of Atriplex this taxon?\} [= FNA, K, Y; ? A. hastata Linnaeus -- C, S, misapplied; < A. patula Linnaeus -- RAB, W, in part; ? A. patula var. hastata (Linnaeus) A. Gray -- F, G, GW]
* Atriplex littoralis Linnaeus, Narrow-leaved Atriplex. Introduced south to PA (FNA) and MD (Kartesz 1999). [= FNA, K; < A.
littoralis Linnaeus -- C; < A. patula Linnaeus var. littoralis (Linnaeus) A. Gray -- F]
* Atriplex semibaccata R. Brown, Australian Saltbush, Berry Saltbush. Introduced at various localities in North America, including DC (FNA). [= FNA, K]
* Atriplex tatarica Linnaeus, Tatarian Orach. Introduced on ballast at scattered localities, including AL, FL, NJ, and PA (FNA). [= FNA; ? A. lampa Gillies - K, S, misapplied] \{not keyed\}

\section*{Bassia Allioni 1766 (Bassia)}

A genus of about 21 species, herbs and dwarf shrubs, of Europe, Asia, Africa, and North America. All or part (the annuals) of Kochia are now sometimes merged into Bassia (Judd \& Ferguson 1999). References: Judd \& Ferguson (1999)=Z; Mosyakin in FNA (2003b); Blackwell, Baechle, \& Williamson (1978)=Y; Collins \& Blackwell (1979)=X; Kühn in Kubitzki, Rohwer, \& Bittrich (1993).

1 Calyx segments (1 lower and 2 upper) bearing stout knobs . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . B. hirsuta
1 Calyx segments (all5) bearing a horizontal wing . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . B. scoparia
* Bassia hirsuta (Linnaeus) Ascherson, Bassia. Cp (VA): beaches, salt marshes; uncommon, native of Eurasia. AugustOctober. [= C, F, FNA, G, K, X, Z]
* Bassia scoparia (Linnaeus) A.J. Scott, Summer-cypress. Pd, Mt, Cp (VA): waste ground, particularly along railroad tracks; uncommon, native of Eurasia. [= Z; = Kochia scoparia (Linnaeus) Schrader -- C, F, G, K, W, Y; > Kochia scoparia ssp. scoparia FNA]

\section*{Beta Linnaeus 1753 (Beet)}

A genus of about 6-12 species, herbs, of Mediterranean region and w. and c. Asia. References: Schultz in FNA (2003b); Judd \& Ferguson (1999)=Z; Kühn in Kubitzki, Rohwer, \& Bittrich (1993).
* Beta vulgaris Linnaeus ssp. vulgaris, Garden Beet, Swiss Chard, Ruby Chard, Mangel-wurzel. Cp, Pd, Mt (NC, SC, VA): commonly cultivated, rarely escaped or persisting, introduced from Eurasia. [=FNA; > B. vulgaris var. vulgaris -- G; > B. vulgaris var. cicla -- G; < B. vulgaris - K, Z; ? B. vulgaris - S]

Chenopodium Linnaeus 1753 (Goosefoot, Lamb's-quarters, Pigweed) (also see Dysphania)

A genus of about 140 species, herbs, shrubs, and small trees, of nearly cosmopolitan distribution. References: Clemants \& Mosyakin in FNA (2003b); Judd \& Ferguson (1999)=Z; Wahl (1954)=Y; Mosyakin \& Clemants (1996); Kühn in Kubitzki, Rohwer, \& Bittrich (1993). Draft key based closely on Clemants \& Mosyakin in FNA (2003b).

1 Seeds vertical or both horizontal and vertical; leaf blades glabrous or occasionally sparsely farinose; [subgenus Blitum].
2 Perianth segments 5; plants perennial; [subgenus Blitum, section Agathophytum]
[Ch. bonus-henricus]
2 Perianth segments 3; plants annual.
3 Leaves lancolate or oblong, glaucous on the lower surface
Ch. glaucum
3 Leaves triangular or rhombic, green on the lower surface.
4 Leaves farinose on the lower surface; [subgenus Blitum, section Degenia] . . . . . . . . . . Ch. macrospermum
4 Leaves glabrous on the lower surface.
5 Glomerules 3-10 mm in diameter, borne sessile on unbranched terminal and occasionally axillary spikes; perianth segments fleshy and red at maturity; [subgenus Blitum, section Blitum]

Ch. capitatum var. capitatum
5 Glomerules 2-5 mm in diameter, borne sessile on lateral branched spikes; perianth segments membranaceous, green at maturity; [subgenus Blitum, section Pseudoblitum] . . . . . . . . . . [Ch. rubrum] 1 Seeds all horizontal; leaf blades usually farinose; [subgenus Chenopodium].

6 Flowers individually disposed in panicles; leaf blades glabrous; [subgenus Chenopodium, section Grossefoveata]
Ch. simplex
6 Flowers in loose or sense glomerules; leaf blades usually farinose; [subgenus Chenopodium, section Chenopodium]. \(7 \quad\) Primary leaves linear, linear-lanceolate, at least \(2-3 \times\) as long as wide, usually untoothed and unlobed (but often with 2 basal lobes in Ch. foggii); [subsection Leptophylla].
8 Perianth spreading from fruit at maturity; plants strictly erect
Ch. pratericola
8 Perianth enclosing the fruit at maturity; plants erect to spreading.
9 Plants usually spreading; perienth segments obtuse; leaf blades usually unlobed . . . . . [Ch. desiccatum]
9 Plants erect; perianth segments acute; leaf blades often with basal lobes . . . . . . . . . . . . . . . . Ch. foggii
7 Primary leaves ovate, rhombic, triangular, or lanceolate, usually with basal lobes and often also with additional teeth on the margins.
10 Seeds honeycomb-pitted; [subsection Favosa].
11 Seeds 1.2-2.0 mm in diameter.
12 Style bases with yellow area; seeds 1.2 .1 .5 mm in diameter . . . . . . Ch. berlandieri var. zschackei
12 Style bases without yellow area; seeds 1.3-2.0 mm in diameter.
13 Inflorescences large and drooping; seeds 1.7-2.0 mm in diameter
Ch. berlandieri var. bushianum
13 Inflorescences small and erect; seeds 1.3-1.9 mm in diameter
Ch. berlandieri var. macrocalycium
11 Seeds 1.0-1.3 mm in diameter.
14 Leaves rhombic-triangular, usually without basal lobes; inflorescences becoming bractless ........
14 Leaves 3-lobed; inflorescences with or without bracts.
15 Inflorescences bractless . . . . . . . . . . . . . . . . . . . . . . . . . . . . [Ch. berlandieri var. berlandieri]
15 Inflorescences with leafy bracts . . . . . . . . . . . . . . . . . . . . . . . . . Ch. berlandieri var. zschackei
10 Seeds smooth or areolate.
16 Leaves triangular.
17 Seeds 1.0-1.5 mm in diameter, the seed margin sharp; leaf blades without basal lobes; [subsection Undata]

Ch. murale
17 Seeds 0.8-1.2 mm in diameter, the seed margin rounded; leaf blades often with basal lobes; [subsection Urbica]
[Ch. urbicum]
16 Leaves ovate to broadly ovate, rhombic, or lanceolate, variously lobed or toothed.
18 Leaf blades without teeth, except for the often present basal lobes or teeth.
19 Leaves not aromatic; flowers in each glomerule in markedly different stages of development; [subsection Standleyana] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Ch. standleyanum
19 Leaves strongly malodorous; flowers in each glomerule in similar stages of development; [subsection Chenopodium]
. [Ch. vulvaria]
18 Leaf blades with lateral teeth and often basal lobes; [subsection Chenopodium].
20 Leaves widely ovate, \(1 \times\) as long as wide; lateral leaf lobes as large as the terminal lobe
20 Leaves ovate, rhombic, or lanceolate, \(>1 \times\) as long as wide; lateral leaf lobes smaller than the terminal lobe (or absent).
21 Leaf margins more or less parallel below the obtuse apex; leaves lanceolate yo narrowly elliptic; inflorescence generally moniliform, not profusely branched

Ch. strictum
21 Leaf margins tapering to an acute apex; leaves ovate, rhombic, or lanceolate; inflorescence branched (spicate or cymose)

Ch. album
Chenopodium album Linnaeus, Lamb's-quarters, Pigweed. Cp, Pd, Mt (GA, NC, SC, VA): disturbed soils, gardens; common. June-November. As broadly interpreted, this species includes both native and alien races and is now distributed nearly worldwide. [= FNA, W; <Ch. album - RAB, in part (also including Ch. berlandieri and all vars); >Ch. album Linnaeus var. album -K; >Ch. album Linnaeus var. missouriense (Aellen) I.J. Bassett \& C.W. Crompton - K; > Ch. album -- C, in the narrow sense; <Ch. album -- G, in part; >Ch. missouriense Aellen -- C, Y; >Ch. paganum -- F, S, misapplied; <Ch. album -- FNA, G, in part; >Ch. album var. album - Y; > Ch. album var. lanceolatum (Muhlenberg ex Willdenow) Coss. \& Germ. - Y; > Ch. giganteum Don \(-\mathrm{Y} ;>\) Ch. lanceolatum Muhlenberg ex Willdenow]
* Chenopodium atrovirens Rydberg. Cp (SC): waste areas near wool-combing mills; rare, perhaps merely a waif, introduced

\section*{from w. North America. [= FNA, K] \{not keyed\}}
*? Chenopodium berlandieri Moquin-Tandon var. boscianum (Moquin-Tandon) H.A. Wahl. Cp (GA, NC, SC, VA): beaches, marshes; uncommon. August-September. FL west to e. TX; with scattered occurrences further north (these of unknown nativity). [= FNA, K, Y; < Ch. album - RAB, in part ]

Chenopodium berlandieri Moquin-Tandon var. bushianum (Aellen) Cronquist, Soybean Goosefoot. Cp (NC, SC, VA): disturbed areas, alluvial forests; rare. June-November. ME west to ND, south to VA, TN, LA, and KS. [= C, FNA, K; < Ch. album -RAB, G, in part; < Ch. berlandieri -- S, infraspecific taxa not distinguished; = Ch. bushianum Aellen - Y]

Chenopodium berlandieri Moquin-Tandon var. macrocalycium (Aellen) Cronquist. Cp (NC, SC, VA): coastal sands, beaches; rare. August-October. Nova Scotia south to FL. [= C, FNA, K; < Ch. album -- RAB, G, in part; = Ch. macrocalycium Aellen - Y]
* Chenopodium berlandieri Moquin-Tandon var. sinuatum (J. Murr) H.A. Wahl. Cp (SC): waste areas near wool-combing mills; rare, perhaps merely a waif, introduced from sw. North America. [= FNA, K, Y] \{not keyed\}
*? Chenopodium berlandieri Moquin-Tandon var. zschackei (J. Murr) J. Murr ex Ascherson. Mt (VA), \{NC, SC\}. Ontario west to AK, south to LA, CA, and Mexico; scattered eastern occurrences may be introduced. [= C, FNA, K, Y; < Ch. album - RAB, in part]

Chenopodium foggii H.A. Wahl. Mt (NC, VA): rocky, mountain slopes; rare. July. ME and Ontario south to w. VA and w. NC. [= FNA, K, Y; < Ch. pratericola Rydberg - C, in part]
* Chenopodium fremontii S. Watson. Cp (SC): waste areas near wool-combing mills; rare, perhaps merely a waif, native of w. North America. [= FNA; = Ch. fremontii var. fremontii - K, Y] \{not keyed\}
* Chenopodium glaucum Linnaeus, Oakleaf Goosefoot. Pd (VA), \{SC\}: disturbed areas; rare, native of ne. North America and Europe. [= FNA, K; < Ch. glaucum -- C, F, G, in a broad sense; = Ch. glaucum var. glaucum - Y]
* Chenopodium incanum (S. Watson) Heller var. incanum. Cp (SC): waste areas near wool-combing mills; rare, perhaps merely a waif, native of w. North America. [=FNA, K; ? Ch. incanum - Y] \{not keyed\}
* Chenopodium macrospermum Hooker f. Cp (NC): disturbed areas; rare, native of South America. Reported for NC (FNA 2003b). [= FNA; > Ch. macrospermum Hooker f. var. farinosum (S. Watson) J.T. Howell -- K; > Ch. macrospermum Hooker f. var. halophilum (Phil.) Standley - K, Y]
* Chenopodium murale Linnaeus, Nettleleaf Goosefoot, Sowbane. Cp (GA, NC, SC, VA): disturbed areas; rare, native of Europe, Asia, and n. Africa. May-November. [= RAB, C, F, FNA, G, K, S, W, Y]
* Chenopodium opulifolium Schrader ex Koch \& Ziz, Gray Goosefoot. Cp (NC): disturbed areas on ship's ballast; rare, introduced from s. Europe. [= RAB, C, FNA, K]

Chenopodium pratericola Rydberg, Narrowleaf Goosefoot. Cp (GA, NC, SC, VA): sandy soils, roadsides, disturbed areas; uncommon. May-November. Maine and Ontario west to Yukon, south to FL, TX, and CA. [= FNA, K; = Ch. desiccatum A. Nelson var. leptophylloides (J. Murray) H.A. Wahl -- RAB, W, misapplied; < Ch. pratericola - C, in part only (also see Ch. foggii); ? Ch. leptophyllum -- F, G, misapplied; = Ch. pratericola var. pratericola - Y]

Chenopodium simplex (Torrey) Rafinesque, Mapleleaf Goosefoot. Mt (NC, VA), Pd (VA): in shaded situations, generally at cliff bases; rare (NC Rare, VA Watch List). July-October. Nova Scotia west to AK, south to nw. NC, LA, TX, and UT. [= FNA, K; = Ch. gigantospermum Aellen -- C, W, Y; = Ch. hybridum Linnaeus var. gigantospermum (Aellen) Rouleau -- F; <Ch. hybridum -- G; = Ch. hybridum Linnaeus ssp. gigantospermum (Aellen) Hultén]

Chenopodium standleyanum Aellen, Woodland Goosefoot. Mt, Pd, Cp (VA), \{GA, NC, SC\}: rock outcrops, steep slopes, shaded disturbed soils; uncommon? Québec west to ND, south to FL and e. TX. [= RAB, C, FNA, G, K, W; < Ch. boscianum -- F, S, misapplied]

Chenopodium berlandieri Moquin-Tandon var. berlandieri. (SC, VA). Reported for SC and VA by Kartesz (1999), but not attributed to our area by FNA (2003b). [= FNA, K]
* Chenopodium bonus-henricus Linnaeus, Good King Henry, is cultivated and is known from as far south as MD and PA. [= FNA, C, K, Y]

Chenopodium capitatum (Linnaeus) Ascherson var. capitatum, Indian-paint, Strawberry-blite, a native, occurs south to scattered locations in PA (Rhoads \& Klein 1993). [= FNA, Y; < Ch. capitatum - C; = Ch. capitatum -- K, in a narrow sense; Blitum capitatum Linnaeus]
* Chenopodium desiccatum A. Nelson. (SC?, VA?). (VA Watch List). \{Resolve against Ch. pratericola\}. [= FNA; Ch. pratericola var. oblongifolium (S. Watson) H.A. Wahl - Y]
* Chenopodium rubrum Linnaeus, Red Goosefoot, alien, reported as far south as MD and in other widely scattered sites (such as AL) (Kartesz 1999) and PA (FNA). [= C, K; > Ch. rubrum var. rubrum - FNA, Y]
* Chenopodium strictum Roth. Scattered locations south to se. PA. Reported for SC (Kartesz 1999). [= FNA; = Chenopodium album Linnaeus var. striatum (Krašan) comb. nov. ined. -- K; > Chenopodium strictum ssp. glaucophyllum (Aellen) Aellen \& Just.; > Chenopodium strictum Roth var. glaucophyllum (Aellen) H.A. Wahl - Y]
* Chenopodium urbicum Linnaeus, City Goosefoot, occurs as an introduction in waste ground south to MD, s. PA (Rhoads \& Klein 1993), WV, KY, and TN (Kartesz 1999, FNA 2003b). [= C, FNA, K, Y]
* Chenopodium vulvaria Linnaeus, Stinking Goosefoot, is introduced at scattered locations in eastern North America, as in MD,

PA, DE, FL (FNA 2003b). [= C, FNA, K, Y]

Cycloloma Moquin 1840 (Winged-pigweed)
A monotypic genus, an annual herb, native of c. and w. North America. References: Mosyakin in FNA (2003b); Judd \& Ferguson (1999) \(=\) Z; Kühn in Kubitzki, Rohwer, \& Bittrich (1993).
* Cycloloma atriplicifolium (Sprengel) Coulter, Winged-pigweed. Cp (NC, SC, VA): sandy fields; uncommon, rare north of SC,
native of w. North America, adventive in our area. May-frost. [= RAB, C, F, FNA, G, GW, K, S]

Dysphania R. Brown 1810
A genus of about 32 species, annual and perennial herbs, nearly cosmopolitan, mostly in the tropics, subtropics, and warm temperate areas. References: Clemants \& Mosyakin in FNA (2003b); Wahl (1954)=Y.

1 Leaves deeply pinnately lobed, the lobes linear; plant perennial; mature calyx shallowly toothed, obovoid-urceolate, reticulateveiny; [section Adenois] D. multifida

1 Leaves serrate to sinuate-pinnatifid, the lobes broad-based and triangular-tapered; plant annual; mature calyx deeply lobed, neither reticulate nor prominently veined.

Flowers in a slender thyrsoid inflorescence of lateral cymes; [section Botryoides]
D. botrys

Flowers in dense glomerules arranged in spikes and panicles.
3 Leaf blades 2-8 cm long; seeds mostly horizontal; stems 3-15 dm tall; [section Adenois].
4 Inflorescences foliose throughout
D. ambrosioides

4 Inflorescences leafless (leaves in the inflorescence absent or shorter than the glomerules) . . D. anthelmintica
3 Leaf blades 0.5-2.7 cm long; seeds vertical; stems 0.5-5 dm tall; [section Orthospora].
5 Perianth segments keeled and crested
D. cristata

5 Perianth segments rounded . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . D. pumilio
*? Dysphania ambrosioides (Linnaeus) Mosyakin \& Clemants, Mexican-tea. Cp, Pd, Mt (GA, NC, SC, VA): disturbed habitats; common, probably native southwards. Widespread in North America to South America, the original range unclear. [= FNA; < Ch. ambrosioides - RAB, C, G, W, Y (also see Dysphania anthelminitica); = Chenopodium ambrosioides var. ambrosioides - F, in a narrow sense; <Ch. ambrosioides var. ambrosioides - K (also see Dysphania anthelmintica); < Ambrina ambrosioides (Linnaeus) Spach -- S (also see D. anthelmintica); < Teloxys ambrosioides (Linnaeus) W.A. Weber]

Dysphania anthelmintica (Linnaeus) Mosyakin \& Clemants, Wormseed. Cp (GA, NC, SC, VA): dunes; common. NY south to FL, west to TX; Mexico, West Indies, Bermuda, Central America; scattered inland in North America probably as an introduction. [= FNA; < Ch. ambrosioides - RAB, C, G, W, Y; = Ch. ambrosioides var. anthelminticum (Linnaeus) A. Gray -- F; < Ch. ambrosioides var. ambrosioides - K; < Ambrina ambrosioides (Linnaeus) Spach -- S]
* Dysphania botrys (Linnaeus) Mosyakin \& Clemants, Jerusalem-oak, Feather-geranium. Cp (NC, VA): disturbed areas, ship's ballast; rare, introduced from Eurasia. August-October. [= FNA; = Chenopodium botrys Linnaeus -- RAB, C, F, G, K, Y; = Botrydium botrys (Linnaeus) Small -- S; Teloxys botrys (Linnaeus) W.A. Weber]
* Dysphania cristata (F. Mueller) Mosyakin \& Clemants, Crested Goosefoot. Cp (SC): wool mill waste areas; rare, introduced from Australia. July. [= FNA; = Chenopodium cristatum (F. Mueller) F. Mueller -- K]
* Dysphania multifida (Linnaeus) Mosyakin \& Clemants, Cutleaf Goosefoot, Scented Goosefoot. Cp (GA, NC, SC, VA), Pd (GA, NC, SC): disturbed areas, rare, introduced from South America. [= FNA; = Chenopodium multifidum Linnaeus - C, K, Y; = Roubieva multifida (Linnaeus) Moquin-Tandon -- RAB, F, S; = Teloxys multifida (Linnaeus) W.A. Weber]
* Dysphania pumilio (R. Brown) Mosyakin \& Clemants, Clammy Goosefoot. Pd (GA, SC, VA): disturbed areas; rare, introduced from Australia. First reported for South Carolina by Hill \& Horn (1997). Also known from DC. [=FNA; = Chenopodium pumilio R. Brown -- C, G, K, Y; < Ch. carinatum R. Brown -- F, misapplied; = Teloxys pumilio (R. Brown) W. A. Weber]

\section*{Kochia Roth 1801}
(see Bassia)

Salicornia Linnaeus 1753 (Glasswort)
(also see Sarcocornia)

A genus of about 10-20 species, succulent herbs, of cosmopolitan distribution. References: Judd \& Ferguson (1999)=Z; Ball in FNA (2003b); Kühn in Kubitzki, Rohwer, \& Bittrich (1993).

1 Scale-leaves below the spikes mucronate; spikes mostly 4.5-6 mm in diameter . . . . . . . . . . . . . . . . . . . . . . . . . S. bigelovii
1 Scale-leaves below the spike obtuse to slightly acute; spikes mostly 1.5-4.5 mm in diameter . . . . ............ . S. virginica
Salicornia bigelovii Torrey, Dwarf Glasswort, Dwarf Saltwort. Cp (GA, NC, SC, VA): salt pannes in coastal marshes; common. July-October. ME (Nova Scotia?) south to FL, west to TX; also West Indies; also CA. [= RAB, C, F, FNA, G, GW, K, S, Z]

Salicornia virginica Linnaeus, Samphire. Cp (GA, NC, SC, VA), Mt (VA): salt pannes in coastal marshes; common. JulyOctober. Nova Scotia and Québec south to FL. It is unclear whether our eastern North American plants are distinct from European plants of the S. europaea complex. Recent European workers recognize multiple species in the S. europaea complex. S. europaea (in the narrow sense) is a diploid species; our plants are apparently all tetraploid and may or may not be conspecific with one of the European tetraploid entities in this complex. Until further studies are completed, it seems best to recognize our plants as distinct. The oldest name available for the American plants is Salicornia virginica Linnaeus, which has unfortunately been generally misapplied to the perennial glasswort, Sarcocornia perennis. [= K; = Salicornia depressa Standley in N.L. Britton et al. - FNA; < Salicornia europaea Linnaus -- RAB, C, G, GW, S, W, Z, misapplied; <> Salicornia europaea var. europaea -- F]

Salicornia maritima Wolff \& Jefferies, Sea Saltwort, suposedly occurs south to MD (Kartesz (1999); FNA (2003b) does not map it south of the Canadian Maritimes. [= FNA, K] \{not yet mapped; add synonymy\}

Salsola Linnaeus 1753 (Saltwort, Russian-thistle)
A genus of about 116 species, herbs and shrubs, of Europe, Asia, n. Africa, and America. References: Mosyakin in FNA (2003b); Judd \& Ferguson (1999) \(=\) Z; Kühn in Kubitzki, Rohwer, \& Bittrich (1993). Treatment based on Mosyakin in FNA (2003b).

1 Leaf blades not fleshy in fresh material, narrowly linear to filiform, < 1 mm wide in herbarium material; leaves with a weak apical spine; [of disturbed areas] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. tragus
1 Leaf blades fleshy in fresh material, linear, 1-2 mm wide in dried specimens; leaves with a strong apical spine; [of seabeaches].
2 Perianth segments with a weak non-spiny apex and obscure midvein; bracteoles connate at base, swollen S. caroliniana
2 Perianth segments witha subspinose apex and prominent midvein; bracteoles distinct, not swollen . . . . . . . . . . . . S. kali
*? Salsola caroliniana Walter, Southern Saltwort. Cp (GA, NC, SC, VA): upper beaches, fore-dunes, and island-end flats; uncommon. June-frost. MA to FL, west to TX and Mexico; Eurasia, n. Africa; introduced on the west coast of North America. Generally considered to be introduced in North America, but it may well be a native. [<S. kali Linnaeus -- RAB, C, S, Z, in part; = S. kali var. caroliniana (Walter) Nuttall -- F; < S. kali Linnaeus ssp. pontica (Pallas) Mosyakin - FNA, K; < S. kali var. kali - G, in part] *? Salsola kali Linnaeus, Northern Saltwort. Cp (NC, SC, VA): upper beaches, fore-dunes, and island-end flats; uncommon. June-frost. Newfoundland to SC; Europe. Generally considered to be introduced in North America, but it may well be a native. [< S. kali Linnaeus -- RAB, C, S, Z, in part; = S. kali var. kali -- F; = S. kali ssp. kali - FNA, K; < S. kali var. kali - G]

Salsola tragus Linnaeus, Russian Thistle, Tumbleweed. Mt (VA), Pd (GA?, NC, SC?, VA): disturbed areas; rare, native of Eurasia. June-frost. [= C, FNA, K; <S. kali Linnaeus -- RAB, in part; = S. kali var. tenuifolia Tausch -- F, G; = S. pestifer A. Nelson -- S, Z; = S. iberica Sennen \& Pau]

\section*{Sarcocornia A.J. Scott 1978 (Woody Glasswort)}

A genus of about 15 species, dwarf shrubs. Of controversial and uncertain taxonomic status, Sarcocornia is sometimes included in Salicornia, sometimes in Arthrocnemum, and sometimes maintained as a separate genus. References: Judd \& Ferguson (1999)=Z; Ball in FNA (2003b); Kühn in Kubitzki, Rohwer, \& Bittrich (1993).

Sarcocornia pacifica (Standley) A.J. Scott, Woody Glasswort, Perennial Glasswort. Cp (GA, NC, SC, VA): coastal salt marshes; common. July-October. NH south to FL; CA south into w. Mexico. Ball in FNA (2003b) treats all North American Sarcocornis as Sarcocornia pacifica, which is also present on the Pacific coast of Noerth America. Sarcocornia perennis is restricted to the Pacific coast of North America, as well as being in Europe, sw. Asia, and Africa. [= FNA; ? Sarcocornia perennis (P. Miller) A.J. Scott -- K, apparently misapplied to east Coast material; ? Salicornia virginica Linnaeus -- RAB, C, F, G, GW, misapplied; ? Salicornia perennis P. Miller -- S, Z, apparently misapplied to East Coast material; ? Arthrocnemum perenne (P. Miller) Moss; ? Salicornia ambigua Michaux]

\section*{Spinacia Linnaeus 1753 (Spinach)}

A genus of 3 species, herbs, of \(n\). Africa and w. Asia. References: Judd \& Ferguson (1999)=Z; Schultz in FNA (2003b); Kühn in Kubitzki, Rohwer, \& Bittrich (1993).
* Spinacia oleracea Linnaeus, Spinach. Mt, Pd, Cp (NC, SC, VA): commonly grown in gardens, rarely persisting, introduced from Eurasia. [= F, FNA, G, K, S, Z]

\section*{Suaeda Forsskål ex Scopoli 1777 (Sea-blite)}

A genus of about 100 species, herbs and subshrubs, of cosmopolitan distribution. References: Judd \& Ferguson (1999)=Z; Ferren \& Schenk in FNA (2003b); Hopkins \& Blackwell (1977)=Y; Fisher et al. (1997); Kühn in Kubitzki, Rohwer, \& Bittrich (1993).

1 Calyx segments keeled on the back; flowers in 1-3-flowered glomerules, these aggregated in a dense panicle; seeds dimorphic, black seeds shiny, 1-1.8 mm in diameter, brown seeds dull, 1.5-2.6 mm in diameter
1 Calyx segments rounded or obscurely keeled on the back; flowers in axillary glomerules of 1-3 (-4) flowers; seeds monomorphic, reddish brown or black, 1-2.2 mm in diameter

Suaeda linearis (Elliott) Moquin, Southern Sea-blite. Cp (GA, NC, SC, VA): island-end flats, marsh edges, brackish flats; uncommon. August-frost. ME south to FL, west to TX; West Indies. [= C, F, FNA, G, GW, K, Y, Z; = Dondia linearis (Eliott) Heller -S]
*? Suaeda maritima (Linnaeus) Dumortier, White Sea-blite. Cp (VA): salt marsh edges and disturbed saline habitats; uncommon, possibly native, introduced, or a combination. Usually considered (as by C, GW, S) to be naturalized from Eurasia, but Ferren \& Schenk (2003b) consider S. maritima in North America to include native and naturalized components. [= C, F, FNA, G,

GW, Y, Z; > S. maritima ssp. maritima -- K; = Dondia maritima (Linnaeus) Druce -- S]

\section*{CHRYSOBALANACEAE (Coco-plum Family)}

A family of about 18 genera and 530 species, trees and shrubs, of tropical and subtropical areas, especially tropical America. References: Prance \& Sothers (2003); Prance (1970).

\section*{Licania Aublet (Gopher-apple)}

A genus of about 218 species, trees and shrubs, mainly of tropical America, but with a few species in Africa and Asia. References: Prance (1970)=Z; Prance \& Sothers (2003)=Y.

Licania michauxii Prance, Gopher-apple, Ground-oak. Cp (GA, SC): sandhills, dry sandy pinelands; rare north of GA (SC Rare). May-June; September-October. Se. SC south to s. FL, west to LA, becoming abundant and ubiquitous in dry sandy habitats in the southern part of its range. L. michauxii is one of 49 species of subgenus Moquilea, section Moquilea, which is distributed from se. North America through Central America and the West Indies to South America; our species may be most closely related to \(L\). retifolia Blake, a small tree of sw. Mexico and El Salvador (Prance 1970; Prance \& Cothers 2003). [= K, Y, Z; = Chrysobalanus oblongifolius Michaux -- RAB; = Geobalanus oblongifolius (Michaux) Small -- S]

\section*{CISTACEAE (Rockrose Family)}

A family of about 8 genera and 180 species, shrubs and herbs, of warm temperate and subtropical areas, centered in Mediterranean Europe. References: Arrington \& Kubitzki in Kubitzki \& Bayer (2003).

1 Shrub, usually much branched from the lower stem; flowers solitary, terminal on the branches; leaves 1-3 mm long and scalelike, or \(3-7 \mathrm{~mm}\) long and acicular; capsule cylindric, more than \(2 \times\) as long as wide \(\qquad\) Hudsonia
1 Suffrutescent herb, usually little branched from the lower stem (often much branched above, and in Lechea with specialized short basal shoots at ground level); flowers axillary or terminal in branching inflorescences; leaves 4-50 mm long, mostly linear, lanceolate, oblong, or elliptic; capsule globose, subglobose, ellipsoid, ovoid, or obovoid, less than \(2 \times\) as long as wide.
2 Flowers of 2 types, the chasmogamous with 5 showy yellow petals, the cleistogamous lacking petals; pubescence of the stem stellate; leaves \(10-50 \mathrm{~mm}\) long, alternate; plants with shoots of one type only, not producing short basal shoots; capsules 1.3-12.5 mm long, the larger capsules of chasmogamous flowers at least 2.0 mm long . . . . . . Crocanthemum
2 Flowers of 1 type, with 3 inconspicuous, dark red petals; pubescence of the stem simple; leaves \(4-15 \mathrm{~mm}\) long (to 30 mm long in L. pulchella and L. mucronata), linear to linear-elliptic, \(0.5-4 \mathrm{~mm}\) wide (to 13 mm wide in L. mucronata), alternate, opposite, or whorled; plants with shoots of two types, the short, prostrate to ascending basal shoots produced late in the season and overwintering; capsules \(0.9-1.7 \mathrm{~mm}\) long

Lechea

\section*{Crocanthemum Spach 1836 (Frostweed, Rockrose)}

A genus of about 20 species, of eastern North America, California, Mexico, and s. South America. The eastern North American species previously attributed to Helianthemum are in a clade distinct from the Old World Helianthemum, and should be recognized as Crocanthemum. References: Daoud \& Wilbur (1965)=Z; Wilbur \& Daoud (1964)=Y; Arrington \& Kubitzki in Kubitzki \& Bayer (2003).

Identification notes: The identification of most of our species of Crocanthemum requires anderstanding of the 2 types of flowers produced. Chasmogamous flowers have showy yellow petals and larger sepals, the distinct portion of the 2 linear outer sepals usually linear, (0.7-) 1.3-5.5 mm long, the distinct portion of the 3 broader inner sepals \(2.5-12\) (-14) mm long. Cleistogamous flowers lack petals and have smaller sepals, the distinct portion of the 2 linear outer sepals \(0.2-3 \mathrm{~mm}\) long, the distinct portion of the 3 broader inner sepals \(1.5-4.8 \mathrm{~mm}\) long. In some species (C. canadense, C. bicknellii, C. propinquum) the chasmogamous flowers open earlier (April-July) than the cleistogamous (June-September). In others (C. corymbosum, C. georgianum, C. nashii, C. rosmarinifolium), the two types of flowers open at the same time (March-June) or cleistogamous flowers are nearly always absent (C. carolinianum). Capsules from chasmogamous flowers are larger and contain more seeds than those from cleistogamous flowers.

1 Leaves 1-4 (-7) mm wide, (5-) \(7-15 \times\) as long as wide; capsules from chasmogamous flowers 2-3 mm long, with 1-3 (-6) seeds; capsules from cleistogamous flowers 1.3-1.7 mm long, with \(1(-2)\) seeds . . . . . . . . . . . . . . . . . . . . . . . . . . C. rosmarinifolium
1 Leaves 2-20 mm wide, 2-6 (-8)× as long as wide; capsules from chasmogamous flowers (2.4-) 3-9 (-10.5) mm long, with 6-92 (135 ) seeds; capsules from cleistogamous flowers \(1.5-4.2 \mathrm{~mm}\) long, with 1-20 seeds.
2 Leaves basally disposed, the largest and most prominent leaves in a basal rosette; stem leaves 2-5 below those subtending flowers or fruits; stem with spreading trichomes to 2.5 mm long; lower surface of leaves sparsely pubescent, the surface readily visible; cleistogamous flowers usually never produced; capsules 6-9 (-10.5) mm long, with 80-92 (-135) papillate seeds
C. carolinianum

2 Leaves predominantly cauline (in some species a rosette of closely spaced smaller and caducous leaves present at the ground's surface); stem leaves 5-20 below those subtending flowers or fruits; stem glabrate to densely puberulent (the pubescence not long and spreading); lower surface of leaves densely pubescent, hiding the surface; cleistogamous
flowers regularly produced, either intermixed with the chasmogamous or in separate inflorescences; capsules 1.3-7 (-8.5) mm long, with 1-46 papillate, reticulate, or smooth seeds (pebbled to somewhat papillate in H. nashii).
3 Ovary and capsule densely stellate pubescent C. nashii

\section*{3 Ovary and capsule glabrous.}

4 Chasmogamous flowers usually solitary, terminal or subterminal, later overtopped by lateral branches; seeds papillate, 35-46 per chasmogamous capsule, 5-9 (-12) per cleistogamous capsule; chasmogamous capsules (4) 6-7 (-8.5) mm long, cleistogamous capsules (2-) 2.3-3.0 (-3.8) mm long; upper surface of cauline leaves with some long simple trichomes mixed with the shorter stellate trichomes \(\qquad\) C. canadense

4 Chasmogamous flowers usually (1-) 2-18, rarely overtopped by lateral branches (often 1-3 in cymes in \(H\). georgianum); seeds smooth or reticulate, 12-35 per chasmogamous capsule, 1-20 per cleistogamous capsule; chasmogamous capsules (2.4-) 3.5-5.7 mm long, cleistogamous capsules 1.5-4.2 mm long; upper surface of cauline leaves with the shorter stellate trichomes only.
5 Chasmogamous and cleistogamous flowers borne together, the two types of flowers open at the same time (March-June); seeds smooth, 15-35 per chasmogamous capsule, 4-20 per cleistogamous capsule; outer sepals of the cleistogamous flowers 1.4-3.0 mm long; inner sepals of the cleistogamous flowers 2.0-4.8 mm long; [of the outer Coastal Plain (primarily barrier islands) of NC and SC].
\(6 \quad\) Flowers borne in dense many-flowered flat-topped cymes terminating the stem and sometimes also the main branches; capsules of the cleistogamous flowers \(1.6-3.8 \mathrm{~mm}\) long, with \(4-8(-10)\) seeds; pedicels and calyx with \(0.5-1.5 \mathrm{~mm}\) long simple trichomes mixed with the shorter stellate trichomes; outer sepals of both chasmogamous and cleistogamous flowers with an expanded, obtuse, spatulate tip, \(0.3-1.2 \mathrm{~mm}\) wide \(\qquad\) C. corymbosum 6 Flowers borne in loose 1-7-flowered cymes or racemes at the ends of the main branches; capsules of the cleistogamous flowers \(3.0-4.2 \mathrm{~mm}\) long, with \(12-20\) seeds; pedicels and calyx with short stellate pubescence only; outer sepals of both chasmogamous and cleistogamous flowers linear, 0.2-0.5 mm wide \(\qquad\) C. georgianum

5 Chasmogamous and cleistogamous flowers borne in separate inflorescences, the chasmogamous flowers opening earlier (April-July) than the cleistogamous flowers (June-September); seeds reticulate, 12-26 per chasmogamous capsule, 1-2 (-3) per cleistogamous capsule; outer sepals of the cleistogamous flowers 0.2-1.2 (-1.8) mm long; inner sepals of the cleistogamous flowers 1.7-2.5 (-3.0) mm long; [of the Mountains and less commonly the Piedmont of NC and VA, and very rarely the Coastal Plain of VA].
7 Stems mostly \(20-50 \mathrm{~cm}\) tall, clustered, arising from an upright caudex; distinct portion of the outer sepals of the cleistogamous flowers linear, (0.3-) 0.6-1.2 (-1.8) mm long, about \(3-5 \times\) as long as wide; distinct portion of calyx of the chasmogamous flowers (2.4-) 3.5-4.5 (-8) mm long; cleistogamous capsules sharply 3 -angled in cross-section; leaf with broadly cuneate base C. bicknellii

7 Stems mostly \(10-30 \mathrm{~cm}\) tall, scattered, arising from horizontal elongate rootstocks; distinct portion of the outer sepals of the cleistogamous flowers rudimentary, knob-like, 0.2-0.5 mm long, 1-2× as long as wide; distinct portion of calyx of the chasmogamous flowers (0.7-) 1.5-3.0 (-4.0) mm long; cleistogamous capsules somewhat rounded in cross-section; leaf with narrowly cuneate to attenuate base
C. propinquum

Crocanthemum bicknellii (Fernald) Barnhart, Hoary Frostweed, Plains Frostweed, Plains Sunrose, Bicknell's Hoary Rockrose. Mt (GA, NC, VA), Pd (NC, VA): woodlands, glades, barrens, rock outcrops, and grassy balds, to at least 1500 m in elevation; rare (GA Special Concern, NC Rare, VA Rare). June-July (chasm.), July-September (cleist.); August-October. ME and s. Ontario west to MN and s. Manitoba, south to ne. GA, e. TN, AR, KS, and CO. [=S; = Helianthemum bicknellii Fernald -- RAB, C, F, G, K, W, Y, Z; Halimium]

Crocanthemum canadense (Linnaeus) Britton, Canada Frostweed, Canada Sunrose. Cp (GA, NC, SC, VA), Pd (NC, SC, VA), Mt (GA, NC, VA): fields, woodlands, forest edges, roadsides, disturbed areas; common (uncommon in VA Mountains and VA Piedmont) (GA Special Concern). April-May (chasm.), May-August (cleist.); June-October. Nova Scotia and ME west to MI and MN, south to e. GA, e. AL, e. TN, KY, and MO. [= S; = Helianthemum canadense (Linnaeus) Michaux -- RAB, C, F, G, K, W, Y, Z; > Helianthemum canadense var. canadense - F; > Helianthemum canadense var. sabulonum Fernald -- F; Halimium canadense (Linnaeus) Grosser]

Crocanthemum carolinianum (Walter) Spach, Carolina Sunrose. Cp (GA, NC, SC): fields, savannas, dry pine flatwoods; uncommon. April-May; July-August. E. NC south to s. FL, west to AR and e. TX. [= S; = Helianthemum carolinianum (Walter) Michaux -- RAB, K, Y, Z; Halimium carolinianum (Walter) Grosser]

Crocanthemum corymbosum (Michaux) Britton, Pinebarren Sunrose. Cp (GA, NC, SC): openings in maritime forests; rare (NC Rare). April-May; July-October. E. NC south to s. FL, east to s. MS. [= S; = Helianthemum corymbosum Michaux -- RAB, K, Y, Z; Halimium corymbosum (Michaux) Grosser]

Crocanthemum georgianum (Chapman) Barnhart, Georgia Sunrose, Georgia Frostweed. Cp (GA, NC, SC): openings in maritime forests; rare (NC Rare, SC Rare). April-May; May-October. E. NC south to n. FL, west to c. TX and AR. [= S; = Helianthemum georgianum Chapman -- RAB, K, Y, Z; Halimium georgianum (Chapman) Grosser]

Crocanthemum nashii (Britton) Barnhart, Florida Scrub Sunrose, Nash's Sunrose. Cp (NC): xeric sandhills; rare (NC Rare). Endemic to peninsular FL; disjunct in se. NC (New Hanover County). May-June; July-September. [= S; = Helianthemum nashii Britton -- K, Y, Z; Halimium nashii (Britton) Grosser]

Crocanthemum propinquum (Bicknell) Bicknell, Low Frostweed, Creeping Sunrose. Mt, Pd (NC, VA), Cp (VA): woodlands, rock outcrops, sandy barrens and fields (in VA); rare (NC Rare, VA Rare). June-July (chasm.), July-September (cleist.); AugustOctober. Se. MA and se. NH south to w. NC and e. and c. TN. [= Helianthemum propinquum Bicknell - RAB, C, F, G, K, W, Y, Z; Halimium]

Crocanthemum rosmarinifolium (Pursh) Barnhart, Rosemary Sunrose. Cp (GA, NC, SC): sandy roadsides, fields; common
(NC Watch List). May-June; July-October. S. NC south to panhandle FL, west to c. TX; also disjunct in the West Indies. [= S; = Helianthemum rosmarinifolium Pursh -- RAB, K, Y, Z; Halimium rosmarinifolium]

\section*{Hudsonia Linnaeus 1767 (Sand-heather, Golden-heather, Beach-heather)}

A genus of 3 species, dwarf shrubs, of ne. North America. Molecular systematics suggests that \(H\). tomentosa may warrant generic status separate from H. ericoides and H. montana. References: Morse (1979)=Z; Skog \& Nickerson (1972)=Y; Arrington \& Kubitzki in Kubitzki \& Bayer (2003). Key based in part on Morse (1979).

1 Pedicels 0-1 (-3) mm long; leaves 1-3 mm long, ovate, densely tomentose, appressed to the stem and overlapping; stamens 820; [of the outer Coastal Plain of VA and ne. NC northwards]
1 Pedicels \(4-10 \mathrm{~mm}\) long; leaves \(3-7 \mathrm{~mm}\) long, subulate, slightly pubescent, spreading; stamens \(10-30\); [collectively of the Mountains of NC and inner Coastal Plain of SC].
2 Sepals obtuse to acute, lacking long-acuminate apices; stamens 10-20; leaves 3-4.5 (-6) mm long, sparsely villous; fruits cylindric; [of the inner Coastal Plain of SC (in our area)]
H. ericoides

2 Sepals acuminate, with attenuate apices 1-2 mm long; stamens 20-30; leaves 5-7 mm long, glabrate to sparsely villous; fruits urceolate to campanulate; [of the Mountains of NC]
H. montana

Hudsonia ericoides Linnaeus, Northern Golden-heather. Cp (SC): sandy flats in longleaf pine sandhill; rare (SC Rare). May; August. Newfoundland south to ME, NH, MD (Sipple 2002), and DE; disjunct in nc. SC. The disjunct occurrence in SC has every appearance of being native; it is discussed by Bozeman \& Logue (1968). [=RAB, C, F, G, K, S, Z; = H. ericoides Linnaeus ssp. ericoides -- Y]

Hudsonia montana Nuttall, Mountain Golden-heather. Mt (NC): shallow sandy soils on ledges of quartzite or other felsic rocks in the Blue Ridge Escarpment, at various sites along the eastern side of Linville Gorge, Burke County, NC, and disjunct further south in McDowell County, NC; rare (US Threatened, NC Endangered). June-early July; mid-July-September. This species is endemic to W . NC; it is almost certainly a southern sibling of the more northern \(H\). ericoides. As well as being a very narrowly distributed endemic, H. montana is endangered by fire suppression in its habitat. [= RAB, K, S, W, Z; = H. ericoides Linnaeus ssp. montana (Nuttall) Nickerson \& J. Skog -- Y]

Hudsonia tomentosa Nuttall, Woolly Beach-heather. Cp (NC, VA): dunes, sand flats, blowouts; common (NC Rare). MayJune; August-September. Labrador west to s. Mackenzie and Manitoba, south to WV (Panther Knob), WI, and MN, and south along the Atlantic Coast from ME to VA and ne. NC (where it reaches its southern limit in Dare County). [= RAB, C, F, G, S, Z; > H. tomentosa var. tomentosa-K; = H. ericoides Linnaeus ssp. tomentosa (Nuttall) Nickerson \& J. Skog -- Y]

Lechea Linnaeus 1753 (Pinweed)
(contributed by Bruce A. Sorrie)
A genus of about 18 species, herbs, of North America, the West Indies, and Central America. References: Hodgdon (1938)=Z; Wilbur \& Daoud (1961)=Y; Arrington \& Kubitzki in Kubitzki \& Bayer (2003).

Identification notes: Lechea is recognizable by its production of numerous basal shoots (usually prostrate) in the late summer and fall. These are evergreen and overwinter, and the fertile stems (usually erect or ascending) are produced from renewed growth of the basal shoots in the spring and summer.

1 Pubescence of the stems strongly spreading, not at all appressed; inner sepals carinate (U- or V-shaped in cross-section); plant tall, often more than 5 dm tall . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . L. mucronata
1 Pubescence of the stems more or less appressed, usually strongly so; inner sepals shallowly curved in cross section, not carinate.
2 Outer (slender) sepals equalling or exceeding the inner (broad) sepals.
3 Base of the fruiting calyx clearly differentiated into a hardened, shiny, yellowish, obconic base 0.4-0.6 mm long, contrasting in color and texture with the rest of the calyx; pedicels averaging 2 mm long or longer ... L. racemulosa
3 Base of the fruiting calyx not conspicuously differentiated in texture and color; pedicels averaging less than 2 mm long, often less than 1.5 mm long.
4 Capsule completely enclosed by the sepals, subglobose; leaves averaging \(10 \times\) or more as long as wide; plant short and usually densely bushy, less than 3 dm tall . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . L. tenuifolia
4 Capsule exserted, usually conspicuously so, the sepals not enclosing the summit of the fruit, ellipsoid to ovate; leaves less than \(8 \times\), and usually less than \(6 \times\), as long as wide; plant usually taller, 1-7 dm tall.
5 Outer sepals distinctly longer than the inner sepals, usually also longer than the capsule; stem leaves usually whorled, 2 mm wide; plant erect, with short, ascending branches ................... L. minor
5 Outer sepals shorter than to barely longer than the inner sepals, shorter than the capsule; stem leaves alternate, rarely wider than 1.5 mm wide; plant ascending (sometimes erect or spreading, branches spreading .
L. sessiliflora

2 Outer (slender) sepals shorter than the inner (broad) sepals.
6 Capsules ellipsoid to narrowly pyriform, normally about \(2 \times\) as long as wide (or even longer in L. racemulosa).
7 Stigmas not persistent; pedicels averaging about 2 mm long; base of the fruiting calyx clearly differentiated into a hardened, shiny, yellowish, obconic base \(0.4-0.6 \mathrm{~mm}\) long, contrasting in color and texture with the rest of the calyx
L. racemulosa

7 Stigmas persistent, reddish-brown, conspicuous on the summit of the capsule; base of the fruiting calyx not conspicuously differentiated in texture and color . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . L. sessiliflora
Capsules of a broader shape, ovoid, broadly ellipsoid, or subglobose, normally less than \(1.5 \times\) as long as wide. 8 Capsules obviously longer than the sepals.

9 Seeds 3-4, 1-1.1 mm long, frequently thickened dorsiventrally and keeled; calyx in fruit light- to dark-brown, cuneate-obovoid; panicle slenderly ovoid to subcylindric, the principal branches subequal, the ultimate branches greatly reduced, bearing crowded, frequently clustered fruits; fruiting stems to 5.5 dm tall
L. pulchella var. pulchella

9 Seeds 2 (-3), 1.1-1.25 mm long, compressed dorsiventrally and equilateral; calyx in fruit brownish- to reddish-purple, pyriform, narrow to broad above; panicle subcylindric to subglobose, the branches diminishing upward, the ultimate branches several cm in length, bearing racemes of scattered fruits; fruiting stems to 8 dm tall
L. pulchella var. 1

8 Capsules almost completely enveloped by the sepals.
10 Leaves sparsely pubescent on the midrib and margin only beneath; branches and stems sparsely subappressed-pilose; seeds 4-6 . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . L. intermedia var. intermedia
10 Leaves appressed pubescent on the surface beneath; branches and stems moderately to densely graycanescent; seeds 2-3.
11 Leaves 1.5-3.0 (-4.0) mm wide; seeds 2 ( -3 ); [of coastal dunes] . . . . . . . . L. L. maritima var. virginica 11 Leaves 0.5-1.0 mm wide; seeds 3; [of sandhills and flatwoods] . . . . . . . . . L. torreyi var. congesta

Lechea intermedia Leggett ex Britton var. intermedia, Pinweed. Mt, Pd (VA): dry areas; rare (VA Rare). July-August; August-October. L. intermedia ranges from New Brunswick west to Ontario, MN, and Saskatchewan, south to VA, n. OH, n. IL, and nw. NE. Only var. intermedia ranges south of New England; 3 other varieties occur in New England and Canada. [ \(=\mathrm{F}, \mathrm{K} ;<\mathrm{L}\). intermedia -- C, G, W; L. intermedia var. typica -- Z]

Lechea maritima Leggett ex Britton, Sterns, \& Poggenburg var. virginica Hodgdon. Cp (NC, VA): sandy dunes, flats, and blowouts, often associated with Hudsonia tomentosa; uncommon (NC Rare, VA Watch List). June-August; August-September. L. maritima occurs from s. ME south to n. NC, and disjunct in n. New Brunswick. Reports of this species south to GA are apparently based on misidentifications. Var. virginica is endemic to the Delmarva Peninsula of VA, se. VA, and extreme ne. NC. Var. maritima ranges from s. ME south to MD. Var. subcylindrica Hodgdon is endemic to n. New Brunswick. [= C, F, G, K, Z; < L. maritima -- S]

Lechea minor Linnaeus, Thymeleaf Pinweed. Cp, Pd (GA, NC, SC, VA): savannas, sandhills, pine-oak woodlands, sandy disturbed places; common, rare in VA Piedmont. July-August; August-October. MA and VT west to s. Ontario and n. IN, south to FL and LA (primarily Coastal Plain and around the Great Lakes). [= RAB, C, F, G, K, S, W, Y, Z; ? L. thymifolia Michaux]

Lechea mucronata Rafinesque. Pd (GA, NC, SC, VA), Mt (GA, NC, SC), Cp (VA): open dry habitats, dunes, woodlands; common (uncommon in VA Coastal Plain, rare in Piedmont and Mountains). June-August; July-October. NH west to MI and OK, south to FL, TX, and n. Mexico. [= C, K, W; L. villosa Elliott -- RAB, F, G, S, Y; L. villosa var. typica -- Z]

Lechea pulchella Rafinesque var. pulchella. Mt, Pd (VA): dry woodlands, disturbed places; uncommon. June-August; August-October. L. pulchella was interpreted by Hodgdon (under the name L. leggettii) as consisting of 3 varieties. Var. pulchella ranges from e. MA west to ne. OH, south to c. VA. A second variety, var. moniliformis (Bicknell) Seymour, is not known from our area, occurring on the Coastal Plain from Nantucket Island, MA south to s. NJ, and disjunct along the Great Lakes (a common phytogeographic pattern, lending credence to the validity of the variety). The third variety, of the Southeastern Coastal Plain, is treated below. [L. leggettii Britton \& Hollick -- RAB, C, infraspecific taxa not distinguished; L. leggettii var. leggettii -- F, G, Y; L. pulchella var. pulchella -- K, in part only; L. pulchella -- W, infraspecific taxa not distinguished; L. leggettii var. typica -- Z]

Lechea pulchella Rafinesque var. 1. Cp (GA, NC, SC, VA): pine-oak woodlands, savannas, flatwoods, sandhills, openings in maritime forests, sometimes in wet, almost peaty soils; common. June-August; August-October. This taxon, treated by Hodgdon under the name L. leggettii Britton \& Hollick var. ramosissima Hodgdon apparently currently lacks a valid name, following the adoption of the Rafinesquian L. pulchella. Wilbur \& Daoud (1961) tacitly accepted the validity of the variety. It ranges from se. VA south to n . FL and west to e. LA; disjunct in sc. TN (Coffee County). [L. leggettii Britton \& Hollick -- RAB, C, G, S, infraspecific taxa not distinguished; L. leggettii Britton \& Hollick var. ramosissima Hodgdon -- F, G, Y, Z; L. pulchella var. pulchella -- K, in part only]

Lechea racemulosa Michaux. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): dry pine woodlands, other woodlands, forest edges, old fields; common. June-July; July-October. Se. NY west to s. OH and s. IL, south to se. VA, NC, c. GA, and AL, with a few disjunct occurrences west to MO; the range is centered on the Appalachian Mountains. [= RAB, C, F, G, K, S, W, Y, Z]

Lechea sessiliflora Rafinesque. Cp (GA, NC, SC): sandhills; common. July-August; August-October. A Southeastern Coastal Plain endemic: s. NC south to s. FL and west to s. MS. [= K; L. patula Leggett -- RAB, S, Y, Z]

Lechea tenuifolia Michaux. Pd, Cp (GA, NC, SC, VA): dry oak-pine forests and openings; common. June-August; AugustOctober. S. ME south to SC (mostly inner Coastal Plain and Piedmont), and from s. IN n. IL, s. MN, and NE south to e. LA and c. TX. [= RAB, K, S, W, Y; L. tenuifolia var. tenuifolia -- C, F, G; L. tenuifolia var. typica -- Z]

Lechea torreyi Leggett ex Britton var. congesta Hodgdon. Cp (GA, NC, SC): sandhills and pine flatwoods; rare (NC Rare, SC Rare). June-July; August-October. As interpreted by Hodgdon, L. torreyi consists of 2 varieties, the more widespread var. congesta ranging from se. NC south to s. FL and west to s. MS (disjunct in Belize), and the more restricted var. torreyi restricted to FL. Wilbur \& Daoud (1961) express doubt about the validity of the 2 varieties, but present little evidence for or against their recognition. Var. congesta may indeed prove to be no more than a form. [= Z; L. torreyi -- RAB, K, S, Y, infraspecific taxa not distinguished]

Lechea deckertii Small, Deckert's Pinweed. Cp (GA): xeric sands of scrub; rare (GA Special Concern). Sc. GA (Jones \& Coile 1988) south to s. FL. [= K, S] \{not yet keyed\}

Lechea maritima Leggett ex Britton, Sterns, \& Poggenburg var. maritima, ranges from ME south to MD. [= K] \{not yet keyed\}

\title{
Flora of the Carolinas, Virginia, and Georgia, Working Draft of 27 November 2002 - CLEOMACEAE \\ CLEOMACEAE (Cleome Family)
}

The Cleomaceae is here circumscribed to include the members of the Capparaceae, subfamily Cleomoideae, following phylogenetic analyses which show this group to be a monophyletic clade more closely related to Brassicaceae than to the rest of Capparidaceae (Hall, Sytsma, \& Iltis 2002). References: Hall, Sytsma, \& Iltis (2002); Judd, Sanders, \& Donoghue (1994); Sanders \& Judd (2000).

1 Stamens 6; petals obtuse or acute at the apex; gynophore (stipe of the pistil, above the calyx) 10-60 mm long; leaflets 5-7 . . .

1 Stamens (7-) 10-27; petals notched or irregularly lacerate at the apex; gynophore (stipe of the pistil, above the calyx) 2-6 mm long; leaflets (1-) 3 . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Polanisia

Cleome Linnaeus 1753 (Cleome, Spiderflower)
A genus of about 250 species, annual and perennial herbs, pantropical and extending into subtropical and warm temperate regions. References: Iltis (1960)=Z; Kers in Kubitzki \& Bayer (2003).

1 Bracts subtending the flowers 3 -foliolate; leaves lacking stipular spines; corolla in bud minute, not covering the stamens .....
. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. .

1 Bracts subtending the flowers simple; leaves subtended by stipular spines; corolla in bud well-developed, the petals overlapping and surrounding the stamens
C. hassleriana
* Cleome gynandra Linnaeus, Spiderwisp. Cp (GA, NC, SC): fields, disturbed areas; rare, introduced from Africa. JuneOctober. [= RAB, K, S, Z]
* Cleome hassleriana Chodat, Cleome, Spiderflower. Pd, Cp, Mt (GA, NC, SC, VA): gardens, disturbed areas, persistent and self-seeding from cultivation as an ornamental; rare, introduced from South America. June-November. The petals in bud are a pale pink to nearly white, they turn a deep pink upon opening late in the day; by morning the petals have once again faded to a pale pink or white. [= C, K; C. houtteana -- RAB, misapplied; C. spinosa -- F, G, misapplied; Neocleome spinosa (Jacquin) Small -- S, misapplied]
* Cleome serrata Jacquin is reported as introduced in GA (Kartesz 1999). [= K] \{not yet keyed; add synonymy\}
* Cleome viscosa Linnaeus is reported for sc. GA (Jones \& Coile 1988) and se. PA (Rhoads \& Klein 1993). [= K] \{not yet keyed; add synonymy\}

Polanisia Rafinesque (Clammy-weed)

\section*{References:}

Identification notes: Polanisia has some resemblance to Warea.
1 Petals broadest towards the base, barely or not at all clawed; capsule valvate; [of xeric longleaf pine sandhills] . . P. tenuifolia 1 Petals broadest towards the tip, narrowed to a long, distinct claw; capsule opening near the tip; [of floodplains and disturbed soils].
2 Larger petals 3.5-6.5 (-8) mm long; longest stamens 4-10 (-14) mm long . . . . . . . . . . P. dodecandra ssp. dodecandra
2 Larger petals (7-) 8-13 (-16) mm long; longest stamens (9-) 12-30 mm long . . . . . . P. dodecandra ssp. trachysperma
Polanisia dodecandra (Linnaeus) Augustin de Candolle ssp. dodecandra, Clammy-weed, Spider-weed. Mt, Pd (VA): sandy or gravelly floodplains along the James River; rare (VA Rare). June-September. VT west to Manitoba, south to MD, w. VA, TN, AR, and OK. Apparently native in our area. [=K; P. dodecandra var. dodecandra -- C ; \(P\). graveolens Rafinesque -- \(\mathrm{F}, \mathrm{S}\); \(P\). dodecandra -- G, in the narrow sense; P. dodecandra -- W, infraspecific taxa not distinguished; Cleome graveolens (Rafinesque) Sch. \& Sch.] * Polanisia dodecandra (Linnaeus) Augustin de Candolle ssp. trachysperma (Torrey \& A. Gray) Iltis. Cp (VA): disturbed areas; rare, apparently adventive from w. North America. June-September. [= K; P. dodecandra var. trachysperma (Torrey \& A. Gray) Iltis -- C; P. trachysperma Torrey \& A. Gray -- F, G, S]

Polanisia tenuifolia Torrey \& A. Gray, Slenderleaf Clammy-weed. Cp (GA): sandhills; uncommon. E. GA (several counties from the SC border) (Jones \& Coile 1988) south to FL. [= K; Aldenella tenuifolia (Torrey \& A. Gray) Greene -- S]

\section*{CLETHRACEAE (Clethra Family)}

A monogeneric family of 65-95 species, shrubs and trees, primarily of tropical America and Asia. Sometimes combined into the Cyrillaceae. References: Sleumer (1967b); Anderberg \& Zhang (2002); Schneider \& Bayer in Kubitzki (2004).

Clethra Linnaeus (Sweet Pepperbush, White-alder, Clethra)
A genus of 65-95 species, shrubs and trees, primarily of tropical America and Asia. References: Sleumer (1967b)=Z;Schneider \& Bayer in Kubitzki (2004).
1 Leaves oblong or elliptic, \(8-20 \mathrm{~cm}\) long, acuminate; [of the Mountains]
C. acuminata

1 Leaves obovate or oblong, \(4-11 \mathrm{~cm}\) long, obtuse to acute; [of the Coastal Plain and rarely lower Piedmont] C. alnifolia

Clethra acuminata Michaux, Mountain White-alder. Mt (GA, NC, SC, VA): moist forests, heath balds, margins of rock outcrops at high elevations; common. July-August; September-October. Endemic to the Southern and Central Appalachians, C. acuminata ranges from sw. PA south through e. WV, w. VA, e. TN, w. NC to nw. SC and ne. GA. [= RAB, C, F, G, K, S, W, Z]

Clethra alnifolia Linnaeus, Coastal White-alder. Cp (GA, NC, SC, VA), Pd (VA): pocosins, blackwater swamp forests, nonriverine swamp forests; common (rare in Piedmont). June-July; September-October. Primarily a southeastern Coastal Plain species, C. alnifolia ranges from Nova Scotia and ME south to FL, west to TX; disjunct in sc. TN (Coffee County) (Chester, Wofford, \& Kral 1997). Two taxa are sometimes recognized; they need additional assessment. Var. alnifolia, with glabrous to glabrescent undersurface of the leaf occupies the full range of the species. Var. pubescens Aiton differs in its persistently white-tomentose undersurface of the leaf, and ranges from e. SC south to FL, and west to e. LA (east of the Mississippi River). If the more pubescent (and more southern) variety is recognized, the correct name is var. pubescens Aiton, which predates var. tomentosa (Lamarck) Michaux (Sleumer 1967b, Wilbur 1970b). [= C, F, G, GW, K, S; > C. alnifolia var. alnifolia - RAB, Z; > C. alnifolia var. tomentosa (Lamarck) Michaux -- RAB; > C. alnifolia - S, in a narrower sense; >C. tomentosa Lamarck -- S; >C. alnifolia var. pubescens Aiton - Z]

\section*{CLUSIACEAE (Mangosteen Family)}
(see HYPERICACEAE

\section*{CONVOLVULACEAE (Morning Glory Family)}

A family of about 56 genera and 1600 species, nearly cosmopolitan, especially in tropical and subtropical areas. Tribes follow the classification of Stefanović, Austin, \& Olmstead (2003). References: Wilson (1960); Austin (1979), Stefanović, Krueger, \& Olmstead (2002); Stefanović, Austin, \& Olmstead (2003).

1 Plant parasitic; stems orange; [tribe Cuscuteae) ............................................................... . . Cuscuta
1 Plant photosynthetic; stems green.
2 Corolla 0.1-0.2 cm long; capsule deeply 2-lobed; leaves orbicular-reniform, 1-3 cm long and wide, not fleshy; [tribe Dichondreae]

Dichondra
2 Corolla 1-10 cm long; capsule entire; leaves various, but not as above (most similar vegetatively are Calystegia soldanella, Ipomoea pes-caprae var. emarginata, and I. imperati, all beach plants with fleshy, emarginate, and usually larger leaves).
3 Styles 2, free nearly to the ovary or fused most of their length (at least the terminal 1-2 mm free); corolla 1-2.5 cm long; leaves cuneate or rounded at the base, and narrowly ovate, lanceolate, or linear; [tribe Cresseae].
4 Styles free, each 2-cleft, the stigmas therefore 4, linear-filiform . . . . . . . . . . . . . . . . . . . . . . . . . . . Evolvulus
4 Styles free or fused at the base, the stigmas 2 , globose-peltate . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Stylisma
3 Styles 1 (sometimes with 2 stigmas, or a bilobed stigma); stigmas capitate, elongate, flattened, or filiform; corolla more than 2.5 cm long (except Jacquemontia, Convolvulus, and a few Ipomoea spp.); leaves cordate, sagittate, or truncate at the base, and (mostly) ovate in outline.
5 Flowers in a dense head with numerous interspersed bracts; [tribe Jacquemontieae] . . . . . . . . Jacquemontia 5 Flowers solitary or in an open, few-flowered inflorescence.

6 Calyx concealed by 2 large bracts; [tribe Convolvuleae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Calystegia 6 Calyx not concealed by bracts.

7 Stigmas 2, elongate; leaves 2-4 cm long, truncate or weakly hastate at base; corolla white or pink; [tribe Convolvuleae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Convolvulus
7 Stigma 1, capitate (sometimes lobed); leaves 3-15 cm long, mostly strongly hastate or cordate at base; corolla white, pink, lavender, blue, orange, or red.
8 Anthers straight after dehiscence; fruits valvate-dehiscent; [tribe Ipomoeeae] . . . . . . . Ipomoea
8 Anthers twisted after dehiscencel fruits longitudinally or irregularly dehiscent; [tribe Merremieae]
Merremia

\section*{Calystegia R. Brown}

A genus of about 25 species, vines, cosmopolitan. Stefanović, Krueger, \& Olmstead (2002) conclude (based on molecular phylogeny) that Calystegia should be combined with Convolvulus. References: Wilson (1960)=Z; Lewis \& Oliver (1965); Brummitt (1980).

Calystegia catesbeiana Pursh, Catesby's Bindweed. (GA, NC, SC, VA): longleaf pine savannas, openings in dry to drymesic montane forests; rare (GA Special Concern). [= K; Calystegia spithamaea -- C , in part; Convolvulus spithamaeus Linnaeus var. pubescens (Gray) Fernald - F; Calystegia sericata (House) Bell -- RAB, W; Convolvulus sericatus House -- S]

Calystegia macounii (Greene) Brummitt. (NC, VA). [= K; Convolvulus macounii Greene]
* Calystegia pubescens Lindley. (NC, VA). [Calystegia pellita (Ledebour) G. Don -- K; Convolvulus pellitus Ledebour -- F; Convolvulus japonicus Thunberg -- G; Calystegia hederacea Wallroth]

Calystegia sepium (Linnaeus) R. Brown ssp. americana (Sims) Brummitt. (GA, NC, VA). [=K; Calystegia sepium -- RAB, C,

GW, W, infraspecific taxa not distinguished; Convolvulus sepium var. repens (Linnaeus) A. Gray -- F, G, Z; Convolvulus sepium var. americanus Sims -- G; Convolvulus americanus (Sims) Greene -- S; Convolvulus repens Linnaeus -- S]

Calystegia sepium (Linnaeus) R. Brown ssp. angulata (Sims) Brummitt. (GA, NC, SC, VA). [= K; Calystegia sepium -- RAB, C, GW, W, infraspecific taxa not distinguished]

Calystegia sepium (Linnaeus) R. Brown ssp. appalachiana Brummitt. (NC, VA). [= K; Calystegia sepium -- RAB, C, GW, W, infraspecific taxa not distinguished]

Calystegia sepium (Linnaeus) R. Brown ssp. limnophila (Greene) Brummitt. (GA, NC, SC, VA). [= K; Calystegia sepium -RAB, C, GW, W, infraspecific taxa not distinguished; Convolvulus limnophilus Greene]

Calystegia sepium (Linnaeus) R. Brown ssp. sepium. (GA, NC, SC, VA). [= K; Calystegia sepium -- RAB, C, GW, W, infraspecific taxa not distinguished; Convolvulus sepium var. sepium -- F, G, Z; Convolvulus sepium var. communis \(R\). Tryon -- G; Convolvulus sepium -- S]

Calystegia silvatica (Kit.) Grisebach ssp. fraterniflora (Mackenzie \& Bush) Brummitt. (GA, NC, SC, VA). [= K; Convolvulus sepium Linnaeus var. fraterniflorus Mackenzie \& Bush -- F, G, Z]
* Calystegia soldanella (Linnaeus) R. Brown ex Roemer \& J.A. Schultes. Cp (NC, VA): beaches, fore-dunes; rare (NC Watch List, VA Watch List). [= RAB, K; Convolvulus soldanella Linnaeus]

Calystegia spithamaea (Linnaeus) Pursh ssp. purshiana (Wherry) Brummitt, Shale Bindweed. Mt (GA, NC, SC, VA): shale barrens and woodlands; common. [= K; Calystegia spithamaea -- RAB, C, W, infraspecific taxa not distinguished; Convolvulus spithamaeus var. pubescens (A. Gray) Fernald -- F; Convolvulus purshianus Wherry -- G]

Calystegia spithamaea (Linnaeus) Pursh ssp. spithamaea, Low Bindweed. (VA) [= K; Calystegia spithamaea -- RAB, C, W, infraspecific taxa not distinguished; Convolvulus spithamaeus var. spithamaeus -- F; Convolvulus spithamaeus -- G, S]

Convolvulus Linnaeus (Field-bindweed)
(also see Calystegia)
A genus of about 100 species, vines, cosmopolitan, especially in tempertae areas.
* Convolvulus arvensis Linnaeus, Field-bindweed, Creeping Jenny. Mt (NC, SC, VA), Pd (GA, NC, VA), Cp (NC, VA): fields, roadsides, disturbed areas; common (uncommon to rare south of \(V A\) ), introduced from Europe. June-November. [= RAB, C, F, G, K, W; Strophocaulos arvensis (Linnaeus) Small -- S]

\section*{Cuscuta Linnaeus (Dodder)}

Variously treated as a monogeneric family, or as a component of the Convolvulaceae; Neyland (2001) and Stefanović, Krueger, \& Olmstead (2002) provide Stefanović, Krueger, \& Olmstead (2002) molecular evidence for the treatment of Cuscuta as a derived member of Convolvulaceae. References: Yuncker (1921); Yuncker (1965)=Z; Neyland (2001).
* Cuscuta cassytoides Nees ex Engelmann, African Dodder. (NC). introduced from s. Africa. [= RAB, K, Z]

Cuscuta cephalanthi Engelmann, Buttonbush Dodder. Cp (GA), Pd (SC): (NC, SC, VA). Nelson (1993). [= C, K, Z; C.
cephalanthii -- RAB, orthographic error]
Cuscuta compacta Antoine Laurent de Jussieu ex Choisy var. compacta. Cp, Pd, Mt (GA): (NC, SC, VA). [= K, Z; C. compacta -- RAB, C, infraspecific taxa not distinguished]

Cuscuta coryli Engelmann, Hazel Dodder. (NC, SC, VA). [= C, K, Z; C. corylii -- RAB, orthographic variant]
Cuscuta gronovii Willdenow ex J.A. Schultes, Common Dodder. Cp, Pd, Mt (GA): (NC, SC, VA). [= RAB, C, Z; C. gronovii var. gronovii - K; C. gronovii var. latiflora -- K, Z]

Cuscuta harperi Small, Harper's Dodder. Cp, Pd (GA): outcrops of granite (Piedmont) and Altamaha grit (Coastal Plain), typically on Liatris microcephala; rare (GA Threatened). C. and w. GA and AL. [= K, Z] \{add synonymy\}

Cuscuta indecora Choisy. Cp (GA, SC, VA), Pd (GA): (NC) Nelson (1993). Silberhorn (1998) describes an occurrence of this species in VA. [= C, Z; C. indecora var. indecora -- K, Z; C. indecora var. neuropetala (Engelmann) A.S. Hitchcock - K] * Cuscuta japonica Choisy, Japanese Dodder. (SC). Introduced and apparently eradicated. [= K]
* Cuscuta obtusiflora Kunth var. glandulosa Engelmann, Peruvian Dodder, introduced in GA, KY, and PA (Kartesz 1999). [= K]

Cuscuta pentagona Engelmann. Cp, Pd (GA): (NC, SC, VA). [= RAB, C, Z; C. campestris -- RAB, Z; C. pentagona var. pentagona-K]

Cuscuta polygonorum Engelmann, Smartweed Dodder. (VA). [= C, K, Z]
Cuscuta rostrata Shuttleworth ex Engelmann \& A. Gray, Appalachian Dodder, Beaked Dodder. Mt (GA, NC, SC, VA): high elevation hardwood forests and thickets; common (GA Special Concern). [= RAB, C, K, Z]
* Cuscuta epilinum Weihe, Flax Dodder. Introduced, south to MD and PA (Kartesz 1999). [= K]
* Cuscuta epithymum Linnaeus, introduced, is known from scattered localities in PA (Rhoads \& Klein 1993). Reported for VA by Kartesz (1999), based on Massey (1961). [= K]

Cuscuta glomerata Choisy. East to TN, KY (K). [= K]

Dichondra J.R. \& J.G. Forster (Ponyfoot, Dichondra)
A genus of about 9 species, of tropical subtropical and warm temperate areas. References: Tharp \& Johnston (1961).

Dichondra carolinensis Michaux, Carolina Ponyfoot. Cp (GA, NC, SC, VA), Pd (GA, NC, SC): lawns, roadsides, moist pinelands; common (VA Watch List). March-May. Se. VA south to FL, west to AR and TX; also in Bermuda and reported for the Bahamas. This plant is rarely seen in a "natural" habitat, but is often seen in lawns and other mowed grassy areas. [= RAB, C, GW, K, S; D. repens J.R. Forster var. carolinensis (Michaux) Choisy -- F, G]

\section*{Evolvulus Linnaeus (Dwarf Morning-glory)}

A genus of about 90-100 species, almost all of tropical, subtropical, and warm temperate America. References: Ward (1968).

1 Leaves densely pilose on both surfaces with spreading to loosely appressed hairs; internodes short, generally < 1 cm long; [of calcareous glades and barrens of c. TN] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [E. nuttallianus]
1 Leaves densely pilose with appressed (sericeous) hairs below, the upper surface glabrous or looslely pubescent; internodes long, many over 1.5 cm long; [of Altamaha Grit outcrops in the the Coastal Plain of GA] . . . . . . . . . E. sericeus var. sericeus

Evolvulus sericeus Swartz var. sericeus, Silky Dwarf Morning-glory. Cp (GA): Altamaha Grit outcrops; rare (GA
Endangered). Coastal Plain of ec. GA (Appling, Jeff Davis, and Coffee counties) (Bridges \& Orzell 1989; Patrick, Allison, \& Krakow 1995) west and south ... [= K; <E. sericeus -- S]

Evolvulus nuttallianus J.A. Schultes, Shaggy Dwarf Morning-glory, in c. TN (Chester, Wofford, \& Kral 1997). [= F, K; E. nuttalianus -- C, orthographic variant; E. pilosus Nuttall - G]

\section*{Ipomoea Linnaeus (Morning-glory)}

A genus of about 650 species, herbs, vines, and shrubs, of tropical, subtropical, and warm temperate areas. References: Austin (1984) \(=\) Z; Austin \& Huáman (1996) \(=\) Y; Austin \& Bianchini (1998). Key adapted closely from Z.

1 Erect woody shrub with hollow stems; [subgenus Eriospermum, section Eriospermum, series Jalapae] \(\qquad\)
1 Trailing or twining vine.
2 Corolla salverform, the long narrow tube cylindrical (with sides more-or-less parallel) for most of its length, the limb abruptly flaring at the summit of the tube.
3 Corolla \(3-9 \mathrm{~cm}\) long, lavender to white; flowers open from evening until early morning.
4 Leaves tomentose beneath; corolla mostly white on the outer surface, lavender to purple on the inner surface, thus bicolored in-and-out; [of outer Coastal Plain hammocks and shell middens in se. NC and SC]; [subgenus Eriospermum, section Eriospermum, series Jalapae]
I. macrorhiza

4 Leaves glabrous beneath; corolla either white on both surfaces or lavender on both surfaces, not bicolored in-and-out; [weedy, of disturbed habitats]; [subgenus Quamoclit, section Calonyction] . . . . . . . . . . . I. turbinata
3 Corolla 2-4 cm long, scarlet, orange or yellow; flowers open from early morning to late morning or late afternoon; [subgenus Quamoclit, section Mina].
5 Leaf blade pinnately divided into 11-31 (or more) linear segments . . . . . . . . . . . . . . . . . . . . . . . I. quamoclit
5 Leaf blade entire, or angled or lobed into 3-7 lanceolate or ovate segments. 6 Calyx (5-) 6-8 (-9) mm long; fruit reflexed . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . I. coccinea 6 Calyx 4-4.5 mm long; fruits erect . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . I. hederifolia
2 Corolla funnelform to campanulate, the short to long tube expanding from below the middle, the limb gradually to abruptly flaring at the summit of the tube.
7 Pedicels and peduncles with spreading, ascending, or reflexed trichomes; gynoecium 3-parted; [subgenus Ipomoea, section Pharbitis].
8 Sepals with slightly narrowed green tips shorter than to slightly longer than the body of the sepal; [series Pharbitis] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . I. purpurea 8 Sepals with very narrow elongate green tips much longer than the body of the sepal; [series Heterophyllae]. 9 Sepals abruptly narrowed, the long subacute tips strongly spreading or curved . . . . . . . . . . . I. hederacea 9 Sepals gradually narrowed, the long acute tips suberect, straight, scarcely spreading . . . . . . . . . . [I. nil]
7 Pedicels and peduncles glabrous or with short, appressed trichomes; gynoecium 2-parted; [subgenus Eriospermum].
10 Stems trailing, rooting at the nodes; leaf apex emarginate, truncate, or obtuse; [of beaches from se. NC southwards]; [subgenus Eriospermum, section Erpipomoea].
11 Corolla white with a yellowish or purple eye; larger leaves 3-7-lobed . . . . . . . . . . . . . . . . . . . I. imperati 11 Corolla lavender; larger leaves not lobed (though notched at the apex) ... I. pes-caprae var. emarginata
10 Stems erect or twining, not rooting at the nodes (except sometimes in I. batatas); leaf apex acute to acuminate; [collectively of various habitats, not beaches, widespread]; [subgenus Eriospermum, section Eriospermum].
12 Leaf base sagittate; [series Jalapae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . I. sagittata 12 Leaf base cuneate to cordate.

13 Corolla 1.5-2.3 cm long, white; [series Batatas] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . I. Iacunosa
13 Corolla 3-8 cm long, at least partly pink to lavender (sometimes entirely white in \(I\). batatas).
14 Sepals ovate to oblong-elliptic; corolla usually white on the limb, the throat purple; anthers 5-7 mm long; [series Jalapae]
I. pandurata

14 Sepals oblong-ovate to oblong-lanceolate; corolla usually pink to lavender on the limb, the throat
lavender to purple; anthers \(1.5-3.2 \mathrm{~mm}\) long; [series Batatas].
15 Sepals unequal in length, oblong-ovate, with acute to caudate apices; leaves mostly 10-15 cm wide
I. batatas

15 Sepals more-or-less equal in length, oblong-lanceolate, with acuminate apices; leaves 2-5 cm wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . I. cordatotriloba var. cordatotriloba
* Ipomoea batatas (Linnaeus) Lamarck, Sweet Potato. Cp (GA?, NC, SC, VA?): persistent in fields after cultivation, disturbed areas; rare, apparently introduced from tropical America. [= RAB, K, S, Y, Z]
* Ipomoea carnea Jacquin ssp. fistulosa (Martius ex Choisy) D. Austin, Bush Morning-glory. Cp (SC): barrier island; rare, apparently introduced from the tropics. [=K, Y, Z; = I. fistulosa Martius -- RAB, S]

Ipomoea coccinea Linnaeus, Scarlet Creeper, Red Morning-glory. Cp, Pd, Mt (GA, NC, SC, VA): fields, roadsides, thickets, streambanks; common (uncommon in VA Mountains). August-December. Native distribution uncertain, but apparently native to se. United States. [= RAB, C, F, GW, K, W, Y, Z; = Quamoclit coccinea (Linnaeus) Moench -- G, S]

Ipomoea cordatotriloba Dennstedt var. cordatotriloba, Coastal Morning-glory. Cp (GA, NC, SC): dunes, sandy areas on barrier islands, other sandy habitats; uncommon. September-October. Se. NC south to s. FL, west to e. TX and AR. The correct nomenclature is discussed by Manitz (1983). [= K; I. trichocarpa Elliott -- RAB, GW, S, Z; I. trifida -- S, misapplied; I. cordatotriloba -- Y]

Ipomoea hederacea Jacquin, Ivyleaf Morning-glory. Cp, Pd, Mt (GA, NC, SC, VA): fields, disturbed areas; common. JulyDecember. Native distribution obscure, apparently native to temperate North America, including our area. [= RAB, C, F, G, GW, K, W, Y, Z; > I. hederacea var. hederacea - RAB, F, G; > I. hederacea var. integriuscula A. Gray -- RAB, F, G; > Pharbitis hederacea (Linnaeus) Choisy -- S; > Pharbitis barbigera (Sweet) G. Don -- S]
* Ipomoea hederifolia Linnaeus, Scarlet Creeper. Cp (GA): disturbed areas; uncommon. \{Distribution in our area uncertain, native of tropical America - Kartesz (1999) says GA only\} [=GW, K, Y, Z; = I. coccinea Linnaeus var. hederifolia (Linnaeus) A. Gray]

Ipomoea imperati (Vahl) Grisebach, Beach Morning-glory. Cp (GA, NC, SC): beaches, dune blowouts, fore-dunes; rare (NC Rare, SC Rare). August-October. Se. NC south to s. FL, west to TX, and extensively distributed in the tropics. [= K, Y; I. stolonifera (Cirillo) J.F. Gmelin -- RAB, GW, S, Z]

Ipomoea lacunosa Linnaeus, White Morning-glory. Cp, Pd, Mt (GA, NC, SC, VA): fields, roadsides, disturbed areas; common (rare in VA Mountains). September-December. NJ west to OH, IL, and KS, south to FL and e. TX. [= RAB, C, F, G, GW, K, S, W, Y, Z]

Ipomoea macrorhiza Michaux, Manroot. Cp (GA, NC, SC): hammocks, shell middens, dry sands, disturbed maritime areas; rare (GA Special Concern, NC Watch List, SC Rare). June-July. Se. NC south to FL, west to s. AL. [= RAB, K, S, Y, Z]

Ipomoea pandurata (Linnaeus) G.F.W. Meyer, Wild Sweet Potato, Manroot, Man-of-the-earth. Cp, Pd, Mt (GA, NC, SC, VA): May-July; July-September. CT, NY, and s. Ontario west to OH, s. MI, and KS, south to c. peninsular FL and e. TX. [= RAB, C, F, G, GW, K, S, W, Y, Z; > I. pandurata var. pandurata - G; > I. pandurata var. rubescens Choisy -- G]

Ipomoea pes-caprae (Linnaeus) R. Brown var. emarginata Hallier f., Railroad Vine, Goat's-foot, Bay Hops, Bay Winders. Cp (GA, NC, SC): ocean beaches; rare. The species ranges from NC (Carteret County), SC (Beaufort County), south to FL, west to TX, and widespread on tropical shores of the the New World and Old World. The records in the Carolinas may reflect the periodic arrival of sea-borne seeds. [<I. pes-caprae -- GW, S, Z, infraspecific taxa not distinguished; I. pes-caprae ssp. brasiliensis (Linnaeus) van Ooststr. -- K, Y]
* Ipomoea purpurea (Linnaeus) Roth, Common Morning-glory. Cp, Pd, Mt (GA, NC, SC, VA): fields, disturbed areas; common, native of tropical America. July-September. [=RAB, C, F, G, GW, K, W, Y, Z; = Pharbitis purpurea (Linnaeus) Voigt -- S] * Ipomoea quamoclit Linnaeus, Cypress-vine. Cp (GA, NC, SC), Pd (NC, SC, VA): fields, hedgerows, disturbed areas; common (rare in VA), introduced from tropical America. September-December. [= RAB, C, F, GW, K, Y, Z; = Quamoclit vulgaris Choisy -- G; = Quamoclit quamoclit (Linnaeus) Britton -- S]

Ipomoea sagittata Poiret. \(\mathrm{Cp}(\mathrm{GA}, \mathrm{NC}, \mathrm{SC})\) : edges of brackish marshes, moist thickets on barrier islands, hammocks; common. July-September. E. NC south to s. FL, west to TX; also in the West Indies. [= RAB, GW, K, S, Y, Z]
* Ipomoea turbinata Lagasca y Segura, Lilacbell. Cp (GA, NC, SC): fields, disturbed areas; rare, native (apparently) of Mexico. Austin \& Jansson (1988) discuss the species' spread in se. United States, apparently as a contaminent in soybean seeds. [= K, Y, Z]
* Ipomoea cairica (Linnaeus) Sweet. East to AL. [= K] \{not yet keyed; add synonymy\}
* Ipomoea nil (Linnaeus) Roth occurs in scattered states, such as MD and MS, as a rare introduction from tropical America (Kartesz 1999). [= K, Y, Z; Pharbitis nil (Linnaeus) Choisy -- S]

Ipomoea tricolor Cavanilles is reported for several locations in se. PA (Rhoads \& Klein 1993). [= K] \{not yet keyed; add synonymy\}
* Ipomoea wrightii A. Gray, native of India, has been reported as likely naturalized in central TN, "spreading northward from the

Gulf Coastal Plain" (Kral 1981). It also is known from GA (Kartesz 1999). [= K] \{not yet keyed; add synonymy\}
* Ipomoea \(\times\) multifida (Rafinesque) Shinners [l. coccinea \(\times\) quamoclit], Cardinal Climber, is cultivated and may escape. [=K] \{not keyed\}

\section*{Jacquemontia Choisy (Jacquemontia)}

A genus of about 90 species, tropical, subtropical, and warm temperate areas, especially America
Jacquemontia tamnifolia (Linnaeus) Grisebach, Jacquemontia. Cp (GA, NC, SC, VA), Pd (GA, SC): fields, roadsides, other disturbed areas; uncommon (rare in VA). August-September. Se. VA south to FL, west to AR and TX; also widespread in West

Indies, Central America, and South America, its original range difficult to determine. In our area, it is probably adventive. Fox, Godfrey, \& Blomquist (1952) report the first collections of the species in NC, in 1938 and 1950, from obviously disturbed situations. [= RAB, C, F, G, GW, K; Thyella tamnifolia (Linnaeus) Rafinesque -- S]

\section*{Merremia Dennst. ex Endlicher}
* Merremia dissecta (Jacquin) Hallier f., Noyau Vine. Cp (GA): disturbed areas; rare, introduced from South America. Ranges as far north as e. and sw. GA. [= K; Ipomoea sinuata Ortega; Operculina dissecta (Jacquin) House]

\section*{Stylisma Rafinesque (Dawnflower)}

A genus of about 6 species (and about 8 taxa), vining to trailing herbs, endemic to se. North America. References: Myint (1966)=Z; Shinners (1962)=Y.

