2 Ovary and fruit glabrous; leaf bases rounded or cuneate (rarely truncate or cordate), the angle of leaf tissue mostly 130-170 degrees, glabrescent to sparsely pubescent beneath (mostly on the veins and in the vein axils); stamens at full anthesis exceeding the petals
\(R\). rotundifolium

Ribes americanum P. Miller, American Black Currant. Mt (VA): moist forests, marl marshes; rare (VA Rare). April-June. Nova Scotia west to Alberta, south to w. VA, IN, NE, and CO. [= C, F, G, K, W]

Ribes cynosbati Linnaeus, Prickly Gooseberry, Dogberry. Mt (GA, NC, VA): moist slopes, periglacial boulderfields, grassy balds, mostly at high elevations; common. May-June; July-September. Ne. United States and s. Canada south to w. NC, e. TN, n. GA, n. AL, AR, and OK. [= RAB, C, G, K, W, Z; > R. cynosbati var. cynosbati - F; > R. cynosbati var. glabratum Fernald -- F; = Grossularia cynosbati (Linnaeus) P. Miller -- S]

Ribes echinellum (Coville) Rehder, Miccosukee Gooseberry. Pd (SC): mesic, nutrient-rich forests; rare (US Endangered, SC Rare). March-April; June-September. This species has a remarkable range, known only from a small area of McCormick County, SC and the vicinity of Lake Miccosukee, Jefferson County, FL. Godfrey (1988) has a detailed description of R. echinellum. Catling, Dumouchel, \& Brownell (1998) discuss its pollination biology. [= K, Z; = Grossularia echinella Coville -- S]

Ribes glandulosum Grauer, Skunk Currant, Mountain Currant. Mt (NC, VA): periglacial boulderfields, high elevation seeps, spruce-fir forests; uncommon, but locally abundant (VA Watch List). May-June; June-September. Newfoundland and British Columbia, south to VT, MI, and MN, and in the mountains to w. NC and e. TN. [= RAB, C, F, G, K, S, W]

Ribes lacustre (Persoon) Poiret, Bristly Black Currant, Spiny Swamp Currant. Mt (VA): forests, acid swamps; rare (VA Rare). May-June. Labrador to AK, south to MA, PA, w. VA, TN (allegedly), n. OH, MI, MN, CO, UT, and CA. The documentation for the inclusion of \(R\). lacustre in the flora of VA is a sterile specimen not definitely identifiable (Wieboldt, pers. comm.). [= C, F, G, K, W]
*? Ribes missouriense Nuttall, Missouri Gooseberry. Mt (VA): forests; rare, probably introduced from further west (VA Watch List). April-June; May-July. W. WV, sw. OH, IN, WI, MN, and e. ND south to KY, TN, s. IL, MO, n. AR, and KS, with scattered occurrences (perhaps escapes from cultivation) in CT, NJ, PA, MD, and VA. [= C, F, G, K, Z; = Grossularia missouriensis (Nuttall) Coville \& Britton -- S]

Ribes rotundifolium Michaux, Appalachian Gooseberry. Mt (NC, SC, VA), Pd (VA): moist slopes, balds, boulderfields, rocky forests, mostly at high elevations south of VA; common (rare in Piedmont). April-May; June-September. An Appalachian endemic: MA, CO, and NY south to w. NC and e. TN. [= RAB, C, F, G, K, W, Z; = Grossularia rotundifolia (Michaux) Coville \& Britton -- S] * Ribes rubrum Linnaeus, Garden Red Currant. Mt (NC, VA), Pd (VA): persistent from cultivation and rarely escaped to adjacent fence-rows and disturbed areas; rare, native of Europe. [= K; > R. sativum Syme -- C, F, G]

Ribes aureum Pursh var. villosum Augustin de Candolle, Buffalo Currant, of midwestern United States is cultivated in ne. United States, rarely as far south as our area; it may escape. It also is reported as occurring as a native species as far east as Montgomery County in nc. TN (Chester, Wofford, \& Kral 1997). It will key to couplet 6 , where trouble will be encountered. It has the hypanthium long-tubular, the flowers golden yellow, and fruits black (rarely yellow). [=K; = R. odoratum H. Wendland -- C, F, G] \{not yet keyed\}

Ribes curvatum Small, Granite Gooseberry. Pd, Mt (GA): rocky upland forests; rare (GA Special Concern). Native from c. and nw. GA (Jones \& Coile 1988) and e. TN, in the Cumberland Plateau (Chester, Wofford, \& Kral 1997) westward. Also reported for NC by Sinnott (1985), and his report is backed up by specimens. The specimens, however, indicate that the species was cultivated in a botanist's garden; there is no evidence that \(R\). curvatum is a native or naturalized component of NC's flora. It will key best to \(R\). missouriense; it can be distinguished from all our species of gooseberries by its glandular-punctate leaves, and additionally from \(R\). missouriense by its calyx lobes \(7.5-9 \mathrm{~mm}\) long, sparsely hairy to villous (vs. 5-7.5 mm long, glabrous to sparsely pubescent). [= K; = Grossularia curvata (Small) Coville \& Britton -- S] \{not yet keyed\}

Ribes hirtellum Michaux, Northern Gooseberry, ranges south to WV (Tucker County), n. NJ, s. PA, and OH. It will key to couplet 2, where trouble will be encountered. It has glabrous ovaries and fruits, but the stamens are short and included. [= C, K; > R. hirtellum var. hirtellum - F, G] \{not yet keyed\}
* Ribes nigrum Linnaeus, Garden Black Currant or Cassis, native to Europe, is cultivated in ne. United States, rarely as far south as our area; it may escape. It will key to \(R\). americanum, from which it can be distinguished by its pedicels \(2-8 \mathrm{~mm}\) long, much longer than subtending ovate bracts (vs. pedicels \(0-2 \mathrm{~mm}\) long, shorter than the subtending lanceolate bracts). [=C, F, G, K] \{not yet keyed\}

Ribes triste Pallas, Swamp Red Currant, ranges south to WV (Mineral, Pocahontas, and Randolph counties); it may occur in our area. It is very similar to \(R\). rubrum, and will key there. It differs in the following ways: decumbent or straggling shrub (vs. erect), axis and pedicels of inflorescence often with stipitate glands (vs. not glandular). If found in our area, it should be in an obviously native habitat, likely in boggy forests or seepage wetlands at high elevations, and probably in VA. [= C, F, G, K] \{not yet keyed\}
* Ribes uva-crispa Linnaeus var. sativum Augustin de Candolle, Garden Gooseberry, native of Europe, is cultivated in ne. United States, rarely as far south as our area; it may escape. It will key best to \(R\). cynosbati, but differs in the fruits being glandularpubescent (vs. hispid), and the peduncles and pedicels being short (vs. peduncles 7-25 mm long, pedicels 5-16 mm long). [=K; > \(R\). uva-crispi -- C; = R. grossularia Linnaeus \(-\mathrm{F}, \mathrm{G}]\) \{not yet keyed\}

\section*{HALORAGACEAE (Water-milfoil Family)}

A family of about 9 genera and 145 species, aquatic and wetland herbs, but also shrubs and trees, cosmopolitan but centered in the Southern Hemisphere. The family is sometimes spelled "Haloragidaceae."

1 Leaves whorled or alternate; stamens 4 or 8; carpels 4; emersed leaves bract-like and much-reduced (except in M. aquaticum)
. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Myriophyllum

1 Leaves alternate; stamens 3; carpels 3 ; emersed leaves foliaceous, little if at all reduced . . . . . . . . . . . . . . . . . Proserpinaca

Myriophyllum Linnaeus (Water-milfoil)
(contributed by B.A. Sorrie and A.S. Weakley)
A genus of about 60 species, aquatic and wetland herbs, cosmopolitan, but centered in Australia. References: Crow \& Hellquist (2000) \(=\) Z; Aiken (1981). Keys adapted from Aiken (1981), GW, RAB, C, and Z.

Keying Note: \{Treatment partial at this time, owing to confusion in various sources about taxa in our area -- material at all area herbaria needs to be looked at to resolve uncertainties -- neither key includes all species attributed to our area by Aiken, Harvill et al. (1992), C, etc.\}

Key 1
(treating 6 species, not M. humile, M. sibiricum, or M. verticillatum)
1 Submersed leaves entire and scale-like (or absent); plants unbranched, erect from the substrate . . . . . . . . . . . . M. tenellum 1 Submersed leaves pinnately divided into filiform segments; plants usually branched, floating in the water column.

2 Leafy vegetative branches considerably emersed, markedly featherlike; emersed leaves mostly 2.5-3.5 cm long; plants dioecious (ours pistillate), but rarely flowering M. aquaticum

2 Leafy vegetative branches mostly submersed (unless stranded by low water), not markedly featherlike (although pinnately divided); emersed leaves less than 2 cm long; plants monoecious, the upper flowers staminate.

3 Bracts of the inflorescence usually longer than the internodes of the axis, very conspicuous even at a distance.
4 Submersed leaves with a total of 7-17 segments; bracts normally pectinately toothed; fruit mericarps each with with 2 longitudinal ridges, the ridges sharply tuberculate
M. pinnatum

4 Submersed leaves with a total of (15-) 17-31 (-37) segments; bracts normally broad, serrate to entire (sometimes pectinate when stranded); fruit mericarps rounded longitudinally or with 2 low ridges, the ridges obscurely tuberculate with low, rounded projections
M. heterophyllum

3 Bracts of the inflorescence shorter than the internodes of the axis, inconspicuous at almost any distance.
5 Submersed leaves with a grayish cast, with a total of at least 23 segments neatly disposed in pairs (or suboppositely), parallel to each other; bracts elliptical to obovate, entire (or nearly so) . . . . . . . . . M. spicatum
5 Submersed leaves green or with a reddish cast, with a total of 7-15 (-17) segments disposed alternately, irregularly, or suboppositely (nt neatly); lower bracts pectinate, above gradually becoming lanceolate and fewtothed, then narrowly obovate and nearly entire
M. laxum

\section*{Key 2}
(treating 7 species in our area, not \(M\). humile or M. sibiricum)
1 Submersed leaves entire and scale-like (or absent); plants unbranched, erect from the substrate .............. . M. tenellum
1 Submersed leaves pinnately divided into filiform segments; plants usually branched, floating in the water column.
2 Submersed leaves (at least some of them) alternate or "pseudo-whorled' (some of the leaves separated by very short internodes), often some of them also opposite or in true whorls of 3-5.
3 Upper bracts subentire, spatulate, shorter than the adjacent flowers; submersed leaves with a total of 11-21 capillary divisions . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . M. \(\boldsymbol{M}\) Iaxum
3 Upper bracts pinnately divided, filiform, much longer than the adjacent flowers; submersed leaves with a total of 8-10 (rarely more) capillary divisions
M. pinnatum