1 Bracteoles of the flowers and fruits leaflike, (2-) 10-20 mm long (tending to be deciduous in August or September); styles fused nearly to bases of the stigmas (fused more than \(5 / 6\) of the total length); stylar branches less than 3 mm long; leaves 1-3 mm wide (the very basal sometimes wider), held in a vertical, erect position \(\qquad\) S. pickeringii var. pickeringii

1 Bracteoles of the flowers and fruits bractlike, 1-3 (-5) mm long; styles free to near the summit of the ovary (fused less than \(1 / 2\) of the total length); stylar branches more than 5 mm long; leaves \(2-28 \mathrm{~mm}\) wide, held in a horizontal or ascending position (rarely nearly erect).
2 Corolla pink or purple; filaments glabrous, or nearly so; leaves densely and conspicuously silvery-sericeous; [of seasonally wet habitats]
S. aquatica

2 Corolla white; filaments villous, at least near the base; leaves puberulent or pubescent, but not consopicuously silkysericeous; [of dry habitats].
3 Larger leaves (7-) 12-30 mm wide; inflorescences with (1-) 3-7 (-12) flowers; stems with tendency to twine, at least near growing tip.
4 Sepals glabrous; [widespread in the Coastal Plain and Piedmont of our area] . . . . . . . . . . . . . . S. humistrata
4 Sepals densely villous; [of s. GA southwards and westwards] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. villosa
3 Larger leaves 2-10 mm wide; flowers usually solitary (rarely in 3-5-flowered cymes); stems without tendency to twine.
5 Surface of sepals moderately to densely villous (rarely nearly glabrous); leaves mostly 4-6× as long as wide; inflorescence of \(1(-5)\) flowers . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. patens ssp. paten
5 Surface of sepals glabrous (rarely with a few scattered hairs), the margins ciliate; leaves \(7-15 \times\) as long as wide; inflorescence of 1 (-3) flowers)
S. patens ssp. angustifolia

Stylisma aquatica (Walter) Rafinesque, Water Dawnflower. Cp (GA, NC, SC): clay-based Carolina bays and wet savannas; rare (NC Rare). June-July. Se. NC south to FL panhandle, west to se. AR and e. TX. S. aquatica, as the epithet implies, occurs in wetter habitats than our other species. [= GW, K, S, Z; = Bonamia aquatica (Walter) A. Gray -- RAB, Y; Breweria michauxii Fernald \& Schubert -- F]

Stylisma humistrata (Walter) Chapman, Southern Dawnflower. Cp, Pd (GA, NC, SC, VA): sandhills and other dry woodlands, especially on dryish stream terraces; common (VA Watch List). June-August. Se. VA south to n. FL, west to AR and e. TX, north in the Interior to n. AL and w. TN. [= C, K, S, Z; = Bonamia humistrata (Walter) A. Gray -- RAB, Y; = Breweria humistrata (Walter) A. Gray -- F, G]

Stylisma patens (Desrousseaux) Myint ssp. angustifolia (Nash) Myint, Narrowleaf Dawnflower. Cp (GA, NC, SC): sandhills; uncommon (NC Watch List). May-August. According to Myint (1966), ssp. angustifolia is widespread in \(n\). and c. peninsular FL, with relatively sparse occurrences north to se. NC and west to the Panhandle of FL. [= K, Z; = Bonamia patens (Desrousseaux) Shinners var. angustifolia (Nash) Shinners -- RAB, Y; = S. angustifolia (Nash) House -- S]

Stylisma patens (Desrousseaux) Myint ssp. patens, Common Dawnflower. Cp (GA, NC, SC): sandhills and other relatively dry sandy areas; common. June-August. Overall, the most common and widespread taxon of the genus in our area, regularly encountered in its habitat. E. NC south to n. FL, and west to s. MS. [= K, Z; = Bonamia patens (Desrousseaux) Shinners var. patens -- RAB, Y; S. trichosanthes (Michaux) House -- S, misapplied]

Stylisma pickeringii (Torrey ex M.A. Curtis) A. Gray var. pickeringii, Pickering's Dawnflower. Cp (GA, NC, SC): sandhills, usually in the driest, most barren, deep-sand areas, occasionally colonizing dry, disturbed areas in sandhills, such as sandy roadbanks, known from the Fall-line Sandhills, aeolian rims of Carolina bays, and sandhills on relict riverine dunes along Coastal Plain rivers; rare (GA Threatened, NC Endangered, SC Rare). June-August (-September); July-September. This rare species is easily recognizable by its growth form, with numerous stems arching from a central point, then trailing radially away, forming a mound 1-2 meters in diameter. The narrowly linear leaves are borne vertically. Fernald and Schubert (1949) named four varieties in this widely but disjunctly distributed species; Myint (1966) reduced this to two varieties, one eastern and one western. Var. pickeringii ranges from s. NC south through SC, GA, AL, and e. MS, with a disjunct area in the Pine Barrens of NJ, sometimes treated as the separate var. caesariensis Fernald \& Schubert. Var. pattersonii ranges from IL and IA south through KS and OK to e. TX, w. LA, and w. MS. Material in MS is equivocal. [= C, K, Z; < Bonamia pickeringii (Torrey ex M.A. Curtis) A. Gray \(--\mathrm{RAB}, \mathrm{Y} ;=\) Breweria pickeringii (Torrey ex M.A. Curtis) A. Gray var. pickeringii -- F; Breweria pickeringii (Torrey ex M.A. Curtis) A. Gray -- G; < S. pickeringii (Torrey ex M.A. Curtis) A. Gray -- S]

Stylisma villosa (Nash) House, Hairy Dawnflower. \(\mathrm{Cp}(\mathrm{GA})\) : sandhills; rare. Late April-July. S. GA south to s. peninsular FL, west to e. TX. [= K, S, Z; = Bonamia villosa (Nash) K.A. Wilson - Y; = Breweria villosa Nash]

\section*{CORNACEAE (Dogwood Family)}

A family of 2 genera and about 80 species, trees, shrubs, lianas, and subshrubs, semicosmopolitan. The Cornaceae is best circumscribed to exclude Nyssa (Xiang et al. 2002). References: Xiang et al. (2002); Kubitzki in Kubitzki (2004).

1 Leaves evergreen, glossy, coriaceous, often spotted with yellow; flowers in terminal panicles [see Aucuba in GARRYACEAE]
1 Leaves deciduous, dull to slightly glossy, herbaceous, uniformly green (unless diseased); flowers in umbels, cymes, or involucrate heads

Cornus

Cornus Linnaeus 1753 (Dogwood, Cornel)
A genus of about 60 species, trrees, shrubs, and subshrubs, mainly north temperate. The generic limits are controversial. Phylogenetic analyses show that Cornus is monophyletic, but various clades within it are also monophyletic and have levels of genetic and morphologic divergence often regarded as warranting generic distinction. At very least, the subgenera are well-marked References: Godfrey (1988)=Z; Murrell (1993); Fan \& Xiang (2001); Eyde (1987); Xiang, Soltis, \& Soltis (1998); Ferguson (1966c, 1966d) \(=\) Y; Kubitzki in Kubitzki (2004).
subgenus Mesomora (genus Swida): alternifolia
subgenus Kraniopsis (genus Swida): amomum, asperifolia, drummondii, foemina, obliqua, racemosa, rugosa, sericea subgenus Arctocrania (genus Chamaepericlymenum): canadensis
subgenus Cynoxylon (genus Cynoxylon): florida
subgenus Syncarpea (genus Cynoxylon): kousa
1 Leaves alternate (the internodes typically short and therefore the leaves looking nearly whorled); [subgenus Mesomora] . . . .
\(\qquad\)
1 Leaves opposite
2 Herb or dwarf shrub, to 2 dm tall; [subgenus Arctocrania] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. canadensis
2 Shrub or tree, much taller than 2 dm when mature.
3 Inflorescence subtended by 4 showy bracts.
4 Showy bracts subtending the inflorescence rounded-notched; [subgenus Cynoxylon] . . . . . . . . . . . C. florida
4 Showy bracts subtending the inflorescence acute; [subgenus Syncarpea] . . . . . . . . . . . . . . . . . . ... C. kousa
3 Inflorescence lacking bracts; [subgenus Kraniopsis].
5
5
amomum, asperifolia, drummondii, foemina, obliqua, racemosa, rugosa, sericea
Cornus alternifolia Linnaeus f., Alternate-leaf Dogwood, Pagoda Cornel, Pagoda Dogwood. Mt, Pd (GA, NC, SC, VA), Cp (VA, GA): moist forests. Newfoundland west to MN, south to FL (Gadsden Co.), AL, s. MS, and AR. [= RAB, C, F, G, K, W, Y, Z; Swida alternifolia (Linnaeus f.) Small -- S (as Svida)]

Cornus amomum P. Miller, Silky Dogwood. Mt, Pd, Cp (GA, NC, SC, VA). NY and MA west to IN, south to GA and MS. [= RAB, F, G, K, W; Cornus amomum var. amomum -- C; Cornus amomum P. Miller ssp. amomum -- GW, Y, Z; Swida amomum (P. Miller) Small -- S (as Svida)]

Cornus asperifolia Michaux, Eastern Roughleaf Dogwood. Cp (GA, NC, SC), Pd (GA): mesic calcareous forests and thickets, shell middens; uncommon. [= RAB, K, Y, Z; Cornus foemina P. Miller ssp. microcarpa (Nash) J.S. Wilson -- GW; Swida microcarpa (Nash) Small -- S (as Svida); Swida asperifolia (Michaux) Small]

Cornus canadensis Linnaeus, Bunchberry, Dwarf Cornel, Dwarf Dogwood. Mt (VA): high elevation forests; rare. Greenland west to AK, south to NJ, VA, WV, and CA. [= C, F, G, K, W, Y; Chamaepericlymenum canadense (Linnaeus) Ascherson \& Graebner]

Cornus drummondii C.A. Meyer, Midwestern Roughleaf Dogwood. Mt (GA): open woodlands and glades over calcareous rocks (limestone, calcareous shale); rare (GA Special Concern). OH west to IA, south to e. TN, nw. GA, and TX. [= C, F, G, GW, K, Y; Cornus priceae Small -- F; Swida priceae (Small) Small -- S (as Svida); Swida asperifolia -- S, misapplied; Swida drummondii (C.A. Meyer) Sojak]

Cornus florida Linnaeus, Flowering Dogwood. Mt, Pd, Cp (GA, NC, SC, VA). ME west to MI, south to FL and ne. Mexico (Veracruz and Nuevo Léon). [= RAB, C, F, G, K, W, Y, Z; Cynoxylon floridum (Linnaeus) Rafinesque ex B.D. Jackson -- S]

Cornus foemina P. Miller, Southern Swamp Dogwood. Cp, Pd, Mt (GA, NC, SC, VA). common, rare in Mountains. DE south to FL, west to TX, and north in the interior to TN, s. IN, s. IL, AR, and se. OK. [= F, K, Z; Cornus stricta Lamarck -- RAB, C, G; Swida stricta (Lamarck) Small -- S (as Svida); Cornus foemina P. Miller ssp. foemina -- GW, W, Y; Swida foemina (P. Miller) Rydberg]

Cornus obliqua Rafinesque, Silky Dogwood. Mt, Pd (VA): . ME and Québec west to MN, south to KY, c. TN, AR, and OK. [= F, K; Cornus amomum P. Miller var. schuetzeana (C.A. Meyer) Rickett -- C; Cornus purpusii Koehne -- G; Cornus amomum P. Miller ssp. obliqua (Rafinesque) J.S. Wilson -- GW, Y; Swida obliqua (Rafinesque) Moldenke]

Cornus racemosa Lamarck, Northern Swamp Dogwood. Mt (VA), Pd (NC, VA), Cp (VA): . ME and s. Québec west to s. manitoba, south to VA, nc. NC, s. IL, and MO. [= RAB, C, F, G, K; Swida foemina (P. Miller) Small -- S, misapplied (as Svida femina); Cornus foemina P. Miller ssp. racemosa (Lamarck) J.S. Wilson -- W, Y; Swida racemosa (Lamarck) Moldenke]

Cornus rugosa Lamarck, Roundleaf Dogwood. Mt (VA): . Québec to Manitoba, south to NJ, PA, w. VA, OH, IN, and IL. [= C, F, G, K, W]

Cornus sericea Linnaeus ssp. sericea, Red Osier Dogwood. Pd (VA): . [= C, K; Cornus stolonifera Michaux -- F, G, W;

Cornus stolonifera var. stolonifera -- F; Cornus stolonifera var. baileyi (Coulter \& Evans) Drescher -- F; Swida sericea (Linnaeus) Holub]
* Cornus kousa Hance, Kousa Dogwood, is sometimes planted as an ornamental and may persist. [= K; Cynoxylon kousa (Hance) Nakai]

\section*{CRASSULACEAE (Stonecrop Family) (see also PENTHORACEAE)}

A family of about 35 genera and 1100 species, succulent shrubs and herbs, nearly cosmopolitan. References: Moran in FNA (in prep.).

1 Leaves connate at the base, opposite; flowers solitary in the axils of leaves; flowers 3-4-merous; [subfamily Crassuloideae] . .

1 Leaves distinct, opposite, whorled, or alternate; flowers in terminal cymose inflorescences; flowers 4-5 (-8)-merous; [subfamily Sedoideae].
2 Perennials without rosettes, the stems 0.5-10 dm tall; leaves large, relatively thin in texture, usually 5-25 times as wide as thick, often crenate; flowers pink, purple, white, or greenish; [subtribe Telephiinae].
3 Flowers 5-merous, bisexual; flowering stems 2-10 dm tall, from an underground, tuberous base; average leaves 3-11 cm long, \(1-5 \mathrm{~cm}\) wide; ovaries attenuate at the base

Hylotelephium
3 Flowers 4 -(5)-merous, usually unisexual and then the plants dioecious; flowering stems 0.5-4 dm tall, from axils of brown scale-leaves clothing a stout rootstock at least in part exposed aboveground; average leaves 1-5 cm long, 0.41.5 cm wide; ovaries not attenuate at the base

Rhodiola
2 Perennials or annuals with or without rosettes, the stems less than 2 dm tall; leaves smaller, flat or terete, relatively thicker, entire; flowers white or yellow; [subtribe Sedinae].
4 Carpels united basally (to about \(1 / 3\) their length); petals cucullate, initially partly enclosing 4 of the 8 stamens; follicles dehiscing by a tear-shaped valve on the abaxial (lower) surface; stem and leaves normally red; [of granitic flatrocks of the Piedmont of NC and SC] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Diamorpha
4 Carpels free; petals flat, never enclosing any of the 8 anthers; follicle dehiscing by a longitudinal slit along the adaxial (upper) suture; stem and leaves normally green, sometimes somewhat pink or reddish; [collectively various habitats, including granitic flatrocks of GA, NC, SC, and VA]

Sedum

\section*{Crassula Linnaeus}

A genus of about 250 species, nearly cosmopolitan (centered in Africa). References: Moran in FNA (in prep.).

1 Seeds with sharp-pointed papillae; leaves \(1.5-3 \mathrm{~mm}\) long, the apex acute; sepals 0.4-0.6 mm long ........ C. drummondii
Crassula aquatica (Linnaeus) Schönland, Pygmyweed. Pd (SC): artificial lake; rare. Introduced? Occuring in tidal marshes and shores, south to MD and se. PA, and also in GA and AL (Kartesz 1999). [= FNA, K; = Tillaea aquatica Linnaeus -- GW; = Tillaeastrum aquaticum (Linnaeus) Britton -- S]
?* Crassula drummondii (Torrey \& A. Gray) Fedde. Cp (SC): habitat not known; rare. Introduced? [= FNA, K; = Tillaea drummondii Torrey \& A. Gray]

Crassula longipes (Rose) Bywater \& Wickens, in GA. [= K] \{not yet keyed\}

Diamorpha Nuttall (Elf-orpine)
A monotypic genus, a succulent annual, endemic to se. North America. References: Wilbur (1988a)=Z; Moran in FNA (in prep.); Clausen (1975) \(=\mathrm{Y}\).

Diamorpha smallii Britton ex Small, Elf-orpine. Pd (GA, NC, SC, VA), Mt (GA, NC, SC): in very thin soil (generally less than 2 cm deep) of vernally wet depressions on granite flatrocks and other granitic outcrops; uncommon (rare in Mountains) (VA Rare). April-May; May-June. Primarily limited to granitic flatrocks of the Piedmont, ranging from sc. VA to ec. AL, and locally north into se. TN. This species is both one of the most typical and one of the most interesting of the dozens of species endemic (or largely so) to granite flatrocks of the southeastern Piedmont. See Wilbur (1988a) for a thorough discussion of the muddled nomenclatural history of this remarkable species, as well as for a detailed summary of systematic and ecological information. [= FNA, GW, K, S, Z; = Sedum smallii (Britton ex Small) Ahles -- RAB, W; = Diamorpha cymosa (Nuttall) Britton ex Small -- S, Y]

Hylotelephium H. Ohba (Live-for-ever)
A genus of about 30 species, of temperate Eurasia and North America. References: Moran in FNA (in prep.); Clausen (1975)=Z.

1 Petals \(2 \times\) as long as the sepals; nectaries wider than long; flowers fertile; [native]
H. telephioides

1 Petals \(3-4 \times\) as long as the sepals; nectaries longer than wide; flowers sterile (rarely fertile); [introduced]
2 Flowers white or greenish; cymes lax, subcorymbose; leaves not markedly reduced upwards from base of plant upwards H. erythrostictum

2 Flowers deep pink to purple; cymes densely subglobose; leaves typically strongly reduced in size from base of plant upwards
H. telephium
* Hylotelephium erythrostictum (Miquel) H. Ohba, Garden Orpine, Live-for-ever. Pd (GA, NC), Cp (NC): disturbed areas; rare, inroduced from Europe. August-September; September-October. [= FNA, K; Sedum spectabile Boreau -- RAB, K, misapplied; Sedum xerythrostictum -- C; Sedum alboroseum Baker -- Z]

Hylotelephium telephioides (Michaux) H. Ohba, Allegheny Live-for-ever. Mt, Pd (NC, SC, VA): rock outcrops, mostly at high to moderate elevations, ascending to 2000 m ; uncommon. July-September; August-October. Essentially a Central and Southern Appalachian endemic, H. telephioides ranges from s. PA south to W. NC, with a few outlying populations to the west in s. IL, s. IN, and w. KY. The species is apparently not known from TN. [= FNA, K; Sedum telephioides Michaux -- RAB, C, F, G, W, Z; Anacampseros telephioides (Michaux) Haworth -- S]
* Hylotelephium telephium (Linnaeus) H. Ohba, Live-for-ever. Cp (NC): disturbed areas; rare, native of Europe. SeptemberOctober; October-November. [= FNA; Sedum purpureum (Linnaeus) Link -- RAB, C, F, Z; Sedum telephium Linnaeus ssp. purpureum (Link) Schinz \& R. Keller -- G; Sedum telephium ssp. fabaria (Koch) Schinz \& Keller -- G; Hylotelephium telephium ssp. telephium -- K]

\section*{Rhodiola Linnaeus (Roseroot)}

A genus of about 40 species, of cold temperate and boreal areas of the northern hemisphere. References: Moran in FNA (in prep.); Clausen (1975)=Z.

Rhodiola rosea Linnaeus, Roseroot. Mt (NC): high elevation rocky summits; rare (NC Endangered). July-August; AugustSeptember. Circumboreal, widely distributed in northern Europe, Asia, and North America, south in e. North America to e. PA and thence disjunct to Roan Mountain (Mitchell County, NC) and Grandfather Mountain (Avery County, NC), where nearly (if not completely) extirpated. Dwarfed, high elevation forms of Sedum telephioides, with narrow, nearly toothless leaves, have been confused with Rh. rosea; they are perhaps readily distinguished only in flower or fruit. [= FNA, K; = Sedum rosea (Linnaeus) Scopoli -- RAB, F, G, W, Z; Sedum rosea (Linaeus) Scopoli var. rosea -- C; > Rhodiola roanensis Britton -- S; > Sedum rosea (Linnaeus) Scopoli var. roanense (Britton) Berger]

> Sedum Linnaeus (Stonecrop, Orpine, Sedum)
> (also see Diamorpha, Hylotelephium, and Rhodiola)

A genus of perhaps 200 species, depending on circumscription. There is considerable controversy about the circumscription of the genus Sedum. Diamorpha is clearly to be separated; the separation of Rhodiola and Hylotelephium seem warranted, but are less clear. Other segregates which would affect the species treated below have been proposed, such as Chetyson, Clausenellia, and Spathulata (see synonymy). References: Clausen (1975)=Z; Calie (1981)=Y.

1 Perennials without rosettes, the stems 0.5-10 dm tall; leaves large, relatively thin in texture, usually 5-25 times as wide as thick, often crenate; flowers pink, purple, white, or greenish; [subtribe Telephiinae].
2 Flowers 5-merous, bisexual; flowering stems 2-10 dm tall, from an underground, tuberous base; average leaves 3-11 cm long, 1-5 cm wide; ovaries attenuate at the base [see Hylotelephium]
2 Flowers 4 -(5)-merous, usually unisexual and then the plants dioecious; flowering stems 0.5-4 dm tall, from axils of brown scale-leaves clothing a stout rootstock at least in part exposed aboveground; average leaves 1-5 cm long, 0.4-1.5 cm wide; ovaries not attenuate at the base
[see Rhodiola]
1 Perennials or annuals with or without rosettes, the stems less than 2 dm tall; leaves smaller, flat or terete, relatively thicker, entire; flowers white or yellow; [subtribe Sedinae].
3 Carpels united basally (to about \(1 / 3\) their length); petals cucullate (hoodlike), initially partly enclosing 4 of the 8 stamens; follicles dehiscing by a tear-shaped valve on the abaxial (lower) surface; stem and leaves normally red; [of granitic flatrocks of the Piedmont of NC and SC] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [see Diamorpha]
3 Carpels free; petals flat, never enclosing any of the 8 anthers; follicle dehiscing by a longitudinal slit along the adaxial (upper) suture; stem and leaves normally green, sometimes somewhat pink or reddish; [collectively various habitats, including granitic flatrocks of NC, SC, and VA].
4 Leaves primarily opposite
4 Leaves primarily alternate or in whorls of 3-4.
5 Leaves primarily whorled in 3's or 4's.
6 Largest leaves distinctly spatulate, much wider than thick, \(8-20 \mathrm{~mm}\) wide; flowers and fruits 4 -merous; petals white; [native, of moist forest and rock outcrops]
6 Largest leaves linear-lanceolate, oblanceolate, or elliptic, almost as thick as wide, less than 7 mm wide; flowers and fruits 5 -merous; petals yellow; [alien].
7 Stems decumbent; leaves linear-lanceolate . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [S. lineare]
7 Stems long-creeping; leaves oblanceolate to elliptic
S. sarmentosum

5 Leaves primarily alternate.

Flowers and fruits 5-merous; [plants aliens].
Leaves flat, spatulate, \(15-50 \mathrm{~mm}\) long
[S. kamtschaticum ssp. ellacombianum]
9 Leaves terete or subterete, 2-15 mm long.
10 Leaves \(2-5 \mathrm{~mm}\) long; petals yellow
S. acre

10 Leaves 6-15 mm long; petals yellow or white.
11 Petals white; flowers 5-merous
11 Petals yellow; flowers (5-) 7 (-9) merous . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [S. reflexum]
8 Flowers and fruits 4-merous; [plants natives].
12 Leaves of flower-bearing stems linear, sagittate-spurred at the base (the spurs clasping the stem); petals pink to white; annual; [section Ternata]. \(\qquad\) S. pulchellum

12 Leaves of flower-bearing stems narrowly elliptic, oblanceolate, spatulate, cuneate or short-spurred at the base (not clasping); petals white; perennial or annual.
13 Plants annual; sepals \(0.4-1 \mathrm{~mm}\) long; petals \(1.4-4.2 \mathrm{~mm}\) long; [restricted to shallow soils of granitic flatrocks of the Piedmont, from s. NC south to wc. GA]; [section Tetrorum] . S. pusillum
13 Plants perennial; sepals 2-9 mm long; petals \(4-9 \mathrm{~mm}\) long; [of outcrops of various rocks, not as above]; [section Ternata].
14 Leaves of flowering stems with width/thickness ratio of \(>2.0\); seeds averaging 0.8 mm long; leaves pale green or bluish green, sometimes with a glaucous coating; [of MD south through VA and WV to sc. and sw. NC] . . . . . . . . . . . . . . . . . . . . . . . S. glaucophyllum
14 Leaves of flowering stems with width/thickness ratio of \(<1.7\); seeds averaging 0.7 mm long; leaves green or gray-green, but not glaucous; [of se. TN south into AL and GA] . . . S. nevii
* Sedum acre Linnaeus, Wallpepper, Mossy Stonecrop, Golden Carpet, Gold-moss, Bitter Stonecrop. Mt (NC, VA), Pd (NC, VA): rock outcrops, gravel parking lots, disturbed areas; commonly cultivated, rarely naturalizing, native of Europe. May-June; June-July. [= RAB, C, F, G, K, S, W, Z]

Sedum glaucophyllum Clausen, Cliff Stonecrop. Mt, Pd (NC, VA): rock outcrops, usually basic and/or sedimentary; common (rare in Piedmont and south of VA) (NC Rare). May-June; June-July. Endemic to the Central and Southern Appalachians (extending into the Piedmont), known from MD, WV, VA, and NC (reports for GA are based on confusion with S. nevii). This species is complex, with several ploidies and morphologies represented, some at least showing geographic segregation and probably worthy of taxonomic recognition. Material in sw. NC (south of the Asheville Basin) has been identified as polyploid and differs in many ways from more typical S. glaucophyllum, in some ways suggesting the similar and closely related S. nevii A. Gray (known from nearby TN and \(A L\) ). Further study is needed of this interesting group. [= C, F, K, W, Y, Z; < S. nevii A. Gray -- RAB, G, S]

Sedum nevii A. Gray, Nevius's Stonecrop. Pd (GA): gneiss rock outcrops on river bluffs; rare (GA Threatened). Endemic to se. TN (Polk County, just west of Cherokee County, NC) (Chester, Wofford, \& Kral 1997), nc. and ec. AL, and wc. GA (where it occurs on gneiss outcrops along the Chattahoochee River in Muscogee and Harris counties). [=K, W, Y, Z; < S. nevii -- S (also see S. glaucophyllum)]

Sedum pulchellum Michaux, Widow's-cross. Mt (GA): calcareous rock outcrops; rare. E. TN (Monroe, Knox, and Bradley counties) (Chester, Wofford, \& Kral 1997) and nw. GA (Jones \& Coile 1988) west to KS, OK, and TX. [= C, F, G, K, W, Y, Z; > Chetyson pulchella (Michaux) A. \& D. Löve; > Sedum pulchellum - S; > Sedum vigilimontis Small -- S; > Chetyson vigilimontis (Small) A. \& D. Löve]

Sedum pusillum Michaux, Puck's Orpine. Pd (GA, NC, SC): in very thin soil (generally less than of vernally wet depressions on granite flatrocks, often in mats of the moss Hedwigia ciliata; rare (US Species of Concern, GA Threatened, NC Endangered, SC Rare). March-April; April-May. Endemic to granite flatrocks of the southeastern Piedmont, from sc. NC south to wc. GA. Superficially rather similar to Diamorpha smallii, and historically confused with it (see Wilbur 1988 for details). Wyatt (1983) discusses the reproductive biology of this species. [= RAB, GW, K, S, Z; = Tetrorum pusillum (Michaux) Rose]
* Sedum sarmentosum Bunge. Pd (GA, NC, SC, VA), Mt (GA, NC, VA), Cp (VA): xeric rock outcrops, disturbed areas; rare, introduced from China. May-June; June-July. [= RAB, C, F, G, K, W, Z]

Sedum ternatum Michaux, Mountain Stonecrop. Mt (GA, NC, SC, VA), Pd (NC, SC, VA), Cp (VA): moist forests, coves, bottomlands, shaded rock outcrops; common. April-June; May-July. NJ west to IA and AR, south to nw. GA and AL. [= RAB, C, F, G, K, S, W, Y, Z; = Clausenellia ternata (Linnaeus) A. \& D. Löve]
* Sedum album Linnaeus, White Stonecrop, native of Eurasia, is introduced and naturalized as far south as se. PA. [= C, F, G, K, Z; = Oreosedum album (Linnaeus) Grulich]
* Sedum kamtschaticum Fischer \& C.A. Meyer ssp. ellacombianum (Praeger) Clausen, Kamchatka Stonecrop, is introduced and naturalized as far south as se. PA. [=K, Z]
* Sedum lineare Thunberg. Pd (GA): margin of granitic flatrock; rare, native of e. Asia. Duncan (1985) discusses the establishemnt of this species in Columbia co. GA. [= K, Z] \{not yet keyed\}
* Sedum reflexum Linnaeus. Pd (GA): Reported for nc. GA (Jones \& Coile 1988). [= C, K; = Petrosedum reflexum (Linnaeus) Grulich]
* Sedum spurium M. Bieberstein, Caucasian Stonecrop, native of the Caucasus, is introduced and naturalized as far south as se. PA. [= C, F, G, K, Z; = Spathulata spuria (M. Bieberstein) A. \& D. Löve]

Many other species of Sedum are grown as ornamentals, especially in rock gardens; some are aggressive and rather weedy and can be expected eventually to become a naturalized part of our flora.

1 Ovaries and fruits with prickles; fruits \(1-5 \mathrm{~cm}\) long at maturity; tendrils present, 3 -forked.
2 Corolla 6-lobed; fruit 4-seeded, dehiscent by 2 pores; stems and leaves glabrous or glabrescent . Echinocystis

2 Corolla 5-lobed; fruit 1-seeded, indehiscent; stem and leaves conspicuously viscid-pubescent Sicyos
1 Ovaries and fruits smooth or pubescent, but not prickly; fruits \(1-70 \mathrm{~cm}\) long at maturity; tendrils absent or present (if present either forked or simple).
3 Leaves pinnately lobed, the divisions rounded; fruit surface green and white, the flesh red or pink ............ Citrullus
3 Leaves palmately lobed, the divisions angular and toothed; fruit surface red, green, white, black, orange, yellow, or blue, the flesh white, orange, yellow, tan, or green.
4 Fruit less than 3 cm long; tendrils present, simple; [native, mostly in moist forests or thickets].
5 Fruit surface red at maturity; pedicel of pistillate flowers and fruits 1-3 mm long
Cayaponia
5 Fruit surface black or dark green at maturity; pedicel of pistillate flowers and fruits more than 20 mm long
Melothria
4 Fruit more than 5 cm long; tendrils absent or present (if present, forked); [introduced, mostly in gardens, fields, or disturbed places].
6 Corolla less than 3 cm long; [canteloupes and cucumbers] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Cucumis 6 Corolla more than 5 cm long; [squashes, gourds, pumpkins].

Cp, Pd, Mt (GA, NC, SC, VA): gardens, fields, trash heaps; commonly cultivated in home gardens and commercially, sometimes volunteering from seed the following year, introduced from the Old World. [= K; L. cylindrica (Linnaeus) M. Roemer -- S]

Melothria Linnaeus (Melonette)

Melothria pendula Linnaeus var. pendula, Melonette, Creeping Cucumber. Cp, Pd, Mt (GA, NC, SC, VA): bottomland forests, moist roadsides and disturbed areas, marshes; common (rare in Mountains). June-November. DC, MD, and VA west to IN, south to FL and TX. Several varieties (treated as species by Small) are found in FL and AL. [= K; < M. pendula -- RAB, C, W; M. pendula -- F, G, S, in the narrow sense]

Melothria pendula Linnaeus var. aspera Cogn. AL and FL. [= K; M. microcarpa Shuttleworth; M. nashii Small] \{not yet keyed; add synonymy\}

\section*{Sicyos Linnaeus (Bur-cucumber)}

Sicyos angulatus Linnaeus, Bur-cucumber, Nimble-Kate, Star-cucumber. Mt, Pd, Cp (GA, NC, SC, VA): August-November. S. ME west to MN, south to panhandle FL and c. TX. [= RAB, C, F, G, GW, K, S, W]

CUSCUTACEAE (Dodder Family) [see CONVOLVULACEAE]

CYRILLACEAE (Ti-ti Family)
A family of 2 genera and 3 or more species, ranging from se. North America to the West Indies and \(n\). South America (following the removal of Purdiaea to the Clethraceae (Anderberg \& Zhang 2002). References: Godfrey (1988); Anderberg \& Zhang (2002); Thomas (1960)=Y; Kubitzki in Kubitzki (2004). Key adapted from Godfrey (1988).

1 Lateral veins of the leaf blades scarcely or not at all apparent on either surface; flowers in terminal and axillary racemes, the racemes solitary or several at a node, not markedly radiating; fruit \(5-7 \mathrm{~mm}\) long, 2-5 winged Cliftonia
1 Lateral veins of the leaf blades readily apparent on both surfaces, the main laterals neatly pinnate, the smaller veins forming a fine reticulum; flowers in lateral racemes, the racemes clustered together at the summit of the previous year's growth and radiating outwards or reflexed; fruit 2-2.5 mm long, not winged Cyrilla

\section*{Cliftonia Banks ex Gaertner f. (Black Ti-ti, Buckwheat-tree)}

A monotypic genus, shrub or small tree, of se. North America. References: Thomas (1960)=Y; Kubitzki in Kubitzki (2004).

Cliftonia monophylla (Lamarck) Britton ex Sargent, Black Ti-ti, Buckwheat-tree. Cp (GA, SC): acid bogs, swamps, and streambanks; common, rare north of GA (SC Rare). Se. SC south to \(n\). FL, west to se. LA. [= GW, K, S, Y]

A genus of 1-3 (or more) species, trees and shrubs, of tropical and subtropical North America, West Indies, and n. South America. References: Kurz \& Godfrey (1962)=Z; Thomas (1960)=Y; Kubitzki in Kubitzki (2004).

1 Leaves mostly 1-4 cm long, mostly less than 1 cm wide; inflorescences mostly 4-9 cm long; petals < 3 mm long; [mostly of flatwoods ponds, in s. GA southwards) ..................................................................... C. parvifolia
1 Leaves mostly \(5-10 \mathrm{~cm}\) long, mostly more than 1 cm wide; inflorescences mostly more than 10 cm long; petals \(>3 \mathrm{~mm}\) long; [of various wetland habitats, throughout our area and widely distributed beyond]
C. racemiflora

Cyrilla parvifolia Rafinesque, Littleleaf Ti-ti. Cp (GA): flatwood pond margins and along drains through savannas; rare. S. GA south into Panhandle FL. Its taxonomy is problematic; while very distinctive in some places (such as Apalachicola National Forest, FL), apparent intermediates are seen elsewhere. [= K, S, Z; < C. racemiflora - GW, Y]

Cyrilla racemiflora Linnaeus, Ti-ti. Cp (GA, NC, SC, VA), Pd (GA, NC, SC): pocosins, swamps, lake and flatwood pond margins, streambanks, pine flatwoods; common, uncommon in VA, rare in Piedmont. May-July; September-October. Se. VA south to FL, west to TX, and south into the West Indies, Belize, Mexico, and n. South America (Thomas 1960). The leaves are quite variable in shape and size; the venation and glossy smoothness, however, are distinctive once learned. Under various ecological conditions, titi can be anything from a small shrub to a medium tree (or large tree in the West Indies). [= K, S, Z; < C. racemiflora RAB, C, F, G, GW, Y; ? C. racemiflora var. subglobosa Fernald]

\section*{DIAPENSIACEAE (Diapensia Family)}

A family of 5-6 genera and about 13-15 species, subshrubs and perennial herbs, largely arctic and north temperate. References: Scott \& Day (1983)=X; Scott in Kubitzki (2004).

1 Leaves cauline, generally less than 10 cm long and 3 mm wide; [of Coastal Plain pinelands] . . . . . . . . . . . . . . Pyxidanthera
1 Leaves basal (or on a short caudex), generally more than 50 mm long and 30 mm wide; [throughout our area, more common in the Piedmont and Mountains].
2 Leaves orbicular, rounded or with a slight point at the apex, finely serrate (4-8 teeth per cm ), the teeth not prominently mucronate; flowers in racemes; [widespread]

Galax
2 Leaves broadly elliptic, generally emarginate (slightly notched) at the apex, coarsely serrate (1-4 teeth per cm), the teeth prominently mucronate; flowers solitary; [native to humid gorges along the escarpment between the Mountains and Piedmont, sometimes cultivated and becoming established elsewhere]

Shortia

\section*{Galax Sims 1804 (Galax)}

A monotypic genus, a perennial herb, endemic to eastern North America. References: Nesom (1983); Soltis, Bohm, \& Nesom (1983); Scott in Kubitzki (2004).

Galax urceolata (Poiret) Brummitt, Galax. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): mountain forests, rock outcrops, nearly ubiquitous in the Mountains, more restricted in habitat elsewhere, moist to dry slopes in the Piedmont and Coastal Plain, often associated with Kalmia latifolia or Rhododendron maximum; common (uncommon in the Coastal Plain, absent from n . VA). May-July; August-October. The genus consists of this single species, with a range centered in the Southern Appalachians, occurring in NC, SC, GA, AL, e. TN, KY, VA, WV, and MD. Diploid and tetraploid races exist, and both are present in our area (Nesom 1983). In NC, diploids are the predominant race in the Mountains, the s. Piedmont, and the s. and c. Coastal Plain; tetraploids predominate along the Blue Ridge Escarpment, the n. Piedmont, and the n. Coastal Plain. In SC, diploids occur in the Coastal Plain and Piedmont, tetraploids in the mountains and escarpment. In GA, the pattern is similar, with diploids extending further into the Piedmont and tetrploids restricted to the Mountains and upper Piedmont. In AL, only diploids are known. In VA, however, tetraploids occupy the Coastal Plain and e. Piedmont, diploids in the upper Piedmont and Mountains. A study of the flavonoids supported the idea that the tetraploid is an autopolyploid derivative of the diploid. Because of the close morphologic similarity, substantially sympatric distributions, and apparent general absence of demonstrable ecologic differentiation between the two races, it seems best not to attempt to taxonomically distinguish them (Nesom 1983; Soltis, Bohm, \& Nesom 1983). "Galax-pulling" (the gathering of the often bronze-colored evergreen leaves for the florist trade) is an important folk industry in the mountains. [= K, W, X; = G. aphylla Linnaeus -- RAB, C, F, G, S]

\section*{Pyxidanthera Michaux 1803 (Pyxie-moss, Pyxie)}

A genus of 1 species (and 2 varieties), creeping subshrubs, endemic to se. North America. Superficially, Pyxidanthera is reminiscent of the circumboreal, arctic-alpine Diapensia. References: Primack \& Wyatt (1975)=Z; Godt \& Hamrick (1995); Scott in Kubitzki (2004).

1 Leaves (3.3) 4-10 mm long; leaves lanceolate, averaging more than 1.0 mm wide (oblanceolate and up to 2.5 mm wide if etiolated under leaf litter); leaves (in fresh material) herbaceous in texture, less than 0.1 mm thick; leaves of sterile shoots ciliate along the margins at the base, usually also pubescent on the upper surface near the base, but the pubescence rarely extending more than a third of the way from the base to the tip; internodes usually more than 1 mm long
P. barbulata var. barbulata

1 Leaves \(1-5 \mathrm{~mm}\) long (rarely to 7 mm long if etiolated under leaf litter); leaves ovate, averaging less than 1.2 mm wide (lanceolate and up to 1.5 mm wide if etiolated under leaf litter); leaves (in fresh material) succulent in texture, often up to 0.5 mm thick; leaves of sterile shoots lanose to densely pubescent on the upper surface at the base, the pubescence becoming sparser towards the tip of the leaf, but extending past the midpoint of the leaf and often its full length; internodes usually less than 1 mm long
\(P\). barbulata var. brevifolia

Pyxidanthera barbulata Michaux var. barbulata, Common Pyxie-moss, Big Pyxie. Cp (NC, SC, VA): pine savannas, pine flatwoods, pocosin margins, edges of sandhill seepage bogs, primarily in mesic to hydric sites, in wet sands and peaty sands, occasionally extending to submesic sands, but generally with a permanently or seasonally high water table, often with Sphagnum; common (uncommon to rare in the inner Coastal Plain and Sandhills) (SC Rare, VA Rare). March-April; May-June. NY (Long Island) south to \(N J\), and from se. VA south to \(n\). SC. In the Sandhills, where its range overlaps var. brevifolia, var. barbulata is limited to seepage areas or pocosin ecotones, while \(P\). brevifolia occurs in xeric situations upslope. [= RAB; = P. barbulata -- F, G, GW, K, S; < P. barbulata - X, Z]

Pyxidanthera barbulata Michaux var. brevifolia (B.W. Wells) Ahles, Sandhills Pyxie-moss, Wells's Pyxie-moss, Little Pyxie. \(C p\) (NC, SC): on xeric sandhills, generally over deep sand or sand-clay mixtures near the summits or on the upper slopes of sandhills, restricted to the Sandhills region; rare (US Species of Concern, NC Endangered, SC Rare). December-March; FebruaryMay. The variety is endemic to a six-county area of the Sandhills of NC and SC. In NC, it is nearly limited to Fort Bragg, and is puzzlingly absent from seemingly suitable habitat on the Sandhills Game Land to the west. The taxonomic status of this entity has been controversial, with different authors considering it a species, a variety, or an ecotype not worthy of taxonomic status. A combination of morphologic, embryologic, phytogeographic, ecological, and phenologic evidence favors the recognition of two taxa in Pyxidanthera. Recent surveys of Pyxidanthera in the Sandhills of NC have shown that it is ecologically distributed in a strongly bimodal manner. While ecologically intermediate situations predominate in the Sandhills, this habitat is rarely occupied by Pyxidanthera. Instead, Pyxidanthera is usually found either in very dry (hill-top) or moist (pocosin ecotones) situations. Morphologically intermediate populations are occasionally found, in ecologically intermediate situations, but the vast majority of populations are readily assigned to one taxon or the other. The occasional intermediate populations suggest an imperfect evolutionary separation of the two taxa, warranting varietal rather than specific status. Godt \& Hamrick (1995) showed low levels of allozyme differentiation between the two taxa, also suggesting varietal status as the most appropriate taxonomic treatment. [= RAB; \(=P\). brevifolia B.W. Wells -- K, S; < P. barbulata \(-\mathrm{X}, \mathrm{Z}]\)

\section*{Shortia Torrey \& Gray 1842 (Shortia, Oconee Bells)}

A genus of 5-6 species, perennial herbs, of e. Asia and the Southern Appalachians. The Asian species are: S. uniflora (Maximowicz) Maximowicz of montane Japan (with 3 varieties), S. rotundifolia (Maximowicz) Makino of Japan, S. exappendiculata Hayata, of montane Taiwan, S. soldanelloides (Siebold \& Zuccarini) Makino, of montane Japan (with as many as 5 varieties recognized), and S. sinensis Hemsley of montane Yunnan Province, China. References: Davies (1952)=Z; Hatley (1977)=Y; Barnes (1990); Scott in Kubitzki (2004).

1 Style 6-10 (-12) mm long; filaments generally 5-7 mm long; [native of McDowell County, NC] . . Sh. galacifolia var. brevistyla 1 Style (10-) 12-18 mm long; filaments generally 6-9 mm long; [native to Transylvania and Jackson counties, NC, Oconee and Pickens counties, SC, and Rabun County, GA; introduced elsewhere]

Sh. galacifolia var. galacifolia

Shortia galacifolia Torrey \& A. Gray var. brevistyla Davies, Northern Shortia. Mt (NC): on moist slopes, creekbanks, and rock outcrops in humid escarpment gorges with high rainfall, generally in deep shade under Rhododendron maximum, at elevations of \(350-550 \mathrm{~m}\); rare (NC Endangered). March-April; July-August. This variety is known only from McDowell County, NC, where it occurs on several tributaries of the Catawba River and North Fork Catawba River. It has also been reported from the gorge of the Linville River, Burke County, but this locality is questionable and has not been relocated. This area is disjunct about 100 kilometers to the northeast along the Blue Ridge Escarpment from the range of the typic variety. In addition to the characters used in the key, var. brevistyla differs in a variety of characters of the flowers and leaves, as discussed in Davies (1952) and Hatley (1977). Whether the recognition of infraspecific taxa is warranted is not clear; Davies argued for and Hatley against. Though the morphological characters are relatively minor and partially overlapping, their correlation with disjunct ranges and their likely influence on pollination and reproduction influence me to provisionally accept varietal status, pending further research. [= K, Z; < Shortia galacifolia -- RAB, C, G, W, X, Y; < Sherwoodia galacifolia (Torrey \& A. Gray) House -- S]

Shortia galacifolia Torrey \& A. Gray var. galacifolia, Southern Shortia, Oconee Bells. Mt (GA, NC, SC): on moist slopes, creekbanks, and rock outcrops in humid escarpment gorges with high rainfall, generally in deep shade under Rhododendron maximum and Rh. minus, at elevations (in NC) of 350-650m; rare (GA Endangered, NC Endangered, SC Rare). March-April; JulyAugust. This variety occurs in Transylvania and Jackson counties, NC, Oconee and Pickens counties, SC, and Rabun County, GA, where it occurs in the remarkable escarpment gorges region, at elevations from 200-650m (formerly at lower elevations, now submerged under Lake Jocassee). Most of the population of this species, including the type locality, was destroyed in the early 1960's by the construction of Lake Jocassee (Zahner \& Jones 1983). In the gorge tributaries of the Eastatoe, Toxaway, Horsepasture, and Thompson rivers, Shortia can sometimes form a dense groundcover covering acres. Various outlying locations, such as in NC (Swain and Macon counties), VA (Amherst County), and TN (Blount, Monroe, and McMinn counties) are not considered native, and are adventive or the result of persistence after cultivation. The species is prized by gardeners, and survives well outside its natural range. [= K, Z; < Shortia galacifolia -- RAB, C, G, W, X, Y; < Sherwoodia galacifolia (Torrey \& A. Gray) House -- S]

Various segregate families (or reassignments) of taxa traditionally placed in the Caprifoliaceae have been proposed, including the transfer of Sambucus and Viburnum to the Adoxaceae, placement of Diervilla and Weigela in the Diervillaceae (Backlund \& Pyck 1998), placement of Abelia and Linnaea in the Linnaeaceae (Backlund \& Pyck 1998, Pyck et al. 2002), and retention of Lonicera, Symphoricarpos, and Triosteum in a much more narrowly circumscribed Caprifoliaceae. Alternatively, all these taxa could be included in the Caprifoliaceae, along with Dipsacaceae and Valerianaceae, as a very broadly circumscribed Caprifoliaceae. References: Backlund \& Pyck (1998); Pyck et al. (2002); Ferguson (1966a).

\section*{Diervilla P. Miller (Bush-honeysuckle)}

A genus of 3 species, shrubs, of e. North America. References: Hardin (1968)=Z; Ferguson (1966a)=Y.
1 Petioles 5-8 mm long; leaves ciliate on the margins; twig terete in cross-section; [of the Mountains of VA and \(n\). NC, south to Buncombe and McDowell counties, NC]
1 Petioles 0-5 mm long; leaves not ciliate; twig more-or-less square in cross-section; [of the Mountains of SC and s. NC, north to Mitchell and Yancey cos., NC].
2 Branchlets, leaves, pedicels, and calyx densely pubescent; sepal lobes less than 2 mm long . . . . . . . . . . . . . D. rivularis
2 Branchlets, leaves, pedicels, and calyx glabrous, except for hairs on the twig angles; sepal lobes 2-3 mm long
D. sessilifolia

Diervilla lonicera P. Miller, Northern Bush-honeysuckle. Mt (NC, VA): rock outcrops and ridges at high elevations; uncommon. June-July; August-October. Newfoundland west to Saskatchewan, south to w. NC, e. TN, IN, and IA. Reported for GA (GANHP). [= RAB, C, G, K, S, W, Y, Z; > D. lonicera var. lonicera - F; > D. lonicera var. hypomalaca Fernald -- F]

Diervilla rivularis Gattinger, Hairy Southern Bush-honeysuckle. Mt (GA, NC): rock outcrops, ridges, and streambanks at moderate to high elevations; rare (NC Rare). June-August; August-October. W. NC (Yancey County) and e. TN south to nw. GA (Jones \& Coile 1988) and ne. AL. [= K, S, Y, Z; = D. sessilifolia Buckley var. rivularis (Gattinger) Ahles -- RAB, W]

Diervilla sessilifolia Buckley, Smooth Southern Bush-honeysuckle. Mt (GA, NC, SC): rock outcrops, ridges, landslide scars, trail margins, other rocky open places, streambanks, at moderate to high elevations; uncommon. June-August; August-October. Sw. NC and e. TN south to nw. SC, ne. GA, and ne. AL. [=F, K, S, Y, Z; = D. sessilifolia Buckley var. sessilifolia -- RAB, W]

\section*{Weigela Thunberg}

A genus of about 10 species, shrubs, of e. Asia.
Weigela floribunda (Siebold \& Zuccarini) K. Koch, native of Asia, is cultivated and sometimes naturalized, as in e. TN (Chester, Wofford, \& Kral 1998). [= K]

\section*{DIONAEACEAE (Venus Flytrap Family)} (see DROSERACEAE)