2 Submersed leaves all whorled (sometimes "pseudo-whorled" in M. heterophyllum).
4 Emergent leaves mostly 2.5-3.5 cm long, with 18-36 uniform linear divisions, each 4-8 mm long .... M. aquaticum
4 Emergent leaves all less than 2.0 cm long, entire, serrate, or pectinate, the teeth or divisions < 4 mm long. 5 Upper bracts entire; lower bracts entire, pectinate, or serrate, not more than \(2 \times\) the length of the adjacent pistillate flowers M. spicatum 5 Upper bracts pectinate or dentate; lower bracts pectinate, usually \(>2 \times\) as long as the adjacent pistillate flowers. 6 Bracts laminate, the lower more deeply toothed than the upper; bracteoles 1.0-1.3 mm long

6 Bracts without a distinct lamina, the lower pinnatifid, the upper pectinate; bracteoles absent or less than 0.1 mm long
[M. verticillatum]
* Myriophyllum aquaticum (Vell. Conc.) Verdc., Parrot-feather. Cp, Pd, Mt (NC, VA); \{GA\}: ditches, slow-moving rivers, pools, ponds; common (rare in Piedmont and Mountains), native of South America. April-June. An introduced species now widespread in se. United States, north to NY, WV, and MO. [= C, GW, K, W, Z; ? M. brasiliense Cambessedes -- RAB, F, G; ? M. proserpinacoides Gillies ex Hooker \& Arnott -- S]

Myriophyllum heterophyllum Michaux, Southern Water-milfoil. Cp (NC, VA), \{GA, SC\}: ditches, slow-moving waters of rivers and streams, pools, ponds; common. April-July. NY west to Ontario and MN, south to FL and TX. [= RAB, C, F, G, GW, K, S, Z]

Myriophyllum humile (Rafinesque) Morong. Cp (VA): floating in an artificial pond; rare (VA Rare). [= C, F, G, K, Z]
Myriophyllum laxum Shuttleworth ex Chapman, Loose Water-milfoil. Cp (GA, NC, SC, VA): limesink depression ponds (dolines), spring-runs, rarely also in lakes; rare (GA Threatened, NC Threatened, SC Rare). June-October. Se. VA south to n. FL, s. AL, and s. MS (Sorrie \& Leonard 1999). M. laxum and M. heterophyllum both have reddish submersed stems and present difficulties in identification when in sterile condition. M. laxum has a total of 7-15 (-17) segments per leaf, vs. (15-) 17-31 (-37) segments in M. heterophyllum. Documented for VA by a 1922 specimen from Princess Anne County at GH (Sorrie, pers. comm.). [= RAB, GW, K, S]

Myriophyllum pinnatum (Walter) Britton, Sterns, \& Poggenburg, Alternate-leaved Water-milfoil. Cp (NC, VA), Mt (VA), \{GA, SC\}: pools, ditches; uncommon (VA Watch List). June-October. MA west to IA and SD, south to GA and TX. [= RAB, C, F, G, GW, K, S, W, Z]
* Myriophyllum spicatum Linnaeus, Eurasian Water-milfoil. Cp (SC), \{GA, NC, VA\}: ponds and impoundments; uncommon? \{habitat and range in our area uncertain\}, native of Eurasia, confused with M. sibiricum, (see below). An introduced species, now widespread in e. United States. Reported for South Carolina by Hill \& Horn (1997). [= C, GW, K, W, Z]

Myriophyllum tenellum Bigelow, Leafless Water-milfoil. Cp (NC, VA): natural lakes (Carolina bay lakes), typically growing on the sandy bottoms in water 1-2 meters deep; rare (NC Rare, VA Rare). Newfoundland west to MN, south to PA and NJ, and disjunct south to a few occurrences in VA and NC. [= C, F, G, K, Z]

Myriophyllum sibiricum Komarov is reported to range south to VA. It is closely related to M. spicatum, but can be distinguished by leaf divisions mostly 10-24 per leaf (vs. mostly 24-40 per leaf), presence of oblanceolate turions (vs. not turion-forming), stem not thickened below inflorescence (vs. stem thickened to nearly \(2 \times\) the diameter of the lower stem). Given the dispersal of this genus via waterfowl and boats, other species may be found to occur in our area, at least as vagrants. [= C, G, K, Z; > M. exalbescens Fernald - F]

Myriophyllum verticillatum Linnaeus. Habitat and range in our area uncertain. A circumboreal species, south in North America to DE, MD, IN, NE, TX, and CA. [= C, G, K, Z; > M. verticillatum var. pectinatum Wallroth -- F]

\section*{Proserpinaca Linnaeus (Mermaid-weed)}

A genus of 2-3 species, aquatic and wetland herbs, of e. North America and the West Indies. References: Catling (1998)=Z.

1 Bracteal (emersed) leaves serrate; submersed pectinate leaves with 8-14 pairs of divisions \(5-30 \mathrm{~mm}\) long; fruits \(2.3-6.0 \mathrm{~mm}\) wide.
2 Fruit 2.3-4.0 mm wide, acutely angled, not winged, the sides of the capsule more-or-less planar . P. palustris var. crebra
2 Fruit (3.5-) 4.0-6.0 mm wide, sharply angled (to somewhat winged), the sides of the capsule concave
1 Bracteal (emersed) leaves pinnatifid to pectinate; submersed pectinate leaves with 4-12 pairs of divisions 2-7.5 mm long; fruits 2.0-3.6 mm wide

3 Leaves with a flattened rachis 1-4 mm wide, the \(7-12\) pairs of divisions 2.0-3.5 mm long; fruits 2.3-3.6 mm wide . . . . . . . .
3 Leaves with a filiform rachis (midrib) 0.2-1.0 mm wide, the \(4-9\) pairs of divisions \(2.0-7.5 \mathrm{~mm}\) long; fruits \(2.0-2.8 \mathrm{~mm}\) wide
P. pectinata

Proserpinaca intermedia Mackenzie, Intermediate Mermaid-weed. Cp (NC, SC, VA), Mt (VA); \{GA\}: wet places; rare (NC Watch List). July-September. Nova Scotia to SC on the Coastal Plain; disjunct in sc. TN. This taxon is intermediate in morphology between \(P\). palustris and \(P\). pectinata; whether it warrants species status is unclear. If merely a rarely produced first-generation hybrid, it should be treated as a hybrid binomial ( \(P\). xintermedia); if it forms independent, self-reproducing populations, it should probably be treated as a species. [= RAB, C, F, G, K, Z; <P. palustris -- GW]

Proserpinaca palustris Linnaeus var. crebra Fernald \& Griscom, Common Mermaid-weed. Cp (GA, NC, SC, VA): wet places, swamp forests; uncommon. June-October. Throughout e. North America and south to the Caribbean and Central America. [= C, F, G, K, Z; < P. palustris -- RAB, S, W; < P. palustris -- GW (also including P. intermedia)]

Proserpinaca palustris Linnaeus var. palustris, Coastal Mermaid-weed. Cp (NC, SC, VA), Pd (NC, SC), \{GA\}: wet places, swamp forests; common. June-October. MA (?) to FL and west to LA, on the Coastal Plain. [= C, F, G, K, Z; < P. palustris -- RAB, \(\mathrm{S}, \mathrm{W}\); \(P\). palustris -- GW (also including \(P\). intermedia)]

Proserpinaca pectinata Lamarck, Feathery Mermaid-weed. Cp (NC, SC, VA), \{GA\}: bogs, savannas, ditches, other wet places; common. June-October. Nova Scotia south to s. FL and west to w. LA, mostly on the Coastal Plain, but scattered inland as well, as in c. TN. [= RAB, C, F, G, GW, K, S, Z]

Proserpinaca palustris Linnaeus var. amblyogona Fernald occurs east to KY, TN, and GA. [= C, F, G, K; < P. palustris GW, S] \{not yet keyed\}

HAMAMELIDACEAE R. Brown 1818 (Witch Hazel Family) (see also ALTINGIACEAE)

A family of ca. 27 genera and ca. 87 species, trees and shrubs, tropical to temperate, and especially e. Asian. References: Meyer in FNA (1997); Endress in Kubitzki, Rohwer, \& Bittrich (1993).

1 Leaves 5-7-palmately lobed and palmately veined, glabrous . . . . . . . . . . . . . . . . . . . [see Liquidambar in ALTINGIACEAE] 1 Leaves unlobed, pinnately veined, stellate-pubescent beneath (at least when young).

2 Petals 0; stamens 12-32; flowers numerous in dense globose or elongate spikes; leaves with a symmetric or asymmetric (oblique) base, the lateral veins marginal for a distance of at least 2-3 mm; [tribe Fothergilleae]

Fothergilla
2 Petals 4; stamens 4; flowers few in small clusters; leaves with a weakly to strongly asymmetric (oblique) base, the lateral veins included in the blade tissue or barely exposed for a distance of \(<1 \mathrm{~mm}\); [tribe Hamamelideae]

Hamamelis

\section*{Fothergilla Murray in Linnaeus 1774 (Witch-alder)}

A genus of 2 species, shrubs, of temperate e. North America. References: Meyer in FNA (1997); Weaver (1969)=Z; Endress in Kubitzki, Rohwer, \& Bittrich (1993).

Identification notes: Fothergilla major often occurs with Hamamelis virginiana, with which it is easily confused in vegetative condition; a reliable character is the base of the lateral veins (marginal in Fothergilla, included in leaf tissue in Hamamelis).

1 Leaves stellate-pubescent above, up to 6 cm long and 5 cm wide (the largest less than 5.2 cm wide); stamens 12-24; capsules 6.5-10-5 (-13) mm long, the persistent hypanthium 3.4.5 mm long; seeds 4.8-6.3 mm long; [of wet savannas, pocosins, and pocosin margins of the Coastal Plain]
F. gardenii

1 Leaves glabrous or sparsely stellate-pubescent above, up to 12 cm long and 10 cm wide (the largest more than 5.2 cm wide); stamens (18-) 22-32; capsules 8-15.2 mm long, the persistent hypanthium 4-9.2 mm long; seeds 6.2-7.8 mm long; [of rocky habitats of the Mountains and Piedmont] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . F. \(\boldsymbol{m}\) major

Fothergilla gardenii Linnaeus, Coastal Witch-alder. Cp (GA, NC, SC): wet savannas, pocosins, and pocosin margins; uncommon (GA Threatened). March-May; September-October. Se. NC (and allegedly se. VA) south to panhandle FL and s. AL. An ornamental prized for its small size and attractive fall color. [= RAB, F, FNA, GW, K, S, Z; F. parvifolia Kearney -- S]

Fothergilla major (Sims) Loddiges, Large Witch-alder. Mt, Pd (GA, NC, SC): dry ridgetop forests of middle elevation ridges in the mountains, especially along the Blue Ridge Escarpment, summits and upper slopes of Piedmont monadnocks, north-facing bluffs in the lower Piedmont; rare (GA Special Concern, NC Rare, SC Rare). April-May; July-October. C. NC west to ne. TN, south to nc. GA and nc. AL; disjunct in AR. [= RAB, FNA, K, S, W, Z; F. monticola Ashe]

Hamamelis Linnaeus 1753 (Witch-hazel)

A genus of 5-6 species, shrubs and small trees, of e. North America and e. Asia (China and Japan). The other North American species, H. vernalis Sargent, is endemic to the Ozark/Ouachita region of AR, OK, and MO. References: Meyer in FNA (1997); Wen \& Shi (1999); Endress in Kubitzki, Rohwer, \& Bittrich (1993).

Hamamelis virginiana Linnaeus, Witch-hazel. Mt, Pd, Cp (GA, NC, SC, VA): forests; common. October-December; OctoberNovember (of the following year). Québec and Nova Scotia west to n. MI and MN, south to FL and TX. Some Coastal Plain populations in SC and GA have very small leaves and may warrant taxonomic recognition; they need additional study. The bark is still gathered in large quantities in the Southern Appalachians, as the source for witch hazel liniment. The name "witch-hazel" alludes to its superficial resemblance to Corylus, the true hazel, and to its "perverse" habit of flowering in the fall, as it drops its leaves. [= RAB, C, F, FNA, G, GW, K, S, W; > H. virginiana var. parvifolia Nuttall -- F; > H. virginiana var. virginiana - F]
```

HIPPOCASTANACEAE (Buckeye Family)
(see SAPINDACEAE)

```

\section*{HYDRANGEACEAE (Hydrangea Family)}

A family of about 17 genera and 190-220 species, trees, shrubs, vines, and herbs, primarily north temperate. As here interpreted, the family Hydrangeaceae includes two well-marked groups, the Hydrangeae (including Decumaria and Hydrangea) and the Philadelpheae (including Deutzia and Philadelphus). This group has been shown by molecular research to be unrelated to the Saxifragaceae, and to have its closest affinities to the Loasaceae, Cornaceae, and Nyssaceae (Xiang et al. 2002; Soltis, Xiang, \& Hufford 1995; Morgan \& Soltis 1993). References: Spongberg (1972); Soltis, Xiang, \& Hufford (1995); Morgan \& Soltis (1994); Xiang et al. (2002); Hufford in Kubitzki (2004).

1 Woody vine, climbing by aerial rootlets; petals 7-10; [tribe Hydrangeae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Decumaria 1 Shrub; petals 5 (rarely 10 in the cultivars of the alien Deutzia).

2 Pubescence of leaves and twigs stellate; stamens 10; [a cultivated alien, rarely escaped]; [tribe Philadelpheae] . . Deutzia 2 Pubescence of leaves and twigs simple; stamens 8-10 (in Hydrangea) or 25-90 (in Philadelphus); [natives and aliens]. 3 Leaf blades \(10-30 \mathrm{~cm}\) long; inflorescences of 25-many flowers; stamens 8-10; [tribe Hydrangeae] . . . . . Hydrangea 3 Leaf blades 3-8 cm long; inflorescences of 1-7 flowers; stamens 25-90; [tribe Philadelpheae] . . . . . . Philadelphus

\section*{Decumaria Linnaeus (Climbing Hydrangea, Woodvamp)}

A genus of 2 species, vines, of e. North America and e. Asia (China). References: Hufford in Kubitzki (2004).
Identification notes: Decumaria is readily distinguished from the other opposite-leaved, woody vines in our flora (Gelsemium, Trachelospermum, Lonicera, Bignonia, Campsis, and Clematis) by its leaves (simple, ovate, and usually serrate) and climbing structures (adventitious roots).

Decumaria barbara Linnaeus, Climbing Hydrangea, Woodvamp. Cp (GA, NC, SC, VA), Pd (GA, SC), Mt (GA, NC): swamp forests and bottomlands in the Coastal Plain (and Piedmont of SC), moist forests in the mountains of n. GA, nw. SC, sw. NC; common (rare in Mountains). May-June; July-October. Se. VA south to FL and west to LA, inland to nw. SC, se. TN, and w. TN. This handsome vine climbs to the tops of trees via adventitious roots. The opposite leaves are somewhat fleshy in texture. [= RAB, C, F, G, GW, K, S, W]

\section*{Deutzia Thunberg (Deutzia)}

A genus of about 60 species, shrubs, mainly Asian. References: Hufford in Kubitzki (2004).
* Deutzia scabra Thunberg, Deutzia, Pride-of-Rochester. Mt (NC, VA), Pd, Cp (VA): fairly commonly cultivated, persistent around old homesites and escaping to adjacent woodlands; rare, native of Japan and China. [= C, F, K]
* Deutzia crenata Siebold \& Zuccarini, Chinese Deutzia, is introduced in GA (Kartesz 1999). [= K] \{not yet keyed\}

A genus of about 25 species, shrubs, of e. North America and e. Asia. Recent molecular analyses suggest that Hydrangea as usually interpreted is polyphyletic (Soltis, Xiang, \& Hufford 1995); future taxonomic changes are to be expected. See Dirr (2004) and van Gelderen \& van Gelderen (2004) for information on cultivated hydrangeas. References: Pilatowski (1982)=Z; McClintock (1957) \(=Y\)

1 Leaves pinnately lobed, the lobes toothed; inflorescence a panicle; large sterile flowers many (more than 20 per inflorescence), borne throughout the inflorescence H. quercifolia

1 Leaves unlobed, merely toothed; inflorescence a corymb (except \(H\). paniculata); large sterile flowers absent to relatively few (0-15 per inflorescence), borne around the periphery of the corymb (except H. paniculata).
2 Inflorescence a panicle; large sterile flowers many (more than 20 per inflorescence), borne throughout the inflorescence; [large shrub to small tree (to 8 m tall); small tree to 6 m tall, or shrub; [alien, cultivated and sometimes persistent] H. paniculata

2 Inflorescence a corymb; large sterile flowers absent to relatively few ( \(0-15\) per inflorescence), borne around the periphery of the corymb; [small to medium shrub, to 3 m tall]; shrub; [native].
3 Lower leaf surface glabrous or inconspicuously puberulent, appearing green; trichomes of the lower leaf surface restricted to the midrib and major veins; sterile flowers absent, or, if present, usually less than 1 cm in diameter ....
H. arborescens

3 Lower leaf surface variously pubescent, appearing white or gray; trichomes of the lower leaf surface on veins and interveinal areas; sterile flowers usually present, large and showy, usually greater than 1 cm in diameter.
4 Lower leaf surface velutinous, pilose, or tomentose, appearing gray; trichomes usually not dense enough to entirely mask the green leaf surface; trichomes with prominent tubercles (as seen at \(40 \times\) magnification); sterile flowers generally very few (0-3 per inflorescence) . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . H. cinerea
4 Lower leaf surface densely floccose-velutinous, felt-like, appearing bright white or silver; trichomes dense enough to entirely mask the green leaf surface; trichomes without tubercles, or with small and inconspicuous tubercles (as seen at \(40 \times\) magnification); sterile flowers generally fairly many (2-15 per inflorescence)
H. radiata

Hydrangea arborescens Linnaeus, Smooth Hydrangea. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): forests, especially around rock outcrops and along streambanks; common (rare in Coastal Plain). May-July. NJ, s. NY, OH, IN, IL, MO, and se. KS south to e. NC, c. SC, c. GA, panhandle FL, s. AL, LA, and OK. [=K, S, W, Z; = H. arborescens ssp. arborescens -- RAB, Y; = H. arborescens var. arborescens -- C, G, in a broader sense; >H. arborescens var. arborescens - \(F\), in a narrower sense; \(>\boldsymbol{H}\). arborescens var. oblonga Torrey \& A. Gray -- F]

Hydrangea cinerea Small, Ashy Hydrangea. Mt, Pd (GA, NC, SC): rocky forests and rock outcrops, roadbanks, perhaps strictly or mostly associated with mafic or calcareous rocks; uncommon. May-July. Sw. NC, c. IN, c. IL, and c. MO south to n. SC, sc. AL, and c. AR. [= K, S, W, Z; = H. arborescens ssp. discolor (Seringe) McClintock -- RAB, Y; = H. arborescens var. discolor Seringe -- C, G; = H. arborescens var. deamii E. St. John -- F]
* Hydrangea paniculata Siebold, Panicle Hydrangea. Mt (NC, VA): persistent after cultivation at old home-sites, sometimes appearing naturalized; rare, native of e. Asia. July-August. [= C, F, G, K]

Hydrangea quercifolia Bartram, Oakleaf Hydrangea. Pd, Mt, Cp (GA, *NC, SC): native in rich foothill forests (very rare), also in disturbed areas, thickets, or forests adjacent to urban or suburban areas; rare, introduced from further south. May-July. C. and sw. TN and nw. SC, south through w. GA, AL, and MS to panhandle FL and e. LA; scattered elsewhere as a remnant or escpae from cultivation. Boufford \& Wood (1977) describe an apparently native occurrence in nw. SC. This southeastern native is a spectacular garden plant, frequently planted, rarely escaping or persisting. [= C, F, G, K, S]

Hydrangea radiata Walter, Snowy Hydrangea, Silverleaf. Mt (GA, NC, SC), Pd (NC, SC): rocky forests and rock outcrops, often common and conspicuous on roadbanks; common. May-July. A Southern Appalachian endemic: sw. NC (in the valley of the French Broad River and to its southwest), nw. SC, ne. GA, and se. TN, with outliers (perhaps escaped from cultivation?) in Stokes County, NC and Calhoun County, SC. This attractive species is especially typical of the escarpment gorge region near the tricorner of NC, SC, and GA, in the vicinity of the towns of Highlands, Cashiers, and Rosman, NC, where it is conspicuous along roadbanks. [= K, S, W, Z; = H. arborescens ssp. radiata (Walter) McClintock -- RAB, Y]

\section*{Philadelphus Linnaeus (Mock-orange)}

A genus of 65 (or fewer) species, shrubs, of north temperate areas. The most recent monographer of the genus, Hu (1954-1955) recognizes many species and varieties on the basis of minor differences in pubescence. Many of the recognized taxa are based only on cultivated material. The native distributions of the varieties have little phytogeographic coherence, and several varieties are often reported from the same site, suggesting that they reflect merely variation within a population (if genetically based at all). For instance, Hu recognizes three varieties in Ph. hirsutus and five in Ph. inodorus, but these seem to be no more than forms. As Hu writes, "the formerly recognized species, Ph. grandiflorus Willd., and Ph. laxus Schrad., are merely different forms of a species with heterogeneous leaf shape, size, and margins. Fostered by growers, propagated and distributed through cuttings, these forms have maintained their distinction in gardens since their discoveries. But when they are projected on the spectrum of variations exhibited by a large number of specimens collected from the homeland of Ph. inodorus Linn. they appear to be nothing but a few transitional forms. In this paper, these forms are treated as varieties." Hu's "varieties" should be treated as forms or cultivars, if recognized at all. I have taken a conservative approach, though variation in several of our native species could use additional study. References: Hu (1954-1955)=Z; A.E. Weakley (2002).