\section*{DIPSACACEAE (Teasel Family)}

A family of about 11 genera and 300 species, herbs and shrubs, of Eurasia and Africa.
```

\section*{Dipsacus Linnaeus (Teasel)}

A genus of about 15 species, herbs, of Eurasia. Dipsacus begins flowering about halfway up the head, the flowers then opening sequentially toward both the base and the tip of the inflorescence. References: Ferguson (1965)=Z; Ferguson \& Brizicky (1965); Stace (1997).

1 Principal cauline leaves laciniate-pinnatifid, cut at least halfway to the midrib
D. Iaciniatus

1 Principal cauline leaves entire or toothed.
2 Bracts on the receptacle with straight apical spines, these stiff but flexible; bracts of the involucre curved upwards . . . . .
. D. fullonum
2 Bracts on the receptacle with recurved apical spines, these rigid; bracts of the involucre spreading more or less horizontally
D. sativus
* Dipsacus fullonum Linnaeus, Wild Teasel, Common Teasel. Mt (NC, VA), Pd, Cp (VA): roadsides, pastures, disturbed areas; common (rare in NC and in Coastal Plain of VA), introduced from Europe. July-September; September-October. The inflorescences are frequently collected for crafts and dried arrangements. [=K, W, Z; D. sylvestris Hudson -- RAB, C, G, S; D. fullonum ssp. sylvestris (Hudson) Clapham; D. fullonum ssp. fullonum]
* Dipsacus laciniatus Linnaeus, Cutleaf Teasel. Mt, Pd (VA): disturbed areas; uncommon, introduced from Europe. JulySeptember; September-October. [= C, G, K, Z]
* Dipsacus sativus (Linnaeus) Honckeny, Fuller's Teasel. Mt (VA): disturbed areas; rare, introduced from Europe. JulySeptember; September-October. I am here following Ferguson (1965), Ferguson \& Brizicky (1965), and Stace (1997) in their determination that \(D\). sativus is the correct name to apply to this plant. The occurrence of this species in our area is implied in various sources; I have not seen specimens. The dried inflorescences were used in the past for fulling cloth (raising the nap). [=K, Z; D. fullonum -- C, G, misapplied]

\section*{Knautia Linnaeus}
* Knautia arvensis (Linnaeus) Coulter, Blue Buttons, is naturalized south at least to s. PA (Rhoads \& Klein 1993), MD, and WV (Kartesz 1999). [= K; = Scabiosa arvensis Linnaeus] \{add synonymy\}

\section*{DROSERACEAE (Sundew Family)}

A family of 3 genera (Drosera, Dionaea, Aldrovanda) and about 100 species, nearly cosmopolitan. References: Schnell (2002b); Kubitzki in Kubitzki \& Bayer (2003).

1 Leaves catching insects via "snap-trap" leaves, with stiff marginal hairs; stamens 10-20; inflorescence cymosa; [endemic to the Coastal Plain of se. NC and ne. SC] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Dionaea
1 Leaves catching insects via "flypaper" leaves, with gland-tipped hairs; stamens 5 ; inflorescence racemose; [collectively widespread in our area]

Drosera

Dionaea Ellis 1768 (Venus Flytrap, Meadow Clam)
This monotypic genus is endemic to the Coastal Plain of NC and SC; it has been introduced in various places, including panhandle FL, Yancey County in the mountains of NC, and s. NJ, where it persists and spreads to varying degrees (Evert 1957). References: Roberts \& Oosting (1958); Wood (1960); Schnell (2002b)=Z.

Dionaea muscipula Ellis, Venus Flytrap, Meadow Clam, Tippitiwitchet. Cp (NC, SC): wet savannas, sandhill seepages; rare (US Species of Concern, NC Rare/Special Concern, SC Rare). The shiny black seeds are exposed at the maturity and dehiscence of the capsule. Perhaps the most remarkable species in our flora, Dionaea has become increasingly rare and now receives some protection as a NC Special Concern species and a Convention on International Trade in Endangered Species "Appendix 2" species. Although collection and trade as a novelty item have contributed to the decline of Dionaea, its more fundamental problem is that faced by the great majority of Coastal Plain species in our area -- destruction of habitat and fire suppression. In the fall-line Sandhills, Dionaea is now restricted to a very few sites on Fort Bragg; in the central Coastal Plain, it is also nearly extirpated. Substantial populations remain only in the Outer Coastal Plain, primarily in Brunswick, Pender, and Onslow counties. Ellis's Latin phrase describing the plant to Linnaeus (quoted in Croom 1837) is worth repeating for its succinctness: "Miraculum naturae! -- folia biloba, radicalia, ciliata, sensibilia, conduplicanda, insecta incarcerantia." The colonial governor of North Carolina, Arthur Dobbs, wrote in 1759, "we have a kind of Catch Fly Sensitive which closes upon anything that touches it." Gibson (1991) shows that trap size and prey size are correlated; trap leaves of Dionaea primarily capture insects about 5 mm smaller than the length of the trap. [= RAB, GW, K, S, Z]

\section*{Drosera Linnaeus 1753 (Sundew)}

A genus of about 100 species, herbs, nearly cosmopolitan. References: Wood (1960)=Z; Shinners (1962)=Y; Wynne (1944)=X; Schnell (2002b)=Q; Schnell \((1976,1995)\).

1 Leaves filiform, the expanded leaf bases forming a corm-like base.
2 Petals \(7-10(12) \mathrm{mm}\) long; leaves \(8-25(-30) \mathrm{cm}\) long, less than 1 mm wide; glandular hairs on the leaves red to purple, drying dark brown; scape \(6-26 \mathrm{~cm}\) long
2 Petals 12-17 (-20) mm long; leaves \(30-50 \mathrm{~cm}\) long, more than 1 mm wide; glandular hairs on the leaves pale green, drying pale greenish brown; scape \(25-60 \mathrm{~cm}\) long
D. tracyi

1 Leaves spatulate or suborbicular, the leaf bases not expanded.
3 Scapes stipitate-glandular; basal rosettes \(0.8-3.5 \mathrm{~cm}\) in diameter; stipules absent or obsolete (consisting of a few hair-like segments); seeds black, crateriform
D. brevifolia

3 Scapes glabrous; basal rosettes (2-) 3-12 cm in diameter; stipules present, fimbriate; seeds light brown and longitudinally striate, or reddish brown to black and densely papillose, or brown and coarsely corrugated into 14-16 longitudinal ridges.
4 Leaf blades wider than long, suborbicular or reniform; seeds about \(6 \times\) as long as wide; [primarily of the Mountains, rarely disjunct eastwards] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . D. rotundifolia var. rotundifolia 4 Leaf blades about as wide as long, spatulate to obovate; seeds \(1-2 \times\) as long as broad; [primarily of the Coastal Plain, rarely disjunct westwards].
5 Petioles glabrous; petals white; plants usually with a leafy stem 1-10 cm long; scape arching at base; seeds reddish brown to black and densely papillose . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . D. intermedia 5 Petioles with few to many long trichomes; petals pink (sometimes fading to white); plants scapose; scapes

Drosera brevifolia Pursh, Dwarf Sundew. Cp (GA, NC, SC, VA), Pd (GA, NC), Mt (GA, SC): pine savannas, other wet sandy sites, rarely in seepage over rock outcrops; common (rare in lower Piedmont only and Mountains) (VA Watch List). April-May. The species ranges from se. VA south to FL and west to AR, OK, and TX; disjunct in sc. TN. D. leucantha may be the correct name for this taxon; see Shinners (1962) and Wood (1966) for a contentious discussion of nomenclatural issues. [=C, F, GW, G, K, Q, S, X, Z; = D. leucantha Shinners -- RAB, Y]

Drosera capillaris Poiret, Pink Sundew. Cp (GA, NC, SC, VA), Pd (NC, SC, VA): pine savannas, other wet sandy or peaty sites; common (rare in Piedmont) (VA Watch List). May-August. Se. VA south to FL and west to TX, rarely inland, as in TN; also extending into tropical America, in the West Indies, Mexico, and n. South America. [= RAB, C, F, G, GW, K, Q, S, W, X, Y, Z]

Drosera filiformis Rafinesque, Threadleaf Sundew. Cp (NC): margins of natural pools in pinelands, especially clay-based Carolina bays; rare (NC Rare). June; August. E. MA south to se. NC; disjunct in the FL panhandle (Bay and Washington counties) and in sw. Nova Scotia (Sorrie 1998a). Sorrie (1998a) has clarified the taxonomy and phytogeography of D. filiformis and D. tracyi. See comments about \(D\). tracyi below. [ \(=\mathrm{GW}, \mathrm{K}, \mathrm{Y} ;<\mathrm{D}\). filiformis -- RAB, C, G (see also \(D\). tracyi); \(D\). filiformis var. filiformis -- \(\mathrm{F}, \mathrm{Q}\), X, Z; D. tracyi Macfarlane in L.H. Bailey -- S (see also D. filiformis)]

Drosera intermedia Hayne, Water Sundew, Spoonleaf Sundew. Cp (GA, NC, SC, VA), Pd (NC, SC): savannas, ditches, pocosins, margins of pools or streams, often in standing water; common (rare in Piedmont and n. of NC) (VA Watch List). JulySeptember. D. intermedia is circumboreal, in North America ranging from Newfoundland and MN south to FL and TX, and into tropical America. [= RAB, C, F, G, GW, K, S, Q, W, X, Y, Z]

Drosera rotundifolia Linnaeus var. rotundifolia, Roundleaf Sundew. Mt (GA, NC, SC, VA), Cp (NC, VA), Pd (VA): mountain bogs and fens, seepages slopes, vertical seepages on rock (in the mountains) or clay (as along the Little River in the Sandhills of NC); uncommon (GA Special Concern). A circumboreal species ranging south in North America to SC, ne. GA, e. and nc. TN, IL, and CA. Var. comosa Fernald is restricted to e. Canada, New England, and n. NY. [=F, K; < D. rotundifolia -- RAB, C, G, GW, S, Q, W, X, Y, Z]

Drosera tracyi MacFarlane in Bailey, Tracy's Sundew. Cp (GA): savannas; rare (GA Special Concern). Sc. GA and panhandle FL, west to e. LA; it has been reported for SC by various authors, including Wynne (1944), but the basis for these reports is unknown. The notion that this species is not distinguishable from D. filiformis (or is only varietally distinct) is erroneous (Sorrie 1998a). See Schnell (1995) for a contrary view. [= GW, K, Y; D. filiformis Rafinesque var. tracyi (MacFarlane in Bailey) Diels - Q]

\section*{EBENACEAE (Ebony Family)}

A family of 2 genera and 500-600 species, trees and shrubs, distributed in tropical and subtropical (rarely warm temperate) regions. References: Wallnöfer in Kubitzki (2004).

\section*{Diospyros Linnaeus 1753 (Persimmon)}

A genus of 500-600 species, trees and shrubs, of tropical and subtropical regions (with very few exceptions). The genus includes a variety of tropical trees called ebony in the wood trade. References: Spongberg (1977)=Z; Wallnöfer in Kubitzki (2004).

Identification notes: Seedlings and fire sprouts are superficially very similar to Nyssa sylvatica, but can be separated in the following ways: bundle scar 1 per bud scar, narrowly crescent-shaped (vs. Nyssa with 3 distinct, circular, bundle scars arranged in a broad \(V\) pattern), leaves never with teeth (vs. Nyssa leaves sometimes with a few irregular teeth), leaves glabrate to tomentose with curly hairs (vs. glabrous or with a few straight, forward-pointing hairs), leaves with sessile to short-stipitate glands on upper surface of midrib and outer petiole, later becoming necrotic spots (vs. leaves without glands).

1 Twigs stout, reddish-pubescent; fruits to 7.5 cm in diameter; [cultivated alien] \(\qquad\)
1 Twigs slender, glabrous or with gray pubescence; fruits to 4 cm in diameter; [native]
D. virginiana

Diospyros virginiana Linnaeus, American Persimmon. Pd, Cp, Mt (GA, NC, SC, VA): dry woods, sandhills, disturbed places, floodplain and mesic forests, fencerows; common. May-June; September-December (and persisting). CT, PA, OH, IN, IL, MO, and e. KS south to FL and TX. East of the Mississippi River, D. virginiana var. virginiana has leaves cuneate to rounded at the base, and glabrous or glabrescent; mostly west of the Mississippi River and perhaps eastwards along the Coastal Plain, D. virginiana var. pubescens (Pursh) Dippel has leaves subcordate, and persistently pubescent. Though these differences seem relatively trivial, they are consistent, geographically correlated, and may be worthy of varietal recognition. Persimmons are famous for their sweet and edible fruits, and infamous for the bitter-astringency of the not fully ripe fruit. The species is dioecious, the male trees appear to reach a greater size than the females. The wood is one of the heaviest and hardest in e. North America. [= RAB, GW, K, W; > D. virginiana var. virginiana - \(\mathrm{C}, \mathrm{F}, \mathrm{G}, \mathrm{Z}\); \(>\mathrm{D}\). virginiana \(-\mathrm{S} ;>\mathrm{D}\). mosieri Small -- S ]
* Diospyros kaki Linnaeus f., Kaki, Kaki-plum, Japanese Persimmon, is rarely grown in our area for its fruits, which are much larger than D. virginiana (to 9 cm in diameter). [= Z]

\section*{ELAEAGNACEAE (Oleaster Family)}

A family of 3 genera and 30-50 species, shrubs, small trees, and lianas, of temperate Eurasia and North America, and tropical Asia and Australia. References: Bartish \& Swenson in Kubitzki (2004).

\section*{Elaeagnus Linnaeus 1753 (Silverberry, Oleaster, Russian-olive)}

A genus of 20-45 species, shrubs and small trees, of Asia (mostly) and North America. References: Bartish \& Swenson in Kubitzki (2004).

E. umbellata var. parvifolia
* Elaeagnus angustifolia Linnaeus, Russian Olive, Oleaster. Pd (NC, VA), Mt, Cp (VA): disturbed areas; uncommon, introduced from Eurasia. June-July. [= C, F, G, K]
* Elaeagnus multiflora Thunberg. Mt (NC, VA): disturbed areas; rare, introduced from Japan and China. April. First reported for NC by Leonard (1971b). [= C, F, G, K; E. multiflorus -- S]
* Elaeagnus pungens Thunberg, Autumn Silverberry. Pd (GA, NC, SC, VA), Cp (NC, SC, VA): forests and woodlands in suburban areas, spread by birds; uncommon, introduced from Japan. October-November; March-April. [= RAB, K]
* Elaeagnus umbellata Thunberg var. parvifolia (Royle) Schneider, Spring Silverberry. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): forests and woodlands, spread by birds; common, introduced from Japan and China. April-May; August-September. This species is becoming a noxious weed shrub, still unfortunately sometimes promoted for "wildlife plantings." [=K; < . umbellata -RAB, C, F, G, W; E. umbellatus -- S]

\section*{ELATINACEAE (Waterwort Family)}

A family of 2 genera and about 35 species, herbs. References: Tucker (1986).
Elatine Linnaeus (Waterwort)
1 Seeds mostly straight, the areoles elliptic, the rounded ends not dovetailing into adjacent rows, the longitudinal ridges thus appearing straight and distinct; seeds basal-axile, extending lengthwise through the capsule, not overlapping; leaves 1-5 mm long; flowers mostly 2 -merous . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . E. minima
1 Seeds mostly curved, the areoles 6 -sided, the angular ends dovetailing into the adjacent rows, the longitudinal ridges thus appearing broken or irregular; seeds axile, attached along an elevated placenta at different levels, therefore overlapping; leaves 3-8 (-10) mm long; flowers mostly 3 -merous.
2 Leaves obovate to broadly spatulate, rounded at the the tip, 3-8 mm long, the larger 1.5-5 mm wide; seeds with 20-30 pits in each row .
E. americana

2 Leaves linear-lanceolate to narrowly spatulate, emarginate to truncate to rounded at the tip, 1-15 mm long, the larger 0.5-3 mm wide.
3 Leaves 1.5-4 mm long, 0.7-1.8 mm wide; seeds with \(9-15\) pits per row . . . . . . . . . . . . . . . . . . . . E. brachysperma
3 Leaves \(2.8-15 \mathrm{~mm}\) long, \(0.5-3 \mathrm{~mm}\) wide; seeds with \(16-25\) pits per row . . . . . . . . . . . . . . . . . . . . . E. rubella
Elatine americana (Pursh) Arnott, American Waterwort. Cp (VA), Mt (NC, SC): tidal flats, lakes; rare (NC Watch List, VA Watch List). July-October. Widespread in ne. United States, s. to NC and MO. The only known site for this species in NC is an artificial lake; it is uncertain whether it should be considered native or introduced. [=F,K, S; E. triandra Schkuhr -- RAB, W (broadly interpreted to include E. americana); E. triandra var. americana (Pursh) Fassett -- C, G, GW]

Elatine brachysperma A. Gray, Shortseed Waterwort. Pd (GA): \{habitat not known\}; rare. It has been reported for nc. GA (Jones \& Coile 1988). [= F, K; E. triandra Schkuhr var. brachysperma (A. Gray) Fassett -- C, G]

Elatine minima (Nuttall) Fischer \& C.A. Meyer, Tiny Waterwort. Cp (VA), Pd (NC, SC): tidal flats, lakes; rare (NC Watch List, VA Rare). July-October. First found in NC in 1990, E. minima is widespread in ne. United States, south to VA, NC, and SC (Horn, pers. comm. 2004). The only known site for this species in NC is the spillway of an artificial lake (Lake Butner, Granville County); it is uncertain whether it should be considered native or exotic in NC. It may have been introduced by waterfowl or humans. [=C, F, G, K]

Elatine rubella Rydberg, Red Waterwort. Pd (SC): ponds; rare. This species occurs in AL (Fayette County) as well as north of our area (Haynes 1998). Hill \& Horn (1997) reported E. triandra for SC, but the specimen is E. rubella Rydberg (Horn, pers. comm. 2004). [= K; E. triandra Schkuhr - F, misapplied; E. triandra var. triandra -- C, G, misapplied]

\section*{ERICACEAE (Heath Family)}

A family of about 107-124 genera and 3400-4100 species, primarily shrubs, small trees, and subshrubs, nearly cosmopolitan. The

Ericaceae is very important in our area, with a great diversity of genera and species, many of them rather narrowly endemic. Our area is one of the north temperate centers of diversity for the Ericaceae. Along with Quercus and Pinus, various members of this family are dominant in much of our landscape. References: Kron et al. (2002); Wood (1961); Judd \& Kron (1993); Kron \& Chase (1993); Luteyn et al. (1996)=L; Dorr \& Barrie (1993); Cullings \& Hileman (1997); Stevens et al. in Kubitzki (2004)

\section*{Main Key, for use with flowering or fruiting material}

1 Plant an herb, subshrub, or sprawling shrub, not clonal by underground rhizomes (except Gaultheria procumbens and Epigaea repens), rarely more than 3 dm tall; plants mycotrophic or hemi-mycotrophic (except Epigaea, Gaultheria, and Arctostaphylos).
2 Plants without chlorophyll (fully mycotrophic); stems fleshy; leaves represented by bract-like scales, white or variously colored, but not green; pollen grains single; [subfamily Monotropoideae; tribe Monotropeae].
3 Petals united; fruit nodding, a berry; flower and fruit several per stem . . . . . . . . . . . . . . . . . . . . . . . . Monotropsis
3 Petals separate; fruit erect, a capsule; flower and fruit 1-several per stem.
4 Flowers few to many, racemose; stem pubescent, at least in the inflorescence; plant yellow, orange, or red when fresh, aging or drying dark brown

Hypopitys
4 Flower solitary; stem glabrous; plant white (rarely pink) when fresh, aging or drying black . . . . . . . Monotropa
2 Plants with chlorophyll (hemi-mycotrophic or autotrophic); stems woody; leaves present and well-developed, green; pollen grains in tetrads (single in Orthilia).
4 Herb with a rosette of ascending basal leaves; flowers scapose; [subfamily Monotropoideae; tribe Pyroleae].
5 Style and filaments straight; filaments straight, the anthers closely surrounding the style; inflorescence distinctly secund (1-sided) . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Orthilia
5 Style and filaments strongly declined; filaments curved, the anthers not closely surrounding the style; inflorescence slightly or not at all secund (1-sided)

Pyrola
4 Subshrub or sprawling shrub with cauline leaves; flowers axillary (except scapose in Chimaphila).
6 Plant erect, the leaves clustered near the apex of the single stem.
7 Leaves lanceolate or oblanceolate, normally \(2-4 \times\) as long as wide (sometimes proportionately less narrow in stunted individuals; fruit a capsule, borne 1 -several on an erect scape above the leaves [subfamily Monotropoideae; tribe Pyroleae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Chimaphia
7 Leaves obovate, 1-2× as long as wide; fruit a red berry, borne on nodding axillary pedicels beneath the leaves; [subfamily Vaccinioideae; tribe Gaultherieae] . .

Gaultheria
\(6 \quad\) Plant creeping or sprawling, leaves scattered along the stems.
8 Flowers solitary and axillary; fruit a white berry; [subfamily Vaccinioideae; tribe Gaultherieae]. Gaultheria
8 Flowers in axillary or terminal spikes or racemes; fruit a fleshy loculicidal capsule or red drupe.
9 Leaves glabrous, 1-3 cm long, tapered to the base; corolla urceolate; calyx not subtended by large bracts; [subfamily Arbutoideae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Arctostaphylos 9 Leaves pilose (glabrate in age), 2-10 cm long, rounded or subcordate at the base; corolla salverform, the lobes spreading; calyx subtended by 2 large bracts; [subfamily Ericoideae; tribe Phyllodoceae] . .

1 Plant a shrub, more than 3 dm tall, or 1-3 dm tall and definitely and obviously clonal by underground rhizomes; plants not mycotrophic or hemi-mycotrophic.
10 Leaves ca. 1 mm wide, \(8-12 \mathrm{~mm}\) long, appearing opposite, alternate, or whorled (the internodes very short, thus the leaves generally appearing whorled); petals absent; fruit a subglobose, 2-stoned drupe, 2-3 mm in diameter; branches often appearing in whorls of 3-7; [subfamily Ericoideae; tribe Empetreae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Ceratiola
10 Leaves either more than 2 mm wide or less than 5 mm long, mostly alternate or whorled; petals present; fruit not as above, mostly either a capsule or 10-or many-seeded berry; branches appearing alternate or whorled; subfamily Vaccinioideae; tribe Vaccinieae].
11 Ovary inferior; fruit indehiscent, a fleshy berry.
12Ovary 10 locular; seeds 10; leaves glandular-punctate, at least on the lower surface (except G. brachycera)....
12 Ovary \(4-5\)........................................................................... . . . Gaylussacia 11 Ovary superior; fruit dehiscent, a dry capsule.

13 Petals separate; fruit 2-7-locular; either a shrub to 1 m tall with ovate to oblong, evergreen leaves, 0.6-1.2 cm long, or a shrub to small tree 2-6 (-9) m tall with elliptic, deciduous leaves, \(4-12 \mathrm{~cm}\) long, or a shrub 1-2.5 m tall, with elliptic to ovate, evergreen leaves \(2-4 \mathrm{~cm}\) Iong; [subfamily Ericoideae].
14 Fruit 2-3 (5)-locular; shrub to 1 m tall; leaves, 0.4-1.2 cm long; petals 2-4 mm long; [subfamily Ericoideae; tribe Phyllodoceae]
14 Fruit 4-7-locular; shrub to small tree 1-6 (-9) m tall; leaves \(2-12 \mathrm{~cm}\) long; petals \(12-30 \mathrm{~mm}\) long.
15 Fruit 7-locular; leaves evergreen 2-4 cm long; petals 20-30 mm long; shrub 1-2.5 m tall; [subfamily Ericoideae; tribe Bejarieae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Bejaria
15 Fruit 4-5-locular; leaves deciduous, 4-12 cm long; petals 12-14 mm long; shrub to small tree 2-6 (-9) m tall; [subfamily Ericoideae; tribe Phyllodoceae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Elliottia
13 Petals fused for part or all their lengths; fruit (4-) 5-locular; shrub or tree with leaves of various shape, evergreen or deciduous, these either less than 6 mm long, linear and whorled, or longer than 12 mm .
16 Leaves whorled, less than 5 mm long, linear; [subfamily Ericoideae, tribe Ericeae] Erica 16 Leaves alternate or whorled, more than 20 mm long.

17 Flowers 4-merous; fruits 4-locular; leaves with a series of fascicles of trichomes on the midrib below; [subfamily Ericoideae; tribe Rhodoreae]

Menziesia

17 Flowers 5-merous; fruits 5-locular; leaves not as above.
18 Leaves coriaceous, evergreen, shiny and dark green above.
19 Leaves sharply and distinctly serrate.
20 Pedicels slender, \(7-10 \mathrm{~mm}\) long; filaments strongly curved just below the anthers; pith transversely diaphragmed; [subfamily Vaccinioideae; tribe Lyonieae] ....... Agarista
20 Pedicels stout, 2-6 mm long; filaments straight; pith solid; [subfamily Vaccinioideae;
tribe Gaultherieae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Leucothoe
19 Leaves entire, or obscurely and finely crenulate-serrulate.
21 Capsules elongate, more than \(2 \times\) as long as broad, \(8-18 \mathrm{~mm}\) long; [subfamily Ericoideae; tribe Rhodoreae] Rhododendron
21 Capsules ovoid to globose or subglobose, about as long as broad, 5-8 mm long.
22 Leaves with a prominent vein running parallel to (and about 1 mm in from) the
margin; [subfamily Vaccinioideae; tribe Lyonieae] . . . . . . . . . . . . . . . . . Lyonia
22 Leaves without a prominent marginal vein.
23 Corolla saucer-shaped, 20-30 mm across; leaves entire; [subfamily Ericoideae; tribe Phyllodoceae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . Kalmia
23 Corolla narrowly urceolate, 4-6 mm across; leaves finely crenulate-serrulate; [subfamily Vaccinioideae; tribe Lyonieae] . . . . . . . . . . . . . . . . . . . . . Pieris
18 Leaves membranaceous or subcoriaceous, deciduous or evergreen, if subcoriaceous and evergreen, then not shiny and dark green above.
24 Capsules elongate, more than \(2 \times\) as long as broad, \(7-23 \mathrm{~mm}\) long; [subfamily Ericoideae; tribe Rhodoreae] Rhododendron
24 Capsules ovoid to globose or subglobose, about as long as broad, or broader than long, 2-7 mm long.
25 Leaves less than 2.5 cm wide.
26 Leaves linear to narrowly lanceolate, \(8 \times\) or more as long as wide. strongly revolute, strongly whitened beneath; [subfamily Vaccinioideae; tribe Andromedeae]
[Andromeda]
26 Leaves broader, not revolute or slightly so, not strongly whitened below.
27 Leaves whorled or alternate; corolla saucer-shaped, \(10-20 \mathrm{~mm}\) across; [subfamily Ericoideae; tribe Phyllodoceae] \(\qquad\) Kalmia 27 Leaves alternate; corolla narrowly urceolate, 2-8 mm across. 28Pedicels with 2 bracteoles near the summit; [subfamily Vaccinioideae; tribe Gaultherieae] . \(\qquad\) Chamaedaphne 28Pedicels with 2 bracteoles near the base; [subfamily Vaccinioideae; [tribe Lyonieae]

Lyonia
25 Leaves (at least the larger) more than 2.5 cm wide. 29 Pedicels with 2 bracteoles.

30 Capsule broader than long; shrub; bracteoles just below the calyx; [subfamily Vaccinioideae; tribe Gaultherieae]

Eubotrys
30 Capsule longer than broad; tree; bracteoles generally near the middle of the pedicel; [subfamily Vaccinioideae; tribe Oxydendreae] . . . . . Oxydendrum
29 Pedicels without bracteoles.
31 Leaves entire to minutely serrulate; capsule sutures pale and thickened; [subfamily Vaccinioideae; tribe Lyonieae]

Lyonia
31 Leaves crenate; capsule sutures not thickened and pale; [subfamily Vaccinioideae; tribe Andromedeae]

Zenobia

Key to Ericaceae (including some relatives), emphasizing vegetative characters
This key includes some related shrubs, of the Diapensiaceae, Clethraceae, and Cyrillaceae
1 Leaves and stems lacking chlorophyll (either white or variously tinted with colors such as pink, tan, red, or violet) . . . . . Key A
1 Leaves and stems with chlorophyll (green, though some parts may have the green pigment obscured with purple or other colors).
2 Leaves membranaceous or subcoriaceous, deciduous or tardily deciduous, usually not particularly glossy (except in new foliage of some species) Key B
2 Leaves coriaceous, more or less stiff, evergreen, usually glossy and often dark green.
3 Subshrub or sprawling shrub, 0-1 (-2) dm tall, not clonal by underground rhizomes (except Gaultheria procumbens), though often clonal by creeping stems, or sprawling and patch-forming (many of these species are only ambiguously shrublike and are considered herbs by the casual observer); leaves evergreen

Key C
3 Shrub, more than 3 dm tall, or 1-3 dm tall and definitely and obviously clonal by underground rhizomes; leaves evergreen or deciduous \(\qquad\)

\section*{Key A -- Achlorophyllose plants}

1 Flower solitary; stem glabrous; plant white (rarely pink) when fresh, aging or drying black . . . . . . . . . . . . Monotropa uniflora

1 Flowers few to many, racemose; stem glabrous (Monotropsis) or pubescent, at least in the inflorescence (Hypopitys); plant yellow, orange, or red when fresh, aging or drying dark brown.

Key B -- Deciduous ericaceous shrubs and trees
Gaylussacia spp.
Vaccinium spp
Elliottia racemosa
Menziesia pilosa
Rhododendron spp.
Kalmia cuneata
Chamaedaphne calyculata
Lyonia mariana
Lyonia ligustrina var. ligustrina
Lyonia ligustrina var. foliosiflora
Eubotrys racemosa
Eubotrys recurva
Oxydendrum arboreum
Zenobia pulverulenta
Clethra acuminata
Clethra alnifolia
Cyrilla racemiflora

\section*{Key C -- Evergreen subshrubs and sprawling shrubs}

1 Plant erect, the leaves few (less than 10), clustered near the apex of the single stem.
2 Leaves obovate, \(1-2 \times\) as long as wide; fruit a red berry, borne on nodding axillary pedicels beneath the leaves

2 Leaves lanceolate or oblanceolate, normally \(2-4 \times\) as long as wide (sometimes proportionately less narrow in stunted individuals; fruit a capsule, borne 1-several on an erect scape above the leaves.
3 Leaves lanceolate (broadest below the middle), base rounded, striped with white or paler green along the major veins

Chimaphila maculata
3 Leaves oblanceolate (broadest above the middle), base cuneate, solid dark green throughout \(\qquad\)
Chimaphila umbellata ssp. cisatlantica
1 Plant creeping or sprawling, leaves scattered along the stems, or tufted at the base.
4 Leaves 2-15 cm wide; leaves (2-) 3.5-15 cm long, rounded or subcordate at the base.
5 Leaves dull green, with a pebbled texture, pilose (glabrate in age).
Epigaea repens
5 Leaves bright shiny green (or prrple), with a smooth texture, glabrous.
6 Leaves orbicular, rounded or with a slight point at the apex, finely serrate (4-8 teeth per cm), the teeth not prominently mucronate; flowers in racemes; [widespread in distribution] . Galax urceolata [DIAPENSIACEAE]
\(6 \quad\) Leaves broadly elliptic, generally emarginate (slightly notched) at the apex, coarsely serrate (1-4 teeth per cm), the teeth prominently mucronate; flowers solitary; [native to humid gorges along the escarpment between the Mountains and Piedmont, sometimes cultivated and becoming established elsewhere]

Shortia galacifolia [DIAPENSIACEAE]
4 Leaves 0-1.5 cm wide; leaves 0.5-3 cm long, cuneate at the base (at least widely so), glabrous (or bristly beneath in Gaultheria hispidula).
7 Leaves linear, less than 2 mm wide.
8 Leaves (3.3) 4-10 mm long; leaves lanceolate, averaging more than 1.0 mm wide (oblanceolate and up to 2.5 mm wide if etiolated under leaf litter); leaves (in fresh material) herbaceous in texture, less than 0.1 mm thick; leaves of sterile shoots ciliate along the margins at the base, usually also pubescent on the upper surface near the base, but the pubescence rarely extending more than a third of the way from the base to the tip; internodes usually more than 1 mm long . ............... Pyxidanthera barbulata var. barbulata [DIAPENSIACEAE]
8 Leaves \(1-5 \mathrm{~mm}\) long (rarely to 7 mm long if etiolated under leaf litter); leaves ovate, averaging less than 1.2 mm wide (lanceolate and up to 1.5 mm wide if etiolated under leaf litter); leaves (in fresh material) succulent in texture, often up to 0.5 mm thick; leaves of sterile shoots lanose to densely pubescent on the upper surface at the base, the pubescence becoming sparser towards the tip of the leaf, but extending past the midpoint of the leaf and often its full length; internodes usually less than 1 mm

7 Leaves broader, more than 2 mm wide
9 Leaves serrate or serrulate (sometimes inconspicuously so); [of pinelands of the Coastal Plain and (very rarely) lower Piedmont of se. VA southwards].
10 Leaves (2-) 3-18 (-25) mm long, generally elliptic (less commonly ovate or obovate); angle of leaf base typically \(>90\) degrees; margins finely glandular mucronulate-crenulate, the teeth tightly appressed and therefore often obscure, the margin superficially entire; stems mostly prostrate (ascending in areas that
have been long fire-suppressed); [widespread in NC and SC, rare in se. VA and e. GA] Vaccinium crassifolium
10 Leaves (4-) 7-35 (-63) mm long, elliptic to obovate (less commonly elliptic-ovate); angle of leaf base typically <90 degrees; margins glandular mucronulate-serrulate to serrulate-crenulate, the teeth apparent, especially towards the apex; stems often ascending to upright; [of Lexington County, SC]

Vaccinium sempervirens
9 Leaves entire; [of the Mountains of VA northwards, except Vaccinium macrocarpon of bogs, as far south as se. sc. and sw. NC].
11 Leaves \(10-30 \mathrm{~mm}\) long; leaves oblanceolate to obovate, the widest point past the middle; primary stems 13 mm in diameter; [of relatively dry, rocky habitats]

Arctostaphylos uva-ursi
11 Leaves (3-) 5-10 (-18) mm long; leaves ovate or elliptic, the widest point belowor at the middle; primary stems delicate; [of moist to distinctly boggy habitats].
12 Leaf undersurface green, sparsely bristly; [of moist habitats]
[Gaultheria hispidula]
12 Leaf undersurface whitened, glabrous; [of saturated wetlands].
13 Leaves elliptic, broadest near middle, (5-) 7-10 (-18) mm long, (2-) 3-4 (-5) mm wide; leaves blunt-rounded and non-involute; pedicels with 2 green, leaf-like bracts 1-2 mm wide; berry \(8-15\) mm in diameter Vaccinium macrocarpon
13 Leaves ovate, broadest towards base, (3-) 5-6 (-9) mm long, (1-) 2-3 (-5) mm wide; leaves involute at least along the margins, thus making the leaf tip acute; pedicels with (0-) \(2(-5)\) reddish, scale-like bracts less than 1 mm wide; berry 6-12 mm in diameter
[Vaccinium oxycoccos]

\section*{Key D -- Evergreen ericaeous shrubs (either tall or obviously clonal) and trees}

1 Leaves linear, needle-like, appearing whorled (at least in part, sometimes also with nodes appearing opposite or alternate). 2 Leaves glabrous; leaves \(5-15 \mathrm{~mm}\) long; [native] Ceratiola ericoides
2 Leaves densely puberulent and ciliate with gland-tipped hairs; leaves \(1.5-5 \mathrm{~mm}\) long; [exotic, rarely naturalized]
Erica tetralix
1 Leaves broader, alternate (or whorled or opposite in Kalmia).
3 Leaves (all of them) less than 2 cm long.
4 [Either of the Mountains, the Piedmont, or the Coastal Plain of ne. SC and se. NC].
5 Leaves alternate, glabrous, finely serrulate . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Gaylussacia brachycera
5 Leaves alternate or opposite, stipitate-glandular or glabrous, entire, or with a few obscure teeth
Kalmia buxifolia
4 [Of the Coastal Plain, from se. SC southwards].
6 Twigs densely hispid; leaves hispid on both surfaces
. Kalmia hirsuta
6 Twigs glabrous to puberulent; leaves glabrous or with scattered inconspicuous hairs.
7 Plant glaucous and bluish-green throughout; leaf undersurface lacking scattered glandular hairs; [of s. GA south to s. peninsular FL, west to e. TX]

Vaccinium darrowii
7 Plant dark green throughout, generally exceeding 20 mm in length; leaf undersurface with scattered glandular hairs, these sometimes very few by late in the season (best seen in the field by folding a leaf, holding the fold up to the light, and using a \(10 \times\) lens); [of se. SC southwards to n. FL, west to s. AL] .....

Vaccinium myrsinites
3 Leaves (at least the larger) more than 3 cm long.
8 Leaves toothed, at least towards the tip of the leaf (note that fine serrations or crenations can be obscured by revolute margins).
9 Leaves elliptic to oblanceolate, widest near or above the middle, obtuse, acute, or short-acuminate, 1.5-7 cm long, \(0.5-2.5 \mathrm{~cm}\) wide; leaf serrations fine and obscure; leaf surfaces with small stipitate glands (Pieris) or lepidote with scales (Chamaedaphne).
10 Leaves lepidote with scales; leaves oblanceolate, widest above the middle . . Chamaedaphne calyculata 10 Leaves with small stipitate glands, otherwise appearing glabrous; leaves elliptic, widest near the middle. 11 Inflorescence a many-flowered panicle of racemes, borne terminally; seeds \(2.5-3 \mathrm{~mm}\) long; [of slopes and ridges of the Mountains and upper Piedmont] Pieris floribunda 11 Inflorescence a 3-9 flowered raceme, borne in the axils of upper leaves; seeds ca. 1 mm long; [of wetlands of the Coastal Plain, often associated with Taxodium ascendens] . . . . Pieris phillyreifolia
9 Leaves lanceolate or ovate, widest below the middle, short acuminate to short acuminate, 4-15 cm long, 1-5 cm wide; leaf serrations generally obvious (at least towards the acuminate leaf tip); leaf surfaces glabrous, or with non-stipitate hairs on the lower surface.
12 Pith transversely diaphragmed; [pedicels slender, 7-10 mm long]; [filaments strongly curved just below the anthers]

Agarista populifolia
12 Pith solid; [pedicels stout, 2-6 mm long]; [filaments straight].
13 Leaves with an acute or short-acuminate apex; racemes 2-4 (5) cm long; sepals ovate, with an obtuse or rounded apex; longest petioles \(3-8 \mathrm{~mm}\) long

Leucothoe axillaris
13 Leaves with a long-acuminate apex; racemes \(4-10 \mathrm{~cm}\) long; sepals lanceolate-ovate, with an acute (or subacute) apex; longest petioles 8-15 mm long . . . . . . . . . . . . . . . . . . Leucothoe fontanesiana
8 Leaves entire.
14 Leaves whitened beneath by a dense mat of white hairs; leaves linear and strongly revolute
14 Leaves green or brown beneath, glabrous, glabrescent, or lepidote.
15 Leaves densely lepidote on the under surface with brown scales.
16 Leaves planar, not revolute; petioles \(7-20 \mathrm{~mm}\) long; twigs more-or-less terete in cross-section; [of the Mountains, Piedmont, and upper Coastal Plain].
17 [Corolla mostly \(1.5-2 \mathrm{~cm}\) long, the corolla tube ( \(0.9--1.3 \mathrm{~cm}\) long) shorter than to as long as the corolla lobes (1.2-1.8 cm long)]; [plant flowering early relative to Rh. minus, despite occurring at higher elevations and more northern latitudes]; [calyx lobes deltoid]; [of mountain ridges, heath balds, and rocky summits, mostly either away from the Blue Ridge Escarpment or north of the Asheville Basin] \(\qquad\) Rhododendron carolinianum
17 [Corolla mostly \(2.5-3 \mathrm{~cm}\) long, the corolla tube (1.6-2.2 cm long) longer than the corolla lobes ( \(0.8-1.2 \mathrm{~cm}\) long)]; [plant flowering late relative to \(R h\). carolinianum]; [calyx lobes ovate]; [of the Coastal Plain, Piedmont, and Mountains, in the Mountains mostly of the Blue Ridge Escarpment of sw. NC and nw. SC, ranging in elevation up to the higher granitic domes in Macon and Jackson counties, NC] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Rhododendron minus 16 Leaves slightly to strongly revolute (or nearly planar in Lyonia fruticosa); petioles 1-7 mm long; twigs angled in cross-section; [of the lower Coastal Plain, from se. SC southwards].
18 Ultimate branches not rigidly ascending, flowers nearly always restricted to branches of the previous year, the leaves not conspicuously reduced toward the branch tips; leaves with distal margin usually revolute, sometimes strongly so; major veins usually depressed; lower leaf surface with some scales often large and with irregular margins, others smaller and more nearly entire, at least the smaller scales more-or-less persistent; [shrub or small tree to \(6(-10) \mathrm{m}\) tall] .
18 Ultimate branches rigidly ascending flowers frequent on branches of the current yar (thoun also on older growth), the leaves conspicuously reduced toward the branch tips; leaves with distal margin at most slightly revolute; major veins not depressed; lower leaf surface with scales usually all large and with irregular margins, the scales often deciduous; [shrub to \(1.5(-3) \mathrm{m}\) tall] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Lyonia fruticosa
15 Leaves not lepidote beneath (Lyonia lucida with scattered minute scales on young leaves). 19 Leaves whorled or rarely opposite.
20 Calyx stipitate-glandular and finely puberulent; bracts and bracteoles densely glandular; stomates \(18 \mu\) long and \(13 \mu\) wide, \(15-24\) per 0.2 square millimeter; shrub to \(1(-1.2) \mathrm{m}\) tall; [of c . VA northwards]
Kalmia angustifolia
20 Calyx finely canescent, lacking glands; bracts and bracteoles nearly glandless; stomates \(13 \mu\) long and \(9 \mu\) wide, 35-51 per 0.2 square millimeter; shrub to 1.5 m tall; [of s . VA southwards] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Kalmia carolina 19 Leaves alternate.
21 Leaf blades (8-) 10-30 cm long, 3-9 cm wide, rounded to obtuse at the tip.
22 Leaves rounded at base (rarely broadly cuneate or slightly cordate), obtuse at apex; leaf generally \(1.5-2.5 \times\) as long as wide; [corolla usually deep pink to purple]; [sepals \(0.5-1 \mathrm{~mm}\) long] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Rhododendron catawbiense 22 Leaves cuneate at base, acute at apex; leaf generally \(3-5 \times\) as long as wide; [corolla usually white to pale pink]; [sepals 4-6 mm long] .................. Rhododendron maximum
21 Leaf blades 2-10 (-12) cm long, 1-5 cm wide, acute, short-acuminate (or obtuse or rounded in Cyrilla) at the tip.
23 Leaf with a prominent vein running the length of the margin, about 1 mm in; [shrub to 4 m tall] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Lyonia lucida 23 Leaf venation not as above; [shrub to small tree].

\section*{Agarista D. Don ex G. Don 1834 (Agarista)}

A genus of about 30 species, shrubs, primarily of tropical America, but also in Africa, Madagascar, and se. North America. Judd (1979, 1984) discusses the reasons for separating Agarista from Leucothoe; Agarista is more closely related to Pieris than Leucothoe (Judd \& Kron 1996). References: Judd \((1984,1979)=\) Z; Stevens et al. in Kubitzki (2004).

Agarista populifolia (Lamarck) Judd, Agarista, Pipe-plant. Cp (GA, NC?, SC): blackwater swamps, hydric hammocks, marly spring runs; rare (GA Special Concern, NC Watch List, SC Rare). April-May; September-October. E. SC (or se. NC?) south to n. peninsular FL. A specimen at the University of North Carolina at Chapel Hill is labeled as coming from a nursery, originally taken from plants in a swamp in Columbus County, NC. The record is plausible and would add the species to the state's flora. \([=K, L, Z\); \(=\) Leucothoe populifolia (Lamarck) Dippel -- RAB, GW; =? Leucothoe acuminata (Aiton) G. Don -- S; = Andromeda populifolia Lamarck]

\section*{Andromeda Linnaeus 1753 (Bog-rosemary, Andromeda)}

A genus of 1-2 species, shrubs, north temperate. References: Stevens et al. in Kubitzki (2004)

Andromeda polifolia Linnaeus var. glaucophylla (Link) Augustin de Candolle, Bog-rosemary, occurs south to ne. PA (Rhoads \& Klein 1993) and e. WV (at Cranberry Glades, Pocahontas County), and NJ. [= K; = A. glaucophylla Link -- C, F, G, L]

\section*{Arctostaphylos Adanson 1760 (Bearberry)}

A genus of 50-60 species, shrubs, woody vines, or small trees, mostly in w. North America, but with 2 circumboreal species. References: Rosatti (1987b)=Z; Stevens et al. in Kubitzki (2004).

Arctostaphylos uva-ursi (Linnaeus) Sprengel, Bearberry, Kinnikinick. Mt (VA): high elevation granitic outcrop; rare (VA Rare). May-June. Following Rosatti (1987), A. uva-ursi is here treated inclusively, as a complex species not readily divisible into infraspecific taxa. A. uva-ursi is circumboreal, ranging in North America from Labrador west to AK, south to n. VA, n. IN, NM, and CA. [= C, K, L, W, Z; > A. uva-ursi var. coactilis Fernald \& J.F. Macbride -- F, G; > A. uva-ursi ssp. coactilis (Fernald \& J.F. Macbride) A. \& D. Löve \& Kapoor]

\section*{Bejaria Mutis in Linnaeus 1771 (Tarflower)}

A genus of 15 species, ranging from southeastern United States to Cuba, and from Mexico south into Bolivia. The spelling of the generic name has been controversial; it was originally published as 'Befaria,' because of Linnaeus's misreading of Mutis's handwriting, but was intended to commemorate Don Bejar. The spelling has now been conserved as 'Bejaria' (Greuter et al. 2000). References: Stevens et al. in Kubitzki (2004).

Bejaria racemosa Ventenat, Tarflower, Flycatcher. Cp (GA): pine flatwoods; common. E. GA (adjacent to se. SC) south to s. peninsular FL. [= L; = Befaria racemosa -- GW, K, S, orthographic variant]

\section*{Calluna R.A. Salisbury 1802 (Heather)}

A monotypic genus, a shrub, of Europe. References: Stevens et al. in Kubitzki (2004).
* Calluna vulgaris (Linnaeus) Hull, Heather, is naturalized in Tucker County, WV (Luteyn et al. 1996). [= C, F, G, K, L]

\section*{Ceratiola Michaux 1803 (Florida Rosemary)}

A monotypic genus, a shrub, of se. North America. Ceratiola has been traditionally placed in the Empetraceae. Many workers have expressed doubt about the naturalness of the Empetraceae and its distinction from the Ericaceae. Molecular data have corroborated that concern, and shown Ceratiola and the rest of the Empetraceae to be better included in a broader Ericaceae (Kron \& Chase 1993); the affinities of Ceratiola may actually be with other southeastern United States genera, Kalmia, Elliottia, and Bejaria (Kron \& Chase 1993). References: Kron \& Chase (1993); Judd \& Kron (1993); Johnson (1982); Stevens et al. in Kubitzki (2004).

Ceratiola ericoides Michaux, Rosemary, Florida Rosemary, Sandhill Rosemary, Sand Heath. Cp (GA, SC): xeric sandhills, usually in white "sugar sand"; uncommon (GA Threatened). October-November. Ne. SC south to FL and west to s. MS. Its content of aromatic compounds makes it very flammable. [= RAB, K, L, S]

\section*{Chamaedaphne Moench 1794 (Leatherleaf, Cassandra)}

A monotypic genus, a shrub, circumboreal in distribution. References: Stevens et al. in Kubitzki (2004).
Chamaedaphne calyculata (Linnaeus) Moench, Leatherleaf, Cassandra. Cp (NC, SC), Mt (NC): pocosins in the Coastal Plain, bogs in the Mountains; uncommon (nearly extirpated in the Mountains). March-April; June-October. Circumboreal; in North America from Newfoundland to Alberta to Newfoundland, south to MD, OH, n. IL, WI, n. IA, Alberta, and British Columbia; disjunct to the mountains of NC (where now nearly extirpated, known only from a single bog of less than 1 hectare) and to the Coastal Plain of NC and ne. SC. The Coastal Plain occurrences in our area are mainly in the centers of large peat dome or Carolina Bay pocosins, the insufficiently famous southern blanket bogs or "southern muskeg." In these areas, Chamaedaphne is sometimes dominant (or codominant with Zenobia pulverulenta or Sarracenia flava) over expanses of 25 square kilometers. The southern occurrences of Chamaedaphne are certainly the result of Pleistocene distributions. A number of varieties have been named (the Eurasian var. calyculata, var. Iatifolia in Maritime Canada, south to n . New England, and var. angustifolia, to which our material would presumably be referred). The validity of the varieties is questionable. [=C, G, K, L, S, W; = Cassandra calyculata (Linnaeus) D. Don -- RAB, GW; > Chamaedaphne calyculata var. angustifolia (Aiton) Rehder - F]

A genus of 4-5 species, subshrubs, of temperate and tropical America, and Eurasia. References: Stevens et al. in Kubitzki (2004).
1 Leaves lanceolate (broadest below the middle), base rounded, striped with white or paler green along the major veins . . . . . .
\(\qquad\)
1 Leaves oblanceolate (broadest above the middle), base cuneate, solid dark green throughout . C. umbellata ssp. cisatlantica
Chimaphila maculata (Linnaeus) Pursh, Pipsissewa, Striped Wintergreen. Mt, Pd, Cp (GA, NC, SC, VA): forests and woodlands, mostly rather xeric and acid; common. May-June; July-October. ME west to MI, south to GA and AL. [= RAB, C, F, G, K, L, S, W]

Chimaphila umbellata (Linnaeus) W. Barton var. cisatlantica Blake, Prince's-pine. Pd, Cp (NC, VA), Mt (VA): forests and woodlands, mostly rather xeric and acid; uncommon. May-June; July-October. Circumboreal, extending (in the interpretation of some) south into Central America. Var. cisatlantica is widespread in ne. North America, from Nova Scotia and Québec west to MN, south to NC and IN. [= C, F, G, L; <Ch. umbellata -- RAB, W; = Ch. umbellata ssp. cisatlantica (Blake) Hultén -- K; ? Ch. corymbosa Pursh -- S]

\section*{Elliottia Muhlenberg ex Elliott 1817 (Elliottia, Southern-plume)}

A genus of 4 species (as here circumscribed), shrubs to small trees, of se. North America, nw. North America, and Japan. As discussed by Wood (1961), the generic limits of Elliottia have been controversial. The closest relatives of \(E\). racemosa, whether or not considered congeneric (here considered congeneric), are E. paniculata (Siebold \& Zuccarini) Bentham \& Hooker and E. bracteata (Maximowicz) Bentham \& Hooker, both of Japan, and E. pyroliflorus (Bong.) S.W. Brim \& P.F. Stevens [Cladothamnus pyroliflorus Bong.], of AK, British Colombia, WA, and OR. References: Stevens et al. in Kubitzki (2004).

Elliottia racemosa Muhlenberg ex Elliott, Elliottia, Southern-plume, Georgia-plume. Cp (GA, SC), Pd (GA): xeric sandy ridges, sandhills, river bluffs; serpentine woodlands; rare (GA Threatened, SC Rare). June-August. Endemic to e. GA and s. SC (Aiken County, where considered to have been extirpated). Elliottia extends barely into the Piedmont in Georgia, occurring on Burks Mountain on serpentine in a Pinus palustris woodland. [= K, L, S]

\section*{Epigaea Linnaeus 1753 (Trailing Arbutus)}

A genus of 3 species, subshrubs, in e. North America and Eurasia; the other 2 species of the genus occur in the Caucasus and Asia Minor, and in Japan. References: Stevens et al. in Kubitzki (2004).

Epigaea repens Linnaeus, Trailing Arbutus. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): a wide variety of acidic forests, xeric to mesic, sandy, rocky, and loamy; common. Late February-early May; April-June. Newfoundland and Québec west to Saskatchewan, south to FL, MS, and IA. At maturity, the fruits split along the sutures, exposing tiny brown seeds embedded in "sticky, white, placental tissue" which is "distinctly sweet to the taste" (Clay 1983). Ants are strongly attracted to the placental tissue, and in carrying it away disperse the seeds (Clay 1983). [= RAB, C, G, K, L, S, W; > E. repens var. glabrifolia Fernald -- F; > E. repens var. repens - F]

\section*{Erica Linnaeus 1753 (Heath)}

A genus of 735-860 species, shrubs and trees, of Africa and Eurasia (mostly s. Africa). References: Stevens et al. in Kubitzki (2004).
* Erica tetralix Linnaeus, Cross-leaved Heath. Cp (NC): sandy thickets; rare, introduced from Europe. July-August; September-October. [= RAB, C, F, G, K, L]

\section*{Eubotrys Nuttall 1842 (Deciduous Fetterbush)}

A genus of 2 species, shrubs to small trees, of e. North America. Recent molecular evidence supports the recognition of Eubotrys as a genus separate from Leucothoe, supporting the views, based on morphological grounds, of many earlier authors (Kron et al. 2002). References: Kron et al. (2002); Stevens et al. in Kubitzki (2004).

1 Anthers with 4 awns; capsule rounded on the sutures; sepals broadly lanceolate; seeds not winged, shaped like a section of an orange . E. racemosa 1 Anthers with 2 awns; capsule angled on the sutures; sepals ovate; seeds winged, oblanceolate, flat . . . . . . . . . . . E. recurva

Eubotrys racemosa (Linnaeus) Nuttall, Coastal Fetterbush. Cp, Pd, Mt (GA, NC, SC, VA): swamps, pocosins, streambanks, and other wet places; common (uncommon in Piedmont, rare in Mountains). Late March-early June; September-October. E. MA south to FL and west to LA, primarily on the Coastal Plain; disjunct inland, as in c. TN (Chester, Wofford, \& Kral 1997). [= C, G; = Leucothoe racemosa (Linnaeus) A. Gray -- RAB, GW, K, L, W; > L. racemosa var. projecta Fernald -- F; > L. racemosa var. racemosa - F; > Eubotrys racemosa - S; > Eubotrys elongata Small -- S]

Eubotrys recurva (Buckley) Britton, Mountain Fetterbush. Mt (GA, NC, SC, VA), Pd (NC, SC, VA): heath balds, high
elevation ridges and granitic domes, bogs; common (rare in Piedmont) (GA Special Concern). April-early June (rarely sporadically in the fall); August-October. A Southern Appalachian endemic: sw. VA, s. WV, and se. KY south through w. NC and ne. TN to ne. GA (Rabun County) and nw. SC. [= C, G, S; = Leucothoe recurva (Buckley) A. Gray -- RAB, F, K, L, W]

\section*{Gaultheria Kalm ex Linnaeus 1754 (Wintergreen, Teaberry)}

A genus of 130-135 species, shrubs and subshrubs, of Asia, Australia and New Zealand, South America, Central America, and North America (primarily Asian). References: Stevens et al. in Kubitzki (2004).

1 Stems creeping, the leaves \(5-10 \mathrm{~mm}\) long, well-distributed along the stem; berries white; flowers 4-merous ... [G. hispidula]
1 Stems erect, the leaves \(15-50 \mathrm{~mm}\) long, clustered at the tip of the stem; berries red; flowers \(5-\mathrm{merous} \ldots .\). . G. procumbens
Gaultheria procumbens Linnaeus, Wintergreen, Teaberry. Mt (GA, NC, SC, VA), Pd, Cp (NC, SC, VA): heath balds, woodlands, and openings, usually acidic and xeric; common (uncommon in Piedmont and Coastal Plains) (SC Rare). June-August; September-November. Newfoundland west to Manitoba, south to e. NC, ne. GA, AL, c. TN, KY, n. IN, and MN. [= RAB, C, F, G, K, L, S, W]

Gaultheria hispidula (Linnaeus) Muhlenberg ex Bigelow, Creeping Snowberry, Moxie, has been attributed to NC by C, F, G, and \(S\); the documentation is unknown. It is known from as far south as \(e . W V\) and MD and its occurrence in our area is plausible. [= C, F, G, K; = Chiogenes hispidula (Linnaeus) Torrey \& A. Gray -- S]

\section*{Gaylussacia Kunth 1819 (Huckleberry)}

A genus of ca. 50 species, shrubs, of North and South America (centered in South America). The sections and subsections follow Sleumer (1967a). A study of the phylogeny of the genus Gaylussacia provided some evidence for the treatment of Gaylussacia brachycera as a monotypic genus or within Vaccinium; additional study is needed. References: Sleumer (1967a)=Z; Camp (1935) \(=\) Y; Godfrey (1988)=X; Duncan \& Brittain (1966)=V; Fernald (1911); Stevens et al. in Kubitzki (2004).

1 Leaves 0.7-2.2 cm long, serrulate, leathery, evergreen, lacking punctate glands; [section Vitis-idaea] ........ G. brachycera
1 Leaves \(1.5-10 \mathrm{~cm}\) long, entire (or minutely glandular-crenate), membranaceous to subcoriaceous, deciduous, with punctate glands.
2 Leaves subcoriaceous, upper surface shining, dark green, 1.5-4 cm long; bracts of the inflorescence equal to or longer than the pedicels (5-12 mm long), persistent; sepals, pedicels, bracts, and leaves stipitate-glandular and pubescent; [section Gaylussacia].
3 Young twigs, raceme axes, flower stalks, and floral tubes with long, spreading, silvery-silky hairs, minutely glandular at their tips; shrub to 1.5 m (or more) tall . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . G. mosieri
3 Young twigs, raceme axes, flower stalks, and floral tubes with short (less than 1 mm long), curly hairs and short stipitate-glandular hairs intermixed; shrub to 1.0 m tall.
4 Leaf margins entire, ciliate with abundant whitish hairs as well as red-tipped stipitate glands; shrub commonly 510 dm tall, well-branched; bracts of the inflorescence slightly to densely stipitate-glandular above as well as below; [of mountain bogs, high elevation peaks, and low pocosins, in very wet, boggy sites]
G. dumosa var. bigeloviana

4 Leaf margins entire or serrulate, the serrulations gland-tipped, and also ciliate with red-tipped glandular hairs (sometimes with some whitish hairs as well); shrub 1-3 (-4) dm tall, typically rather virgate in above-ground growth form and little branched; bracts of the inflorescence only slightly (if at all) stipitate-glandular above; [of dry to moist Coastal Plain pinelands and sandhills, and (rarely) dry mountain slopes at low to moderate elevations]
G. dumosa var. dumosa

2 Leaves membranaceous to subcoriaceous, upper surface dull, yellow-green to medium-green, 2-10 cm long; bracts of the inflorescence shorter than the pedicels, early deciduous; sepals, pedicels, bracts, and leaves with sessile glands, pubescent or not pubescent; [section Decamerium].
5 Leaves glandular on both surfaces; racemes 0.5-1.5 cm long; [section Decamerium, subsection Baccatae]
G. baccata

5 Leaves glandular on the lower surface only; racemes 1-5 cm long.
6 Leaves membranaceous, medium-green, with acuminate apices; [section Decamerium, subsection Ursinae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . G. ursina
6 Leaves subcoriaceous, yellow-green to glaucous, with obtuse to emarginate apices; [section Decamerium, subsection Frondosae].
7 Young twigs glabrous; leaves glabrous or pubescent beneath, often glaucous; shrub to 20 dm tall; [widespread in our area] G. frondosa

7 Young twigs densely pubescent with short, curled hairs; leaves sparsely to densely pubescent beneath, glaucous or not; shrub to 10 dm tall; [of se. NC and southwards in the Coastal Plain].
8 Larger leaves mostly 2-4 cm long and 1-2 cm wide, the lower surface sparsely short-pubescent with the longer hairs ca. 0.13 mm long, usually strongly glaucous; floral tube and calyx glaucous; shrub 2-\(6(-10) \mathrm{dm}\) tall
G. nana

8 Larger leaves mostly \(3-6 \mathrm{~cm}\) long and \(2-3.5 \mathrm{~cm}\) wide, the lower surface sparsely to densely shortpubescent with the longer hairs ca. 0.25 mm long, not glaucous; floral tube and calyx not glaucous; shrub to 10 dm tall
G. tomentosa

Gaylussacia baccata (Wangenheim) K. Koch, Black Huckleberry, Crackleberry. Mt (GA, NC, SC, VA), Pd (NC, SC, VA), Cp (NC, VA): xeric, acidic forests and woodlands, rock outcrops, to 1600 m elevation; common (uncommon in Piedmont and Coastal Plain of NC and SC) (SC Rare). April-June; July-August. Newfoundland and Québec west to Ontario and Manitoba, south to ne. NC, nw. SC, n. GA, AL, and MO; in GA, NC, and SC it is primarily montane in distribution, but in VA it occurs throughout the state. [= RAB , C, F, G, K, L, V, W, Y, Z; = Decachaena baccata (Wangenheim) Small -- S]

Gaylussacia brachycera (Michaux) A. Gray, Box Huckleberry. Mt (VA), Pd (NC): dry, acidic ridgetops and upper slopes; uncommon (but locally forming large clones) (VA Rare). May-June. Sc. PA and DE south to e. KY and ec. TN, primarily on the Cumberland and Alleghany Plateaus; also disjunct on a steep, xeric, west-facing bluff in Durham Co. NC, where evidently native. Treatment of this species in a monotypic genus may be warranted, but the genus Buxella is unavailable, as it had already been used prior to Small (Wilbur \& Bloodworth 2004). [= C, F, G, K, L, W, Y, Z; = Buxella brachycera (Michaux) Small -- S (but Buxella is preoccupied); = Vaccinium brachycerum Michaux; note that the report in RAB is based on a misidentification]

Gaylussacia dumosa (Andrews) Torrey \& A. Gray var. bigeloviana Fernald, Northern Dwarf Huckleberry. Mt (GA, NC), Cp (NC, VA): mountain bogs, high elevation peaks, peat dome pocosins, generally growing in peat, forms transitional to var. dumosa in wet pinelands and disturbed pocosins; rare (NC Watch List). April-June; June-October. Var. bigeloviana ranges from Newfoundland south to NJ, with forms transitional to var. dumosa as far south as se. VA, and disjunct in Carteret, Dare, and Pender counties, NC (in low pocosins of large peat domes with Chamaedaphne and Zenobia) and in the sw. mountains of NC (Henderson, Transylvania, Macon, and Jackson counties), where found in bogs and wet, high elevation peaks. The montane plants named Lasiococcus orocola by Small are closely allied to northern G. dumosa var. bigeloviana, and occur with other notable northern disjuncts, such as Myrica gale and Chamaedaphne calyculata (often associated with var. bigeloviana in northern peat bogs). They are tentatively assigned here to var. bigeloviana, though further study may indicate that they deserve separate varietal rank. [= C, \(F\), G, Y; < G. dumosa -- RAB, GW, K, L, W, X, Z; > Lasiococcus orocola (Small) Small -- S; > G. orocola (Small) Camp -- Y, Z]

Gaylussacia dumosa (Andrews) Torrey \& A. Gray var. dumosa, Southern Dwarf Huckleberry. Cp, Pd, Mt (GA, NC, SC, VA): xeric to mesic, acidic forests and woodlands; common (uncommon in Piedmont and Mountains of NC and SC, rare in Piedmont and Mountains of VA). March-June; June-October. This variety is one of the most common shrubs of the Southeastern Coastal Plain, with an overall range from NJ south to FL and west to e. LA, primarily in the Coastal Plain, less commonly inland (as in sc. TN and se. WV). [= C, F, G, Y; < G. dumosa -- RAB, GW, K, L, V, W, X, Z; = Lasiococcus dumosus (Andrews) Small -- S]

Gaylussacia frondosa (Linnaeus) Torrey \& A. Gray ex Torrey, Dangleberry. Cp, Mt, Pd (NC, SC, VA): mesic, acidic woodlands, especially in sandhill-pocosin and savanna-pocosin ecotones, also in xeric chestnut oak forests in the lower Piedmont; common (uncommon in Piedmont and Mountains). Late March-May; June-August. Primarily a Southeastern Coastal Plain species: s. NH south to s. SC, less commonly inland to w. NY, c. and w. PA, w. VA, and w. SC. [= C, F, G, K, L, W, V; = G. frondosa var. frondosa -- RAB, GW, X, Y, Z; = Decachaena frondosa (Linnaeus) Torrey \& Gray -- S]

Gaylussacia mosieri Small, Mosier's Huckleberry, Hirsute Huckleberry. Cp (GA, SC): savannas and seepages; rare (SC Rare). SC south to FL and west to s. LA. Material from Lexington County, SC apparently does not closely match G. mosieri from further south. [= GW, K, L, V, X, Y, Z; = Lasiococcus mosieri (Small) Small -- S]

Gaylussacia nana (A. Gray) Small, Dwarf Dangleberry. Cp (GA, NC, SC): xeric sandhills; rare (NC Rare). This species is disjunct at several sites in xeric sandhills of se. NC (on the Carolina Beach peninsula and the 421 Sandhills nw. of Wilmington), and otherwise is known to range from se. SC (Beaufort Co.) south and west to \(n\). and \(c\). peninsular \(F L\), panhandle \(F L\), and \(s w\). \(A L\). It is common in e. GA (such as Glascock and Bryan counties), and may also be found in se. SC. G. nana has a diploid chromosome complement ( \(n=12\) ), compared to tetraploid for G. tomentosa ( \(n=12\) ) (Luteyn et al. 1996). [=K, L, V, Y; = G. frondosa (Linnaeus) Torrey \& A. Gray ex Torrey var. nana A. Gray -- GW, X, Y; = Decachaena nana (A. Gray) Small -- S]

Gaylussacia tomentosa (A. Gray) Pursh ex Small, Hairy Dangleberry. Cp (GA, SC): pine flatwoods, sandhills, xeric coastal fringe sandhills; rare. March-May; June-August. Se. SC (spodosolic flatwoods in Beaufort County) south to c. peninsular FL, west to s. GA and sw. AL. As discussed by Godfrey (1988) and Duncan \& Brittain (1966), probably better treated as a species than as a variety of G. frondosa. G. tomentosa has a tetraploid chromosome complement ( \(n=24\) ), compared to diploid for G. nana and G. frondosa ( \(\mathrm{n}=12\) ) (Luteyn et al. 1996). [ K K, L, V, Y; = G. frondosa (Linnaeus) Torrey \& A. Gray ex Torrey var. tomentosa A. Gray -RAB, GW, X, Z; = Decachaena tomentosa (Pursh ex Small) Small -- S]

Gaylussacia ursina (M.A. Curtis) Torrey \& A. Gray ex A. Gray, Bear Huckleberry, Mountain Huckleberry. Mt (GA, NC, SC): mesic to xeric forests, frequently dominant, but limited to areas southwest of the Asheville Basin; common. May-June; JulySeptember. A narrow Southern Appalachian endemic: sw. NC, nw. SC, ne. GA, and se. TN. On mountain slopes and summits in that area it is often the dominant shrub, forming large clonal patches. [= RAB, K, L, V, W, Y, Z; = Decachaena ursina (M.A. Curtis) Small -- S]

\section*{Hypopitys Crantz 1766 (Pinesap)}

A genus of 1-several species, herbs, of circumboreal distribution. Recent molecular evidence supports its separation as a genus distinct from Monotropa (as has often been done in the past) (Neyland \& hennigan 2004). References: Stevens et al. in Kubitzki (2004).

Hypopitys monotropa Crantz, Pinesap. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): forests; uncommon. May-October; JulyNovember. Circumboreal, south nearly throughout North America. [= Monotropa hypopithys Linnaeus -- RAB, C, F, G, K, L, W; > Hypopitys americana (Augustin de Candolle) Small -- S; > Hypopitys lanuginosa (Michaux) Nuttall -- S]

Kalmia Linnaeus 1753 (Wicky, Sheepkill, Mountain Laurel, Ivy, Sand-myrtle)
A genus of \(9-11\) species, shrubs, of North America and Cuba, except the circumboreal K. procumbens (formerly Loiseleuria). Leiophyllum, traditionally treated as a monotypic or small genus of se. United States, is better treated as a part of Kalmia along with
the northern Loiseleuria, based on molecular and morphological studies (Kron \& King 1996, Kron et al. 2002). While this idea may initially seem outlandish (particularly to those whose concept of Kalmia is based only on Kalmia latifolia), the morphological and habital similarities of Leiophyllum to Kalmia are striking. The foliage and wood of all species (and the smoke from burning them) are poisonous. References: Southall \& Hardin (1974)=Z; Ebinger (1974) \(=\) Y; Strand \& Wyatt (1991)=Q; Wilbur \& Racine (1971)=R; Camp (1938)=P; Kron \& King (1996); Kron et al. (2002)=V; Stevens et al. in Kubitzki (2004).

1 Petals fused; fruit 5-locular.
2 Leaves whorled (rarely opposite); inflorescence an axillary raceme.
3 Calyx stipitate-glandular and finely puberulent; bracts and bracteoles densely glandular; stomates \(18 \mu\) long and \(13 \mu\) wide, 15-24 per 0.2 square millimeter; [of se. VA northwards] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . K. angustifolia
3 Calyx finely canescent, lacking glands; bracts and bracteoles nearly glandless; stomates \(13 \mu\) long and \(9 \mu\) wide, 35-51 per 0.2 square millimeter; [of se. VA southwards]
K. carolina

2 Leaves alternate; inflorescence an axillary fascicle or a terminal panicle.
4 Leaves 0.5-1.5 cm long, 2-8 mm wide; twigs densely persistently hispid; [of s. SC southwards] . . . . . . . . K. hirsuta
4 Leaves \(2.5-12 \mathrm{~cm}\) long, \(7-50 \mathrm{~mm}\) wide; twigs glabrous or puberulent (glabrescent in age); [collectively widespread in our area].
5 Leaves deciduous, dull, and subcoriaceous, 1.5-3 cm wide; inflorescence a lateral fascicle of 1-3 flowers, axillary to leaf scars near the tips of the previous year's growth; petiole \(1-4 \mathrm{~mm}\) long; [of the Coastal Plain of NC and SC]
K. cuneata

5 Leaves evergreen, glossy, and coriaceous, (1) 3-5 cm wide; inflorescence a terminal panicle; petiole \(7-45 \mathrm{~mm}\) long; [widespread] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . K. Katifolia

Kalmia angustifolia Linnaeus, Northern Sheepkill. Cp (VA): sandy, xeric to mesic hillsides and moist areas; rare (VA Rare). April-May; September-October. Labrador west to MN, south to se. VA, s. Ontario, and MI, reaching its southern limit in the se Coastal Plain and n . Mountains of VA. See Kalmia carolina for discussion of the taxonomy of these two taxa. [= K, S, Z; = K. angustifolia var. angustifolia -- C, F, G, L, Y]

Kalmia buxifolia (P.J. Bergius) Gift, Kron, \& Stevens, Sand-myrtle. Mt (GA, NC, SC), Cp (NC, SC), Pd (NC): locally abundant but very restricted in wet (spodosol) pinelands of the outer Coastal Plain (in Brunswick and Carteret counties, NC), locally common in relatively dry sandhills in a few locations in the Sandhills, disjunct in the Piedmont on a few quartzite monadnocks, fairly common in the mountains on rock outcrops at high to moderate elevations (on a wide variety of rock types); uncommon (GA Special Concern). Late March-June (sporadically to October); September-October. The species is curiously distributed, both in its overall range and within NC. Kalmia buxifolia is found in the Pine Barrens of NJ, the outer Coastal Plain of se. NC, the inner Coastal Plain (fall-line sandhills) of sc. NC and nc. SC, monadnocks of the upper Piedmont of NC, mountain peaks of NC and immediately adjacent nw. SC, ne. GA, and e. TN, and isolated in extreme e. PA (Monroe County) and in se. KY (on sandstone in Whitley County, in the Cumberland Plateau). Populations in the high mountains consist of very old, prostrate krummholz, the stems to 6 cm in diameter at the base, the branches spreading to cover at least a square meter. The disjunct distribution, various habitats, and subtle morphological variation between populations has led to periodic attempts to divide the species into two or more varieties or species, but the variability apparently cannot be successfully described taxonomically; it is here treated as a single species, the genus therefore monotypic. See \(X, Y\), and \(Q\) for detailed discussion of the various taxa recognized by various authors (within the genus Leiophyllum). Strand \& Wyatt (1991) found a population from Hanging Rock, Stokes County, NC to be the most distinctive, but did not choose to give it formal taxonomic status. [= V; = Leiophyllum buxifolium (P.J. Bergius) Elliott -- C, K, L, Q, R, W; > Leiophyllum buxifolium var. buxifolium - RAB; > Leiophyllum buxifolium var. prostratum (Loudon) Gray -- RAB; > Leiophyllum buxifolium var. hugeri (Small) Schneider -- F, G, P; > Leiophyllum lyonii Sweet -- S, P; > Leiophyllum hugeri (Small) K. Schumann -- S; = Dendrium buxifolium (Bergius) Desvaux]

Kalmia carolina Small, Southern Sheepkill, Carolina Wicky, Carolina Bog Myrtle. Cp (NC, SC, VA), Mt (GA, NC, VA): moist to wet pinelands of the Coastal Plain, pocosin margins (or seemingly in pocosins or swamps because of fire suppression), mountain bogs and fens (and less commonly in rocky areas at high elevations) in the Mountains; common (rare in the Mountains and rare in VA) (GA Special Concern, VA Rare). April-May (sporadically to September, especially in response to fire); September-October. This species, a close relative of the more widespread and northern K. angustifolia, occurs in two disjunct areas: the Coastal Plain, from se. VA south through NC to c. SC, and the Southern Appalachians from sw. VA south through w. NC and ne. TN to ne. GA. Southall \& Hardin (1974) favored species status for K. carolina because of its essentially allopatric distribution relative to \(K\). angustifolia (the 2 meet in Southampton County, VA), the absence of intermediates or hybrids in nature, and because "significant morphological and anatomical differences have developed and remain constant between these two species when grown together." [= GW, K, S, W, Z; = K. angustifolia Linnaeus var. caroliniana (Small) Fernald -- RAB (an orthographic error); = K. angustifolia var. carolina (Small) Fernald -- C, F, G, L, Y]

Kalmia cuneata Michaux, White Wicky. Cp (NC, SC): pocosins and pocosin-savanna or pocosin-sandhill ecotones; rare (US Species of Concern, NC Endangered/Proposed Candidate, SC Rare). Late May-June; September-October. This species is a narrow endemic of the Coastal Plain of se. NC and e. SC. It is not closely related to other species in the genus. It is most easily distinguished from other pocosin shrubs by the combination of the following characters: leaves deciduous, alternate, oblanceolate (cuneate-attenuate at base, obtuse at apex), revolute, dark green above, paler and prominently stipitate-glandular beneath, woody capsule rounded, stipitate-glandular, persistent through the winter, borne on delicate, recurved pedicels usually \(2-3 \mathrm{~cm}\) long. [= RAB, GW, K, L, S, Y, Z]

Kalmia hirsuta Walter, Hairy Wicky. Cp (GA, SC): pine savannas and pine flatwoods; common (rare in SC). June-July; September-October. Se. SC (Beaufort, Jasper, Hampton, and Colleton counties) south to nc. peninsular FL, west to s. AL. The closest relatives of \(K\). hirsuta are 3 Cuban species: K. aggregata (Small) Copeland, K. ericoides Wright ex Grisebach, and \(K\). simulata (Britton \& Wilson) Southall. [= RAB, GW, K, L, Y, Z; = Kalmiella hirsuta (Walter) Small -- S]

Kalmia latifolia Linnaeus, Mountain Laurel, Ivy, Calico-bush. Mt, Pd, Cp (GA, NC, SC, VA): acidic forests, bluffs, bogs, along sandhill steams, and in a wide range of other habitats, nearly ubiquitous in the mountains, up to at least 1600 m , more restricted in
habitat in the lower Piedmont and Coastal Plain; common. April-June; September-October. ME and OH south to FL and extreme e. LA. Unlike our other species, which are strictly shrubs, \(K\). latifolia reaches the stature and diameter of a small tree. [= RAB, C, K, L, S, W, Y, Z; > K. latifolia var. laevipes Fernald -- F, G; > K. latifolia var. Iatifolia - F, G]

\section*{Leiophyllum}
(see Kalmia)

\section*{Leucothoe D. Don 1834 (Fetterbush, Leucothoe)} (see also Agarista and Eubotrys)

A genus of about 6 species, shrubs, of Japan, Himalayan Asia, and e. North America. References: Stevens et al. in Kubitzki (2004).

Leucothoe axillaris (Lamarck) D. Don, Coastal Doghobble. Cp (GA, NC, SC, VA), Pd (GA, NC, SC): pocosins, blackwater swamp forests, and moist and acid slopes; common (rare in Piedmont, uncommon in VA). Late March-May; September-October. A Southeastern Coastal Plain endemic: se. VA south to FL and west to extreme e. LA. [= C, G, GW, K, L, S; = L. axillaris var. axillaris -- RAB; > L. axillaris var. axillaris - F; > L. axillaris var. ambigens Fernald -- F]

Leucothoe fontanesiana (Steudel) Sleumer, Mountain Doghobble, Switch-ivy. Mt (GA, NC, SC, VA), Pd (GA, NC, SC): moist slopes, streambanks, ravines, often associated with Rhododendron maximum thickets; common (VA Rare). April-May; SeptemberOctober. A Southern Appalachian endemic: sw. VA south through w. NC and e. TN to nw. GA. [= GW, K, L, W; = L. axillaris var. editorum (Fernald \& Schubert) Ahles -- RAB; = L. walteri (Willdenow) Melvin -- C; = L. editorum Fernald \& Schubert -- F, G; = L. catesbaei (Walter) Gray -- S]

\section*{Lyonia Nuttall 1818 (Staggerbush, Maleberry, Fetterbush)}

A genus of about 35 species, shrubs and small trees, of e. and se. Asia, e. North America, Mexico, and the West Indies. References: Judd (1981)=Z; Stevens et al. in Kubitzki (2004).

1 Lower leaf surfaces stipitate-peltate with rusty scales; [of s. SC southwards].
2 Ultimate branches not rigidly ascending, flowers nearly always restricted to branches of the previous year, the leaves not conspicuously reduced toward the branch tips; leaves with distal margin usually revolute, sometimes strongly so; major veins usually depressed; lower leaf surface with some scales often large and with irregular margins, others smaller and more nearly entire, at least the smaller scales more-or-less persistent; [shrub or small tree to \(6(-10) \mathrm{m}\) tall] L. ferruginea
2 Ultimate branches rigidly ascending, flowers frequent on branches of the current year (though also on older growth), the leaves conspicuously reduced toward the branch tips; leaves with distal margin at most slightly revolute; major veins not depressed; lower leaf surface with scales usually all large and with irregular margins, the scales often deciduous; [shrub to 1.5 (-3) m tall]
L. fruticosa

1 Lower leaf surfaces glabrous or pubescent; [collectively widespread].
3 Leaves evergreen (some leaves present on wood of the previous year), coriaceous, and shining . . . . . . . . . . . . L. Iucida
3 Leaves deciduous (no leaves present on wood of the previous year), subcoriaceous, and dull.
4 Young twigs angled; leaf margin entire; corolla 7-14 mm long; inflorescence umbellate-racemose, in fascicles along previous year's (leafless) growth; capsule 4-6 mm long; leaf surfaces with tiny, red, short-stalked capitate glands (also often with spreading, translucent hairs on the main veins) . . . . . . . . . . . . . . . . . . . . . . . . . . . L. mariana 4 Young twigs terete; leaf margin minutely serrulate; corolla \(3-5 \mathrm{~mm}\) long; inflorescence a terminal panicle; capsule 2.5-3 mm long; leaf surfaces with appressed, strigillose hairs, pale with a red base.

5 Inflorescences naked, or with only a few leafy bracts; [of the Mountains, Piedmont, and (less commonly) Coastal Plain] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . L. ligustrina var. ligustrina 5 Inflorescences (at least the lower) with conspicuous bracts; [of the Coastal Plain and lower Piedmont]
L. ligustrina var. foliosiflora

Lyonia ferruginea (Walter) Nuttall, Crookedwood, Dragonwood, Staggerbush. Cp (GA, SC): pocosins; common (rare but locally common in spodosolic flatwoods of Jasper and Beaufort counties, SC) (SC Rare). April-May; September-October. Se. SC south to sc. peninsular FL, west to panhandle FL. See discussion under L. fruticosa. [= RAB, GW, K, L, Z; = Xolisma ferruginea (Walter) Heller -- S]

Lyonia fruticosa (Michaux) G.S. Torrey, Staggerbush, Poor-grub. Cp (GA, SC): pocosins; common (rare in SC). Se. SC (at least formerly) south to s. peninsular FL, west to panhandle FL. Though not included in RAB for our area, Judd (1981) cites several old specimens from SC. The species is definitely known from immediately adjacent GA, and there seems no reason to doubt its (at least historical) occurrence in SC. This species is difficult to distinguish from L. ferruginea, with which it often co-occurs. [= GW, K, L, Z; = Xolisma fruticosa (Michaux) Nash -- S]

Lyonia ligustrina (Linnaeus) Augustin de Candolle var. foliosiflora (Michaux) Fernald, Southern Maleberry, He-huckleberry
 Watch List). Late April-June; September-October. Se. VA south to c. FL, west to e. TX and e. OK, and (west of the mountains) north to TN and AR. Rather nondescript when sterile, the gray-green hue of the leaves is a useful character. Var. foliosiflora is the usual variety on the Coastal Plain (including the fall-line sandhills). [= GW, K, L, W, Z; < L. ligustrina -- RAB, C, G; > L. ligustrina var. capreaefolia (Watson) Augustin de Candolle -- F; > L. ligustrina var. foliosiflora - F; > L. ligustrina var. salicifolia (Watson) Augustin de Candolle -- F; = Arsenococcus frondosus (Pursh) Small -- S]

Lyonia ligustrina (Linnaeus) Augustin de Candolle var. ligustrina, Northern Maleberry, He-huckleberry. Mt (GA, NC, SC, \(V A), P d(G A, N C, S C, V A), C p(N C, S C)\) : mountain bogs, shrub balds, bottomlands, other moist to wet habitats, "dry" ridges at high elevations; common. May-June; September-October. S. ME, s. NH, s. VT, s. and e. NY, s. OH, WV, and KY south to w. and c. SC, n . GA, and ne. AL, primarily in the mountains and adjacent provinces. Var. ligustrina is the usual variety in the Mountains and Piedmont, but extends as well into the Coastal Plain in NC and SC. This variety is very variable in leaf shape and size, some populations having leaves about 3 cm long and 1.3 cm wide, others with leaves to as large as 8 cm long and 5 cm wide. The plants with smaller leaves occur in bogs and other distinctly wet habitats, while plants with large leaves occur in thin soils in high elevation heath balds and thin soils around rock outcrops (as, for instance, on Grandfather Mountain, NC). [= F, GW, K, L, W, Z; < L. ligustrina -- RAB, C, G; = Arsenococcus ligustrinus (Linnaeus) Small -- S]

Lyonia lucida (Lamarck) K. Koch, Shining Fetterbush. Cp (GA, NC, SC, VA), Pd (GA): pocosins, wet woodlands, blackwater swamp forests, other acidic wetlands, especially if peaty; common (uncommon in VA). April-early June; September-October. Se. VA south to s. FL and west to e. and c. LA; also in w. Cuba. Readily distinguished by the glossy, coriaceous leaves with a prominent vein running along the margins. When in flower in large numbers, the odor is cloyingly sweet. [= RAB, C, F, G, GW, K, L, Z; = Desmothamnus lucidus (Lamarck) Small -- S; = Neopieris nitida (Bartram ex Marshall) Britton]

Lyonia mariana (Linnaeus) D. Don, Staggerbush. Cp, Pd (GA, NC, SC, VA): pine flatwoods, savannas, pocosin-sandhill ecotones, dry rocky woodlands in the lower Piedmont (especially with chestnut oak); common (uncommon in Piedmont). April-May; September-October. RI (formerly) and NY (Long Island) south to c. and w. FL; disjunct in sc. MO, c. AR, nw. LA, se. OK, and e. TX. Readily distinguishable by the broadly elliptic leaves borne at an ascending 45 degree angle, with bright pink axillary buds. [= RAB, C, F, G, GW, K, L, Z; = Neopieris mariana (Linnaeus) Britton -- S]

\section*{Menziesia J.E. Smith 1791 (Minniebush)}

A genus of about 7-10 species, shrubs, of e. Asia (mostly), w. North America, and se. North America. Menziesia ferruginea J.E. Smith of w. North America is closely related; the other species of the genus are e. Asian. References: Stevens et al. in Kubitzki (2004).

Menziesia pilosa (Michaux ex Lamarck) Antoine Laurent de Jussieu ex Persoon, Minniebush. Mt (GA, NC, SC, VA), Pd (NC, SC, VA): heath balds, bogs, rocky summits, and rocky woodlands, mostly at high elevations; common (uncommon in NC Mountains, rare in GA Mountains, rare in SC and NC Piedmont) (GA Special Concern). May-July; August-October. A Southern and Central Appalachian endemic: sc. PA, sw. PA, e. WV, w. VA, e. TN, w. NC, and ne. GA. The very prominent mucro on the leaves and the series of fascicles of trichomes along the leaf midrib below readily distinguish the species in sterile condition from superficially somewhat similar Rhododendron and Vaccinium. [= RAB, C, F, G, K, L, S, W]

\section*{Monotropa Linnaeus 1753 (Indian Pipes, Pinesap) \\ (see also Hypopitys)}

A monotypic genus, an herb, of North America, Central America, South America, and e. Asia. The segregation of Monotropa, Hypopitys, and Monotropsis into the Monotropaceae or their inclusion in the Ericaceae has been controversial. Recent studies suggest that their inclusion in the Ericaceae is warranted (Kron \& Chase 1993, Judd \& Kron 1993). References: Stevens et al. in Kubitzki (2004).

1 Flowers few to many, racemose; stem pubescent, at least in the inflorescence; plant yellow, orange, or red when fresh, aging or drying dark brown [Hypopitys monotropa] 1 Flower solitary; stem glabrous; plant white (rarely pink) when fresh, aging or drying black . . . . . . . . . . . . . Monotropa uniflora

Monotropa uniflora Linnaeus, Indian Pipes. Mt, Pd, Cp (GA, NC, SC, VA): a wide variety of forests; common. June-October; August-November. Widespread in North America, and also in South America and e. Asia. A preliminary molecular study suggests that splitting of Monotropa uniflora in several species or varieties may be warranted (Neyland \& Hennigan 2004). [= RAB, C, F, G, K, L, S, W; > M. uniflora - S; > M. brittonii Small -- S]

Monotropsis Schweinitz in Elliott 1817 (Sweet Pinesap)

A monotypic genus, an herb, of e. North America. References: Stevens et al. in Kubitzki (2004).

Monotropsis odorata Schweinitz ex Elliott, Sweet Pinesap. Pd, Mt (GA, NC, SC, VA), Cp (VA): dry to mesic upland woods, especially slopes or bluffs with abundant heaths, often Rhododendron maximum; rare (GA Special Concern, NC Rare, SC Rare, VA Rare). September-November and February-April; October-November and May-June. Centered in the Appalachians: MD and WV south to GA and AL. The flowers are very fragrant, the odor variously described as similar to cloves, nutmeg, cinnamon, and violets. Since the diminutive plants ( \(3-10 \mathrm{~cm}\) tall) are often covered by leaf litter, fragrance is often the key to finding this species. Monotropsis is mycotrophic, receiving its nutritrion by association with a mycorrhizal fungus, the intertwined root mass and fungal mantle about 1-2 cm in diameter. [= C, F, G, K, L, W; > M. odorata var. lehmaniae (Burnham) Ahles -- RAB; > M. odorata var. odorata - RAB; >M. lehmaniae Burnham -- S ; \(>\mathrm{M}\). odorata - S , in a narrower sense]

\section*{Orthilia Rafinesque 1840 (One-sided Shinleaf)}

A monotypic genus, a subshrub, circumboreal in distribution. The recognition of Orthilia as separate from Pyrola is supported by molecular data (Freudenstein 1999a). References: Stevens et al. in Kubitzki (2004).

Orthilia secunda (Linnaeus) House, One-sided Shinleaf, One-sided Pyrola. Pd, Cp (VA): forests under Pinus virginiana, other forests?; rare (VA Rare). June-July; July-September. Circumboreal, in North America south to VA, IN, MN, and NM. [= K, L; = Pyrola secunda Linnaeus -- C, G, W; ? P. secunda var. secunda -- F]

\section*{Oxydendrum Augustin de Candolle 1839 (Sourwood)}

A monotypic genus, a tree, of se. North America. The genus Oxydendrum is "isolated ... among the Ericaceae, apparently with no close relatives" (Wood 1961): the only member of tribe Oxydendreae. References: Stevens et al. in Kubitzki (2004).

Oxydendrum arboreum (Linnaeus) Augustin de Candolle, Sourwood, Sorrel-tree. Mt, Pd, Cp (GA, NC, SC, VA): mesic to xeric deciduous forests, especially dry-mesic to xeric oak-hickory and oak-pine forests, also in the fall line sandhills in sandhill/pocosin ecotones; common (becoming uncommon to rare in \(n\). VA). Se. and sw. PA west to IL, south to \(n\). FL and se. and c. LA. It is an especially characteristic understory tree of upland forests of the Piedmont and lower Mountains. The bark is dark grayish-brown and fairly deeply furrowed; the tree nearly always has a characteristic lean (towards a former canopy light-gap). The finely serrate, elliptic leaves are distinctive, with the sour taste of garden sorrel (Rumex acetosa Linnaeus), sheep sorrel (Rumex acetosella), or wood sorrel (Oxalis). [= RAB, C, F, G, K, L, S, W]

\section*{Pieris D. Don 1834 (Evergreen Fetterbush)}

A genus of 7 species, shrubs, of e. Asia, e. North America, and Cuba. Judd (1982) treats Pieris as a genus of 7 species, 4 in e. Asia, 1 in the Southern Appalachian Mountains, 1 in the se. United States Coastal Plain, and 1 in w. Cuba. References: Judd (1982) \(=\) Z; Judd (1979); Stevens et al. in Kubitzki (2004).

1 Inflorescence a many-flowered panicle of racemes, borne terminally; seeds 2.5-3 mm long; [of slopes and ridges of the Mountains and upper Piedmont]; [subgenus Pieris, section Pieris] . P. floribunda

1 Inflorescence a 3-9 flowered raceme, borne in the axils of upper leaves; seeds ca. 1 mm long; [of wetlands of the Coastal Plain, often associated with Taxodium ascendens]; [subgenus Pieris, section Phillyreoides] P. phillyreifolia

Pieris floribunda (Pursh) Bentham \& Hooker f., Mountain Andromeda, Evergreen Mountain Fetterbush. Mt, Pd (NC, VA): acid wooded slopes, heath balds at high elevations, summits of Piedmont monadnocks; common (uncommon and local in NC, rare in Piedmont). May-June; August-October. A Southern Appalachian endemic: e. WV, w. VA, w. NC, e. TN, and n. GA. The range in NC is peculiar, the species occurring at high elevations southwest of Asheville, absent from apparently suitable habitats to the northeast (such as the Craggies, Blacks, Roan Mountain, and Grandfather Mountain), yet reappearing in a few disjunct populations at low elevations in the upper Piedmont. In w. VA (and adjacent e. WV), P. floribunda occurs on rather dry sandstone ridges and upper slopes, often under an oak canopy, especially in the front ranges of the Cumberland Mountains. P. floribunda is placed in subgenus Pieris, section Pieris, along with two Asian species. [= RAB, C, F, G, K, L, S, W, Z]

Pieris phillyreifolia (Hooker) Augustin de Candolle, Vine-wicky, Climbing Fetterbush. Cp (GA, SC): swamp forests; rare (SC Rare). E. SC south to c. peninsular FL west to s. AL. This southeastern species has the remarkable habit of growing as a creeping vine under the bark of Taxodium ascendens, the branches exserted through the cypress bark, sometimes ascending into the upper canopy with the main stem never visible except at the very base of the tree. Godfrey (1969) documents the occurrence of this species in our area. See GW and Godfrey (1989) for excellent decriptions and illustrations of this curious "shrub-vine." It is apparently most closely related to the other two members of subgenus Pieris, section Phillyreoides, P. cubensis (Grisebach) Small, endemic to w. Cuba, and \(P\). swinhoei Hemsley, of se. China, neither of which shares its unique habit. \([=G W, K, L, Z\); \(=\) Ampelothamnus phillyreifolius (Hooker) Small -- S]
* Pieris japonica (Thunberg) D. Don ex G. Don, Japanese Andromeda or Lily-of-the-valley Bush, rather closely related to our \(P\). floribunda, is frequently grown as an ornamental. \{not keyed\}

Pyrola Linnaeus 1753 (Shinleaf, Pyrola)
A genus of 30-35 species, subshrubs, circumboreal and also in Sumatra and Guatemala. The inclusion of this group of species in
the Ericaceae or its recognition as a separate family has been controversial. Recent studies (Judd \& Kron 1993, Kron \& Chase 1993) suggest that it is best resubmerged in the Ericaceae. References: Stevens et al. in Kubitzki (2004).

1 Calyx lobes distinctly longer than broad, 3-4 mm long; leaves coriaceous, more or less glossy
P. americana

1 Calyx lobes about as broad as long, 1.5-2 mm long; leaves not coriaceous, dull.
2 Leaves mostly 1-3 cm long, the blade less than 2.5 cm wide; calyx lobes broadly ovate, the apex subacute to obtuse
P. chlorantha

2 Leaves mostly 3-9 cm long, the blade more than 2.5 cm wide; calyx lobes triangular, the apex acute to acuminate
P. elliptica

Pyrola americana Sweet, Rounded Shinleaf. Mt, Pd (NC, VA), Cp (VA): xeric to mesic woodlands and forests; common (uncommon in NC). May-August; July-October. Widespread in ne. North America, south to NC, ne. TN, KY, IN, and MN. [= K, S, W; = P. rotundifolia Linnaeus var. americana (Sweet) Fernald -- RAB, C, F, G, L]

Pyrola chlorantha Swartz. Mt, Pd (VA): dry forests; rare (VA Rare). June-August; August-October. Circumboreal, in North America south to VA, WV, IN, and NE. [= C, K, L, W; ? P. virens var. convoluta (Bart.) Fernald -- F, G]

Pyrola elliptica Nuttall, Elliptic Shinleaf. Mt (NC, VA): moist to dry forests, including rich northern hardwood forests; rare (NC Rare, VA Rare). June-August; July-October. Newfoundland and Québec, west to British Columbia, south to WV, nw. NC, and IA. Known in NC only from Ashe County, in Long Hope Valley (McDowell 1984) and on Phoenix Mountain. [= C, F, G, K, L, S, W]

\section*{Rhododendron Linnaeus 1753 (Rhododendron, Azalea)}

A genus of about 850 species, shrubs and trees, mostly north temperate (centered in Himalayan Asia). References: Kron (1993)=Z; Judd \& Kron (1995)=Y; Chamberlain (1982)=X; Cullen (1980)=Q; Davidian (1982)=D; Kron \& Creel (1999); Stevens et al. in Kubitzki (2004).

1 Leaves evergreen, coriaceous, entire; stamens 10.
2 Lower surface of leaves punctate with brown scales; larger leaves 6-12 cm long; [subgenus Rhododendron, section Rhododendron].
3 Corolla mostly \(1.5-2 \mathrm{~cm}\) long, the corolla tube ( \(0.9-1.3 \mathrm{~cm}\) long) shorter than to as long as the corolla lobes (1.2-1.8 cm long); plant flowering early relative to Rh. minus, despite occurring at higher elevations and more northern latitudes; calyx lobes deltoid; [of mountain ridges, heath balds, and rocky summits, mostly either away from the Blue Ridge Escarpment or north of the Asheville Basin]

Rh. carolinianum
3 Corolla mostly \(2.5-3 \mathrm{~cm}\) long, the corolla tube (1.6-2.2 cm long) longer than the corolla lobes ( \(0.8-1.2 \mathrm{~cm}\) long); plant flowering late relative to Rh. carolinianum; calyx lobes ovate; [of the Coastal Plain, Piedmont, and Mountains, in the Mountains mostly of the Blue Ridge Escarpment of sw. NC and nw. SC, ranging in elevation up to the higher granitic domes in Macon and Jackson counties, NC]

Rh. minus
2 Lower surface of leaves not punctate with brown scales; larger leaves 10-30 cm long; [subgenus Hymenanthes,
subsection Pontica].
4 Leaves cuneate at base, acute at apex; leaf generally \(3-5 \times\) as long as wide; corolla usually white to pale pink; sepals 4-6 mm long

Rh. maximum
4 Leaves rounded at base (rarely broadly cuneate or slightly cordate), obtuse at apex; leaf generally \(1.5-2.5 \times\) as long as wide; corolla usually deep pink to purple; sepals \(0.5-1 \mathrm{~mm}\) long . . . . . . . . . . . . . . . . . . . . . . . Rh. catawbiense
1 Leaves deciduous, membranaceous, ciliate or serrulate; stamens 5-7; \{also see Alternate Key to azaleas emphasizing vegetative characters\}.
5 Corolla tube 2-5 mm long, much shorter than the corolla lobes; stamens (5-) 7; leaves elliptic, often broadly so (commonly 3-6 cm wide), acuminate; capsule ellipsoid-ovoid, \(10-14 \mathrm{~mm}\) long; [subgenus Pentanthera, section Rhodora] . Rh. vaseyi
5 Corolla tube \(13-25 \mathrm{~mm}\) long, equal to or longer than the corolla lobes; stamens 5 ; leaves generally oblanceolate to narrowly elliptic, generally less than 3 cm wide, acute to obtuse, mucronate; capsule cylindroid-ellipsoid, \(10-25 \mathrm{~mm}\) long; [subgenus Pentanthera, section Pentanthera].

\section*{6 Corolla yellow, orange, or red.}
\(7 \quad\) Flowers appearing after the leaves have expanded.
8 Twigs pubescent with multicellular hairs; [north of ec. AL and wc. GA] . . . . . . . . . Rh. cumberlandense
8 Twigs glabrous; [south of ec. AL and wc. GA]
7 Flowers appearing before or with the leaves.
9 Corolla limb shorter than the length of the corolla tube, the tube gradually expanding into the limb..
... Rh. austrinum
9 Corolla limb nearly as broad as the tube is long, the tube abruptly expanding into the limb.
10 Floral bud-scales with glandular margins, the outer surface glabrous; corolla tube glandularpubescent on its outer surface; sepals 2.0-3.0 mm long . . . . . . . . . . . . . . . . . . . Rh. calendulaceum
10 Floral bud-scales with ciliate margins, the outer surface glabrous to sparsely pubescent; corolla tube pubescent (not glandular or rarely very weakly so) on the outer surface; sepals 0.5-3.0 mm long ....

6 Corolla white or pink (white marked with yellow in Rh. eastmanii and Rh. alabamense).
11 Sepals \(1.5-5 \mathrm{~mm}\) long.
12 Young stems densely pubescent, generally with a mixture of glandular and nonglandular hairs; clonal shrub, the upright stems up to 1.5 m tall

Rh. atlanticum
12 Young stems glabrous (rarely very sparsely pubescent); nonclonal shrub or small tree, to 7 m tall

11 Sepals 0.1-1 mm long.
13 Leaves glabrous beneath, except for strigose bristles along the midrib and major veins.
14 Pedicels densely stipitate-glandular; flowers appearing after the leaves . . Rh. viscosum
14 Pedicels strigose to puberulent, not stipitate-glandular; flowers appearing with or before the leaves .
\(R h\). periclymenoides
13 Leaves densely and softly pubescent beneath.
15 Corolla lobes about as long as the corolla tube; capsule densely glandular-pubescent; [of northern distribution, of montane areas of w. NC, w, VA, and northwards] . . . . . . . . . . . . . Rh. prinophyllum
15 Corolla lobes much shorter than the corolla tube; capsule sparsely pubescent, the pubescence not glandular (or with some of the hairs glandular in Rh. eastmanii and Rh. alabamense); [of southern distribution, from c. SC and se. TN southwards].
16 Corolla pale to deep pink, without yellow markings; scales of the winter buds pubescent on the outer surface . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Rh. canescen
16 Corolla white, with a blotch of yellow on the upper lobe; scales of the winter buds glabrous on the outer surface.
17 Flowers opening before the leaves have expanded; flower buds with non-glandular margins
Rh. alabamense
17 Flowers opening after the leaves have expanded; flower buds with margins glandular along their lower \(2 / 3 \mathrm{~s}\). . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Rh. eastmanii

\section*{Alternate Key to Azaleas}

This key makes as much use as possible of vegetative characters, geography, and capsule characters; capsules are generally available for longer during the year than flowers, and even when plants are in flower, last year's capsules can often be found.

1 Corolla tube 2-5 mm long, much shorter than the corolla lobes; stamens (5-) 7; leaves elliptic, often broadly so (commonly 3-6 cm wide), acuminate; capsule ellipsoid-ovoid, \(10-14 \mathrm{~mm}\) long; [subgenus Pentanthera, section Rhodora]