1 Axillary buds exposed; twigs of the current year villous-hirsute; seeds not caudate; [subgenus Deutzioides, section Deutzioides]
Ph. hirsutus

1 Axillary buds enclosed; twigs of the current year glabrous; seeds with caudate tails about as long as the embryo; [subgenus Philadelphus].
2 Flowers \(1-3(-9)\) in a cymule; stamens \(60-90\); [subgenus Philadelphus, section Pauciflorus] ............... Ph. inodorus
2 Flowers \(5-9\) in a determinate raceme; stamens \(20-50\); [subgenus Philadelphus, section Philadelphus].
3 Bark of the current year brown, exfoliating in its second year; flowers fragrant ................. Ph. coronarius
\(3 \quad\) Bark of the current year gray, not exfoliating later; flowers not fragrant or only slightly so ........ Ph. pubescens
* Philadelphus coronarius Linnaeus, European Mock-orange. Pd (NC), \{GA, SC, VA\}: cultivated (though moreso in the past than now), and sometimes escaped or persisting around old homesites; rare, native of Europe. May-July. Ph coronarius is the most commonly cultivated Philadelphus in our area, though it is currently considered rather old-fashioned. [= C]

Philadelphus hirsutus Nuttall, Hairy Mock-orange, Cumberland Mock-orange. Mt (GA, NC, SC, VA), Pd (SC): bluffs, rock outcrops, rocky woodlands, often with seepage, over mafic or calcareous rocks; rare (NC Watch List, SC Rare, VA Watch List). April-May; June-August. A Southern Appalachian species: sw. VA and KY south and west to w. NC, TN, n. GA, and n. AL. Ph. sharpianus Hu , known from e. TN and nc. AR, is similar to Ph. hirsutus, allegedly differing in the hypanthium glabrous (vs. more or less pubescent), the leaves strigose-pilose above, glabrous or sparsely strigose or with the nerves only villous beneath (vs. scabrous-hirsute above, uniformly villous beneath); it is probably best considered only a form of Ph. hirsutus. Ph. hirsutus is cultivated and it may escape outside of the range stated. [=RAB, C, F, G, S, W; >Ph. hirsutus - K, Z, in a narrower sense; > Ph. sharpianus Hu -- K, Z; > Ph. hirsutus var. intermedius Hu -- Z; > Ph. hirsutus var. nanus Hu -- Z; > Ph. sharpianus Hu var. parviflorus Hu -- Z]

Philadelphus inodorus Linnaeus, Appalachian Mock-orange. Mt, Pd, Cp (GA, NC, SC, VA): rich forests and woodlands, rocky bluffs over mafic or calcareous rocks, and also cultivated and persistent; uncommon (rare in Coastal Plain). April-May; JuneAugust. VA and TN south to panhandle FL, GA, and s. AL (and according to C, also in e. PA). Ph. floridus Beadle, known from nw. GA, is similar to Ph. inodorus, allegedly differing in the pedicels and hypanthium pubescent (vs. glabrous); it is probably only a form of Ph. inodorus. [= RAB, C, G, W; > Ph. inodorus var. inodorus - F, S, Z; > Ph. inodorus var. carolinus Hu -- Z; > Ph. inodorus var. grandiflorus (Willdenow) A. Gray -- F, Z; >Ph. inodorus var. laxus (Schrader) Hu -- Z; >Ph. inodorus var. strigosus Beadle -- S, Z; > Ph. grandiflorus Willdenow -- S; > Ph. gloriosus Beadle -- S; > Ph. inodorus - K; > Ph. floridus Beadle -- K, S, Z]

Philadelphus pubescens Loiseleur, Ozark Mock-orange, Hairy Mock-orange. Mt (GA): limestone bluffs; rare (GA Special Concern). E. TN, KY, nw. GA (Jones \& Coile 1988), AL, s. IL, MO, OK, and AR, west of the Blue Ridge. It has been documented from TN counties adjacent to both VA and NC, and is likely to be found in VA, at least. [ \(>\) Ph. intectus Beadle -- S, Z; > Ph. latifolius Schrader ex Augustin de Candolle -- S; >Ph. intectus var. pubigerus Hu -- Z; >Ph. pubescens var. verrucosus (Schrader) Hu -- Z; > Ph. pubescens var. pubescens - K, Z; > Ph. pubescens var. intectus (Beadle) A.H. Moore - K]

\section*{HYDRASTIDACEAE (Golden-seal Family)}

A family of 2 genera and 2 species, perennial herbs, of temperate e. North America and Japan. In chemistry, morphology, and anatomy, Hydrastis shows some relationship to Podophyllum and Diphylleia of the Podophyllaceae (often included in the Berberidaceae). Though usually placed in the Ranunculaceae, Tobe \& Keating (1985) present evidence from morphology, anatomy, embryology, palynology, chemistry, and cytology that suggests that Hydrastis is best recognized as a monotypic family. They contend that "Hydrastis represents a relictual primitive group which very early diverged from a common ancestral stock of the Ranunculaceae, Berberidaceae and probably of Circaeasteraceae, and that Hydrastis has evolved in its own evolutionary line parallel with other lines leading to the modern representatives of these families." In recent papers on classification of the flowering plants, Thorne (1992) and Reveal (1993) have also accepted Hydrastidaceae as a distinct family. Tobe in Kubitzki \& Bayer places Hydrastis with Glaucidium Siebold \& Zuccarini in a bigeneric Hydrastidaceae. References: Tamura in Kubitzki, Rohwer, \& Bittrich (1993); Tobe in Kubitzki \& Bayer (2002).

\section*{Hydrastis Linnaeus 1759 (Golden-seal)}

A monotypic genus, an herb, endemic to e. North America. References: Ford in FNA (1997); Tamura in Kubitzki, Rohwer, \& Bittrich (1993).

Hydrastis canadensis Linnaeus, Golden-seal. Mt (GA, NC, SC, VA), Pd (GA, NC, VA): mesic, very nutrient-rich forests, with circumneutral soils, over calcareous or mafic rocks such as limestone, amphibolite, and dolostone, sometimes forming large colonies after canopy disturbance such as logging; rare (GA Endangered, NC Endangered, VA Watch List). April; May-June. VT and MN south to w . and c. NC, n. GA, TN, and AR. Exploited for the herbal trade (and still often used as a home remedy in more remote parts of the mountains, though too rare in our area to support any economically significant wild collection. The root is bitter in taste and contains several alkaloids. Reported for SC (P. McMillan, pers.comm. 2002). [= RAB, C, F, FNA, G, K, S, W)

\section*{HYDROLEACEAE}

The Hydroleaceae is not closely related to Hydrophyllaceae; recent molecular data confirm the prevailing view through most of the \(19^{\text {th }}\) century that Hydrolea was in its own family. References: Ferguson (1998); Hilger \& Diane (2003); Angiosperm Phylogeny Group (1998, 2003).

Hydrolea Linnaeus

A genus of about 11 species, aquatic and wetland herbs, of tropical and subtropical regions.
1 Flowers in axillary cymes; leaves \(3-14 \mathrm{~cm}\) long, \(1.5-4 \mathrm{~cm}\) wide; axillary spines present in the axils of some leaves; corolla \(7-8\) mm long.
2 Calyx and stem sparsely pubescent with spreading hairs 2-3 mm long
H. quadrivalvis

2 Calyx and stem glabrous, or minutely puberulent or with sessile glands . . . . . . . . . . . . . . . . . . . . . . . . . . . . [H. uniflora]
1 Flowers in terminal cymes or corymbs; leaves 2-6 cm long, \(0.6-2.5 \mathrm{~cm}\) wide; axillary spines present or absent; corolla 10-15 mm long.
3 Leaves elliptic to lanceolate, 2-3 cm long, 0.6-1.0 cm wide; axillary spines absent or rudimentary \(\qquad\) H. corymbosa

3 Leaves ovate to ovate-lanceolate, \(3-6 \mathrm{~cm}\) long, \(1.5-2.5 \mathrm{~cm}\) wide; axillary spines preset, well-developed, to 1.5 cm long .. H. ovata

Hydrolea corymbosa J. Macbride ex Elliott, Skyflower. Cp (GA, SC): pond cypress savannas, depression meadows; rare. Ne. SC south to sw. GA and FL. See Nelson (1993). The author is sometimes stated as J.F. Macbride, but this is an error. [= RAB, GW, K; = Nama corymbosum (Macbride ex Elliott) Kuntze -- S]

Hydrolea quadrivalvis Walter, Waterpod. Cp (GA, NC, SC, VA), Pd (NC, VA): swamp forests, backwater sloughs, marshes, ditches; common (VA Watch List). June-September. Se. VA south to FL, west to LA. [= RAB, C, F, G, GW, K; = Nama quadrivalve (Walter) Kuntze -- S]

Hydrolea ovata Nuttall ex Choisy, Ovate False-fiddleleaf. Cp (GA): swamps, ponds, ditches; rare. June-August. C. GA west to TX, north in the interior to sc. TN and MO. [= C, F, G, GW, K; = Nama ovatum (Nuttall ex Choisy) Britton -- S]

Hydrolea uniflora Rafinesque. Swamp forests, sloughs, marshes. June-September. Mainly in the Mississippi River Alluvial Plain, west to e. TX and east to AL, TN, and KY. [= C, F, G, GW, K; = Nama affine (A. Gray) Kuntze - S; = Hydrolea affinis A. Gray]

\section*{HYDROPHYLLACEAE (Waterleaf Family)}
(also see HYDROLEACEAE)

A family of about 18 genera and 270 species, herbs and shrubs, nearly cosmopolitan, concentrated in w. North America. References: Wilson (1960); Constance (1963).