. . Rh. vaseyi
1 Corolla tube \(13-25 \mathrm{~mm}\) long, equal to or longer than the corolla lobes; stamens 5 ; leaves generally oblanceolate to narrowly elliptic, generally \(<3 \mathrm{~cm}\) wide, acute to obtuse and usually also noticeably mucronate; capsule cylindroid-ellipsoid or ovoid, 10-29 mm long; [subgenus Pentanthera, section Pentanthera].
2 Outer (abaxial) surface of the vegetative bud scales densely pubescent; flowers appearing before or with the leaves (at least some of the leaves still folded or the vegetative bud scales still present) (except Rh. viscosum).
3 Capsule ovoid, 2-3 (-4)× as long as broad (if capsules absent, try both leads).
4 Corolla yellow-orange to orange-red; upper corolla lobe with a contrasting blotch; hairs of the capsule not glandtipped; [of the Piedmont and Coastal Plain of GA and w. SC]

Rh. flammeum
4 Corolla white to pink; upper corolla lobe uniform in color (lacking a contrasting blotch); hairs of the capsule gland-tipped (at least in part; nonglandular hairs also present); [collectively widespread in our area].
5 Flowers appearing after the leaves have expanded (essentially all of the leaves unfolded, and the vegetative bud scales absent), typically May (Coastal Plain, low elevation, or south) to August (mountains, high elevation, or north). \(\qquad\) . Rh. viscosum
5 Flowers appearing before or with the leaves (at least some of the leaves still folded or the vegetative bud scales still present), typically April-May (unless stimulated by fire or weather).
6 Leaf blade (3.2-) 3.4-4.7 (-5.2) cm long, (0.8-) 1.1-1.9 (-2.0) cm wide; plant typically strongly rhizomatous; [plants of the Coastal Plain from s. NJ south to sc. GA] . . . . . . . . . . . Rh. atlanticum
6 Leaf blade (3.9-) 5.0-7.3 (-8.7) cm long, (1.2-) 1.8-3.0 (-3.7) cm wide; plant typically nonrhizomatous;
[plants of Mountains and upper Piedmont] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Rh. prinophyllum
3 Capsule cylindroid, (3-) 4-5× as long as broad.
7 Corolla yellow-orange to orange-red; upper corolla lobe with a contrasting blotch; [of s. GA west to se. MS] ...
Rh. austrinum
7 Corolla white to pink; upper corolla lobe uniform in color (lacking a contrasting blotch); [collectively widespread in our area].
8 Corolla tube narrow and somewhat abruptly expanding into the lobes, the lobes distinctly shorter than the tube; pedicels usually eglandular (occasionally glandular), (4-) 5-10 (-13) mm long; leaves inconspicuously ciliate, the cilia appressed to the leaf margin; capsule densely covered with nonglandular hairs; flowering March-May; [widely distributed from s. NC and \(n\). TN southwards]

Rh. canescens
8 Corolla tube broader, gradually expanding into the lobes, the lobes about as long as or longer than the tube; pedicels usually glandular, (7-) 10-16 (-26) mm long; leaves conspicuously ciliate, the cilia diverging from the leaf margin; capsule glabrous or sparsely pubescent, the hairs at least partly gland-tipped; flowering May-June; [of the Mountains and upper Piedmont from n. NC (and rarely ne. AL) northwards] . .

Rh. prinophyllum
2 Outer (abaxial) surface of the vegetative bud scales glabrous or sparsely pubescent.
9 Capsule cylindric, (3-) 4-5 \(\times\) as long as broad; corolla white to pink; flowers appearing before or with the leaves (at least some of the leaves still folded or the vegetative bud scales still present).
10 Corolla white, with a contrasting yellowish blotch on the upper lobe; [of se. TN and w. GA westwards] ........ .
Rh. alabamense
10 Corolla deep pink (rarely white or nearly so), lacking a contracting blotch on the upper lobe; [widespread in our Capsule ovate, 2-3.5× as long as broad; corolla yellow, orange, or orange-red (except white or pink in \(R h\). arborescens and Rh. viscosum); flowers appearing before, with, or after the leaves. 11 Corolla white to pink.
Rh. arborescens
Rh. eastmanii
Rh. viscosum
11 Corolla yellow, orange, or orange-red.
Rh. calendulaceum
Rh. flammeum
Rh. cumberlandense
[Rh. prunifolium]
Rhododendron alabamense Rehder, Alabama Azalea. Cp, Pd, Mt (GA): moist slopes, blufs, streambanks; uncommon. March-April. W. GA and Panhandle FL west through AL to e. MS. Rh. alabamense is reported by RAB to occur Calhoun County, SC; this record actually represents Rh. eastmanii. [=K, L, Z; = Azalea alabamensis (Rehder) Small -- S]

Rhododendron arborescens (Pursh) Torrey, Sweet Azalea, Smooth Azalea. Mt, Pd (GA, NC, SC, VA), Cp (GA, NC, SC): rocky riversides, wooded stream banks, swamps, high elevation forests, shrub balds; common (rare in VA) (VA Rare). Late MayJuly; July-October. Primarily Appalachian: ne. PA and se. KY south to sc. NC, w. SC, c. GA, and c. AL. [= RAB, C, F, G, K, L, W, Z; = Azalea arborescens Pursh -- S]

Rhododendron atlanticum (Ashe) Rehder, Dwarf Azalea. Cp (GA, NC, SC, VA): pocosins, savannas, pine flatwoods, sandhill-pocosin ecotones; common. April-May (sporadically later, particularly in response to fire); August-October. An Atlantic Coastal Plain endemic: s. NJ and se. PA south to sc. GA. [= RAB, C, F, G, GW, K, L, Z; = Azalea atlantica Ashe -- S]

Rhododendron austrinum (Small) Rehder. Cp (GA): \{habitat\}; rare. Sc. GA west to se. MS (Kron 1993), and reported for e. GA (Jones \& Coile 1988). [= K, L, Z; = Azalea austrina Small -- S]

Rhododendron calendulaceum (Michaux) Torrey, Flame Azalea. Mt (GA, NC, SC, VA), Pd (GA, NC, SC): deciduous forests, particularly on mountain slopes, grassy balds; common (rare in Piedmont, absent from n. VA). May-June; June-September. Largely Appalachian: s. PA and s. OH to c. GA and e. TN. This is the only species of azalea in our area with a tetraploid chromosome number; various theories have been advanced about the origin of this polyploid chromosome complement. Kron (1993) argues that the evidence best fits an allopolyploid derivation of \(R h\). calendulaceum, involving hybridization between ancestors of Rh. cumberlandense and Rh. prinophyllum. [= RAB, C, F, G, K, L, W, Z; = Azalea calendulacea Michaux -- S]

Rhododendron canescens (Michaux) Sweet, Piedmont Azalea, Southern Pinxterbloom Azalea, Wild Azalea. Cp, Pd (GA, NC, SC), Mt (GA): swamps, pocosins, and savannas; uncommon. March-early May; September-October. Se. and sc. NC, n. TN, se. KY, s. IL, and e. OK, south to c. peninsular FL and se. TX. [= RAB, C, F, G, GW, L, W, Z; > Rh. canescens var. canescens -- K; >Rh. canescens var. candidum (Small) Rehder -- K; > Rh. canescens var. subglabrum Rehder -- K; > Azalea candida Small -- S; > Azalea canescens Michaux -- S]

Rhododendron carolinianum Rehder, Carolina Rhododendron, Punctatum. Mt (NC, SC): rocky summits, heath balds, high elevation forests, moist slopes; uncommon. Late April-May; September-October. A Southern Appalachian endemic: w. NC, e. TN, ne. GA, and nw. SC. Rh. carolinianum is phenologically separated from Rh. minus, flowering earlier than Rh. minus, despite its occurrence at higher elevations and with a more northerly distribution. Ranging from the Linville Gorge area south and west to the Great Smoky Mountains; its precise southern limit uncertain. Morphological distinctions between the two taxa are subtle and inconsistent, as discussed by Duncan \& Pullen (1962). From a horticultural perspective, Davidian (1982) supports recognition of \(R h\). carolinianum and \(R h\). minus as distinct. [= D, K, S; < Rh. minus -- RAB, W, in part; < Rh. minus var. minus -- L, Q, in part]

Rhododendron catawbiense Michaux, Pink Laurel, Catawba Rhododendron, Mountain Rosebay. Mt (GA, NC, SC, VA), Pd (NC, SC, VA): rocky summits, shrub balds, acid ridges and slopes (mostly at high elevations), north-facing bluffs in the Piedmont; common (rare in Piedmont) (SC Rare). April (in the Piedmont)-June; July-October. A Southern Appalachian endemic: VA and KY south to GA and AL, with scattered disjunct populations in the Piedmont. The disjunct Piedmont populations in northcentral NC are discussed by Coker (1919), who named them forma insularis on the basis of "the larger and broader leaves and ... the longer flowers." Rh. catawbiense is apparently most closely related to Rh. macrophyllum D. Don ex G. Don of nw. North America (Milne 2004). [= RAB, C, F, G, K, L, S, W, X]

Rhododendron cumberlandense E.L. Braun, Cumberland Azalea. Mt (GA, NC, VA), Pd (SC): balds and exposed or moist slopes; rare (NC Rare, VA Rare). June-July; July-October. A Southern Appalachian endemic, primarily west of the Blue Ridge: e. KY and w. VA south to ec. TN, n. GA, and ne. AL; apparently disjunct in the Piedmont of SC (Kron 1993). [= F, G, K, L, W, Z; Rh. bakeri (Lemmon \& McKay) Hume -- C, misapplied]

Rhododendron eastmanii Kron \& Creel, May White Azalea, Eastman's Azalea. Pd (SC): rich slopes, rare. Early-mid May. This species is known only from Calhoun, Laurens, Newberry, Orangeburg, Richland, Union counties, South Carolina (Kron \& Creel 1999; C. Horn pers. comm. 2000). It is locally fairly common, in the Broad River drainage (C. Horn, pers. comm. 2000). It should be sought in NC and GA. The RAB reference to Rh. alabamense in SC is probably based on this species. [= Rhododendron alabamense Rehder - RAB, misapplied]

Rhododendron flammeum (Michaux) Sargent, Oconee Azalea. Cp, Pd (GA, SC), Mt (GA): sandhills, upland forests on slopes, ridges, stream bluffs; rare (SC Rare). April. W. SC west to w. GA. [= K, L, Z; Azalea speciosa Willdenow -- S; Rhododendron speciosum (Willdenow) Sweet]

Rhododendron maximum Linnaeus, Great Laurel, White Rosebay, Great Rhododendron. Mt, Pd (GA, NC, SC, VA), Cp (VA): moist slopes, wet flats, bogs, swamps, north-facing bluffs in the Piedmont; common (uncommon in Piedmont, rare in VA Coastal Plain). Apparently most closely related to Rh. ponticum Linnaeus of Turkey and vicinity (Milne 2004). June-August; SeptemberOctober. Largely Appalachian: Nova Scotia and s. Ontario south to GA and AL, primarily in the mountains. [= RAB, C, F, G, K, L, S, W, X]

Rhododendron minus Michaux, Gorge Rhododendron, Punctatum. Mt, Pd, Cp (GA, NC, SC): rocky slopes, escarpment
gorges, rocky areas in the Piedmont, sandhill bluffs in the Coastal Plain; common (rare in Piedmont and Coastal Plain). Late April (in the Piedmont and Coastal Plain)-June (at the higher elevations along the Blue Ridge escarpment); September-October. GA and AL north to the Blue Ridge escarpment of n. GA, nw. SC, and sw. NC, and the Piedmont and inner Coastal Plain (fall-line sandhills) of sc. NC. This species ranges up to granite domes along the Blue Ridge Escarpment (such as Whiteside Mountain, Macon and Jackson counties, NC). Rh. chapmanii A. Gray [= Rh. minus var. chapmanii (A. Gray) Duncan \& Pullen], of FL, is related. [= D, K, \(\mathrm{S} ;<R h\). minus -- RAB, W (also see Rh. carolinianum); < Rh. minus var. minus -- L, Q]

Rhododendron periclymenoides (Michaux) Shinners, Wild Azalea, Pinxterflower, Pinxterbloom Azalea, Election Pink. Mt, Pd, Cp (GA, NC, SC, VA): moist to dry slopes and streambanks; common. Late March-May; September-October. Fairly widespread in e. United States, ranging from MA, NY, and s. OH, south to GA and AL. See Shinners (1962) for explanation of the change from the name Rh. nudiflorum. [= C, K, L, W, Z; = Rh. nudiflorum (Linnaeus) Torrey -- RAB, F, G, GW; = Azalea nudiflora Linnaeus -- S]

Rhododendron prinophyllum (Small) Millais, Election Pink, Early Azalea, Roseshell Azalea. Mt (NC, VA), Pd (VA): upland forests (especially under Quercus montana and Quercus rubra), xeric pine and oak woodlands; common in VA, rare in NC, rare in VA Piedmont (NC Rare). May-June; August-October. NH, NY, and ne. OH, south to w. NC, nc. KY, and s. OH; disjunct in ne. AL and c. TN; also disjunct from s. IL and s. MO south to AR and e. OK. The only known location in NC is on Bluff Mountain, Ashe County (on a rocky plateau over amphibolite at about 1300 m elevation); Kron (1993) also cites a collection from Transylvania County. See Shinners (1962) for explanation of the change from the name Rh. roseum. [= C, K, L, W, Z; = Rh. roseum (Loiseleur) Rehder -- RAB, F, G; = Azalea prinophylla Small -- S]

Rhododendron prunifolium (Small) Millais, Plumleaf Azalea. Cp, Pd (GA): mesic ravine forests and streambanks; rare (GA Threatened). Endemic to a small area along the AL-GA border, in se. AL (Kron 1993) and sw. and wc. GA (Jones \& Coile 1988). [= \(\mathrm{K}, \mathrm{L}, \mathrm{Z}\); = Azalea prunifolia Small -- S]

Rhododendron vaseyi A. Gray, Pinkshell Azalea. Mt (GA?, NC): moist slopes, bogs, high elevation rocky summits, cliffs, high elevation heath balds; rare (NC Rare). May-June; August-October. Endemic to the mountains of NC, though approaching very close to SC and GA in the vicinity of Cashiers and Highlands, NC and reported for Rabun Bald (Rabun Co. GA) without definite documentation; Rh. vaseyi occurs primarily southwest of the Asheville Basin, but is found at scattered locations farther north and is locally abundant on Grandfather Mountain (at the junction of Avery, Watauga, and Caldwell counties, NC), its northernmost outpost. Judd \& Kron (1995) treat Rh. vaseyi and Rh. canadense (Linnaeus) Torrey (of ne. North America) as the only two members of section Rhodora. When not in flower, \(R h\). vaseyi is readily distinguished from our other azaleas by its distinctive foliage (see key). [= RAB, F, K, L, W, Y; = Biltia vaseyi (A. Gray) Small -- S]

Rhododendron viscosum (Linnaeus) Torrey, Swamp Azalea, Clammy Azalea. Cp, Mt, Pd (GA, NC, SC, VA): bogs, pocosins, moist streambanks, shrub balds, and other moist habitats; common (uncommon in VA Piedmont and VA Mountains). Late May-July; July-October. ME and OH south to FL and LA. Rh. serrulatum (Rh. viscosum var. serrulatum) may well deserve recognition at some taxonomic level. [= GW, K, L, W, Z; Rh. viscosum var. serrulatum (Small) Ahles -- RAB; Rh. viscosum var. viscosum - RAB; > Rh. serrulatum (Small) Millais -- C, F, G; > Rh. viscosum - C, F, G, in a narrow sense; > Azalea viscosa Linnaeus -- S; > Azalea serrulata Small -- S]

\section*{Vaccinium Linnaeus 1753 (Blueberry)}

A genus of 140 species, shrubs, lianes, and small trees, semicosmopolitan. Vaccinium in our area is divided into 6 strongly differentiated sections, sometimes, as by Small, treated as separate genera. The taxonomy of Vaccinium remains unclear -- past divergence of opinion is obvious in the synonymy. For instance, Small (1933) recognizes 6 genera and 25 species for our area, Ahles in RAB (1968) recognizes 1 genus and 14 species (one with 2 varieties) (not including VA), and Vander Kloet (1988) recognizes 1 genus and 9 species. The highbush blueberries of section Cyanococcus are particularly difficult. Vander Kloet's extremely broad concept of the highbush blueberries as consisting of a single species, V. corymbosum, including V. fuscatum (V. atrococcum -- RAB), V. simulatum ("V. constablaei" -- RAB), V. virgatum (V. amoenum -- RAB), V. elliottii, V. formosum (V. australe), and \(V\). caesariense (and many other named taxa not recognized here) has been adopted by some recent authors, at least partly for its ease of application. I agree with Godfrey (1988), though, that V. elliottii has "such distinctiveness as to be recognizable in the field at a glance." The other taxa are less easily recognizable, but seem to have substantial morphological and phytogeographic integrity. The fairly frequent presence of hybrid individuals and populations can make identification frustrating, but I agree with Ward (1974) that "the genus Vaccinium ... is difficult but not in any way an irresolvable tangle of intergrading populations. The vast bulk of individuals encountered in the field may be assigned, as with any non-apomict genus, to a relatively few, discrete, and wholly recognizable species". Many of the taxa included in V. corymbosum by Vander Kloet (1988) and Luteyn et al. (1996) occur together in combinations of two to four, are immediately recognizable in the field, bloom at different times, and have different flower, fruit, and leaf morphology. Failure to recognize multiple entities within the highbush blueberries results in the taxonomic homogenization of the diversity of the group and obscures important phytogeographic patterns. Our area, with 20 species ( 24 taxa) in 6 sections, has a greater diversity of Vaccinium than any other comparably sized area in North America. References: Vander Kloet (1988) \(=Z\); Uttal (1987) \(=\) Y; Camp (1945) \(=\) X; Ashe (1931)=V; Ward (1974)=Q; Luteyn et al. (1996)=L; Vander Kloet \& Hall (1981); Vander Kloet (1977, 1978a, 1978b, 1980, 1982, 1983a, 1983b); Uttal (1986a, 1986b); Stevens et al. in Kubitzki (2004). Key based in part on Uttal (1987).

1 Trailing vines, erect shoots (if present) borne on horizontal stems; leaves evergreen, glossy and dark green above, rarely exceeding 20 mm in length.
2 Leaves narrowly elliptic, glabrous above, glaucous-white below; leaf margin entire and eglandular; berry red when ripe, 8-15 mm long; [section Oxycoccus] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Key A
2 Leaves elliptic, puberulent above, pale green below; leaf margin obscurely to fairly strongly serrate and glandular; berry black when ripe, 6-8 mm long; [section Herpothamnus] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Key B
1 Erect shrubs, the growth form various (single-stemmed, multi-stemmed and clump-like, or clonal with numerous erect shoots from a network of subterranean rhizomes); leaves deciduous to semi-evergreen (evergreen in \(V\). myrsinites), dull to somewhat
glossy and medium green above (dark green and glossy in V. myrsinites), generally exceeding 20 mm in length (5-30 mm long in \(V\). myrsinites).
3 Twigs of the season verrucose (the surface abundantly covered with small bumps, readily visible without magnification); [section Cyanococcus]

Key C
3 Twigs of the season not verrucose.
4 Corolla lobes 4, strongly recurved, 7-10 mm long; calyx lobes 4 (visible on the berry); leaves lanceolate to ovate, the apex acuminate, the margin regularly and finely serrate with glandular teeth; [of high elevations in the Mountains]; [section Oxycoccoides]
. Key D
4 Corolla lobes 5, not or only slightly recurved, 1-8 mm long; calyx lobes 5 (visible on the berry); leaves elliptic, obovate, oblanceolate, or nearly round, the apex generally obtuse to rounded, the margin entire to obscurely and irregularly serrate; [collectively widespread in our area, but not at high elevations].
5 Mature leaves green (or glaucous), glandular beneath, mostly elliptic to round, generally \(1.5-4.5 \mathrm{~cm}\) long; corolla broad-urceolate to narrow-campanulate, the stamens included; berry black, lustrous, 5-9 mm long; [section Batodendron] Key E
5 Mature leaves pale and glaucous, eglandular beneath, mostly elliptic, 3-10 cm long; corolla campanulate, the stamens long-exserted; berry green, yellow, pink, or purple, usually glaucous, 7-18 mm long; [section Polycodium]

Key F

\section*{Key A -- section Oxycoccus}

1 Leaves elliptic, broadest near middle, (5-) 7-10 (-18) mm long, (2-) 3-4 (-5) mm wide; leaves blunt-rounded and non-involute; pedicels with 2 green, leaf-like bracts 1-2 mm wide; berry \(8-15 \mathrm{~mm}\) in diameter . . . . . . . . . . . . . . . . . . . . . . V. macrocarpon
1 Leaves ovate, broadest towards base, (3-) 5-6 (-9) mm long, (1-) 2-3 (-5) mm wide; leaves involute at least along the margins, thus making the leaf tip acute; pedicels with (0-) \(2(-5)\) reddish, scale-like bracts less than 1 mm wide; berry 6-12 mm in diameter
[V. oxycoccos]

\section*{Key B -- section Herpothamnus}

1 Leaves (2-) 3-18 (-25) mm long, generally elliptic (less commonly ovate or obovate); angle of leaf base typically >90 degrees; margins finely glandular mucronulate-crenulate, the teeth tightly appressed and therefore often obscure, the margin superficially entire; stems mostly prostrate (ascending in areas that have been long fire-suppressed); [widespread in NC and SC, rare in se. VA and e. GA] V. crassifolium

1 Leaves (4-) 7-35 (-63) mm long, elliptic to obovate (less commonly elliptic-ovate); angle of leaf base typically <90 degrees; margins glandular mucronulate-serrulate to serrulate-crenulate, the teeth apparent, especially towards the apex; stems often ascending to upright; [of Lexington County, SC]
V. sempervirens

\section*{Key C -- section Cyanococcus}

Note: Hybrids and apparent local races in this section are frequent, and will key poorly. Hybrids are particularly frequent among the taxa of the highbush blueberries, somewhat less so among lowbush blueberries and between lowbush and highbush. In the Coastal Plain, V. \(\times\) marianum (formosum \(\times\) fuscatum) is the most common, and will be responsible for most difficulties encountered in the key from lead 10 on. Uttal (1987) presents a complicated key with V. \(\times\) marianum (but not other hybrids) included.

1 Shrubs rhizomatous, forming clonal colonies, the upright stems less than 1 m tall (often less than 0.5 m tall); ["lowbush blueberries"].
2 Leaves evergreen, \(5-15 \mathrm{~mm}\) long (rarely to 30 mm long on fire sprouts), subcoriaceous, glossy dark-green or dull bluegreen; [restricted in our area to the Coastal Plain of se. SC southwards].
3 Plant glaucous and bluish-green throughout; leaf undersurface lacking scattered glandular hairs; [of s. GA south to s. peninsular FL, west to e. TX].
V. darrowii

3 Plant dark green throughout; leaf undersurface with scattered glandular hairs, these sometimes very few by late in the season (best seen in the field by folding a leaf, holding the fold up to the light, and using a \(10 \times\) lens); [of se. SC southwards to n . FL, west to s . AL]
. V. myrsinites
2 Leaves deciduous to semi-evergreen, herbaceous, generally exceeding 20 mm in length, dull to somewhat glossy and medium green; [collectively widespread in our area].
3 Lower surfaces of the leaves with red stipitate glands (sometimes pubescent as well when young); berry usually black and lustrous; [of the Coastal Plain and lower Piedmont] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . V. tenellum
3 Lower surfaces of the leaves eglandular, pubescent or glabrous; berry either blue and glaucous, or black and glandular-hirsute; [collectively widespread in our area].
4 Leaves sharply serrulate (each tooth with a small glandular tip), 20-32 mm long, 6-16 mm wide, green and shiny below (rarely glaucous), glabrous or nearly so . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . V. angustifolium 4 Leaves entire or obscurely serrulate (if obscurely serrulate then \(30-50 \mathrm{~mm}\) long and \(13-25 \mathrm{~mm}\) wide), either glaucous and glabrous (or nearly so) beneath, or green and densely pubescent beneath.
5 Leaves pale and glaucous, glabrous on both sides or pubescent on the underside only; berry blue and glaucous; [plants collectively widespread].
6 Plants mostly 0.5-1.0 (-1.4) m tall, stems brown for much of their length; leaves entire; fruit 7-12 mm in diameter; [of moderate to high elevations of the Mountains] V. altomontanum

6 Plants mostly 0.2-0.6 (-1.0) m tall, stems green to the base (or brown at the very base); leaves
serrulate (rarely entire); fruit 4-7 (-8) mm in diameter; [widespread, at low to moderate elevations] . .
V. pallidum

5 Leaves green, pilose on both sides; berry either blue and glaucous, or black and glandular-hirsute; [of the Mountains].
7 Berry black and glandular-hirsute; calyx and corolla hirsute and stipitate-glandular; leaves mostly more than 3 cm long; [of the mountains of sw. NC and adjacent TN and GA] . . . . . . . . V. hirsutum
7 Berry blue and glaucous; calyx and corolla glabrous; leaves mostly less than 3.5 cm long; [of the mountains of n . NC and north] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . V. myrtilloide
1 Shrubs crown-forming, single-stemmed or several-stemmed from the base, the upright stems generally more than 1 m tall (often 2-3 m tall, and rarely to 7 m ); ["highbush blueberries"].
8 Leaves with stipitate glands on the lower surface; [of the Coastal Plain of SC and s. NC] .................. V. virgatum
8 Leaves lacking stipitate glands on the lower surface (variously glabrous to pubescent with eglandular hairs); [collectively widespread].
9 Leaves 0.7-3.5 cm long, 0.3-1.5 cm wide, with serrulate margins; twigs slender, numerous . . . . . . . . . . . V. elliottii 9 Leaves \(3-10 \mathrm{~cm}\) long, \(1.5-4.5 \mathrm{~cm}\) wide, with entire, ciliate, or serrulate margins; twigs stouter, fewer.

10 Young twigs glabrous; leaf surfaces glabrous; leaf margins eciliate or ciliate.
11 Leaves \(4-10 \mathrm{~cm}\) long, \(2.5-4.5 \mathrm{~cm}\) wide, most of them widest below the middle, eciliate; leaf bud scales reddish, 2-4 mm long, including the elongated (1.5-3 mm long), slender awnlike tips; corollas \(8-12 \mathrm{~mm}\) long, cylindrical; berry \(7-12 \mathrm{~mm}\) in diameter, dark blue with a glaucous bloom; [primarily of the Coastal Plain, very rarely disjunct in Coastal Plain like habitats in the Mountains or Piedmont] ..... V. formosum
11 Leaves \(3-8 \mathrm{~cm}\) long, \(1.5-3 \mathrm{~cm}\) wide, most of them widest at or above the middle, ciliate or not; leaf bud scales flesh-colored or pink to reddish, 1-3 mm long, including the short (to 1.5 mm long) awnlike tips; corollas 4-10 mm long, cylindrical, subglobose, subcampanulate, or urceolate; berry \(5-10 \mathrm{~mm}\) in diameter, blue with a glaucous bloom; [collectively widely distributed in our area].
12 Leaves \(3-6 \mathrm{~cm}\) long, \(1.5-2 \mathrm{~cm}\) wide, eciliate; corolla 4-6 mm long; [primarily of the Coastal Plain, very rarely disjunct in Coastal Plain like habitats in the Piedmont] . . . . . . . . . . . . . . . . . V. caesariense 12 Leaves \(3-8 \mathrm{~cm}\) long, 2-3 cm wide, usually ciliate-margined, at least basally; corolla 5-10 mm long; [of the Mountains and montane sites in the upper Piedmont] . . . . . . . . . . . . . . . . . . . V. corymbosum 10 Young twigs puberulent, at least in lines; leaf surfaces more-or-less pubescent; leaf margins ciliate (rarely eciliate).
13 Puberulence of the young twigs merely in 2 lines; [of the Mountains and montane sites in the upper Piedmont].
14 Leaves elliptic to elliptic-obovate, broadest at or beyond the middle, the apex acute to shortacuminate; leaf margins entire to obscurely serrulate; corolla \(5-10 \mathrm{~mm}\) long; berry blue, glaucous . .
V. corymbosum

14 Leaves narrowly ovate, broadest below the middle, the apex acuminate; leaf margins distinctly serrulate; corolla 5-7 mm long; berry purple-black, not glaucous (sometimes drying so as to appear somewhat glaucous blue)
V. simulatum

13 Puberulence of the young twigs extending around their circumference (not merely in 2 lines); [collectively widely distributed in our area].
15 Hairs of the twigs and leaf surfaces whitish; leaves medium to pale green, not darkening on drying; berry blue, glaucous; twigs and bud scales flesh-colored to reddish; corolla \(5-10 \mathrm{~mm}\) long, usually not narrowed to the tip; blooming May; [of the Mountains and montane sites in the upper Piedmont]
V. corymbosum

15 Hairs of the twigs and leaf surfaces dingy, brownish, or dark; leaves dark green, darkening on drying; berry black; twigs and bud scales brownish-green to black; corolla \(5-8 \mathrm{~mm}\) long, often narrowed to the tip; blooming February-April; [widely distributed in our area, though most common in the Coastal Plain]
V. fuscatum

Vaccinium altomontanum W.W. Ashe, Blue Ridge Blueberry. Mt (GA?, NC, SC, VA): grassy balds, heath balds, high elevation forests and woodlands; uncommon. May-June; July-September. The tetraploid V. altomontanum occurs primarily in the Mountains at moderate to high elevations (the type collection is from the Fodderstacks, Macon County, NC); it differs from the diploid V. pallidum in forming tighter (often circular) clones, with taller plants (to 1 m tall), the leaves thick in texture, often revolute, strictly glaucous and glabrous, and with excellent berries. [<V. corymbosum -- RAB, in part; = V. alto-montanum -- \(\mathrm{G}, \mathrm{X}\), orthographic variant; < V. pallidum - K, in part; ? Cyanococcus liparis Small -- S]

Vaccinium angustifolium Aiton, Northern Lowbush Blueberry, Sugarberry, Low Sweet Blueberry. Mt (VA): acidic forests and woodlands, cliffs and talus (especially sandstone and quartzite), usually at high elevations; common. Labrador and Newfoundland west to Manitoba, south to NJ, PA, sw. VA, IL, and MN. [= C, K, W, Y, Z; > V. angustifolium var. angustifolium - F; > V. angustifolium var. laevifolium House -- F; > V. angustifolium var. hypolasium Fernald -- F; > V. angustifolium var. nigrum (Wood) Dole -- F; > V. angustifolium - G, X, in a narrower sense; > V. lamarckii Camp -- G, X; > V. brittonii Porter ex Bicknell -- X]

Vaccinium arboreum Marshall, Farkleberry, Sparkleberry. Cp (GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC): rocky or sandy woodlands, bluffs, and cliffs, usually xeric and often fire-maintained, and unlike most other Vaccinium, often on mafic, ultramafic, or calcareous rocks; common (uncommon in Piedmont, rare in Mountains). Late April-June; September-October. This species is widely distributed in se. North America, from TX and FL north to MO, IN, KY, and VA. It can be a small tree, to 30 cm DBH and 10 m tall. The leaves are coriaceous and semi-evergreen, often being retained for much or all of the winter. Var. glaucescens (Greene) Sargent may be worthy of recognition. It occurs mainly south and west of our area, but is known in our area from SC and s. NC (Coastal Plain and Piedmont). It differs from var. arborescens in its subglaucous to conspicuously blue-green leaves (vs. dark green leaves) and the bracts at the base of the pedicels nearly equal in size and shape to the leaves (vs. bracts distinctly smaller and often also different in shape than the leaves). [= RAB, C, G, K, L, W, Y, Z; > V. arboreum var. arboreum - F; > V. arboreum var. glaucescens (Greene) Sargent -- F; Batodendron arboreum (Marshall) Nuttall -- S]

Vaccinium caesariense Mackenzie, New Jersey Highbush Blueberry. Cp (GA, NC, SC, VA), Pd (GA?, SC): swamps, bogs, moist ground; rare. Late February-May; June-August. S. ME south to \(n\). \(F L\). This species is diploid. \([=C, F, G, K, X, Y ;<V\). corymbosum -- RAB, L, Z, in part]

Vaccinium corymbosum Linnaeus, Smooth Highbush Blueberry. Mt (GA, NC, SC, VA), Pd (NC): bogs, wet swamp forests, moist high elevation bogs, balds, and forests; common (rare in Piedmont). May; August. Nova Scotia west to MI, south to WV, OH, and IN, south in the Appalachians (and rarely on Piedmont monadnocks) to w. NC, nw. SC, n. GA, and e. TN. In our area, V. corymbosum (sensu stricto) appears to be limited to the Mountains, except for occurrences on Piedmont monadnocks and outlier ridges, such as Hanging Rock, Stokes County, NC, and the Brushy Mountains, NC. See the end of the genus treatment for discussion of taxonomic controversy involving this species and its allies. Note that this treatment recognizes 2 species ( \(V\). formosum and V. caesariense) included within V. corymbosum by RAB. V. formosum is the common "corymbosum" type blueberry of the Coastal Plain. V. corymbosum is primarily tetraploid; V. constablaei A. Gray (misapplied to V. simulatum by RAB) is correctly applied to hexaploid plants of the high elevation Blue Ridge of NC and TN, especially on heath balds and grassy balds. Camp (1945) considered V. constablaei to be an allopolyploid derivative of V. simulatum and V. altomontanum (itself a tetraploid apparently related to diploid \(V\). pallidum, and of uncertain derivation). The appropriate taxonomic treatment of these plants is unclear; they are apparently not reliably identifiable based on morphology. [= K, X, Y; < V. corymbosum -- RAB, G, L, Z, in part only; not including V. constablaei -- RAB (see V. simulatum); > V. corymbosum var. albiflorum (Hooker) Fernald -- F; > V. corymbosum var. glabrum Gray -- F; V. corymbosum -- C, in part only (also see V. fuscatum and V. simulatum); V. constablaei A. Gray -- G, X; Cyanococcus corymbosus (Linnaeus) Rydberg -- S; V. corymbosum -- W, in part only (also see V. simulatum)]

Vaccinium crassifolium Andrews, Creeping Blueberry. Cp (GA, NC, SC, VA), Pd (NC): savannas, pine flatwoods, pocosinsandhill ecotones, upland sandhills over clay pans; common (rare in VA, rare in lower Piedmont only of NC and SC) (VA Rare). April-May; June-July. This species is nearly endemic to the Carolinas, barely extending into immediately adjacent VA and GA. See Kirkman, Wentworth, \& Ballington (1989) and Kirkman \& Ballington (1990) for discussion of the systematics and ecology of this species and the closely related V. sempervirens. [= RAB, C, F, G, GW, Y; = V. crassifolium ssp. crassifolium -- K; = Herpothamnus crassifolius (Andrews) Small -- S; < V. crassifolium -- L, Z (also see V. sempervirens)]

Vaccinium darrowii Camp, Darrow's Blueberry. Cp (GA): pine flatwoods; uncommon. S. GA south to s. peninsular FL and west to se. TX. [= K, L, X, Z; = V. darrowi -- GW, orthographic variant; = Cyanococcus myrsinites (Lamarck) Small var. glaucum A. Gray -- S]

Vaccinium elliottii Chapman, Mayberry. Cp (GA, NC, SC, VA), Pd (GA, NC, SC): bottomlands, slopes, sandy river terraces, natural levees; common (rare in Piedmont, uncommon in VA). March-April; May-June. Primarily a Coastal Plain species, V. elliottii ranges from se. VA south to FL, west to se. TX and AR; disjunct in Coffee County, TN (Chester, Wofford, \& Kral 1997). [= RAB, C, F, G, GW, K, X, Y; Cyanococcus elliottii (Chapman) Small -- S; V. corymbosum -- L, Z, in part]

Vaccinium erythrocarpum Michaux, Bearberry, Highbush Cranberry, Mountain Cranberry. Mt (GA, NC, VA): rocky ridges, shrub or grassy balds, bogs, spruce-fir forests, usually at high elevations; uncommon. Late May-July; August-September. A Southern and Central Appalachian endemic, V. erythrocarpum ranges from WV through VA to w. NC, e. and ec. TN, and ne. GA. The only other member of Section Oxycoccoides is \(V\). japonicum Miguel of montane Japan, so similar as to be sometimes regarded as only a subspecies or variety of our species. [= RAB, C, F, G, K, L, W, Y, Z; Hugeria erythrocarpa (Michaux) Small -- S]

Vaccinium formosum H.C. Andrews, Southern Highbush Blueberry, Swamp Highbush Blueberry. Cp (GA, NC, SC, VA), Mt (VA): bogs, swamps (especially blackwater, or at least where away from strong alluvial influence), seepages, depression ponds (dolines), other moist ground; common (rare in Mountains). Late February-May; June-August. Apparently ranging from \(N J\) south to n. FL and e. TX, primarily on the Coastal Plain. This species is the primary source of the cultivated highbush blueberries. It has the largest and arguably the highest quality fruit of the native highbush blueberries. [=K, Y; V. corymbosum -- RAB, C, L, Z, in part; V.
australe Small -- G, GW, X; Cyanococcus virgatus (Aiton) Small -- S, misapplied]
Vaccinium fuscatum Aiton, Hairy Highbush Blueberry, Black Highbush Blueberry. Cp, Pd, Mt (GA, NC, SC, VA): bogs, pocosins, swamps, also in uplands; common. Late February-May; June-August. The species is apparently widespread in e. United States. [= GW, K, W, X, Y; V. atrococcum (Gray) Heller -- RAB, F, G, X; V. corymbosum -- C, L, Z, in part; V. marianum S. Watson -- G?; Cyanococcus fuscatus (Aiton) Small -- S; Cyanococcus atrococcus (A. Gray) Small -- S]

Vaccinium hirsutum Buckley, Woollyberry, Hairy Blueberry. Mt (GA, NC): mountain slopes, primarily in pine-oak and oak forests; rare (NC Rare). April-May; June-July. V. hirsutum is a narrow Southern Appalachian endemic, occurring only in a few counties of sw. NC, se. TN, and \(n\). GA. It is the only species in our area with pubescent fruit. [= RAB, K, L, W, X, Z; Cyanococcus hirsutus (Buckley) Small -- S]

Vaccinium macrocarpon Aiton, Cranberry, Large Cranberry. Mt, Cp (NC, VA): mountain bogs, low pocosins with deep peat, interdunal swales; rare (NC Rare, VA Rare). May-July; August-November. Unlike the circumboreal V. oxycoccus Linnaeus, \(V\). macrocarpon is limited to North America. This is the familiar edible cranberry, raised commercially in artificial bogs, primarily in MA WI, and NJ. It ranges as a native plant from Newfoundland west and south to s. Ontario, MN, ne. IL, n. IN, n. and c. OH, PA, and NJ , extending south along the Appalachians as a disjunct rarity through \(\mathrm{WV}, \mathrm{w} . \mathrm{VA}\), and ne. and se. TN to w . NC, and south along the outer Coastal Plain as a disjunct rarity in e. MD, se. VA, and ne. and se. NC. The occurrence in the inner Coastal Plain (fall-line sandhills) along the Little River in Cumberland County, NC is questionably native. [= RAB, C, F, G, GW, K, L, W, Y, Z; Oxycoccus macrocarpus (Aiton) Persoon -- S]

Vaccinium myrsinites Lamarck, Southern Evergreen Blueberry. Cp (GA, SC): pine flatwoods; common (rare in SC, but locally dominant in spodosolic flatwoods in Beaufort and Jasper counties, SC); common. March-April; May-June. Se. SC south to s. peninsular FL, west to s. AL. V. myrsinites is readily distinguished from all our species by the following combination of characteristics: clonal shrub with upright stems usually less than 50 cm tall, the young twigs verrucose, leaves evergreen, mostly \(5-15 \mathrm{~mm}\) long and \(2-10 \mathrm{~mm}\) wide, lower surface of young leaves with stout glandular hairs. Further south, it can be difficult to distinguish from the closely related \(V\). darrowii Camp (see key), with which it often co-occurs in their area of overlap. [= RAB, GW, K, L, X, Z; = Cyanococcus myrsinites (Lamarck) Small var. myrsinites -- S]

Vaccinium myrtilloides Michaux, Velvetleaf Blueberry, Sourtop, Canada Blueberry. Mt (NC?, VA): acidic, high elevation slopes and cliffs; rare (VA Rare). May-July. Labrador west to British Columbia, south to PA, VA, WV, IN, and MN. The possible occurrence of this species on Grandfather Mountain is based on somewhat ambiguous specimens and needs additional confirmation. See Vander Kloet \& Hall (1981) for a summary of information on this diploid species. [= C, F, G, K, W, X, Y, Z]

Vaccinium pallidum Aiton, Hillside Blueberry, Dryland Blueberry. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): forested slopes, usually rather xeric; common. March-April; June-July. Widespread in e. United States, V. pallidum is centered in the Appalachians and Ozarks. Vander Kloet \((1978,1988)\) and Uttal (1987) do not favor Camp's (1945) separation of \(V\). pallidum and \(V\). vacillans. If the two taxa are combined (as here), V. pallidum has nomenclatural priority. V. pallidum is primarily diploid. See V. altomontanum for discussion of its relationship to V. pallidum. [= C, F, K, L, W, Y, Z; = V. vacillans Kalm ex Torrey -- RAB; > V. vacillans Torrey var. vacillans -- F; > V. vacillans var. crinitum Fernald -- F; > V. pallidum - G, X; > V. vacillans - G, X; > Cyanococcus pallidus (Aiton) Small -- S; > Cyanococcus vacillans (Kalm ex Torrey) Rydberg -- S]

Vaccinium sempervirens Rayner \& Henderson, Rayner's Blueberry. Cp (SC): seepage bogs in the fall-line Sandhills, longleaf pine woodlands over sandstone and gravel outcrops; rare (US Species of Concern, SC Rare). Endemic to Lexington County, SC, known from only a few sites. This species is clearly closely allied to V. crassifolium. Kirkman \& Ballington (1990) reduce it to a subspecies. Because it is allopatric and relatively discrete morphologically, despite occurring in similar habitats, I prefer to retain it as a species. See Kirkman, Wentworth, \& Ballington (1989) and Kirkman \& Ballington (1990) for further discussion of the systematics and ecology of this species and V. crassifolium. [= V. crassifolium Andrews ssp. sempervirens (Rayner \& Henderson) Kirkman \& Ballington -- K; < V. crassifolium -- L, Z]

Vaccinium simulatum Small, Mountain Highbush Blueberry. Mt (GA, NC, SC, VA): forested slopes (northern hardwoods, spruce-fir forests), ridges, and shrub balds, at moderate and high elevations; common. Late April-early June; July-August. A Southern and Central Appalachian endemic, V. simulatum ranges from e. KY and sw. VA south through w. NC and e. TN to n. GA and \(n\). AL. The name V. constablaei has been misapplied to this species, as by RAB; see V. corymbosum for a discussion of the correct application of V. constablaei. [= G, K, X, Y; = V. constablaei Gray -- RAB, G, misapplied; < V. corymbosum -- C, L, W, Z, in part; = Cyanococcus simulatus (Small) Small -- S]

Vaccinium stamineum Linnaeus var. 1, Dwarf Deerberry. Cp (GA, NC, SC): pinelands; common. April-June; AugustOctober. This dwarf taxon is characteristic of Coastal Plain pinelands; its stature is not the result of fire; it never achieves greater height, even following decades of fire suppression. Se. NC south to GA. [V. stamineum var. stamineum -- RAB, in part; Vaccinium stamineum -- C, K, L, W, Y, Z, infraspecific taxa not distinguished; Polycodium arenicola W.W. Ashe -- V]

Vaccinium stamineum Linnaeus var. 2, Appalachian Deerberry. Mt, Pd (GA, NC, SC, VA): xeric to submesic woodlands and forests, including pine-oak/heath and shrub balds; common. April-June; August-October. PA south to GA, in the Appalachians and adjacent provinces. [V. stamineum var. stamineum -- RAB, F, in part; Vaccinium stamineum -- C, K, L, W, Y, Z, infraspecific taxa not distinguished; Polycodium candicans Small -- S, V; Vaccinium candicans (C. Mohr) Sleumer]

Vaccinium stamineum Linnaeus var. caesium (Greene) D.B. Ward, Florida Deerberry, Whiteleaf Deerberry. Cp (GA, NC, SC): xeric woodlands; rare. April-May; August-October. Se. NC south to c. peninsular FL, and west to s. AL. [= Q; V. stamineum var. stamineum -- RAB, in part; Vaccinium stamineum -- C, K, L, W, Y, Z, infraspecific taxa not distinguished; V. caesium Greene -F (probably misapplied); Polycodium floridanum (Nuttall) Greene -- S; Polycodium ashei Harbison -- S; Polycodium floridanum var. floridanum -- V; Polycodium floridanum var. caesium -- V]

Vaccinium stamineum Linnaeus var. sericeum (C. Mohr) D.B. Ward, Southern Deerberry. Cp (GA, SC), Mt (GA, NC), Pd (GA): xeric woodlands; rare. April-June; August-October. S. SC, w. NC, TN, and AR south to Panhandle FL and TX; disjunct in Mexico. [= Q; V. stamineum var. melanocarpum C. Mohr -- RAB, F, misapplied; Vaccinium stamineum -- C, K, L, W, Y, Z infraspecific taxa not distinguished; V. melanocarpum (C. Mohr) C. Mohr ex Kearney -- G, misapplied; Polycodium melanocarpum (C. Mohr) Small -- S, misapplied; Polycodium sericeum (C. Mohr) C.B. Robinson -- V]

Vaccinium stamineum Linnaeus var. stamineum, Common Deerberry. Mt, Pd, Cp (GA, NC, SC, VA): xeric to submesic woodlands, forests, and rock outcrops (unlike most Vaccinium, often on mafic, ultramafic, or calcareous rocks); common. AprilJune; August-October. MA, NY, s. Ontario, and MO south to Panhandle FL and TX. [= Q; V. stamineum var. stamineum -- RAB, F,
in part; Vaccinium stamineum -- C, K, L, W, Y, Z, infraspecific taxa not distinguished; V. stamineum var. interius (Ashe) Palmer \& Steyermark -- F; V. stamineum var. neglectum (Small) Deam -- F; Vaccinium neglectum (Small) Fernald -- G; Polycodium stamineum (Linnaeus) Greene -- S, V; Polycodium candicans Small, in part -- S; Polycodium neglectum Small -- S, V]

Vaccinium tenellum Aiton, Southern Blueberry, Small Cluster Blueberry. Cp, Pd (GA, NC, SC, VA): sandhills, pine flatwoods, other xeric woodlands; common (uncommon in Piedmont and VA Coastal Plain, rare in VA Piedmont). Late March-early May; JuneJuly. Though abundant in the Carolinas, V. tenellum is rather restricted, occurring as a common species from se. VA to c. GA, with an range extension (where it is scattered and rare) south and west to \(n\). \(F L\), s. AL, and se. MS. \(\quad=R A B, C, F, G, K, L, X, Y, Z ;=\) Cyanococcus tenellus (Aiton) Small -- S]

Vaccinium virgatum Aiton, Swamp Blueberry. Cp (GA, NC, SC): pocosins and Chamaecyparis swamps, also in various drier habitats, including turkey oak sandhills; uncommon in SC, rare in NC (NC Watch List). March-April; May-June. A Southeastern Coastal Plain species, V. virgatum occurs from se. NC south to FL and west to e. TX. [= GW, K, X; = V. amoenum Aiton -- RAB, X; = Cyanococcus amoenus (Aiton) Small -- S; < V. corymbosum -- L, Z, in part]

Vaccinium oxycoccos Linnaeus, Small Cranberry, has been reported for our area (NC) by Fernald (1950), as V. oxycoccos var. ovalifolium Michaux, and by Scoggan (1979), as Oxycoccus ovalifolius (Michaux) Porsild, and by Kartesz (1999). Whether it is indeed present is not known; it is more likely that ambiguous collections of V. macrocarpon are involved. V. oxycoccos does range south to bogs in WV (Grant, Mineral, Pendleton, Pocahontas, Preston, Randolph, and Tucker counties), and its occurrence in our area is plausible. [= C, G, K; V. oxycoccos Linnaeus var. ovalifolium -- F; Oxycoccus palustris Persoon; Oxycoccus palustris Persoon var. ovalifolius (Michaux) Seymour; Oxycoccus ovalifolius (Michaux) Porsild]

Vaccinium stamineum Linnaeus var. glandulosum (Ashe) D.B. Ward. Supposedly endemic to the FL Panhandle, probably in GA. [= Polycodium glandulosum Ashe] \{not yet keyed; add synonymy\}

Some of the hybrids known to occur in our area are listed below. Nearly every combination of co-occurring species in section Cyanococcus may be expected to form hybrids.
V. \(\times\) atlanticum Bicknell (pro sp.) [angustifolium \(\times\) corymbosum]
V. \(\times\) dobbinii Burnham (prosp.) [angustifolium \(\times\) pallidum]
\(\boldsymbol{V} . \times \boldsymbol{m}\) argarettiae Ashe (pro sp.) [fuscatum \(\times\) pallidum]
\(\boldsymbol{V} . \times \boldsymbol{m}\) arianum S. Watson (pro sp.) [formosum \(\times\) fuscatum]

\section*{Zenobia D. Don 1834 (Zenobia, Honey-cups)}

A monotypic genus, a shrub, of se. North America (endemic to the flora area). References: Stevens et al. in Kubitzki (2004).

Zenobia pulverulenta (Bartram ex Willdenow) Pollard, Zenobia, Honey-cups. Cp (GA, NC, SC, VA): pocosins, margins of pineland ponds; common (rare in GA and VA) (VA Rare). April-June; September-October. This monotypic genus is a narrow endemic of the Coastal Plain of se. VA, NC, SC, and e. GA (Bryan Co.). It was considered by Wood (1961) to have "no close relatives," but molecular phylogeny suggests that it is sister to Andromeda. The crenate leaves help distinguish Zenobia from other pocosin shrubs. The flowers are extremely fragrant. The species is remarkably variable in leaf glaucescence. Many plants in the fall-line sandhills and upper Coastal Plain have the lower leaf surface, pedicels, and capsules covered in wax to the point that they are bright white; outer Coastal Plain plants generally lack any glaucescence. The division into two species listed below in synonymy was based largely on this character; further study appears warranted. In the centers of major peat domes in the Outer Coastal Plain and in large Carolina bays in the Bladen Lakes region, where peat depths reach 3-5 meters, occur areas of up to 25 square kilometers dominated by Zenobia (sometimes codominant with Chamaedaphne or Sarracenia flava). This community has been referred to as "deciduous low pocosin," to distinguish it from the dominance of evergreen shrubs found in most pocosins. [= RAB, C, F, G, GW, K, L; > Z. pulverulenta - S; > Z. cassinefolia (Ventenat) Pollard -- S]

\section*{EUPHORBIACEAE (Spurge Family)}
(also see PHYLLANTHACEAE)
A family of about 313-322 genera and 8100-9000 species, trees, shrubs, vines, and herbs, nearly cosmopolitan in distribution, as defined broadly. Molecular systematics suggests that various units traditionally included in the Euphorbiaceae should be segregated (Soltis et al. 2000, Chase et al. 2002). In our flora, this includes Phyllanthus (in Phyllanthaceae). References: Webster (1967), Webster (1994); Govaerts, Frodin, \& Radcliffe-Smith (2000).

\footnotetext{

\section*{Acalypha Linnaeus 1753 (Copperleaf, Three-seeded Mercury)}

A genus of about 430-462 species, shrubs and herbs, of tropical, subtropical, and warm temperate regions. References: Levin (1999b) \(=\) Z; Levin (1999a); Govaerts, Frodin, \& Radcliffe-Smith (2000)=Y.

1 Pistillate flowers all or chiefly in terminal spikes, the staminate flowers in axillary clusters.
2 Leaves cordate at base; fruit tuberculate, but not pubescent
A. ostryifolia

2 Leaves rounded to widely cuneate at base; fruit pubescent with pustular-based trichomes
A. setosa

1 Pistillate and staminate flowers all in axillary inflorescences, the staminate flowers above and pistillate flowers below in each inflorescence.
3 Bracts subtending the pistillate flowers (5-) 7-9 (-11) lobed, usually stipitate-glandular; petiole \(0.5-1.5 \times\) as long as the leaf blade; stems with only short, incurved trichomes.
4 Fruit 2-seeded; seeds 2.2-3.2 mm long .
A. deamii

4 Fruit 3-seeded; seeds 1.2-2.0 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. rhomboidea
3 Bracts subtending the pistillate flowers 9-15 (-16) lobed, stipitate-glandular or merely pubescent; petiole \(0.2-0.5 \times\) as long as the leaf blade; stems with short incurved trichomes, with or without longer, straight, spreading trichomes as well.
5 Bracts subtending the pistillate flowers usually stipitate-glandular, the bract lobes ovate to deltoid, the longest 2 mm long or less.
A. gracilens

5 Bracts subtending the pistillate flowers usually with non-stipitate, pointed hairs, the bract lobes linear to oblong, the longest usually more than 3 mm long
A. virginica

Acalypha deamii (Weatherby) Ahles, Big-seeded Copperleaf, Two-seeded Copperleaf. Pd (VA): alluvial forests, especially on sandy levees; rare (VA Watch List). W. PA (Rhoads \& Klein 1993), s. OH, and s. IN south to w. TN (Chester, Wofford, \& Kral 1997) and AR; apparently disjunct in c. VA (Chesterfield, Powhatan, Buckingham, Fluvanna, and Cumberland counties on the James River; Pittsylvania, Halifax, and Campbell counties on the Staunton River; Rappahannock River), but perhaps only overlooked elsewhere. This plant is up to a meter tall and occurs in moist bottomland forests. \([=C, K, Z ; A\). virginica Linnaeus var. deamii Weatherby - Y]

Acalypha gracilens A. Gray, Shortstalk Copperleaf. Cp, Pd, Mt (GA, NC, SC, VA): woodlands, disturbed ground; common. Late June-November. ME west to WI, south to FL and TX. The related A. monococca (Engelm. ex A. Gray) Lill. W. Miller \& Gandhi is of Ozarkian distribution and warrants specific status (Levin 1999a, 1999b). Var. fraseri is generally more southern and is considered to differ in having more elongate staminate spikes, to \(3-4 \mathrm{~cm}\) long (vs. 0.5-1.5 cm long). It may have merit, but was not recognized by Levin (1999a, 1999b). [= K, Z; A. gracilens var. gracilens -- C, F, G; A. gracilens -- RAB, S, W, in a broad sense; A. gracilens var. fraseri (Müller of Aargau) Weatherby -- C, F, G; A. virginica Linnaeus var. gracilens (A. Gray) Müller of Aargau -- Y; A. gracilens ssp. gracilens]

Acalypha ostryifolia Riddell, Rough-pod Copperleaf. Pd (GA, NC, SC, VA), Mt (GA, NC, VA), Cp (GA, SC): disturbed ground; uncommon (VA Watch List). Late June-November. NJ west to IN and NE, south to FL, TX, Mexico, and the West Indies. [= K, W, Y; A. ostryaefolia -- RAB, C, F, G, S, orthographic variant]

Acalypha rhomboidea Rafinesque, Rhombic Copperleaf. Cp, Pd, Mt (GA, NC, SC, VA): woodlands, disturbed ground; common. Late June-November. Nova Scotia and ME west to ND, south to panhandle FL and e. TX. [= RAB, C, G, GW, K, S, W, Z; A. rhomboidea var. rhomboidea -- F; A. virginica Linnaeus var. rhomboidea (Rafinesque) Cooperrider - Y]
* Acalypha setosa A. Richard, Cuban Copperleaf. Cp (GA, SC): disturbed ground; rare, introduced from Cuba. JuneNovember. [= RAB, K, S, Y]

Acalypha virginica Linnaeus, Virginia Copperleaf. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): woodlands and disturbed ground; common. Late June-November. ME west to IN, IL, MO, and KS, south to c. GA and TX. [= RAB, C, F, G, GW, K, S, W, Z; A. virginica Linnaeus var. virginica -Y ]

\section*{Aleurites \\ (see Vernicia)}

\section*{Chamaesyce S.F. Gray 1821}

In our area, Chamaesyce is largely weedy and the original distributions of some of the species are difficult to assess. Only 3 of our species are definitely native, occurring characteristically in natural habitats: Ch. bombensis and Ch. polygonifolia of dunes, and Ch. cordifolia of sandhills. Other species are often found in shallow soils of rock outcrops, cliffs, glades, and barrens, perhaps reflecting their pre-Columbian habitats. References: Herndon (1993)=Z; Govaerts, Frodin, \& Radcliffe-Smith (2000)=Q.

1 Young stems and leaves glabrous; leaves entire or serrulate, at least at the apex (use 10× magnification).
2 Leaves serrulate, at least at the apex (use \(10 \times\) magnification); seeds with 2-4 transverse ridges.
3 Seeds \(1.0-1.3 \mathrm{~mm}\) long, with 3-4 transverse ridges..
[Ch. glyptosperma]
3 Seeds 0.8-1.0 mm long, with 2-3 (-4) transverse ridges . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Ch. hyssopifolia
2 Leaves absolutely entire; seeds smooth.
4 Stipules united into a triangular scale-like structure (this often lobed or fringed), thus appearing as 2 stipules at each node
[Ch. serpens]
4 Stipules separate, lacerate, appearing as 4 stipules at each node.
5 Leaves \(1.5-2 \times\) as long as wide, not fleshy; mature seeds \(1.0-1.2\) (-1.4) mm long, angled; [of inland sandhills] . .
Ch. cordifolia
5 Leaves \(2-3 x\) as long as wide, often somewhat fleshy; mature seeds (1.3-) 1.5-2.6 mm long, rounded; [of barrier island dunes and other sandy coastal habitats].
6 Mature seeds (1.3-) 1.5-1.9 mm long; cyathia terminal on the stems and also axillary . . . Ch. bombensis
6 Mature seeds (2.0-) 2.2-2.6 mm long; cyathia terminal on the stems . . . . . . . . . . . . . Ch. polygonifolia
1 Young stems and leaves pubescent (at least in lines along the stems); leaves serrulate, at least at the apex (use \(10 \times\) magnification).
7 Ovary and capsule glabrous.
8 Seeds 0.8-1.0 mm long, light gray, the faces with 2-3 (-4) horizontal, low, blunt ridges, sometimes connected by 1-2 cross ridges; stems glabrous when young (uncommonly puberulent along 1 side of the branchlets); capsule 1.5-2.0 mm long

Ch. hyssopifolia
8 Seeds 1.0-1.3 mm long, dark gray, faces without ridges, though irregularly and finely wrinkled; stems puberulent when young on 1 side only; capsule \(2.0-2.5 \mathrm{~mm}\) long.
9 Stems ascennding or suberect, puberulent when young . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Ch. nutans 9 Stems prostrate or widely spreading, spreading-hirsute . . . . . . . . . . . . . . . . . . . . . . . . . . . . Ch. vermiculata
7 Ovary and capsule pubescent.
10 Stems with 2 types of trichomes, the longer \(3-5 \mathrm{~mm}\) long; cyathia in axillary and terminal cymes, at least some of the peduncles more than 10 mm long

Ch. hirta
10 Stems with 1 type of trichome, these less than 2 mm long; cyathia solitary or several in axils, the peduncles less than 5 mm long.
11 Capsules spreading-villous, especially or solely on the angles; styles 0.2-0.3 mm long, bifid nearly to the base; seeds sharply quadrangular-angled, the faces with \(3-4\) transverse ridges . . . . . . . . . . . . . . . . . Ch. prostrata
11 Capsules minutely appressed-puberulent, on the entire surface (though sometimes primarily on the lower portion); styles \(0.3-0.7 \mathrm{~mm}\) long, bifid only in the upper half or third; seeds quadrangular but not angled, the faces with inconspicuous transverse ridges or nearly smooth.
12 Involucre cleft on 1 side half its length; leaves mostly obovate, \(1.5-2 \times\) as long as wide; styles \(0.5-0.7 \mathrm{~mm}\) long, filiform; seed faces nearly smooth; adventitious roots formed at middle nodes along the stem

Ch. humistrata
12 Involucre cleft on 1 side a fourth to a third its length; leaves mostly oblong, 2-3× as long as wide; styles 0.3-0.4 mm long, clavate; seed faces transversely ridged; adventitious roots not formed . Ch. maculata

Chamaesyce bombensis (Jacquin) Dugand, Southern Seaside Spurge, Dixie Sandmat. Cp (GA, NC, SC, VA): open sands of dunes, dune blowouts and overwashes, often growing with perennial grasses such as Uniola paniculata, but preferring open sands with little competition, sometimes mixed with the more common Ch. polygonifolia; uncommon (VA Rare). June-October. E. VA south to s. FL along the Atlantic, from s. FL to TX and Mexico along the Gulf of Mexico, and south into n. South America. Johnson (1992) contrasts the habitat of this species with that of the closely similar Ch. polygonifolia; Ch. bombensis prefers areas behind the foredune, while Ch. polygonifolia prefers the pioneer situation on the upper beach and foredune front. [= K, Z; Euphorbia ammannioides Kunth -- RAB, C, F, G; Ch. ingallsii Small -- S; Euphorbia bombensis Jacquin - Q]

Chamaesyce cordifolia (Elliott) Small, Heartleaf Sandmat. Cp (GA, NC, SC): open sands of very dry sandhills; rare (NC Rare). July-October. Se. NC south to s. FL and west to s. TX. [= K, S, Z; Euphorbia cordifolia Elliott -- RAB, Q]

Chamaesyce hirta (Linnaeus) Millspaugh, Pillpod Sandmat. Cp (GA, SC), Pd (GA): fields, disturbed ground; rare. JuneOctober. SC south to FL, west to TX, and south into Central and South America. [=K, S, Z; Euphorbia hirta Linnaeus -- RAB, C, G, Q]
* Chamaesyce humistrata (Engelmann) Small, Spreading Sandmat. Cp, Mt (VA), Pd (GA, VA): exposed river shores, rocky riverside gravel bars, disturbed areas; rare, apparently adventive from further west, but possibly native in some areas. [= GW, K, S, Z; Euphorbia humistrata Engelmann -- C, F, G, Q]

Chamaesyce hyssopifolia (Linnaeus) Small, Hyssopleaf Sandmat. Cp (GA, SC): disturbed ground; uncommon? MayOctober. SC south to FL, west to LA; also in w. TX, s. NM, and n. Mexico, and south to s. South America. Its status in our area has been muddled by confusion with C. nutans. [= GW, K, Z; Euphorbia hyssopifolia Linnaeus - Q]

Chamaesyce maculata (Linnaeus) Small, Milk-purslane, Spotted Spurge. Pd, Cp, Mt (GA, NC, SC, VA): gardens, fields, disturbed places, crevices in pavement or sidewalks; common. January-December. Québec west to ND, south to FL and TX; introduced in various places worldwide. [= GW, K, S, Z; Euphorbia supina Rafinesque -- RAB, F; Euphorbia maculata Linnaeus -- C, G, Q, W]

Chamaesyce nutans (Lagasca y Segura) Small, Eyebane. Pd, Cp, Mt (GA, NC, SC, VA): fields, gardens, waste places, disturbed ground; common. May-October. NH west to MI and ND, south to FL and TX; introduced in various places worldwide. [= GW, K, Z; Euphorbia maculata Linnaeus -- RAB, F, misapplied; Euphorbia nutans Lagasca y Segura -- C, Q, W; Euphorbia preslii Guss. -- G; Ch. hyssopifolia (Linnaeus) Small -- S, in part, misapplied]

Chamaesyce polygonifolia (Linnaeus) Small, Northern Seaside Spurge, Northern Sandmat. Cp (GA, NC, SC, VA): open sands of dunes, upper beach, dune blowouts and overwashes, sometimes growing with perennial grasses such as Uniola paniculata, but preferring open sands with little competition, sometimes mixed with the less common Ch. bombensis; common. May-October. Québec to ne. FL along the Atlantic Ocean; disjunct to the Great Lakes. See Ch. bombensis for discussion of the habitats of these related species. [= K, S, Z; Euphorbia polygonifolia Linnaeus -- RAB, C, F, G, Q]
* Chamaesyce prostrata (Aiton) Small, Prostrate Sandmat. Pd (GA, NC, SC, VA), Cp, Mt (NC, SC, VA): crevices of pavement or sidewalks, disturbed places; rare, naturalized from tropical America. January-December. Probably native to South America, introduced and naturalized in se. United States. [ \(=\mathrm{C}, \mathrm{K}, \mathrm{S}, \mathrm{Z}\); Euphorbia chamaesyce Linnaeus -- RAB, F, G, misapplied; Euphorbia prostrata Aiton - Q]

Chamaesyce vermiculata (Rafinesque) House. (VA). Widespread and common in PA (Rhoads \& Klein 1993). [= K; Euphorbia vermiculata Rafinesque - C, Q]

Chamaesyce glyptosperma (Engelmann) Small, Ridge-seed Spurge, east to sc. TN (Chester, Wofford, \& Kral 1997). VA, WV, LA (Q). [= K; Euphorbia glyptosperma Engelmann -- C, Q]

Chamaesyce hypericifolia (Linnaeus) Millspaugh, reported for SC (Kartesz 1999), FL, GA, LA (Q). \{Investigate\} [= K; Euphorbia hypericifolia Linnaeus - Q] \{not yet keyed\}

Chamaesyce ophthalmica (Persoon) Burch. GA and PA (Kartesz 1999), but not in North America (Q). [= K; Euphorbia ophthalmica Persoon -- Q] \{not yet keyed\}

Chamaesyce serpens (Kunth) Small. Cp (GA): In se. PA (Rhoads \& Klein 1993) and e. GA. [= K; Euphorbia serpens Kunth -- C, Q]

Chamaesyce serpyllifolia (Persoon) Small ssp. serpyllifolia. In GA, PA, and DE (Kartesz 1999). In NC, GA, SC (Q) \{Investigate\} [= K; Euphorbia serpyllifolia var. serpyllifolia - Q] \{not yet keyed\}

\section*{Cnidoscolus Pohl 1827 (Spurge-nettle)}

A genus of about 75 species, herbs, of America. References: McVaugh (1944)=Y; Govaerts, Frodin, \& Radcliffe-Smith (2000)=Z.

Cnidoscolus stimulosus (Michaux) Engelmann \& A. Gray, Spurge-nettle, Tread-softly, Finger-rot, Bull-nettle. Cp (GA, NC, SC, VA), Pd (GA, NC, SC), Mt (NC, SC): sandhills, dry sandy woodlands, other dry sandy soils; common (rare in Piedmont and Mountains). Late March-August; May-September. Se. VA south to FL, west to e. LA, mostly on the Coastal Plain, but further inland southward. Beset with stinging trichomes. Allied to Cn. urens of Mexico, central America, and \(n\). South America, and sometimes treated as a variety of it. [= RAB, C, F, G, K, W, Y; Bivonea stimulosa (Michaux) Rafinesque -- S; Cn. urens (Linnaeus) Arthur var. stimulosus (Michaux) Govaerts - Z]

\section*{Croton Linnaeus 1753 (Croton, Doveweed, Rushfoil)}

A genus of about 750-1225 species, herbs, shrubs, and (rarely) trees, of nearly cosmopolitan distribution. Webster (1992, 1993) considers the 2 species traditionally treated as Crotonopsis to be closely related to sections within Croton, such as section Gynamblosis. His reasoning is followed here. References: Webster (1992)=Z; Webster (1993)=Y; Govaerts, Frodin, \& RadcliffeSmith (2000).

5 Stem leaves mostly \(2 \times\) or more as long as wide); lobes of the calyx of the pistillate flowers 5-9 (-12); [section Pilinophytum].
6 Leaves (the larger) \(4-15 \mathrm{~cm}\) long, \(1.5-6 \mathrm{~cm}\) wide (generally \(2-3 \times\) as long as wide), lanceolate to elliptic, cordate at the base; hairs of 2 colors, the shorter gray, the longer tan; lobes of the calyx of the pistillate flowers (6-) 7-9 (-12); [alien, of disturbed habitats] . . . . . . . . . . . . . . . . . . . . C. capitatus var. capitatus
6 Leaves (the larger) \(2.5-6 \mathrm{~cm}\) long, \(0.7-1.5 \mathrm{~cm}\) wide (generally \(3-6 \times\) as long as wide), linear to linearlanceolate, cuneate at the base; hairs of 1 color, all gray; lobes of the calyx of the pistillate flowers 5-6; [native, of Coastal Plain pondshores] C. elliottii

5 Stem leaves mostly less than \(2 \times\) as long as wide, \(1-8 \mathrm{~cm}\) long, broadly cuneate to rounded at the base (a few rarely subcordate); lobes of the calyx of the pistillate flowers 5 .
7 Styles 3, each 4-lobed, the style branches thus 12; capsule erect, 5-7 mm long; seeds 4.5-5.0 mm long; lower leaf surface silvery; plant an annual or perennial; [of coastal dunes]; [section Drepadenium]

7 Styles 2 or 3, each 2-lobed, the style branches thus 4 or 6; capsule pendulous, 3-6 mm long; seeds 2.5-4.0 mm long; lower leaf surface white to silvery; plant an annual; [of limestone outcrops, fields, or weedy situations].
8 Fruit 2-locular; seeds 1 per fruit; styles 2, each 2-lobed; [of limestone outcrops or weedy situations]; [section Gynamblosis] C. monanthogynus

8 Fruit 3-locular; seeds 3 per fruit; styles 3, each 2-lobed or 4-lobed; [of fields or weedy situations]; [section Velamea]
C. lindheimerianus var. lindheimerianus
* Croton capitatus Michaux var. capitatus, Woolly Croton, Hogwort, Capitate Croton. Pd, Mt (GA, NC, SC, VA), Cp (GA, NC, SC): fields, disturbed areas; uncommon, adventive from further west (VA Watch List). July-October. [= C, G, K; < Croton capitatus -- RAB, W; = Croton capitatus - F, S, sensu stricto]

Croton elliottii Chapman, Pondshore Croton, Elliott's Croton. Cp (GA, SC): shores and exposed drawdown zones of claybased Carolina bays and limesink ponds (dolines); rare (GA Special Concern, SC Rare). Se. SC south to panhandle FL, west to se. AL. [=K, S]
* Croton glandulosus Linnaeus var. septentrionalis Müller of Aargau, Doveweed, Tooth-leaved Croton, Sand Croton. Cp, Pd, Mt (GA, NC, SC, VA): fields, roadsides, disturbed areas; common. May-October. C. glandulosus is widespread in tropical and subtropical America; var. septentrionalis is the northernmost variety, but its pre-Columbian range is obscure because of its weedy nature. [= RAB, C, F, G, K, S, W]
* Croton lindheimerianus Scheele var. lindheimerianus, Lindheimer's Croton. Pd (NC): fields and other disturbed soils; rare, adventive from further west. June-October. [= K; Croton lindheimerianus -- RAB, infraspecific taxa not distinguished]

Croton michauxii Webster, Sand Rushfoil, Michaux's Croton. Cp (GA, SC, VA?): sandhills, disturbed sandy soils; rare (SC Rare). June-October. SC south to FL, west to TX, north in the interior to MO, IL, and IA. Fernald (1950) alleges that this species extends as far north as VA, but the documentation is unknown to me. [= K, Z; Crotonopsis linearis Michaux -- RAB, C, F, G, S]

Croton monanthogynus Michaux, Prairie-tea, One-seed Croton. Mt (GA, NC, VA), Pd (GA, SC, VA), Cp (VA): limestone outcrops, disturbed dry soil; rare (NC Rare, VA Rare). June-October. Sw. VA, OH, IN, IA, NE, and CO, south to nw. GA, FL, TX, and Mexico; adventive as a weed at scattered locations east of the Blue Ridge. [= RAB, C, F, G, K, S, W]

Croton punctatus Jacquin, Silverleaf Croton, Beach-tea, Gulf Croton. Cp (GA, NC, SC): beach dunes, coastal grasslands, usually with Uniola paniculata and/or Spartina patens; common. Late May-November. NC (Dare County) south to s. FL, west to TX, and south into Central and South America. [= RAB, K, S]

Croton willdenowii Webster, Glade Rushfoil, Outcrop Rushfoil, Willdenow's Croton. Pd, Cp (GA, NC, SC, VA), Mt (GA, NC, SC): granitic flatrocks, diabase barrens, thin soils around other rock outcrops, disturbed sandy soil; common (uncommon in VA). June-October. CT, se. PA (Rhoads \& Klein 1993), IL, and se. KS, south to FL and TX. [= K, Z; Crotonopsis elliptica Willdenow -RAB, C, F, G, S, W]

Croton alabamensis E.A. Smith ex Chapman var. alabamensis, Alabama Croton, is endemic to scattered populations in sc. TN (Chester, Wofford, \& Kral 1997) and c. AL. C. alabamensis var. texensis S. Ginzbarg is endemic to c. TX (Ginzbarg 1992; Aplet et al. 1994), where it occurs in canyons in the Edwards Plateau. The species is most closely related to species of the West Indies, Central America, and South America; its distribution is obviously relictual. [= K; Croton alabamensis -- S, infraspecific taxa not distinguished]

Croton argyranthemus Michaux. Cp (GA): sandhills; common. [= K, S] \{not yet keyed\}
Croton capitatus Michaux var. lindheimeri (Engelmann \& A. Gray) Müller of Aargau. In GA and westwards. [= K; C. engelmannii Ferguson - S] \{not yet keyed\}

\section*{Crotonopsis \\ (see Croton)}

\section*{Ditrysinia Rafinesque 1825 (Sebastian-bush)}

A monotypic genus, a shrub, of the Southeastern United States Coastal Plain. Perhaps as close to Gymnanthes as to Sebastiania. References: Govaerts, Frodin, \& Radcliffe-Smith (2000)=Z.

Ditrysinia fruticosa (W. Bartram) Govaerts \& Frodin, Sebastian-bush. Cp (GA, NC, SC): swamp forests, other wet to moist, mostly shaded, habitats; uncommon (NC Rare). May-June; July-October. Se. NC south to c. peninsular FL, west to e. TX. [= Z;

Sebastiania fruticosa (W. Bartram) Fernald -- GW, K; Sebastiania ligustrina (Michaux) Müller of Aargau -- RAB; Sebastiana ligustrina -- S (orthographic error)]

\section*{Euphorbia Linnaeus 1753 (Spurge)}
(see also Chamaesyce)
An extremely large and polymorphic genus. References: Huft (1979)=Z; Park (1998)=Y; Bridges \& Orzell (2002)=X; Govaerts, Frodin, \& Radcliffe-Smith (2000)=Q.

1 Bracteal leaves lobed or toothed (rarely linear), usually marked with red or white at the base; glands of the cyathia usually 1 (rarely more), bilabiate, lacking petaloid appendages; [subgenus Poinsettia].
2 Principal stem leaves alternate, either lobed or linear; plant usually glabrous
E. cyathophora

2 Principal stem leaves opposite, dentate, neither lobed nor linear; plant pubescent
E. dentata

1 Bracteal leaves entire, not marked with red (white-margined in E. marginata); glands of the cyathia 4-5, not bilabiate, with or without petaloid appendages.
3 Glands of the cyathia 5 (or 7-10 on the central cyathium in E. pubentissima), with petaloid appendages \(0.1-5.0 \mathrm{~mm}\) long (measured along a radius), these white, maroon, red, pink, or green; stipules present, glandlike, often minute; [subgenus Tithymalopsis].
4 Upper stem leaves and bracteal leaves with white margins, ovate, the apex acute; [alien, cultivated and rarely persisting or a waif]; [section Petaloma]. E. marginata

4 Upper stem leaves and bracteal leaves entirely green, obovate, elliptic, narrowly elliptic, or oblanceolate, the apex rounded or obtuse; [native]; [section Tithymalopsis].
5 Petaloid appendages (0.5-) 1.0-4.4 mm long (measured along a radius), about as long as wide or longer, white; stems (1.5-) 3-9 (-11) dm tall, erect; leaves not ciliate-margined.
6 Nodes below the umbel (25-) 35-60 (-115); cyathia (5-) 6.5-8.0 (-11.0) mm wide (across the appendages); stems (1-) 3-10 from a crown, each (1.2-) 2.5-5 (-7) mm in diameter at the base; plants (2-) 4-9 (-1.3) dm tall; leaves ascending, leathery, sessile or subpetiolate; plants flowering June-September; [plants (in our area) of the Mountains, upper Piedmont of NC, lower Piedmont and Coastal Plain of VA] . . . E. corollata
6 Nodes below the inflorescence (6-) 15-26 (-41); cyathia (3.5-) 4.0-5.5 (-6.5) mm wide (across the appendages); stems usually 1-2 (-3) from a crown, each (0.8-) 1.5-2.8 (-3.5) mm in diameter at the base; plants (1.5-) 3-5 (-6.5) dm tall; leaves usually reflexed (E. pubentissima) or usually ascending ( \(E\). discoidalis), thin, petiolate or subpetiolate; plants flowering March-July; [plants (in our area) nearly throughout, except sw. VA].
7 Leaves \(1.9-7.2 \mathrm{~cm}\) long, \(0.1-0.5 \mathrm{~cm}\) wide, averaging \(>10 \times\) as long as wide; primary inflorescence rays usually 3 ; [plants south of our area, and possibly in SC] . . . . . . . . . . . . . . . . . . . . . . . . E. discoidalis
7 Leaves (1.6-) avg. 3.8 (-6.1) cm long, \(0.5-2.2 \mathrm{~cm}\) wide, averaging \(<4 \times\) as long as wide; primary
inflorescence rays usually 5 ; [widespread in our area] . . . . . . . . . . . . . . . . . . . . E. pubentissima
5 Petaloid appendages 0.05-0.6 mm long (measured along a radius), shorter than wide, green, red, white, or pink; stems (0.8-) 1.5-4.5 (-6) dm tall, erect, ascending or decumbent; leaves ciliate-margined ( \(E\). mercurialina and \(E\). curtisii) or not.
8 Leaf margins ciliate; cyathia 3.5-5.9 mm wide (across the appendages), green; leaves not fleshy, 1.7-2.2 (\(3) \times\) as long as wide, not especially variable; [of mesic forests with rich soils] . . . . . . . . . . E. mercurialina
8 Leaf margins not ciliate (except some marginal hairs in E.curtisii); cyathia 2.0-3.4 mm wide (across the appendages), green or maroon; leaves slightly to strongly fleshy, \(0.7-20 \times\) as long as wide, often very variable in shape, even on the same plant; [of more or less xeric sandhill woodlands with acidic, sandy soils].
9 Stems usually 10-18 per crown, decumbent to weakly ascending; leaves opposite (scales on the lower stem sometimes alternate), fleshy, blue-green with a narrow, thickened, red-hyaline margin; branching dichotomous from the base of the plant (the branches typically equal, though sometimes unequal) E. ipecacuanhae

9 Stems 1-4 (-9) per crown, erect to strongly ascending; leaves alternate, opposite, or in whorls of 3 (at least some alternate on a plant), less fleshy, green to blue-green, without a red margin (or with a very narrow, slightly red-hyaline, but not thickened margin in E. exserta); branching alternate below the inflorescence (rarely dichotomous or trichotomous), the branches typically unequal.
10 Cyathia and capsules green; petaloid appendages white or pink; leaves thin-textured, green, finely pubescent with appressed white hairs ( \(0.1-0.3 \mathrm{~mm}\) long) on the lower surface and margins (visible at \(10 \times\) or greater); branching primarily alternate; leaves primarily alternate (typically opposite or 3 -whorled below the inflorescence); cyathia unisexual, plants usually unisexual (dioecious) . . . E. curtisii
10 Cyathia and capsules maroon; petaloid appendages maroon-red; leaves slightly fleshy,
somewhat blue-green, glabrous; branching primarily opposite; leaves primarily opposite (usually some alternate on upper branches); cyathia bisexual, plants bisexual . . . . . . . . . . E. exserta
3 Glands of the cyathia 4 (except 5 in E. purpurea), oval, reniform, or crescent-shaped, lacking petaloid appendages (the glands themselves yellowish or green); stipules absent or vestigial; [subgenus Esula].
11 Principal stem leaves finely serrulate (especially towards the apex); [subgenus Esula, section Tithymalus].
12 Ovary and capsule smooth
E. helioscopia

12 Ovary and capsule verrucose-roughened.
13 Seeds smooth or very obscurely reticulate, 2-2.5 mm long
E. obtusata

13 Seeds distinctly alveolate, \(1.5-1.8 \mathrm{~mm}\) long

\section*{E. spathulata} 11 Principal stem leaves entire

14 Stem leaves opposite, decussate (each succeeding pair turned by 90 degrees); seeds 4-6 mm long; [subgenus Esula, section Lathyris]
E. lathyris

14 Stem leaves alternate (or mostly so); seeds 1-3 mm long.
15 Stem leaves linear to narrowly oblong, averaging ca. \(10 \times\) as long as wide; [subgenus Esula, section Esula].
16 Stem leaves 1-3 cm long, 1-3 mm wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . E. cyparissias
16 Stem leaves 3-8 cm long, 4-8 mm wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . E. esula
15 Stem leaves oblanceolate, obovate, elliptic, or oblong, 1-10 cm long, 5-30 mm wide, averaging 1-5x as long as wide.
17 Principal stem leaves elliptic to oblong, (5-) \(7-10 \mathrm{~cm}\) long; rhizomatous perennial to 1 m tall; seeds smooth, 3-4 mm long; rays of the umbel usually 5-8; [subgenus Esula, section Tithymalus]
E. purpurea

17 Principal stem leaves oblanceolate to obovate, 1-2 cm long; annual, or perennial by basal offshoots, to 0.4 m tall; seeds pitted, \(1.3-2.0 \mathrm{~mm}\) long; rays of the umbel 3 ( -5 ); [subgenus Esula, section Esula]. 18 Seeds pitted only on one face, the inner face furrowed
E. peplus 18 Seeds pitted on both the inner and outer faces.

19 Seeds finely pitted with numerous, evenly distributed, circular pits; bracteal leaves broader than long; glands of the cyathia crescent-shaped, the horns slender, elongate, and caudate E. commutata

19 Seeds coarsely pitted with transversely elongate pits in 4 vertical rows (appearing nearly transversely rugose); bracteal leaves longer than broad; glands of the cyathia crescentshaped, the horns short and blunt
E. falcata

Euphorbia commutata Engelmann ex A. Gray, Woodland Spurge, Tinted Spurge. Mt (GA, NC, VA), Pd (GA, NC, SC, VA), Cp (GA, VA): rich forests and rock outcrops, over calcareous or mafic rocks; uncommon, rare in Coastal Plain (NC Rare). March-May. PA west to s. ON and MN, south to FL and TX. The southern var. erecta J.B.S. Norton may be worthy of recognition; we probably have both it and the typic var. commutata in our area. Var. erecta (ranging north to VA, KY, and MO) has all the cauline leaves oblanceolate and with petioles \(5-12 \mathrm{~mm}\) long; var. commutata has leaves varying from oblanceolate to obovate or ovate, the upper leaves usually broad and sessile. [= RAB, C, F, G, K, Q, W; Eu. commutata var. erecta J.B.S. Norton -- C, G; Galarhoeus commutatus (Engelmann) Small -- S]

Euphorbia corollata Linnaeus, Eastern Flowering Spurge. Mt (GA, NC, SC, VA), Pd (GA, NC, VA), Cp (VA): woodlands and forests; common. June-September. NH and MA west to s. Ontario, MI, WI, MN, and NE, south to se.VA, c. NC, n. GA, s. AL, and e. TX. Huft (1979) considered Eu. marilandica a sporadic growth form of Eu. corollata. [=K, Y, Z; Eu. corollata var. corollata -- RAB, C, F; Eu. marilandica Greene -- C, F, G; Eu. corollata -- G, W, in part (see also Eu. pubentissima); Tithymalopsis corollata (Linnaeus) Klotzsch -- S; Eu. corollata var. corollata - Q, in part only (also see Eu. discoidalis)]

Euphorbia curtisii Engelmann, White Sandhills Spurge, Curtis's Spurge. Cp (GA, NC, SC): sandhills; common. Late MarchJune. Sc. and se. NC to ne. FL and w. panhandle FL, on the Coastal Plain. Less variable in leaf shape than Eu. ipecacuanhae or Eu. exserta. [= RAB, GW, K, Q, Y, Z; Tithymalopsis curtisii (Engelmann) Small -- S; Tithymalopsis eriogonoides Small -- S]

Euphorbia cyathophora Murray, Painted Leaf, Fire-on-the-mountain. Cp, Pd (GA, NC, SC, VA): disturbed habitats, dunes; uncommon. June-October. Ranging from se. United States, south into the New World tropics, the original range obscure. [= C, K, Q; Eu. heterophylla Linnaeus -- RAB, F, G, misapplied; Eu. heterophylla var. graminifolia Engelmann -- RAB, F; Poinsettia cyathophora (Murray) Klotzsch \& Garcke -- S; Poinsettia heterophylla -- S, misapplied]
* Euphorbia cyparissias Linnaeus, Cypress Spurge, Graveyard Spurge. Mt, Pd (GA, NC, SC, VA), Cp (VA): roadbanks, graveyards, waste places; common, introduced from Europe. March-May (occasionally later). [= RAB, C, F, G, K, Q, W; Galarhoeus cyparissias (Linnaeus) Small ex Rydberg -- S; Tithymalus cyparissias (Linnaeus) Lamarck]
* Euphorbia dentata Michaux, Painted Leaf, Wild Poinsettia, Toothed Spurge. Mt (GA, NC, VA), Pd (NC, SC, VA), Cp (VA): disturbed areas, hedgerows, thickets, railroad cinders; common, introduced from further west. July-October. [= RAB, C, F, G, Q, W; Eu. dentata var. dentata - K; Poinsettia dentata (Michaux) Klotzsch \& Garcke -- S]

Euphorbia discoidalis Chapman, Summer Spurge. Cp (GA): sandhills. E. and c. GA (or e. SC?) south and west to Panhandle FL and e. TX. Park (1998) includes in synonymy Eu. corollata var. angustifolia Elliott, with a stated type locality is e. SC. [= K, Y; Tithymalopsis discoidalis (Chapman) Small -- S; Eu. corollata var. corollata - Q] \{augment\}

Euphorbia esula Linnaeus var. esula, Wolf's-milk, Leafy Spurge Pd (VA): disturbed areas; rare, introduced from Eurasia. [= K; Eu. esula -- C, F, G, infraspecific taxa not distinguished; Eu. esula ssp. esula - Q; Tithymalus esula (Linnaeus) Scopoli]

Euphorbia exserta (Small) Coker, Maroon Sandhills Spurge, Coastal Sand Spurge. Cp (GA, NC, SC, VA): sandhills; uncommon. March-June. Sc. NC south to c. peninsular and e. panhandle FL; disjunct in se. VA (Sussex County) (Belden et al. 2004). The leaves are extremely variable in size and shape, from linear to rotund. Park (1998) recognizes Eu. exserta and Eu. gracilior as distinct from one another, differing in the involucre (purple in Eu. exserta and green in Eu. gracilior) and the appendages (rudimentary and purple in Eu. exserta and semicircular and white in Eu. gracilior). [= K, Q, Y, Z; Eu. gracilior Cronquist -- RAB, Y; Tithymalopsis exserta Small -- S; Tithymalopsis gracilis (Boissier) Small -- S]

Euphorbia falcata Linnaeus. Mt, Pd (VA): disturbed areas; rare, introduced from Europe. [= C, F, G, K; Eu. falcata ssp. falcata - Q]
* Euphorbia helioscopia Linnaeus, Wartweed. Pd (GA, NC, SC, VA), Mt (VA), Cp (VA): cultivated ground; rare, introduced from Europe. Late March-June. [= RAB, C, F, G, K; Galarhoeus helioscopia (Linnaeus) Haworth -- S; Eu. helioscopia ssp. helioscopia - Q]

Euphorbia ipecacuanhae Linnaeus, Carolina Ipecac. Cp (GA, NC, SC, VA): sandhills; common. February-May (and later, especially in response to fire). CT (formerly), NY (Long Island), NJ, and se. PA (Rhoads \& Klein 1993) south to ec. GA, on the

Coastal Plain. The leaves are extremely variable in size and shape, from linear to rotund. Huft (1979) considered Eu. arundelana Bartlett (reported from MD, SC, and GA) a sporadic form of Eu. ipecacuanhae. Park (1998) suggested that Eu. ipecachuanhae is actually a member of Chamaesyce (treated by Park as a subgenus), rather than of Euphorbia. [= RAB, C, F, G, K, Q, Z; Eu. arundelana Bartlett -- F; Tithymalopsis ipecacuanhae (Linnaeus) Small -- S]
* Euphorbia lathyris Linnaeus, Caper Spurge, Myrtle Spurge, Mole Plant. Mt (NC, SC, VA), Pd (VA), Cp (VA): roadsides, disturbed areas; rare, introduced from Europe. June-August. [= RAB, F, K, Q, W; Eu. lathyrus -- C, G, an orthographic variant; Galarhoeus lathyrus -- S]
* Euphorbia marginata Pursh, Snow-on-the-mountain. Cp (GA, NC, SC, VA), Pd (GA, VA), Mt (VA): roadsides, disturbed areas; uncommon, introduced from further west. July-November. [= RAB, C, F, G, K, Q; Lepadena marginata (Pursh) Nieuwland -S; Agaloma marginata (Pursh) A. \& D. Löve]

Euphorbia mercurialina Michaux, Cumberland Spurge, Mercury Spurge. Pd (GA, NC, VA*): rich slope over gabbro; rare (NC Rare). May-June. S. KY south through e. TN to nw. GA and n. AL; disjunct in c. NC, where found in 1992. Apparently introduced in VA. [= C, F, G, K, Q, W, Y, Z; Tithymalopsis mercurialina (Michaux) Small -- S]

Euphorbia obtusata Pursh, Woodland Spurge. Pd, Cp, Mt (NC, SC, VA): rich bottomland forests; uncommon (rare in Mountains). April-July. Sc. PA west to IN and IA, south to SC and TX. [= RAB, C, F, G, W; Eu. spathulata Lamarck -- K, Q, in part; Galarhoeus obtusatus (Pursh) Small -- S]
* Euphorbia peplus Linnaeus, Petty Spurge. Mt (VA): disturbed areas; rare, introduced from Eurasia. [= C, F, G, K; Galarhoeus peplus (Linnaeus) Haworth -- S; ? Eu. peplus var. minima Augustin de Candolle - Q; ? Eu. peplus var. peplus - Q; Tithymalus peplus (Linnaeus) Hill]

Euphorbia pubentissima Michaux, Southeastern Flowering Spurge. Cp, Pd, Mt (GA, NC, SC, VA): dry woodlands, sandhills; common. March-July. C. MD, VA, and c. and sw. TN south to ne. FL, panhandle FL, and s. MS. [= K, Y, Z; Eu. corollata Linnaeus var. zinniiflora (Small) Ahles -- RAB; Eu. corollata Linnaeus var. corollata -- RAB, in part; Eu. corollata var. paniculata Boissier -- C, F, Q; Eu. zinniiflora Small -- F; Eu. apocynifolia Small -- F; Eu. corollata var mollis Millspaugh -- F; Eu. corollata -- G, W, in part; Tithymalopsis zinniiflora (Small) Small -- S; Tithymalopsis apocynifolia (Small) Small -- S; Tithymalopsis paniculata (Boissier) Small -- S; Agaloma pubentissima (Michaux) D.B. Ward]

Euphorbia purpurea (Rafinesque) Fernald, Glade Spurge, Darlington Spurge, Purple Spurge. Mt (NC, VA): rich moist forests in bottomlands or on slopes, in rich soil around rock outcrops, especially over calcareous rocks (such as dolomite) or mafic rocks (such as amphibolite); rare (US Species of Concern, NC Rare, VA Rare). May-August. NJ, PA, and OH south to w. NC. [= RAB, C, F, G, K, Q, W; Galarhoeus darlingtonii (A. Gray) Small -- S]

Euphorbia spathulata Lamarck, Prairie Spurge, Warty Spurge. Mt (NC?, VA): rocky woodlands; rare? May-June. MN and WA south to w. VA, AL, LA, TX, and Mexico. [= C, W; Eu. dictyosperma Fischer \& Meyer -- F, G; Eu. spathulata -- K, Q, in part only (also see Eu. obtusata); Galarhoeus arkansanus (Engelmann \& A. Gray) Small ex Rydberg -- S]
* Euphorbia davidii Subils, introduced in se. TN (Chester, Wofford, \& Kral 1997). Also in our area according to Kartesz (1999). \{investigate\} [=K, Q; Eu. dentata var. gracillima Millspaugh] \{not yet keyed\}

Euphorbia exigua Linnaeus, Dwarf Spurge, in PA and WV (Kartesz 1999). [= K; Eu. exigua ssp. exigua - Q] \{not yet keyed\}
Euphorbia floridana Chapman, Florida Spurge. Cp (GA): In sw. GA (Bridges \& Orzell 2002, Jones \& Coile 1988). [= K, Q, X; Galarhoeus floridanus (Chapman) Small-S] \{not yet keyed\}

Euphorbia heterophylla Linnaeus, in GA (Kartesz 1999). [= K, Q] \{not yet keyed\}
Euphorbia inundata Torrey ex Chapman var. inundata. Cp (GA): In se. GA (Bridges \& Orzell 2002). [=X; Eu. inundata -- K, Q, infraspecific taxa not distinguished] \{not yet keyed\}

Euphorbia tetrapora Engelmann. In GA (Kartesz 1999). GA west to TX. [= K, Q] \{not yet keyed\}

Manihot P. Miller 1754 (Cassava)
A genus of about 100 species, trees, shrubs, and herbs, of tropical and subtropical America. References: Govaerts, Frodin, \& Radcliffe-Smith (2000) \(=\) Z.

Manihot grahamii Hooker, Graham's Cassava. Cp (GA): disturbed areas; grown as an ornamental, rarely naturalizing. Introduced in sw. GA (Jones \& Coile 1988) and FL west to LA. [= K, Z] \{add to genus key\}
* Manihot esculenta Crantz, Manioc, Tapioca, is naturalized on the Gulf Coast, as in AL and FL. [= K] \{not keyed; add to synonymy\}

Mercurialis Linnaeus 1753 (Mercury)
A genus of about 8 species, herbs, of the Old World. References: Govaerts, Frodin, \& Radcliffe-Smith (2000)=Z.
* Mercurialis annua Linnaeus, Annual Mercury, Boys-and-girls, has been reported as a rare "ballast weed" from Charleston, SC and Mobile, AL(Wiggins 1932). It is presumably not established in our area. [= C, F, G, K, S, Z] \{not keyed\}

Ricinus Linnaeus 1753 (Castor-bean)
A monotypic genus, a shrub or tree, native to Africa and w. Asia, now pantropical. References: Govaerts, Frodin, \& Radcliffe-Smith (2000) \(=\) Z.
* Ricinus communis Linnaeus, Castor-bean, Castor-oil Plant, Palma Christi. Cp (GA, NC, SC, VA), Pd (NC, SC): waste places, gardens; rare, native of the tropics, probably Africa. July-October. The seeds are dangerously poisonous, formerly the source of an oil used as a purgative and machine lubricant. In FL and further south in the tropics, \(R\). communis is a small to medium tree. [= RAB, C, F, G, K, S, Z]

\title{
Sapium P. Browne (Chinese Tallow-tree) (see Triadica) \\ Sebastiania Sprengel (Sebastian-bush) (see Ditrysinia)
}

Stillingia Garden ex Linnaeus (Queen's-delight)
A genus of about 30 species, herbs, shrubs, and small trees, of tropical to subtropical regions of America, Madagascar, and se. Asia. References: Govaerts, Frodin, \& Radcliffe-Smith (2000)=Z.

1 Stems woody, single; leaves less than 1 cm wide; [of pineland ponds and other aquatic habitats] . . . . . . . . . . . . S. aquatica
1 Stems herbaceous, several from a crown; leaves more than 1 cm wide; [of dry habitats] . . . . . . . . S. sylvatica ssp. sylvatica
Stillingia aquatica Chapman, Corkwood, Water Toothleaf. Cp (GA, SC): ponds in pine flatwoods; rare (SC Rare). MaySeptember. Se. SC south to s. FL, west to sw. AL. [= RAB, K, S, Z]

Stillingia sylvatica Garden ex Linnaeus ssp. sylvatica, Queen's-delight. Cp (GA, NC, SC, VA), Pd (GA): sandhills, dryish coastal plain woodlands; common (VA Rare). May-July; June-September. Se. VA south to FL, west to TX and NM, north in the interior to KS. Ssp. tenuis (Small) D.J. Rogers is in s. FL. [= K, Z; S. sylvatica -- RAB, C, G, infraspecific taxa not distinguished; S. sylvatica -- F, S; S. sylvatica var. salicifolia Torrey -- F; S. spathulata (Müller of Aargau) Small -- S]

\section*{Tragia Linnaeus 1753 (Noseburn)}

A genus of about 100-170 species, of tropical to warm temperate regions of the Old and New Worlds. References: Miller \& Webster (1967)=Z; Govaerts, Frodin, \& Radcliffe-Smith (2000)=Y.

Tragia cordata Michaux, Heartleaf Noseburn. Cp (GA): rocky calcareous woodlands, calcareous prairies; rare (GA Rare). C. KY, s. IN to s. MO, south through c. TN, rarely to e. TN (Meigs County, in the Ridge and Valley Province) (Chester, Wofford, \& Kral 1997), n. AL (Jackson Co.) (D. Spaulding pers. comm.) to sw. GA, Panhandle FL and e. TX. [= C, K, Z; T. macrocarpa Willdenow -S]

Tragia smallii Shinners, Gulf Coast Noseburn. Cp (GA): sandhills; uncommon. Sw. GA west to e. TX. Reports of \(T\). betonicifolia from GA are based on misapplication of that name to material representing T. smallii. [=K, Z; T. betonicaefolia Nuttall S, misapplied; T. betonicifolia Nuttall, misapplied]

Tragia urens Linnaeus, Southeastern Noseburn, Wavyleaf Noseburn. Cp (GA, NC, SC, VA), Pd (GA, NC, SC), Mt (SC): sandhills, sandy woodlands, other woodlands; common (rare in Piedmont and Mountains). May-October. Se. VA south to FL and west to TX, mostly on the Coastal Plain, but ranging into the mountains southward. [= RAB, C, F, G, K, S, W, Z; T. linearifolia Elliott -- S]

Tragia urticifolia Michaux, Nettleleaf Noseburn. Pd (GA, NC, SC, VA), Cp (GA, SC), Mt (SC): dry woodlands and rock outcrops, particularly over mafic or calcareous rocks; common (VA Rare). May-October. Sc. VA west to MO, KS, and CO, south to FL and AZ. [= RAB, F, G, K, W; = T. urticaefolia -- S, orthographic variant]

\section*{Triadica Loureiro 1790 (Chinese Tallow-tree)}

A genus of 2-3 species, native to tropical and subtropical Asia. The most recent monographers of Sapium and related genera (Kruijt 1996, Esser 2002) place our single naturalized species in the genus Triadica, native to Asia; Sapium (excluding Triadica) is a genus of 21 species restricted to the neotropics. References: Kruijt (1996)=Z; Esser (2002)=Y; Govaerts, Frodin, \& Radcliffe-Smith (2000)=X.
* Triadica sebifera (Linnaeus) Small, Chinese Tallow-tree, Popcorn Tree. Cp (GA, NC, SC): marsh edges, shell deposits, disturbed areas; uncommon. May-June; August-November, native of e. Asia. With Euphorbia, Chamaesyce, and Cnidoscolus, one of our few Euphorbiaceous genera with milky sap. Triadica has become locally common from Colleton County, SC southwards
through the tidewater area of GA, and promises to become a serious weed tree (as it is in parts of LA, TX, and FL). [= K, S, X, Y, Z; = Sapium sebiferum (Linnaeus) Roxburgh -- RAB, GW]

Vernicia Loureiro 1790 (Tung-oil Tree)

A genus of 3 species, trees, native of se. Asia. References: Govaerts, Frodin, \& Radcliffe-Smith (2000)=Z.
* Vernicia fordii (Hemsley) Airy-Shaw, Tung-oil Tree, Tung Tree. Cp (GA, NC): planted for the oil and for ornament, rarely naturalizing; rare, introduced from central and western China. Naturalized in GA, from former plantations; planted and showing a tendency to naturalize in the Coastal Plain of NC (Mount Olive, Wayne Co.). [=K, Z; = Aleurites fordii Hemsley]

\section*{FABACEAE or LEGUMINOSAE (Legume Family)}

A family of about 730 genera and 20,000 species, trees, shrubs, and herbs, cosmopolitan. References: Isely (1990)=SE (throughout the family treatment); Wojciechowski, Lavin, \& Sanderson (2004); Wilbur (1963); Isely (1998)=I; Robertson \& Lee (1976).

\section*{Key A - woody legumes (trees, shrubs, or woody vines)}

1 Leaves unifoliolate or trifoliolate, or reduced to phyllodial spines.
2 Tree; leaves unifoliolate and \(>5 \mathrm{~cm}\) wide; [subfamily Caesalpinioideae, tribe Cercideae] . . . . . . . . . . . . . . . . . . . Cercis
2 Shrubs or woody vines (rarely tree in Erythrina); leaves trifoliolate, unifoliolate, or reduced to phyllodial spines (if unifoliolate, <2 cm wide); [subfamily Papilionoideae].
3 Woody vine.
4 Calyx 4.5-6 mm long; leaflets unlobed; [tribe Phaseoleae, subtribe Diocleinae] . . . . . . . . . . . . . . . . . . Dioclea
4 Calyx 10-12 mm long; leaflets generally lobed; [tribe Phaseoleae, subtribe Glycininae] . . . . . . . . . . . Pueraria
3 Shrub or tree.
5 Shrub or tree with twigs various, but not conspicuously green or flanged; leaves pinnately trifoliolate.
6 Corolla 30-50 mm long, scarlet; legume with several seeds; leaflets lobed; [tribe Phaseoleae, subtribe
Erythrininae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Erythrina
6 Corolla 8-15 mm long, purplish, pink, or white; legume 1-seeded; leaflets not lobed; [tribe Desmodieae, subtribe Lespedezinae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Lespedeza
5 Shrub with angled or flanged green twigs; leaves palmately trifoliolate, unifoliolate, or reduced to spine-tipped phyllodes; flowers bright yellow; [introduced, usually of roadsides or as remnants of cultivation]; [tribe Genisteae, subtribe Genistinae].
7 Leaves all reduced to phyllodial spines; flowers axillary; calyx 10-15 mm long . . . . . . . . . . . . . . . . . Ulex
7 Leaves with normal lamina, either unifoliolate or trifoliolate; flowers in terminal racemes; calyx 3-6 mm long.
8 Leaves trifoliolate lower on the stem, unifoliolate above; corolla 15-22 mm long ......... Cytisus
8 Leaves unifoliolate throughout; corolla 10-14 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . [Genista]
1 Leaves pinnate.
9 Woody vines; [subfamily Papilionoideae].
10 Leaves even-pinnate; legume 3.5-4 cm long; seeds shiny scarlet and black; [tribe Abreae] ............... [Abrus]
10 Leaves odd-pinnate; legume 4-15 cm long; seeds brown; [tribe Milletieae] . . . . . . . . . . . . . . . . . . . . . . . . Wisteria
9 Trees or shrubs.
11 Leaves \(2 \times\)-paripinnate; [subfamily Mimosoideae]
12 Stamens connate at the base; inflorescence pink, 2.5-5 cm in diameter; [tribe Ingeae] . . . . . . . . . . . . . Albizia
12 Stamens free; inflorescence orange or yellowish-white, 1.0-2.2 cm in diameter.
13 Inflorescence orange, 1.0-1.3 cm in diameter; stamens many; [tribe Acacieae] . . . . . . . . . . . . . . . Acacia
13 Inflorescence yellowish-white, 1.8-2.2 cm in diameter; stamens 10; [tribe Mimoseae] . . . . . . . . Leucaena
11 Leaves otherwise.
14 [subfamily Papilionoideae].

15 Leaves glandular-punctate; corolla of only 1 petal; inflorescence a spike; shrubs; [tribe Amorpheae] .....
. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Amorpha
Leaves not glandular-punctate; corolla of 5 petals; inflorescence a raceme or panicle; trees or shrubs.
16 Leaflets alternate on the rachis; leaflets 4-15 (-20) cm long; [tribe Sophoreae] . . . . . . . . . Cladrastis 16 Leaflets opposite on the rachis, leaflets (1-) 2-5 (-6) cm long.

17 Leaflets with persistent linear stipels; native and cultivated, collectively widespread in our area; [tribe Robinieae]

Robinia
17 Leaflets lacking stipels; cultivated, perhaps not established; [tribe Sophoreae] [Styphnolobium] 14 [subfamily Caesalpinioideae].

18 Leaves all 2-pinnate, or a mixture of 2-pinnate and 1-pinnate on the same plant; shrub or tree; [tribe Caesalpineae].
19 Leaves a mixture of 1-pinnate and 2-pinnate . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Gleditsia 19 Leaves all 2-pinnate.

20 Leaves petiolate; leaflets 20-70 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Gymnocladus
20 Leaves subsessile (the pinnae simulating 1-pinnate leaves); leaflets 1-5 mm long . Parkinsonia
18 Leaves all 1-pinnate (or appearing so in Parkinsonia); herb, shrub or tree.
21 Shrub with prominent glands on the leafstalk; [tribe Cassieae] . . . . . . . . . . . . . . . . . . . . . . . . . Senna
21 Tree or shrub (if a shrub, then lacking prominent glands on the leafstalk); [tribe Caesalpineae].
22 Leaflets 13-45 mm long; tree; leaves 1-pinnate . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Gleditsia
22 Leaflets \(1-5 \mathrm{~mm}\) long; shrub; leaves actually 2-pinnate, but subsessile, the pinnae simulating
1-pinnate leaves . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Parkinsonia

Key B - herbaceous legumes with palmate leaves with 4 or more leaflets
Lupinus
Orbexilum
Pediomelum
Psoralidium
Zornia

Key C - herbaceous legumes with bipinnate leaves
\begin{tabular}{|c|c|c|}
\hline & Pe & hus \\
\hline 1 & \multicolumn{2}{|l|}{Petiole without glands; stems prostrate to weakly arching; flowers pink-purple, yellow, or greenish-yellow.} \\
\hline & 2 Flowers pink-purple; legume ribbed, the ribs with prickles & Mimosa \\
\hline & & \\
\hline
\end{tabular}

Key D - pinnate plus
Aeschynomene
Apios
Arachis
Astragalus
Clitoria
Dalea
Galactia
Glottidium
Glycyrrhiza
Lathyrus
Lotus
Pisum
Securigera
Sesbania
Tephrosia

Pediomelum
Phaseolus
Rhynchosia
Stylosanthes
Strophostyles
Trifolium
Vigna

\section*{Abrus Adanson (Precatory Bean)}

A genus of about 15 species, woody vines and shrubs, pantropical. References: Isely (1998)=1.
* Abrus precatorius Linnaeus, Precatory Bean, Rosary Pea, Crab's Eye. Apparently reported for GA, AL, and AR by Isely (1998) and Kartesz (1999), but this is actually based on mislabeling in Map 64 in Isely (1998). The species does occur in FL, near the GA border and might be expected in s. GA. [= I, K; = Abrus abrus (Linnaeus) L.F. Wight - S]

\section*{Acacia P. Miller (Acacia)}

A genus of about 1200 species (as broadly circumscribed, but currently under study and very likely to be divided), trees and shrubs, of tropical, subtropical, and warm temperate regions of Australia, Africa, and America. References: Isely (1998) \(=1\); Isely (1969)=Z; Maslin, Miller, \& Seigler (2003).

1 Leaves with 2-4 (-6) pairs of pinnae; each pinna with 10-20 pairs of leaflets . . . . . . . . . . . . . . . . . . . . . . . . . . . A. farnesiana
1 Leaves with 10-15 (-20) pairs of pinnae; each pinna with 20-30 pairs of leaflets . . . . . . . . . . . . . . . . . . . . . . A. macracantha
Acacia farnesiana (Linnaeus) Willdenow, Sweet Acacia. Cp (GA): sandy flats on barrier islands, maritime scrub; rare, apparently native but possibly adventive from further south (GA Special Concern). E. GA, along the coast, south to s. FL. See Duncan (1985). [= I, K, SE, Z; = Vachellia farnesiana (Linnaeus) Wight \& Arnott -- S]
* Acacia macracantha Humboldt \& Bonplandt ex Willdenow, Apopanax. Cp (GA): planted as an ornamental and rarely naturalized; rare, introduced from further south. [=I, K, SE, Z; Vachellia]

A genus of about 130 species, herbs, pantropical and warm temperate. References: Carulli, Tucker, \& Dill (1988)=Z; Rudd \((1955)=Y\); Isely (1998)=I. Key adapted in part from SE.

1 Prostrate perennial; leaves with 3-7 (-9) leaflets; [of dry sandy habitats]
Ae. viscidula
1 Erect or ascending annual; leaves with 20-50 or more leaflets; [of moist to wet habitats]
2 Leaflets with 2-4 longitudinal nerves; mature fruit stipe \(1.5-3 \mathrm{~mm}\) long . . . . . . . . . . . . . . Ae. americana var. americana
2 Leaflets with 1 longitudinal nerve; mature fruit stipe 4-25 mm long.
3 Mature fruit stipe \(12-25 \mathrm{~mm}\) long; corolla (10-) 12-15 mm long; fruit segments \(5-7 \mathrm{~mm}\) long, \(4.5-6.5 \mathrm{~mm}\) wide; paired bracts subtending each flower toothed (rarely entire); standard greenish-yellow with distinct dark-red veins; leaflets \(6-25 \mathrm{~mm}\) long, \(2-5 \mathrm{~mm}\) wide

Ae. virginica
3 Mature fruit stipe 4-8 (-10) mm long; corolla 7-13 (-15) mm long; fruit segments 4-6 mm wide, \(3.5-6 \mathrm{~mm}\) wide; paired bracts subtending each flower toothed or entire; standard pale orange or reddish-orange, the veins usually indistinct; leaflets \(2.5-25 \mathrm{~mm}\) long, \(1-4 \mathrm{~mm}\) wide.
4 Paired bracts subtending each flower entire (rarely toothed); leaflets 2.5-13 mm long, 1-2.5 mm wide; fruit segments \(4-5 \mathrm{~mm}\) wide, \(3.5-5 \mathrm{~mm}\) wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Ae. indica 4 Paired bracts subtending each flower toothed (rarely entire); leaflets \(6-25 \mathrm{~mm}\) long, \(1.5-4 \mathrm{~mm}\) wide; fruit segments \(5-6 \mathrm{~mm}\) wide, \(5-6 \mathrm{~mm}\) wide
Ae. rudis

Aeschynomene americana Linnaeus var. americana, Shyleaf. Cp (GA): moist, disturbed sites; rare (GA Watch List). s. GA southwards (Jones \& Coile 1988, SE). [= I, SE, Y; < Ae. americana -- K, S, infraspecific taxa not distinguished]

Aeschynomene indica Linnaeus, Southern Joint-vetch Cp (GA, NC, SC, VA): marshes, ditches, disturbed wetlands; uncommon. July-October. Apparently native to se. North America, from NC west to AR, south to FL and TX, now widespread in the tropics and subtropics of the Old World and New World. Perry, Ware, \& McKenney-Mueller (1998) discuss the occurrence of this species in VA. [= GW, I, K, SE, Y, Z; < Ae. virginica -- S, in large part]
* Aeschynomene rudis Bentham, Frisolillo. Cp (GA, NC, SC): roadside ditches, rice fields, disturbed wetlands; rare, introduced from South America. July-October. Native to South America, introduced in se. United States, recently becoming a weed. [ \(=\mathrm{I}, \mathrm{K}, \mathrm{SE}, \mathrm{Y}, \mathrm{Z}\) ]

Aeschynomene virginica (Linnaeus) Britton, Sterns, \& Poggenburg, Northern Joint-vetch, Sensitive Joint-vetch. Cp (NC, VA): fresh to brackish tidal marshes and adjacent ditches, fields, and disturbed areas; rare (US Threatened, NC Endangered, VA Rare). July-October. NJ to ne. NC. Generally not weedy in most of its range, but in NC (now) found mostly in weedy situations, such as ditches or fields hydrologically connected to tidal waters. See Tyndall, Holt, \& Lam (1996) and Belden \& Van Alstine (2003) for additional information on habitat, population biology, and survey techniques. See Baskin et al. (1998) for additional information about seed germination and viability. [= RAB, C, F, G, I, K, SE, Y, Z; < Ae. virginica -- S (see also Ae. indica)]

Aeschynomene viscidula Michaux, Sticky Joint-vetch. Cp (GA): dry sandy areas, such as sandhills, dry pinelands, and barrier islands; rare (GA Special Concern). From s. GA southwards (Jones \& Coile 1988, SE). [=I, K, SE, Y; = Secula viscidula (Michaux) Small -- S]

\section*{Albizia Durazzini (Silktree)}

A genus of about 100-120 species, trees, shrubs, and vines, of tropical, subtropical, and warm temperate Asia, Africa, and America. References: Isely (1973)=Z; Isely (1998)=I.

1 Leaflets 7-15 mm long; bark of mature trees smoothish, with small wart-like bumps ......................... A. julibrissin
1 Leaflets \(15-30 \mathrm{~mm}\) long; bark of mature trees rough, with plates
A. kalkora
* Albizia julibrissin Durazzini, Mimosa, Silktree. Cp, Pd, Mt (GA, NC, SC, VA): disturbed areas, suburban woodlots, escaped and persistent in forests and woodlands; common, native of tropical Asia. May-August; July-November. Becoming a serious weed; "literally almost everywhere in the 'Dixie' south" (Isely 1973). [= RAB, C, I, K, SE, W, Z; = Albizzia julibrissin -- F, G, S, an orthographic variant]
* Albizia kalkora (Roxburgh) Prain, Kalkora Mimosa. Pd (NC): naturalizing in suburban areas; rare, introduced from e. Asia (Japan, Korea, Taiwan). Documented by herbarium specimens at DUKE and NCU.

Alysicarpus Necker ex Desvaux (Alyce Clover)
A genus of about 25 species, herbs, native of the Old World tropics. References: Isely (1998)=I.
* Alysicarpus vaginalis (Linnaeus) Augustin de Candolle, Alyce Clover. Cp (GA), Pd (GA, NC): planted as a forage crop (at least formerly), and rarely naturalized; introduced from the Old World tropics. [= I, K, SE]

Amorpha Linnaeus (Indigo-bush, Leadplant)
References: Wilbur (1964)=Z; Wilbur (1975)=Y; Isely (1998)=I.
1 Short shrubs, usually 0.3-1 (-1.5) m tall; petioles 1-15 (-20) mm long, usually shorter than the width of the contiguous leaflets (except in A. georgiana var. confusa); leaflets usually slightly or conspicuously revolute.

2 Leaflet mucros mostly swollen apically; plant usually evidently and rather densely pubescent or puberulent (except \(A\). herbacea var. floridana, of s. GA and FL).
3 Upper portions of the plant (stems and leaves) glabrescent; calyx tube glabrous to sparsely or densely minutely strigillose; fruit glabrous; [of s. GA southwards] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. herbacea var. floridan
3 Upper portions of the plant (stems and leaves) conspicuously pubescent; calyx tube densely puberulent to short pilose; fruit densely to sparsely puberulent (rarely glabrate); [widespread in our area] . . . A. herbacea var. herbacea
2 Leaflet mucros mostly tapered apically; plant usually glabrous or sparsely pubescent.
4 Leaflets (10-) 15-25 (-35) mm long, (7-) 9-15 (-18) mm wide; standard intense (rarely light) bright blue; petiole (6-) 8-15 (-20) mm long; racemes mostly panicled, (1-) 3-5 (-8) per flowering branch, 10-20 (-45) cm long; flowering June-July
A. georgiana var. confusa

4 Leaflets (3-) 6-10 (-15) mm long, (2-) 3-5 (-8) mm wide; standard reddish-purple; petiole 1-3 (-5) mm long; racemes solitary (less commonly panicled), 1 (-4) per flowering branch, (2-) 3-5 (-6) cm long; flowering April-May

\section*{A. georgiana var. georgiana}

1 Taller shrubs, usually 1-3 (-4) m tall, petioles 10-30 mm long, usually exceeding the width of the contiguous leaflets; leaflets not revolute, or slightly so.
5 Calyx lobes (1.2-) 2.0-3.5 mm long (thus approaching, equal to, or exceeding the length of the calyx tube); racemes 3-8 (-15) cm long
A. schwerinii

5 Calyx lobes (0-) 0.2-1.2 mm long (thus distinctly shorter than the calyx tube); racemes 5-20 (-25) cm long.
6 Calyx lobes obsolete to very small, (0-) 0.2-0.6 (-0.8) mm long; plants glabrous to glabrate; leaflets usually not mucronate, the midrib commonly terminating in a sessile or shortly exserted (0.2-0.4 mm), slightly enlarged, glandular tip; leaflets relatively few, (9-) 11-15 (-19)
A. glabra

6 Calyx lobes small, 0.2-1.2 mm long (the abaxial lobe usually \(0.8-1.2 \mathrm{~mm}\) long); plants pubescent or puberulent, usually conspicuously so; leaflets usually mucronate, the midrib usually slender, exserted, 0.5-1.5 mm long and tapering; leaflets relatively many, 9-23 (-31).
\(7 \quad\) Foliage remaining green when dried; leaflets (7-) 9-23 (-31) per leaf, dull to somewhat shiny above; [widespread in our area]
A. fruticosa
\(7 \quad\) Foliage blackening when dried; leaflets (7-) 9-15 (-19) per leaf, usually shiny above; [of s. SC and southwards]
A. nitens

Amorpha fruticosa Linnaeus, Tall Indigo-bush. Pd, Mt, Cp (GA, NC, SC, VA): forests, woodlands, marsh edges, sometimes in disturbed sites; uncommon (rare in VA Mountains). April-June; June-October. [= RAB, C, G, GW, I, K, SE, W, Y; > A. fruticosa var. fruticosa - \(;\); > A. fruticosa var. tennessensis (Shuttleworth) E.J. Palmer -- F ; > A. curtissii Rydberg -- S ; \(>\) A. fruticosa - S , in a narrow sense; > A. tennesseensis Shuttleworth -- S; > A. virgata Small -- S]

Amorpha georgiana Wilbur var. confusa Wilbur, Savanna Indigo-bush. Cp (NC, SC): pine savannas; rare (NC Threatened). May-July; July-October. The varietal epithet is rather unfortunate; it refers to nomenclatural, rather than taxonomic, confusion. In fact, the two varieties of \(A\). georgiana seem so distinct that they warrant specific status. Var. confusa is a narrow endemic of the se. Coastal Plain of NC (Brunswick, Columbus, and Bladen counties) and immediately adjacent SC (Horry County). It is restricted to moist loamy savannas, especially on the Foreston soil series, a habitat now largely destroyed by fire suppression, real estate development, and conversion of savannas to pine tree farms. [= I, K, SE, Y, Z; < A. georgiana -- RAB, GW; ? A. cyanostachya auct. non M.A. Curtis -- S, in part]

Amorpha georgiana Wilbur var. georgiana, Georgia Indigo-bush. Cp (GA, NC, SC): pine savannas, sandy river terraces; rare (GA Special Concern, NC Endangered). May-July; July-October. As mentioned above, the two varieties of A. georgiana probably deserve specific recognition. Var. georgiana is endemic to the Coastal Plain of sc. NC, SC, and se. GA, primarily in the fall-line Sandhills region, but rarely found on younger terraces (as far east as Pender County, NC). Much of its habitat has been destroyed. [= I, K, SE, Y, Z; < A. georgiana -- RAB, GW]

Amorpha glabra Desfontaines ex Poiret, Appalachian Indigo-bush, Mountain Indigo. Mt, Pd (GA, NC, SC): dry to dry-mesic ridgetop and slope forests, primarily in the Blue Ridge escarpment; uncommon (SC Rare). May-July; July-October. Endemic to the Southern Appalachian mountains (and nearby provinces) of n. AL, ne. GA, w. NC, nw. SC, and e. and c. TN. [= RAB, I, K, S, SE, W, Y]

Amorpha herbacea Walter var. floridana (Rydberg) Wilbur, Florida Indigo-bush. Cp (GA): pine flatwoods and sandy river terraces; rare (GA Special Concern). Se. GA (Echols County) south into FL (Sorrie 1998b). [= Y, Z; < A. herbacea var. herbacea -I, K, SE; = A. floridana Rydberg -- S]

Amorpha herbacea Walter var. herbacea, Dwarf Indigo-bush. Cp (GA, NC, SC), Pd (GA, SC), Mt (NC): pine savannas, pine flatwoods, sandhills, other open forests and disturbed sites; common (rare in Mountains). May-July; July-October. Endemic to FL, GA, SC, and NC, mostly limited to the Coastal Plain. [= Y, Z; <A. herbacea -- RAB, W; = A. herbacea -- S, in the narrow sense; < A. herbacea var. herbacea -- I, K, SE]

Amorpha nitens Boynton, Dark Indigo-bush. Cp (SC), Pd, Mt (GA): sandy woodlands, rocky slopes, bottonland forests; rare (GA Special Concern). April-June. S. SC south to GA, west to LA, north in the interior to w. KY, s. IL, AR, and e. OK. First reported for SC by Nelson \& Kelly (1997). [= I, K, S, SE, Y]

Amorpha schwerinii C. Schneider, Piedmont Indigo-bush. Pd (GA, NC, SC): forests and woodlands, primarily rather xeric and rocky (though not exclusively so); rare (GA Special Concern, NC Rare, SC Rare). April-June; June-October. Endemic to the Piedmont (rarely adjacent provinces) of sc. NC, c. SC, nc. GA, e. AL, and ne. MS. [= RAB, I, K, S, SE, Y]

A genus of \(3-5\) species, of Asia, North America, and Africa. It now appears that \(2-3\) semi-cryptic taxa should be recognized in what has traditionally been considered a single species of Amphicarpaea (Callahan 1997, Parker 1996). The genus name has been corrected to Amphicarpaea from the frequently used Amphicarpa. References: Callahan (1997)=Y; Parker (1996)=Z; Isely (1998)=I.

1 Petiole 3.5-5.3 cm long; petiolule of the terminal leaflet 1.0-1.4 mm long; terminal leaflet 4.2-5.2 cm long
A. bracteata var. bracteata

1 Petiole 6.0-6.8 cm long; petiolule of the terminal leaflet 1.7-1.9 mm long; terminal leaflet 5.5-6.1 cm long
A. bracteata var. comosa

Amphicarpaea bracteata (Linnaeus) Fernald var. bracteata, Hog-peanut. \{Mt, Pd, Cp (GA, NC, SC, VA): dry to moist forests, thickets; common. July-September; August-October. Producing inflorescences of 2 types, one with chasmogamous flowers and aerial legumes, the other with cleistogamous flowers and subterranean legumes. The distributions and habitats of the two varieties in our area require herbarium and field investigation\}. [= K; = Amphicarpa bracteata var. bracteata -F , G , orthographic variant; < Amphicarpaea bracteata -- C, I, SE; < Amphicarpa bracteata -- RAB, orthographic variant; < Falcata comosa (Linnaeus) Kuntze -- S]

Amphicarpaea bracteata (Linnaeus) Fernald var. comosa Fassett, Hog-peanut. (Mt, Pd, Cp (GA, NC, SC, VA): dry to moist forests, thickets; common. July-September; August-October. Producing inflorescences of 2 types, one with chasmogamous flowers and aerial legumes, the other with cleistogamous flowers and subterranean legumes. The distributions and habitats of the two varieties in our area require herbarium and field investigation\}. [= K; = Amphicarpa bracteata var. comosa -- F , G , orthographic variant; < Amphicarpaea bracteata -- C, I, SE; < Amphicarpa bracteata -- RAB, orthographic variant; < Falcata comosa (Linnaeus) Kuntze -- S]

\section*{Apios Fabricius (Groundnut)}

A genus of about 10 species, perennial vines, of temperate e. Asia and e. North America. References: Isely (1998)=I.
1 Tubers 1-2 cm in diameter; corolla 0.9-1.3 cm long, dark; legume 5-12 cm long; leaflets 5 (-7) per leaf
A. americana

1 Tubers 12-20 cm in diameter; corolla 2-2.5 cm long, pale; legume (12-) 15-25 cm long; leaflets (5-) 7 (-9) per leaf
[A. priceana]
Apios americana Medikus, Common Groundnut. Cp, Pd, Mt (GA, NC, SC, VA): marshes, wet thickets, streambanks; common. June-August; July-September. Nova Scotia, New Brunswick, and Québec west to MN and SD, south to s. FL and TX. [= RAB , C, GW, I, K, SE, W; > A. americana var. americana - F, G; > A. americana var. turrigera Fernald -- F, G; = Glycine apios Linnaeus -- S]

Apios priceana B.L. Robinson, Kentucky Groundnut, Price's Potato-bean, occurs in sw. KY, c. TN, ne. MS, and ne. AL. It is a rare species. [= C, F, G, I, K, SE; = Glycine priceana (B.L. Robinson) Britton -- S]

\section*{Arachis Linnaeus (Peanut)}

A genus of 9-60 species, annual and perennial herbs, native of South America (especially Brazil). References: Isely (1998)=I.
* Arachis hypogaea Linnaeus, Peanut. Cp (GA, NC, SC, VA), Pd (NC): fields; commonly cultivated, rarely persistent, introduced from South America. July-October. This remarkable plant bears normal aerial flowers, but following pollination the pedicels elongate and arch downwards, the legume soon buried and developing underground. [= RAB, C, F, K, S, SE]

\section*{Astragalus Linnaeus (Milkvetch)}

Astragalus is a massive genus, usually considered to include over 2000 species, and most diverse in arid regions of w. North America and w . and c . Asia. The habitats of the southeastern species may be characterized as rocky or sandy, "relictual islands" of aridity in the generally moist landscape of eastern North America. References: Barneby (1964)=Z; Isely (1998)=I.

1 Legume pilose with hairs ca. 1 mm or more long; stems conspicuously pubescent, the hairs spreading and simple; plants decumbent, spreading, or ascending, the stems 0.5-4 dm long.
2 Corolla 14-19 mm long; leaflets 17-29; legume bilocular; calyx lobes shorter than the calyx tube; [of calcareous habitats of the interior]
[A. tennesseensis]
2 Corolla 8-12 mm long; leaflets (5-) 7-15; legume unilocular; calyx lobes equaling or longer than the calyx tube [of dry sandy habitats from SC south] .
A. villosus

1 Legume glabrous; stems glabrous or inconspicuously pubescent, the hairs appressed, simple or dolabriform; plants erect with stems (3-) 4-15 dm long, or decumbent with stems 1-3 dm long (A. distortus var. distortus and A. bibullatus).
3 Plants decumbent or ascending, stems 1-5 dm long; legume either dry and strongly curved (about 90 degrees), or globose and initially fleshy.
4 Legume globose, 1.3-2 cm in diameter, initially fleshy; corolla 18-25 mm long; [of calcareous glades of c. TN]
[A. bibullatus]

4 Legume lanceolate, 1.2-2.5 cm long, 4-7 mm wide, strongly curved; corolla (7-) 8-15 mm long; [of shaley habitats from w. VA northwards or of dry sandy sites in FL and possibly adjacent GA].
5 Leaflets mostly 2-3.5× as long as wide; mature legume lacking a reticulately textured surface; corolla \(10-15 \mathrm{~mm}\) long; [of shaley habitats from w . VA northwards]
A. distortus var. distortus

5 Leaflets mostly \(1-2 \times\) as long as wide; mature legume reticulately textured; corolla 8-11 mm long; [of dry sandy sites in FL and possibly adjacent GA]
[A. obcordatus]
3 Plants erect, stems (3-) 4-15 dm long; legume straight to moderately curved.
6 Lower stipules connate; pubescence dolabriform; legumes 1-1.5 cm long, 4-5 mm in diameter; [typically of dry to mesic soils] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. canadensis var. canadensis
6 Lower stipules free; pubescence simple; legumes either longer or wider (2-3 cm long and 4-6 mm in diameter in \(A\). michauxii, \(1.5-2.0 \mathrm{~cm}\) long and \(8-18 \mathrm{~mm}\) in diameter in A. neglectus); [typically of notably dry, either rocky or sandy, soils].
7 Leaves with 21-31 coriaceous to somewhat fleshy leaflets, many of the leaflets alternate or subopposite; legumes \(2-3 \mathrm{~cm}\) long, \(4-6 \mathrm{~mm}\) in diameter; [of dry sandy habitats from NC south] . . . . . . . . . . . A. michauxii
7 Leaves with 11-23 thin-textured leaflets, all of the leaflets usually opposite; legumes 1.5-2 cm long, 8-18 mm in diameter; [of rocky calcareous habitats from VA north]
A. neglectus

Astragalus canadensis Linnaeus var. canadensis, Canada Milkvetch. Mt (GA, NC, SC, VA), Pd, Cp (NC, SC, VA): forests, woodlands, streambanks, rocky slopes and bluffs; uncommon, rare in VA Piedmont, rare in Coastal Plain (GA Special Concern). June-August; July-October. Ranging through much of North America, from Québec and Hudson Bay west to British Columbia, south to GA, TX, CO, and Utah; also apparently in Siberia. The other varieties occur further west. See Barneby (1964) for a detailed discussion of taxonomic and nomenclatural problems involving A. canadensis. Barneby comments that "the eastern mountain race [in the Southern Appalachians] is commonly distinguished from var. canadensis of the Mississippi Valley and northward by a narrower and more open flowering and fruiting raceme, and the flowers at the same time are relatively small. There is something to be said in favor of recognizing an eastern montane variety, so long as we confine its distinguishing characteristic to a loose raceme." The distribution, as mapped by Barneby, is suggestive of a composite map of 2 (or more) different taxa, one of them being a Southern (and Central) Appalachian endemic. F and G separate var. carolinianus, basing the distinction, however, on a different set of characters, and considering var. canadensis to range south to VA (at least). Further study is needed; it seems we may have in our area 2 taxa worthy of distinction at the varietal level. [=I, K, SE, Z; < A. canadensis -- RAB, C, W, infraspecific taxa not distinguished; > A. canadensis var. canadensis - F, G; > A. canadensis var. carolinianus (Linnaeus) M.E. Jones -- F, G; > A. carolinianus Linnaeus -- S]

Astragalus distortus Torrey \& A. Gray var. distortus, Ozark Milkvetch, Bent Milkvetch. Mt, Pd (VA): shale barrens and other dry, shaley places; rare (VA Rare). May-July. A. distortus is interpreted by \(Z\) (and followed by C and SE) to consist of 2 varieties: var. distortus, occurring in the s. Midwest from IL, MO, and OK south to MS, LA, and AR, and disjunct in n. and sc. VA, e. WV, and w. MD, and var. engelmannii (Sheldon) M.E. Jones, of TX and ne. LA. The two varieties seem fairly readily distinguishable morphologically in the Midwest. Appalachian var. distortus complicates the issue, since it approaches var. engelmannii in flower size and matches it in ovule number. The Appalachian plant, with a combination of morphologic characters not matching the two named varieties and far allopatric from them might better be considered a distinct variety. Further study is needed. [=C,I, K, SE, Z; < A. distortus -- F, G, infraspecific taxa not distinguished; = Holcophacos distortus (Torrey \& A. Gray) Rydberg -- S]

Astragalus michauxii (Kuntze) F.J. Hermann, Sandhills Milkvetch, Michaux's Milkvetch. Cp (GA, NC, SC): sandhills; rare (GA Special Concern, NC Proposed Threatened). Late April-June; June-October (and persisting). Sc. NC south through SC to GA, a Southeastern Coastal Plain endemic. "The Michaux milk-vetch is greatly isolated from any member of the genus morphologically similar" (Barneby 1964). [= RAB, I, K, SE, Z; = Tium michauxii (Kuntze) Rydberg -- S]

Astragalus neglectus (Torrey \& A. Gray) Sheldon, Cooper Milkvetch. Mt (VA): dry calcareous woodlands and barren, over dolostone and limestone; rare (US Species of Concern, VA Rare). June-September. Se. Ontario west to se. Saskatchewan and ne. ND, south to w. NY, ne. PA, c. PA, n. OH, s. MI, se. WI, and e. SD; disjunct in w. VA and e. WV (Wieboldt et al. 1998). [= C, F, G, I, K, SE, Z]

Astragalus villosus Michaux, Bearded Milkvetch, Southern Milkvetch. Cp (GA, SC): sandhills and other dry, sandy places; rare (SC Rare). May-June; June-August. A Southeastern Coastal Plain endemic: s. SC south to Panhandle FL, west to s. MS. This species is described by Barneby as "a lowly but delightful little astragalus." [= RAB, I, K, SE, Z; = Phaca intonsa (Sheldon) Rydberg ex Small -- S]

Astragalus bibullatus Barneby \& E.L. Bridges, Pyne's Ground-plum. Endemic to calcareous glades of c. TN (Barneby \& Bridges 1987). [= I, K, SE; = Geoprumnon crassicarpum (Nuttall) Rydberg ex Small -- S, misapplied; = A. crassicarpus Nuttall, misapplied]

Astragalus obcordatus Elliott, Florida Milk-vetch. Cp (GA?): sandhills; rare. S. MS south to c. peninsular FL. Reported for s. GA, but no specimen documentation is known (Barneby 1964). [= I, K, SE, Z; = Phaca obcordata (Elliott) Rydberg ex Small - S]

Astragalus tennesseensis A. Gray ex Chapman. Calcareous glades. C. TN, n. AL, s. KY (and formerly IL and IN, and possibly MO). [=I, K, SE, Z; ><A. tennessensis - F; ><A. plattensis Nuttall-F; > Geoprumnon tennesseense (A. Gray ex Chapman) Rydberg -- S; >< Geoprumnon plattense (Nuttall) Rydberg -- S]

\section*{Baptisia Ventenat (Wild Indigo)}

A genus of about 15 species, perennial herbs, of temperate e. and c. North America. References: Isely (1981)=Y; Larisey (1940a)=Z; Mendenhall (1994a, 1994b)=X; Isely (1998)=I.

1 Leaves 1 -foliolate, sessile or perfoliate.
2 Leaves sessile; plant densely cobwebby pubescent; [of e. GA (Brantley and Wayne counties)]
B. arachnifera
\begin{tabular}{|c|c|c|}
\hline 2 & Leaves perfoliate; plant glabrous or nearly so; [widespread from s. SC southwards] & B. perfoliata \\

\end{tabular}

\section*{Key A -- flowering Baptisia}

1 Flowers lavender or blue.
2 Leaflets 2-4 (-5) cm long, mostly less than 10 mm wide (if wider, then shorter than 4 cm ); leaflets mostly oriented in a vertical plane; fertile stems usually \(0.4-1.0 \mathrm{~m}\) tall, the leafy branches horizontally spreading; racemes 1-2.5 (-4) dm long, rather compactly flowered; petioles \(0-4(-12) \mathrm{mm}\) long; [of diabase glades and barrens] . . . . . B. australis var. aberrans
2 Leaflets 4-6 (-9) cm long, mostly more than 12 mm wide; leaflets not oriented in a vertical plane; fertile stems usually 1-1.5 m tall, the leafy branches ascending; racemes 2-4 (-5) dm long, rather sparsely flowered; petioles 5-20 (-40) mm long; [of flood-scoured rocky riversides, also frequently cultivated and sometimes persistent or escaped]
B. australis var. australis

1 Flowers yellow, cream-white, or white.
3
B. bracteata
[B. leucophaea]
B. tinctoria
B. cinerea
B. megacarpa
B. lanceolata var. lanceolata
[B. lanceolata var. tomentosa]
B. albescens
B. alba
[B. leucantha]

\section*{3 Flowers yellow.}

4 Flowering pedicels 14-18 (-30) mm long, subtended by persistent bracts 1-2.5 cm long and \(7-10 \mathrm{~mm}\) wide; flowers cream-white to pale-yellow.
5 Petioles of median leaves 4-10 mm long
B. bracteata

5 Petioles of median leaves \(2-4 \mathrm{~mm}\) long [B. leucophaea]
4 Flowering pedicels \(2-10 \mathrm{~mm}\) long, subtended by caducous bracts \(0.2-1.0 \mathrm{~cm}\) long and \(1-2 \mathrm{~mm}\) wide; flowers bright yellow.
6 Leaflets mostly 1-2.5 (-4) cm long, 1-2.5× as long as wide, the petiolules 0-1 mm long; corolla 1.2-1.6 cm long; racemes numerous, terminating most of the branches . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . B. tinctoria
6 Leaflets mostly \(4-8 \mathrm{~cm}\) long, \(1.5-4 \times\) as long as wide, the petiolules \(2-10 \mathrm{~mm}\) long; corolla 2.0-2.8 cm long; racemes solitary ( -3 ) (B. cinerea) or numerous ( \(B\). lanceolata var. lanceolata).
7 Petiolules 2-5 mm long; stipules (some of them at least) persistent . . . . . . . . . . . . . . . . . . . . . . B. cinerea 7 Petiolules \(4-10 \mathrm{~mm}\) long; stipules caducous.

8 Leaflets \(3-5 \times\) as long as wide, usually \(<1.5 \mathrm{~cm}\) wide; flowers usually solitary or in clusters of 2-3; fruits broadly ellipsoid or subspheroidal, \(<2 \times\) as long as wide; [se. SC south through GA Coastal Plain to ne. FL] B. lanceolata var. lanceolata

8 Leaflets 1.7-3.2 (-5) \(\times\) as long as wide, the larger typically \(>2 \mathrm{~cm}\) wide; flowers in racemes of (1-) 310 flowers; fruits usually ellipsoid, often \(>2 \times\) as long as wide; [FL Panhandle, s. AL, and c. peninsular \(\mathrm{FL}]\)
[B. lanceolata var. tomentosa]
3 Flowers white or cream-white
9 Flowering pedicels \(1.0-1.8(-3.0) \mathrm{cm}\) long, subtended by persistent bracts \(1-2.5 \mathrm{~cm}\) long and \(7-10 \mathrm{~mm}\) wide; flowers cream-white to pale-yellow.
10 Petioles of median leaves \(4-10 \mathrm{~mm}\) long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . B. bracteata

8 Petiolules 2-5 mm long; stipules (some of them at least) persistent
B. cinerea

8 Petiolules 4-10 mm long; stipules caducous . . . . . . . . . . . . . . . . . . . . . . . B. lanceolata var. lanceolata
6 Stems glabrous and generally glaucous as well
B. alba, [B. leucantha], [B. leucophaea], B. australis var. australis, B. australis var. aberrans

Baptisia alba (Linnaeus) Ventenat, Thick-pod White Wild Indigo. Pd, Cp (GA, NC, SC): dry woodlands, roadsides; rare (NC Rare). May-July; June-October. AL, FL, GA, SC, and NC. B. leucantha (see below) is a western sibling, treated as either a species or a variety. In fruit, it is easily separated from B. albescens and other Baptisia by its nearly spheroidal legume. B. alba and B. albescens have been nomenclaturally confused; Isely (1986a) corrects the application of the epithet "alba." [= S; = B. alba var. alba -- I, K, SE; = B. pendula Larisey -- RAB; = B. lactea (Rafinesque) Thieret var. obovata (Larisey) Isely -- C (by implication), X, Y]

Baptisia albescens Small, Narrow-pod White Wild Indigo, Spiked Wild Indigo. Pd, Mt (GA, NC, SC), Cp (GA, NC, SC, VA): dry woodlands, roadsides; uncommon (NC Rare, VA Rare). May-July; June-October. Se. VA south through NC, SC, and GA to \(n\). FL, e. AL and e. TN. The fruits are unlike any of our other species in being cylindric, about \(3 \times\) as long as the diameter, and yellowish- brown (rather than black) when mature. [=I, K, S, SE; = B. alba -- RAB, C, F, G, W, X, Y, misapplied]

Baptisia arachnifera Duncan, Hairy Rattleweed, Hairy Wild Indigo. Cp (GA): sandhills; rare (US Endangered, GA Endangered). With simple leaves and unmistakable for its dense "cobwebby" pubescence, this species is endemic to GA (Wayne and Brantley counties). [= I, K, SE, X, Y]

Baptisia australis (Linnaeus) R. Brown var. aberrans (Larisey) M. Mendenhall, Eastern Prairie Blue Wild Indigo, Glade Wild Indigo. Pd (NC), Mt (GA): glades, barrens, and open woodlands over limestone (or other calcareous rocks) and diabase (or other mafic rocks), in areas that were formerly prairies, barrens, glades, or oak savannas; rare (GA Special Concern, NC Rare). AprilMay; June-August. C. and se. TN, nw. GA, c. NC, and (possibly) s. KY and sc. VA. Blue-flowered Baptisia from mafic glades, barrens, and former prairies and oak savannas in NC has proven problematic to taxonomists. Larisey (1940a) treated B. australis and \(B\). minor as separate species, and placed eastern plants resembling B. minor in B. minor var. aberrans Larisey, but without providing very satisfying characters for separating it from typical B. minor of midwestern North America. RAB apparently (though tacitly) include B. minor within B. australis. Isely \((1981,1990)\) treated blue-flowered Baptisia as B. australis var. australis and var. minor, regarding var. minor as reaching its eastern limit in MO (the two varieties thus allopatric), and stating that "sporadic collections within the range of var. australis have the pods and some of the vegetative characters of var. minor... most of these collections are from dry or sterile habitats, e.g., cedar glades, that var. australis typically does not inhabit" (Isely 1990). His treatment of australis and minor at the varietal level seems largely based on the troubling existence of minor-like plants within his concept of the range of australis. NC plants from glade-like sites are morphologically more similar to midwestern prairie \(B\). minor, occur in similar habitats, and grow with a large number of other plants with midwestern phytogeographic affinities, such as Eryngium yuccifolium var. yuccifolium, Echinacea laevigata (an eastern sibling of E. purpurea), Oligoneuron album, Oligoneuron rigidum ssp. glabratum (an eastern sibling of O. rigidum ssp. rigidum), Silphium terebinthinaceum, and others. The affinities of these plants seem to be with B. minor; "shoehorning" them into the more eastern B. australis, which they do not resemble in morphology, habitat, or (indeed) range is not a desirable disposition. Eastern plants referrable to B. minor do, however, as noted by Larisey and Isely, differ from midwestern plants in leaflet size and shape, branching, and pod shape; they are best treated as an eastern, relictual variety, var. aberrans Larisey. Mendenhall (1994a, 1994b) found that B. minor var. aberrans warranted taxonomic recognition, and indeed that it is less closely related to B. australis s.s. and B. minor than they are to one another; she chose to treat the three entities as varieties under B. australis. For now, the best treatment seems to be to follow Mendenhall, and acknowledge the existence of three varietal entities, with the phylogenetic affinities uncertain. The range of \(B\). minor var. minor is thus largely midwestern, from se. NE, s. MO, and e. and c. KS south to w. AR, e. and c. OK, and ne. TX. [= K, X; = Baptisia minor Lehmann var. aberrans Larisey -- Z; B. australis (Linnaeus) R. Brown -- RAB, S; < B. australis var. australis -- I, SE; < B. australis var. minor (Lehmann) Fernald -- C, G; < B. minor -- F]

Baptisia australis (Linnaeus) R. Brown var. australis, Tall Blue Wild Indigo, Streamside Blue Indigo. Mt (GA, NC*?, VA), Pd (NC*?, VA): riverbank scour areas, gravel bars, and disturbed areas (where persisting from cultivation); rare (GA Special Concern, VA Watch List). April-May; June-August. Native to w. and n. VA, w. MD, WV, w. PA, e. and c. KY, ne. TN, se. IN, and s. OH, and possibly native to other states, the original range obscured by its frequent cultivation. [= C, G, K, X; = B. australis \(-\mathrm{F}, \mathrm{W}, \mathrm{Z}\); < B. australis -- RAB, S (also see B. minor); < B. australis var. australis -- I, SE (also see B. minor)]

Baptisia bracteata Elliott, Creamy Wild Indigo. Pd (GA, NC, SC), Mt (GA, SC), Cp (SC): sandhills, other dry woodlands; uncommon (NC Rare). March-April; May-June. Ne. AL northwest through n. GA and n. SC to w. NC. The more western \(B\). leucophaea Nuttall is better treated as a species than as B. bracteata var. leucophaea (Nuttall) Kartesz \& Gandhi (Mendenhall 1994b). [= RAB, S, W, X; = B. bracteata var. bracteata - C, I, K, SE]

Baptisia cinerea (Rafinesque) Fernald \& Schubert, Carolina Wild Indigo. Cp (NC, SC, VA), Pd (VA): sandhills, other dry sandy woods; common, rare in VA (VA Rare). Late April-June; June-July. Though common in the Coastal Plain of the Carolinas, \(B\). cinerea is a narrow endemic, ranging only from s. VA south to s. SC. The large, yellow flowers are very showy. In fall, the leaves do not drop, but stay attached to the stems, the whole plant turning an ashy gray; these dried plants are conspicuous through the following winter. The report in Jones \& Coile (1988) of \(B\). cinerea in GA is in error; the specimen is of \(B\). lanceolata. [= RAB, C, F, G, I, K, SE, X; = B. villosa auct. non (Walter) Nuttall -- S]

Baptisia lanceolata (Walter) Elliott var. Ianceolata, Gopherweed. Cp (GA, SC): sandhills; rare (SC Rare). April-May; June-November. Var. lanceolata ranges from s. SC south to ne. FL and sw. GA, a Southeastern Coastal Plain endemic. Small (1933) alleges that \(B\). lanceolata ranges north to NC, but no documentation is known. The plant is reminiscent of \(B\). cinerea, but forms larger, bushier plants and is separable by characters in the key. [=I, K, SE, X; < B. lanceolata -- RAB, S]

Baptisia lecontei Torrey \& A. Gray, Leconte's Wild Indigo. Cp (GA): sandhills; rare (GA Special Concern). Sc. GA south to e. Panhandle FL and s. peninsular FL. [= I, K, S, SE, X, Y, Z]

Baptisia megacarpa Chapman ex Torrey \& A. Gray, Bigpod Wild Indigo. Cp (GA): moist florests of floodplains and lower slopes; rare (GA Special Concern. E. Panhandle FL and sw. GA (Jones \& Coile 1988) west to se. AL. [= I, K, S, SE, X, Y, Z]

Baptisia perfoliata (Linnaeus) R. Brown ex Aiton f., Catbells, Gopherweed. Cp (GA, SC): sandhills; uncommon. April-May; May-July. S. SC through e. GA to peninsular FL, a Southeastern Coastal Plain endemic. [= RAB, I, K, S, SE, X, Y, Z]

Baptisia tinctoria (Linnaeus) Ventenat, Honesty-weed, Rattleweed. Cp, Pd, Mt (GA, NC, SC, VA): sandhills, pine flatwoods, xeric woodlands, ridges, woodland edges, and roadbanks; common. April-August; July-November. Widespread in eastern United States, from NY and MN south to GA. The most widespread and common of our species of Baptisia, B. tinctoria is readily recognizable from its small, yellow flowers, small leaflets, and small fruits. The taxa synonymized need further investigation. [= RAB, C, I, K, S, SE, W, X; >B. tinctoria var. projecta Fernald -- F, G; > B. tinctoria var. tinctoria - F, G; > B. tinctoria var. crebra Fernald -- F; > B. tinctoria - S, in a narrow sense; > B. gibbesii Small -- S]

Baptisia lanceolata (Walter) Elliott var. tomentosa (Larisey) Isely. Var. tomentosa (Larisey) Isely occurs in panhandle FL and adjacent s. AL; disjunct in c. peninsular FL. Two forms have been recognized, the "narrow-leaved form," endemic to the Apalachicola Lowlands portion of the FL Panhandle, and the "typical form", occupying the FL Panhandle, s. AL, and disjunct in c. peninsular FL (Isely 1981). Mendenhall (1994b) included broad-leaved and narrow-leaved forms of var. tomentosa in her study, which provided some support for the taxonomic recognition of these unnamed entities. \([=I, \mathrm{~K}, \mathrm{SE}, \mathrm{Y} ;=B\). elliptica Small \(-\mathrm{S} ;>\mathrm{B}\). elliptica var. elliptica - Z; > B. elliptica var. tomentosa Larisey - Z]

Baptisia leucantha Torrey \& A. Gray ranges east to s. MS, ne. MS, c. TN, c. KY, and s. OH; it was alleged by S to occur in NC, probably based on misinterpreted material of B. alba. [= S, X; = Baptisia alba var. macrophylla (Larisey) Isely \(--\mathrm{I}, \mathrm{K}, \mathrm{SE}\); = B. lactea (Rafinesque) Thieret var. lactea - C, Y; > B. leucantha var. leucantha - Z; > B. pendula Larisey var. macrophylla Larisey - Z] \{keyed\}

Baptisia leucophaea Nuttall. Nw. IN west to s. MN and e. NE, south to w. KY, c. MS, c. LA, and e. TX. [= F, G; = B. bracteata Muhlenberg ex Elliott var. leucophaea (Nuttall) Kartesz \& Gandhi - K; = B. bracteata var. glabrescens (Larisey) Isely - C, I, SE, Y; = B. leucophaea var. glabrescens Larisey - Z]

Many of our species hybridize; hybrids known in our area include the following, listed in alphabetic order by hybrid formulae. Others may certainly occur. Additional hybrids have been created by plant breeders and may be found in cultivation.
B. albescens \(\times\) cinerea. Known from SC.
B. albescens \(\times\) perfoliata [B. ×fulva Larisey]. Known from GA and SC. [B. \(\times\) fulva Larisey \(-Z\) ]
B. albescens \(\times\) tinctoria [B. \(\times\) serenae M.A. Curtis (pro sp.); B. \(\times\) pinetorum Larisey]. Known from GA, NC, SC, and VA. B. cinerea \(\times\) tinctoria. Known from NC (Brunswick County).
B. perfoliata \(\times\) tinctoria \([B . \times\) microphylla Nuttall (prosp.) -Z\(]\). Known from SC.

Cassia
(see Chamaecrista, Senna)

\section*{Centrosema (Augustin de Candolle) Bentham (Spurred Butterfly Pea)}

A genus of about 40 species, perennial vining herbs, of tropical and warm temperate regions of the Western Hemisphere. References: Isely (1998)=I; Fantz (2002a).

Identification notes: Centrosema virginianum is easily confused with Clitoria mariana. The following key summarizes the differences:

1 Calyx 10-16 mm long, the calyx lobes 7-11 mm long, distinctly longer than the calyx tube; legume 7-12 cm long, 3-4 mm broad Centrosema virginianum
1 Calyx 15-20 mm long, the calyx lobes 5-7 mm long, distinctly shorter than the calyx tube; legume 3-5 cm long, 5-7 mm broad
Clitoria mariana var. mariana

Centrosema virginianum (Linnaeus) Bentham, Spurred Butterfly Pea. Cp, Pd (GA, NC, SC, VA), Mt (GA, NC, SC): dry woodlands and openings; common. June-August; July-October. S. NJ south to FL, west to KY, AR, and TX. [= RAB, C, G, K, SE, W; > C. virginianum var. virginianum - F; > C. virginianum var. ellipticum Fernald -- F; = Bradburya virginiana (Linnaeus) Kuntze -S]

Cercis Linnaeus (Redbud)
A genus of about 6 species, trees of north temperate areas. References: Isely (1975)=Z; Robertson \& Lee (1976)=Y; Isely (1998) \(=1\).

1 Flowering pedicels 6-8 mm long; flowers 8-11 mm long .....................................c.c.canadensis var. canadensis
1 Flowering pedicels 10-20 mm long; flowers (11-) 12-14 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [C. chinensis]

Cercis canadensis Linnaeus var. canadensis, Eastern Redbud. Pd, Mt, Cp (GA, NC, SC, VA): moist to dry forests and woodlands, especially over calcareous or mafic rocks, also commonly planted as an ornamental; common (uncommon in Coastal Plain south of VA, uncommon in Mountains). March-May; June-November. This spectacular small tree is showy in bud or flower. The smooth, medium gray bark is distinctive in winter. Other varieties occur in TX and Mexico. [= C, G, I, K, SE, Y, Z; < C. canadensis -- RAB, F, S, W, infraspecific taxa not distinguished]
* Cercis chinensis Bunge, native to China, is sometimes cultivated. [= I]

Chamaecrista (Linnaeus) Moench (Partridge-pea)

A genus of about 265 species, shrubs and herbs, of primarily tropical and warm temperate areas. References: Isely (1975)=Z; Irwin \& Barneby (1982)=Y; Robertson \& Lee (1976)=X; Isely (1998)=I.

1 Corolla 0.8-1.0 cm in diameter, the larger petals 4-7 (-8) mm long; functional stamens 5-8.
2 Petiole pilose with hairs 1-2 (-3) mm long; petiolar gland cylindric or clavate; functional stamens 5-8; leaflets \(5-6 \times\) as long as wide

Ch. nictitans var. aspera
2 Petiole incurved-puberulent with hairs \(0-0.8 \mathrm{~mm}\) long; petiolar gland stalked-cupuliform or stalked-discoid; functional stamens 5 ; leaflets \(3-5 \times\) as long as wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Ch. nictitans var. nictitans
1 Corolla 2.5-3.5 cm in diameter, the larger petals \(15-20 \mathrm{~mm}\) long; functional stamens 10.
3 Perennial from a horizontal woody root or crown; stems clustered
Ch. deeringiana
3 Annual from a taproot; stems solitary.
4 Pods 6.5-10 mm wide; seeds 4.7-6.3 mm across; [of tidal marshes in e. VA] . . Ch. fasciculata var. macrosperma 4 Pods 3-5 (-6.5) mm wide; seeds (2.8-) \(3.2-4.8 \mathrm{~mm}\) across; [widespread geographically and ecologically]. 5 Surface of leaflets pubescent; [fro, w. Panhandle FL and s. AL westwards] . . [Ch. fasciculata var. puberula] 5 Surface of leaflets galbrous; [collectively widespread in our area].

6 Petiolar gland depressed, 1.5-2.5 mm wide, raised at both ends; pods 6-10 cm long; plant usually glabrous or glabrescent, to 24 dm tall Ch. fasciculata var. brachiata 6 Petiolar gland not depressed, \(<1.5 \mathrm{~mm}\) wide; pods \(4-6 \mathrm{~cm}\) long; plant usually pubescent, to 10 dm tall ...

Ch. fasciculata var. fasciculata
Chamaecrista deeringiana Small \& Pennell, Florida Senna. Cp (GA): sandhills, dry longleaf pine woodlands, disturbed sandy areas; rare (GA Special Concern). Sw. and wc. GA (Jones \& Coile 1988) south to Panhandle FL and west to s. MS (Sorrie \& Leonard 1999); disjunct in s. FL. [= I, K, S, SE, Y, Z]

Chamaecrista fasciculata (Michaux) Greene var. brachiata (Pollard) Isely. Cp (GA): fields, disturbed areas; uncommon. E. GA south to s. FL, west to w. panhandle FL. [= I, SE; < Chamaecrista fasciculata var. fasciculata - K; = Cassia fasciculata var. brachiata (Pollard) Pullen ex Isely -- X, Z; = Chamaecrista brachiata Pollard -- S; < Ch. fasciculata - Y, infraspecific taxa not distinguished]

Chamaecrista fasciculata (Michaux) Greene var. fasciculata, Common Partridge-pea. Cp, Pd, Mt (GA, NC, SC, VA): fields, disturbed areas, fencerows, and a wide range of other habitats; common. June-September; July-November. MA west to MN, south to FL and Mexico. See discussion of the Chamaecrista fasciculata complex under var. macrosperma. [< Cassia fasciculata Michaux -- RAB, W, infraspecific taxa not distinguished; < Chamaecrista fasciculata -- C, S, Y, infraspecific taxa not distinguished; > Cassia fasciculata var. fasciculata -- F, G, X; > Cassia fasciculata var. robusta (Pollard) J.F. Macbride -- F, G, X; > Chamaecrista robusta Pollard - S; = Chamaecrista fasciculata var. fasciculata (variant 1, variant 2, and typical variant) - Z; < Chamaecrista fasciculata var. fasciculata -- I, SE, in part (also see var. macrosperma); < Chamaecrista fasciculata var. fasciculata - K (also see var. brachiata); > Cassia fasciculata var. littoralis (Pollard) J.F. MacBride -- X]

Chamaecrista fasciculata (Michaux) Greene var. macrosperma (Fernald) C.F. Reed, Tidal-marsh Partridge-pea. Cp (VA): freshwater tidal marshes; rare (US Species of Concern, VA Rare). Endemic to e. VA and MD. Isely (1975) did not recognize it formally, but treated it informally as "variant 1," commenting (incorrectly) that it is "apparently a local, saline-adapted ecotype." Irwin \& Barneby (1982) treated Ch. fasciculata as a very polymorphic species in which it was impractical to recognize infraspecific taxa, concluding "a student of tropical Chamaecrista has the choice of accepting as a fact of life that sort of infraspecific variability that inspired the dissection of Ch. fasciculata or of retreating to the position of Britton \& Urban who, driven by logic rather than sense, found a species in every particular combination of gland and hairiness that fell in their way. But in passing over the observed variation as taxonomically insignificant, it is well to bear in mind that its cause and its biological significance remain a mystery."

Botanists familiar with var. macrosperma in the field contend that it shows a cohesion in morphologic characters, ecology, and distribution that is biologically and taxonomically significant; it seems clearly to warrant varietal status. [=K; < Cassia fasciculata Michaux -- RAB, W, infraspecific taxa not distinguished; < Chamaecrista fasciculata -- C, S, Y, infraspecific taxa not distinguished; = Cassia fasciculata var. macrosperma Fernald -- F, G; < Chamaecrista fasciculata var. fasciculata -- I, SE, in part; = Cassia fasciculata var. fasciculata "variant 1" -- Z]

Chamaecrista nictitans (Linnaeus) Moench var. aspera (Muhlenberg ex Elliott) Irwin \& Barneby, Southern Sensitive-plant Cp (GA, SC): savannas, pinelands, disturbed sandy soils; uncommon. June-October; July-November. Var. aspera ranges from se. SC south to s. FL. [= I; = Cassia aspera Muhlenberg ex Elliott -- RAB, X, Z; = Chamaecrista nictitans ssp. nictitans var. aspera (Muhlenberg ex Elliott) Irwin \& Barneby -- K, SE, Y; = Chamaecrista aspera (Muhlenberg ex Elliott) Greene -- S]

Chamaecrista nictitans (Linnaeus) Moench var. nictitans, Common Sensitive-plant. Cp, Pd, Mt (GA, NC, SC, VA): forests, woodlands, disturbed areas, pine savannas, and a wide variety of other habitats; common. June-October; July-November. Ch. nictitans is widely distributed in e. North America, and (depending on the scope of what is included in it) south into South America. Var. nictitans ranges throughout se. United States, north to MA, NY, OH, and KA. [= I; < Cassia nictitans Linnaeus -- RAB, W, X, Z; < Chamaecrista nictitans -- C, infraspecific taxa not distinguished; > Cassia nictitans var. nictitans -- F, G; > Cassia nictitans var. hebecarpa Fernald -- F, G; = Chamaecrista nictitans ssp. nictitans var. nictitans -- K, SE, Y; Chamaecrista procumbens (Linnaeus) Greene -- S]

Chamaecrista fasciculata (Michaux) Greene var. 1. Dunes, sandy disturbed areas. s. AL west to e. and s. TX. [= I; <Ch. fasciculata var. fasciculata - K, in part; > Chamaecrista littoralis Pollard - S ; > Chamaecrista mississipiensis (Pollard) Pollard ex Heller - S; < Ch. fasciculata - Y, infraspecific taxa not distinguished; = Cassia fasciculata Michaux var. puberula (Greene) J.F. Macbride (variants 1, 2, and 3) - SE, Z; > Chamaecrista puberula Greene] \{add synonymy\}

Cladrastis Rafinesque (Yellow-wood)

A genus of about 6 species, trees, of the se. United States and montane regions of Japan and China. References: Duley \& Vincent (2003) \(=\) X; Isely (1981)=Z; Isely (1998)=I; Rudd (1972) \(=\) Y .

Cladrastis kentukea (Dumont de Courset) Rudd, Yellow-wood. Mt (GA, NC), Pd (NC*, SC): mountain forests, Piedmont bluffs, especially on calcareous or mafic rocks (introduced only in the Piedmont of NC); uncommon (NC Watch List, SC Rare). April-May; July-August. This small to large tree has a native range primarily in the Southern Appalachians (mostly on the west side), the Ozarks, and limestone regions in-between (such as c. TN), ranging from s. OH, s. IN, and s. MO south to sw. NC, sc. SC, n. GA, AL, c. AR, and e. OK, but is cultivated more widely. As discussed by Wyatt (1985), the SC occurrence on Fall Line bluffs of the Savannah River is an interesting disjunction, apparently relictual. Yellow-wood is a distinctive tree, distinguished by its smooth silvery-gray bark, peculiar leaves with alternate leaflets, and pendent panicles of white flowers. The genus Cladrastis has 4 other species, all of temperate e. Asia. Cladrastis is the only member of the tribe Sophoreae in our area, with the exception of the cultivated (and weakly, if at all, established) Sophora. [= K, W, X, Y; = C. Iutea (Michaux f.) K. Koch -- RAB, C, F, G, I, S, SE, Z]

\section*{Clitoria Linnaeus (Butterfly Pea)}

A genus of about 60 species, of tropical and warm temperate regions of the New and Old World. References: Isely (1998)=1; Fantz \((2000,2002 b)=Z\).

Identification notes: Centrosema virginianum is easily confused with Clitoria mariana. See key under Centrosema.
\begin{tabular}{ll}

\end{tabular}

Clitoria mariana Linnaeus var. mariana, Butterfly Pea. Cp, Pd, Mt (GA, NC, SC, VA): dry woodlands and openings; common. June-August; July-October. NY (Long Island), NJ west to s. OH, s. IL, MO, and OK, south to FL, TX, and South America; disjunct in s. AZ; also in se. Asia. [= Z; < C. mariana - RAB, C, F, G, I, K, SE, W; < Martiusia mariana (Linnaeus) Small -- S]
* Clitoria ternatea Linnaeus var. ternatea, Blue-pea. Cp (GA): disturbed areas; rare, introduced and weakly naturalized. In s. GA (Isely 1998). [= Z; < C. ternatea - I, K, S, SE]

Coronilla Linnaeus (Crown-vetch) (see Securigera)

\section*{Crotalaria Linnaeus (Rattlebox)}

A genus of about 600 species, annual and perennial herbs, of nearly cosmopolitan in tropical and temperate regions (especially diverse in Africa). References: Windler (1974)=Z; Isely (1986b)=Y; Isely (1998)=I. Key adapted in part from SE.

1 Leaves trifoliolate; erect annual herb, typically 1-2 m tall.
2 Leaflets obovate to elliptic-oblong, 1.5-3.5× as long as wide; legume conspicuously curved (or straight in C. incana).
3 Legume \(10-15 \mathrm{~mm}\) in diameter, pilose; stem pubescence spreading
C. incana

3 Legume 5-6 mm in diameter, minutely puberulent; stem pubescence appressed . . . . . . . . . C. pallida var. obovata
2 Leaflets lanceolate, often narrowly so, \(3-15 \times\) as long as wide; legume straight or nearly so (or upcurved at the tip).
4 Corolla \(8-10 \mathrm{~mm}\) long; legume \(4-6 \mathrm{~mm}\) in diameter, upcurved at tip
C. Ianceolata

4 Corolla 18-20 mm long; legume 15 mm in diameter, not upcurved
C. ochroleuca

1 Leaves unifoliolate; plants of various habits, mostly either perennial, smaller, or both.
5 Corolla 1.7-3.0 cm long; leaflets 4-15 cm long; stipules not decurrent on the stem and not conspicuously foliose; [exotic annual herbs, in disturbed habitats].
6 Bracts of the inflorescence 2-3 mm long, caducous; leaflets \(4-8 \mathrm{~cm}\) long . . . . . . . . . . . . . . . . . . . . . . . . . C. retusa
6 Bracts of the inflorescence \(5-8 \mathrm{~mm}\) long, persistent; leaflets \(5-15 \mathrm{~cm}\) long . . . . . . . . . . . . . . . . . . . . C. spectabilis
5 Corolla 0.7-1.4 cm long; leaflets \(1-8 \mathrm{~cm}\) long; stipules of at least the upper leaves conspicuously decurrent on the stem, giving the impression of a downward-pointing arrowhead (this feature sometimes inconspicuous or essentially absent in \(C\). rotundifolia); [native perennial or annual herbs, in natural or disturbed habitats].
7 Plant an erect annual; stems with spreading pubescence, the longer hairs 1-2 mm long; leaflets of the upper portion of the plant (4-) avg. \(6(-8) \times\) as long as wide; [mostly of the Piedmont and Mountains (and Coastal Plain of VA)] ....
C. sagittalis

7 Plant a decumbent, sprawling, or erect perennial; stems with appressed or spreading pubescence, the longer hairs \(<1.2 \mathrm{~mm}\) long; leaflets of the upper portion of the plant averaging either (1-) avg. 1-2 (-4) \(\times\) or (5-) avg. 8-10 (-15)× as long as wide; [mostly of the Coastal Plain].
8 Leaflets glabrous above; leaflets of the upper portion of the plant usually (5-) \(10(-15) \times\) as long as wide; plant erect or ascending . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. purshii
8 Leaflets pubescent above (the hairs sometimes sparse -- check with hand lens); leaflets of the upper portion of the plant usually (1-) \(2(-4) \times\) as long as wide; plant decumbent to low-ascending.
9 Stem pubescence appressed . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. rotundifolia var. rotundifolia

* Crotalaria incana Linnaeus, Shake-shake. Cp (SC): disturbed areas; rare, introduced from Africa. [=I, K, S, SE]

Cytisus Linnaeus (Broom)
References: Isely (1998)=1.
* Cytisus scoparius (Linnaeus) Link, Broom, Scotch Broom, Besom, Ginster. Cp (NC, SC, VA), Pd, Mt (GA, NC, SC, VA): roadbanks, woodland borders, disturbed areas; common (rare in Mountains), introduced from Europe. April-May; May-July. [= RAB, C, F, G, I, S, SE, W; < C. scoparius var. scoparius -- K]

The inclusion of Petalostemon in Dalea is controversial; recent evidence suggests that the recognition of Petalostemon may be warranted. If Petalostemon is recognized, only D. leporina is retained in Dalea. References: Barneby (1977)=Z; Ward (2004c)=Y; Isely (1998)=I. Key adapted from SE.

1 Spikes corymbosely aggregated, capitate, surrounded by an involucre of 3-4 series of sterile bracts; [subgenus Dalea, section Kuhnistera].
2 Leaflets 5-9 (-15); petals (other than the standard) mostly 3.7-4.5 mm long . . . . . . . . . . . . . . . . . D. pinnata var. pinnata
2 Leaflets usually 3; petals (other than the standard) mostly 4.8-6.8 mm long . . . . . . . . . . . . . . . D. pinnata var. trifoliata
1 Spikes not corymbosely disposed, ovoid to cylindric, with or without a few subtending, sterile bracts.
3 Corolla subpapilionaceous, with apparent, differentiated wings and keel; stamens 9-10; annual herb; [alien, of disturbed habitats]; [subgenus Dalea, section Dalea]
D. leporina

3 Corolla not papilionaceous, the wings and keel not differentiated; stamens 5; perennial herb; [native, primarily of calcareous glades and Coastal Plain pinelands]; [subgenus Dalea, section Kuhnistera].
4 Leaflets 15-25; leaflets 2.5-3.5x as long as wide
[D. foliosa]
4 Leaflets 3-9; leaflets 3-10 (or more) \(\times\) as long as wide.
5 Plants slightly to obviously pubescent (at least the spikes obviously pubescent); leaflets commonly involute or tubular, and more than \(10 \times\) as long as wide; corolla purple or pink.
6 Leaflets 5-7 (-9); spikes lengthening and loosening in fruit, often becoming sinuous; plants decumbent to ascending, stems normally branching only below the middle . . . . . . . . . . . . . . . . . . . . . . D. gattingeri
6 Leaflets 3-5 (-7); spikes remaining compact; plants decumbent or ascending, stems normally branching only below the middle ( \(D\). cahaba), or ascending to erect, the stems branching above the middle ( \(D\). purpurea var. purpurea).
\(7 \quad\) Interfloral bracts with pucescence along the keel and margins; plants decumbent to ascending, stems normally branching only below the middle
[D. cahaba]
7 Interfloral bracts with pubescence in a transverse band only; plants ascending to erect, the stems branching above the middle . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [D. purpurea var. purpurea]
5 Plants glabrous (except that the calyx lobes may be pubescent); leaflets broad and flat or narrow and involute; corolla pink-purple or white.
7 Calyx tube not incised on the ventral (upper) side; blade of the standard cordate; corolla white; [of calcareous habitats of inland provinces of GA, AL, TN, WV and westwards] . . . . . . . . . . . . . D. candida 7 Calyx tube deeply incised on the ventral (upper side; blade of the standard not cordate; corolla pink-purple or white; [of the Coastal Plain of GA southwards and westwards].
8 Leaflets linear, folded, or involute and terete-filiform; spikes globose ca. 6-12 mm long and in diameter; bracts much shorter than the calyx; corolla usually bright pink-purple (less commonly white or lavender)
8 Leaflets elliptic to oblanceolate, flat or folded; spikes ovoid to cylindric, 7-40 mm long; bracts as long as or longer than the calyx; corolla pink or white.
9 Plants spreading or decumbent; leaves widely spaced, generally lacking axillary fascicles; bract tips recurved in bud; calyx 2.7-3.3 mm long; flowers white; [of sc. and sw. GA west to se. LA] . .
D. gracilis

9 Plants erect-ascending to sprawling; leaves more densely spaced, generally with well-developed axillary fascicles; bract tips not recurved in bud; flowers pink or white; [of the GA Coastal Plain, se. AL, and south through e. FL Panhandle to the s. FL peninsula].
10 Leaflets of primary stem leaves mostly 5 ; corolla white D. albida

10 Leaflets of primary stem leaves mostly 7-9; corolla pink (rarely white) D. carnea

Dalea albida (Torrey \& A. Gray) D.B. Ward, White-tassels. Cp (GA): pinelands; uncommon. July-November. E. GA (near the SC border) west to se. AL, south ne. FL, n. peninsular FL, and e. FL Panhandle. [= Y; = Dalea carnea (Michaux) Poiret var. albida (Torrey \& A. Gray) Barneby -- I, K, SE, Z; = Petalostemon albidus (Torrey \& A. Gray) Small -- S]

TN, w. AL, sc. MS, s. LA, and ne. TX. [= I, SE, in a narrow sense (excluding D. occidentalis); = D. candida var. candida -- C, K, Z; = Petalostemum candidum (Michaux ex Willdenow) Michaux - F, G; = Petalostemon candidus (Michaux ex Willdenow) Michaux - S]

Dalea carnea (Michaux) Poiret, Pink-tassels. Cp (GA): dry sandy pinelands; rare (GA Special Concern). June-November. Se. GA south to s. peninsular FL. [= Y; = Dalea carnea (Michaux) Poiret var. carnea - I, K, SE, Z; = Petalostemon carneus Michaux -- S]

Dalea feayi (Chapman) Barneby, Feay’s Prairie-clover. Cp (GA): sandhills; rare (GA Special Concern). June-October. E. GA (vicinity of the Altamaha River); FL peninsula; Panhandle FL (vicinity of the Altamaha River). [=I, K, SE, Z; = Petalostemon feayi Chapman -- S]

Dalea gattingeri (A. Heller) Barneby, Gattinger's Prairie-clover. Mt (GA): limestone glades and barrens; rare (GA Special Concern). May-August. C. TN, nw. GA, n. AL, s. MO, and n. AR (Sundell et al. 1999). [=I, K, SE; = Petalostemon gattingeri (A. Heller) A. Heller -- S]

Dalea gracilis (Nuttall) D.B. Ward, Sprawling White-tassels. Cp (GA): wet pine savannas; rare (GA Special Concern). August -September. Sc. and sw. GA west to se. LA. [= Y; = Dalea carnea (Michaux) Poiret var. gracilis (Nuttall) Barneby -- I, K, SE, Z; = Petalostemon gracilis Nuttall - S]
* Dalea leporina (Aiton) Bullock, Hare's-foot Dalea. Mt (VA): \{habitat not known\}; rare, introduced from farther west. [= I, K, SE, Z; ? Parosela alopecuroides (Willdenow) Rydberg -- S]

Dalea pinnata (J.F. Gmelin) Barneby var. pinnata, Summer Farewell, Eastern Prairie-clover. Cp (GA, NC, SC): sandhills and other dryish pinelands, especially in loamy sands; uncommon (NC Watch List). August-November. Sc. and se. NC south through SC and GA to c. peninsular FL and e. panhandle FL. [=I, K, SE, Z; <? Petalostemum pinnatum (J.F. Gmelin) Blake -- RAB; < Kuhnistera pinnata (J.F. Gmelin) Kuntze -- S, in part]

Dalea pinnata (J.F. Gmelin) Barneby var. trifoliata (Chapman) Barneby. Cp (GA): sandhills, dry to moist longleaf pine flatwoods; uncommon. September-November. E. GA (near the Savannah River) south and west to w. Panhandle FL, s. AL, and s. MS. [= I, K, SE, Z; < Kuhnistera pinnata (J.F. Gmelin) Kuntze -- S, in part; = Petalostemon pinnatus (J.F. Gmelin) Blake ssp. trifoliatus (Chapman) Wemple]

Dalea cahaba J. Allison, Cahaba Prairie-clover. Dolomitic Ketona glades. May-June; June-September. C. AL (Bibb County) (Allison \& Stevens 2001).

Dalea foliosa (A. Gray) Barneby, Cedar Glade Prairie-clover. Calcareous glades. Late June-September. C. TN, n. AL, IL, and OH (?). [= C, I, K, SE, Z; = Petalostemum foliosum A. Gray - F, G; = Petalostemon foliosus A. Gray -- S]

Dalea purpurea Ventenat var. purpurea, Purple Prairie-clover. Prairies, glades, and open woodlands. NY and Ontario west to British Columbia, south to KY, TN, n. AL, c. MS, TX, and NM. [= C, I, K, SE, Z; < Petalostemum purpureum (Ventenat) Rydberg - F, G; < Petalostemon purpureus (Ventenat) Rydberg -- S]

\section*{Daubentonia (see Sesbania)}

\section*{Desmanthus Willdenow (Bundleflower)}

A genus of about 25 species, mostly herbs, of warm temperate and subtropical America. References: Isely (1973)=Z; Isely (1998) \(=\) I.
* Desmanthus illinoensis (Michaux) MacMillan ex B.L. Robinson \& Fernald, Bundleflower, Prairie Mimosa. Pd (NC, SC), Cp (GA, SC, VA), Mt (GA): disturbed areas; rare, introduced from west of the Appalachians. June-July; August-November. Native primarily west of the Mississippi River (but probably also on limestone through much of TN), with scattered occurrences to the east, most of these adventive. The species is probably not native in our area. [= RAB, C, F, G, I, K, SE, W, Z; = Acuan illinoense (Michaux) Kuntze -- S; = Mimosa illinoensis Michaux]

\section*{Desmodium Desvaux (Tick-trefoil, Tick-clover, Beggar's-ticks, Stick-tights)}

A genus of about 300 species, annual herbs, perennial herbs, and shrubs, nearly cosmopolitan (but lacking from Europe). In our area, Desmodium is a complex genus. Some of the species in our area are confusing and can be identified only with difficulty. The three species in Key A form a group quite distinct from the others in our area. It may be that these two groups warrant recognition as two genera, in which case D. nudiflorum, D. glutinosum, and D. pauciflorum are retained in Desmodium, and the rest of our taxa would be in Meibomia (whch is the older genus name, but Desmodium is conserved against it when the two are united). References: Isely (1998)=I. Key based on SE, C, RAB, and F. Some parts adapted with little change from SE. Some parts, especially Key E, will likely be substantially revised, based on additional herbarium and field testing.

1 Calyx lobes shorter than the calyx tube; stipe of the loment \(4-20 \mathrm{~mm}\) long, about \(3 \times\) or more as long as the calyx; mature leaves without stipels at the base of the petiolules of the leaflets; leaves subverticillate at the top of the stem (alternate in \(D\). pauciflorum); stamens monadelphous; lower margin of the loment incised to the upper suture ...................... Key A
1 Calyx lobes equal to or longer than the calyx tube (at least the lower calyx lobes longer than the calyx tube); stipe of the loment absent or nearly so, included within the calyx; mature leaves retaining stipels at the base of the petiolules of the leaflets; leaves alternate; stamens diadelphous; lower margin of the loment not incised to the upper suture.
2 Leaflets narrow, the terminal leaflet less than 10 mm wide, and also \(4-12 \times\) as long as wide, typically thick and strongly reticulate; petioles of midstem leaves 1-10 (-15) mm long; [primarily of the Coastal Plain and lower Piedmont (rarely Mountains) in our area] \(\qquad\)
2 Leaflets broader, the terminal leaflet more than 15 mm wide, or less than \(4 \times\) as long as wide, typically thin and not reticulate; petioles of midstem leaves various, but more than 15 mm long if leaflet proportions are narrow; [collectively widespread in our area].
3 Stems trailing vinelike along the ground
Key C
Stems erect or ascending, not vinelike.
4 Stipules persistent (most or all of the stipules persisting through the year), 4-20 mm long, ovate to amplexicaulclasping (to lance-attenuate, and if so, generally longer than 8 mm long, except in \(D\). floridanum); leaflets 1.5-3x as long as wide
4 Stipules caducous (most or all of the stipules falling soon after expansion of the leaves), 2-6 (-8) mm long, mostly linear-subulate or lance-attenuate (in some species narrowly ovate to triangular); leaflets 1-8 (-10)× as long as wide

1 Stems dimorphic, the flowering stem normally lacking leaves (rarely with leaves), the sterile stem with a subverticillate cluster of 3-7 leaves near the top; pedicels \(10-20 \mathrm{~mm}\) long D. nudiflorum

1 Stems monomorphic, bearing both leaves and flowers, the leaves either subverticillate or not; pedicels \(2-10 \mathrm{~mm}\) long.
2 Leaves subverticillate, clustered; leaflets conspicuously and strongly acuminate, 5-10 cm long; flowers usually distinctly pink or pink-purple; inflorescence 3-8 dm long, elongate, large, and conspicuous, much exceeding the leaves
D. glutinosum

2 Leaves alternate, scattered; leaflets acute to slightly acuminate, 3-7 cm long; flowers white; inflorescence 1-2 dm long small and inconspicuous, often partly obscured by the leaves
D. pauciflorum

\section*{Key B (Desmodium with very narrow leaflets)}

1 Petioles (0-) 1-3 (-4) mm long, the leaves thus subsessile; leaflets \(5-10 \mathrm{~mm}\) wide, strongly pubescent on the lower surface ...
\(\qquad\)
1 Petioles 3-15 mm long, the leaves thus obviously petiolate; leaflets 2-5 (-8) mm wide, glabrate or inconspicuously puberulent on the lower surface.
2 Loment segments flat to distinctly concave along the upper (suture) margin; [of dry to mesic habitats] . . . . . . D. strictum
2 Loment segments slightly convex along the upper (suture) margin; [of boggy, wet, or mesic habitats] . . . D. tenuifolium

\section*{Key C (Desmodium with trailing stems)}

1 Stipules ovate, persistent, slightly to strongly clasping at the base, 6-12 mm long.
2 Leaflets ovate, 1.2-1.9× as long as wide; flowers white to yellowish; loment uncinate-puberulent only along the sutures .
D. ochroleucum

2 Leaflets ovate, 0.8-1.1× as long as wide; flowers blue-purple; loment uncinate-puberulent over the surface
D. rotundifolium

1 Stipules lanceolate to linear (or deltate in \(D\). humifusum), usually quickly deciduous, not clasping at the base, 2-8 mm long.
3 Terminal leaflet 1.4-2.0× as long as wide, 3.0-7.0 cm long; loment segments 6-8 mm long; stipules 4-8 mm long, ovate to lance-acuminate
[D. humifusum]
3 Terminal leaflet 0.9-1.2x as long as wide, \(1.5-2.3 \mathrm{~cm}\) long; loment segments \(4-5 \mathrm{~mm}\) long; stipules lanceolate, 1-5 mm long
D. lineatum

\section*{Key D}

1 Loment segments nearly symmetrical along the axis of the loment (the isthmi more or less equal above and below, thus each segment diamond-shaped, rounded-diamond-shaped, or essentialy elliptical), each segment 3-3.5 mm long; annual from a taproot; [of the Coastal Plain of NC and SC]
D. tortuosum

1 Loment segments asymmetrical along the axis of the loment (the isthmi deeper below than above, thus each segment triangular, rounded-triangular, or semi-circular), each segment 5-11 mm long; perennial; [collectively widespread in our area].
2 Corolla 6-7 mm long; loment with 2-4 segments, each 5-7 mm long; lower leaves often 1-foliolate; [of se. SC and southwards]
D. floridanum

2 Corolla 8-13 mm long; loment with 4-6 segments, each \(6.5-11 \mathrm{~mm}\) long; lower leaves usually 3 -foliolate; [collectively widespread in our area].
3 Stem densely spreading pilose (at least the upper stem) and also uncinate-puberulent; loment segments 6.5-10 mm
long .................................................................................... . . D. canescens

3 Stem glabrous or uncinate-puberulent; loment segments 9-11 mm long ........ D. cuspidatum var. cuspidatum

\section*{Key E}

1 Corolla 8-11 mm long; petioles mostly \(1-8 \mathrm{~mm}\) long; [plants of the Mountains of VA and possibly NC] ........ D. canadense
1 Corolla 3-8 (-9) mm long (or 8-10 mm long in D. laevigatum); petioles mostly longer, mostly 10-60 mm long (except \(D\). ciliare and \(D\). obtusum); [plants collectively widespread in our area].
2 Loment with 1-3 segments, rounded below.
3 Leaflets cinereous on the lower surface; corolla 6-7 mm long; loment with 3 (-4) segments ............ D. nuttallii
3 Leaflets not cinereous on the lower surface; corolla 3.5-6 mm long; loment with 1-2 (-3) segments; ["Desmodium ciliare group"].
4 Leaflets \(3-5.5 \times\) as long as wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . D. ciliare 4 Leaflets 1.2-3-5x as long as wide.

5 Terminal leaflet usually distinctly longer and narrower than the lateral leaflets; stem (near the middle) sparsely to densely uncinate-pubescent D. obtusum

5 Terminal leaflet similar to the lateral leaflets; stem (near the middle) glabrous to pilose, or also with some uncinate-pubescence.
6 Stem usually pilose; leaflets sub-appressed pubescent (to glabrate) . . . . . . . . . . . . . . . . D. ciliare

6 Stem glabrous (to sparsely uncinate-puberulent); leaflets glabrous or with only a few scattered hairs
D. marilandicum

2 Loment with 3-5 segments, mostly obtusely angled below.
7 Leaves densely villous on the lower surface; stem densely pubescent with uncinate or non-uncinate hairs.
8 Leaflets 1.5-2.0 (-2.2)× as long as wide; loment usually curved (the upper margin convex); loment with 2-4 segments; loment segments \(4-5 \mathrm{~mm}\) long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . D. nuttallii 8 Leaflets 1.0-1.5 (-1.9)× as long as wide; loment straight; loment with (3-) 4-5 (-6) segments; loment segments (4-) 5-8 (-9) mm long
D. viridiflorum

7 Leaves glabrous to moderately appressed-villous on the lower surface; stem glabrate, pilose or, uncinate pubescent. \(9 \quad\) Bracts (subtending clusters of 2-3 flowers) usually villous; plants moderately to densely villous; loment usually incurved (the upper margin convex); loment with 2-4 segments, each segment 4-5 mm long ...... D. nuttallii 9 Bracts (subtending clusters of 2-3 flowers) not villous; plants glabrous or slightly to moderately villous or pilose; loment usually nearly straight; loment with 3-5 segments, each segment \(4-8.5 \mathrm{~mm}\) long.
10 Corolla 8-10 mm long; pedicels usually 10-15 (-20) mm long; stems and leaves glabrous; leaflets distinctly pale on the lower surface
10 Coroll at least on the leaves); leaflets green or slightly pale on the lower surface; ["Desmodium paniculatum group"].
11 Leaflet lower surface glabrous, except for the conspicuous uncinate puberulence on the veins; stems and petioles glabrous or uncinate-puberulent; [plant of the Coastal Plain and possibly lower Piedmont]
D. fernaldii

11 Leaflet lower surface strigose to conspicuously sub-appressed-villous, and sometimes also uncinatepuberulent; stems and petioles glabrate to conspicuously pilose or uncinate-puberulent; [plants collectively widespread in our area].
12 Leaflets (2.5-) 3-8 (-10)× as long as wide; leaflet pubescence usually sparse, of straight, appressed hairs less than 0.5 mm long (or sometimes of longer spreading hairs); leaflets usually lacking uncinate pubescence on either surface; mid-stems glabrous or glabrate, the pubescence usually uncinate puberulence.
13 Loment segments rounded on the lower margin (thus semicircular to gibbous); leaves subsessile to short-petiolate; [plant restricted to Coastal Plain]
D. paniculatum var. epetiolatum

13 Loment segments angled on the lower margin (thus triangular to sub-rhombic); leaves longpetiolate; [plant widespread in our area]
D. paniculatum var. paniculatum

12 Leaflets 1.5-3 (-4)× as long as wide; leaflet pubescence usually evident, of spreading hairs more than 0.5 mm long; leaflets usually with uncinate pubescence on the veins of the upper surface; mid-stems pubescent, either pilose or with uncinate pubescence (if not, evidently pubescent on the petioles).
14 Stem and petiole pubescence sparsely to densely uncinate-puberulent; upper surface of leaflets commonly uncinate-puberulet on the veins
D. glabellum

14 Stem and petiole pubescence pilose; upper surface of leaflets occasionally uncinatepuberulent on the veins
D. perplexum

Desmodium canadense (Linnaeus) Augustin de Candolle, Showy Tick-trefoil, Canadian Tick-trefoil. Mt (NC?, VA), Pd (VA): \{insert habitat\}; rare (VA Rare). July-September; August-October. Québec and Nova Scotia west to Alberta, south to n. VA, sw. VA, NC (?), MO, and OK. Small (1933) reports this species for NC; the documentation is not known. [= C, F, G, I, K, SE, W; = Meibomia canadensis (Linnaeus) Kuntze -- S]

Desmodium canescens (Linnaeus) Augustin de Candolle, Hoary Tick-trefoil. Pd, Mt, Cp (NC, SC, VA): fields, woodland borders, disturbed areas; common. June-August; August-October. MA west to WI and NE, south to FL and TX. [= RAB, C, F, G, I, K, SE, W; = Meibomia canescens (Linnaeus) Kuntze -- S]

Desmodium ciliare (Muhlenberg ex Willdenow) Augustin de Candolle. Cp, Pd, Mt (NC, SC, VA): fields, woodland borders, disturbed areas; common. June-September; August-October. MA west to IN, MO, and se. KS, south to FL and TX; also in Cuba. [= RAB , C, G, I, SE, W; > D. ciliare var. ciliare - F, K; > D. ciliare var. lancifolium Fernald -- F, K; = Meibomia ciliaris (Muhlenberg ex Willdenow) Blake -- S]

Desmodium cuspidatum (Muhlenberg ex Willdenow) Augustin de Candolle ex Loudon var. cuspidatum, Toothed Tick-trefoil. Mt, Pd, Cp (NC, SC, VA): fields, woodland borders, disturbed areas; uncommon (VA Rare). June-August; August-October. VT and MA west to MI and WI, south to GA and OK. [= C, F, G, K, SE; < D. cuspidatum -- RAB, I, W; = Meibomia grandiflora (Augustin de Candolle) Kuntze -- S]

Desmodium fernaldii Schubert, Fernald's Tick-trefoil. Cp (NC, SC, VA), Pd? (SC): sandhills, dry flatwoods, woodland borders; common (VA Watch List). June-September; August-October. Se. VA south to s. SC (and maybe e. GA); Isely (1998) states that reports from the Gulf Coast are based on "glabrate forms of \(D\). glabellum," and also suggests that \(D\). fernaldii is only weakly differentiated from D. glabellum. [= RAB, C, F, G, I, K, SE, W; < Meibomia rhombifolia Vail -- S, in part (also see D. floridanum)]

Desmodium floridanum Chapman, Florida Tick-trefoil. Cp (GA, SC): sandhills, other dry sandy habitats; uncommon. JuneSeptember; August-October. Se. SC south to FL. [= RAB, I, K, SE; < Meibomia rhombifolia Vail -- S, in part (also see D. fernaldii)]

Desmodium glabellum (Michaux) Augustin de Candolle. Cp, Pd, Mt (NC, SC, VA): fields, woodland borders, disturbed areas; common. June-September; August-October. ME west to WI and NE, south to FL and TX. [= RAB, F, I, K, SE; < D. glabellum -- C, in part (also see D. perplexum); ? Meibomia paniculata (Linnaeus) Kuntze -- S, in part; ? Meibomia pubens (Torrey \& A. Gray) Rydberg -- S, in part (also see D. paniculatum var. paniculatum); D. paniculatum var. dillenii (Darlington) Isely -- W, in part]

Desmodium glutinosum (Muhlenberg ex Willdenow) A. Wood, Heartleaf Tick-trefoil, Clusterleaf Tick-trefoil. Mt, Pd, Cp (NC, SC, VA): moist forests, especially nutrient-rich; uncommon. June-August; August-October. Nova Scotia west to Saskatchewan, south to FL and Mexico. [= RAB, C, F, G, I, K, SE, W; = Meibomia acuminata (Michaux) Blake -- S]
\{Desmodium humifusum (Muhlenberg ex Bigelow) Beck. MA (Nova Scotia?) south to MD and DC (and possibly VA). Perhaps only a hybrid. [= C, F, I, K, SE; D. glabellum -- G, misapplied; Meibomia glabella -- S, misapplied]\}

Desmodium laevigatum (Nuttall) Augustin de Candolle. Cp, Pd, Mt (NC, SC, VA): fields, woodland borders, disturbed areas; common. June-September; August-October. S. NY west to IN and MO, south to FL and TX. [= RAB, C, F, G, I, K, SE, W; = Meibomia laevigata (Nuttall) Kuntze -- S]

Desmodium lineatum Augustin de Candolle, Matted Tick-trefoil. Cp (NC, SC, VA), Pd (NC): sandhills and other dry forests and woodlands; common (VA Watch List). June-August; August-October. Se. MD south to FL, west to TX. [= RAB, C, F, G, I, K, SE, W; > Meibomia arenicola Vail -- S; > Meibomia polymorpha (A. Gray) Small -- S]

Desmodium marilandicum (Linnaeus) Augustin de Candolle. Mt, Pd, Cp (NC, SC, VA): fields, woodland borders, disturbed areas; common. June-September; August-October. MA west to MI and MO, south to FL and TX. [= RAB, C, F, G, I, K, SE, W; = Meibomia marilandica (Linnaeus) Kuntze -- S]

Desmodium nudiflorum (Linnaeus) Augustin de Candolle, Naked Tick-trefoil. Cp, Pd, Mt (NC, SC, VA): moist to dry forests; common. July-August; August-October. ME west to MN, south to FL and TX. [= RAB, C, F, G, I, K, SE, W; = Meibomia nudiflora (Linnaeus) Kuntze -- S]

Desmodium nuttallii (Schindler) Schubert. Cp, Pd, Mt (NC, SC, VA): fields, woodland borders, disturbed areas; common. July-September; August-October. NY west to IN, south to n. FL, AL, and AR. [= RAB, F, I, K, SE, W; D. viridiflorum -- C, G, in part; Meibomia viridiflora (Linnaeus) Kuntze -- S, in part (also see D. viridiflorum)]

Desmodium obtusum (Muhlenberg ex Willdenow) Augustin de Candolle. Mt, Pd, Cp (NC, SC, VA): dry pine woodlands, fields, woodland borders, disturbed areas; common. June-September; August-October. MA west to s. MI, south to FL and TX. [= RAB, I, K, SE, W; D. rigidum (Elliott) Augustin de Candolle -- C, F, G; Meibomia rigida (Elliott) Kuntze -- S]

Desmodium ochroleucum M.A. Curtis ex Canby, White Tick-trefoil, Creamflower Tick-trefoil. Pd (NC, VA), Cp (VA), Mt (GA, NC): dry woodlands, especially over calcareous soils; rare (GA Special Concern, NC Rare, VA Rare). June-August; AugustOctober. NJ (?), DE, and MD south to sc. and sw. NC, GA, TN, AL, FL, MS, and MO. [= RAB, C, F, G, I, K, SE, W; = Meibomia ochroleuca (M.A. Curtis ex Canby) Kuntze -- S]

Desmodium paniculatum (Linnaeus) Augustin de Candolle var. epetiolatum Schubert. Cp (NC, SC?, VA): pine savannas and flatwoods, bogs; uncommon? (VA Watch List). June-September; August-October. Var. epetiolatum ranges from se. VA south to se. NC or e. SC. It may reflect hybridization between D. paniculatum var. paniculatum and another species. Further study is needed. [= F, I, K, SE; < D. paniculatum -- RAB, C; < D. paniculatum var. paniculatum -- W, in part]

Desmodium paniculatum (Linnaeus) Augustin de Candolle var, paniculatum. Mt, Pd, Cp (NC, SC, VA): fields, woodland borders, disturbed areas; common. June-September; August-October. S. ME west to s. Ontario, MI, and NE, south to FL and TX. [= F, I, K, SE; < D. paniculatum -- RAB, C; Meibomia chapmanii (Britton) Small -- S; D. paniculatum var. pubens Torrey \& A. Gray -G; Meibomia paniculata (Linnaeus) Kuntze -- S, in part; Meibomia pubens (Torrey \& A. Gray) Rydberg -- S (also see D. glabellum); < D. paniculatum var. paniculatum -- W]

Desmodium pauciflorum (Nuttall) Augustin de Candolle, Few-flowered Tick-trefoil. Cp, Pd (NC, SC, VA), Mt (VA): moist forests; common (NC Watch List). June-August; August-October. NY west to OH and IA, south to FL and TX. [= RAB, C, F, G, I, K, SE, W; = Meibomia pauciflora (Nuttall) Kuntze -- S]

Desmodium perplexum Schubert. Mt, Pd, Cp (NC, SC, VA): fields, woodland borders, disturbed areas; common. JulySeptember; August-October. [= RAB, F, I, K, SE; < D. glabellum -- C; Meibomia dillenii (Darlington) Kuntze -- S; D. paniculatum var. dillenii (Darlington) Isely -- W, in part]

Desmodium rotundifolium Augustin de Candolle, Roundleaf Tick-trefoil. Mt, Pd, Cp (NC, SC, VA): dry forests and woodlands; common. June-August; August-October. VT and MA west to s. MI, south to GA, LA, and MO. [= RAB, C, F, G, I, K, SE, W; Meibomia michauxii Vail -- S]

Desmodium sessilifolium (Torrey) Torrey \& A. Gray, Sessile-leaf Tick-trefoil. Pd (NC, SC, VA), Mt (VA), Cp (GA, SC?): dry woodlands; rare (NC Rare, VA Rare). July-August; August-October. RI west to s. MI and KS, south to NC, MS, and TX. [= RAB, C, F, G, I, K, SE, W; = Meibomia sessilifolia (Torrey) Kuntze -- S]

Desmodium strictum (Pursh) Augustin de Candolle, Pineland Tick-trefoil, Pinebarren Tick-trefoil. Cp (NC, SC, VA), Pd (NC, SC): sandhills, other dry wodlands; common (VA Rare). July-August; August-October. NJ south to FL, west to LA. [= RAB, C, F, G, I, K, SE, W; = Meibomia stricta (Pursh) Kuntze -- S]

Desmodium tenuifolium Torrey \& A. Gray, Slimleaf Tick-trefoil. Cp (NC, SC, VA), Pd? (NC?): bogs, pine savannas, wet pine flatwoods; common (VA Rare). July-August; August-October. Se. VA south to FL, west to LA. [= RAB, C, F, G, I, K, SE; = Meibomia tenuifolia (Torrey \& A. Gray) Kuntze -- S]

Desmodium tortuosum (Swartz) Augustin de Candolle. Cp (NC, SC): fields, woodland borders, disturbed areas; common. July-August; August-October. E. NC south to FL, west to TX. [= RAB, I, K, SE; = Meibomia purpurea (P. Miller) Vail -- S]

Desmodium viridiflorum (Linnaeus) Augustin de Candolle. Pd, Cp, Mt (NC, SC, VA): fields, woodland borders, disturbed areas; common. June-September; August-October. DE south to FL, west to TX, and inland to w. VA, w. NC, n. TN, and AR. [= RAB, F, I, K, SE, W; < D. viridiflorum -- C, G, in part only (also see D. nuttallii); < Meibomia viridiflora (Linnaeus) Kuntze -- S, in part (also see D. nuttallii)]

Desmodium cuspidatum (Muhlenberg ex Willdenow) Augustin de Candolle ex Loudon var. longifolium (Torrey \& A. Gray) Schubert, in GA. Var. longifolium (Torrey \& A. Gray) Schubert, differing in its pubescent stem, leaves, stipules, and calyx (vs. nearly glabrous), is generally more western, ranging from OH west to MN and NE, south to GA and ne. TX. [= C, F, G, K, SE; < D. cuspidatum -- RAB, I, infraspecific taxa not distinguished] \{not yet keyed\}

Desmodium incanum Augustin de Candolle. Cp (GA): lawns, disturbed areas; rare, presumably introduced or adventive from further south. A pantropical weedy species. [=I, SE; > D. incanum var. incanum -- K; = Meibomia cana (J.F. Gmelin) Blake -- S, illegitimate basionym; = D. canum (J.F. Gmelin) Schinz \& Thellung, illegitimate basionym] \{not yet keyed\}

\section*{Dioclea Kunth}

A genus of about 30 species, perennial to woody vines, of tropical (rarely temperate) regions of the Old and New World. References: Isely (1998)=I.

Dioclea multiflora (Torrey \& A. Gray) C. Mohr. Cp (GA): alluvial forests; rare. S. GA and FL Panhandle west to e. TX, north in the interior to w. TN and w. KY. [= C, G, I, K, S, SE; = Galactia mohlenbrockii R.H. Maxwell]

\section*{Erythrina Linnaeus (Coral Bean)}

A genus of about 100 species, trees, shrubs, and perennial herbs, of tropical and subtropical regions of the Old and New World. References: Isely (1998)=1.

1 Leaflets not lobed; [cultivated tree, persistent] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . E. crista-galli
1 Leaflets hastately lobed; [native herb or shrub]
E. herbacea
* Erythrina crista-galli Linnaeus, Coraltree. Cp (GA): cultivated, disturbed areas, roadside ditches; rare, introduced from South America. [=I, K, SE; = Micropteryx crista-galli (Linnaeus) Walpers - S]

Erythrina herbacea Linnaeus, Coral Bean, Cardinal-spear. Cp (GA, NC, SC): maritime forests, dry sandy woodlands, sandhills in the outer Coastal Plain; uncommon (rare in NC). May-July; July-September. Se. NC south to FL, west to se. TX, and south to e. Mexico (Tamaulipas and e. San Luis Potosi). [= RAB, I, K, SE; >E. herbacea - S, in a narrow sense; >E. arborea (Chapman) Small -- S]

\section*{Galactia P. Browne (Milkpea)}
(also see Dioclea)
A genus of about 50 species, herbs, of tropical and warm temperate regions, primarily American. References: Duncan (1979)=Z; Isely (1998) \(=1\); Ward \& Hall (2004)=Y.

Identification notes: Definite identification of the taxa from key lead 4 on is problematic. Note also that the traditional application of \(G\). regularis and G. volubilis is reversed.

2 Plant erect, with 4-6 (-8) leaves . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . G. erecta

2 Plant prostrate, trailing, or twining, generally with numerous leaves.
3 Legumes villous with hairs \(1-1.5 \mathrm{~mm}\) long; corolla when fresh bright reddish purple and white (drying dark on herbarium specimens); stems villous with hairs \(>0.5 \mathrm{~mm}\) long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . G
3 Legumes glabrous, or pubescent with hairs \(<1 \mathrm{~mm}\) long; corolla pink to pink-purple (drying pale or the petals dropping on herbarium specimens); stems glabrate to villosulous with hairs \(<0.5 \mathrm{~mm}\) long.
4 Inflorescences generally exserted, (2-) 4-15 (-20) cm long, the flowers well distributed along half or more of the length of the inflorescence axis; flower buds generally 5-8 mm long; corolla 8-12 (-14) mm long; plants twining (rarely trailing)
G. regularis

4 Inflorescences short or exserted, if exserted then the flowers generally from nodes crowded into the upper half of the axis; flower buds \(5-10 \mathrm{~mm}\) long; corolla (11-) 12-16 (-18) mm long; plants trailing or twining.
5 Internodes short, 1-2 cm long, the stem thus appearing leafy; inflorescences with 1-3 flowers (or also with solitary axillary flowers); [plants of Coastal Plain of SC southwards] . . . . . . . . . . . . . . . . . . . . . . . . . G. minor

5 Internodes generally longer; inflorescences with 1-3 or more flowers; [plants collectively widespread in our area].
6 Stems glabrescent to conspicuously pubescent with spreading hairs \(<0.5 \mathrm{~mm}\) long; leaflets 1.5-3.5 (4) cm long, the undersurface with hairs \(0.4-0.7 \mathrm{~mm}\) long; [plants of e. GA southwards] . . G. floridana 6 Stems antrorse- or retrorse-strigose; leaflets \(1.5-5(-7) \mathrm{cm}\) long, the undersurface strigose with hairs \(<0.3 \mathrm{~mm}\) long; [plants widespread in our area] . . . . . . . . . . . . . . . . . . . . . G. volubilis var. volubilis

Galactia elliottii Nuttall, Elliott's Milkpea. Cp (GA, SC): moist forests; uncommon. July-September; August-October. S. SC south to s. FL. [= RAB, I, K, S, SE, Y, Z]

Galactia erecta (Walter) Vail, Erect Milkpea. Cp (GA, NC, SC): sandhills; common. May-July; July-September. Se. NC south to Panhandle FL, west to e. TX. [= RAB, I, K, S, SE, Y, Z]

Galactia floridana Torrey \& A. Gray, Florida Milkpea. Cp (GA): sandhills and other xeric sands; rare (GA Special Concern). S. GA south to s. FL, west to s. MS. [= I, K, SE, Y, Z; ? G. floridana var. floridana -- S; ? G. brevipes Small -- S]

Galactia minor Duncan, Little Milkpea. Cp (GA, NC?, SC): sandhills; uncommon. June-August; July-October. Nc. SC south to Panhandle FL, west to s. MS. [= Y, Z; = G. microphylla (Chapman) H.J. Rogers ex Isely -- I, K, SE; = G. floridana Torrey \& A. Gray var. microphylla Chapman -- S]

Galactia mollis Michaux. Cp (GA, NC, SC): sandhills; uncommon (rare in NC and SC). May-July; July-September. Se. NC south to c. peninsular FL, west to Panhandle FL and se. AL. [= RAB, I, K, S, SE, Y, Z]

Galactia regularis (Linnaeus) Britton, Sterns, \& Poggenburg. Cp, Pd, Mt (GA, NC, SC, VA): dry forests and woodlands; common. July-September; August-October. Se. PA west to MO and OK, south to s. FL and se. TX. [= Y, Z; > G. volubilis (Linnaeus) Britton - RAB, C, F, G, misapplied; > G. macreei M.A. Curtis -- RAB, C, F, G; = G. volubilis - I, K, S, SE, misapplied]

Galactia volubilis (Linnaeus) Britton var. volubilis. Cp (GA, NC, SC, VA), Pd?, Mt? (VA): sandhills, other dry forests and openings; common. June-August; July-October. NJ and s. PA west to c. AR, south to s. FL and LA. Duncan (1979) describes various forms of this taxon (which he treated under the name G. glabella) that he considered possibly warranting description as varieties or species. [= Y; < G. regularis (Linnaeus) Britton, Sterns, \& Poggenburg - RAB, C, F, G, I, K, S, SE, misapplied; < G. glabella Michaux -- Z]

\section*{Genista Linnaeus (Dyer's Greenweed)}

A genus of about 80 species, shrubs and small trees, native to Eurasia. References: Isely (1998)=1.
* Genista tinctoria Linnaeus, Dyer's Greenweed. Cp (VA): disturbed areas; rare, introduced from Europe. June-September. Not cited in Harvill et al. (1992), but described as naturalized in sterile soils south to VA in C, F, and G. [= C, F, G, I, K]

\section*{Gleditsia Linnaeus (Honey Locust, Water Locust)}

A genus of 13-14 species, scattered in the Old and New Worlds. References: Isely (1975)=Z; Robertson \& Lee (1976)=Y; Isely (1998) =I; Schnabel \& Wendel (1998).

1 Legume ovate, 3-5 (-8) cm long and 1-3-seeded; foliage glabrous (or slightly puberulent when young); [trees of frquently flooded swamps, often with Taxodium, rarely planted and escaped] G. aquatica

1 Legume elongate, \(20-40 \mathrm{~cm}\) long and multi-seeded; foliage puberulent (even in age); [trees of moist to dry forests, frequently planted and escaped in disturbed areas]
G. triacanthos

Gleditsia triacanthos Linnaeus, Honey Locust. Pd, Mt, Cp (GA, NC, SC, VA): woodlands, forests (generally bottomland), fencerows, often planted as a street tree; common (uncommon in Mountains). April-May; July-November. NY west to SD, south to panhandle FL and TX. Its occurrence over much of our region appears to be as an adventive; the native range is poorly known. G. triacanthos is more likely to be native in the western part of our region, particularly in the Mississippi drainage. The trunks are normally beset with lengthy, branched thorns, but thornless trees are encountered (and are usually favored for horticultural planting). [= RAB, C, G, GW, I, K, S, SE, W, Y, Z]

Gleditsia aquatica Marshall, Water Locust. Cp (GA, SC): swamp forests; common. April-May; July-November. E. SC south to c. peninsular FL, west to \(T X\), and north in the interior to \(I N\), \(I L\), and \(M O\); occasionally cultivated north of its native range. [= RAB, C, F, G, GW, I, K, S, SE, Y, Z]

The hybrid Gleditsia \(\times\) texana Sargent (pro sp.) [G. aquatica \(\times\) triacanthos] occurs occasionally in the area of range overlap of its parents. Isely (1975) reports its occurrence in SC. It is intermediate between its parents. [=I,K]

Glottidium Desvaux (Bladderpod)

A genus of a single species, a coarse annual herb, of se. North America. References: Isely (1998)=I.

Identification notes: See key under Sesbania for distinctions.
Glottidium vesicarium (Jacquin) Harper, Bladderpod, Bagpod. Cp (GA, NC, SC), Pd (GA): ditches, marshes, disturbed wet areas; common. The native status of G. vesicarium is uncertain; its distribution is from ne. NC south to s. FL, west to e. OK and se. TX, and Isely (1998) states that it is unknown from outside the United States. Its weedy habit suggests that it may have expanded its distribution northwards into our area from the deeper South. July-September; August-November. [= RAB, I, K, S, SE; = Sesbania vesicaria (Jacquin) Elliott -- GW]

\section*{Glycine Linnaeus (Soybean, Soya)}

A genus of about 10 species, annual and perennial herbs, of Asia and Australia. References: Isely (1998)=I.
* Glycine max (Linnaeus) Merrill, Soybean. Cp, Pd, Mt (GA, NC, SC, VA): abundantly cultivated, rarely persisting as a waif, introduced from e. Asia. July-October. One of the most important legume crops in the world. [= RAB, F, I, K, SE]

Glycyrrhiza Linnaeus (Licorice)

References: Isely (1998)=I.
* Glycyrrhiza lepidota Pursh, Wild Licorice. Cp (VA): disturbed areas; rare, introduced from w. North America. Not cited in Harvill et al. (1992), but described as naturalized in old fields in e. VA in C, F, and G. [= K; > G. lepidota Pursh var. glutinosa (Nuttall) S. Watson -- C, F, G, I]

Gymnocladus Lamarck (Kentucky Coffee-tree)
A genus of 5 species, all trees, ours in e. North America and four species in e. Asia. References: Isely (1975)=Z; Robertson \& Lee (1976) \(=\mathrm{Y}\); Lee (1976)=X; Isely (1998)=1.

Gymnocladus dioicus (Linnaeus) K. Koch, Kentucky Coffee-tree. Mt (GA*, VA), Pd* (GA*, NC*): native in rich bottomland and slope forests, also in disturbed areas, persistent and weakly spreading from horticultural plantings; rare (VA Watch List), also rare east of the Appalachians as an introduction. April-May; August-November (and persistent). The original native range has been obscured, perhaps PA west to se. SD, south to w. VA, TN, n. AL, and OK. [= RAB, C, F, G, I, K, S, SE, X, Y, Z]

\section*{Indigofera Linnaeus (Indigo)}

A genus of about 700 species, annual herbs, perennial herbs, and shrubs, nearly cosmopolitan in tropical and warm temperate regions. References: Isely (1998)=I.

1 Stem pubescence hirsute or pilose with long brownish hairs . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . I. hirsuta
1 Stem pubescence strigose-appressed.
2 Legume 7-9 mm long, ovoid, not falcate, indehiscent, with 2-3 seeds; [native species] I. caroliniana

2 Legume 15-36 mm long, linear-cylindric, slightly to strongly falcate, dehiscent, with 3-12 or more seeds; [introduced species].
3 Legume 15-20 mm long, strongly falcate . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . I. suffruticosa
3 Legume 28-36 mm long, slightly falcate . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . I. tinctoria

Indigofera caroliniana P. Miller, Wild Indigo, Carolina Indigo. Cp (GA, NC, SC): sandy forests and woodlands, including sandhills and sandy maritime forests; common (uncommon in NC and SC). June-August; July-October. E. NC south to FL, west to se. LA, a Southeastern Coastal Plain endemic. [= RAB, I, K, S, SE]
* Indigofera hirsuta Linnaeus, Hairy Indigo. Cp (GA, SC): sandy disturbed areas, such as wildlife "food fields"; rare, introduced from the Old World tropics. First reported for SC by Nelson \& Kelly (1997). [= I, K, SE]
* Indigofera suffruticosa P. Miller, West Indian Indigo. Cp (GA, NC, SC): formerly commonly cultivated, locally established as a weed at that time, perhaps no longer present in our area, introduced from native range in the New World tropics, including s. FL. [ \(=1, \mathrm{~K}, \mathrm{~S}, \mathrm{SE}\) ]
* Indigofera tinctoria Linnaeus, African Indigo. Cp (GA, NC, SC): formerly commonly cultivated, locally established as a weed at that time, perhaps no longer present in our area, introduced from Africa. Both this species and I. suffruticosa were cultivated as an important export crop in the Coastal Plain of GA, SC, and (less so) NC in the seventeenth and eighteenth centuries. [=I, K, S, SE]