1 Leaves entire, simple; styles 2, distinct to the summit of the ovary.
2 Flowers in axillary cymes; capsule subglobose; leaves 2-12 cm long . . . . . . . . . . . [see Hydrolea in HYDROLEACEAE]
2 Flowers solitary or paired in the leaf axils; capsule cylindrical leaves 0.8-1.5 (-3.5) cm long
Nama
1 Leaves dissected, lobed, or toothed (sometimes the basalmost leaves simple); style fused for a portion of its length, 2-cleft towards the tip; ovary with 1 locule.
3 Flowers solitary opposite the leaves on the upper portion of the stem (sometimes also terminal in a lax, (1-) 2-6-flowered cyme).
4 Leaves opposite below, alternate above; petals \(5-8 \mathrm{~mm}\) long; leaves elliptical in outline, pinnatifid into 7-13 lanceolate segments; calyx lobes to 10 mm long in fruit; capsule 4 -seeded
. . Ellisia
4 Leaves all alternate; petals \(2-4 \mathrm{~mm}\) long; leaves broadly triangular in outline, divided into 3-5 obovate segments; calyx lobes 1-3 mm long; capsule 1-2 (-3)-seeded . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Nemophila
3 Flowers all terminal in 3-many-flowered cymes.
5 Inflorescence repeatedly branched subdichotomously; larger leaf blades more than 8 cm wide; stamens well exserted from the corolla ( 3 mm or more beyond the corolla); plants perennial from fibrous roots . . . Hydrophyllum
5 Inflorescence with a strong central axis (some secondary branching in Ph. bipinnatifida, but not as above); larger leaf blades less than 5 cm wide (except Ph. bipinnatifida); stamens slightly exserted from the corolla (less than 3 mm beyond the corolla) (except well-exserted in Ph. bipinnatifida, included in Ph. covillei); plants annual (biennial in Ph. bipinnatifida) from a taproot

Phacelia

\section*{Ellisia Linnaeus (Waterpod)}

Ellisia is considered to be a monotypic genus, an herb of c. and e. North America, but generic limits in the Hydrophyllaceae are badly in need of critical reassessment. References: Constance (1940)=Z.

Ellisia nyctelea (Linnaeus) Linnaeus, Waterpod, Aunt Lucy. Pd, Mt (VA): moist shaded forests, especially bottomlands; uncommon. May-June. IN and MI west to Alberta, south to AR and OK; disjunct in e. North America from s. NY and NJ south to sc. VA. Likely to occur in nc. NC. [= C, F, G, GW, K, W, Z; = Nyctelea nyctelea (Linnaeus) Britton -- S]

Hydrolea
(see HYDROLEACEAE)

Hydrophyllum Linnaeus (Waterleaf)

A genus of 8 species, herbs, of e. and w. North America. References: Constance (1942)=Z; Beckmann (1979)=Y; Alexander (1941)=X.

1 Principal cauline leaves palmately lobed, maple-like, differing from the pinnately divided basal leaves.
2 Sepals with small reflexed appendages exserted at each sinus of the calyx; plant biennial from a taproot; stamens exserted 1-3 mm beyond the corolla; leaf lobing relatively shallow and irregular . . . . . . . . . . . . . [H. appendiculatum]
2 Sepals with appendages absent or rudimentary; plant perennial from fibrous roots; stamens exserted 3-6 mm beyond the corolla; leaf lobing relatively deep and regular
H. canadense

1 Principal cauline leaves pinnately divided, similar to the basal leaves.
3 Inflorescence and upper stem densely hirsute with spreading hairs 1-2 mm long; leaves pinnatifid with (7-) 9-13 segments, these toothed but not lobed . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . H. macrophyllum
3 Inflorescence and upper stem glabrate to strigose with appressed to ascending hairs less than 0.5 mm long; leaves with 5-7 (-9) segments, some of them sometimes deeply 2-lobed.
4 Corolla deep purple to maroon; lower stem glabrous to slightly (rarely moderately) pubescent with retrorse hairs; [of low to high elevations in the Mountains] H. virginianum var. atranthum

4 Corolla white to lavender or pale purple; lower stem slightly to densely pubescent with retrorse to spreading hairs; [of low elevations of the Piedmont, Mountains, and Coastal Plain]
H. virginianum var. virginianum

Hydrophyllum canadense Linnaeus, Mapleleaf Waterleaf, Canada Waterleaf, Broadleaf Waterleaf. Mt (GA, NC, SC, VA), Pd (NC, VA), Cp (VA): cove forests, rocky streambanks, other moist and nutrient-rich forests; common (rare in Coastal Plain and in Piedmont south of VA) (SC Rare). May-June; August. VT and s. Ontario west to MI and WI, south to n. GA, AL, AR, and MO. [= RAB, C, F, G, K, S, W, Y, Z]

Hydrophyllum macrophyllum Nuttall, Hairy Waterleaf. Mt (GA, NC, VA): cove forests and other moist rocky forests, especially over calcareous or mafic rocks; rare (GA Special Concern, NC Rare, VA Watch List). May; July. WV west to OH, and IL, south to sw. VA, w. NC, n. GA, and n. AL; reports from AR are erroneous, and are based on material of Hydrophyllum brownei Kral \& Bates (Peck 2003). The w. North American H. occidentale (S. Watson) A. Gray is rather closely related. [= RAB, C, F, G, K, S, W, Y, Z]

Hydrophyllum virginianum Linnaeus var. atranthum (E.J. Alexander) Constance, Appalachian Waterleaf. Mt (NC, VA): cove forests and other moist rocky forests; common. May-June; July-August. N. WV south through w. and sw. VA and e. KY to w. NC and e. TN. Since its naming as a species (Alexander 1941) and subsequent reduction to a variety (Constance 1942) there has been little consensus about this taxon, some regarding it as merely a color form. Alexander lists numerous characters additional to that of flower color; they need further investigation. "H. atranthum differs from \(H\). virginianum in the dark-violet flowers, the brown hairs on the appendages, brown filaments, corolla-lobes longer than the tube, stamens shorter [11.5 mm] and more slender, and the more numerous leaf-lobes. H. virginianum has flowers white to pale lavender or pinkish, white hairs on the appendages, white filaments, corolla-lobes and tube equal in length, filaments longer ( 13.5 mm ) and stouter, and 5-7 leaf-segments." Beckmann (1979) did not accept the variety, stating that "this pigment combination appears sporadically in other sectors of the species range." Based on herbarium material I have seen darker than usual flowers are found outside of the Southern Appalachians; they do not, however, approach in darkness the flowers of Southern Appalachian material and the somewhat darker-flowered plants outside the Southern Appalachians do not share the stem pubescence character stated in the key above. The general correlation of flower color and lower stem pubescence and the tight geographical range of var. atranthum incline me to accept it provisionally as a variety. It is not, however, limited to high elevations, as stated or implied by some authors. The two varieties provisionally accepted here need more careful study, including either statistical studies of morphology, or electrophoretic or molecular studies. [= C, F, G, Z; < H. virginianum -- RAB, K, W, Y; <H. virginicum -- S, orthographic error; = H. atranthum E.J. Alexander -- X]

Hydrophyllum virginianum Linnaeus var. virginianum, Eastern Waterleaf, Virginia Waterleaf. Mt, Pd (NC, VA), Cp (VA): cove forests, moist rocky forests, alluvial forests; common. April-June; July-August. NH and Québec west to ND, south to e. VA, c. NC, KY, s. IN, s. IL, nc. AR, and ne. OK. As discussed by Beckmann (1979) and Constance (1941), H. virginianum is a closely related vicariant of \(H\). tenuipes Heller of British Columbia south to CA. See Phacelia bipinnatifida for additional suggestions on distinguishing it from this species. [= C, F, G, Z; < H. virginianum -- RAB, K, W, Y; <H. virginicum -- S, orthographic error; = H. virginianum -- X]

Hydrophyllum appendiculatum Michaux, Biennial Waterleaf. S. Ontario and MN, south to sw. PA, WV, e. TN, n. AL (Jackson Co.), MO, and e. KS. It was attributed to NC by Small (1933) on unknown grounds. [= C, F, G, K, Y, Z; = Decemium appendiculatum (Michaux) Small -- S]

> Nama Linnaeus (Fiddleleaf) (also see Hydrolea in HYDROLEACEAE)

A genus of about 45 species, herbs, of sw. North America, tropical America, and Hawaii.
* Nama jamaicense Linnaeus, Jamaica Weed. Cp (SC): lawns; rare, introduced from tropical America (including FL and TX). May. [= K; N. jamaicensis -- RAB, orthographic variant; Marilaunidium jamaicense (Linnaeus) Kuntze -- S]

Nemophila Nuttall (Baby Blue-eyes)
A genus of 11 species, herbs, of North America (mostly w. North America). References: Constance (1941).

Identification notes: Nemophila is superficially similar to Phacelia covillei and Ph. ranunculacea, with which it often co-occurs. They can be distinguished with the following key.

1 Flowers solitary, on pedicels opposite the leaves, the pedicels mostly > 12 mm long; corolla white (sometimes aging to pale lavender), 2.5-3.5 mm long; fruits ovoid, longer than thick, turning purple at maturity, exceeding the 2-4 mm long calyx lobes.

Nemophila aphylla
1 Flowers borne in 2-6-flowered terminal cymes, the pedicels mostly < 12 mm long; corolla pale blue or lavender, 4-5 mm long; fruits depressed globular and weakly 4 -lobed, the apex depressed, remaining green at maturity, shorter than the calyx, the lobes of which expand to \(5-8 \mathrm{~mm}\) long.
2 Pubescence of the lower stem consisting of appressed to ascending, stiff, pointed hairs; [of rivers in the Atlantic drainage]
Phacelia covillei
2 Pubescence of the lower stem spreading or even retrorse, most of the hairs weak and twisted, and many of them glandular-tipped; [of rivers in the Mississippi drainage]
[Phacelia ranunculacea]
Nemophila aphylla (Linnaeus) Brummitt. Cp, Pd (GA, NC, SC, VA): moist, nutrient-rich floodplain forests; uncommon, though often locally abundant. March-April. MD south to panhandle FL and west to TX, north in the interior to e. TN, w. KY, and se. MO. [= GW, K; = N. microcalyx (Nuttall) Fischer \& Meyer -- RAB, F, G, S; = N. triloba (Rafinesque) Thieret -- C]

\section*{Phacelia Antoine Laurent de Jussieu (Phacelia)}

A genus of about 150 species, of North America and South America, concentrated in w. North America. References: Constance (1949) \(=\) Z; Levy (1991) \(=\) Y; Murdy (1966); Gillett (1968, 1964).

Identification notes: 1. Phacelia bipinnatifida and Hydrophyllum virginianum are sometimes confused. Ph. bipinnatifida has the larger and more basal leaves distinctly bipinnatifid, the lower pinnae often stalked (vs. pinnatifid, the basal or terminal pinnae sometimes 2-lobed, all the pinnae more-or-less sessile), pubescence of the upper stem and inflorescence in part glandular (pubescence nonglandular), and seeds 4 per capsule, black (vs. 2 per capsule, light brown). 2. Phacelia covillei and Ph. ranunculacea are superficially similar to and sometimes confused with Nemophylla aphylla, which see for discussion.