* Indigofera decora Lindley in GA (Lexington) (Duncan \& Duncan in prep.). \{not yet keyed; synonymy\}

\section*{Kummerowia Schindler (Korean-clover, Japanese-clover)}

A genus of 2 species, annual herbs, native to temperate e. Asia. Kummerowia differs from Lespedeza in its annual habit (vs. perennial), conspicuous stipules (vs. not conspicuous), inflorescence branching pattern (see Akiyama \& Ohba 1985), and leaflets with striate, parallel, lateral veins (vs. with reticulate lateral veins). It is distinct at the generic level. References: Akiyama \& Ohba (1985)=Z; Isely (1998)=I. Key based closely on SE.

1 Mid-stem leaves with petioles 4-10 mm long; leaflets emarginate at the apex; leaflets conspicuously spreading-ciliate; stems antrorsely appressed-strigose; calyx covering 1/3-1/2 of the legume
K. stipulacea

1 Mid-stem leaves with petioles 1-2 (-4) mm long; leaflets not emarginate at the apex; leaflets inconspicuously appressed-ciliate; stems retrorsely appressed-strigose; calyx covering 1/2-4/5 of the legume
K. striata
* Kummerowia stipulacea (Maximowicz) Makino, Korean Lespedeza, Korean-clover. Mt, Pd, Cp (GA, NC, SC, VA): fields, roadsides, disturbed areas; common, introduced from e. Asia. July-September; August-November. [=I, K, SE, Z; = Lespedeza stipulata Maximowicz -- RAB, C, F, G, W]
* Kummerowia striata (Thunberg) Schindler, Japanese-clover, Common Lespedeza. Cp, Pd, Mt (GA, NC, SC, VA): fields, roadsides, disurbed areas; common, introduced from e. Asia. July-September; August-November. [= I, K, SE, Z; = Lespedeza striata (Thunberg) Hooker \& Arnott -- RAB, C, F, S, G, W]

Lablab Adanson (Hyacinth-bean)

A genus of a single species, an annual to perennial herb, native of the Old World tropics. References: Isely (1998)=l.
* Lablab purpureus (Linnaeus) Sweet, Hyacinth-bean, is cultivated and rarely may escape or persist as a waif in disturbed areas; it is reported from se. PA (Rhoads \& Klein 1993). [= I, K, SE; = Dolichos lablab Linnaeus]

Lathyrus Linnaeus (Wild-pea, Vetchling)
A genus of about 150 species, annual and perennial herbs, of nearly cosmopolitan distribution. References: Isely (1998)=1. Key adapted in part from C.

1 Leaflets more than 2, generally 4-12; [native species of various habitats].
2 Foliaceous stipules laterally symmetrical, with 2 approximately equal basal lobes; leaves somewhat fleshy; [plants of ocean beaches and dunes]
[L. maritimus var. pellitus]
2 Foliaceous stipules asymmetrical, oblique at the base, the basal lobe well-developed only on one side.

3 Basal lobe of stipule acute to acuminate at tip; flowers purplish (rarely whitish, or faded in old specimens).
4 Racemes with 2-6 (-9) flowers; leaflets 4-8 (-10) per leaf; [plants of marshes, bottomlands, and other wet
habitats] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . L. palustris 4 Racemes with (5-) 10-20 flowers; leaflets (8-) 10-14 per leaf; [plants of dry to mesic forests] . . . . . L. venosus 1 Leaflets 0-2; [alien species, except \(L\). pusillus].

3 Leaflets absent (but with foliaceous stipules) . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [L. aphaca]
3 Leaflets 2.
4 Stems with wings 0-1 (-2) mm wide; corolla 6-14 mm long; flowers 1-3 (-4) per raceme.
5 Legume (in fruit) and ovary (in flower) hirsute with swollen-based hairs; corolla 10-14 mm long . . . . L. hirsutus 5 Legume (in fruit) and ovary (in flower) glabrous; corolla 6-9 mm long . . . . . . . . . . . . . . . . . . . . . . . L. pusillus
4 Stems with wings 1-3 mm wide; corolla 13-30 mm long; flowers 2-12 per raceme.
6 Stems hirsute with swollen-based hairs; plant an annual; flowers 2-4 per raceme .............. L. odoratus 6 Stems glabrate; plant a perennial; flowers (3-) 4-12 per raceme.

7 Stipules 4-10 mm wide; leaflets \(2-5 \times\) as long as wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . L. latifolius
7 Stipules 2-3 mm wide; leaflets \(6-15 \times\) as long as wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . L. sylvestris
* Lathyrus hirsutus Linnaeus, Caley Pea, Singletary Pea. Cp, Pd (GA, NC, SC, VA), Mt (GA, VA): roadsides, fields, disturbed areas; common, introduced from Europe. April-July. [= RAB, C, F, G, I, K, S, SE, W]
* Lathyrus latifolius Linnaeus, Everlasting Pea, Perennial Sweet Pea. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): roadsides, fencerows, disturbed areas; common, introduced from Europe. May-September. [= RAB, C, F, G, I, K, SE, W]
* Lathyrus odoratus Linnaeus, Sweet Pea. Cp, Pd, Mt (GA, NC, SC, VA): cultivated, and occasionally persisting; rare, introduced from s. Europe. [= C, F, G, I, K, SE]

Lathyrus palustris Linnaeus, Marsh Pea, Marsh Vetchling. Pd (GA, VA), Mt (VA), Cp (NC): bottomland forests, marshes, streambanks; rare (GA Special Concern). May-June; July-September. Circumboreal, ranging in North America south to NJ, VA, ne. NC, ec. GA, OH, IN, MO, CO, and CA. [= RAB, I, K, SE; > L. palustris var. palustris -- C, F, G; > L. palustris var. myrtifolius (Muhlenberg ex Willdenow) A. Gray -- F, G; > L. palustris var. linearifolius Ser. -- G; = L. myrtifolius Muhlenberg ex Willdenow -- S]

Lathyrus pusillus Elliott. Cp (NC, VA): open areas in bottomlands; rare. April-July. E. VA, MO and KS south to FL and TX. [= RAB, F, G, I, K, S, SE]

Lathyrus sylvestris Linnaeus, Perennial Pea. Pd (GA) (NC?, SC?, VA): cultivated, and occasionally persisting; rare, introduced from Europe. [= C, F, G, I, K, SE]

Lathyrus venosus Muhlenberg ex Willdenow, Forest Pea, Bush Vetch. Mt, Pd (GA, NC, VA), Cp (VA): dry to mesic slope and bottomlands forests and woodlands, especially in base-rich soils; common. July-September. S. Ontario west to MN and Saskatchewan, south to c. NC, wc. GA, and MO. [= RAB, I, K, S, SE, W; > L. venosus var. venosus -- C, F, G; > L. venosus var. intonsus Butters \& St. John -- C, F, G; > L. venosus var. meridionalis Butters \& St. John -- F]
* Lathyrus aphaca Linnaeus, Yellow Vetchling, introduced from Eurasia, is scattered in occurrence in the Southeast, including AL, TN, and KY (Kartesz 1999). [= I, K, SE]

Lathyrus maritimus (Linnaeus) Bigelow var. pellitus (Fernald) Gleason, Beach Pea, has been reported from ocean beaches in Dare County (NC). Documentation of the occurrence of this species in our area is needed. [= C, G; Lathyrus japonicus Willdenow var. pellitus Fernald -- F, K; L. japonicus -- I, infraspecific taxa not distinguished]

Lathyrus ochroleucus Hooker, a native plant of forests over limestone, is distributed south to sc. PA (Rhoads \& Klein 1993) and NJ (Kartesz 1999). [= I, K]
* Lathyrus pratensis Linnaeus is reported for VA on the basis of "personal communication" (Kartesz 1999). \{investigate\} [= I, K] \{not yet keyed\}
* Lathyrus tuberosus Linnaeus, introduced in e. TN (Chester, Wofford, \& Kral 1997), WV (Kartesz 1999), and at scattered locations in PA (Rhoads \& Klein 1993). [= I, K, SE] \{not yet keyed\}

\section*{Lespedeza Michaux}
(also see Kummerowia)
A genus of about 40 species, perennial herbs and shrubs, of temperate regions of e. Asia and e. North America. References: Clewell (1966a)=Z; Clewell (1966b) \(=\) Y; Isely (1986b) \(=\) X; Akiyama (1988)=Q; Clewell \& Stickel (1990); Isely (1998)=I. Key based primarily on \(Z\) and \(S E\).

1 Plants annual; stipules ovate to ovate-lanceolate, conspicuous; leaflets with striate, parallel, lateral veins .... [Kummerowia]
1 Plants perennial, stipules subulate, setaceous, or lanceolate, not conspicuous; leaflets with reticulate lateral veins, joining before reaching the margin.
2 Plant a shrub, usually 1-3 m tall, bushy-branched, the woody stems over-wintering; corolla 8-15 mm long; [plants alien, planted in "wildlife food plots" and persisting or spreading]; [section Macrolespedeza).
3 Calyx lobes equal to or shorter than the calyx tube; corolla \(8-11 \mathrm{~mm}\) long; leaflets \(1.5-2 \times\) as long as wide; racemes erect or strongly ascending; stems 1 -several per crown, brown when young . . . . . . . . . . . . . . . . . . . . . . . L. bicolor
3 Calyx lobes longer than the calyx tube (especially or at least the lowest lobe); corolla (10-) 12-15 mm long; leaflets 2\(3 \times\) as long as wide; racemes lax and drooping; stems many per crown, purplish when young . . . . . . . L. thunbergii
2 Plant an herb, 0.1-2 m tall, not bushy-branched (the taller species often wand-like), the stems in some species somewhat woody but dying back; corolla to 10 mm long; [plants native, except L. cuneata and L. virgata).
4 Leaflets distinctly widest towards the tip, \(3-5 \times\) as long as wide, the base and apex very differently shaped (the base narrowly cuneate, the tip rounded, truncate or even retuse); racemes reduced, with 2-3 flowers, shorter than the subtending leaves; [plants alien]
L. cuneata

4 Leaflets generally widest near the middle, 1-8 (-10) \(\times\) as long as wide, the base and apex shaped similarly (i.e. both rounded, or both cuneate); racemes with 3-many flowers, shorter or longer than the subtending leaves; [plants native, except \(L\). virgata].
5 Midrib of leaflets distinctly excurrent as a spinose bristle \(0.5-1.5 \mathrm{~mm}\) long; [plant a rare introduction] . L. virgata 5 Midrib of leaflets not excurrent, or only as an obscure mucro, not at all spinose; [plants native].

6 Plants trailing at maturity (young stems erect to arching-ascending up to 2 dm tall, then lopping over); stems slender, wiry; corolla pink to purple.
7 Pubescence of the stem spreading (pilose) . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . L. procumbens
7 Pubescence of the stem appressed (strigose).
8 Calyx of legumes produced from cleistogamous flowers \(1 / 4-1 / 3\) as long as the pod; stems usually lacking axillary leaves; keel subequal to the wings, or shorter; stipules 2-4 (-5) mm long L. repens

8 Calyx of legumes produced from cleistogamous flowers ca. \(1 / 5\) as long as the pod; stems often with axillary leaves distinctly smaller than the primary leaves; keel usually longer than the wings; stipules 3-5 (-6) mm long L. frutescens

6 Plants erect at maturity; stems generally stout, stiff; corolla pink, purple, white, cream, or mixed.
9 Plants in flower.
10 Corolla primarily white or cream (often with a purplish throat).
11 Raceme peduncles short (shorter than the subtending leaf), the inflorescence itself barely if at all exceeding the subtending leaf; calyx lobes \(6-10 \mathrm{~mm}\) long; leaflets (2-) 2.5-5 (-8)× as long as wide
L. capitata

11 Raceme peduncles elongate (often longer than the subtending leaf), the inflorescence itself well-exserted beyond the subtending leaf; calyx lobes \(3-7 \mathrm{~mm}\) long; leaflets either narrower or wider (see below).
12 Leaflets 4-8 (-10)× as long as wide . . . . . . . . . . . . . . . . . . . . . . . . . . . L. angustifolia
12 Leaflets 1.3-1.8 \(\times\) as long as wide.
13 Leaves closely strigose on both surfaces with hairs \(0.2-0.5 \mathrm{~mm}\) long, silvery when fresh; leaflets \(1-2 \mathrm{~cm}\) long; petiole of midstem leaves not generally more than 1 cm long, about the same length as the rachis; [plants of the Coastal Plain and, in NC and SC, the lower Piedmont] \(\qquad\) L. hirta var. curtissii

13 Leaves glabrate, or strigose above only, at least some of the hairs (especially those on the veins below) more than 0.5 mm long, green or grey (to somewhat silvery) when fresh; leaflets 1.5-4 (-5) cm long; petiole of midstem leaves 1-1.5 (2) cm long, much exceeding the rachis; [plants widespread in our area]
L. hirta var. hirta

10 Corolla primarily pink or purple.
14 Peduncles of the racemes of chasmogamous (petaliferous) flowers longer than the subtending leaves; keel \(1-2 \mathrm{~mm}\) longer than the wings . . . . . . . . . . . . . . . . L. frut subtending leaves; keel about as long as or shorter than the wings.
15 Upper surface of the leaflets glabrous (sometimes strigose along the midrib only); pubescence of the stem appressed; leaflets \(1.5-3 \times\) as long as wide . . . . L. violacea
15 Upper surface of the leaflets pubescent; pubescence of the stem appressed or spreading; leaflets \(1.3-7 \times\) as long as wide.
16 Leaflets 1.3-3 ( -3.5 ) \(\times\) as long as wide . . . . . . . . . . . . . . . . . . . . . . . . . . . L. stuevei 16 Leaflets (4-) \(5-7 \times\) as long as wide . . . . . . . . . . . . . . . . . . . . . . . . . . L. virginica
9 Plants not in flower.
17 Leaflets of average, mid-stem leaves more than \(4 \times\) as long as wide (L. capitata keyed here and below).
18 Petioles of mid-stem leaves ca. 10 mm long . . . . . . . . . . . . . . . . . . . . . . . . . L. virginica
18 Petioles of mid-stem leaves \(1-3 \mathrm{~mm}\) long.
19 Leaflets \(4-8(-10) \times\) as long as wide; pubescence of the stems and leaves usually not silvery-cinereous . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . L. angustifolia

19 Leaflets (2-) 2.5-5 (-8)× as long as wide; pubescence of stems and leaves usually silvery-cinereous
L. capitata

17 Leaflets of average, mid-stem leaves less than \(3.5 \times\) as long as wide (L. capitata keyed here and above).
20 Leaflets (2-) 2.5-5 (-8)× as long as wide; leaf rachis (the apparent petiolule of the terminal leaflet) longer than the petiole
L. capitata

20 Leaflets 1.3-3 (-3.5)× as long as wide; leaf rachis shorter than the petiole (or about equal in L. hirta var. curtissii).

21 Central axis not strongly dominant, branches divaricate, irregular; stems slender, wiry
. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . L. frutescens
21 Central axis strongly dominant, branches ascending, mostly on the upper stem; stems stout, stiff.
22 Leaflets 1.3-3 ( -3.5 ) \(\times\) as long as wide, mostly more than \(1.8 \times\).
23 Upper surface of the leaflets glabrous (sometimes strigose along the midrib only); pubescence of the stem appressed . . . . . . . . . . . . . . . . . L. violacea
23 Upper surface of the leaflets pubescent; pubescence of the stem appressed or spreading
L. stuevei

22 Leaflets 1.3-1.8× as long as wide.
24 Leaves closely strigose, the hairs \(0.2-0.5 \mathrm{~mm}\) long, silvery when fresh; leaflets \(1-2 \mathrm{~cm}\) long; [plants of the Coastal Plain and, in NC and SC, the lower Piedmont]. L. hirta var. curtissii

24 Leaves glabrate, or strigose above only, at least some of the hairs more than 0.5 mm long, green or grey when fresh; leaflets 1.5-4 (-5) cm long; [plants widespread in our area]
L. hirta var. hirta

Lespedeza angustifolia (Pursh) Elliott, Narrow-leaved Lespedeza. Cp (GA, NC, SC, VA), Pd (GA), Mt (NC): sandhill-pocosin ecotones and dry to moist savannas, mountain bogs; common. August-October; September-November. MA south to c. FL, west to s. MS, essentially a Southeastern Coastal Plain endemic, rarely disjunct inland to w. NC, c. GA, and ec. TN (Chester, Wofford, \& Kral 1997). [= RAB, C, G, I, K, S, SE, W, Y, Z; > L. angustifolia - F; > L. hirta var. intercursa Fernald -- F]
* Lespedeza bicolor Turczaninow, Bicolor Lespedeza. Pd, Cp, Mt (GA, NC, SC, VA): "wildlife food plots", roadsides; common, introduced from e. Asia. June-September; August-November. [= RAB, C, I, K, Q, S, SE, W]

Lespedeza capitata Michaux, Bush-clover. Cp, Pd (GA, NC, SC, VA), Mt (NC, SC, VA): woodlands and woodland borders; common. August-October; September-November. ME and s. Ontario west to MN, SD, and NE, south to FL and TX. [= RAB, C, I, K, S, SE, W, Y, Z; > L. capitata var. capitata -- F, G; > L. capitata var. stenophylla Bissell \& Fernald -- F, G; > L. capitata var. velutina (Bicknell) Fernald -- F, G; > L. capitata var. vulgaris Torrey \& A. Gray -- F]
* Lespedeza cuneata (Dumont-Cours.) G. Don, Sericea Lespedeza, Chinese Lespedeza. Cp, Pd, Mt (GA, NC, SC, VA): roadbanks, "wildlife food plots", disturbed areas; common, introduced from e. Asia. July-September; October-November. [= RAB, C, F, G, I, K, SE, W]

Lespedeza frutescens (Linnaeus) Elliott, Violet Lespedeza. Mt, Pd (GA, NC, VA), Cp (GA, SC, VA): woodlands and woodland borders; common. July-September; October-November. MA and NY west to MI, WI, IA, and KS, south to NC, SC, GA, AL, MS, AR, and TX. [= K, S; = L. violacea (Linnaeus) Persoon -- RAB, C, F, G, I, K, S, SE, W, Y, Z]

Lespedeza hirta (Linnaeus) Hornemann var. curtissii (Clewell) Isely, Silvery Lespedeza. Cp (GA, NC, SC, VA), Pd (GA, NC, SC): sandhills and dry to moist savannas; common. August-October; September-November. Se. VA south to s. FL, west to panhandle FL and se. AL, barely extending onto the Piedmont in NC, SC, and GA. Clewell (1966a) discusses apparent intergrades between the two varieties in s. NJ. [= C, I, SE, X; < L. hirta -- RAB, G, S; =? L. hirta var. appressipilis Blake -- F (as to intent, but not the type); = L. hirta ssp. curtissii Clewell -- K, Y, Z]

Lespedeza hirta (Linnaeus) Hornemann var. hirta, Hairy Lespedeza. Mt, Pd, Cp (GA, NC, SC, VA): woodlands and woodland borders; common. August-October; September-November. S. ME and s. Ontario west to MI, n. IL, c. MO, and OK, south to FL and TX. [= C, I, SE, X; < L. hirta -- RAB, G, S, W; L. capitata var. calycina (Schindler) Fernald -- F; = L. hirta ssp. hirta -- K, Y, Z]

Lespedeza procumbens Michaux, Downy Trailing Lespedeza. Pd, Cp, Mt (GA, NC, SC, VA): woodlands and woodland borders; common. July-September; August-November. MA, NH, and NY west to IL, MO, and KS, south to panhandle FL and TX. [= RAB, C, G, I, K, S, SE, W, Y, Z; L. procumbens var. procumbens -- F]

Lespedeza repens (Linnaeus) W. Barton, Smooth Trailing Lespedeza. Cp, Pd, Mt (GA, NC, SC, VA): woodlands and woodland borders; common. July-September; August-November. CT and NY west to n. OH, s. WI, MO, and KS, south to panhandle FL and c. TX. [= RAB, C, F, G, I, K, S, SE, W, Y, Z]

Lespedeza stuevei Nuttall, Velvety Lespedeza. Cp, Pd (GA, NC, SC, VA), Mt (NC, SC): woodlands and woodland borders; common. July-September; August-November. MA south to n. FL, west to c. and n. TX, north in the interior to. NC, TN, s. IN, s. IL, c. MO, and nc. KS. [= RAB, C, F, G, I, K, SE, W, Y, Z; = L. stuvei -- S, orthographic variant]
* Lespedeza thunbergii (Augustin de Candolle) Nakai. Pd (GA, NC, SC), Cp (NC, SC): "wildlife food plots"; rare, introduced from e. Asia. [= C, F, G, I, K, Q, SE]

Lespedeza violacea (Linnaeus) Persoon, Wand Lespedeza. Mt, Pd, Cp (GA, NC, SC, VA): woodlands and woodland borders; common. July-September; August-November. S. ME and s. Ontario west to MI and se. MN, south to panhandle FL and e. TX. [= K; = L. intermedia (S. Watson) Britton - RAB, C, F, G, I, SE, W, Y, Z]

Lespedeza virgata (Thunberg) Augustin de Candolle. Mt (NC): roadbanks; rare, introduced from e. Asia. Clewell \& Stickel (1990) report the occurrence of this species in NC. [= I, K]

Lespedeza virginica (Linnaeus) Britton, Virginia Lespedeza. Cp, Pd, Mt (GA, NC, SC, VA): woodlands and woodland borders; common. July-September; August-November. MA and NH west to MI, WI, IA, and KS, south to n. FL and c. TX. [= RAB, C, F, G, I, K, S, SE, W, Y, Z]

Many species of Lespedeza hybridize, and most combinations may occur in our area. Some of the hybrids have been named in the past as varieties or species. Hybrids generally occur in mixed populations with both parents and can usually be identified by their intermediate morphology (identification much easier in the field where context is apparent than in the herbarium). See Isely (1990) and Clewell (1966a) for additional hints about identification of hybrids. The following hybrids combinations are known to occur in our area.
L. angustifolia \(\times\) capitata.
L. angustifolia \(\times\) hirta \([=\) L. \(\times\) oblongifolia (Britton) W. Stone (pro sp.) -- K; L. hirta var. appressipilis Blake -- F (as to type)].
L. angustifolia \(\times\) repens.
L. angustifolia \(\times\) stuevei.
L. capitata \(\times\) hirta. [= L. ×longifolia Augustin de Candolle (pro sp.) -- K; L. hirta var. longifolia (Augustin de Candolle) Fernald -- F; L. longifolia Augustin de Candolle -- S]
L. capitata \(\times\) repens.
L. capitata \(\times\) stuevei.
L. capitata \(\times\) virginica. [= L. \(\times\) simulata Mackenzie \& Bush (pro sp.) -- F, K; L. simulata Mackenzie \& Bush -- S]
L. hirta \(\times\) procumbens.
L. hirta \(\times\) repens
L. hirta \(\times\) stuevei.
L. hirta \(\times\) violacea. [= L. ×nuttallii Darlington (pro sp.) -- K; L. nuttallii Darlington -- RAB, F, S; L. nuttallii var. nuttallii -- G].
L. hirta \(\times\) virginica.
L. intermedia \(\times\) procumbens.
L. intermedia \(\times\) repens.
L. intermedia \(\times\) stuevei.
L. procumbens \(\times\) repens.
L. procumbens \(\times\) virginica. [= L. ×brittonii Bicknell (pro sp.) -- K; L. brittonii Bicknell -- F; L. procumbens var. elliptica Blake -- F].
L. repens \(\times\) stuevei.
L. repens \(\times\) virginica.
L. stuevei \(\times\) violacea.
L. stuevei \(\times\) virginica [ \(=\) L. \(\times n\) neglecta Mackenzie \& Bush (pro sp.) -- K; L. stuevei var. angustifolia Britton -- F; L. neglecta Mackenzie
\& Bush -- S].
L. violacea \(\times\) virginica [= L. ×acuticarpa Mackenzie \& Bush (pro sp.) - K]. Documented from Northampton Co. VA.

\section*{Leucaena Bentham (Leadtree)}

A genus of about 22 species, of tropical and warm temperate America. References: Hughes (1998)=Z; Isely (1998)=I.
* Leucaena leucocephala (Lamarck) de Wit ssp. leucocephala, Leadtree. Cp (GA): disturbed areas; rare, introduced from the New World tropics. E. GA (Kartesz 1999, voucher at UGA), south into FL and the New World tropics. [= Z; < L. leucocephala -- I, K, SE, infraspecific taxa not distinguished; ? L. glauca (Linnaeus) Bentham -- S, misapplied]

\section*{Lotus Linnaeus (Birdsfoot-trefoil)}

A genus of about 70-90 species, annual and perennial herbs, of temperate Northern Hemisphere. References: Isely (1981)=Z; Isely (1998) \(=\) I; Grant \& Small (1996).

1 Leaves 3 -foliolate, the upper commonly 1 -foliolate; flowers solitary in leaf axils; [native annual herbs]; [Microlotus group] . . . . .
. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . L. helleri

1 Leaves 5 -foliolate; flowers in umbels; [alien perennial herbs]; [Lotus group].
2 Calyx tube 2.8-3.5 mm long; corolla usually 10-14 mm long; leaflets of the medial leaves mostly 1.5-2.5 (-5)× as long as wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . L. corniculatus
2 Calyx tube 1.8-2.8 mm long; corolla usually 8-10 mm long; leaflets of the medial leaves \(3-4(-6) \times\) as long as wide .....
* Lotus corniculatus Linnaeus, Birdsfoot-trefoil, Eggs-and-Bacon. Cp (GA?, NC, VA), Pd, Mt (VA): fields, roadsides, and waste places; uncommon, introduced from Eurasia. June-September. [= RAB, C, F, G, K, S, SE, W, Z; < L. corniculatus Linnaeus -- I, in part] \{check GA record, Castanea 1998 according to Kartesz (1999)\}

Lotus helleri Britton, Carolina Prairie-trefoil. Pd (GA, NC, SC, VA): dry woodlands and openings, originally probably limited to prairie-like sites (fire-maintained, post oak-blackjack oak savannas), generally on clayey soils, now primarily seen on roadbanks, along railroads, and in powerline rights-of-way, where mowing and bush-hogging have replaced fire as the force keeping the habitat open, sunny, and suitable for this plant of prairie affinities; rare (US Species of Concern, GA Special Concern, NC Rare, VA Rare). June-September. L. helleri is endemic to the Piedmont of extreme sc. VA, NC, SC, and ne. GA. L. helleri is clearly closely related to L. unifoliolatus (= L. purshianus, = L. americanus), of prairies of the midwestern states and various habitats further west, which ranges east to LA, AR, MO, IL, IN, and WI. Isely (1981) reduced L. helleri to a variety, because it "is but one of many elements
within the L. purshianus complex and its differences from the rest are less than among the California races," while also stating "since it has no breeding contact with var. purshianus, it is reasonably maintained as a species." Since L. helleri seems adequately separated from L. unifoliolatus by its narrower leaflets, glabrate vestiture, and allopatric distribution, I have chosen to "reasonably maintain it as a species." [= RAB; L. americanus (Nuttall) Bisch. -- F; <L. purshianus F.E. \& E.G. Clements -- G; = L. unifoliolatus (Hooker) Bentham var. helleri (Britton) Kartesz \& Gandhi -- K; = Acmispon helleri (Britton) Heller -- S; = L. purshianus F.E. \& E.G. Clements var. helleri (Britton) Isely -- C, I, SE, Z]
* Lotus tenuis Waldstein \& Kitaibel ex Willdenow, Slender Birdsfoot-trefoil. Pd (NC): fields, roadsides, and waste places; rare, introduced from Eurasia. June-September. [= C, K, SE, Z; < L. corniculatus Linnaeus -- I, in part]

\section*{Lupinus Linnaeus (Lupine)}

A genus of about 150-200 species, annual herbs, perennial herbs, and shrubs, of temperate and tropical regions in North America, Mediterranean Europe, South America, and Africa (especially diverse in w. North America and South America). References: Isely (1998) \(=1\).

1 Leaves palmately compound; leaves and stems deciduous, dying back in winter; plant inconspicuously pubescent.
2 Stem short; leaves clustered, nearly whorled; leaflets narrow; racemes long exserted; flowers small; [plants of e. GA southwards] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . L. perennis ssp. gracilis
2 Stem elongate; leaves alternate; leaflets broad; racemes only moderately exserted; flowers large; [plants of \(n\). SC

1 Leaves unifoliolate; leaves and stems evergreen, overwintering (absent in midsummer); plant conspicuously pubescent
3 Standard blue, with a white to creamy eyespot; hairs on legume ca. 2 mm long; petioles with short and appressed pubescence
L. diffusus

3 Standard reddish to purplish, with a red or deep purple eyespot; hairs on legume 3-5 mm long; petioles with long and spreading (shaggy) pubescence . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . L. villosus

Lupinus diffusus Nuttall, Blue Sandhill Lupine. Cp (GA, NC, SC): sandhills, sandy roadsides; common. March-May; JuneJuly. Se. NC south to s. FL, west to s. MS. I concur with Duncan \& McCartney (1992) in recognizing L. cumulicola Small of peninsular FL as distinct from L. diffusus. [= RAB, K, S; < L. diffusus -- I, SE (excluding L. cumulicola)]

Lupinus perennis Linnaeus ssp. gracilis (Nuttall) Dunn, Southern Sundial Lupine. Cp, Pd (GA): sandhills and sandy or dry rocky roadsides; uncommon. E. GA (immediately across the Savannah River from SC), south to n. FL and west to s. AL. The validity of this taxon is uncertain; the differences may be only clinal. [=K, SE; < L. perennis -- RAB, C, G; = L. perennis var. gracilis (Nuttall) Chapman -- I; = L. nuttallii S. Watson -- S]

Lupinus perennis Linnaeus ssp. perennis, Northern Sundial Lupine. Mt (VA), Pd (NC, SC, VA), Cp (NC, SC, VA): sandhills, sandy roadsides, other dry habitats; uncommon. April-May; June-July. ME west to MN, south to n. SC, w. VA, e. WV, IN, and IL. [= SE; < L. perennis -- RAB, C, G, W; > L. perennis var. perennis -- F, I; > L. perennis var. occidentalis S. Watson -- F; > L. perennis ssp. perennis var. perennis -- K; > L. perennis ssp. perennis var. occidentalis -- K ; \(=\) L. perennis -- S ]

Lupinus villosus Willdenow, Pink Sandhill Lupine. Cp (GA, NC, SC): sandhills, sandy roadsides; uncommon (NC Watch List). April-May; June-August. Se. NC south to n. FL, west to se. LA. [= RAB, I, K, S, SE]

\section*{Macroptilium (Bentham) Urban}

A genus of about 20 species, annual and perennial herbs, of tropical and subtropical America. References: Isely (1998)=I.
* Macroptilium lathyroides (Linnaeus) Urban. Cp (GA, SC?): disturbed areas; rare, naturalized from tropical America. Reported for SC (K). It is apparently naturalized from a native range in tropical America. [=I, K, SE; = Phaseolus lathyroides Linnaeus]

\section*{Medicago Linnaeus (Medick, Bur-clover)}

A genus of about 80 species, annual and perennial herbs, of Eurasia and Africa. References: Isely (1998)=I. Key based largely on SE.

6 Leaflets \(0.7-1.1 \times\) as long as wide, usually marked with a central dark spot; leaflet tip usually strongly notched; stipules shallowly lacerate, the sinuses extending less than halfway to the base .... M. arabica
6 Leaflets \(1-2 \times\) as long as wide, not marked with a central dark spot; leaflet tip not strongly notched; stipules deeply lacerate, the sinuses extending more than halfway to the base
M. polymorpha
* Medicago arabica (Linnaeus) Hudson, Spotted Medick, Spotted Bur-clover. Cp, Pd (GA, NC, SC), Mt (GA, VA): fields, roadsides, disturbed areas; uncommon, introduced from Mediterranean Europe. April-August. [= RAB, F, G, I, K, S, SE]
* Medicago falcata Linnaeus, Yellow Alfalfa, Sickle Medick. Mt? (VA?): disturbed areas; rare, introduced from n. Eurasia. April-July. The occurrence of this taxon in our area requires verification. [=F, G, I, S, SE; = M. sativa Linnaeus ssp. falcata (Linnaeus) Arcangeli -- C, K]
* Medicago lupulina Linnaeus, Black Medick, Yellow Trefoil. Cp, Pd (GA, NC, SC, VA), Mt (NC, SC, VA): fields, roadsides, disturbed areas; common, introduced from Europe. April-August. [= RAB, C, G, I, K, S, SE, W; > M. lupulina var. lupulina - F; > M. lupulina var. glandulosa Neilreich -- F]
* Medicago minima (Linnaeus) Linnaeus, Downy Bur-clover, Bur Medick. Cp (NC, SC?, VA): fields, roadsides, disturbed areas; rare, introduced from Eurasia. April-August. [= RAB, C, G, I, K, S, SE; > M. minima var. minima - F; > M. minima var. compacta Neyraut -- F; > M. minima var. longiseta Augustin de Candolle -- F]
* Medicago orbicularis (Linnaeus) Bartalini. Pd (GA, NC): lawns, disturbed areas; rare, introduced from Mediterranean Europe and n . Africa. April-July. [= RAB, G, I, K, SE]
* Medicago polymorpha Linnaeus, Smooth Bur-clover, Toothed Medick. Cp (GA, NC, SC), Pd (SC): fields, roadsides, lawns, disturbed areas; uncommon, introduced from Mediterranean Europe. March-April. [= RAB, C, I, K, SE; ? M. hispida Gaertner -- F, G, S]
* Medicago sativa Linnaeus, Alfalfa, Lucerne, Blue Alfalfa. Mt, Pd, Cp (GA, NC, SC, VA): roadsides, fields, disturbed areas; common, introduced from se. Europe. April-July. [= RAB, F, G, I, S, SE, W; = M. sativa Linnaeus ssp. sativa -- C, K]
* Medicago laciniata (Linnaeus) P. Miller is reported for SC (Kartesz 1999). \{investigate\} [= K] \{not yet keyed; voucher at NCU according to K\}

Melilotus P. Miller (Melilot, Sweetclover, Sourclover)
A genus of about 20 species, annual and perennial herbs, of temperate Eurasia. References: Stace (1997)=Z; Isely (1998)=I. Key based in part on Stace (1997).
\(\qquad\) 1 Flowers yellow.

2 Flowers 2-3.5 mm long; fruits \(<3 \mathrm{~mm}\) long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . M. indicus
2 Flowers \(>4 \mathrm{~mm}\) long; fruits \(>3 \mathrm{~mm}\) long.
3 Fruits \(>5 \mathrm{~mm}\) long, mostly 2 -seeded, black when ripe, pubescent (at \(10 \times\) ); keel about equalling the wings
[M. altissimus]
3 Fruits \(<5 \mathrm{~mm}\) long, mostly 1 -seeded, brown when ripe, glabrous; keel shorter than the wings ....... M. officinalis
* Melilotus albus Medikus, White Melilot, White Sweetclover. Cp, Pd, Mt (GA, NC, SC, VA): fields, roadsides, disturbed areas; common, introduced from Eurasia. M. albus and M. officinalis, nearly identical except in flower color, are apparently incompatible (Isely 1998); they should not be synonymized, as was done by K. Other differences useful in the determination of faded herbarium specimens are given but Isely (1998): corolla 3.5-5 mm long, the wing petals about as long as the keel (M. albus) vs. corolla 5-7 mm long, the wing petals generally longer than the keel (M. officinalis). \([=I, Z ;=M\). alba -- RAB, C, F, G, S, SE, W, orthographic variant; < M. officinalis -- K, in part]
* Melilotus indicus (Linnaeus) Allioni, Small Melilot, Sourclover. Cp (GA, NC, SC, VA), Pd (GA, SC): roadsides, disturbed areas; uncommon, introduced from Mediterranean Europe. [ \(=1, K, Z ;=M\). indica -- RAB, C, F, G, S, SE, orthographic variant] * Melilotus officinalis (Linnaeus) Pallas, Yellow Melilot, Yellow Sweetclover, Ribbed Melilot. Cp, Pd, Mt (GA, NC, SC, VA): fields, roadsides, disturbed areas; common, introduced from Eurasia. [= RAB, C, F, G, I, S, SE, W, Z; < M. officinalis -- K, in part only (also see M. albus)]
* Melilotus altissimus Thuiller, Tall Melilot, another Eurasian weed, is known to be naturalized as far south as e. PA (Rhoads \& Klein 1993). It likely occurs in our area. It superficially resembles \(M\). officinalis; see key for distinguishing characteristics. [= \(C, I, Z]\)

\section*{Mimosa Linnaeus (Mimosa)}

A genus of about 500 species, herbs, shrubs, trees, and vines, of tropical, subtopical, and warm temperate areas, especially America. Barneby (1991) and Beard (1963) argue that there are no characters which serve to separate Schrankia from Mimosa. References: Barneby (1991)=Y; Isely (1973)=Z; Isely (1998)=I.

Identification notes: Unmistakable in our flora for its bipinnate leaves, with tiny (2-4 mm long) leaflets, responding to touch by closing.

\footnotetext{
1 Plant unarmed
M. strigillosa

1 Plant armed.
}

2 Leaflets without apparent secondary veins; pinnae 4-8 (-11) pairs . . . . . . . . . . . . . . . . . . . . . . . . . . . . M. microphylla
2 Leaflets with evident (sometimes weakly so) secondary veins; pinnae 3-5 (-6) pairs . . . . M. quadrivalvis var. floridana
Mimosa microphylla Dryander, Eastern Sensitive-brier. Cp, Pd (GA, NC, SC, VA), Mt (GA, NC, SC): dry woodlands and forests, especially sandhills, disturbed areas; common (VA Rare). June-September; August-November. DE, WV, and MO south to FL and e. TX. A form with smaller fruits ( \(3-5 \mathrm{~cm}\) long vs. \(5-12 \mathrm{~cm}\) long) has been variously treated as a species [Leptoglottis chapmanii -- S, Schrankia chapmani] or a "recurrent fruit-form genotype" [phase brachycarpa of Isely (1973)]. [= K; = Mimosa quadrivalvis Linnaeus var. angustata (Torrey \& A. Gray) Barneby -- C, I, Y; = Schrankia microphylla (Dryander) J.F. Macbride -RAB, F, G, W; = Schrankia microphylla (Dryander) J.F. Macbride var. microphylla -- SE; > Leptoglottis microphylla (Dryander) Britton \& Rose -- S; > Leptoglottis chapmanii Small ex Britton \& Rose -- S; > Schrankia microphylla "phase brachycarpa" -- Z; > Schrankia chapmanii (Small ex Britton \& Rose) F.J. Hermann]

Mimosa quadrivalvis Linnaeus var. floridana (Chapman) Barneby, Florida Sensitive-briar. Cp (GA): xeric sandhills and other dry, sandy habitats; rare. A Southeastern Coastal Plain endemic: GA south into FL. This taxon is distinct at the specific level from M. quadrivalvis and nomenclatural adjustments are forthcoming (Flores-Cruz et al. 2004). [= I, K, Y; = Leptoglottis floridana (Chapman) Small ex Britton \& Rose -- S); = Schrankia microphylla (Dryander) J.F. MacBride var. floridana (Chapman) Isely -- SE]

Mimosa strigillosa Torrey \& A. Gray, Powderpuff Mimosa. Cp (GA): floodplain forests, open wet areas; uncommon. A Southeastern Coastal Plain endemic: e. GA south to FL, west to TX. It might be expected in se. SC (see SE, Y, Z). [=I, K, S, SE, Y, Z]

\section*{Mucuna Adanson (Velvetbean)}

A genus of about 100 species, perennial herbs, annual herbs, and woody vines, of tropical regions of Old World and New World. References: Isely (1998)=1.
* Mucuna pruriens (Linnaeus) Augustin de Candolle var. pruriens, Velvetbean, Bengal Bean, Florida Bean. Cp (NC, SC): cultivated and sporadically established in disturbed areas; rare, introduced from se. Asia. [= K; M. pruriens -- I, SE, infraspecific taxa not distinguished; > Stizolobium deeringianum Bort -- S; > M. deeringiana (Bort) Merrill]

\section*{Neptunia Loureiro (Neptunia)}

A genus of ca. 10-11 species, herbs, of the tropics and subtropics of America and Eurasia. References: Isely (1998)=1; Windler (1966) \(=Z\).

1 Leaflets 9-15 pairs per pinna; stipules 2-4 mm long; all flowers perfect, with functional stamens; stipe of fruit 4-14 mm long [N. Iutea]
1 Leaflets (12-) 15-25 pairs per pinna; stipules 4-10 mm long; flowers in the lower part of the inflorescence with flattened staminodes; stipe of fruit \(2-5 \mathrm{~mm}\) long
[N. pubescens var. pubescens]
Neptunia lutea (Leavenworth) Bentham, Yellow Neptunia. Savannas, prairies, roadsides. AL west to OK and TX. [=I, K, S, SE, Z]

Neptunia pubescens Bentham var. pubescens, Tropical Neptunia. Savannas, sandhills, scrub, prairies, roadsides. AL and FL west to TX and south to Argentina. [= I, K, SE, Z; > N. floridana Small - S]

Orbexilum Rafinesque (Scurfpea, Sampson's-snakeroot)
A genus of about 9 species, perennial herbs, of \(s\). North America and Mexico. References: Grimes (1988, 1990)=Z; Isely (1998)=I.
1 Leaves unifoliolate; [subgenus Poikadenia] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . O. virgatum
1 Leaves with 3-7 leaflets.
2 Leaves palmately (3-) 5-7 foliolate, the leaflets linear to very narrowly oblanceolate, 2-7 cm long, 0.5-2.0 (-3.5) mm wide, more than \(10 \times\) as long as wide; [subgenus Orbexilum] . O. Iupinellum
2 Leaves pinnately 3 -foliolate, the leaflets orbicular, ovate, elliptic or lanceolate, more than 8 mm wide, \(1-8 \times\) as long as wide.
3 Leaflets \(1.5-7 \mathrm{~cm}\) wide, \(1-2.5 \times\) as long as wide; [subgenus Orbexilum].
4 Upper leaf surfaces lacking glands; leaflets \(3.7-5.5 \mathrm{~cm}\) long; [endemic to Jefferson Co. KY and now extinct] ...
4 Upper leaf surfaces glandular; leaflets 4-12 cm long.
5 Leaflets subcordate, 4-7 cm wide, 1-1.5× as long as wide, glandular-punctate above and below, the apex obtuse; calyx stipitate-glandular; petals \(8-10 \mathrm{~mm}\) long; [endemic to Polk Co. NC] ..... O. macrophyllum
5 Leaflets rounded at base, 2-4 cm wide, 1.5-2.5× as long as wide, eglandular or sparsely glandular above, the apex acute; calyx lacking stipitate glands; petals \(5-7 \mathrm{~mm}\) long; [widely scattered from w. VA and w. NC westwards].
O. onobrychis

3 Leaflets \(0.8-2 \mathrm{~cm}\) wide, 2.5-7.5x as long as wide; [subgenus Poikadenia].
6 Flowers \(8-10 \mathrm{~mm}\) long; [of s . AL westwards]
[O. simplex]
6 Flowers \(5-7 \mathrm{~mm}\) long; [collectively widespread in our area].

7 Calyx tube, fruits, and bracts of the inflorescence conspicuously glandular-punctate; leaflets conspicuously glandular-punctate below; hairs on calyx 0.3-0.5 mm long; upper 2 calyx teeth 0.7-1.0 mm long, lateral teeth 1.2-1.5 mm long, lower calyx tooth \(1.7-2.0 \mathrm{~mm}\) long \(\ldots . .\). . . . . pedunculatum var. psoralioides
7 Calyx tube, fruits, and bracts of the inflorescence eglandular (rarely slightly glandular-punctate); leaflets eglandular below (rarely slightly punctate); hairs on calyx 0.7-1.0 mm long; upper 2 calyx teeth \(1.0-1.5 \mathrm{~mm}\) long, lateral teeth \(1.5-2.0 \mathrm{~mm}\) long, lower calyx tooth \(2.0-3.0 \mathrm{~mm}\) long
O. pedunculatum var. pedunculatum

Orbexilum lupinellum (Michaux) Isely, Lupine Scurfpea. Cp (GA, NC, SC): sandhills; uncommon (NC Watch List). May-July; July-October. This peculiar species is a Southeastern Coastal Plain endemic, ranging from sc. and se. NC, south to c. peninsular FL, s. AL, and e. GA. The very peculiar leaves, palmately 5-7-foliolate with "oblinear" leaflets, make the species unmistakable. First reported for SC by McMillan et al. 2002). [= K; = Psoralea lupinellus Michaux - RAB; = Orbexilum lupinellus -- I, SE, Z, orthographic variant; = Rhytidomene lupinellus (Michaux) Rydberg -- S]

Orbexilum macrophyllum (Rowlee in Small) Rydberg, Bigleaf Scurfpea. Mt (NC): wooded slopes of mountain on Blue Ridge escarpment, precise habitat not known (probably nutrient-rich dry woodlands); rare (US Species of Concern, NC Endangered). June; July-August? This species was discovered on 18 June 1897 and subsequently collected on 8 June 1899 by E.C. Townsend, somewhere on the double peak of Tryon Mountain and White Oak Mountain, Polk County, NC, a phytogeographically interesting area with disjunct, endemic, and relictual species largely of midwestern affinities. It is currently presumed to be extinct, following a number of unsuccessful attempts to relocate it. Isely (1990) is correct in stating that the assignment of "this distinctive species" to Orbexilum is "reasonably assumptive," since fruits have never been seen. [=I, K, S, SE, Z; = Psoralea macrophylla Rowlee in Small -- RAB, W]

Orbexilum onobrychis (Nuttall) Rydberg, Lanceleaf Scurfpea. Mt (NC, VA): habitat in our area not known, elsewhere usually in nutrient-rich, open or semi-open areas; rare (NC Watch List, VA Rare). June-July; August-October. Primarily a species of prairies and prairie-like areas of OH and KY west to se. IA and e. MO, O. onobrychis also occurs (at least formerly) as a rare disjunct in the mountains of w. NC, nw. SC, w. VA, and e. TN. The only report for NC was in the 1800's. [= C, I, K, S, SE, Z; = Psoralea onobrychis Nuttall -- RAB, F, G, W]

Orbexilum pedunculatum ( P. Miller) Rydberg var. pedunculatum, Western Sampson's-snakeroot. Mt (GA, NC, SC), Pd, Cp (GA, SC): open woodlands; rare (NC Watch List). May-July; July-September. Var. pedunculatum, the western and more widespread variety, occurs primarily west of the Blue Ridge, with scattered occurrences in and east of the Blue Ridge. Its range is s. OH, s. IN, s. IL, c. MO, and se. KS, south to sw. NC, sc. SC, sw. GA, s. AL, s. LA, and e. TX. [= C, I, K, SE, Z; = Psoralea psoralioides (Walter) Cory var. eglandulosa (Elliott) F.L. Freeman -- RAB, F, G, GW, W; = Orbexilum pedunculatum -- S]

Orbexilum pedunculatum (P. Miller) Rydberg var. psoralioides (Walter) Isely, Eastern Sampson's-snakeroot. Cp (GA, NC, SC, VA), Pd (NC, SC, VA): savannas, open woodlands; uncommon. May-July; July-September. Var. psoralioides, the eastern variety, occurs primarily on the Atlantic Coastal Plain, ranging from e. VA to n. FL, inland to the Piedmont of NC and SC. [= K; = Psoralea psoralioides (W alter) Cory var. psoralioides -- RAB, F, G, GW; = Orbexilum pedunculatum var. gracile (Torrey \& A. Gray) Grimes -- C, I, SE, Z; = Orbexilum gracile (Torrey \& A. Gray) Rydberg -- S]

Orbexilum virgatum (Nuttall) Rydberg, Slender Leather-root. Cp (GA, SC?): sandhills; rare (GA Special Concern). Se. GA (or SC?) south to ne. FL. A collection by Curtiss is labeled as from South Carolina. [=I, K, SE, Z; = Psoralea virgata Nuttall]

Orbexilum simplex (Nuttall ex Torrey \& Gray) Rydberg. Prairies, open woodlands. AR and OK south to s. AL and e. TX; perhaps disjunct in IL. [= I, K, S, SE, Z]

Orbexilum stipulatum (Torrey \& Gray) Rydberg. Rocky limestone glade. So far as is known, once endemic to Rock Island, Jefferson Co., KY, and now extinct. [= C, I, K, SE, Z; = Psoralea stipulata Torrey \& Gray - F, G]

\section*{Parkinsonia Linnaeus (Jerusalem Thorn)}

A genus of about 30 species (if circumscribed to include Cercidium), shrubs and trees of sw. North America, Central America, and Africa. References: Isely (1975)=Z; Robertson \& Lee (1976)=Y; Isely (1998)=I.
* Parkinsonia aculeata Linnaeus, Jerusalem Thorn, Retama, Horse-bean, Mexican Palo Verde. Cp (GA, SC): disturbed areas; rare, introduced from sw. North America. May. Rarely established or spread from cultivation in our area, more commonly so in much of FL. [= I, K, S, SE, Y, Z]

\section*{Pediomelum Rydberg (Buckroot, Prairie-turnip)}

A genus of about 21 species, perennial herbs, of North America. References: Grimes (1988, 1990)=Z; Isely (1998)=I.
1 Plants caulescent, 3-10 dm tall; leaves 3-foliolate; [plants of sandhills of the Coastal Plain]; [subgenus Pediomelum] ........ P. canescens

1 Plants acaulescent, 1-2 dm tall; leaves (4-) 5-7-foliolate; [plants of calcareous glades of the Interior (nw. GA, TN, \(n\). AL)]; [subgenus Disarticulatum] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. subacaule

Pediomelum canescens (Michaux) Rydberg, Buckroot, Eastern Prairie-turnip, Hoary Scurfpea. Cp (GA, NC, SC, VA): sandhills; rare (NC Watch List, VA Rare). May-July; July-October. A Southeastern Coastal Plain endemic: se. VA south to c. peninsular FL, Panhandle FL, and \(s\). AL. This uncommon species tends to occur as very widely scattered individuals in sandhill habitats, rarely with more than a few seen at a time. It is related to \(P\). esculentum (Pursh) Rydberg, the "prairie potato," prized by
early travelers across the prairies for its edible tubers. An interesting collection label (by R.E. Wicker, collected in 1942, the specimen at NCU) mentions both the edible tubers and the characteristically sparse population structure of the species. "Not uncommon near Pinehurst in ... open places in sandy pine woods..., but usually only one plant at a time. Tuber hard, dark brown, about size of a medium-sized Irish potato, somewhat ventral-elongated with roots coming from pointed base. Internal pure white, apparently almost entirely starch... Mr. Wicker says that he rather likes to take a bit of it and chew when fresh, has a rather condiment taste, but does not think it well to eat..." Because of its rarity, P. canescens should not (of course) be eaten. Because of its habit, that of a very bushy, tumbleweed-like plant, it superficially most closely resembles various Baptisia species, but it is easily separated by its rather dense and soft pubescence (our Baptisia are all glabrous or rather inconspicuously puberulent, except the very unifoliolate B. arachnifera). [= C, I, K, S, SE, Z; = Psoralea canescens Michaux -- RAB, F, G]

Pediomelum subacaule (Torrey \& A. Gray) Rydberg, Nashville Breadroot. Mt (GA): limestone glades; rare (GA Special Concern). E. TN and nw. GA west to c . TN and n. nw. AL. [=I, K, SE, Z; = P. subacaulis -- S , orthographic variant]

A new species occurs on serpentine in the Piedmont of Georgia (Allison pers. comm.). \{not yet treated\}

\section*{Petalostemon}
(see Dalea)

\section*{Phaseolus Linnaeus (Bean)}

A genus of about 50 species, annual and perennial herbs, of tropical and warm temperate America (now widely distributed worldwide in cultivation). References: Isely (1998)=I; Maréchal, Mascherpa, \& Stainier (1978)=Z; Freytag \& Debouck (2002)=Y Key based on SE.

1 Raceme axes slender, flexuous; [plants native perennials]; [section Paniculati; subsection Volubili].
2 Stems climbing and twining on other vegetation; leaflets 3-10 cm long, usually not lobed and only slightly reticulate; [plants of various habitats]

Ph. polystachios
2 Stems trailing across ground; leaflets 1-4 cm long, usually strongly 3-lobed and strongly reticulate; [plants of sandhill habitats of the Coastal Plain]

Ph. sinuatus
1 Raceme axes stout, stiff; [plants alien annuals, only weakly naturalized].
3 Corolla 1.5-2 cm long, scarlet red or bright lavender; racemes exserted; plants twining; [section Coccinei] Ph. coccineus ssp.
3 Corolla ca. 1 cm long, pink-purple, greenish white, or bicolored pink and white; racemes short or exserted; plants bushyerect (rarely twining).
4 Legumes distinctly flattened at maturity, 15-20 mm wide; corolla usually greenish white; [section Paniculati; subsection Volubil]

Ph. Iunatus
4 Legumes nearly terete at maturity, about 8 mm in diameter; corolla usually pink-purple, at least in part; [section Phaseoli] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Ph. vulgaris
* Phaseolus coccineus Linnaeus ssp. coccineus, Scarlet Runner Bean. Cp, Pd, Mt (GA, NC, SC, VA): infrequently cultivated, mostly as an ornamental in home gardens, rarely found as a waif, introduced from tropical America. [= Z; < Ph. coccineus - C, F, G, I, K, SE, infraspecific taxa not distinguished; > Ph. coccineus ssp. coccineus var. coccineus - Y]
* Phaseolus lunatus Linnatus, Lima Bean. Cp, Pd, Mt (GA, NC, SC, VA): frequently cultivated (both commercially and in home gardens), rarely found as a waif, introduced from tropical America. [=I, K, S, SE, Y, Z; = Ph. limensis Macfadyen -- F]

Phaseolus polystachios (Linnaeus) Britton, Sterns, \& Poggenburg, Wild Bean, Wild Kidney Bean. Mt, Pd, Cp (GA, NC, SC, VA): thickets, woodlands; uncommon. July-September; August-October. S. ME west to OH, IL, and MO, south to FL and TX. [= RAB, C, G, I, SE, W; > Ph. polystachios var. polystachios - F; > Ph. polystachios var. aquilonius Fernald -- F; = Ph. polystachios var. polystachios -- K; = Ph. polystachyus -- S, orthographic variant; = Ph. polystachyus ssp. polystachyus - Y; = Ph. polystachyus var. polystachyus - Z]

Phaseolus sinuatus (Nuttall) Torrey \& A. Gray, Sandhills Bean. Cp (GA, NC, SC): sandhills; rare (GA Special Concern). July-September; August-October. Sc. NC south to s. peninsular FL, west to s. MS, a Southeastern Coastal Plain endemic. Freytag \& DeBouck (2002) describe Ph. sinuatus and Ph. polystachios as being "very distinct and there seems to be no intergradation;" I choose to recognize them as species. Not easy to distinguish in sterile condition from Strophostyles. [= RAB, I, S, SE, W; = Ph. polystachios (Linnaeus) Britton, Sterns, \& Poggenburg var. sinuatus (Nuttall) R. Marechal, J.M. Mascherpa, \& F. Stainier -- K; = Ph. polystachyus ssp. sinuatus (Nuttall) Freytag - Y; = Ph. polystachyus var. sinuatus (Nuttall) R. Marechal, J.M. Mascherpa, \& F. Stainier -- Z]
* Phaseolus vulgaris Linnaeus, Garden Bean, Green Bean, Snap Bean, String Bean, Kidney Bean, Pole Bean, Bush Bean. \(\mathrm{Cp}, \mathrm{Pd}, \mathrm{Mt}(\mathrm{GA}, \mathrm{NC}, \mathrm{SC}, \mathrm{VA})\) : frequently cultivated (both commercially and in home gardens), rarely found as a waif, introduced from tropical America. [= C, F, G, I, K, S, SE; > Ph. vulgaris var. vulgaris - F; > Ph. vulgaris var. humilis Alefeld -- F; < Ph. vulgaris var. vulgaris - Z]

Pisum Linnaeus (Pea)

A genus of 2 species, annual herbs, native to the Mediterranean region. References: Isely (1998)=I.
* Pisum sativum Linnaeus, Pea, Garden Pea, English Pea. Mt, Pd, Cp (GA, NC, SC, VA): commonly cultivated in home gardens, rarely found as a waif. March-May. [=I, K, SE; >P. sativum var. sativum -F ; >P. sativum var. arvense (Linnaeus) Poiret -- RAB, F]

\section*{Pueraria Augustin de Candolle (Kudzu)}

A genus of about 15 species, perennial vining herbs, of tropical and subtropical Asia. References: Isely (1998)=I; Ward (1998).
* Pueraria montana (Loureiro) Merritt var. Iobata (Willdenow) van der Maesen \& S. Almeida, Kudzu. Mt, Pd, Cp (GA, NC, SC, VA): roadsides, waste areas; common, introduced from e. Asia. July-October. Kudzu was strongly promoted in the 1920's and 1930 's in the Southeastern United States as a stabilizer of eroded areas. Hundreds of Kudzu Clubs formed, and Kudzu Songbooks were published. It is now notorious as a weed and symbol of the South. Despite its notoriety in the popular press, kudzu is an ecologically relatively trivial (though conspicuous) weed, since it rarely produces viable seeds in our area, and generally does not invade high quality natural areas. The thickened rhizome can weigh as much as 100 kg , and is the source of a high quality cooking starch prized in the Orient. The purple flowers smell like artificial grape flavoring. The leaves are very frost-sensitive. [=I, K; = \(P\). lobata (Willdenow) Ohwi -- RAB, C, F, G, SE, W; = P. thunbergiana (Siebold \& Zuccarini) Bentham -- S]

\section*{Rhynchosia Loureiro (Snoutbean)}

A genus of about 200 species, perennial herbs, of tropical and warm temperate regions, nearly cosmopolitan. References: Grear (1978)=Z; Isely (1998)=I.

Leaves unifoliolate (rarely with a few upper leaves trifoliolate).
( Phat michauxii
Plants erect or ascending, usually with fewer than 6 leaves; stipels present; [plant common in the Coastal Plain in our area] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Rh. reniformis
1 Leaves trifoliolate (rarely with a few lowermost leaves unifoliolate, these generally withering before flowering and fruiting). Plant trailing or twining: pubescence of

Rh. difformis
Calyx 2.5-3 (-4) mm long, clearly shorter than the corolia; [plants of e. GA southwards]
Rh. minima velvety to the touch.
............................................................................ Rh. Romentosa var. mollissima
5 Inflorescences several and axillary, 1-3 cm long; stipules persistent; [plants widespread in our area]

Rhynchosia difformis (Elliott) Augustin de Candolle. Cp (GA, NC, SC, VA), Pd (SC): sandhills; common. June-August; JulyOctober. Se. VA south to s. FL, west to e. TX. [= RAB, C, F, G, I, K, SE; Rh. tomentosa -- S, misapplied]
*? Rhynchosia michauxii Vail. Cp (GA, NC): disturbed areas; rare. June-August; August-October. Se. NC (one record) and e. GA (one record) south to s. peninsular FL, west to Panhandle FL. The disjunct sites are of uncertain origin. [=I, K, S, SE; Rh. americana (Houston ex P. Miller) M.C. Metz -- RAB, based on misidentification of specimen]

Rhynchosia minima (Linnaeus) Augustin de Candolle. Cp (GA): coastal sands; uncommon. Along the coast in e. GA, south to FL, west to s. TX. The species also occurs in the Old World, and the New World distribution is sometimes considered a result of introduction. [= I, K, SE; Dolicholus minimus (Linnaeus) Medikus - S]

Rhynchosia reniformis Augustin de Candolle, Dollarweed. Cp (GA, NC, SC): sandhills; common. June-September; AugustOctober. Se. NC south to s. FL, west to e. TX; disjunct (introduced?) in e. TN (Chester, Wofford, \& Kral 1997). [= RAB, K, SE; Rh. simplicifolia (Walter) Wood -- S]

Rhynchosia tomentosa (Linnaeus) Hooker \& Arnott var. mollissima (Elliott) Torrey \& A. Gray. Cp (GA, SC): sandhills, rare. June-August; August-October. Peninsular FL, e. GA, and se. SC (Beaufort County, documented by an old specimen [GH] by Mellichamp from the vicinity of Bluffton, where it was probably native). [=I, K, SE; Rh. mollissima (Elliott) S. Watson - S]

Rhynchosia tomentosa (Linnaeus) Hooker \& Arnott var. tomentosa. Cp, Pd (GA, NC, SC, VA), Mt (GA, NC, SC): xeric woodlands and forests, sandhills, edges, open areas; common. June-August; August-October. DE south to FL, west to LA, and
north in the interior to e. and c. TN. [= C, I, K, SE; < Rh. tomentosa -- RAB, F, G, W; Rh. erecta (Walter) Augustin de Candolle -- S; Rh. intermedia (Torrey \& Gray) Small - S]

Rhynchosia cytisoides (Bertol.) Wilbur. AL and Panhandle FL west to MS. [= K] \{not yet keyed' add synonymy\}

Robinia Linnaeus (Locust)

A genus of 5-8 species, shrubs and trees, of e. and sw. North America. The Southern Appalachians are a center of diversity of Robinia, with active hybridization, introgression, and formation of local (sterile) races involved; a fully satisfying taxonomic treatment of such a situation is not possible. Isely \& Peabody's (1984) treatment seems a reasonable approach, and I have largely followed it here, differing in the rank of some of the taxa. The key is differently structured than that in RAB or SE; it is presented as an alternative. \{NOTE: This treatment may be altered substantially prior to publication.\} References: Isely \& Peabody (1984)=Z; Ashe (1922) \(=\mathrm{Y}\); Isely (1998)=I.

1 Corolla white, \(1.5-2.0 \mathrm{~cm}\) long; peduncles, pedicels, and calyces velvety-puberulent, the hairs neither glandular nor hispid; plant a small to large tree
R. pseudoacacia

1 Corolla pink to pink-purple (rarely white or nearly so), (1.5-) 2.0-2.5 cm long; peduncles, pedicels, and calyces glandular-pubescent, hispid, or with short-stalked to sessile glands; plant a shrub to small tree.
2 Twigs and leafstalks conspicuously hispid with hairs 1-5 mm long, these stiff, thick-based, and typically persistent several years.
3 Plants fruiting abundantly; shrubs 0.6-2 (-3) m tall; leaflets relatively broad, mostly 1.2-1.8× as long as wide .... . . R. hispida var. fertilis

3 Plants sterile (rarely fruiting scantily); shrubs 0.5-1.5 m tall; leaflets relatively narrow, mostly 1.8-2.5× as long as wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . R. hispida var. hispida
2 Twigs and leafstalks either viscid with sessile or short-stalked glands, or densely glandular-pubescent (the hairs 0.5-2 mm long), or tomentulose, or sparsely hispid with weak, non-persistent hairs.
4 Leaflets usually 13-21, permanently but inconspicuously appressed-pubescent beneath; bracts (evident only before anthesis) aristate; plants never with long, hispid pubescence.
5 Twigs and peduncles viscid with sessile or short-stalked glands (the racemes sometimes with some glandular pubescence); plants sterile or forming pods R. viscosa

5 Twigs and peduncles finely glandular-pubescent with hairs \(1(-2) \mathrm{mm}\) long; plants abundantly pod-forming
R. hartwigii

4 Leaflets usually 9-13, initially appressed-silky but later glabrate beneath; bracts (evident only before anthesis) not aristate; plants with or without sparse long, hispid pubescence.
6 Plants fruiting abundantly; shrubs \(1-3 \mathrm{~m}\) tall
R. hispida var. kelseyi
\(6 \quad\) Plants sterile (rarely fruiting scantily); shrubs or small trees \(0.4-3(-8) \mathrm{m}\) tall.
7 Shrubs or small trees, 1-3 (-8) m tall, much branched, the stems and branches relatively straight, the nodes usually lacking spines; leaflets \(1.5-3 \mathrm{~cm}\) long . . . . . . . . . . . . . . . . . . . . . . . . . R. hispida var. rosea
7 Shrubs, 0.4-1 m tall, little branched, the stems and branches typically zigzag (bent at each node), the nodes usually with spines; leaflets \(1-2(-3) \mathrm{cm}\) long
R. nana

Robinia hartwigii Koehne, Granite Dome Locust, Highlands Locust, Hartwig's Locust. Mt (NC, SC): forests and outcrop edges on high elevation granitic domes, also clearings; rare (NC Rare). June-July; August-September. Apparently endemic to several mountains within a 5 km radius of Highlands, NC. While certainly related to and apparently hybridizing with \(R\). viscosa, \(R\). hartwigii seems worthy of recognition as a species. [= RAB, S; = R. viscosa var. hartwegii (Koehne) Ashe -- K; = R. viscosa var. hartwigii -- SE, Z; < R. viscosa -- W; = R. viscosa var. hardwegii -- Y, orthographic variant]

Robinia hispida Linnaeus var. fertilis (Ashe) Clausen, Arnot Bristly Locust. Mt (NC): woodlands and forests; rare (NC Rare). May-June; July-August. Apparently endemic to the Southern Appalachians of w. NC and e. TN. A horticultural selection of var. fertilis, the Arnot Bristly Locust, is used as a soil binder. [= C, F, K, SE, Z; < R. hispida -- RAB; > R. fertilis Ashe -- S; > R. grandiflora Ashe -- S, Y; > R. pedunculata Ashe -- S; < R. hispida -- W]

Robinia hispida Linnaeus var. hispida, Common Bristly Locust. Mt, Pd*, Cp* (GA, NC, SC, VA); woodlands and forests, and as an escape in disturbed areas and roadsides; common (uncommon in Piedmont and Coastal Plain, where mostly or entirely introduced). May-June. Probably originally endemic to the Southern Appalachians (and perhaps adjacent provinces) of NC, SC, GA, and VA, now widely distributed in e. North America as an escape from cultivation. [= C, F, K, SE, Z; < R. hispida -- RAB (also see \(R\). hispida var. fertilis); = R. hispida -- G, S, Y, in a narrow sense; > R. hispida - \(\mathrm{S} ;>\). pallida Ashe -- S ; > R. speciosa Ashe -S ; < R. hispida -- W]

Robinia hispida Linnaeus var. kelseyi (Cowell ex Hutchinson) Isely, Kelsey's Locust. Mt (NC, SC), Pd* (VA*): mountain woodlands, introduced elsewhere; rare (NC Rare). April-July; July-October. Traditionally considered an endemic originally restricted to \(w\). NC, but SE and Z suggest that var. kelseyi may have been only of horticultural origin. [= K, SE, Z; = R. kelseyi Cowell ex Hutchinson -- RAB, G, S, Y; < R. hispida -- W]

Robinia hispida Linnaeus var. rosea Pursh, Boynton's Locust. Mt (GA, NC, SC, VA): mountain woodlands; rare (NC Watch List). April-July. Originally distributed from w. NC and e. TN south to nw. SC, n. GA, and ne. AL, now ocasionally found outside that range as an escape from cultivation. [= C, K, SE, Z; = R. boyntonii Ashe -- RAB, G, S, Y; < R. hispida -- W]

Robinia nana Elliott, Dwarf Bristly Locust. Cp, Pd, Mt (GA, NC, SC): sandhills, dry rocky forests (especially associated with chestnut oak); uncommon (rare in Piedmont and escarpment region of Mountains). April-June; July-October. Se. and nc. NC south through SC to GA and AL. This species flowers infrequently. [= RAB, S, Y; = R. hispida Linnaeus var. nana (Elliott) Augustin de

Candolle -- K, SE, Z; = R. elliottii (Chapman) Ashe ex Small -- RAB, F, G, S; < R. hispida -- W, in part; > R. nana - Y; > R. elliottii Y]

Robinia pseudoacacia Linnaeus, Black Locust. Mt, Pd, Cp (GA, NC, SC, VA): forests, woodlands, disturbed areas, roadcuts; common. April-June; July-November. Native in the s. and c. Appalachians, from PA south to GA and AL, now much more widespread, throughout e. and c. North America, also widely cultivated and escaped in Europe. Generally considered a weed tree. [= C, K, SE, Z; = R. pseudo-acacia -- RAB, F, S, orthographic variant; > R. pseudo-acacia var. pseudo-acacia - G, orthographic variant; > R. pseudo-acacia var. rectissima (Linnaeus) Raber -- G]

Robinia viscosa Ventenat, Clammy Locust. Mt (GA, NC, SC), Pd* (NC), Cp* (NC): mountain forests and woodlands, roadsides, disturbed areas; rare in wild, uncommon as an escape (NC Watch List). May-July; July-August. Originally a Southern and Central Appalachian endemic, ranging from PA south through w. MD, w. VA, e. WV, w. NC, and e. TN, to n. GA and n. AL, now much more widespread as an escape from cultivation. [= RAB, F, G, S; = R. viscosa var. viscosa -- C, K, SE, Y, Z; <R. viscosa -W, in part (also see R. hartwigii)]

A variety of hybrids (including some cultivars) are known, including the following:
Robinia \(\times\) longiloba Ashe (pro sp.) [R. hispida \(\times\) viscosa]. Known from NC and SC.
Robinia \(\times\) margaretta Ashe (pro sp.) [R. hispida \(\times\) pseudoacacia]. Known from NC, SC, and GA.
Robinia \(\times\) ambigua Poiret (prosp.) [R. pseudoacacia \(\times\) viscosa]. Known from NC.
Robinia hartwigii \(\times\) hispida. Known from Whiteside Mountain, Jackson County, NC.
Robinia hartwigii \(\times\) viscosa. Known from Whiteside Mountain, Jackson County, NC.

\section*{Securigera Augustin de Candolle (Crown-vetch)}

A genus of about 12 species, annual and perennial herbs, of Eurasia. This genus is sometimes included in Coronilla, but is apparently better separated (Isely 1998). References: Isely (1998)=I.
* Securigera varia (Linnaeus) Lassen, Crown-vetch. Mt, Pd (GA, NC, SC, VA), Cp (VA): roadbanks, woodland borders; common (rare in Piedmont south of NC), introduced from Europe. This species, generally known as Coronilla varia, is now widely used to stabilize road-cuts. [= I ; = Coronilla varia Linnaeus -- RAB, C, F, G, K, SE, W]

\section*{Senna P. Miller (Senna, Sicklepod, Wild Coffee)}

A genus of about 350 species, trees, shrubs, and herbs, of tropical and warm temperate areas. References: Isely (1975)=Z; Irwin \& Barneby (1982)=Y; Robertson \& Lee (1976)=X; Isely (1998)=I.

1 Racemes spike-like, 3-6 (-10) dm long; legume winged; [section Senna, series Pictae]
1 Racemes not spike-like, <3 dm long; legume not winged; [section Chamaefistula].
2 Plant a shrub, 1-3 m tall; gland between the lowest pair of the acute or acuminate leaflets; [plants aliens, barely established in the vicinity of cultivation]; [section Chamaefistula, series Coluteoideae]. 3 Gland between the lowest pair of leaflets only; leaflets \(3-5 \times\) as long as wide . . . . . . . . . . . . . . . . . . S. corymbosa 3 Glands between each pair of leaflets; leaflets \(2-3 \times\) as long as wide, acuminate . ............. S. septemtrionalis
2 Plant an herb, 0.1-1.5 m tall; gland near the base of the petiole (except in S. occidentalis which has leaflets rounded to emarginate at the apex); [plants natives, or aliens generally well-established and weedy].
4 Leaflets obovate, the apex rounded to emarginate, 1.3-2× as long as wide; gland between the lowest pair of leaflets; [section Chamaefistula, series Trigonelloideae].
S. obtusifolia

4 Leaflets ovate or narrowly elliptic, the apex acute or acuminate, 2-3.5× as long as wide; gland near the base of the petiole.
5 Leaflets \(1.5-3.0 \mathrm{~cm}\) wide, in 3-6 pairs; racemes with 1-5 flowers; [section Chamaefistula, series
Basiglandulosae]
S. occidentalis

5 Leaflets \(0.7-2.0 \mathrm{~cm}\) wide, in 6-10 pairs; racemes with 5-10 (-25) flowers; [series Temperatae].
6 Legume 5.5-8 mm wide, with broad, nearly square segments, usually pilose initially, the hairs up to 0.8-2 mm long (sometimes glabrate); ovary lanate with hairs to 1 mm long; ovules 10-15 (-18); petiolar gland broadest above the middle
S. hebecarpa

6 Legume 8-11 mm wide, with narrow segments (much shorter than broad), glabrous (or with a few hairs, these less than 0.6 mm long); ovary strigulose with hairs to 0.5 mm long; ovules 20-25 (-30); petiolar gland usually broadest at or below the middle
S. marilandica
* Senna corymbosa (Lamarck) Irwin \& Barneby. Cp (GA, SC), Pd (GA): cultivated as an ornamental, rarely persistent or spreading to disturbed areas; rare, introduced from South America. August-September. [= I, K, SE, Y; = Adipera corymbosa (Lamarck) Britton \& Rose -- S; = Cassia corymbosa -- X, Z]

Senna hebecarpa (Fernald) Irwin \& Barneby, Northern Wild Senna. Pd (GA?, NC, VA), Mt (NC, VA), Cp (VA): open wet habitats, moist forests; uncommon in VA Mountains and VA Piedmont, rare in VA Coastal Plain and NC (NC Watch List). JulyAugust; August-November. MA and s. NH west to s. WI, south to sc. NC, e. TN, s. IN, and c. IL. [= C, I, K, SE, Y; Cassia hebecarpa Fernald -- RAB, G, W, X, Z; > C. hebecarpa var. hebecarpa - F; > C. hebecarpa var. longipila E.L. Braun -- F; = Ditremexa marilandica (Linnaeus) Britton \& Rose -- S, misapplied]

Senna marilandica (Linnaeus) Link, Maryland Wild Senna. Pd (GA, NC, SC, VA), Mt, Cp (NC, GA, VA): dry to moist forests, especially on greenstone and diabase barrens and rocky woodlands, thickets, woodland borders, sometimes somewhat weedy;
uncommon (rare in NC). July-August; August-November. S. MA and s. NY west to e. NE, south to c. peninsular FL and c. TX. [= C, I, K, SE, Y; = Cassia marilandica Linnaeus -- RAB, F, G, W, X, Z; = Ditremexa medsgeri (Shafer) Britton \& Rose -- S]

Senna obtusifolia (Linnaeus) Irwin \& Barneby, Sicklepod, Coffeeweed. Cp, Pd (GA, NC, VA), Mt (GA): fields (especially soybean fields), disturbed areas; common (uncommon in VA), probably introduced from the New World Tropics. July-September; August-November. The species is now pantropical. [= C, I, K, SE, X, Y; = Cassia obtusifolia Linnaeus -- RAB, W, Z; < Cassia tora Linnaeus -- F, G, misapplied; < Emelista tora (Linnaeus) Britton \& Rose -- S, misapplied]
* Senna occidentalis (Linnaeus) Link, Coffee Senna. Cp, Pd (GA, NC, SC), Mt (VA): disturbed places; rare, native of the Old World Tropics. July-August; August-November. The species is now pantropical. [= C, I, K, SE, Y; = Cassia occidentalis Linnaeus -RAB, F, G, X, Z; = Ditremexa occidentalis (Linnaeus) Britton \& Rose ex Britton \& Wilson -- S]
* Senna septemtrionalis (Viviani) Irwin \& Barneby. Cp (NC): disturbed areas; rare, introduced from the tropics, where it is widespread, probably originally from tropical America, perhaps not truly established, though Isely (SE) states that "the weedy nature of this species suggests that it is almost certainly somewhat established." [=I, K, SE, Y; = Cassia laevigata Willdenow -- Z]
* Senna alata (Linnaeus) Roxburgh, Emperor's Candlesticks, Candlestick Plant. September-November. Native to the American tropics, planted and slightly naturalized from s. AL and FL west to OK and TX. [= I, K, SE, Y; = Cassia alata Linnaeus - Z] \{add to synoynmy\}

Sesbania Scopoli
(also see Glottidium)
A genus of about 50 species, annual herbs, perennial herbs, shrubs, and trees, of tropical, subtropical, and less commonly warm temperate regions of the Old and New World. References: Isely (1998)=I.

1 Corolla 8-9 mm long; legume flat; leaves with 8-13 pairs of leaflets
. . . . . . . . . . . . . . . . . . . . . .
[see Glottidium vesicarium]
1 Corolla 10-25 mm long; legume quadrangular or 4-winged; leaves with 10-35 pairs of leaflets.
2 Legume quadrangular in cross-section, the corners not winged, \(15-20 \mathrm{~cm}\) long \(\times 0.3-0.5 \mathrm{~cm}\) wide; corolla 10-15 ( -20 ) mm long, yellow, often marked with purple; leaves with \(15-35\) pairs of leaflets; [plant a robust herb, to 4 m tall] . . S. herbacea
2 Legume conspicuously 4 -winged longitudinally, \(3-8 \mathrm{~cm}\) long \(\times 1-1.5 \mathrm{~cm}\) wide; corolla \(13-25 \mathrm{~mm}\) long, yellow, orange, or scarlet; leaves with 10-20 pairs of leaflets; [plant a shrub, to 4 m tall].
3 Corolla yellow; pedicels \(0.5-1.0 \mathrm{~cm}\) long; legume blunt or short-acuminate to a beak ........... S. drummondii
3 Corolla orange or red; pedicels \(0.5-1.2(-1.5) \mathrm{cm}\) long; legume acuminate or tapering to beak ......... S. punicea
* Sesbania drummondii (Rydberg) Cory, Rattlebox, Poison-bean. Cp (GA, SC): disturbed areas, spoil, marsh edges, ditches; rare, introduced. First reported for GA and SC by Townsend et al. (2000). [= GW, I, K, SE; = Daubentonia drummondii Rydberg -S]
*? Sesbania herbacea (P. Miller) McVaugh, Sesban, Coffee-weed, Indigo-weed. Cp (GA, NC, SC, VA), Pd (NC): ditches, wet fields; common (rare in Piedmont), presumably introduced from the deeper South. July-September; August-November. [= K; ? S. exaltata (Rafinesque) Cory - RAB, C, F, I, SE; ? Sesbania macrocarpa Muhlenberg ex Rafinesque -- GW; ? Sesban exaltatus (Rafinesque) Rydberg -- S]
* Sesbania punicea (Cavanilles) Benxtham, Purple Sesban. Cp (GA, NC, SC, VA), Pd (GA): ditches, wet fields, marshes, ponded wetlands, wet pinelands; common, presumably introduced from South America. June-October; August-November. [= GW, I, K, SE; = Daubentonia punicea (Cavanilles) Augustin de Candolle -- RAB, S]

\section*{Sophora Linnaeus [see Styphnolobium]}

\section*{Strophostyles Elliott (Sand Bean, Woolly Bean, Wild Bean)}

A genus of 3 species, annual and perennial herbs, of North America. References: Pelotto \& Martínez (1998)=Z; Isely (1998)=I. Key adapted from SE.

1 Legumes 2-4 cm long, permanently pubescent; corolla 5-8 mm long; leaves permanently pubescent on the upper surface; seeds glabrous
1 Legumes \(3-8 \mathrm{~cm}\) long, glabrate at maturity; corolla \(8-15 \mathrm{~mm}\) long; leaves usually glabrate on the upper surface; seeds pubescent.
2 Bracteoles (immediately subtending the calyx) 2-3 mm long, equalling or exceeding the calyx tube; leaflets usually prominently 3-lobed; terminal leaflet 2.5-3.5 cm wide; plant an annual . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. helvula
2 Bracteoles (immediately subtending the calyx) 0.5-1.0 (-1.5) mm long, shorter than the calyx tube; leaflets not lobed; terminal leaflet 0.3-2.0 cm wide; plant a perennial
S. umbellata

Strophostyles helvula (Linnaeus) Elliott, Annual Sand Bean. Cp, Pd, Mt (GA, NC, SC, VA): coastal dunes, beaches, dry sandy woodlands, disturbed areas; common. June-September; August-October. Québec west to MN and SD, south to \(n\). peninsular FL and e. TX. See Isely (1986b) for a discussion of the orthography of the epithet. [=K, SE, W, Z; = S. helvola -- RAB, C, G, S, orthographic variant; > S. helvola var. helvola - F; > S. helvola var. missouriensis (S. Watson) Britton -- F]
* Strophostyles leiosperma (Torrey \& A. Gray) Piper, Small-flowered Sand Bean. Cp (VA): disturbed areas; rare, presumably introduced but possibly native (VA Watch List). This species is native east to KY and TN; it should be sought in our area in prairies, glades, and barrens with midwestern affinities. [= C, F, G, K, SE, Z; S. pauciflora (Bentham) S. Watson -- S]

Strophostyles umbellata (Muhlenberg ex Willdenow) Britton, Perennial Sand Bean. Cp, Pd, Mt (GA, NC, SC, VA): dry sandy or rocky woodlands, disturbed areas; common. June-September; August-October. S. NY west to s. IN, s. MO, and KS, south to c. peninsular FL and s. TX. [= RAB, C, F, G, K, S, SE, W, Z; > S. umbellata var. umbellata - F; > S. umbellata var. paludigena Fernald -- F]

\section*{Stylosanthes Swartz (Pencil-flower)}

A genus of about 25 species, annual and perennial herbs, pantropical and less commonly temperate. References: Isely (1998)=1.
Stylosanthes biflora (Linnaeus) Britton, Sterns, \& Poggenburg, Pencil-flower. Cp, Pd, Mt (GA, NC, SC, VA): sandhills, dry to moist (but not wet) pine savannas and flatwoods, dry forests, woodlands, woodland borders, glades, barrens, rock outcrops; common. June-August; July-October. S. NY west to OH, s. IL, and KS, south to c. peninsular FL and e. TX. The large, adnate stipules are distinctive. Variation in this species (see synonymy) needs additional study. [= RAB, C, K, SE, W; > S. biflora var. biflora - F, G; > S. biflora var. hispidissima (Michaux) Pollard \& Ball -- F, G; > S. riparia Kearney -- F, G, S; > S. riparia var. setifera Fernald - F; > S. biflora - S]

\section*{Styphnolobium Schott (Pagoda Tree)}

A genus of about 9 species, trees, shrubs, of central and South America and e. Asia. References: Isely (1998)=I; Isely (1981)=Z; Sousa S. \& Rudd (1993) \(=\) Y; Palomino et al. (1993).
* Styphnolobium japonicum (Linnaeus) Schott, Pagoda Tree. Pd (GA, NC, SC, VA), Mt (VA): cultivated ornamental, native of China. Reported as "slightly escaped" in the United States by Isely (1981), but all specimens seen are from cultivated plants. Also reported for VA, MD, PA, and OH (Kartesz 1999). [= Y; = Sophora japonica Linnaeus -- I, K, Z]

\section*{Tephrosia Persoon (Goat's-rue)}

A genus of about 400 species, perennial herbs, of tropical and warm temperate regions of the Old World and New World.
References: Isely (1998)=I; Ward (2004c)=Z; Wood (1949)=Y. Key adapted from SE.
1 Corolla bicolored, the standard yellow and the wings pink; racemes terminal; stems erect; stamens monadelphous; leaves with (9-) 13-23 (-37) leaflets.
2 Inflorescence reduced, foliose, flowers solitary or in small clusters overtopped by leaves; plants < 25 cm tall; leaflets generally < 10 mm long and < 5 mm wide; [restricted to the West Gulf Coastal Plain of sw. GA, adjacent FL and westwards]
. T. mohrii
2 Inflorescence terminal, not foliose and overtopped by leaves; plants \(>25 \mathrm{~cm}\) tall; leaflets generally \(>10 \mathrm{~mm}\) long and \(>5\) mm wide; [widespread in our area] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . T. virginiana
1 Corolla unicolored, initially white or pink, darkening in age to a dark maroon or purple; racemes opposite the leaves (the uppermost appearing terminal); stems decumbent or ascending; stamens diadelphous; leaves with (3-) 5-23 (-27) leaflets.
3 Upper stamen fused with the staminal sheath for part or most of its length (submonadelphous); leaves with (9-) 13-23 (27) leaflets; [plants from s. AL westwards]. [T. onobrychoides]
3 Upper stamen completely separate from the staminal sheath (diadelphous); leaves with (3-) 5-17 (-19) leaflets; [plants collectively widespread in our area].
4 Petiole \(1-4 \times\) as long as the lowest leaflets of the leaf; peduncle and rachis of inflorescence strongly flattened (2angled, or rarely, 3 -angled) in cross-section; leaflets averaging 25 mm long and 12 mm wide T. florida

4 Petiole \(1 / 3-1 \times\) as long as the lowest leaflets of the leaf; peduncle and rachis of inflorescence terete or inconpicuously \(2-4\)-angled in cross-section; leaflets averaging smaller.
5 Leaves with (3-) 5-7 leaflets; petiole 0-5 mm long; stem and fruit hairs \(<0.5 \mathrm{~mm}\) long ........ T. chrysophylla
5 Leaves with (7-) 9-17 (-19) leaflets; petiole 2-15 mm long; some stem and fruit hairs \(>0.5 \mathrm{~mm}\) long.
6 Inflorescence with 1-3 (-5) nodes; plants inconpicuously pubescent with gray hairs (the hairs appressed or spreading, short to fairly long); leaflets (3-) avg. 5-6 (-7) mm wide, mostly acute; [plants of the Coastal Plain of NC and SC] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . T. Tispidula
6 Inflorescence with 2-20 nodes; plants conspicuously tawny long-pilose with rusty brown hairs; leaflets (6-) avg. \(8(-12) \mathrm{mm}\) wide, mostly obtuse; [plants widespread in our area] . . . . . . . . . . . . . . . . . . . T. spicata

Tephrosia chrysophylla Pursh, Sprawling Goat's-rue. Cp (GA): sandhills; rare (GA Rare). E. GA s. to s. FL, and west to s. MS. [= I, K, SE, Y; = Cracca chrysophylla (Pursh) Kuntze -- S]

Tephrosia florida (F.G. Dietrich) C.E. Wood. Cp (GA, NC, SC): pine savannas and other pinelands; common. May-July; June-September. E. NC south to s. FL, west to se. LA, a Southeastern Coastal Plain endemic. [= RAB, I, K, SE, Y; = Cracca ambigua (M.A. Curtis) Kuntze -- S]

Tephrosia hispidula (Michaux) Persoon. Cp (GA, NC, SC, VA?): pine savannas and other pinelands; common. May-August; July-October. E. NC (se. VA?) south to c. peninsular FL, west to se. LA, a Southeastern Coastal Plain endemic. Fernald (1950) reports this species from se. VA. [= RAB, F, I, K, SE, Y; = Cracca hispidula (Michaux) Kuntze -- S]

Tephrosia mohrii (Rydberg) Godfrey, Dwarf Goat's-rue. Cp (GA): sandhills, dry savannas; rare (GA Rare). GA and westwards in the East Gulf Coastal Plain. Perhaps not distinct from T. virginiana, but not easily dismissed as "little more than a freak" (Wood 1949); see Godfrey \& Kral (1958). [= K; < T. virginiana - I, SE, Y; = Cracca mohrii Rydberg - S; = T. virginiana var. mohrii (Rydberg) D.B. Ward - Z]

Tephrosia spicata (Walter) Torrey \& A. Gray. Cp, Pd (GA, NC, SC, VA), Mt (GA, NC, SC): woodlands; common. JuneAugust; July-October. S. DE south to s. FL, west to w. LA, north in the interior to se., sc., and sw. TN and se. KY. [= RAB, C, G, K, SE, W, Y; > T. spicata var. semitonsa Fernald -- F; > T. spicata var. spicata -- F; = Cracca spicata (Walter) Kuntze -- S]

Tephrosia virginiana (Linnaeus) Persoon, Virginia Goat's-rue. Cp, Pd, Mt (GA, NC, SC, VA): sandhills, other pinelands, xeric and rocky woodlands and forests, outcrops, barrens; common. May-June; July-October. S. NH west to WI, se. MN, and c. KS, south to FL, c. TX, and nw. TX. [= RAB, C, I, K, SE, W; > T. virginiana var. glabra Nuttall -- F, G; > T. virginiana var. virginiana -- F, \(\mathrm{G} ;<\operatorname{T}\). virginiana - I, SE, Y (also see T. mohrii); = Cracca virginiana Linnaeus -- S; = T. virginiana var. virginiana - Z]

Tephrosia onobrychoides Nuttall. Dry pinelands, s. AL west to c. TX. [= I, K, SE, Y; = Cracca onobrychoides (Nuttall) Kuntze S]

Thermopsis R. Brown ex Aiton \& Aiton f. (Golden-banner)
A genus of \(8-10\) species, perennial herbs, of temperate e. North America, w. North America, and e. Asia. References: Larisey (1940b); Chen, Mendenhall, \& Turner (1994)=Y; Isely (1981)=Z; Isely (1998)=I.

1 Legumes erect or strongly ascending, densely villous; stipules clasping, those of the principal leaves (20-) 35-65 mm long, \(10-30 \mathrm{~mm}\) wide; pedicels \(2-3 \mathrm{~mm}\) long; plants mostly \(6-20 \mathrm{dm}\) tall, strict or few-branched . . . . . . . . . . . . . . . . . . . . Th. villos
1 Legumes spreading to ascending, glabrate or pubescent; stipules not clasping, those of the principal leaves 12-25 (-32) mm long, 1-5 mm wide; pedicels \(4-20 \mathrm{~mm}\) long; plants mostly \(3-10 \mathrm{dm}\) tall, branched.
2 Plants from a single woody rootstock, mostly 5-10 dm tall; calyx glabrous or very sparsely pubescent, often also glaucous, the lobes often only 1-1.5 mm long; pedicels glabrate, (4-) 7-20 mm long (as long as or longer than the bracts); racemes terminal or lateral; plants flowering (late May-) early June-July; [plants of moderate to high elevations, (300-) \(700-2000 \mathrm{~m}\) ]

Th. fraxinifolia
2 Plants from extensive rhizomes, mostly 3-6 dm tall; calyx pubescent, the lobes 2-2.5 mm long; pedicels villosulous, 2-6 \((-10) \mathrm{mm}\) long (shorter than the bracts); racemes terminal; plants flowering late April-early May (-June); [plants of low to moderate elevations, 200-800 m]

Th. mollis
Thermopsis fraxinifolia (Nuttall ex Torrey \& A. Gray) M.A. Curtis, Ash-leaf Golden-banner. Mt, Pd (GA, NC, SC): dry slopes and ridges; rare (GA Rare, NC Rare). Late May-July; July-October. A Southern Appalachian endemic: w. NC and e. TN south to nw. SC and n. GA. In addition to the key characters above, Th. fraxinifolia tends to have thinner stems than Th. mollis, to average taller, and to have the inflorescence generally arching to reclining (vs. erect to sometimes arching). The phenologic separation (peak flowering times separated by about 6-7 weeks, generally with a 2 week period between the last flowering of Th. mollis and the first flowering of Th. fraxinifolia) provides strong support to the recognition of Th. fraxinifolia and Th. mollis at the species level. [= RAB, K, S, W, Y; = Th. mollis var. fraxinifolia (Nuttall ex Torrey \& A. Gray) Isely -- I, SE, Z]

Thermopsis mollis (Michaux) M.A. Curtis ex Gray, Appalachian Golden-banner. Pd, Mt (GA, NC, SC, VA): dry slopes and ridges; rare (GA Rare, NC Rare, SC Rare, VA Watch List). April-May; June-August. Centered in the Southern Appalachians, but mostly in the Piedmont and lower elevation periphery of the mountains, ranging from sc. VA south through w. and c. NC and e. TN to nw. SC, n. GA, and ne. AL. See comments under Th. fraxinifolia. [= RAB, C, F, G, K, S, W, Y; = Th. mollis var. mollis -- I, SE, Z; > Th. hugeri Small -- S; > Th. mollis - S]

Thermopsis villosa (Walter) Fernald \& Schubert, Aaron's-rod, Blue Ridge Golden-banner. Mt (GA, NC, VA*): floodplains, mesic disturbed areas, woodland edges, roadbanks; rare (GA Rare, NC Watch List). May-June; July-September. A Southern Appalachian endemic: w. NC and e. TN to n. GA, and escaped from cultivation more widely, as in w. VA, s. MD, c. TN, and WV probably representing escapes from cultivation. Th. villosa is a more erect and unbranched plant than our other 2 species. It is generally found in disturbed sites, its natural habitat somewhat of a mystery. [= RAB, C, I, K, SE, W, Y, Z; Th. caroliniana M.A. Curtis -- S]

\section*{Trifolium Linnaeus (Clover)}

A genus of abut 240 species, annual and perennial herbs, nearly cosmopolitan. References: Isely (1998)=I. Draft key adapted from various published sources, including SE and C.

1 Flowers bright yellow (fading brown); [section Chronosemium].
2 Leaves palmately trifoliolate (all leaflets essentially sessile); heads \(10-13 \mathrm{~mm}\) in diameter; flowers 5-7 mm long T. aureum
2 Leaves pinnately trifoliolate (the lateral leaflets essentially sessile, the terminal leaflet with a petiolule \(0.8-3 \mathrm{~mm}\) long; heads \(5-13 \mathrm{~mm}\) in diameter; flowers \(2.5-5 \mathrm{~mm}\) long.
3 Standard with 5 obvious diagonal veins (striations); heads \(8-13 \mathrm{~mm}\) in diameter, generally with 20-30 flowers; flowers \(3.5-5 \mathrm{~mm}\) long; petiolule of the terminal leaflet \(1-3 \mathrm{~mm}\) long
T. campestre

3 Standard inconspicuously veined; heads \(5-8 \mathrm{~mm}\) in diameter, generally with 5-15 (-20) flowers; flowers 2.5-3.5 m long; petiolule of the terminal leaflet ca. 1 mm long
1 Flowers not bright yellow.
4 Flowers borne on distinct pedicels, (1-) 2-10 mm long, these often curving or reflexing in age; flowers white, fading pink with age in most species; [native and alien species]; [section Lotoidea].
5 Plants stoloniferous, all or some of the leaves alternate from ground level and long petioled.
6 Calyx lobes narrowly triangular, about as long as the calyx tube; peduncles axillary along the stolons; stipules scarious-membranaceous; [plant an abundant introduced weed]
T. repens

6 Calyx lobes subulate, distinctly longer than the calyx tube; peduncles terminal, either at tips of the stolons, or at tips of erect flowering branches; stipules green, foliaceous; [plants rare natives].
7 Peduncle terminal, at the tip of the stolon, lacking leaves; pedicels \(2-3 \mathrm{~mm}\) long . . . . . . . . T. calcaricum
7 Peduncle terminal at tip of erect flowering branches, subtended by a pair of opposite or subopposite, short-
petioled leaves; pedicels (2-) 4-8 mm long
[T. stoloniferum]
5 Plants not stoloniferous, clumped (though sometimes with prostrate or lax stems).
8 Calyx lobes narrowly triangular, about as long as the calyx tube (or longer in \(T\). hybridum); stipules scariousmembranaceous; [plants introduced].
9 Calyx lobes not scarious-margined, straight, equal to or longer than the tube
T. hybridum

9 Calyx lobes scarious-margined, becoming divergent and twisted, about equal to the tube [T. nigrescens]
8 Calyx lobes subulate to lanceolate, distinctly longer than the calyx tube; stipules green, foliaceous; [plants rare natives].
10 Flowers 4-6 mm long; calyx lobes lanceolate, foliaceous, 3-nerved, 0.4-0.8 mm wide . . . T. carolinianum
10 Flowers \(8-12 \mathrm{~mm}\) long; calyx lobes subulate, setaceous, 1 -nerved, \(<0.4 \mathrm{~mm}\) wide.
11 Leaflets \(1-2.8 \times\) as long as wide; stems erect or ascending; flowers purplish; plant an annual or biennial; [plants of a variety of natural woodlands, widespread in our area] ........... T. reflexum
11 Leaflets \(3-7 \times\) as long as wide; stems prostrate; flowers creamy white and purple-veined; plant a perennial; [plants of shale barrens and other rock outcrops, from VA northwards] . . . . T. virginicum 4 Flowers sessile or on very short pedicels (usually <1 mm long); flowers pink, purplish, white, or scarlet; [alien species].

12 Plants stoloniferous, all or some of the leaves alternate from ground level and long petioled.
13 All flowers with petals; fruiting heads enlarging, becoming a reddish brown, pubescent ball ca. 2 cm in diameter, remaining aerial; [section Vesicaria]
T. fragiferum

13 Only 2-5 outer flowers of the head with petals, the others lacking petals and sterile; fruiting heads becoming a subterranean bur, buried by curvature and growth of the peduncle; [section Trichocephalum] . T. subterraneum
12 Plants not stoloniferous, the leaves clustered at or near ground level and/or produced on aerial stems.
14 Heads subtended by a pseudo-involucre of \(2(-3)\) enlarged stipules and/or opposite or subopposite leaves; [section Trifolium].
15 Flowers white (fading pink), 7-8 mm long; calyx tube both externally glabrous and 20-nerved
T. lappaceum

15 Flowers red, pink-purple, or bicolored, either 11-20 mm long or \(4-6 \mathrm{~mm}\) long; calyx tube not both
externally glabrous and 20 -nerved (externally pubescent, or 10 -nerved, or both).
16 Flowers 4-6 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . T. striatum
16 Flowers \(11-20 \mathrm{~mm}\) long.
17 Stipules gradually tapering to a long slender tip, longer than the fused part; calyx densely hirsute; stem soft pubescent with deflexed to spreading hairs . . . . . . . . . . . . . . . . T. hirtum
17 Stipules abruptly narrowed to a short awn; calyx glabrous to sparsely pilose; stem appressed pubescent
T. pratense

14 Heads not subtended by a pseudo-involucre of leaves or expanded stipules.
18 Heads axillary, sessile, in the axils of subtending leaves; calyx tube glabrous (except for a few hairs at apex); [section Lotoidea]
T. glomeratum

18 Heads terminal or axillary; calyx tube pubescent.
19 Calyx bladdery-inflated in fruit; corolla resupinate (inverted 180 degrees, such that the standard is lowermost); [section Vesicaria].
20 Inflorescence with a prominent peduncle; head lobed in fruit \(\qquad\) T. resupinatum 20 Inflorescence subsessile to shortly peduncled; head spherical in fruit ....... T. tomentosum 19 Calyx not bladdery-inflated in fruit; corolla orientation normal (standard uppermost).

21 Corolla \(3-6 \mathrm{~mm}\) Iong; section Trifolium]
T. arvense

21 Corolla \(10-18 \mathrm{~mm}\) long.
22 Corolla crimson, 10-13 (-15) mm long; floral bracts absent; heads 1-1.5 (-2) cm in diameter; [section Trifolium] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . T. incarnatum
22 Corolla white, \(15-18 \mathrm{~mm}\) long; floral bracts present; heads \(2.5-3 \mathrm{~cm}\) in diameter; [section Mistyllus]
T. vesiculosum
* Trifolium angustifolium Linnaeus, Narrowleaf Clover. (SC). SC according to Kartesz (1999), based on specimen at NCU \{check\}. [= K] \{not yet keyed\}

Trifolium arvense Linnaeus, Rabbitfoot Clover. Pd (GA, NC, SC, VA), Cp, Mt (NC, SC, VA): disturbed areas; common, introduced from the Mediterranean region. April-August. [= RAB, C, F, G, I, K, S, SE, W]
* Trifolium aureum Pollich, Large Hop Clover, Yellow Clover. Mt, Pd, Cp (NC, VA): fields, roadsides, disturbed areas;
uncommon, introduced from Eurasia. May-August. [=C,I, K, SE, W; =? T. agrarium Linnaeus -- RAB, F, G, S, misapplied]

Trifolium calcaricum J.L. Collins \& Wieboldt. Mt (VA): limestone glades; rare. In c. TN (Chester, Wofford, \& Kral 1997). For additional information, see Collins \& Wieboldt (1992). [= I, K]
* Trifolium campestre Schreber, Hop Clover. Cp, Pd, Mt (GA, NC, SC, VA): roadsides, fields, lawns, disturbed areas; common, introduced from Eurasia. April-October. [= RAB, C, I, K, SE, W; ? T. procumbens Linnaeus -- F, G, S, misapplied]

Trifolium carolinianum Michaux, Wild White Clover, Carolina Clover. Cp (GA, NC, SC), Pd (GA, SC): open woodlands, woodland edges, pine savannas, thin soils around rock outcrops; rare. April-July. [= RAB, C, F, G, I, K, S, SE, W; > T. carolinianum - S, in a narrow sense; > T. saxicola Small -- S]
* Trifolium cernuum Brot., Nodding-head Clover. (SC). (Kartesz 1999). [= K] \{not yet keyed\}
* Trifolium depauperatum Desvaux var. depauperatum. (SC). (Kartesz 1999). [= K] \{not yet keyed\}
* Trifolium dubium Sibthorp, Low Hop Clover. Cp, Pd, Mt (GA, NC, SC, VA): roadsides, lawns, disturbed areas; common, introduced from Europe. April-September. [= RAB, C, F, G, I, K, S, SE, W]
* Trifolium fragiferum Linnaeus, Strawberry Clover. Pd (GA): disturbed areas; rare, introduced from Middle East. Introduced in c. GA (Jones \& Coile 1988) and reported from an old collection from se. PA (Rhoads \& Klein 1993). [= C, F, G, I, K, SE] * Trifolium glomeratum Linnaeus, Cluster Clover. \{prov\} (SC): \{habitat\}; rare, introduced from Mediterranean region. [=I, K, S, SE]

Trifolium hirtum Allioni, Rose Clover. Pd (NC, VA): roadsides, disturbed areas; rare, introduced from Eurasia and \(n\). Africa. April-July. [= RAB, C, G, I, K, SE]
* Trifolium hybridum Linnaeus, Alsike Clover. Cp, Pd, Mt (GA, NC, SC, VA): lawns, fields, roadsides, disturbed areas; common, introduced from Europe. April-September. [= RAB, C, G, I, K, S, SE, W; > T. hybridum var. hybridum -- F; > T. hybridum var. elegans (Savi) Boiss. -- F]
* Trifolium incarnatum Linnaeus, Crimson Clover. Cp, Pd, Mt (GA, NC, SC, VA): fields, disturbed areas; uncommon, introduced from Europe. April-June; June-August. [= RAB, C, F, G, I, K, S, SE, W]
* Trifolium lappaceum Linnaeus, Lappa Clover. Cp (NC): disturbed areas; rare, introduced from Mediterranean Eurasia and Africa. April-August. [= RAB, I, K, S, SE]
* Trifolium pratense Linnaeus, Red Clover. Mt, Pd, Cp (GA, NC, SC, VA): fields, roadsides, disturbed areas; common, introduced from Europe. April-September. [= RAB, C, G, I, K, S, SE, W; > T. pratense var. pratense -- F; > T. pratense var. sativum (P. Miller) Schreber -- F]

Trifolium reflexum Linnaeus, Buffalo Clover. Pd, Cp (GA, NC, SC, VA), Mt (GA, SC): open woodlands, woodland edges; rare. April-August. [= RAB, C, I, K, S, SE, W; > T. reflexum var. reflexum -- F, G; > T. reflexum var. glabrum Lojacono -- F, G] * Trifolium repens Linnaeus, White Clover, Dutch Clover, Ladino Clover. Cp, Pd, Mt (GA, NC, SC, VA): lawns, roadsides, disturbed areas; common, introduced from Eurasia. April-September. [= RAB, C, F, G, I, K, S, SE, W]
* Trifolium resupinatum Linnaeus, Persian Clover, Reversed Clover. Cp (NC, SC), Pd (GA): lawns and disturbed areas; rare, introduced Mediterranean region and w. Asia. April-July. [= RAB, C, F, G, I, K, S, SE]
* Trifolium striatum Linnaeus, Knotted Clover. Pd (GA, NC): roadesides, disturbed areas; rare, introduced from Europe. AprilAugust. [= RAB, C, F, G, I, K, S, SE]
* Trifolium subterraneum Linnaeus, Subterranean Clover. Pd (GA), \{prov.\} (NC, SC): disturbed areas; rare, introduced from Europe, Asia, and n. Africa. Reported for NC and SC by Isely (1990); reported for Piedmont of GA by Jones \& Coile (1988). [= I, K, SE]
* Trifolium tomentosum Linnaeus. \{prov.\} (NC): disturbed areas; rare, introduced from Mediterranean region. Reported for NC by Isely (1998). [= I, K]
* Trifolium vesiculosum Savi, Arrowleaf Clover. Pd (GA, SC), Cp (GA): roadsides, disturbed areas; uncommon, introduced from s. Europe. First reported for South Carolina by Hill \& Horn (1997). [= I, K, SE]

Trifolium virginicum Small, Kates Mountain Clover, Shale-barren Clover. Mt, Pd (VA): shale barrens, other rock outcrops; uncommon (rare in Piedmont). May-June. Ranges from sc. PA through w. MD south to w. VA and e. WV. [= C, F, G, I, K, SE, W]
* Trifolium medium Linnaeus, Zigzag Clover. Introduced in MD (Kartesz 1999). [= K] \{not keyed\}
* Trifolium nigrescens Viviani, Ball Clover. Introduced in c. TN (Chester, Wofford, \& Kral 1997). [= I, K, S, SE]

Trifolium stoloniferum Muhlenberg ex Eaton, Running Buffalo-clover, a rare native, occurs (at least formerly) in dry upland woodlands and prairies from WV, OH, n. IN, IL, MO, and e. KS, south to KY and AR. [= C, F, G, I, K, S, SE]

Ulex Linnaeus (Gorse)
References: Isely (1998)=1.
* Ulex europaeus Linnaeus, Gorse, Furze. Cp (VA): disturbed areas; rare, introduced from Europe. June. Not cited in Harvill et al. (1992), but naturalized in sandy soils in York County, VA. Also reported from WV and PA. [= C, F, G, I, K, SE]

\section*{Vicia Linnaeus (Vetch, Tare)}

A genus of about 150 species, annual and perennial herbs, of temperate Eurasia and North America. References: Isely (1998)=1; van de Wouw, Maxted, \& Ford-Lloyd (2003)=Y. Key adapted from I.

1 Inflorescence nearly sessile, of 1-4 flowers clustered in the leaf axil; [alien species].
2 Leaves with 2-6 leaflets, succulent; leaflets \(3-7 \mathrm{~cm}\) long; legume with pectinate sutures .................. [V. narbonensis]
2 Leaves with 4-20 leaflets, not succulent; leaflets \(0.3-3.5 \mathrm{~cm}\) long; legume not pectinate (except \(V\). lutea).
3 Corolla 5-6 mm long; leaves with 4-6 (-8) leaflets
V. lathyroides

3 Corolla 10-30 mm long; leaflets 6-16 (-20).
4 Calyx lobes conspicuously unequal; legumes pilose with pustulate-based hairs . . . . . . . . . . . . . . . . . V. Iutea
4 Calyx lobes more or less equal; legumes glabrous at maturity, or very finely pubescent with non-pustulatebased hairs.
5 Calyx lobes all shorter than the calyx tube; corolla yellow, often streaked with purple, 25-30 mm long ...
V. grandiflora

5 Calyx lobes (at least the longer) about as long as the calyx tube; corolla pink, purple, lavender, white, or creamy yellow, 10-25 (-30) mm long.
6 Standard pubescent dorsally; corolla 15-25 (-30) mm long, creamy yellow to purple; legume pubescent, with a basal stipe. V. pannonica

6 Standard glabrous; corolla 10-25 (-30) mm long, pink, purple, lavender, or whitish; legume glabrous, sessile.
7 Calyx 7-11 (-12) mm long; corolla pink-purple to whitish, \(10-18 \mathrm{~mm}\) long; leaflets \(4-10 \times\) as long as wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . V. sativa ssp. nigra 7 Calyx 10-15 mm long; corolla generally pink-purple, 18-25 (-30) mm long; leaflets 2-5 (-7)× as long as wide
V. sativa ssp. sativa

1 Inflorescence pedunculate, of 2-many flowers along a well-developed raceme; [alien and native species].
8 Peduncles 1-10 mm long; raceme axis 2-10 mm long, with 2-7 (-10) flowers.
9 Plant a robust annual, 10-20 dm tall; tendrils absent; leaves with (2-) 4-6 leaflets; leaflets 5-10 cm long; corolla 20-30 mm long
. [V. faba]
9 Plant a trailing perennial, 3-10 dm tall; tendrils present; leaves with 8-16 leaflets; leaflets 2-3.5 cm long; corolla 10-15 mm long
[V. sepium]
8 Peduncles usually \(>10 \mathrm{~mm}\) long; raceme axis usually \(>10 \mathrm{~mm}\) long, with (1-) 2-many flowers.
10 Corolla \(10-25 \mathrm{~mm}\) long.
11 Stipules dimorphic, one of each pair entire, the other palmately lacerate; flowers \(1(-2)\) per inflorescence
[V. articulata]
11 Stipules of a pair alike; flowers 1-numerous per inflorescence.
12 Flowers 15-22 (-25) mm long; legumes with a basal stipe 2-5 mm long; leaves with 8-16 leaflets ........ V. americana var. americana

12 Flowers 8-16 (-18) mm long; legumes with a basal stipe 1-3 mm long; leaves with 8-22 leaflets.
13 Calyx swollen on one side; plant an annual; inflorescence not secund.
14 Plant glabrate or with pubescence of hairs \(<1 \mathrm{~mm}\) long; lower calyx lobe lanceolate to linearlanceolate, 1-2 (-2.4) mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . V. villosa ssp. varia
14 Plant conspicuously villous, the hairs 1-2 mm long; lower calyx lobe acicular or weak, 2-4 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . V. villosa ssp. villosa
13 Calyx not swollen on one side; plant a rhizomatous perennial; inflorescence not secund.
16 Flowers white to lavender, the keel spotted; legumes \(4-5 \mathrm{~mm}\) wide; inflorescence not secund .
V. caroliniana
V. cracca Corolla 2.5-8 (-10) mm long.

17 Plant an annual.
18 Legume symmetrically rounded at the apex; inflorescence with 1-2 (-4) flowers . . . . . . . V. tetrasperma
18 Legume assymetrically acute at the apex; inflorescence with 1-15 flowers.
19 Legume finely hirsute; leaves with (8-) 10-16 leaflets . . . . . . . . . . . . . . . . . . . . . . . . . . . . . V. hirsuta
19 Legume glabrous to inconspicuously puberulent; leaves with 2-4 leaflets . . . . . . . . V. minutiflora
17 Plant a rhizomatous perennial.
18 Leaves with 2-4 (-6) leaflets; [plants of s. SC southwards, native, of the Coastal Plain].
19 Legumes 2.5-3.0 cm long; leaflets \(1.5-4.5 \mathrm{~cm}\) long, oblong to linear, \(8-20 \times\) as long as wide
V. acutifolia

19 Legumes 0.8-1.5 cm long; leaflets 1-1.5 cm long, usually elliptic, 2-4 (-10)× as long as wide
V. floridana

18 Leaves with 10-25 leaflets; [plants collectively widespread in our area, native or alien].
20 Flowers white to lavender, the keel spotted; legumes 4-5 mm wide; inflorescence not secund ......
20 Flowers blue-violet or purple; legumes \(6-8 \mathrm{~mm}\) wide; inflorescence generally secund . . . . . . V. cracca
Vicia acutifolia Elliott, Fourleaf Vetch. Cp (GA, SC): pond margins, pine flatwoods, ditches; rare. April-May; May-June. Se. SC south to s. FL, west to e. Panhandle FL. [= RAB, GW, I, K, S, SE]

Vicia americana Willdenow var. americana, American Vetch, Purple Vetch, Tare. Mt (VA): \{habitat\}; rare. May-June. Var. americana ranges from Québec west to AK, south to w. VA, MO, OK, TX, Mexico. Var. minor Hooker occurs in w. North America. [= C, F, G, I, SE; = V. americana ssp. americana -- K; < V. americana -- W, infraspecific taxa not distinguished]

Vicia caroliniana Walter, Pale Vetch, Wood Vetch, Carolina Vetch. Mt, Pd, Cp (GA, NC, SC, VA): forests, woodlands, and disturbed areas; common. April-June; May-July. NY west to WI, south to s. GA, s. MS, and c. TX. [= C, F, G, I, K, SE, W; > V. caroliniana - RAB, S; > V. hugeri Small -- RAB, S]
* Vicia cracca Linnaeus, Tufted Vetch, Cow Vetch, Canada-pea. Cp, Pd (VA), Mt (NC): disturbed areas; rare, introduced from Europe. May-July; June-August. [= RAB, C, G, S, SE; ? V. cracca var. cracca -- F, I; ? V. cracca ssp. cracca -- K]

Vicia floridana S. Watson, Florida Vetch. Cp (GA): moist soils of hammocks, ditches, roadbanks; rare. S. FL north to McIntosh Co., GA (Isely 1998). [= GW, I, K, S, SE]
* Vicia grandiflora Scopoli, Large Yellow Vetch. Cp, Pd (GA, NC, SC, VA): disturbed areas; uncommon, introduced from Europe. April-June; May-July. [= C, I, F, G, K, SE, W; > V. grandiflora var. kitaibeliana W.D.J. Koch -- RAB]

Vicia hirsuta (Linnaeus) S.F. Gray, Tiny Vetch, Hairy Tare. Cp, Pd (GA, NC, SC, VA), Mt (SC, VA): disturbed areas, uncommon, introduced from Europe. April-June; May-July. [= RAB, C, F, G, I, K, S, SE]
* Vicia lathyroides Linnaeus, Spring Vetch. Cp (NC, SC, VA), Pd (GA, NC): lawns, disturbed areas; rare, introduced from Europe. April-June; May-July. [= RAB, C, I, F, G, K, SE]
* Vicia lutea Linnaeus, Yellow Vetch. Pd (NC): disturbed areas; rare, introduced from Europe. [= I, K, SE]

Vicia minutiflora F.G. Dietrich, Smallflower Vetch. Cp (GA): woodlands; rare. TN, w. FL, and sw. GA west to OK and TX. [=
GW, I, K, SE; V; = V. micrantha Nuttall ex Torrey \& A. Gray -- F, G, S]
Vicia pannonica Crantz, Hungarian Vetch. Pd (GA): disturbed areas; rare, introduced. Introduced in c. GA. Reported for NC (Kartesz 1999). \{investigate\} [= I, K, SE]
* Vicia sativa Linnaeus ssp. nigra (Linnaeus) Ehrhart, Narrowleaf Vetch. Cp, Pd, Mt (GA, NC, SC, VA): disturbed areas; common, introduced from Mediterranean Europe. March-June; May-July. [=I, K, SE; = V. angustifolia Linnaeus -- RAB, C, S, W; V. sativa var. angustifolia (Linnaeus) Ehrhart; > V. angustifolia var. angustifolia -- F, G; > V. angustifolia var. segetalis (Thuill.) Ser. -- F, G; > V. angustifolia var. uncinata (Desv.) Rouy -- F]

Vicia sativa Linnaeus ssp. sativa, Common Vetch. Pd (GA, NC, VA), Mt (NC), Cp (VA): disturbed areas; rare, introduced from Mediterranean Europe. April-June; May-July. [=I, K, SE; = V. sativa -- RAB, C, G, S, in a narrow sense; > V. sativa var. sativa -- F; > V. sativa var. linearis Lange -- F]

Vicia tetrasperma (Linnaeus) Schreber, Slender Vetch, Smooth Tare, Lentil Vetch. Cp, Pd (GA, NC, SC, VA): disturbed areas; uncommon, introduced from Europe. April-June; May-July. [= RAB, C, G, I, K, S, SE; > V. tetrasperma var. tetrasperma -- F; > V. tetrasperma var. tenuissima Druce -- F]

Vicia villosa Roth ssp. varia (Host) Corbière, Winter Vetch. Mt, Pd, Cp (GA, NC, SC, VA): disturbed areas; common, introduced from Europe. May-September. [=I, K, SE; < V. dasycarpa Tenore -- RAB, C, F, G, W]
* Vicia villosa Roth ssp. villosa, Hairy Vetch, Fodder Vetch. Cp, Pd (GA, NC, SC, VA), Mt (NC, SC, VA): disturbed areas; common, introduced from Europe. May-September. [=I, K, SE; < V. villosa -- RAB, C, F, G, W, in a narrow sense]
* Vicia articulata Hornemann, Monantha Vetch. Probably only cultivated. [=I, K, SE]
* Vicia faba Linnaeus, Horse Bean, Faba Bean, Broad Bean. Introduced in se. PA (Rhoads \& Klein 1993). Also reported for VA (Kartesz 1999). \{investigate\} [= C, F, G, I, K, SE]

Vicia ludoviciana Nuttall ssp. Iudoviciana, Louisiana Vetch. AL and FL west to OR and CA. [= K]
* Vicia narbonensis Linnaeus, Narbonne Vetch. Introduced in MD and DC (Fernald 1950). [= C, F, G, I, K, SE]
* Vicia sepium Linnaeus, Bush Vetch, Wild Tare. Introduced south to WV and in e. PA (Rhoads \& Klein 1993). [= C, I, SE; > L. sepium var. sepium -- K]

\section*{Vigna Savi (Cow Pea)}

A genus of about 150 species, annual and perennial herbs, pantropical, rarely extending into warm temperate regions. References: Isely (1998)=I; Maréchal, Mascherpa, \& Stainier (1978)=Z.

1 Corolla yellow, 1.5-1.7 cm long; leaves somewhat fleshy-thickened; [plant native or introduced in maritime situations]; [section Vigna] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . V. Iuteola 1 Corolla pink to purple, \(1.5-2.5 \mathrm{~cm}\) long; leaves herbaceous; [plant a cultivated introduction]; [section Catiang] . . V. unguiculata

Vigna luteola (Jacquin) Bentham, Wild Cow Pea. Cp (GA, NC, SC): edges of freshwater tidal marshes, beaches, disturbed areas, railroad embankments, low fields, in the outer Coastal Plain; rare (GA Special Concern). July-September; August-October. Se. NC south to FL, west to se. TX, and in the New World tropics. Often weedy in appearance, and its nativity in our area perhaps uncertain. [= RAB, GW, I, K, Z; ? V. repens (Linnaeus) Kuntze -- S; = V. marina (Burmann) Merrill (the correct name according to some authors, based on uncertain typification)]

Vigna unguiculata (Linnaeus) Walpers, Black-eyed Pea, Field Pea, Cow Pea. Cp, Pd (GA, NC, SC, VA): commonly cultivated in commercial and home gardens, rarely persistent or occurring as a waif, introduced from tropical Africa or Asia. JuneAugust; July-September. [= RAB, I, K; ? V. sinensis (Linnaeus) Savi -- F, S; > V. unguiculata var. unguiculata - Z]

\section*{Wisteria Nuttall (Wisteria)}

A genus of about 6 species, woody vines, shrubs, and small trees, of temperate e. Asia and e. North America. Some research suggests that the Asian species should be placed in a separate genus (see Isely 1998). References: Isely (1998)=I; Valder (1995) \(=\) Z .

Identification notes: Twining direction can be determined by looking at (or imagining) the vine twining around a branch or pole. Look at the pole or branch from the base (from the direction from which the vine is growing). If the vine is circling the branch or pole in a clockwise direction, that is dextrorse; if counterclockwise, that is sinistrorse.

1 Legume and ovary glabrous; pedicels 5-10 (-15) mm long; [native species of swamps and bottomland forests and thickets] . . .
\(\qquad\)
1 Legume and ovary velvety pubescent; pedicels \(15-20 \mathrm{~mm}\) long; [introduced species, naturalized in a wide variety of situations].

2 Vine twining counter-clockwise (sinistrorse; from lower right ascending to upper left); leaflets 11-19 per leaf; racemes 2-5 \((-7) \mathrm{dm}\) long, the 50-170 flowers opening successively from base to tip of the inflorescence; corolla 1.5-2.0 cm long . . . .
W. floribunda

2 Vine twining clockwise (dextrorse; from lower left ascending to upper right); leaflets 7-13 per leaf; racemes 1-2 (-3.5) dm long, the 25-95 flowers opening nearly simultaneously; corolla 2.0-2.5 (-2.7) cm long W. sinensis
* Wisteria floribunda (Willdenow) Augustin de Candolle, Japanese Wisteria. Cp, Pd, Mt (GA, NC, SC, VA): commonly cultivated, sometimes escaped to urban, suburban, and rural forests and woodlands, introduced from Japan. April-July; JulyNovember. [= RAB, C, F, G, I, K, SE, Z; = Kraunhia floribunda (Willdenow) Taubert -- S]

Wisteria frutescens (Linnaeus) Poiret, American Wisteria, Swamp Wisteria, Atlantic Wisteria. Cp (GA, NC, SC, VA), Pd (GA, NC), Mt (GA, VA): swamp forests, wet thickets; common. April-May; June-September. E. VA south to FL, west to TX, north in the interior to AR, s. IN, and s. MO. The issue of the distinctiveness of \(W\). frutescens and \(W\). macrostachya needs further study. Harvill et al. (1992) reports \(W\). macrostachya from Northumberland and Shenandoah counties, VA. [= RAB, GW, I, K, SE, W; > W.
frutescens - C, F, G, Z, in a narrow sense; > W. macrostachya (Torrey \& A. Gray) Nuttall ex B.L. Robinson \& Fernald -- C, F, G, Z; > Kraunhia frutescens (Linnaeus) Greene -- S; > Kraunhia macrostachya (Torrey \& A. Gray) Small -- S]
* Wisteria sinensis (Sims) Augustin de Candolle, Chinese Wisteria. Cp, Pd (GA, NC, VA), Mt (GA): commonly cultivated, commonly escaped to urban, suburban, and rural forests and woodlands, introduced from China. April-July; July-November. [= RAB, C, F, I, K, SE]

\section*{Zornia J. F. Gmelin (Zornia)}

A genus of about 50-90 species, perennial herbs, of tropical and warm temperate regions. References: Isely (1998)=1.
Identification notes: The palmately 4 -foliolate leaves are unique in the flora of our area.
Zornia bracteata Walter ex J.F. Gmelin. Cp (GA, NC, SC, VA): sandy roadsides, woodlands, and sandhills; common. JuneAugust; July-October. Se. VA south to FL, west to TX and e. Mexico, endemic to the Southeastern Coastal Plain. [= RAB, C, F, G, K, S, SE]

FAGACEAE Dumortier 1829 (Beech Family)

A family of about 8 genera and 620-1050 species, trees and shrubs, mostly of the Northern Hemisphere, but extending into se. Asia and Australia. References: Nixon in FNA (1997); Govaerts \& Frodin (1998); Kubitzki in Kubitzki, Rohwer, \& Bittrich (1993); Elias (1971a).

1 Fruits partially enclosed in a scaly cup; leaves lobed, toothed, crenate, or entire
Quercus
1 Fruits enclosed in a spiny or prickly bur; leaves toothed.
2 Nuts sharply triangular; bur with short, recurved prickles; winter buds 1.5-2.5 cm long; leaves ovate, 6-12 cm long. Fagus 2 Nuts rounded or flattened on one or two sides; bur with long, straight spines; winter buds less than 1 cm long; leaves elliptic or oblanceolate, some of them usually more than 12 cm long

Castanea

Castanea P. Miller 1754 (Chestnut, Chinquapin)
A genus of 8-10 species, trees and shrubs, of temperate regions of the Northern Hemisphere. References: Johnson (1988)=Z; Nixon in FNA (1997); Kubitzki in Kubitzki, Rohwer, \& Bittrich (1993); Stanford (1998). Key adapted from Z.

1 Leaves elliptic to oblanceolate, mostly less than 15 cm long, the apices acute to obtuse; twigs puberulent; spine-covered husk of fruit splitting into 2 sections, enclosing 1 nut; nut circular in cross-section, \(7-19 \mathrm{~mm}\) in diameter; pistillate dichasia of 1 flower; leaves with stellate trichomes, with few bulbous-based trichomes when young, puberulent, pilose, tomentulose, or tomentose in age (usually rather densely so).
2 Longest spines of the fruit husk usually \(>10 \mathrm{~mm}\) long; young twigs glabrous; petiole 8-10 ( -15 ) mm long; [plants of \(n\). \(A L\) and westwards] \(\qquad\) [C. ozarkensis]
2 Longest spines of the fruit husk usually <10 mm long; young twigs puberulent; petiole 3-7 (-10) mm long; [plants widespread in our area]
C. pumila

1 Leaves elliptic, oblanceolate or lanceolate, \(8-30 \mathrm{~cm}\) long, the apices acuminate, sometimes only shortly so; spine-covered husk of fruit splitting into 4 sections, enclosing (2) 3 (5) nuts; nut flattened on at least one side, \(18-25 \mathrm{~mm}\) in diameter; pistillate dichasia of 3 flowers; leaves usually without stellate trichomes; twigs puberulent or glabrous.
3 Undersurface of leaves densely covered with bulbous-based trichomes when young, essentially glabrous in age; leaves mostly more than 15 cm long, generally long-acuminate; twigs glabrous
C. dentata

3 Undersurface of leaves persistently and densely tomentose beneath; leaves mostly less than 15 cm long, generally short-acuminate; twigs puberulent . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. mollissima

Castanea dentata (Marshall) Borkhausen, American Chestnut. Mt (GA, NC, SC, VA), Pd (GA, NC, VA), Cp (GA, VA): mesic and xeric forests; common (uncommon in Piedmont, rare in Coastal Plain). June-July; September-October. Formerly one of the most important, largest, and most abundant forest trees in the Mountains of our area, C. dentata was severely affected by chestnut
blight, Cryphonectria parasitica (Murrill) Barr, introduced at New York City in 1904 on nursery stock of C. mollissima. Blight spread steadily southwards, reaching our area in the 1920's and 1930's. C. dentata remains rather abundant, but now occurs only as stump sprouts and small trees, usually reinfected by blight persisting on oaks and killed at about the size of first fruit production. The accidental introduction of chestnut blight and the subsequent profound alteration of the role of chestnut is one of the most tragic ecological disasters to have affected our area. [= RAB, C, F, FNA, G, K, S, W, Z]
* Castanea mollissima Blume, Chinese Chestnut. Pd, Mt (NC): forests; rare, introduced and naturalized from China. June; September. This species is relatively resistant to chestnut blight and has been planted widely as an ornamental and nut tree; it sometimes naturalizes and appears nearly native. [= C, FNA, K]

Castanea pumila (Linnaeus) P. Miller, Common Chinquapin. Cp, Pd, Mt (GA, NC, SC, VA): xeric forests and woodlands, generally in fire-maintained habitats; uncommon. May-July; September-October. C. pumila var. pumila, as here broadly defined, ranges from NJ, s. PA, s. OH, n. KY, and s. MO, south to c. FL and se. TX. It is relatively resistant to chestnut blight. Related, though showing some relation as well to C. dentata, is C. ozarkensis Ashe [sometimes treated as C. pumila var. ozarkensis (Ashe) Tucker]. C. ozarkensis is more susceptible to blight, and occurs in s. MO, e. OK, and w. AR, and disjunct in c. AL, where now apparently extirpated by blight. [= FNA; = C. pumila var. pumila -- C, K, Z (in a broad sense, in relation to var. ozarkensis); > C. pumila var. pumila -- RAB, F (in a narrow sense); > C. pumila var. ashei Sudworth -- RAB, F; > C. alnifolia Nuttall var. alnifolia -RAB; > C. alnifolia var. floridana Sargent -- RAB; > C. pumila -- G, S, W; > C. ashei (Sudworth) Sudworth -- S; > C. floridana (Sargent) Ashe -- S; > C. alnifolia -- S]

Castanea \(\times\) neglecta Dode (pro sp.) [C. dentata \(\times\) pumila], occurs in our area; "the leaves of the hybrid resemble those of \(C\). dentata in size and shape but have the vestiture and stellate trichomes of C. pumila" (Johnson 1988). [=K, Z] \{not keyed\}

Castanea ozarkensis W.W. Ashe, Ozark Chinquapin, is mainly distributed in the Ozarks and Ouachitas of AR, MO, and OK, but also occurs (at least formerly) as a disjunct in nc. AL. It is affected by the chestnut blight. [=FNA, S; = C. pumila P. Miller var. ozarkensis (W.W. Ashe) G.E. Tucker -- K, Z]

Fagus Linnaeus 1753 (Beech)

A genus of about 10 species, trees, of temperate regions of the Northern Hemisphere. Our native trees belong to subgenus Fagus, section Grandifolia (Shen 1992). References: Cooper \& Mercer (1977)=Z; Nixon in FNA (1997); Shen (1992)=X; Kubitzki in Kubitzki, Rohwer, \& Bittrich (1993); Elias (1971a)=Y; Stanford (1998); Govaerts \& Frodin (1998)=V.

1 Leaves denticulate; cupule prickles 1-2.5 (-4) mm long, slightly to strongly recurved; cupule valves generally ovate, the apex obtuse, reddish in color; leaves with fairly dense white acicular trichomes on the lower leaf surface at maturity; leaf base sometimes clearly cordate; [plants of the Coastal Plain, Piedmont, and low to moderate elevations (mostly below 1050 m or 3500 feet) in the Mountains] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . F. grandifolia var. carolinian
1 Leaves sharply serrate; cupule prickles (3-) 4-10 mm long, projecting forwards; cupule valves generally narrowly triangular, the apex acute, grayish-yellow in color; leaves usually lacking white acicular trichomes on the lower surface at maturity, instead with yellowish glandular hairs (acicular trichomes often present on the veins); leaf base not clearly cordate; [plants of moderate to high elevations (mostly above 1050 m or 3500 feet) in the Mountains]
F. grandifolia var. grandifolia

Fagus grandifolia Ehrhart var. caroliniana (Loudon) Fernald \& Rehder, White Beech, American Beech. Cp, Pd, Mt (GA, NC, SC, VA): moist forests, from near sea level to low elevations in the Mountains, mostly below 1050 meters ( 3500 feet); common (uncommon in Coastal Plain south of VA). March-April; September-October. Se. MA, OH, IN, s. IL, s. MI (?), and MO south to Panhandle FL and e. TX. Several subspecies, varieties, or phases of Fagus grandifolia have been described, and their taxonomic recognition is controversial. The most recent monographer, Shen (1992), recognizes three subspecies, one of which is limited to Mexico, the other two as treated here but at the subspecific level. I have here chosen to recognize 2 intergradient varieties in our area. A third variety, var. mexicana (Martínez) Little, of the mountains of México, is apparently most closely related to var. grandifolia. Cooper \& Mercer (1977) studied variation in NC, concluding that two genetic races or varieties were present, the montane var. grandifolia and the Piedmont and Coastal Plain var. caroliniana, but that patterns of variation were complicated. Hardin \& Johnson \((1985)\) and Hardin \((1992,1985)\) note that variation is "more-or-less" clinal, variation within populations is great, and they do not favor recognition of infraspecific taxa. Depending on one's tolerance or intolerance for intergradational varieties, one may choose to recognize one or two taxa in our area. [= C, F, G, Y; < F. grandifolia -- RAB, FNA, K, S, W, Z; < F. grandifolia ssp. grandifolia - V, in part; = F. grandifolia ssp. caroliniana (Loudon) Camp ex Shen - X, nomen nudum; F. ferruginea Aiton]

Fagus grandifolia Ehrhart var. grandifolia, Gray Beech, Red Beech, American Beech. Mt (NC, VA): moderate to high elevation forests, especially on high elevation ridges, gaps, and open slopes, often forming clonal dwarfed thickets in the most exposed situations; common. April; September-October. Nova Scotia, New Brunswick, and s. Québec west to s. Ontario and n. MI, south to VA, w. NC, n. GA, e. TN, and n. OH. "Red beech" is alleged to differ from "gray beech" in having the involucral segments not covering the nutlets at maturity. Hardin \& Johnson (1985), Hardin (1985), and Shen (1992) point out that var. mexicana (Martínez) Little, of the mountains of México, is more closely related to our montane variety or phase than to the lower elevation variety or phase. [= C, F, G, Y; < F. grandifolia -- RAB, FNA, K, S, W, Z; < F. grandifolia ssp. grandifolia - V, in part; = F. grandifolia ssp. grandifolia - X]

Fagus sylvatica Linnaeus, European Beech, Copper Beech, of subgenus Fagus, section Fagus, is sometimes cultivated, but is not known to escape in our area. It has only 5-10 (-12) lateral veins, as opposed to (12-) 15-18 (-20) in F. grandifolia. \{not keyed\} [= V; F. sylvatica ssp. sylvatica - X]

A genus of about 350-530 species, trees and shrubs, of temperate, subtropical, and rarely tropical regions of the Northern Hemisphere. Oaks are the predominant tree of our area, with a variety of species dominating much of the landscape in nearly every ecological situation. Only in a few specialized (and usually in some sense edaphically extreme) communities are oaks generally entirely absent: deepest Coastal Plain swamps, some Coastal Plain depression ponds, wettest pine savannas, pocosins, spruce-fir forests, highest elevation northern hardwood forests, and mountain bogs. Our oaks are divided into two well-marked sections; other sections occur outside our area. Red oaks (section Lobatae, sometimes treated as subgenus Erythrobalanus) are characterized by acorns maturing in two years (in one year in Qu. elliottii), styles elongate, abortive ovules are at the top of the seed, leaves and leaf lobes bristle-tipped, inner surface of the acorn shell velvety-pubescent, and acorns rooting in spring. Twenty-one of our Quercus species are in this group: Qu. arkansana, Qu. coccinea, Qu. elliottii, Qu. falcata, Qu. georgiana, Qu. hemisphaerica, Qu. ilicifolia, Qu. imbricaria, Qu. incana, Qu. laevis, Qu. laurifolia, Qu. marilandica var. marilandica, Qu. myrtifolia, Qu. nigra, Qu. pagoda, Qu. palustris, \(Q u\). phellos, \(Q u\). rubra var. ambigua, \(Q u\). rubra var. rubra, \(Q u\). shumardii var. shumardii, and \(Q u\). velutina.

White oaks (section Quercus, sometimes treated as subgenus Quercus) are characterized by acorns maturing in a single year, styles short or absent, abortive ovules at the base of the seed, leaves and leaf lobes not bristle-tipped, inner surface of the acorn shell smooth, and acorns rooting in autumn. Twenty of our Quercus species are in this group: Qu. alba, Qu. austrina, Qu. bicolor, Qu. boyntonii, Qu. chapmanii, Qu. geminata, Qu. lyrata, Qu. macrocarpa, Qu. margaretta, Qu. michauxii, Qu. minima, Qu. montana, \(Q u\). muehlenbergii, \(Q u\). oglethorpensis, \(Q u\). prinoides, \(Q u\). robur, \(Q u\). similis, \(Q u\). sinuata var. sinuata, \(Q u\). stellata, and \(Q u\). virginiana. Hybrids within each section are frequent and diverse; hybrids do not naturally occur between the two sections. The live oaks of the southeastern Coastal Plain and Central America are subsection Virentes; other white oaks are subsection Quercus. References: Nixon in FNA (1997) (overall treatment); Jensen in FNA (1997) (red oaks); Nixon \& Muller in FNA (1997) (white oaks); Godfrey (1988); Stein, Binion, \& Acciavatti (2003); Cronquist (1991); Duncan \& Duncan (1988); Hunt (1990)=Z; Hunt (1994); Kubitzki in Kubitzki, Rohwer, \& Bittrich (1993).

Many oak species are well-adapted to ecological situations in which fires frequently burn the ground layer. Fire-maintained communities of the Piedmont and Mountains typically have oaks such as Qu. stellata, Qu. marilandica var. marilandica, Qu. ilicifolia, and Qu. prinoides. The two latter species are normally shrubby, and have become rarer because of fire suppression (they require fire to prevent larger trees from outcompeting them). In contrast, Qu. stellata and Qu. marilandica var. marilandica become larger and more frequent in fire-suppressed conditions.

Fifteen oak species in our area are typical of upland Coastal Plain communities with at least occasional fire: \(Q u\). arkansana, \(Q u\). chapmanii, Qu. geminata, Qu. hemisphaerica, Qu. incana, Qu. laevis, Qu, margerettiae, Qu. marilandica var. marilandica, Qu. minima, \(Q u\). myrtifolia, \(Q u\). stellata, and less typically \(Q u\). falcata, \(Q u\). nigra, \(Q u\). velutina, and \(Q u\). virginiana. Fire suppression of Coastal Plain communities, especially of sandhills, leads to an unnatural increase in the stature and abundance of oaks present. In frequent fire conditions, most oaks will persist as short, shrubby fire sprouts. Additional suggestions of how to recognize fire sprouts of hese species are given below. In general, leaves of fire sprouts are larger and more deeply lobed than normal leaves. In species of the red oak group, the bristle tips are larger and more pronounced. Increased size in leaves is particularly noticeable when an area previously long fire-suppressed is burned (the large underground root system and nutritional resources of a small tree destroyed by fire being devoted to a few very vigorous sprouts). Fire sprouts are often in sunny conditions, which tend to make oak leaves more deeply lobed and more coriaceous than shaded leaves.

White oaks with lobed leaves:
Qu. margaretta -- Often forms dense clonal, stoloniferous patches in frequent fire conditions. Tends to retain standard leaf characteristics.
Qu. stellata -- Less prone to formal clonal patches. Sprout leaves often very large, with exaggerated lobing.
Red oaks normally with deeply lobed leaves:
Qu. laevis -- Not clonal. Vigorous sprouter, leaves more deeply lobed than any other fire red oak. Small sprouts often have vertical leaf orientation characteristic of adults, though vigorous fire sprouts sometimes have more normally disposed leaves. Sprout leaves sometimes very large, with very long, curving lobes.
Qu. falcata -- Not clonal. Sprout leaves generally less lobed than typical adult leaves, more like forma triloba, but larger and coarser in texture, difficult to distinguish in shape from Qu. marilandica var. marilandica and Qu. velutina. See pubescence differences in main key.
Qu. velutina -- Not clonal. Leaves variable, sometimes minimally lobed and closely resembling Qu. marilandica var. marilandica and Qu. falcata. See pubescence differences in main key.

Red oaks normally with unlobed leaves:
Qu. marilandica var. marilandica -- Sprout leaves sometimes coarsely (though never deeply) lobed. Texture often very coriaceous, shiny, and very stiff. See pubescence characters in main key.
Qu. nigra -- Not very typically in fire-prone situations, but sometimes so. Young saplings, as well as fire sprouts, often with wildly different leaves than the typical adult form, frequently deeply lobed (for excellent illustrations showing variability in leaf shapes, see p. 329 of Godfrey, 1988 and pp. 51-52 of Godfrey \& Wooten, 1981). Leaves always smaller and more glabrous than those of other fire oaks (except Qu. hemisphaerica).
Qu. incana -- Generally not strongly clonal and stoloniferous even in frequently burned situations. Fire sprouts and vigorous shoots more prone to lobing than adult trees. Even fire shoots, though, usually with only one to several lobes, and the characteristic bluish-green characteristic holds. See comments above on Qu. elliottii.
Qu. elliottii -- Strongly clonal via a stoloniferous "runner", never tree-like. Leaves never lobed, even on fire sprouts, though fire sprout leaves can be larger (to 15 cm long and 5 cm wide). Very difficult to tell from fire sprouts or seedlings of \(Q u\). incana, best separated by leaf pubescence (white in Qu. elliottii, gray in Qu. incana), margin (slightly revolute in Qu. elliottii, flat in Qu. incana),
leaf vernation (planate in Qu. incana, rolled in Qu. elliottii), and acorn maturation (1 year in Qu. elliottii, with acorns often on small plants, 2 years in Qu. incana, with small plants rarely produing acorns).
Qu. hemisphaerica -- Not clonal. Leaves of vigorous shoots and fire sprouts often shallowly lobed, the lobing usually fairly neat and regular, triangular-ascending, and with bristle tips.

Live oaks:
Qu. geminata -- Sometimes clonal. Leaves, even of sprouts, not normally with lobes or teeth
Qu. virginiana -- Sometimes clonal. Leaves of vigorous summer shoots (but apparently not spring shoots) often coarsely toothed, very similar to similar leaves of \(Q u\). hemisphaerica, but lacking bristle tips (instead the translucent margin with a darker, thickened callus at the tip of the tooth).
Qu. minima -- Always clonal. Leaves often with teeth or lobes.

Identification notes: Some oaks with ambiguous leaves are keyed in both Key A and Key D or in both Key B and Key C. The leaves of juvenile (seedling or sapling) branches, fire-sprout shoots, or other vigorous shoots (resulting from similar stimuli such as insect damage) are often much different than typical leaves and are not accounted for in these keys (see discussion at end of generic treatment). Hybrids are frequently encountered; they, too, are not keyed here, but can usually be identified (with difficulty) by their intermediate morphology and by parental context. Trichome types are useful in making and confirming identifications of oaks, since certain types are restricted to various groups of species. Hand lenses of \(10 \times\) or \(20 \times\) can be useful, but a compound microscope is far preferable. See Hardin (1992, 1976, 1979), and Thomson \& Mohlenbrock (1979).

1 Most of the leaves on a relatively mature tree entire and unlobed (some species frequently with some leaves on a tree, especially those on young or vigorous growth, that are toothed or shallowly lobed, the teeth or lobes generally few and irregular in size or location); [primarily either "laurel oaks" of section Lobatae or "live oaks'" of section Quercus]
1 Most of the leaves on a relatively mature tree lobed or toothed.
2 Venation of the leaves neatly and evenly pinnate, the 3-17 (or more) main lateral veins on each side distinctly parallel to each other, each ending in a tooth or shallow, crenate lobe extending less than \(1 / 4\) of the way to the midrib; ["chestnut oaks" of sections Quercus and Cerris]
2 Venation of the leaves pinnate, but more branched and irregular, the 1-7 main lateral veins on each side rebranching into prominent side veins, the leaf usually distinctly lobed, at least some of the lobes of some of the leaves of a tree extending more than \(1 / 4\) of the way to the midrib
3 Apices of the lobes or teeth obtuse (rarely acute), lacking bristle tips; ["white oaks" of section Quercus] ...... Key C
3 Apices of the lobes or teeth acuminate (rarely acute), and with bristle tips; ["red oaks" of section Lobatae] . . . . Key D

\section*{Key A -- Leaves (most of them) entire and unlobed (Laurel Oaks and Live Oaks)}

on the blade surface near the midrib; blades never with lobes or teeth; leaves deciduous in autumn; young leaves bronze red, emerging tightly rolled lengthwise and appearing linear; [trees of bottomlands and upland depression swamps, mesic uplands, and also weedy and frequent in disturbed successional habitats]

Qu. phellos
9 Leaves predominantly oblanceolate, obovate, or rhombic, mostly \(2.5-10 \mathrm{~cm}\) long and \(1.5-4 \mathrm{~cm}\) wide, most of them 2-5x as long as wide, the apex acute, obtuse, or rounded; mature leaves with or without tufts of hairs in the vein axils below, lacking pubescence on the blade surface; blades sometimes with 1-5 lateral lobes or teeth; leaves persisting until spring, or tardily and irregularly deciduous in winter; young leaves red, yellow, or green, not emerging tightly rolled lengthwise; [trees primarily either of swamp forests, maritime forests, or sandhills, not typically weedy]
10 Mature leaves entirely glabrous below; leaves mostly with acute apices and bristle tips (rarely a few rounded), mostly \(2.5-8 \mathrm{~cm}\) long and \(1-2(-3) \mathrm{cm}\) wide, the upper surface shiny, the vein network not readily visible when backlighted; leaves evergreen (persisting until spring); petiole \(0.5-2 \mathrm{~mm}\) long; leaves of vigorous growth often with dentate lobes; [trees of dry sandy habitats, such as sandhills and maritime forests]

Qu. hemisphaerica
10 Mature leaves with tufts of stellate trichomes in the vein axils; leaves mostly with rounded apices (rarely a few acute and then bristle-tipped), mostly \(5-10 \mathrm{~cm}\) long and (1.8-) \(2-4 \mathrm{~cm}\) wide, the upper surface dull, the vein network readily visible when backlighted; leaves tardily deciduous; petiole 2-6 mm long; leaves of vigorous growth rarely lobed, and then not dentate; [trees of moist habitats, such as floodplain forests] ...

Qu. Iaurifolia
7 Leaves (at maturity) persistently and densely pubescent on the surface below, the pubescence in some species so dense and tight as to be difficult to perceive without at least \(10 \times\) magnification.
11 Leaves bristle-tipped (sometimes the bristle fallen or broken off, but leaving a truncate scar), deciduous in autumn; multi-armed trichomes of the rosulate or multiradiate types, many of the arms ascending or erect (never with the stellate or fused-stellate trichomes characteristic of the live oaks); acorns maturing in 2 years (immature acorns present through the winter on fruiting trees); [section Lobatae].
12 Leaves (including petiole) mostly \(10-17 \mathrm{~cm}\) long, \(3.5-7 \mathrm{~cm}\) wide; lower leaf surface (at maturity) sparsely to moderately densely pubescent with soft hairs; leaves lustrous dark-green above; [trees of the Mountains, Piedmont, and rarely Coastal Plain] Qu. imbricaria
12 Leaves (including petiole) mostly \(4-11 \mathrm{~cm}\) long, \(0.5-3.0 \mathrm{~cm}\) wide; lower leaf surface densely covered with soft hairs; leaves lustrous dark-green or bluish-green above; [stoloniferous shrubs and small to medium trees of the Coastal Plain].
13 Leaves \(1.5-3.0 \mathrm{~cm}\) wide, mostly \(2-4 \times\) as long as wide, dull bluish-green above; acorns \(10-15 \mathrm{~mm}\) long; petioles 4-15 mm long; [plant a small to medium tree] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Qu. incana
13 Leaves \(0.5-1.5 \mathrm{~cm}\) wide, mostly \(4-8 \times\) as long as wide, lustrous dark-green above; acorns \(8-12 \mathrm{~mm}\) long; petioles \(1-3 \mathrm{~mm}\) long; [plant a stoloniferous shrub, to 1 m tall (or to 2 m in fire-suppressed pinelands)]

11 Leaves not bristle-tipped, evergreen (overwintering, falling with the expansion of new leaves in the spring) or deciduous (in Qu. oglethorpensis); multi-armed trichomes of the fused-stellate and stellate types, the arms parallel to the leaf surface, radiating from a well developed disc that appears as a white eye or dot at 20-40× magnification (or rosulate or multiradiate in Qu. oglethorpensis); acorns maturing in 1 year (immature acorns not present through the winter, unless aborted); [section Quercus].
14 Leaves deciduous in autumn; bark gray, resembling Qu. alba; [trees of bottomlands and upland clay flats of GA and SC]
\(Q u\). oglethorpensis
14 Leaves evergreen (overwintering, falling with the expansion of new leaves in the spring); bark (on the tree species) brownish, deeply furrowed; [trees and stoloniferous shrubs of sandy habitats of the Coastal Plain of GA, NC, SC, and VA].
15 Plant a stoloniferous shrub, to 1 m tall (or to 2 m in fire-suppressed pinelands)
Qu. minima 15 Plant a small to large tree.

16 Leaf blades with the margins strongly revolute, and also the sides of the blades generally rolled downwards and obscuring part of the lower surface, the leaf appearing boatlike (the depth of the "boat" often approaching the width of the leaf); midvein and major lateral veins impressed on the upper surface and raised on the lower surface (the lower surface therefore appearing rugose); pubescence of the lower surface stellate, both appressed and erect, the individual stellae readily visible at \(20 \times\) (sometimes at \(10 \times\) ); acorns (1-) \(2(-6)\) per stalk; [typically a small tree of sandhills near the coast]

Qu. geminata
16 Leaf blades flat, or the margins slightly to strongly revolute, the sides of the blade sometimes rolled downwards, usually not obscuring part of the lower surface, the leaf not boatlike (the leaf much wider than deep); midvein and major lateral veins not impressed (or very slightly so) on the upper surface and only very slightly, if at all, raised on the lower surface (the lower surface therefore not appearing notably rugose); pubescence of the lower surface stellate, all of it tightly appressed, the individual stellae readily visible only at \(30 \times\) (sometimes barely distinguishable at \(20 \times\) ); acorns 1-2 per stalk; [typically a salt-pruned shrub to large tree of dunes, estuarine shorelines, and southwards of upland flats and slopes]

Qu. virginiana

\section*{Key B -- Leaves with even crenations or teeth (Chestnut Oaks)}

1 Scales of the acorn cup prolonged and long tapered; lateral veins terminating in a well-developed bristle; [species planted, rarely escaped]; [section Cerris] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Qu. acutissim
1 Scales of the acorn cup acute to obtuse; lateral veins terminating in a minute mucro or hardend projection; [species native]; [section Quercus].
2 Acorns on peduncles (2-) 4-7 cm long; acorns 1.5-2.5 cm long; veins ending in crenations usually 6-10 on each side of leaf . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Qu. bicolor
2 Acorns sessile or on peduncles \(0-1 \mathrm{~cm}\) long; acorns 1-2 cm or 2.5-3.5 cm long; veins ending in crenations usually \(8-15\) or 3-7 (if 3-7, then a stoloniferous shrub).
3 Leaves mostly obovate, with rounded teeth (crenations), the teeth sometimes with a minute mucro; hairs of the leaf undersurface clustered in sessile, stellate-appearing clusters of 2-8 hairs; acorns 2.5-3.5 cm long; large trees.
4 Hairs of the leaf undersurface in clusters with a diameter of 0.15-0.5 mm, dense to sparse; bark of mature trees light gray, loose, breaking into plates or scales Qu. michauxii
4 Hairs of the leaf undersurface in clusters with a diameter of \(0.1-0.25 \mathrm{~mm}\), sparse; bark of mature trees dark gray, tight, deeply furrowed

Qu. montana
3 Leaves mostly narrowly elliptic, narrowly ovate, or narrowly obovate, with sharp ascending, often incurved teeth, the teeth ending in a hardened projection; hairs of the leaf undersurface tiny and stellate, with \(6-16\) rays; acorns 1-2 cm long; medium to large trees or stoloniferous shrubs.
5 Medium to large tree; veins ending in teeth usually 7-13 on each side of the leaf; leaves 8-20 cm long and 4-10 cm wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Qu. muehlenbergii 5 Stoloniferous shrub to 5 m tall; veins ending in teeth usually 3-7 on each side of the leaf; leaves 4-10 cm long and 2-6 cm wide
\(Q u\). prinoides

\section*{Key C -- Leaves with lobes not bristle-tipped (White Oaks)}

1 Lower surfaces of mature leaves glabrous.
2 Leaf lobes with acute apices; sinuses often both broad and "flat-bottomed" (with portions parallel to the midrib); acorn cup covering \(2 / 3\) to \(3 / 4\) of acorn . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Qu. Iyrata
2 Leaf lobes with obtuse apices; sinuses narrow (often notch-like), narrowly to broadly rounded or triangular (lacking portions parallel to the midrib); acorn cup covering \(1 / 4\) to \(1 / 2\) of acorn.
3 Leaves mostly 4-10 (-17) cm long, 2-5 (-9) cm wide, with 1-5 shallow lobes or undulations, extending \(1 / 8\) to \(1 / 2\) of the way to the midrib; acorn cup flat at the base, covering less than \(1 / 4\) of the acorn . . . . . . . Qu. sinuata var. sinuata
3 Leaves mostly \(7-20 \mathrm{~cm}\) long, \(3-10 \mathrm{~cm}\) wide, with \(3-11\) lobes, extending \(1 / 4\) to \(5 / 6\) of the way to the midrib (if the lobing less than \(1 / 2\) of the way to the midrib, then the acorn cup rounded at the base and covering \(1 / 4\) to \(1 / 2\) of the acorn).
4 Leaf base deeply cordate; [tree alien, sometimes planted and persistent] . . . . . . . . . . . . . . . . . . [Qu. robur] 4 Leaf base cuneate; [tree native]

5 Leaves with 7-11 lobes (the sinuses usually deep, those of the larger leaves usually about \(2 / 3\) to \(5 / 6\) of the way to the midrib), \(10-20 \mathrm{~cm}\) long, \(5-10 \mathrm{~cm}\) wide; terminal bud rounded or globose; basal scales of acorn cup thickened, the thickening giving the cup a knobby texture Qu. alba
5 Leaves with 3-7 lobes (the sinuses usually shallow, those of the larger leaves usually ranging from \(1 / 4\) to \(1 / 2\) of the way to the midrib), \(7-15 \mathrm{~cm}\) long, \(3-8 \mathrm{~cm}\) wide; basal scales of the acorn cup thin, appressed, the cup having a rough but not knobby texture

Qu. austrina
1 Lower surfaces of mature leaves pubescent, the pubescence varying from dense to sparse (sometimes minute and requiring \(10 \times\) to be readily visible).
6 Lower surfaces of mature leaves whitish to pale green, with a mixture of minute, sessile, stellate hairs with horizontal tips and longer stellate hairs with erect ascending tips; leaves shallowly lobed (if so, the lobes 9-19) to deeply lobed (if so, the lobes with acute apices), the sinuses extending \(1 / 4\) to \(4 / 5\) of the way to the midrib.
7 Leaves mostly shallowly lobed at the base, the sinuses extending \(1 / 4\) to \(1 / 2\) of the way to midrib, grading into mere crenations towards the tip of the leaf, the total number of lobes/crenations usually 9-19; acorns borne on peduncles \(2-10 \mathrm{~cm}\) long; acorn cup covering \(1 / 3\) to \(1 / 2\) of acorn, the upper scales with long-acuminate apices .... Qu. bicolor 7 Leaves mostly relatively deeply lobed throughout the length of the leaf, the sinuses extending \(1 / 2\) to \(4 / 5\) of the way to the midrib, the total number of lobes \(3-13\); acorns sessile or borne on peduncles up to 1 cm long; acorn cup covering \(1 / 3\) to \(3 / 4\) of acorn, the upper scales with acute, long-acuminate, to long-awned apices.
8 Upper scales of the acorn cups thin and acute; acorn cup covering \(1 / 2\) to \(3 / 4\) of the acorn; [swamps in the Coastal Plain and lower Piedmont of GA, NC, SC, and VA]

Qu. Iyrata
8 Upper scales of the acorn cups long-attenuate into nearly terete awns; acorn cup covering \(1 / 3\) to \(1 / 2\) of the acorn; [Mountains of VA] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Qu. macrocarpa var. macrocarpa
6 Lower surfaces of mature leaves gray, green, pale green, or yellowish, glabrescent or densely pubescent, the hairs few-branched and erect; leaves mostly relatively deeply and obtusely lobed, rarely shallowly lobed (if so, the lobes 3-7), the sinuses extending \(1 / 2\) to \(4 / 5\) of the way to the midrib, the total number of lobes \(3-7\); acorns sessile or nearly so. 9 Leaf lobes with acute apices; acorn cup covering \(2 / 3\) to \(3 / 4\) of acorn . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Qu. Iyrata 9 Leaf lobes with obtuse to rounded apices; acorn cup covering \(1 / 3\) to \(1 / 2\) of acorn.

10 Woody twigs of the season glabrous or with scattered, deciduous 2-forked hairs; petioles of mature leaves 3-10 \((-15) \mathrm{mm}\) long; leaf blades \((2.5-) 4-8(-13.5) \mathrm{cm}\) long, irregularly and often rather shallowly \(3-5(-7)\) lobed, the overall form of the leaf only rarely cruciform; largest lateral lobes usually at the midpoint of the blade (or even below it), the lobes usually not sublobed, tapering from base to tip; [xeric sandy sites in the Coastal Plain from se. VA southwards]

Qu. margaretta

10 Woody twigs of the season densely and persistently stellate-pubescent, especially towards the tip of the twig; petioles of mature leaves \(15-20 \mathrm{~mm}\) long (Qu. stellata) or \(3-10(-15) \mathrm{mm}\) long (Qu. boyntonii and \(Q u\). similis); leaf blades (5-) 7.5-15 (-20) cm long, usually 5-lobed, the overall form of the leaf typically cruciform (Qu. stellata) or not ( \(Q u\). boyntonii and \(Q u\). similis); largest lateral lobes of the leaves usually above the midpoint of the blade, these lobes often sublobed or squarish in shape, usually wider near their tips than at their bases (Qu. stellata) or not sublobed, tapering from base to tip ( \(Q u\). boyntonii and \(Q u\). similis); [collectively widespread in our area].
11 Leaves usually cruciform, the largest lateral lobes often sublobed or squarish in shape, usually wider near their tips than at their bases, and borne at right angles to the midrib; [usually of dry to dry-mesic upland situations, widespread in our area] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Qu. stellata
11 Leaves not cruciform, the largest lateral lobes usually not sublobed, tapering from base to tip, and borne at ascending angles relative to the midrib; [of temporarily flooded calcareous swamps of the Coastal Plain, from SC (NC?) southwards in our area (Qu. similis) or localized on sandstone in nc. AL (Qu. boyntonii)]. 12 Rhizomatous shrubs to small trees, generally < 2 m tall; [of sandstone outcrops in nc. AL] [Qu.boyntonii]
12 Single-trunked large trees; [usually of temporarily flooded calcareous swamps of the Coastal Plain, from SC (NC?) southwards in our area]

Qu. similis

\section*{Key D -- Leaves with lobes or teeth bristle-tipped (Red Oaks)}

1 Leaves shallowly 3-lobed near the broad apex (some leaves of sprout or juvenile shoots may be more lobed).
2 Leaf blades 5-15 cm long; lower leaf surfaces glabrous, except for tufts of hairs in the vein axils (or pubescent across the surface in Qu. arkansana].
3 Leaves with broadly cuneate to rounded leaf bases, the blades \(5-15 \mathrm{~cm}\) long; lower leaf surfaces generally pubescent across the surface, and also with tufts in the axils; [of sw. GA westwards] ............ Qu. arkansana
3 Leaves with cuneate bases, the blades 5-10 (-15) cm long; lower leaf surfaces glabrous, except for tufts of hairs in the vein axils; [widespread in our area]

Qu.nigra
2 Leaf blades 10-30 cm long; lower leaf surfaces pubescent across the surface (and often also with denser tufts of hairs in the vein axils).
4 Petioles short and stout, \(5-15 \mathrm{~mm}\) long; lower leaf surfaces thinly to densely pubescent with a mixture of tawny or orange glandlike hairs and stellate hairs whose structure is easily visible at \(10 \times\). Qu. marilandica var. marilandica
4 Petioles long and slender, (14-) 20-50 mm long; lower leaf surfaces densely puberulent with tawny stellate hairs whose structure is barely visible at \(10 \times\)

Qu. falcata
1 Leaves shallowly to deeply 5-12-lobed (some of the leaves of Qu. georgiana only 3-lobed), the lobes primarily lateral.
5 Mature leaves pubescent beneath on the surface with stellate hairs.
6 Leaves 5-10 (-12) cm long, 5-lobed; shrub or small tree; [w. NC northwards] . . . . . . . . . . . . . . . . . . . . . Qu. ilicifolia
6 Leaves (8-) 10-20 cm long, 5-12-lobed; small to large trees[collectively widespread in our area].
\(7 \quad\) Petioles 0.5-1.0 (-1.8) cm long, generally twisted such that the blade is oriented in a vertical plane; leaves all deeply lobed, some of the sinuses extending more than \(4 / 5\) of the way to the midrib; pubescence of the lower leaf surface greenish yellow, matted, and glandlike, usually sloughing off by late in the year . . . . . . Qu. laevis 7 Petioles 2-5 cm long, not twisted so that the blade is oriented in a vertical plane; leaves shallowly to deeply lobed, some of the leaves on a tree generally shallowly lobed, none of the sinuses extending more than \(2 / 3\) of the way to the midrib; pubescence of the lower leaf surface tawny or gray, stellate, not glandlike, persistent or sloughing off by late in the year.
8 Acorns 12-20 mm long, in a cup 15-25 mm across and \(10-12 \mathrm{~mm}\) deep; mature leaves loosely and rather coarsely pubescent (the stellate hairs conspicuous and readily distinguishable at \(10 \times\) ), often becoming nearly or entirely glabrous by late in the year (except for tufts of hairs in the vein axils); terminal bud 4angled, \(7-10 \mathrm{~mm}\) long, densely gray-tomentose Qu. velutina
8 Acorns \(10-15 \mathrm{~mm}\) long, in a cup \(12-14 \mathrm{~mm}\) across and \(4-5 \mathrm{~mm}\) deep; mature leaves densely and finely pubescent (the stellate hairs minute and scarcely distinguishable at \(10 \times\) ), the pubescence permanent; terminal bud only obscurely angled (if at all), \(5-8 \mathrm{~mm}\) long, brown-puberulent.
9 Base of blades of sun-leaves typically rounded, thus forming a U-shape (some leaves cuneate,
angled, or oblique); terminal lobe of leaves generally long-attenuated, narrow (its sides nearly parallel for much of its length), and curved to one side (falcate) (note that trees with the trilobed leaf form will key out above); leaves with 3-7 well-developed lobes, these often very irregular in size, shape, spacing, and orientation; pubescence of lower leaf surface normally tawny (when fresh) . Qu. falcata 9 Base of blades of sun-leaves typically cuneate or angled, thus forming a V-shape (some leaves somewhat U-shaped or oblique); terminal lobe of leaves generally short, broadly triangular (its sides normally tapering towards the tip for most of their length), not strongly curved to one side; leaves with 5-9 well-developed lobes, these generally rather uniform in size, shape, spacing, and orientation; pubescence of leaf surface gray
4 Mature leaves glabrous beneath on the surface, with tufts of hairs in the main vein axils beneath.
10 Petioles \(0.5-1.0(-1.8) \mathrm{cm}\) long, generally twisted such that the blade is oriented in a vertical plane; inner cup-scales of the acorn cup inflexed, thus the cup appearing to have a broadly rounded rim . . . . . . . . . . . . . . . . . Qu. laevis
10 Petioles 2.5-7 cm long, not twisted so that the blade is oriented in a vertical plane; inner cup-scales of the acorn cup not inflexed, thus the cup appearing to have a sharp rim appressed against the acorn.
11 Terminal buds 4 -angled, \(7-10 \mathrm{~mm}\) long, the bud scales densely gray-tomentose . Qu. velutina
11 Terminal buds not 4-angled, 3-5 (-7) mm long, the bud scales glabrous or with ciliate margins.

12 Leaves relatively shallowly lobed, the sinuses extending up to \(2 / 3\) of the way to the midrib; upper leaf surface dull, not lustrous.
13 Acorn cup covering about \(1 / 4\) of acorn; leaf sinuses extending about \(1 / 4\) of the way to the midrib; bark of mature trees dark gray to black Qu. rubra var. rubra
13 Acorn cup covering about \(1 / 3\) of acorn; leaf sinuses extending about \(1 / 3\) of the way to the midrib; bark of mature trees medium gray . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Qu. rubra var. ambigua
12 Leaves relatively deeply lobed, the sinuses extending \(2 / 3\) to \(9 / 10\) of the way to the midrib; upper leaf surface lustrous.
14 Larger lateral lobes of most leaves with 1 bristle per lobe (-2 on some lobes) ....... Qu. georgiana 14 Larger lateral lobes of most leaves with 2 or more bristles.

15 Mature leaves mostly \(7-12 \mathrm{~cm}\) long, \(5-11 \mathrm{~cm}\) wide (averaging about 9 cm long and 8 cm wide), with 5-7 lobes; acorns (8-) 10-13 (-15) mm long; acorn cup nearly flat at base, covering about 1/4 of the acorn

Qu. palustris
15 Mature leaves mostly \(10-20 \mathrm{~cm}\) long, \(8-15 \mathrm{~cm}\) wide (averaging about 12-15 cm long and 10-12 cm wide), with 5-11 lobes; acorns (12-) 15-25 (-37) mm long; acorn cup nearly flat, turbinate, or rounded, covering \(1 / 4\) to \(1 / 2\) of the acorn.
16 Acorn cup turbinate, covering about \(1 / 2\) of the acorn; acorn (12-) 15-20 mm long, with 1-3 concentric grooves near the tip; upper surface of leaves bright green ...... Qu.coccinea
16 Acorn cup nearly flat at base, covering about \(1 / 4\) to \(1 / 3\) of the acorn; acorn 15-37 mm long, lacking concentric grooves near the tip; upper surface of leaves dark green

Qu. shumardii var. shumardii
* Quercus acutissima Carruthers, Sawtooth Oak. Pd (NC, VA): commonly cultivated as a suburban street tree and also widely planted in "wildlife food plots"; commonly cultivated, rarely (at this time) persistent and spreading, introduced from Japan. This species has been a popular recommendation for "wildlife plantings" in the recent past, and entire stands can be encountered in relatively remote areas, planted by federal and state land management agencies; why "wildlife" species in our area need more oak trees is somewhat mystifying! See Whittemore (2004) for additional information. [= K; Qu. acutissima ssp. acutissima]

Quercus alba Linnaeus, White Oak. Pd, Mt, Cp (GA, NC, SC, VA): mesic to xeric forests; common. April; SeptemberNovember (of the same year). Widespread in e. North America. Historically, one of the most valuable timber trees of eastern North America. Qu. alba is probably the most abundant native plant in our area, and in eastern North America, based on biomass, leaf area, and ubiquity. Hardin (1975) discusses introgression between Qu. alba and many other species of Quercus subgenus Quercus. [= RAB, C, F, FNA, G, K, S, W]

Quercus arkansana Sargent, Arkansas Oak. Cp (GA): dry bluffs; rare (GA Special Concern). Sw. and wc. GA west in a fragmented distribution to sw. AR and e. TX. [= FNA, K, S; > Q. caput-rivuli W.W. Ashe]

Quercus austrina Small, Bluff Oak. Cp (GA, NC, SC), Pd (NC): river bluffs, natural levees of brownwater rivers, over mafic rocks in the Piedmont of NC, on shell or calcareous sediments on the Coastal Plain of SC (Charleston and Beuafort counties); rare (GA Special Concern, NC Rare). April; October (of the same year). Essentially a Southeastern Coastal Plain endemic, ranging from sc. NC south to n . FL and west to MS, nowhere common. [= RAB, FNA, K; apparently included in Qu. alba by S]

Quercus bicolor Willdenow, Swamp White Oak. Mt (VA), Pd (NC, SC, VA), Cp (NC, VA): upland depression swamp forests over mafic rocks such as gabbro or diabase, bottomland swamps with calcareous sediments; uncommon (rare south of VA) (NC Watch List, SC Rare). April; September (of the same year). Widespread in ne. North America, south to NC, SC (Nelson 1993), TN, n. AL, and MO. [= RAB, C, F, FNA, G, GW, K, S, W]

Quercus chapmanii Sargent, Chapman Oak. Cp (GA, SC): dry pinelands; rare (GA Special Concern). February-March; September-November (of the same year). A Southeastern Coastal Plain endemic: se. SC south to FL, west to sw. AL. [= RAB, FNA, K, S]

Quercus coccinea Muenchhausen, Scarlet Oak. Mt, Pd, Cp (GA, NC, SC, VA): xeric upland forests; common (uncommon in Coastal Plain south of VA). April; September-November (of the second year). Centered in the Appalachians, from s. ME south to c. AL, but ranging west to MS, ne. AR, s. IL, and s. MI. [= RAB, C, F, FNA, G, S, W; >Qu. coccinea var. coccinea -- K; >Qu. coccinea var. tuberculata Sargent - K]

Quercus elliottii Wilbur, Running Oak. Cp (GA, NC, SC): pine flatwoods, especially on loamy soils in the Middle Coastal Plain; uncommon. March-April; September (of the first year). A Southeastern Coastal Plain endemic: se. NC south to s. FL and west to s. MS. Wilbur (2002) discusses the reasons for rejecting the traditional use of \(Q u\). pumila for this species; Walter's diagnosis states that \(Q u\). pumila has leaves that are glabrous and glaucous below, ruling out application to this species. [Q. pumila Walter -RAB, FNA, K, S, Z (apparently misapplied; see Wilbur [2002]]

Quercus falcata Michaux, Spanish Oak, Southern Red Oak. Cp, Pd, Mt (GA, NC, SC, VA): upland forests, usually xeric; common (uncommon in Mountains). April; September-November (of the second year). Widespread in se. North America, north to e. OK, s. MO, s. IL, s. IN, s. OH, WV, se. PA, NJ, and reported (apparently without specimen documentation) from Long Island, NY. "Qu. triloba Michaux", the form with the leaves only shallowly trilobed at the apex, causes much confusion. Though even mediumsized trees sometimes have leaves only of this form (rather than the typical form, deeply 5-7-lobed, the terminal lobe long-attenuate and falcate), it has no taxonomic merit. [= C, FNA, K, W; Qu. falcata var. falcata -- RAB, F, G, GW; Qu. falcata var. triloba (Michaux) Nuttall -- F (the juvenile form); Qu. rubra -- S, misapplied; Qu. digitata Sudworth; Qu. triloba Michaux]

Quercus geminata Small, Sand Live Oak. Cp (GA, NC, SC): xeric sandhills near the coast; uncommon (VA Watch List). April; September-November (of the same year). A Southeastern Coastal Plain endemic: se. NC south to FL (where common) and west to s. MS. The alleged occurrence of Qu. geminata as far north as se. VA is apparently based on ambiguous specimens that probably are only \(Q u\). virginiana (the so-called var. maritima). The relative ranges, habitats, and abundance of this species and \(Q u\). virginiana in NC are poorly understood. Apparently flowering about 2-3 weeks later than Qu. virginiana when growing in close proximity and in similar habitats. [= C, FNA, GW, K, S; Qu. virginiana -- RAB, in part; Qu. virginiana var. maritima (Michaux) Sargent -- F, misapplied]

Quercus georgiana M.A. Curtis, Georgia Oak. Pd (GA, SC): dry slopes and bluffs over granite; rare (SC Rare). April; September-October (of the second year). W. SC south and west through GA to c. AL. [= RAB, FNA, K, S]

Quercus hemisphaerica Bartram ex Willdenow, Sand Laurel Oak, Darlington Oak. Cp (GA, NC, SC, VA): sandhills and other dry, sandy soils, an abundant component of maritime forests with Qu. virginiana, and widely planted as a street tree in most parts of our region; common (VA Rare). March-April; September-November (of the second year). Essentially a Southeastern Coastal Plain endemic: se. VA south to s. FL and west to s. TX, north uncommonly in the interior to nc. AL, n. MS, and s. AR. Often confused with Qu. laurifolia (see the key for distinctions). Qu. hemisphaerica is the semi-evergreen laurel oak planted widely as a street tree in southern cities, often intermixed with the strictly deciduous Qu. phellos. [=C,F,FNA, K, Z; < Qu. laurifolia -- RAB; Qu. laurifolia -- S, misapplied; Qu. hemisphaerica var. hemisphaerica - K; Qu. hemisphaerica var. maritima (Michaux) Muller -- K]

Quercus ilicifolia Wangenheim, Bear Oak, Scrub Oak. Mt (VA), Pd (NC, VA): xeric soils in ridges in the Mountains and monadnocks in the upper Piedmont; common (rare in Piedmont and south of VA) (NC Rare). Late April-June; August (of the second year). Primarily Appalachian: s. ME south to w. VA, w. NC, and e. KY. This scrubby oak is limited in NC to dry summits and upper slopes of Piedmont monadnocks; it is rare and probably declining because of fire suppression (Barden 1985), though recent ice storms have opened the tree canopy at several of its NC sites. The occurrence of Q. ilicifolia in KY was confirmed at the Devil's Teatable, Floyd County (Clark et al. 1997). [= RAB, C, F, FNA, G, K, S, W]

Quercus imbricaria Michaux, Shingle Oak. Mt, Pd (NC, VA), Cp (VA): rich soils of upper floodplains of rivers and creeks, often at the base of the slope into the upland, also on lower slopes, and in forests over diabase in the Piedmont of VA and \(n\). NC; uncommon (GA Special Concern). May; October (of the second year). Primarily midwestern, ranging from NJ, PA, n. OH, s. MI, n. IL, and c. IA, south to e. VA, nc. and w. NC, sc. TN, n. AL, and n. AR. [= RAB, C, F, FNA, G, K, S, W, Z]

Quercus incana Bartram, Bluejack Oak. Cp (GA, NC, SC, VA), Pd (GA, NC, SC): sandhills, primarily in somewhat loamier textured, submesic soils; common (rare in Piedmont) (VA Rare). April; September-November (of the second year). Primarily a species of the Southeastern Coastal Plain, but rarely extending inland into the Piedmont (especially on coarse sandy alluvium): se. VA south to c. peninsular FL and west to e. TX, sw. AR, and se. OK. This oak is recognizable even at a distance by its bluish color. [= RAB, F, FNA, K, Z; Qu. cinerea Michaux -- C, G, S; Qu. humilis Walter]

Quercus laevis Walter, Turkey Oak. Cp (GA, NC, SC, VA): sandhills, primarily in very xeric soils of deep sandy deposits (Carolina bay rims, old beach dunes, early Cenozoic deposits of the Sandhills Province); common (VA Rare). April; SeptemberOctober (of the second year). Essentially a Southeastern Coastal Plain endemic: se. VA south to s. FL and west to e. LA. The leaves turn an intense orange-red in the autumn (November). [= RAB, C, F, FNA, G, K, S, Z; Qu. catesbaei Michaux]

Quercus laurifolia Michaux, Laurel Oak. Cp (GA, NC, SC, VA): mesic to seasonally flooded soils of floodplains, also (rarely) mesic slopes and swamps in maritime forests; common. March-April; September-November (of the second year). A Southeastern Coastal Plain endemic: se. VA south to s. FL and west to e. TX and s. AR. Sometimes confused with Qu. hemispherica, but (in addition to the key characters above) Qu. laurifolia has blunter leaf tips, flowers about 2 weeks earlier, and generally occupies much moister habitats. [= C, F, FNA, G, GW, K, Z; < Qu. laurifolia -- RAB (also see Qu. hemisphaerica); Qu. obtusa (Willdenow) Ashe -S]

Quercus lyrata Walter, Overcup Oak. Cp, Pd (GA, NC, SC, VA), Mt (GA): common in seasonally rather deeply and frequently flooded soils of floodplains of the Coastal Plain, less commonly in seasonally flooded swamps in Triassic basins in the lower Piedmont, and rarely in upland depression swamps of the Piedmont (developed over clays weathered from mafic rocks) and Coastal Plain; common (rare in Piedmont and Mountains). March-April; September-October (of the same year). Primarily a species of the Southeastern Coastal Plain: DE south to nw. FL, west to e. TX and se. OK, north in the inland to w. TN, s. IN, s. IL, and se. MO. Of our oaks, Qu. lyrata tolerates the wettest habitats, both in terms of depth and duration of flooding. [= RAB, C, F, FNA, G, GW, K, S]

Quercus macrocarpa Michaux var. macrocarpa, Bur Oak, Mossycup Oak. Mt (VA): bottomland forests; rare (VA Rare). New Brunswick and Québec west to s. Manitoba, south to nw. VA, KY, TN, LA, and TX. Variation in this species needs additional study; Qu. macrocarpa in our area is the typic variety or subspecies if other taxa are recognized. [= K; Qu. macrocarpa - C, F, FNA, G, GW, S, W, infraspecific taxa not distinguished]

Quercus margaretta Ashe ex Small, Sand Post Oak. Cp (GA, NC, SC, VA), Pd (GA): sandhills, typically in slightly loamy or clayey soils, not usual in the deepest and most xeric sands; common (VA Watch List). April; September-November (of the same year). Primarily a species of the Southeastern Coastal Plain: se. VA south to FL and west to TX and se. OK. As stated by F, this oak was "chivalrously named [by W.W. Ashe] in 1903 for Margaret Henry Wilcox, who two years later became Mrs. Ashe." There has been controversy, however, over the spelling of the specific epithet. Some nomenclaturists believe that the original spelling, "margaretta" should be treated as a correctable error, according to Articles 73.10 and Recommendation 73C. 1 of the International Code, and replaced with "margarettiae." [= RAB, C, FNA, G, S; Qu. margarettiae Ashe ex Small -- K, an orthographic variant; Qu. stellata var. margaretta (Ashe ex Small) Sargent -- F]

Quercus marilandica Muenchhausen var. marilandica, Blackjack Oak. Pd, Cp, Mt (GA, NC, SC, VA): uplands forests and woodlands, usually on periodically droughty soils, as over shrink-swell clays, sandstones, deep sands, and sands with clay lenses; common (uncommon in Mountains). April; September-November (of the second year). NY (Long Island), NJ, se. PA, w. VA, s. OH s. IN, c. IL, s. IA, and se. NE south to s. GA, Panhandle FL, and sc. TX (west to the Prairie border). There are historical accounts of the existence of prairies or barrens in the vicinity of Charlotte in the late eighteenth century, known as the "the blackjack lands." These areas were described as open and prairie-like, until the early nineteenth century, when they became dominated by dense forests of blackjack oak. The previously open condition was almost certainly maintained by fire, perhaps set by the Waxhaw Indians. Blackjack oak has long been considered an indicator of poor soil, as in Guthrie (1820), who states in his discussion of NC, "the Black Jack land is generally poor, though it has sometimes a black appearance, it is wet and loose, and is avoided by farmers, as unproductive." Var. marilandica is the widespread taxon; var. ashei Sudworth [= Qu. neoashei Bush] is worthy of recognition at the varietal level at least, and occurs from s. MO and s. KS south to c. AR, e. TX, and sc. TX, especially on the Edwards Plateau (Hunt 1990). [= FNA, K, Z; Qu. marilandica -- RAB, C, F, G, S, W, infraspecific taxa not distinguished]

Quercus michauxii Nuttall, Basket Oak, Swamp Chestnut Oak. Cp, Pd (GA, NC, SC, VA), Mt (GA): bottomland forests, especially in fertile soils of upper terraces where flooded only infrequently and for short periods; common (uncommon in Piedmont). April; September-October (of the same year). NJ south to \(n\). FL and west to e. TX and se. OK, north in the interior to s. IL and s. IN. See discussion under Qu. montana of the application of the name Qu. prinus Linnaeus. [= RAB, C, F, FNA, G, GW, K, W; Qu. prinus Linnaeus -- S, possibly misapplied]

Quercus minima (Sargent) Small, Dwarf Live Oak. Cp (GA, NC, SC): pine flatwoods, coastal fringe sandhills; uncommon (NC Watch List). April; September-November (of the same year). A Southeastern Coastal Plain endemic: se. NC south to FL, west to s. AL. [= FNA, K, S]

Quercus montana Willdenow, Rock Chestnut Oak. Mt, Pd (GA, NC, SC, VA), Cp (GA, NC, VA): xeric forests of ridges, slopes; common. April; September-November (of the same year). Primarily Appalachian: s. ME south to c. GA, c. AL, and ne. MS west as far as s. IL and s. IN. The proper application of the Linnaean "Qu. prinus" is controversial and unclear, having been debated and variously applied for well over a century. I have here decided to err on the side of clarity. The name "Qu. prinus" has nomenclatural priority over either "Qu. montana" or "Qu. michauxii", but it is not clear which species was intended; Whittemore \& Nixon (2005) have proposed its formal rejection. [= FNA, S, W; Qu. prinus Linnaeus -- RAB, C, F, G, K, probably misapplied]

Quercus muehlenbergii Engelmann, Yellow Oak, Chinquapin Oak. Mt, Pd (GA, NC, SC, VA), Cp (GA, SC, VA): slopes and bluffs, on soils derived from calcareous or mafic rocks; common in VA Mountains (rare elsewhere) (NC Watch List). April; OctoberNovember (of the same year). S. New England and Ontario west to WI, se. MN, and IA, south to nw. FL, TX, and n. Mexico. The similar Qu. montana sometimes has a few leaves with somewhat sharply lobed leaves, but these are minutely mucronate and lack the well-developed callus of \(Q u\). muehlenbergii. Additionally, Qu. muehlenbergii has a flaky, light gray bark, very different from the dark gray, deeply furrowed bark of Qu. montana. [= RAB, C, F, K; Qu. muehlenbergii -- FNA, S, W, an orthographic variant; Qu. prinoides Willdenow var. acuminata (Michaux) Gleason -- G]

Quercus myrtifolia Willdenow, Myrtle Oak. Cp (GA, SC): dry pinelands; rare (SC Rare). February-March; September (of the second year). A Southeastern Coastal Plain endemic: se. SC south to s. peninsular FL, west to se. MS. [= RAB, FNA, K, S, Z]

Quercus nigra Linnaeus, Water Oak, Paddle Oak. Cp, Pd (GA, NC, SC, VA), Cp (GA): bottomland forests, especially on levees or second terraces where flooded infrequently and for short periods, less commonly on mesic slopes; common (uncommon in Piedmont). April; September-November (of the second year). Primarily a species of the Southeastern Coastal Plain: s. NJ south to s. FL and west to e. TX and se. OK, north in the interior to se. TN, c. TN, w. KY, se. MO, and e. OK. Seedlings and fire sprouts of this species are highly variable; see discussion at end of generic treatment. [= RAB, C, F, FNA, G, GW, K, S, W, Z; Qu. nigra var. heterophylla (Aiton) Ashe -- F: Qu. aquatica Walter]

Quercus oglethorpensis Duncan, Oglethorpe Oak. Pd (GA, SC): bottomland forests, upland oak flats over clays (Iredell and Enon soils); rare (GA Threatened, SC Rare). April; September-October (of the same year). Ranging (in a widely scattered pattern) from w. SC, to adjacent e. GA, nw. AL (Sorrie pers. comm. 2002), MS, and LA. [= RAB, FNA, GW, K]

Quercus pagoda Rafinesque, Cherrybark Oak, Swamp Spanish Oak. Cp, Pd (GA, NC, SC, VA): bottomland forests especially on second terraces; common (rare in Piedmont). April; September-November (of the second year). A Southeastern Coastal Plain endemic: e. and c. VA south to nw. FL and west to se. TX and north in the interior to e. TN, s. IL, and s. IN. [= C, FNA, K, S; Qu. falcata var. pagodifolia Elliott -- RAB, F, G, GW]

Quercus palustris Muenchhausen, Pin Oak. Pd (NC, VA), Cp (VA), Mt (GA, VA): swamps and bottomlands, especially the broader swamps developed in the sedimentary rocks of Triassic basins of the lower Piedmont, isolated upland sag ponds, also widely planted as a street tree in towns and cities; uncommon (rare south of VA) (GA Special Concern, NC Watch List). March-April; October-November (of the second year). MA and NY west to se. IA and e. KS, south to c. NC, nw. GA, sc. TN, n. AR, and e. OK. [= RAB, C, F, FNA, G, GW, K, S, W]

Quercus phellos Linnaeus, Willow Oak. Cp, Pd (GA, NC, SC, VA), Mt (GA): bottomland forests, especially on natural levees and second terraces, also in upland depression swamps developed on clay soils, weedy and successional on slopes and upland sites following disturbance, and widely planted as a street tree in towns and cities; common (uncommon in Piedmont). March-April; September-November (of the second year). Primarily a species of the Southeastern Coastal plain: NY (Long Island), s. NJ, and se. PA south to s. GA and panhandle FL, west to e. TX and se. OK, north in the interior to e. TN, s. KY, w. KY, s. IL, and se. MO, and e. OK. [= RAB, C, F, FNA, G, GW, K, S, W, Z]

Quercus prinoides Willdenow, Dwarf Chinquapin Oak. Pd, Mt (GA, NC, VA), Cp (VA): xeric uplands, especially on clay soils derived from mafic rocks, and probably in sites which naturally burned rather frequently; rare (GA Special Concern, NC Rare, VA Rare). April; August-September (of the same year). MA and s. MI south to NC, OK, and TX. Fire suppression in the Piedmont sites where this rare oak occurs has nearly or entirely extirpated it from much of our area. [= RAB, C, F, FNA, K, S, W; Qu. prinoides var. rufescens Rehder -- F; Qu. prinoides var. prinoides -- G]

Quercus rubra Linnaeus var. ambigua (A. Gray) Fernald, Gray Oak. Mt (NC, SC, VA), Pd (VA): forests on ridges, slopes, and coves, mostly at over 1000 meters elevation; common. May; September-October (of the second year). Fairly widespread in ne. North America south to PA, and in the Appalachians to NC. This and var. rubra tend to intergrade and their distinction as even varieties may not be warranted. For discussion of the two varieties, see McDougal \& Parks (1984) and Jensen (1977). [= K; Qu. rubra var. borealis (Michaux f.) Farwell -- RAB, F, FNA; Qu. rubra -- C, W, in part, infraspecific taxa not distinguished; Qu. borealis Michaux f. var. borealis -- G; Qu. borealis -- S]

Quercus rubra Linnaeus var. rubra, Red Oak. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): moist to fairly dry forests of slopes, coves, and ravines, below 1000 meters elevation; common (rare in Coastal Plain). April; August-September (of the second year). Widespread in e. North America, south to e. VA, GA, AL, MS, AR, and OK. [= RAB, F, FNA, K; Qu. rubra -- C, W, in part, infraspecific taxa not distinguished; Qu. borealis Michaux f. var. maxima (Marshall) Ashe -- G; Qu. maxima (Marshall) Ashe -- S]

Quercus shumardii Buckley var. shumardii, Shumard Oak. Pd, Cp, Mt (GA, NC, SC, VA): moist and fertile soils of bottomlands and lower slopes, also in xeric sites over calcareous rocks (such as limestone); uncommon (rare in Coastal Plain and Mountains). April; September-October (of the second year). Sc. PA, OH, s. MI, IN, s. IL, MO, and e. KS south to FL and TX. A number of varieties have been recognized in Qu. shumardii, and the morphological and habitat variation needs additional study. Var. schneckii (Britton) Sargent is apparently more midwestern, but should be looked for in our area, especially on dry limestone slopes, its preferred habitat. It is allegedly distinguished by the acorn cups rounded to turbinate below (vs. flattened and saucershaped in var. shumardii). Hess \& Stoynoff (1998) tentatively concluded that no varieties should be recognized within Qu. shumardii, but they plan additional studies. Qu. acerifolia (E.J. Palmer) Stoynoff \& W.J. Hess (Qu. shumardii var. acerifolia Palmer] is an endemic of Magazine Mountain in n. AR and scattered sites in OK; it is best treated asa distinct species, though there has been much debate about its taxonomic status, with opinions ranging from full species to mere form (Smith 1988, Stoynoff \& Hess 1990, Johnson 1992, Johnson 1994, Hess \& Stoynoff 1998). [= F, FNA, G, K; Qu. shumardii -- RAB, C, S, W, infraspecific taxa not distinguished]

Quercus similis Ashe, Swamp Post Oak, Delta Oak. Cp (GA?, NC?, SC): calcareous stream flats; rare. Qu. similis resembles \(Q u\). stellata, differing in its less definitely cross-shaped leaves and its distinctly wetland habitat. [=FNA, K; Qu. stellata Wangenheim var. paludosa Sargent; Qu. ashei Sterret]

Quercus sinuata Walter var. sinuata, Bastard Oak. Cp, Pd (GA?, SC): alluvial and slope forests; rare (GA Special Concern, SC Rare). April-May; September-November (of the same year). Se. SC west to TX. [= FNA, K; Qu. durandii Buckley -- RAB, S]

Quercus stellata Wangenheim, Post Oak. Pd, Cp, Mt (GA, NC, SC, VA): upland forests and woodlands, especially in clay or rocky soils and in fire communities; common (uncommon in Mountains). April; September-November (of the same year). Se. MA, s. NY, s. PA, s. OH, s. IN, s. IA, and e. KS south to FL and TX. In KS, OK, and TX, post oak is one of the trees that forms the Prairie boundary. There is no question of the distinctness of \(Q u\). margaretta from \(Q u\). stellata. See \(Q u\). similis. [= RAB, C, FNA, G, K, S, W; Qu. stellata var. stellata -- F; Qu. villosa Walter]

Quercus velutina Lamarck, Black Oak. Mt, Pd, Cp (GA, NC, SC, VA): upland forests and woodlands, especially in fairly xeric and sandy soils; common. April; September-October (of the second year). Widespread in e. North America. [= RAB, C, F, FNA, G, K, S, W]

Quercus virginiana P. Miller, Live Oak. Cp (GA, NC, SC, VA): locally common to abundant in maritime forests and maritime scrub on barrier islands, more rarely inland (though regularly on the mainland from se. NC south, and extending substantially inland from s. SC south), sometimes in dry, fire-maintained habitats more usually occupied by Qu. geminata, also planted (especially in the outer Coastal Plain); uncommon (VA Watch List). April; September-November (of the same year). A Southeastern Coastal Plain endemic: se. VA south to FL and west to TX. Qu. fusiformis Small of TX has sometimes been treated as a variety of Qu. virginiana, but is best separated as a species. Flowering before Qu. geminata when growing together. [=C, FNA, GW, K, S; Qu. virginiana -\(R A B, G\), in part only (also see Qu. geminata); Qu. virginiana var. virginiana -- F; Qu. sempervirens Walter]

Quercus boyntonii Beadle, Boynton Oak. Dry forests. Ne. AL and (possibly) TX. [= FNA, K, S; Q. stellata Wangenheim var. boyntonii (Beadle) Sargent]
* Quercus robur Linnaeus, English Oak, is cultivated in our area and sometimes persists or escapes in ne. United States, south at least to s. PA (Rhoads \& Klein 1993). [= FNA, K]

Quercus texana Buckley, Nuttall Oak, Texas Red Oak. Floodplain swamps and bottomlands. AL, TN, KY west to e. TX. [= FNA, K; = Qu. nuttallii E.J. Palmer - F, GW; = Qu. shumardii var. texana (Buckley) W.W. Ashe] \{not yet keyed\}

\section*{FUMARIACEAE Augustin de Candolle 1821 (Fumitory Family)}

This family includes 15-20 genera and 500-600 species, herbs, mostly north temperate. The Fumariaceae should likely be merged into the Papaveraceae (Lidén 1981, 1986; Lidén et al. 1997; Judd, Sanders, \& Donoghue 1994). References: Stern in FNA (1997); Hill (1992); Lidén (1986, 1981); Lidén et al. (1997); Lidén in Kubitzki, Rohwer, \& Bittrich (1993).

1 Corolla with the 2 outer petals spurred or saccate at their bases; [tribe Corydaleae].
2 Caulescent herbaceous vine (acaulescent in its first year, and appearing to be an herb); ultimate leaf segments 5-10 mm wide

Adlumia
2 Acaulescent herb with basal leaves; ultimate leaf segments 1-4 mm wide.
3 Leaves basal only . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Dicentra 3 Leaves cauline and basal................................................................... [Lamprocapnos]
1 Corolla with only 1 outer petal spurred or saccate at its base.
4 Ovary and fruit subglobose, with 1 seed; [tribe Fumarieae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Fumaria
4 Ovary and fruit elongate, with several to many seeds; [tribe Corydaleae].
5 Flowers pink, the petals tipped with yellow; biennial; stem erect, 3-8 (-10) dm tall; capsules erect, 25-35 mm long .

5 Flowers yellow; annual; stem erect, decumbent, or prostrate, 1-3 (-4) dm tall; capsules erect, ascending, divergent, or pendent, 10-20 (-25) mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Corydalis

Adlumia Rafinesque ex Augustin de Candolle 1821 (Climbing Fumitory)
A genus of 2 species, herbs, of e. North America, Korea, and Manchuria. References: Boufford in FNA (1997); Lidén in Kubitzki, Rohwer, \& Bittrich (1993).

Adlumia fungosa (Aiton) Greene ex Britton, Sterns, \& Poggenburg, Alleghany-vine, Cliff-Harlequin, Climbing Fumitory. Mt (NC, VA): cliffs, talus, rocky slopes, rich stream-bottom forests, cool rocky forests; rare (NC Rare, VA Watch List). JuneSeptember. Québec west to WI and MN, south to DE, NC, TN, and IN. [= RAB, C, F, FNA, G, K, S, W]

\section*{Capnoides P. Miller 1754 (Rock Harlequin)}

The genus is monotypic, an herb, of \(n\). North America. Recent studies have emphasized its distinction from Corydalis, and its closer relationship to Adlumia and Dicentra than to Corydalis (Lidén 1981, 1986; Lidén et al. 1997). References: Stern in FNA (1997); Ownbey (1947)=Z; Lidén (1981, 1986); Lidén et al. (1997); Lidén in Kubitzki, Rohwer, \& Bittrich (1993).

Capnoides sempervirens (Linnaeus) Borkhausen, Rock Harlequin, Tall Corydalis, Pink Corydalis, Pale Corydalis. Mt (GA, NC, SC, VA), Pd (NC, VA): rock outcrops, especially granitic exfoliation domes, but also quartzite, greenstone, and sandstone;
uncommon (rare in NC and VA Piedmont) (GA Special Concern). April-June; May-July. Newfoundland west to AK, south to NJ, PA, in and near the mountains to ne. GA, n. OH, n. IN, MN, MT, and British Columbia. [= S; = Corydalis sempervirens (Linnaeus) Persoon -- RAB, C, F, FNA, G, K, W, Z]

\section*{Corydalis Augustin de Candolle 1805 (Corydalis)}
(also see Capnoides)

A genus of about 400 species, herbs, of temperate regions of the Northern Hemisphere (especially China and the Himalayas). References: Stern in FNA (1997); Ownbey (1947)=Z; Lidén in Kubitzki, Rohwer, \& Bittrich (1993).

1 Flowers pink, the petals tipped with yellow; biennial; stem erect, 3-8 (-10) dm tall; capsules erect, 25-35 mm long
1 Flowers yellow; annual; stem erect, decumbent, or prostrate, 1-3 (-4) dm tall; capsules erect, ascending, divergent, or pendent, 10-20 (-25) mm long.
2 Fruits pendent or divergent; spurred petal 7-9 mm long; pedicels \(6-15 \mathrm{~mm}\) long; seeds 2-2.5 mm wide, with a narrow, acute ring-margin C. flavula

2 Fruits erect or ascending; spurred petal 10-15 mm long; pedicels 1-6 mm long ( \(5-10 \mathrm{~mm}\) long in \(C\). aurea); seeds 1.0-2.0 mm wide, without a narrow, acute ring-margin.
3 Capsules mostly \(15-20 \mathrm{~mm}\) long, ca. 1.0 mm in diameter, strongly constricted between the seeds at maturity; inflorescence long, usually far exceeding the poorly-developed upper leaves; ultimate leaf segments 0.5-1.5 (-3.0) mm wide; seeds less than 1.5 mm wide; plant slightly to strongly glaucous; [of sandy soils of the outer Coastal Plain]

3 Capsules mostly \(10-15 \mathrm{~mm}\) long, \(1.5-2.0 \mathrm{~mm}\) in diameter, slightly or not at all constricted between the seeds at maturity; inflorescence relatively short, barely (if at all) overtopping the upper leaves; ultimate leaf segments 1.0-2.0 (-4.0) mm wide; seeds more than 1.5 mm wide; plant green to slightly glaucous; [of circumneutral rock outcrops of the upper Piedmont and Mountains]
C. micrantha

Corydalis flavula (Rafinesque) Augustin de Candolle, Short-spurred Corydalis. Pd, Mt, Cp (GA, NC, SC, VA): rich moist forests, especially alluvial forests, glades and outcrops over mafic rocks (such as greenstone); common (rare in NC and SC Coastal Plain) (GA Special Concern). March-April; May-June. S. CT, NY, and s. Ontario west to SD, south to NC, AL, LA, and OK. [= RAB, C, F, FNA, G, K, W, Z; = Capnoides flavulum (Rafinesque) Kuntze -- S]

Corydalis halei (Small) Fernald \& Schubert, Southern Corydalis. Cp (GA, NC, SC): sandy roadsides and disturbed areas; uncommon. March-April; May-June. Ssp. australis ranges from e. NC south to FL, west to TX, and inland north to MO and OK. F and \(S\) recognized it as a species distinct from C. micrantha; Ownbey reduced it to a subspecies, citing inadequate morphological differences and some alleged intermediates in OK and MO. The two taxa appear readily separable on morphological, ecological, and geographical grounds; species status seems warranted. [= F; = Corydalis micrantha (Engelmann ex A. Gray) A. Gray ssp. australis (Chapman) G.B. Ownbey -- RAB, FNA, K, Z; = Corydalis micrantha (Engelmann ex A. Gray) A. Gray var. australis (Chapman) Shinners -- C; < Corydalis micrantha -- G; = Capnoides halei Small -- S]

Corydalis micrantha (Engelmann ex A. Gray) A. Gray, Slender Corydalis. Mt, Pd (NC): circumneutral rock outcrops and adjacent glades and woodlands; rare (NC Rare). April; June. Ssp. micrantha is primarily midwestern, ranging from IL, WI, MN, and SD south to AR, TX, and OK, with disjunct outliers in e. TN and w. NC. Ownbey (1947) had no records of Southern Appalachian populations of C. micrantha, and considered ssp. micrantha to range no further east than IL and MO; RAB included montane populations in ssp. australis, stating "this is the only [subspecies] in our range." Morphologically, however, these populations closely resemble ssp. micrantha; their association in the Brushy Mountains with other species disjunct from western or prairie ranges (Anemone berlandieri, Arabis hirsuta, Pellaea wrightiana) provides phytogeographic corroboration. [= F; = Corydalis micrantha (Engelmann ex A. Gray) A. Gray ssp. micrantha -- FNA, K, Z; = Corydalis micrantha (Engelmann ex A. Gray) A. Gray var. micrantha -- C; < Corydalis micrantha -- G; = Capnoides micranthum (Engelmann ex A. Gray) Britton -- S]

Corydalis aurea Willdenow, south and east to MD, WV (?), and PA (Kartesz 1999). [= G, K; = Corydalis aurea var. aurea - C, F; = Corydalis aurea ssp. aurea - FNA; = Capnoides aureum (Willdenow) Kuntze - S] \{not yet keyed\}

Corydalis crystallina Engelmann, is reported to occur in c. GA (Jones \& Coile 1988). [= FNA, F, G, K] \{not yet keyed; investigate, nowhere close to GA in FNA, K, or S\}

\section*{Dicentra Bernhardi 1833}

A genus of about 12 species, perennial herbs, with a relictual north temperate distribution: e. North America, w. North America, and e. Asia. References: Stern in FNA (1997); Stern (1961)=Z; Lidén in Kubitzki, Rohwer, \& Bittrich (1993).

Leaves cauline and basal. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [see Lamprocapnos spectabilis] 1 Leaves basal only.

2 Flowers pink, in panicles; rootstock lacking bulblets; ultimate leaf segments generally 3-parted, each part 2-5 mm wide at base, gradually tapering to the tip.
3 Reflexed portions of the outer sepals \(4-8 \mathrm{~mm}\) long; [native and cultivated] . . . . . . . . . . . . . . . . . . . . . . . D. eximia 3 Reflexed portions of the outer sepals \(2-5 \mathrm{~mm}\) long; [cultivated] . . . . . . . . . . . . . . . . . . [D. formosa ssp. formosa]
2 Flowers white or yellowish (very rarely pinkish), in racemes; rootstock with bulblets; ultimate leaf segments not generally 3-parted, about 1 (-3) mm wide, with parallel sides for most of their length, then tapering suddenly to the tip.
4 Spurs of the corolla rounded, incurved, 2-5 mm long; bulblets yellow, spherical
D. canadensis

4 Spurs of the corolla elongate, divergent, 7-9 mm longl bulblets white to pink, tear-shaped (narrowed upwards) ....
D. cucullaria

Dicentra canadensis (Goldie) Walpers, Squirrel Corn. Mt (GA, NC, VA), Pd, Cp (NC, VA): rich, moist forests, especially rich cove forests in the mountains; common (uncommon in VA Piedmont, rare in Coastal Plain, rare or extirpated in NC Piedmont) (GA Special Concern). April-May; June. S. ME west to s. MN, south to w. NC, n. GA, TN, and MO. [= RAB, C, F, FNA, G, K, W; = Bicuculla canadensis (Goldie) Millspaugh -- S]

Dicentra cucullaria (Linnaeus) Bernhardi, Dutchman's Britches. Mt (GA, NC, SC, VA), Pd (NC, SC, VA), Cp (NC): rich, moist forests, especially rich cove forests in the mountains; common (rare in NC and SC Piedmont and NC Coastal Plain) (SC Rare). March-April; May-June. Nova Scotia west to n. MN, south to GA, AR, and KS; disjunct in WA, OR, and ID. [= RAB, C, F, FNA, G, K, W; = Bicuculla cucullaria (Linnaeus) Millspaugh -- S]

Dicentra eximia (Ker-Gawler) Torrey, Wild Bleeding Heart. Mt (GA, NC, SC, VA), Pd (NC, VA): cliffs, talus slopes, rocky slopes, rock outcrops, shale slopes; common in VA mountains (rare elsewhere) (GA Special Concern, NC Rare, SC Rare). AprilJune; July-August. An Appalachian endemic: NY and NJ south to NC and TN. [= RAB, C, F, FNA, G, K, W; = Bicuculla eximia (Ker-Gawler) Millspaugh -- S]
* Dicentra formosa (Haworth) Walpers ssp. formosa, native from s. British Columbia south to c. CA, is frequently cultivated and resembles our native \(D\). eximia. It has the reflexed portion of the outer petals \(2-4 \mathrm{~mm}\) long. A variety of cultivars, some apparently derived from hybrids between the 2 species, make identification uncertain in some cases. [= FNA]

Fumaria Linnae 1753 (Fumitory)
A genus of about 50 species, annual herbs, primarily Eurasian. References: Boufford in FNA (1997); Lidén in Kubitzki, Rohwer, \& Bittrich (1993).
* Fumaria officinalis Linnaeus, Fumitory, Earthsmoke. Cp (GA, NC, SC, VA), Pd (NC, SC, VA), Mt (VA): sandy fields, disturbed places, escaped from gardens; rare, introduced from Europe. March-May. [= RAB, C, F, FNA, G, K, S; > F. officinalis ssp. officinalis - K; > F. officinalis ssp. wirtgenii (W.D.J. Koch) Arcangeli -- K]

\section*{Lamprocapnos Endlicher (Asian Bleeding Heart)}

A monotypic genus, a perennial herb of e. Asia. References: Lidén et al. (1997).
Identification notes: Lamprocapnos differs from other "bleeding hearts" (the native Dicentra eximia and the western American Dicentra formosa ssp. formosa) in its leafy stem, the inflorescence borne terminally or opposite a leaf, the leaves much less finely divided, and the flowers about as broad as long (vs. much longer than broad in Dicentra eximia and Dicentra formosa).
* Lamprocapnos spectabilis (Linnaeus) Fukuhara, Bleeding Heart, native to e. Siberia, Korea, and n. China, is frequently cultivated and may persist or weakly naturalize. [= K; Dicentra spectabilis (Linnaeus) Lem.]

\section*{GARRYACEAE}

Garryaceae is here circumscribed to include Aucuba (Bremer et al. 2002). References: Bremer et al. (2002)

> Aucuba Thunberg (Aucuba, Japanese-laurel)
* Aucuba japonica Thunberg, Aucuba, Japanese-laurel, Spotted-laurel. Pd (NC): commonly planted throughout our area, rarely escaping and naturalizing in suburban woodlands; rare, introduced from Japan and se. Asia. The most frequently planted cultivars have the dark green leaves prominently speckled with yellow. [= K]

\section*{GELSEMIACEAE (Jessamine Family)}

A family of 2 genera and about 10 species, shrubs and vines, of tropical and warm temperate America, Africa, and Asia. There is persuasive evidence that Gelsemium and Mostuea Didr., traditionally treated as part of a heterogeneous Loganiaceae, should be accorded family status as Gelsemiaceae (Backlund, Oxelman, \& Bremer 2000; Struwe, Albert, \& Bremer 1994; Sennblad \& Bremer 1996). The Gelsemiaceae form a clade most closely related to the Apocynaceae (Backlund, Oxelman, \& Bremer 2000). References: Backlund, Oxelman, \& Bremer (2000); Struwe, Albert, \& Bremer (1994); Sennblad \& Bremer (1996); Rogers (1986).

> Gelsemium Antoine Laurent de Jussieu (Yellow Jessamine)

A genus of 3 species, vines, our 2 species (distributed in se. North America and Central America) and 1 species in e. Asia. References: Wyatt et al. (1993); Duncan \& Dejong (1964); Godfrey (1988); Rogers (1986)=Z; GW.

1 Sepals acuminate apically, persistent on the fruit; capsule elliptical, 1.0-1.6 cm long, 6-8 mm broad, the tapering tip bearing a definite beak about 3 mm long; seeds wingless; flowers odorless (rarely fragrant), usually golden-yellow . G. rankinii
1 Sepals obtuse to broadly acute, not persistent on the fruit; capsule oblong, 1.5-2.5 cm long, 8-12 mm broad, very abruptly narrowed to a beak \(1.5-2 \mathrm{~mm}\) long; seeds with a prominent membranous wing sharply differentiated from the body of the seed; flowers fragrant, usually lemon-yellow
G. sempervirens

Gelsemium rankinii Small, Swamp Jessamine. Cp (GA, NC, SC): swamps of blackwater rivers, restricted in NC to the se. corner of the state, most notably the swamps of the Waccamaw and Black rivers; rare north of GA (NC Rare). March-April; September-October. Se. NC south through SC and GA to the FL panhandle, and west to e. LA. See Wyatt et al. (1993) and Duncan \& Dejong (1964) for extensive discussions of morphology, habitat, pollination, genetics, distribution, and evolutionary relationships of our 2 species of Gelsemium. [= RAB, GW, K, S, Z]

Gelsemium sempervirens St. Hilaire, Carolina Jessamine. Cp (GA, NC, SC, VA), Pd (GA, NC, SC), Mt (GA): in a wide range of habitats, from swamp forests to dry uplands and thickets, also commonly planted as an ornamental; common. March-early May; September-November. VA, se. TN, and AR south to c. peninsular FL and e. TX; disjunct in Guatemala and Mexico (Chiapas, Oaxaca, Puebla, and Veracruz). Jessamine climbs to the tops of trees. [= RAB, F, G, GW, K, S, W, Z]

\section*{GENTIANACEAE (Gentian Family)}
(also see MENYANTHACEAE)
A family of about 87 genera and over 1600 species, herbs, shrubs, and trees, cosmopolitan (Struwe \& Albert 2002). References: Wood \& Weaver (1982); Struwe \& Albert (2002).

\section*{Bartonia Muhlenberg ex Willdenow (Bartonia)}

A genus of 3 species, herbs, of e. North America. The genus has coralloid mycorrhizae and lacks root hairs, and is thus presumably partially mycotrophic. References: Gillett (1959)=Z.

1 Corolla lobes white, \(5-10 \mathrm{~mm}\) long, spreading, spatulate to obovate, rounded at the apex; flowering in early spring (rarely to early summer) . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . B. verna
1 Corolla lobes green to creamy white, 2-3 (-5) mm long, ascending or erect, oblong to ovate or lance-ovate, acuminate or rounded-mucronate at the apex; flowering in summer or fall.
2 Mid-cauline scale leaves alternate; corolla lobes acuminate at the apex, their margins entire; anthers 0.3-0.5 mm long ...
B. paniculata ssp. paniculata

2 Mid-cauline scale leaves opposite; corolla lobes rounded at the apex, abruptly narrowed to a mucro, their margins erose (uncommonly entire); anthers \(0.5-1.1 \mathrm{~mm}\) long
B. virginica

Bartonia paniculata (Michaux) Muhlenberg ssp. paniculata, Screwstem Bartonia. Cp (GA, NC, SC), Mt (GA, VA), Pd (VA): swamps, bogs, pocosins, pocosin ecotones, sphagnous seepages; rare (NC Watch List, VA Watch List). August-October. Ssp. paniculata ranges from MA south to FL and west to e. TX, chiefly on the Coastal Plain, but with scattered occurrences inland (to c. VA, w. NC, KY, and AR). Ssp. iodandra (B.L. Robinson) J. Gillett is more northern, ranging from Newfoundland south to MA. These
taxa have been variously treated (and ignored). Intermediates are alleged to occur in NC, MS, AL, and northwards to MA (Gillett 1959, Wood \& Weaver 1982). [= K, Z; < B. paniculata -- RAB, GW; = B. paniculata -- \(G\), in the narrow sense; = B. paniculata var. paniculata -- C, F; ? B. lanceolata Small -- S]

Bartonia verna (Michaux) Rafinesque ex Barton, Spring Bartonia, White Bartonia. Cp (GA, NC, SC, VA): wet pine savannas, shores of Coastal Plain depression ponds; uncommon (NC Watch List, VA Rare). February-April (-June). VA (1 site known from City of Virginia Beach) (Belden et al. 2004) and se. NC (Carteret County) south to s. FL, west to se. TX. Perhaps not truly congeneric with the other 2 species; Wood \& Weaver (1982) commented that "the species [of Bartonia] can be divided into two remarkably distinct groups." [= RAB, GW, K, S, Z]

Bartonia virginica (Linnaeus) Britton, Sterns, \& Poggenburg, Virginia Bartonia. Cp, Mt (GA, NC, SC, VA), Pd (NC, SC, VA): bogs, swamps, savannas, pocosin ecotones, pocosins; uncommon (rare in Mountains). July-October. Nova Scotia and Québec west to WI, south to n . FL and LA. [= RAB, C, F, G, GW, K, S, Z]

\section*{Centaurium Hill (Centaury)}

A genus of about 20 species, herbs, mainly north temperate.
```