1 Corolla lobes fimbriate; seeds 4 per capsule.
2 Corolla white (rarely slightly lavender); pubescence of the stem spreading; lobes of cauline leaves mostly obtuse; seeds \(3.0-3.5 \mathrm{~mm}\) long

Ph. fimbriata
2 Corolla lavender to blue; pubescence of the stem appressed; lobes of cauline leaves mostly acute; seeds \(1.5-3.0 \mathrm{~mm}\) long
Ph. purshii
1 Corolla lobes entire; seeds 4-15 per capsule.
3 Stamens \(1.5-2 \mathrm{~mm}\) long; style \(1.5-2 \mathrm{~mm}\) long; corolla tubular; seeds globose-ovoid, nearly spherical, 4 per capsule.
4 Pubescence of the lower stem consisting of appressed to ascending, stiff, pointed hairs; [of rivers in the Atlantic
 glandular-tipped; [of rivers in the Mississippi drainage]
[Ph. ranunculacea]
3 Stamens 3-10 mm long; style 3-15 mm long; corolla rotate to broadly campanulate; seeds ovoid-angled, 4-15 per capsule.
5 Corolla \(10-15 \mathrm{~mm}\) across, blue; plant \(10-60 \mathrm{~cm}\) tall; seeds \(2.5-4 \mathrm{~mm}\) long, black; ultimate segments of the leaf 15-45 mm long, \(10-25 \mathrm{~mm}\) wide; pedicels recurved in fruit; [of moist forests of the Mountains and (very rarely) Piedmont]

Ph. bipinnatifida
5 Corolla 5-11 mm across, white to blue; plant 5-40 cm tall; seeds 1.5-2.2 mm long, brown; ultimate segments of the leaf \(5-15 \mathrm{~mm}\) long, \(5-9 \mathrm{~mm}\) wide; pedicels ascending to spreading in fruit; [of alluvial forests, granitic flatrocks, and other habitats, of the Piedmont, Coastal Plain, and Mountains].
6 Sepals 4-8 mm long, linear or oblanceolate; marginal bristles of sepals spreading, 1.0-1.5 mm long; plants mostly erect

Ph. maculata
6 Sepals 2-4 mm long, narrowly ovate; marginal bristles of sepals appressed, \(0.3-1.0 \mathrm{~mm}\) long; plants mostly decumbent, branched from the base.
7 Sepals 2.6-4.0 mm long; petals 4-6 mm long; marginal bristles of sepals 0.6-0.9 mm long; basal leaves with 1-3 pairs of lateral leaflets. the terminal leaflet larger and usually 3-lobed; cauline leaves with 1-3 pairs of rather broad lobes; [of various habitats (including granitic flatrocks and domes) in SC, NC, and VA]

7 Sepals 2.0-3.0 mm long; petals \(3.5-5 \mathrm{~mm}\) long; marginal bristles of sepals \(0.4-0.7 \mathrm{~mm}\) long; basal leaves with 4-5 pairs of lateral leaflets, the terminal leaflet about the same size and unlobed; cauline leaves with 2-4 pairs of narrow lobes; [of granitic flatrocks and domes of the Piedmont of SC and southwestwards] ...

Ph. dubia var. georgiana
Phacelia bipinnatifida Michaux, Fernleaf Phacelia, Forest Phacelia. Mt (GA, NC, SC, VA): cove forests, especially where rocky; common (SC Rare, VA Watch List). April-May; June. W. VA west to s. OH, n. IN, n. IL, and c. MO, south to w. NC, nw. SC, n. GA, c. AL, and n. AR. Ph. bipinnatifida var. plummeri (= Ph. brevistyla) is "based on a variation with sparser pubescence, larger and less divided leaf segments, smaller flowers, and sub-included stamens and style. These variations are not concomitant, and the distribution of forms showing a complete or partial combination of them is sporadic" (Constance 1949). The matter deserves
additional study. [= RAB, C, F, G, K, S, W, Z; > Ph. bipinnatifida var. bipinnatifida - F; > Ph. bipinnatifida var. plummeri Wood -- F; Ph. brevistyla Buckley -- S]

Phacelia covillei S. Watson ex A. Gray, Eastern Buttercup Phacelia. Pd (NC, VA): rich soils of floodplains, and contiguous terraces and slopes; rare (NC Rare, VA Rare). April; May. Ranging in two disjunct areas -- c. NC and sc. VA (in the drainages of the Cape Fear, Tar, and Roanoke rivers) and DC, n. VA, and sc. MD (in the drainage of the Potomac River). Most recent authors have included this taxon within the closely similar Ph. ranunculacea; as thus broadly defined, Ph. ranunculacea was considered to occur in 3 peculiarly disjunct areas; one centered around St. Louis, MO (w. KY, w. TN, e. MO, ne. AR, se. MO, s. IL, and s. IN), one near Washington, DC (DC, n. VA, and sc. MD), and a third in c. NC and sc. VA. Chuang \& Constance (1977) reported that the western population center has a chromosome number of \(n=6\), and that the two eastern population centers have \(n=14\). The disparate cytotypes of eastern and western Ph. ranunculacea sensu lato led Chuang \& Constance to seek morphological differences that would warrant the recognition of separate taxa, but they reported that "no consistent morphological distinction has been found between the two cytotypes." Stem pubescence does, however, show consistent, though subtle, differences between eastern and western populations of this complex. Eastern material has the stem pubescence relatively sparse, consisting of appressed to ascending, stiff, pointed hairs. Western populations have stem pubescence relatively dense, much of it spreading or even retrorse, most of the hairs weak and twisted, and many of them glandular-tipped. Given the disparate cytotypes, correlated with allopatric distribution and slight but consistent morphological differences, it seems best to provisionally recognize two taxa; further study, using chemical and molecular techniques would be valuable. Recognition at the species level is nomenclaturally the more conservative (and here followed) because of the pre-existence of Watson's binomial; varietal status might be the more appropriate. Ph. covillei and Ph. ranunculacea (sensu stricto) have numerous characteristics that render their inclusion in Phacelia uncomfortable (see discussion in Chuang \& Constance 1977, Constance 1949, Gillett 1968). See Nemophila aphylla for suggestions on distinguishing these two superficially similar species. [= K; < Ph. ranunculacea (Nuttall) Constance -- RAB, C, F, G, Z, in part]

Phacelia dubia (Linnaeus) Trelease var. dubia, Appalachian Phacelia. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): floodplain forests, rocky forests, fields, roadsides, granitic flatrocks; common. April-May; June. Var. dubia ranges from NY and PA west to WV, south to nc. SC, sw. NC, and se. TN. The Phacelia dubia complex has been under detailed biosystematic study by Foster Levy and associates (Levy 1991a, 199b, 1997; Levy et al. 1996; Levy \& Malone 2001; Levy \& Neal 2001; Taylor \& Levy 2002; del Castillo 1994, 1998). Male sterile cytotypic variants are common in some populations but formal taxonomic recognition ius not warranted (Levy 1991a, 1991b; del Castillo 1994, 1998). Additionally, an incipient variety, informally termed "imitator", occurs in c. SC (Levy 1991a; Levy \& Malone 2001). These populations are morphologically variable, some more similar to var. georgiana, others more similar to var. dubia; see Levy (1991a) for further discussion. They may warrant taxonomic recognition, as they are allopatric from each of the 3 named varieties, and show degrees of sterility when bred with each of the three, but morphologic differences have not evolved (Levy \& Malone 2001). [ \(=\mathrm{K}, \mathrm{Y}\); < Ph. dubia -- RAB, C, F, G, S, W; Ph. dubia var. fallax (Fernald) Gleason -- G; Ph. dubia var. dubia -- Z (also including var. interior)]

Phacelia dubia (Linnaeus) Trelease var. georgiana McVaugh, Georgia Phacelia. Pd (GA): granitic flatrocks; rare. April-May; June. Var. georgiana ranges from GA west to ec. AL, in the Piedmont. It has sometimes been attributed to SC, and Levy found plants in SC which morphologically resemble var. georgiana, but he concluded that this "imitator" genotype was largely sterile when bred with var. georgiana. See var. dubia for additional discussion. [=K, Y, Z; < Ph. dubia -- RAB, C, F, G, S, W]

Phacelia fimbriata Michaux, Fringed Phacelia, Blue Ridge Phacelia. Mt (GA, NC, VA): moist forests on slopes and floodplains, at low to high elevations, perhaps mainly over circumneutral soils; uncommon, but locally abundant (GA Special Concern, VA Rare). April-May. Sw. VA south to w. NC, e. TN, and n. GA (Jones \& Coile 1988), a Southern Appalachian endemic. [= RAB, C, F, G, K, S, W, Z]

Phacelia maculata Wood, Flatrock Phacelia. Pd (GA, NC, SC): bottomlands, granitic flatrocks; uncommon (NC Rare List). April; May. Sc. NC south to GA and west to ec. AL. [= RAB, K, W, Y, Z; Ph. hirsuta -- S, misapplied]

Phacelia purshii Buckley, Miami-mist. Mt (GA, NC, SC, VA): moist forests on floodplains and slopes; rare (GA Special Concern, VA Watch List). May-June. S. PA west to s. Ontario, OH and MO, south to nw. SC, nw. GA, and c. AL. Plants "with smaller flowers, shorter pedicels, and smaller capsules and seeds" are the basis of Ph. boykinii and Ph. bicknellii (Constance 1949). A study of the matter was initiated and specimens annotated as "Ph. purshii ssp. boykinii," but the research was not completed and the name was never published; further study is warranted. [= RAB, C, F, G, K, W, Z; > Ph. purshii - S, in a narrower sense; >Ph. boykinii (A. Gray) Small -- S; > Ph. bicknellii Small -- S]

Phacelia dubia (Linnaeus) Trelease var. interior Fernald, endemic in c. TN. [ \(=\mathrm{K}\); < Ph. dubia -- C, F, G, S; < Ph. dubia var. dubia -- Z] \{not yet keyed\}

Phacelia ranunculacea (Nuttall) Constance, Western Buttercup Phacelia. In the Mississippi and Ohio river drainages, centered around St. Louis, MO (w. KY, w. TN, e. MO, ne. AR, se. MO, s. IL, and s. IN). [= K; < Ph. ranunculacea -- RAB, C, F, G, Z, in part] Phacelia strictiflora (Engelmann \& Gray) Gray var. robbinsii Constance. East to AL. [= K, Z] \{not yet keyed\}

\section*{HYPERICACEAE (St. John's-wort Family)}

It appears from molecular analysis that recognition of the Hypericaceae may (after all) be warranted. Hypericum is in a clade with Podostemum and Bonnetia, sister to a clade including Clusiaceae s.s. (Savolainen et al. 2000). References: Adams (1973)=Z; Godfrey (1988)=Y; Wood \& Adams (1976).