1 Flowers pedicellate, the pedicels 3-5 mm long
. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . .
Flowers sessile or nearly so (sometimes appearing stalked but with bracteal leaves immediately below the calyx).
2 Inflorescence a corymbiform cyme (about as broad as long, the central axis poorly developed) ............C. erythraea
2 Inflorescence a spikelike cyme (distinctly elongate, the central axis straight) . . . . . . . . . . . . . . . . . ....... C. spicatum

* Centaurium erythraea Rafinesque, Common Centaury, Forking Centaury. Pd (NC, VA), Cp (VA), {GA}: lawns, disturbed
areas; rare, introduced from Europe and w. Asia. July-September. [= C, K; C. minus -- RAB, apparently misapplied; C. umbellatum
-- F, G, name not validly published]
* Centaurium pulchellum (Swartz) Druce, Lesser Centaury, Branching Centaury. Cp (VA): disturbed areas; rare, introduced
from Europe. June-September. [= C, F, G, K, S]
* Centaurium spicatum (Linnaeus) Fritsch, Spiked Centaury. Cp (VA): disturbed areas; rare, introduced from s. Europe. July-
August. [= C, F, G, K]

```

Eustoma Salisbury ex D. Don (Prairie-gentian)

Eustoma exaltatum (Linnaeus) Salisbury ex D. Don, Prairie-gentian. North and east to AL and FL. [Eu. exaltatum ssp. exaltatum - K] \{add to synonymy\}

\section*{Frasera Walter (Columbo)}

A genus of 15 species, herbs, primarily of w. North America. References: Threadgill \& Baskin (1978)=Z; Horn (1997).
Frasera caroliniensis Walter, American Columbo. Mt (GA, NC), Pd (GA, SC): rich forests over mafic rocks, upper slopes of cove forests, floodplain forests; rare (NC Rare, SC Rare). Late May-June; September-October. W. NY, nw. PA, and s. Ontario west to IL, MI, MO, and e. OK, south to w. SC, n. GA, and LA, primarily west of the Blue Ridge. Horn (1997) studied the ecology of this species in the Piedmont of SC. [= C, K, S, W, Z; = Swertia caroliniensis (Walter) Kuntze -- RAB, F, G]

\section*{Gentiana Linnaeus (Gentian)}

A genus of about 350-400 species, herbs, primarily temperate and arctic. Even following the removal of Gentianopsis and Gentianella, Gentiana is a large and apparently heterogeneous group, perhaps not monophyletic. No satisfactory comprehensive treatment is available, however. All of the species treated here as Gentiana are in the distinctive group often treated as section, subgenus, or genus Pneumonanthe. References: Pringle (1967)=Z; Halda (1996)=Y; Ho \& Liu (2001)=X; Ho \& Liu (1990); Yuan, Küpfer, \& Doyle (1996). Key adapted from Z.

Identification Notes: In some species it may be somewhat difficult to interpret the corolla lobes and the corolla appendages. The filaments are alternate to the corolla lobes, and are therefore attached to the lower portion of the corolla appendages.

1 Flower solitary (rarely 2 or 3); corolla spotted within; leaves twisted, oblanceolate to oblinear; [subgenus Pneumonanthe, series Angustifoliae]
Flowers clustered; corolla not spotted within; leaves planar, mostly lanceolate, elliptic, or ovate (rarely linear); subgenus Pneumonanthe, series Pneumonanthe].
2 Calyx lobes keeled, the keel decurrent on the calyx tube; corolla greenish-white or yellowish-white; leaves ovate to lanceolate, acuminate
G. alba

2 Calyx lobes not keeled; corolla white, greenish-white, or variously blue.
3 Corolla greenish-white (sometimes somewhat purplish); seeds wingless; lower leaves spatulate to obovate G. villosa

3 Corolla blue, purplish, pale blue, or nearly white; seeds winged; lower leaves linear, lanceolate, elliptic, or ovate.

4 Margins of leaves and calyx lobes entire to minutely denticulate; corolla appendages obliquely triangular, broader than high (sometimes with a minute deflexed segment)
G. linearis

4 Margins of leaves and calyx lobes conspicuously ciliate (as seen at10x); corolla appendages with 2 teeth, as long as broad or longer (sometimes with a deflexed segment, if so, the deflexed segment about as long as the erect one).
5 Calyx lobes linear-subulate, broadest at the base, \(4 \times\) or more as long as broad, shorter than the densely puberulent calyx tube; stems densely puberulent; corolla appendages very unevenly bifid, the narrower segment often deflexed into the corolla tube
G. decora

5 Calyx lobes lanceolate, oblanceolate, ovate, or orbicular, 1-5x as long as broad, longer or shorter than the glabrous or puberulent calyx tube; stems glabrous or puberulent; corolla appendages subequally bifid, both segments erect.
6 Corollas tightly closed; involucral and upper leaves acuminate; calyx lobes ovate-orbicular.
7 Calyx tubes densely puberulent; stems puberulent; filaments \(7-12 \mathrm{~mm}\) long; corolla lobes often triangular, about \(1 / 2\) as wide as the corolla appendages
G. austromontana

7 Calyx tubes glabrous; stems glabrous; filaments \(10-15 \mathrm{~mm}\) long; corolla lobes usually rounded,
about as wide as the corolla appendages . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . G. clausa
6
Corollas open to loosely closed; involucral and upper leaves obtuse to acute (rarely acuminate); calyx lobes lanceolate.
8 Leaves ovate, widest near the base, bright green; calyx lobes longer than the calyx tube; corolla lobes spreading, usually \(2-4 \mathrm{~mm}\) longer than the appendages . . . . . . . . . . . . . . . G. catesbaei
8 Leaves linear to elliptic, widest near the middle, dark green; calyx lobes shorter than or about equal to the calyx tube; corolla lobes usually incurved, rarely exceeding the appendages by more than 2 mm
G. saponaria

Gentiana alba Muhlenberg ex Nuttall, Pale Gentian. Mt (NC): habitat unknown (not collected in NC in this century); rare (NC Rare). August-October. Mainly distributed in midwestern United States, from MI west to MN, south to n. AR, G. flavida occurs as scattered disjunctions eastwards to PA, OH, WV, KY, and w. NC. G. alba is the older name; there is controversy, however, over whether it was validly published and applies clearly to the species at hand (see Wilbur 1988c for discussion). [= RAB, K, W, X, Y, Z; \(=\) Gentiana flavida A. Gray -- C, F, G; = Dasystephana flavida (A. Gray) Britton -- S; = Pneumonanthe flavida (A. Gray) Greene]

Gentiana austromontana Pringle \& Sharp, Blue Ridge Gentian. Mt (NC, VA): high elevation forests and grassy balds; rare (NC Watch List, VA Watch List). September-October. A Southern Appalachian endemic: s. WV and sw. VA south to w. NC and ne. TN. The flowers of G. austromontana are usually a deeper and more intense blue-violet than the similar G. clausa and G. decora. See Pringle \& Sharp (1964) for additional discussion. [= C, K, W, X, Y, Z]

Gentiana autumnalis Linnaeus, Pinebarren Gentian. Cp (NC, SC, VA): savannas, pine flatwoods, sandhills, in a variety of sites varying from moist to very xeric, nearly always associated with Pinus palustris and Aristida stricta; uncommon, rare in VA (SC Rare, VA Rare). Late September-early January (rarely at other times of the year, such as spring, in response to fire). This species is a "bimodal endemic," occurring in s. NJ and adjacent DE, and from se. VA south through e. NC to nc. SC. The related G. pennelliana Fernald (sometimes reduced to a subspecies of G. autumnalis) is endemic to the FL panhandle; other siblings occur in Mexico: G. bicuspidata (G. Don) Briq., G. hooperi Pringle, and G. longicollis Nesom. G. autumnalis is often overlooked, since it is very inconspicuous except when in flower, it usually flowers at a season when few botanists are about, and sterile plants greatly outnumber fertile ones. Vegetatively it is extremely distinctive once learned; the leaves are glossy, dark-green, opposite, oblanceolate to "oblinear," and twisted and curved in a manner reminiscent of an airplane propellor. [= RAB, C, F, GW, K, X, Z; = Gentiana porphyrio J.F. Gmelin -- G; = Dasystephana porphyrio (J.F. Gmelin) Small -- S; = Gentiana autumnalis ssp. autumnalis Y; = Pneumonanthe porphyrio (Linnaeus) Greene]

Gentiana catesbaei Walter, Coastal Plain Gentian. Cp (GA, NC, SC, VA), Pd (VA): pocosins, moist savanna edges, edges of moist hardwood forests; common (rare in Piedmont). Late September-November. S. NJ south to n. FL, on the Coastal Plain. [= RAB, C, G, GW, K, X, Y, Z; > G. catesbaei var. catesbaei - F; > G. catesbaei var. nummulariifolia Fernald -- F; > Dasystephana latifolia (Chapman) Small -- S; > D. parvifolia (Chapman) Small -- S; = Pneumonanthe catesbaei (Walter) F.W. Schmidt]

Gentiana clausa Rafinesque, Meadow Closed Gentian, Meadow Bottle Gentian. Mt, Pd (NC, VA), \{GA\}: forests; uncommon (rare in Piedmont). September-October. Mostly Appalachian: ME south to w. NC and ne. TN, extending east and west to adjacent physiographic provinces. [= RAB, C, F, G, GW, K, W, X, Y, Z; = Pneumonanthe clausa (Raf.) Greene]

Gentiana decora Pollard, Appalachian Gentian. Mt, Pd (GA, NC, SC, VA): forests; common (rare in Piedmont). SeptemberOctober. A Southern Appalachian endemic: c. WV south through w. VA to w. NC, e. TN, nw. SC, ne. GA. [= RAB, C, F, G, K, W, X, Y, Z; = Dasystephana decora (Pollard) Small -- S; = Pneumonanthe decora (Pollard) Greene]

Gentiana linearis Frölich, Narrowleaf Gentian. Mt (NC, VA): openings in spruce-fir forest near the summit of Whitetop Mountain, VA; rare (VA Rare). September-October. Mainly occurring in ne. United States and e. Canada, west to Lake Superior, and south (scattered) in the Appalachians to sw. VA and e. TN (Chester, Wofford, \& Kral 1997). On Mount LeConte (Sevier County, TN), G. linearis occurs in thin soils around high elevation outcrops of Anakeesta Slate. [= C, F, G, K, W, X, Y, Z; = Pneumonanthe linearis (Frölich) Greene]

Gentiana saponaria Linnaeus, Soapwort Gentian. Cp, Pd, Mt (GA, NC, SC, VA): bogs, marshes, wet hardwood forests, other moist to wet habitats; uncommon. Late September-November. NY west to n. IL, south to w. FL and e. TX. A peculiar form with very narrow leaves has been found at several localities in Ashe and Watauga counties, NC and in the South Mountains; it may warrant taxonomic recognition after further study. [= RAB, C, F, G, GW, K, W, X, Y, Z; > G. saponaria - F, G; > G. cherokeensis (W.P. Lemmon) Fernald -- F, G; > G. saponaria var. saponaria - K; > G. saponaria var. latidens House - K; = Dasystephana saponaria (Linnaeus) Small -- S; = Pneumonanthe saponaria (Linnaeus) F.W. Schmidt] \{investigate varieties\}

Gentiana villosa Linnaeus, Striped Gentian. Pd, Mt, Cp (GA, NC, SC, VA): upland forests, sandhill/pocosin ecotones; uncommon. Late August-November. Se. PA west to n. KY and w. TN, south to w. FL and e. LA. [= RAB, C, F, G, K, W, X, Y, Z; = Dasystephana villosa (Linnaeus) Small -- S; = Pneumonanthe villosa (Linnaeus) F.W. Schmidt]

Gentiana andrewsii Grisebach var. andrewsii, a northern species, ranges south to s. MD and WV; earlier reports of it as far south as GA or NC (as by F and G) are apparently based on misidentifications. It will key to the vicinity of \(G\). austromontana and \(G\). clausa, but differs from both in having the corolla lobes reduced to a minute triangular projection, much exceeded in size by the appendages. [= C, K, X, Y; < G. andrewsii - F, G; = Pneumonanthe andrewsii (Grisebach) W.A. Weber var. andrewsii] \{not yet keyed; add refs.\}

Gentiana puberulenta J. Pringle, Prairie Gentian, ranges from w. NY west to ND, south to WV, KY, sc. TN (Coffee County) (Chester, Wofford, \& Kral 1997), LA, n. AR, and KS. [= C, K, X, Y; = G. puberula - F, G, misapplied] \{not yet keyed; add refs.\}

\section*{Gentianella Moench (Agueweed)}

A genus of about 125 species, herbs, temperate. The separation of Gentianella from Gentiana appears to be well warranted; some characters suggest that Gentianella is more closely allied to Swertia, Halenia, and Lomatogonium than to Gentiana (Wood \& Weaver 1982). A molecular analysis has confirmed this (Yuan \& Küpfer 1995). References: Gillett (1957)=Z. Key based on Gillett (1957).

1 Calyx 8-10 mm long; calyx tube 3.0-3.5 mm long; calyx lobes \(5-6 \mathrm{~mm}\) long, elliptic-lanceolate to oblanceolate with thickened margins, and with broadly flattened, frequently nerve-like keels; corolla ca. 20 mm long ... G. quinquefolia var. occidentalis
1 Calyx 4-5 mm long; calyx tube 1.5-2.0 mm long; calyx lobes \(2.0-2.5 \mathrm{~mm}\) long, narrowly triangular with hyaline margins and very prominent keels; corolla \(16-18 \mathrm{~mm}\) long
G. quinquefolia var. quinquefolia

Gentianella quinquefolia (Linnaeus) Small var. occidentalis A. Gray, Western Agueweed. Mt (VA): calcareous barrens, possibly other habitats as well; rare. Late August-October. Var. occidentalis A. Gray is more western, from OH and s. Ontario west to MN, east and south to w. VA, sc. KY, AR, and se. KS. [= C, F, G; < Gentiana quinquefolia Linnaeus -- RAB, GW, W; = Gentianella quinquefolia ssp. occidentalis (A Gray) J. Gillett -- K, Z; = Gentianella occidentalis (A. Gray) Small -- S]

Gentianella quinquefolia (Linnaeus) Small var. quinquefolia, Eastern Agueweed. Mt (GA, NC, SC, VA): forests, grassy balds; common. Late August-October. Var. quinquefolia is primarily Appalachian, from ME west to w. NY and s. Ontario, south to \(n\). GA and sc. TN. [= C, F, G; < Gentiana quinquefolia Linnaeus -- RAB, GW, W; = Gentianella quinquefolia ssp. quinquefolia -- K, Z; = Gentianella quinquefolia -- S]

\section*{Gentianopsis Ma 1951 (Fringed-gentian)}

A genus of about 20 species, herbs, of north temperate Asia and North America. The reasons for the recognition of Gentianopsis are enumerated by Ma (1951), Iltis (1965), and Wood \& Weaver (1982). References: Gillett (1957)=Z; Iltis (1965); Ma (1951).

Gentianopsis crinita (Frölich) Ma, Eastern Fringed-gentian. Mt (GA, NC, VA): sunny or semi-shaded seepage areas over calcareous, mafic, or ultramafic rocks (such as limestone, amphibolite, or serpentinized olivine); rare (GA Threatened, NC Endangered, VA Rare). September-October. ME, s. Ontario, and ND south to NJ, IN, and IA (mostly north of the glacial maximum) and from PA south to nw. NC and ne. GA in the unglaciated Appalachians. Certainly one of the most beautiful of our native plants. [= C, K; = Gentiana crinita Frölich -- RAB, F, G, GW, W; = Anthopogon crinitum (Frölich) Rafinesque -- S; = Gentianella crinita (Frölich) G. Don ssp. crinita -- Z]

\section*{Obolaria Linnaeus (Pennywort)}

A monotypic genus, herb, of e. North America. References: Gillett (1959)=Z.

Obolaria virginica Linnaeus, Pennywort. Mt, Pd (GA, NC, SC, VA), Cp (NC, VA): nutrient-rich, moist forests; common (rare in Coastal Plain south of VA). March-May; May-June. NJ west to OH, s. IN, and s. IL, south to panhandle FL and se. LA (reported from TX). The small purplish-green plants are inconspicuous, often nearly hidden under fallen leaves. Obolaria has well-developed mycorrhizae and may be substantially mycotrophic. [= RAB, C, F, G, K, S, W, Z]

Sabatia Adanson (Sabatia, Rose-gentian, Marsh-pink, Sea-pink) (contributed by B.A. Sorrie and A.S. Weakley)

A genus of about 20 species, of North America and the West Indies. References: Wilbur (1955)=Z.

1 Flowers with (7-) 8-12 (-14) corolla lobes.
2 Pedicels < 5 mm long; calyx subtended by linear bracts that usually exceed the corolla lobes; terminal flowers in capitate clusters (less commonly single).
3 Basal leaves similar in shape and size to the stem leaves; cauline leaves (25-) 35-50 (-65) mm long, (7-) 10-20 (-25) mm wide, \(2-4 \times\) as long as wide; corolla lobes pale rose or white; [of mountain slopes, restricted in our area to sw. NC and nw. GA] S. capitata

3 Basal leaves much broader and shorter than the stem leaves; cauline leaves (15-) 40-80 (-100) mm long, 1-3 mm wide, \(20-60 \times\) as long as wide; corolla lobes medium rose to deep rose; [of bogs and savannas, of the Coastal Plain]
S. gentianoides

2 Pedicels > 10 mm long; calyx not subtended by long bracts; terminal flower single.

4 Upper stem leaves about as wide as the diameter of the stem, or narrower; calyx lobes terete or semi-terete; stems 6-12 dm tall; [of Taxodium ascendens-Nyssa biflora depressions and wet pine flatwoods in se. SC] . . . S. bartramii
4 Upper stem leaves much wider than the diameter of the stem; calyx lobes flat, linear to narrowly oblanceolate; stems 3-12 dm tall; [of various habitats, primarily along the shores of blackwater rivers or ponds, or in tidal marshes].
5 Primary branches opposite; terminal flower short-stalked (much shorter than the first internode of the adjacent branch); stems 5-12 dm tall; [of drawdown blackwater riverbanks and similar situations] . . . . . S. kennedyana
5 Primary branches usually alternate; terminal flower long-stalked (usually longer than the first internode of the adjacent branch); stems 3-7 dm tall; [of brackish marshes or openings along blackwater streams].
6 Surficial stolons usually absent or poorly developed; internodes commonly much longer than leaves; [of tidal brackish or freshwater marshes] \(\qquad\) S. dodecandra

6 Surficial stolons usually present and well-developed, elongate; internodes shorter than to equaling the leaves; [of openings of blackwater streams]
S. foliosa

1 Flowers with 5-6 (-7) corolla lobes.
7 Upper branches of main stem alternate.
13 Calyx tube strongly winged; corolla lobes pink; [very rare introduction from c. United States] ....... S. campestris
13 Calyx tube not winged; corolla lobes pink or white; [native, primarily of the Coastal Plain, except S. campanulata which has disjunct occurrences in the Mountains].
14 Calyx lobes foliaceous, 5-8 mm wide, oblong to oblanceolate, mostly exceeding the corolla lobes .. S. calycina 14 Calyx lobes linear-setaceous, \(0.5-2 \mathrm{~mm}\) wide, if equaling the corolla lobes then very narrow and not foliaceous.

15 Calyx lobes (3-) 4-7 (-8) mm long; corolla lobes white; [of se. SC southwards] . . . . . . . . . . . S. brevifolia
15 Calyx lobes (4-) 6-17 (-23) mm long; corolla lobes pink (rarely white in individual plants); [of the Coastal Plain of NC, SC, and VA, and rarely the Mountains of NC and VA].
16 Plants perennial, often with several stems from a caudex; calyx lobes \(>3 / 4 \times\) as long as the corolla lobes, and sometimes exceeding them; [of saturated soils from Coastal Plain savannas to Mountain bogs] S. campanulata

16 Plants annual, solitary; calyx lobes up to \(3 / 4 \times\) as long as the corolla lobes; [of brackish marshes and interdune swales]
S. stellaris

7 Upper branches of main stem opposite.
8 Corolla lobes pink (rarely white); pedicels at least in part \(>5 \mathrm{~mm}\) long.
9 Lower half of stem winged; leaves ovate, clasping, less than \(2 \times\) as long as wide; [widespread in our area] ....
. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. angularis
9 Lower half of stem not winged; leaves elliptic to lanceolate, more or less tapered to the base, mostly more than \(3 \times\) as long as wide; [of the Coastal Plain or very rarely Piedmont]
S. brachiata

8 Corolla lobes white or creamy white; pedicels (above the uppermost bracts or branches) ca. 1-2 (-5) mm long.
10 Lower portion of stem quadrangular, narrowly winged; plants annual or biennial, with 1 (-several) stems arising from a taproot.
S. quadrangula

10 Lower portion of stem terete, not winged (though the upper stem is quadrangular or angled in S. difformis); plants perennial, with several stems arising from a short rhizome; [section Eusabatia, subsection Difformes]. 11 Leaves and upper stem not glaucous; stem terete below, becoming quadrangular or quadrangular-angled above; corolla lobes (5-) 7-15 (-21) mm long; [widespread in our area]
S. difform is 11 Leaves and upper stem glaucous; stem terete throughout; corolla lobes (4-) 5-7 (-8) mm long; [of GA southwards and westwards].

12 Calyx-lobes erect, (0.1-) 0.2-1.5 (-2.0) mm long, as long as or shorter than the calyx-tube;[of sw. GA and n . FL westwards to e. LA] . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. macrophylla var. macrophylla
12 Calyx lobes strongly recurved, (1.0-) 1.5-3 mm long, longer than the calyx-tube; [of e. and sc. GA south to ne. FL] S. macrophylla var. recurvans

Sabatia angularis (Linnaeus) Pursh, Bitter-bloom, Common Marsh-pink. Cp, Pd, Mt (GA, NC, SC, VA): forests, woodlands, marshes, fields; common. July-August; September-October. NY west to s. MI, IL, and e. KS, south to Panhandle FL and e. TX. [= RAB, C, F, GW, K, S, W, Z]

Sabatia bartramii Wilbur, Bartram's Rose-gentian. Cp (GA, SC): margins of Taxodium ascendens-Nyssa depressions, wet pine flatwoods; rare north of GA (SC Rare). June-August; August-October. Ne. SC south to s. FL, west to s. AL and se. MS. [= GW, K, Z; = S. dodecandra var. coriacea (Elliott) Ahles -- RAB; = S. decandra (Walter) Harper -- S, of uncertain application]

Sabatia brachiata Elliott, Narrowleaf Rose-pink. Cp (GA, NC, SC, VA), Pd (GA, NC), Mt (GA): sandhills, pine savannas, pine flatwoods; uncommon (VA Watch List). Late May-July; August-September. Se. VA south to s. GA, west to LA, north in the interior to c. TN and se. MO. [= RAB, C, F, GW, K, S, W, Z]

Sabatia brevifolia Rafinesque. Cp (GA, SC): pine savannas; rare north of GA. September-October; October-November. E. SC south to peninsular FL, west to s. AL. [= RAB, GW, K, Z; S. elliottii Steudel -- S]

Sabatia calycina (Lamarck) Heller, Coastal Rose-pink. Cp (GA, NC, SC, VA): swamp forests, river banks; common (VA Watch List). June-October; July-October. Se. VA south to peninsular FL, west to se. TX; e. Cuba and Hispaniola. [= RAB, C, F, GW, K, S, Z]

Sabatia campanulata (Linnaeus) Torrey, Slender Marsh-pink. Cp (GA, NC, SC, VA), Mt (GA, NC, VA): pine savannas, bogs; common (rare in Mountains) (VA Rare). June-August; September-October. MA south to n. FL, west to LA and AR; scattered inland as in w. VA, w. NC, c. TN, and KY. [= RAB, C, GW, K, S, W, Z; > S. campanulata var. campanulata - F; > S. campanulata var. gracilis (Michaux) Fernald -- F]
* Sabatia campestris Nuttall, Western Marsh-pink, Prairie Rose-gentian, Prairie Sabatia. Mt (NC): roadsides and wodland edges; rare (NC Watch List), introduced from c. United States. July-August; September-October. [= RAB, C, F, GW, K, Z]

Sabatia capitata (Rafinesque) Blake, Cumberland Rose-gentian. Mt (GA, NC): sloping woodlands and meadows, over sandstone or shale; rare (GA Rare, NC Watch List). July-August; September-October. Sw. NC and se. TN south to nw. GA and c. AL. Apparently present in NC, at least formerly, based on a specimen collected "from Cherokee", probably Cherokee County, NC, a remarkably poorly botanized area. [= K, Z; = Lapithea capitata (Rafinesque) Small -- S]

Sabatia difformis (Linnaeus) Druce. Cp (GA, NC, SC, VA), Pd (NC, SC): pine savannas, bogs, pocosins; common (rare in Piedmont) (VA Rare). May-September; September-December. S. NJ south to peninsular FL, west to s. AL. [= RAB, C, F, GW, K, S, Z]

Sabatia dodecandra (Linnaeus) Britton, Sterns, \& Poggenburg, Perennial Sea-pink, Large Marsh Rose-pink. Cp (GA, NC, SC, VA): tidal brackish and freshwater marshes; common (VA Watch List). June-August; August-October. CT south to e. SC and e. GA (Sorrie 1998b). [=F, S; < S. dodecandra var. dodecandra -- RAB (see also S. foliosa); = S. dodecandra var. dodecandra -- C, GW, K, Z]

Sabatia foliosa Fernald. Cp (GA, SC): openings along blackwater rivers, rare north of GA. June-August; August-October. E. SC south to \(n\). FL, west to se. TX. [< S. dodecandra var. dodecandra -- RAB; = S. dodecandra (Linnaeus) Britton, Sterns, \& Poggenburg var. foliosa (Fernald) Wilbur -- GW, K, Z; > S. foliosa - S, in a narrower sense; > S. harperi Small -- S]

Sabatia gentianoides Elliott. Cp (GA, NC, SC): pine savannas, bogs; common. July-August; September-October. NC south to n . FL, west to se. TX. [= RAB, GW, K, Z; = Lapithea gentianoides (Elliott) Grisebach -- S]

Sabatia kennedyana Fernald, Plymouth Gentian. Cp (NC, SC, VA*): seasonally exposed drawdown banks of the Waccamaw River, in adjacent ditches and disturbed flats (in se. NC and ne. SC), and very rarely on shores of beaver ponds (in e. VA, by introduction); rare (NC Threatened, SC Rare). June-August; August-October. This species has a strange, disjunct range, likely related to Pleistocene refugia on the (now) Continental shelf, present in s. Nova Scotia; e. MA and RI; se. NC and ne. SC. The record of the species in e. VA (Caroline County) reported by Fleming \& Ludwig (1996) has now been determined to be a deliberate introduction. Studies underway suggest that the NC/SC plants may differ varietally from those in New England (Sorrie, pers. comm.). [= C, F, GW, K, Z; = S. dodecandra var. kennedyana (Fernald) Ahles -- RAB]

Sabatia macrophylla Hooker var. macrophylla, Large-leaf Rose-gentian. Cp (GA): wet savannas; uncommon. Sw. GA west to e. LA. [= K, Z; < S. macrophylla -- GW; = S. macrophylla Hooker -- S, in a narrow sense]

Sabatia macrophylla Hooker var. recurvans (Small) Wilbur, Small's Rose-gentian. Cp (GA): wet savannas; common. E. and c. GA south to ne. FL; it may occur in se. SC. [ \(\mathrm{K}, \mathrm{Z}, \mathrm{Z} ; \mathrm{S}\). macrophylla -- GW; = S. recurvans Small -- S ]

Sabatia quadrangula Wilbur, Four-angle Sabatia. Cp, Pd (GA, NC, SC, VA): sandhills, moist forests, pocosin ecotones; uncommon (NC Watch List). June-September; August-November. E. VA south to FL, west to s. AL. [= RAB, C, GW, K, Z; S. paniculata Michaux -- F, S, misapplied]

Sabatia stellaris Pursh, Annual Sea-pink. Cp (GA, NC, SC, VA): brackish marshes; common. July-October; AugustNovember. S. MA south to s. FL, west to LA; Bahama Islands, Cuba, c. Mexico. [= RAB, C, F, GW, K, Z]

\section*{GERANIACEAE (Geranium Family)}

A family of about 11 genera and 700 species, herbs and shrubs, mostly temperate.
1 Leaves pinnately cleft or compound; fertile stamens 5 , staminodia 5 .............................................. Erodium
1 Leaves palmately cleft or compound; fertile stamens 10 (except in G. pusillum, and note that anthers are readily deciduous in all species)

Geranium

\section*{Erodium Linnaeus (Stork's-bill, Filaree)}

A genus of about 60 species, herbs, mainly Old World.
1 Primary leaflets sessile or nearly so, sometimes connected by blade tissue; blades of the primary leaflets divided nearly or quite to the base \(<0.75 \times\) to base; apical pits of mericarp lacking sessile glands . . . . . . . . . . . . . . . . . . . . . . . . . E. cicutarium 1 Primary leaflets petiolulate; blades of the primary leaflets divided \(<0.75 \times\) to the base; apical pits of mericarp with sessile glands
* Erodium cicutarium (Linnaeus) L’Héritier, Heron's-bill, Common Stork's-bill, Redstem Filaree, Alfileria, Pin-clover. Mt, Pd, Cp (NC, SC, VA), \(\{G A\}\) : disturbed areas, fields, lawns; common, introduced from Europe. March-June; April-July. [= RAB, C, F, G, S, W; E. cicutarium ssp. cicutarium -- K]
* Erodium moschatum (Linnaeus) L'Héritier var. moschatum, Whitestem Filaree, native of Mediterranean Europe, is naturalized south at least to DE and PA; it is reported for SC (Kartesz 1999). \{investigate\} [= K; <E. moschatum - C] \{add synonymy\} Erodium texanum A. Gray, Texas Stork's-bill, is reported as an introduction for SC (Kartesz 1999). \{investigate\} [= K] \{not yet keyed; add synonymy\}

Geranium Linnaeus (Geranium, Crane's-bill)
A genus of about 300-430 species, herbs, mainly temperate. House plants called 'geranium' are members of the genus Pelargonium. References: Aedo, Aldasoro, \& Navarro (1998).

1 Petals 12-18 mm long; perennial, from a stout rhizome; anthers \(>2 \mathrm{~mm}\) long \(\ldots \ldots\). . . . ................... G. maculatum

1 Petals 2-13 mm long; annual or biennial, from a taproot; anthers \(<1 \mathrm{~mm}\) long.
2 Leaves compound, at least the terminal segment (and often also the two lateral segments) petiolulate, not connected to the lateral segments by leaf tissue; petals 9-13 (-15) mm long; [rare in our area, restricted to Mountains of VA]; [subgenus Robertium, section Robertium]. G. robertianum

2 Leaves dissected, but not compound, all segments interconnected by leaf tissue; petals 2-10 mm long; [collectively common and widespread in our area].
3 Sepals blunt or acute, or terminating in a minute callus tip; [subgenus Robertium, section Batrachioidea].
4 Mericarps glabrous, reticulately ridged; stem pubescence an admixture of long eglandular hairs (1.0-1.7 mm long) and short ( \(<0.5 \mathrm{~mm}\) long) gland-tipped and eglandular hairs; stamens (all 10) fertile (note that anthers may fall readily)
G. molle

4 Mericarps appressed pubescent, not ridged; stem pubescence of short (<0.3 mm long), gland-tipped and eglandular hairs; stamens partly sterile (the inner 5 fertile, the outer 5 lacking anthers)
G. pusillum

3 Sepals awned or subulate, the subulate awn \(0.7-3 \mathrm{~mm}\) long.
5 Mature pedicels \(<1.5 \times\) as long as the calyx.
6 Mericarps with spreading hairs about 0.5 mm long, these often gland-tipped
G. dissectum

6 Mericarps with long appressed hairs about 1 mm long, these not gland-tipped.
7 Inflorescence diffusely corymbiform (because of long upper internodes), mostly 4-12-flowered; pubescence of stem mostly \(<0.5 \mathrm{~mm}\) long . . . . . . . . . . . . . . . G. carolinianum var. carolinianum 7 Inflorescence a compact corymb (because of notably short upper internodes), mostly 5-25-flowered; pubescence of stem mostly \(>0.75 \mathrm{~mm}\) long . . . . . . . . . . . . . G. carolinianum var. confertiflorum
5 Mature pedicels \(>2 \times\) as long as the calyx.
8 Pedicels spreading pubescent, the hairs not glandular; mature stylar beak ca. 1 mm long . [G. sibiricum]
8 Pedicels either rerorse-strigose or glandular-villous; mature stylar beak 3-5 mm long.
9 Pedicels glandular-villous
G. bicknellii

9 Pedicels retrorsely strigose . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . G. columbinum
*? Geranium bicknellii Britton. Mt (VA): \{check with VAHP\} open woodlands and clearings; rare. July-September. [= C, G, K, W; G. bicknellii var. ?? -- F]

Geranium carolinianum Linnaeus var. carolinianum, Southern Carolina Crane's-bill. Cp, Pd, Mt (NC, SC, VA), \{GA\}: fields, roadsides, lawns, pastures, gardens, disturbed areas; common. March-June (and sometimes later). [= C, F, G; < G. carolinianum -RAB, W; G. carolinianum var. carolinianum - K, in part]

Geranium carolinianum Linnaeus var. confertiflorum Fernald, Northern Carolina Crane's-bill. Mt (NC, VA), Pd (VA): fields, roadsides, lawns, gardens, disturbed areas; common. March-June (and sometimes later). [= C, F, G; < G. carolinianum -- RAB, W; G. carolinianum var. carolinianum - K, in part]
* Geranium columbinum Linnaeus, Long-stalk Crane's-bill. Mt (NC, VA), Pd (VA), \{GA\}: roadsides, pastures, disturbed areas; common, introduced from Europe. May-July. [= RAB, C, F, G, K, W]
* Geranium dissectum Linnaeus, Cutleaf Crane's-bill. Mt, Pd (NC, SC, VA), Cp (NC, VA), \{GA\}: roadsides, pastures, disturbed areas; common, introduced from Europe. April-June. [= RAB, C, F, G, K, W]

Geranium maculatum Linnaeus, Wild Geranium. Mt, Pd, Cp (NC, SC, VA), \{GA\}: cove forests, bottomland forests, other mesic, base-rich forests; common (rare in Coastal Plain). April-June. ME west to Manitoba, south to SC, GA, and ne. OK. Sometimes cultivated. [= RAB, C, F, G, K, W]
* Geranium molle Linnaeus, Dove's-foot Crane's-bill. Mt, Pd (NC, SC, VA), Cp (VA), \{GA\}: roadsides, pastures, disturbed areas; common, introduced from Europe and w. Asia. April-July. [= RAB, C, F, G, K, W]
* Geranium pusillum Linnaeus, Small-flowered Crane's-bill. Mt (NC, VA), Pd (SC, VA), Cp (VA): roadsides, pastures, disturbed areas; common, introduced from Europe. May-June. [= RAB, C, G, K, W]

Geranium robertianum Linnaus, Herb Robert. Mt (VA): rocky woodlands, especially over calcareous rocks; rare (VA Rare). June-October. Circumpolar, ranging south in North America to w. VA, nc. TN (Chester, Wofford, \& Kral 1997), OH, IN, and IL. Considered by C and G to be introduced in North America, but apparently native. [=C, F, G, K, W]
* Geranium ibericum Cavanilles has recently been found in Great Smoky Mountains National Park, in both NC and TN (K. Langdon, pers. comm.). [= K; G. nepalense - C] \{not yet keyed\}

Geranium sibiricum Linnaeus, native to Asia, is naturalized south to s. PA (Rhoads \& Klein 1993) and is likely to occur in at least the northern part of our area. [= C, K]
* Geranium thunbergii Siebold \& Zuccarini ex Lindley \& Paxton, reported for NC (Nesom 2000, Kartesz 1999). [= K; = G. nepalense Sweet var. thunbergii (Siebold \& Zuccarini ex Lindley \& Paxton) Kudo] \{add to key, and 'promote' to main text\}

\section*{GROSSULARIACEAE (Currant Family)}

\section*{(also see ITEACEAE)}

A monotypic family, of the northern hemisphere and montane South America (Andes). The familial distinction from the Saxifragaceae is supported by recent molecular data, though the affinities of Grossulariaceae and Saxifragaceae (sensu stricto) are closer than those of many other groups traditionally included in the Saxifragaceae, such as Parnassia, Lepuropetalon, and Penthorum (Morgan \& Soltis 1993).

A genus of about 150 species, temperate, of the Northern Hemisphere and montane South America. The genus is separated into distinctive subgenera, these sometimes maintained as full genera (as by S). Of the species treated or mentioned here, the currants (subgenus Ribes) include \(R\). americanum, \(R\). aureum var. villosum, R. glandulosum, \(R\). lacustre, R. nigrum, \(R\). rubrum, and \(R\). triste. The gooseberries (subgenus Grossularia) include R. curvatum, R. cynosbati, R. echinellum, R. hirtellum, R. missouriense, R. rotundifolium, and \(R\). uva-crispa var. sativum. The dried "currants" commonly available in stores are actually raisins made from a small variety of grape, and have nothing to do with Ribes. A molecular study suggests that recognition of Grossularia as a genus distinct from Ribes is not warranted, though it does form a monophyletic group nested within Ribes s.l. (Senters \& Soltis 2003; Weigend, Mohr, \& Motley 2002). References: Sinnott (1985)=Z; Weigend, Mohr, \& Motley (2002); Spongberg (1972); Schultheis \& Donoghue (2004); Senters \& Soltis (2003). Key adapted from C, F, and Z.

1 Flowers solitary or in corymbs of 2-4; pedicels not jointed just beneath the ovary or fruit, the fruit not disarticulating at maturirty; stems with (0-) 1-3 nodal spines and sometimes also with internodal bristles (especially on young, vigorous growth); [subgenus Grossularia].
2 Ovary and fruit bristly or spiny; stamens (at full anthesis) either \(9-15 \mathrm{~mm}\) long, exserted well beyond the calyx lobes ( \(R\). echinellum) or 1-3 mm long, shorter than the calyx lobes ( \(R\). cynosbati).
3 Bristles of the ovary and fruit not gland-tipped; stamens (at full anthesis) 1-3 mm long, shorter than the calyx lobes; calyx lobes \(2.5-4 \mathrm{~mm}\) long; petals \(1-2 \mathrm{~mm}\) long; [of the Mountains] . . . . . . . . . . . . . . . . . . . . . . . . . . R. cynosbati
3 Bristles of the ovary and fruit gland-tipped; stamens (at full anthesis) either \(9-15 \mathrm{~mm}\) long, exserted well beyond the calyx lobes; calyx lobes 4-7 mm long; petals \(2-3 \mathrm{~mm}\) long; [of the Piedmont or, potentially, Coastal Plain]
\(R\). echinellum
2 Ovary and fruit glabrous; stamens (at full anthesis) \(6-12 \mathrm{~mm}\) long, exserted well beyond the calyx lobes.
4 Calyx tube white; stamens 9-12 mm long; nodal spines 1-3 per node, 7-18 mm long, stout . . . . . . R. missouriense
4 Calyx tube purplish or purplish-green; stamens 6-8 mm long; nodal spines 0-1 (-2) per node, 3-11 mm long, slender
\(R\). rotundifolium
1 Flowers in racemes of 4-many; pedicels jointed just beneath the ovary or fruit, the fruit disarticulating at maturity; stems lacking nodal spines and internodal bristles (except \(R\). lacustre); [subgenus Ribes].
5 Stems (especially young, vigorous growth) with internodal bristles and sometimes internodal spines; fruit bristly, purple or black when mature; racemes drooping
R. lacustre

5 Stems lacking internodal bristles and nodal spines; fruit glabrous or glandular-hispid, red or black when mature (but not both dark and bristly); racemes ascending, spreading, or drooping.
6 Ovary and fruit bristly or spiny with glandular hairs; fruit dark red when mature; racemes ascending; leaves mostly 510 cm across, the \(5-7\) lobes more-or-less acute . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . R. glandulosum
6 Ovary and fruit glabrous; fruit red or black when mature; racemes spreading to drooping; leaves mostly 3-8 cm across, the 3-5 lobes more-or-less obtuse.
7 Leaves with resinous glands beneath; fruits black when mature; [native] . . . . . . . . . . . . . . . . R. americanum
7 Leaves not glandular beneath; fruits red when mature; [introduced, rarely naturalized] . . . . . . . . . . R. rubrum

\section*{Auxiliary Key to widely distributed Ribes of the Mountains}

1 Leaves usually \(5-10 \mathrm{~cm}\) long and wide, serrate or doubly serrate with sharp teeth; plants usually without nodal spines; inflorescence a raceme of 4-15 flowers; pedicel jointed below the fruit R. glandulosum

1 Leaves 1-5 cm long and wide, serrate with rounded teeth; plants usually with nodal spines; inflorescence a raceme of 1-4 flowers; pedicel not jointed below the fruit.
2 Ovary with glandular hairs which become stiff spines on the mature fruit; leaf bases cordate to deeply cordate (rarely truncate or cuneate), the angle of leaf tissue mostly 190-230 degrees, moderately to sparsely silvery-pilose beneath, usually on the surface as well as on the veins and in the vein axils; stamens at full anthesis equalling the petals
R. cynosbati