1 Petals yellow; stamens fascicled or not, if fascicled then not into 3 fascicles of 3 stamens each; staminodia (hypogynous glands) lacking; perianth 4-5-merous; [tribe Hypericeae]

Hypericum
1 Petals pale pink; stamens fascicled, in 3 fascicles of 3 stamens each; staminodia (hypogynous glands) present, alternating with the fascicles of stamens; perianth 5-merous; [tribe Cratoxyleae] .

Triadenum

A genus of about 370 species, trees, shrubs, and herbs, primarily temperate. Hypericum in our area is a large, complex, and interesting genus, with a number of unresolved questions remaining. The species treated in Key B have often been treated in the segregate genus Ascyrum. Evidence from a variety of disciplines now suggests that they should be included in Hypericum (Adams \& Robson 1961; Calie, Schilling, \& Webb 1983; Robson 1996). \{The distribution in our area of H. boreale. The distribution in our area of \(H\). ellipticum. The curious bimodal distribution of \(H\). prolificum (more than one taxon?). Basis of Small's H. Iobocarpum in Blue Ridge of NC. H. nitidum-H. fasciculatum-H. galioides. And more....\} References: Adams (1973)=Z; Godfrey (1988)=Y; Robson (1977, 1981, 1990, 1996, 2001, 2002)=X; Adams (1962)=V; Adams (1957); Webb (1980); Robson \& Adams (1968); Adams \& Robson (1961); Calie, Schilling, \& Webb (1983); Culwell (1970). Key based in part on Adams (1973), Godfrey (1988), C, and GW.

1 Leaves with an articulation at the very base, this appearing as a narrow line, groove, or abrupt change of color and texture which extends across the petiole; shrub; [section Myriandra].
2 Leaves needle-like, 0.5-1.5 (-2) mm wide, the margins essentially parallel (H. galioides keyed here and below); [subsection Centrosperma] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Key A
2 Leaves, at least the largest on the plant, not needle-like, wider than 2 mm , the margins not parallel, the widest point often beyond the middle.
3 Petals 4; sepals 4 (rarely 2); plant 5-100 cm tall; leaves \(2-40 \mathrm{~mm}\) long; [subsection Ascyrum] . . . . . . . . . . . . . Key B
3 Petals 5; sepals 5; plant 50-250 cm tall; leaves (10-) 20-70 mm long; [subsections Centrosperma and Brathydium] .

1 Leaves without an articulation at the very base, the petiole merging gradually into the stem with no break, groove, or abrupt change in color or texture; decumbent shrub (H. buckleyi) or an annual or perennial herb (suffruticose at the base in \(H\). cistifolium, H. dolabriforme, H. nudiflorum, H. apocynifolium, H. sphaerocarpum).
5 Leaves ascending or appressed, 1-nerved, less than 1 mm wide; inflorescence a compound raceme; [section Brathys] .. Key D
5 Leaves spreading or ascending, generally multi-nerved, more than 1 mm wide; inflorescence a dichasial cyme.
6 Capsule 3 (-4) locular; stamens connate at the base into 3 or 5 fascicles; leaves with black glandular dots as well as translucent glandular dots when backlit (except in H. perforatum); sepals and/or petals marked with black glandular dots or lines; [section Hypericum] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Key \(\mathbf{E}\) 6 Capsule 1-locular; stamens separate or connate at the base, but not grouped into fascicles; leaves with translucent glandular dots, without black glandular dots (when backlit); sepals and petals with translucent glandular lines or dots only, not marked with black glandular dots or lines.
7 Decumbent shrub or suffruticose herb; [section Myriandra, subsections Pseudobrathydium and Suturosperma]
7 Herb; [section Trigynobrathys, and section Myriandra subsection Suturosperma] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . .

\section*{Key A -- shrubby St. John's-worts with needle-like leaves and flowers with 5 petals and 5 sepals [section Myriandra, subsection Centrosperma]}

1 Largest leaves \(5-14 \mathrm{~mm}\) long; sepals 2-5 mm long.
2 Capsules 3-4 (-4.5) mm long; seeds brown, 0.6-0.7 mm long, with longitudinal ribbing and alveoli alignment obscure; largest leaves \(11-14 \mathrm{~mm}\) long; [of ultisol or alfisol pine savannas] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . H. species 2
2 Capsules (4-) 6-9 mm long; seeds dark red to black, 0.55-0.6 mm long, with longitudinal ribbing and alveoli alignment evident; largest leaves \(5-11 \mathrm{~mm}\) long; [of sandhills, spodosol wet pine flatwoods, and margins of pineland depressions]..

2 Plant a low shrub to 5 dm tall, forming low rounded clumps; mature capsules ovoid-deltoid, 3-4 mm long, 2-2.5 mm wide, ca. \(1.5 \times\) as long as broad
H. lloydii

2 Plant an erect shrub to 20 dm tall, with a single main stem, branched above; mature capsules oblong-ovoid, 3-6 mm long, \(1.0-2.5 \mathrm{~mm}\) wide, ca. 2-3× as long as broad.
3 Mature capsules elliptic-ovoid, usually more than 1.5 mm broad; living leaves with a deep longitudinal groove below on each side of the midrib, with numerous white papillae present in the groove (visible at \(20 \times\) ); bark somewhat spongy-thickened, soon exfoliating in tissue-thin layers
H. fasciculatum

3 Mature capsules oblong, usually 1.5 mm or less broad; living leaves slightly concave below, not grooved, the papillae inconspicuous, poorly developed; bark thin, even on oldest stems, not spongy, exfoliating in flakes or narrow strips .
H. nitidum
[H. brachyphyllum]
[H. galioides]

\section*{Key B -- shrubby St. John's-worts with 4 petals and 4 (rarely 2) sepals [section Myriandra, subsection Ascyrum]}

1 Styles and carpels 3 (rarely 4); leaves (5-) 7-20 mm wide, rounded, subcordate, or cordate-clasping at the base; plant an erect shrub.
2 Leaves rounded or subcordate at the base; [widespread in our area] . . . . . . . . . . . . . . . . . . . . . . H. crux-andreae
2 Leaves cordate-clasping at the base; [of e. GA southwards] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . H. tetrapetalum

1 Styles and carpels 2 ( 3 in H . microsepalum); leaves \(1-7 \mathrm{~mm}\) wide, mostly cuneate (or if rounded the leaves less than 8 mm long and 3 mm wide); erect or decumbent shrub.
3 Sepals nearly equal in size; styles 3 ; [s. GA south to n . FL ] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . H. microsepalum
3 Sepals markedly unequal, one opposite pair large and enclosing the capsule; styles 2 ; [collectively widespread].
4 Pedicels 6-13 mm long, soon reflexed; subtending bractlets located near the last pair of leaves; decumbent shrub, to 2 dm tall
H. suffruticosum

4 Pedicels 1-5 mm long, erect; subtending bractlets located midway between the base of the flower and the last pair of leaves; erect or decumbent shrub, mostly 1-15 dm tall.
5 Erect shrub, usually with a single stem, freely branched well above ground level (or from ground level if injured, as by fire, but then the multiple branches still erect rather than decumbent), to 1 m or more tall; leaves usually variable in size and shape, widest near the middle
H. hypericoides

5 Decumbent, matted shrub, with several prostrate stems arising from a primary rootstock near ground level, each with numerous erect branchlets, rarely over 3 dm tall; leaves usually relatively uniform in size and shape, widest above the middle
H. stragulum

\section*{Key C -- shrubby St. John's-worts with broader leaves (mostly lanceolate or oblanceolate) and flowers with 5 petals and 5 sepals}

1 Leaves cordate-clasping at the base, ovate; [of s. SC southwards]; [section Myriandra, subsection Brathydium] . . . . . . . . . . . .
. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . H. myrtifoliun

Leaves cuneate at the base, oblanceolate, oblong, elliptic, or narrowly elliptic; [collectively widespread]; [section Myriandra, subsection Centrosperma].
2 Leaves mostly narrowly oblanceolate, the larger 2-3 cm long, 2-5 (-7) mm wide, mostly 5-10× as long as wide; seeds \(0.4-\) 0.8 mm long, dark brown
H. galioides

2 Leaves mostly oblong, elliptic, narrowly elliptic, or broadly oblanceolate, the larger (2-) 3-7 cm long, 5-15 mm wide, mostly \(2.5-5 \times\) as long as wide; seeds \(0.8-1.3 \mathrm{~mm}\) long, amber to medium brown.
3 Flowers solitary, terminal (or in 3-flowered terminal cymes); petals \(10-20 \mathrm{~mm}\) long; sepals \(7-15 \mathrm{~mm}\) long; shrubs to 1 m tall.
H. frondosum

3 Flowers (1-) 3-many in terminal cymes; petals \(5-10 \mathrm{~mm}\) long; sepals \(1.5-8 \mathrm{~mm}\) long; shrubs to 3 m tall.
4 Flowers (1-) 3-7 per inflorescence; capsules (6-) 7-14 mm long; larger leaves (4-) 7-14 mm wide. H. prolificum 4 Flowers 7-many per inflorescence; capsules (3-) 4.5-6 mm long; larger leaves 1-7 (-11) mm wide.

5 Leaves (1.8-) 2.8-8.3 (-11) mm wide, the widest on a plant always over 4 mm wide; [plants widespread] . .
H. densiflorum

5 Leaves 1.0-3.7 (-4.1) mm wide; [plants of the Ridge and Valley of nw. GA, c. and nw. AL, and e. TN] H. interior

\section*{[H. lobocarpum]}

\section*{Key D -- herbaceous St. John's-worts with leaves ascending or appressed, 1 -nerved, less than 1 mm wide and with a diffuse, racemose inflorescence}

1 Leaves linear-subulate, (5-) 8-20 mm long; capsules 1-1.75x as long as the sepals; seeds coarsely rugose-areolate . . . . . . . H. drummondii

1 Leaves scale-like, 1-5 mm long; capsules ca. 2-3× as long as the sepals; seeds minutely and inconspicuously reticulate
H. gentianoides

\section*{Key E -- herbaceous St. John's-worts with broad leaves, 3 (-4) locular capsules, stamens connate at base into 3 or 5 fascicles, \\ leaves with black dots as well as translucent glands (except in H. perforatum), and sepals and/or petals marked with black dots or lines}

1 Smaller stems strongly wing-angled; seeds 1.0-1.3 mm long; leaves of the main stem (8-) 11-20 (-26 mm long, those of the lateral branches typically much smaller; leaves punctate primarily with translucent glands; [alien, usually in disturbed habitats]
H. perforatum

1 Smaller stems not wing-angled; seeds 0.6-1.1 mm long; leaves of the main stem (11-) 21-48 (-64) mm long, those of the lateral branches nearly to quite as large; leaves punctate with black glands; [native, in a variety of habitats].
2 Petals (3.0-) 4.3-12.2 (-14.0) mm long; sepals 1.5-6 mm long, conspicuously punctate with black glands (sometimes also black-lined); capsules (2.5-) 3.0-5.4 (-6.0) mm long; [collectively widespread, occurring in the Coastal Plain, Piedmont, and Mountains of NC, SC, and VA].
3 Sepals 3-6 mm long; styles (2.5-) 5.4-7.4 (-9.0) mm long; petals (6.0-) 9.2-12.2 (-14.0) mm long; leaf apices acute .
H. pseudomaculatum

3 Sepals 1.5-4.0 mm long; styles (1.0-) 1.4-2.4 (-3.0) mm long; petals (3.0-) 4.3-5.9 (-9.0) mm long; leaf apices obtuse to slightly retuse
H. punctatum

2 Petals 6-18 mm long; sepals 4-10 mm long, with or without black lines (sometimes also black-punctate); capsules (3.0-) 4.0-7.7 (-10.0) mm long; [endemic to moderate to high elevations of w. NC, sw. VA, and e. TN].

4 Styles (3.0-) 5.6-10.0 (-12.0) mm long; sepals without black lines; petals (5.0-) 11.5-16.1 (-18.0) mm long, without black lines and with round black glands only along the petal margin; longest stamens (8.0-) 10.7-16.3 (-22.0) mm long; cymes relatively few-flowered, (2-) 5-14 (-22) flowers per plant . . . . . . . . . . . . . . . . . . . . . . . . . H. graveolens
4 Styles (1.5-) 1.9-2.9 (-5.0) mm long; sepals with black lines; petals (6.0-) 7.0-9.2 (-11.0) mm long, with black lines and round black glands scattered over the surface of the petal; longest stamens (4.0-) 6.1-8.5 (-10.0) mm long; cymes relatively many-flowered, (5-) 13-61 (124) flowers per plant . . . . . . . . . . . . . . . . . . . . . . . . . H. mitchellianum
[H. ascyron ssp. pyramidatum]

\section*{Key F -- shrubby and subshrubby St. John's-worts}

1 Plant a matted, decumbent shrub, 0.5-3 (rarely to 5 ) dm tall; leaves 1.5-2.5× as long as wide, without axillary fascicles of leaves; flowers solitary or in small simple cymes; [endemic to rock outcrops at moderate to high elevations in the Mountains of sw. NC, nw. SC, and ne. GA]; [section Myriandra, subsection Pseudobrathydium]
H. buckleyi

1 Plant an erect suffrutescent herb, 1.5-10 dm tall; leaves \(1.5-5 \times\) as long as wide, with or without axillary fascicles of leaves; flowers in compound cymes; [mostly of the Coastal Plain and Piedmont, very rarely in the Mountains and then at low elevations]; [section Myriandra, subsection Suturosperma].
2 Larger leaves 4-10 mm wide, \(3-5 \times\) as long as wide; axillary leaf fascicles present in main leaf axils; seeds pale brown, faintly reticulate, 0.4-0.5 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . H. cistifolium
2 Larger leaves \(10-30 \mathrm{~mm}\) wide, \(1.5-3 \times\) as long as wide; axillary leaf fascicles absent; seeds dark brown, strongly reticulate, \(1.5-2 \mathrm{~mm}\) long.
3 Flowers in simple 3-flowered cymes or in compound cymes with up to 8 flowers; sepals 3 mm long, oblong, obtuse apically; capsules ovoid, \(8-10 \mathrm{~mm}\) long (excluding the styles) and \(5-7 \mathrm{~mm}\) broad; seeds \(1.8-2.0 \mathrm{~mm}\) long, cylindric, sometimes slightly falcate, dull brown whwn mature
[H. apocynifolium]
3 Flowers usually in many-flowered cymes terminating branches; sepals \(1.5-2.0 \mathrm{~mm}\) long, usually triangular-acute; capsules ovoid to subglobose, \(4-5 \mathrm{~mm}\) long (excluding the styles) and 4-5 mm broad; seeds 1.5-1.8 mm long, usually falcate-cylindric, dark purplish-brown and lustrous when mature
H. nudiflorum
[H. dolabriforme]
[H. sphaerocarpum]

Key G -- herbaceous St. John's-worts with broad leaves, 1-locular capsules, stamens separate or connate at base, but not grouped into fascicles, leaves with translucent dots, without black dots, sepals and petals with translucent lines or dots only, not marked with black dots or lines

1 Stems and leaves pubescent; [section Trigynobrathys] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . H. setosum
1 Stems and leaves glabrous.
2 Styles united, persistent as a single straight beak on the capsule; section Myriandra, subsection Suturosperma].
3 Leaves \(3-6 \mathrm{~cm}\) long, \(4-6 \times\) as long as wide, the margins revolute; [plants (in our area) of low elevations in the Coastal Plain] H. adpressum

3 Leaves \(1-3(-4) \mathrm{cm}\) long, \(2-3 \times\) as long as wide, the margins not revolute; [plants (in our area) of high elevations in the Mountains]
H. ellipticum

2 Styles separate, more or less divergent, not persistent as a beak on the capsule; [section Trigynobrathys].
4 Styles 2-4 mm long; stamens 50-80.
5 Punctate glands absent on the stem (rarely very few on the internodes of the inflorescence); punctate glands of the leaves small, round, distributed on the lower leaf surface, becoming sparse toward the base of the leaf and toward the midrib; midstem leaves mostly broadest at or beyond the middle \(\qquad\) H. virgatum

5 Punctate glands frequent on the stem; punctate glands of the leaves and stem large, oval, distributed evenly and densely on the lower leaf surface, also dense on the upper leaf surface in \(H\). denticulatum and \(H\). harperi (absent on upper leaf surface in \(H\). species 1); midstem leaves usually broadest at or below the middle.
6 Upper surface of the leaf with no punctate glands; inflorescence branches typically with 3-12 pairs of bracteal leaves about \(1 / 2\) as large as the foliage leaves; [of shallow soil mats on granitic domes in the Piedmont of NC]
H. species 1

6 Upper surface of the leaf with abundant punctate glands; inflorescence branches with at most a few pairs of very small bracts; [of Coastal Plain wetlands, very rarely disjunct inland and then in wetlands].
7 Leaves \(5-20(-24) \mathrm{mm}\) long, \(5-15 \mathrm{~mm}\) wide, \(1.5-3 \times\) as long as wide, ovate to obovate to narrowly elliptic, mostly appressed to the stem, mostly shorter than the internodes; sepals \(4.0-8.0 \mathrm{~mm}\) long, \(2.0-4.0 \mathrm{~mm}\) wide, acute; lower stem not spongy-thickened with aerenchymatous tissue; [of moist pinelands of the Coastal Plain, very rarely disjunct inland to bog habitats in the Piedmont and Mountains] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . H. denticulatum
7 Leaves 10-35 (-40) mm long, 3-8 (-12) mm wide, 3-10× as long as wide, lanceolate to linearlanceolate, mostly ascending to spreading, often equalling the internodes; sepals \(3.0-5.0 \mathrm{~mm}\) long, \(0.8-2.5 \mathrm{~mm}\) wide, acute to acuminate; lanceolate to linear-lanceolate; upper portion of stem with
numerous axillary branches; lower stem usually spongy-thickened with aerenchymatous tissue; [of upland depression ponds of the Coastal Plain, growing where seasonally inundated] ..... H. harperi 4 Styles 0.5-1.5 mm long; stamens 5-22.

8 Leaves lanceolate to linear, \(6-30 \mathrm{~mm}\) long, \(0.5-3 \mathrm{~mm}\) wide, the leaf base attenuate to cuneate . H. canadense 8 Leaves ovate to elliptic, 3-35 mm long, 2-15 mm wide, the leaf base rounded to cordate-clasping.

9 Sepals broadest near the base; inflorescence with few or no normally sized leaves, these only low in the inflorescence, giving the inflorescence a naked appearance; [of Coastal Plain pinelands] .
H. gymnanthum

9 Sepals broadest near the middle; inflorescence with many normally sized leaves and leaflike bracts, giving the inflorescence a leafy appearance; [collectively widespread].
10 Ultimate bracts of the inflorescence elliptic, much like the leaves; leaves not paler beneath; sepals obtuse, much shorter than the capsule; capsule \(3-5 \mathrm{~mm}\) long
10 Ultimate bracts of the inflorescence linear, differing conspicuously from the leaves; leaves paler beneath; sepals acute, about equalling the capsule; capsule 2-3.5 mm long.
11 Inflorescence branches from the upper 1-6 nodes of the stem, the further branching repeatedly monochasial; stem with apical internode well developed, usually longer than the internode below; sepals broader above the middle, more-or-less imbricate; [of the Coastal Plain] H. mutilum var. Iatisepalum

11 Inflorescence branches from the upper 2-10 nodes of the stem, the further branching mostly dichasial; stem with apical internode shorter than the the internode below or even essentially absent; sepals broader below the middle, not imbricate (rarely broader above the middle and imbricate); [widespread]
H. mutilum var. mutilum
[H. majus]
[H. sp. 3]
Hypericum adpressum Rafinesque ex Barton, Bog St.-John's-wort, Creeping St.-John's-wort. Cp (GA, NC, SC, VA): boggy depressions; rare (US Species of Concern, GA Special Concern, NC Rare, SC Rare, VA Rare). July-August. E. MA south to sw. GA in the Coastal Plain; disjunct inland in WV, IN, IL, and sc. TN. See discussion on its habitats and rarity in Sorrie (1998b). [= RAB, C, F, G, GW, K, S, V, X, Z]

Hypericum apocynifolium Small. \(\mathrm{Cp}(\mathrm{GA})\) : mesic bluffs and ravines, ridges and natural levees in floodplains; rare. \(C\). and \(s\). GA west to se. AR and e. TX. [= S, V, X, Y; < H. nudiflorum -- GW, K, Z]

Hypericum boreale (Britton) Bicknell, Dwarf St.-John's-wort, Northern St.-John's-wort. Cp (VA), Mt (NC?, VA): sinkhole ponds in the Mountains, interdune ponds in the outer Coastal Plain, boggy places; rare (NC Watch List, VA Watch List). Newfoundland and Québec west to w. Ontario, south to VA, NC (?), OH, IN, and n. IL. Hybrids with H. canadense have been called H. ×dissimulatum Bicknell (prosp.). [= C, F, G, K; = H. mutilum Linnaeus ssp. boreale (Britton) J.M. Gillett -- X]

Hypericum buckleyi M.A. Curtis, Granite Dome St.-John's-wort. Mt (GA, NC, SC): thin soil in seasonal seepage around rock outcrops, particularly granitic exfoliation domes; rare (GA Special Concern, NC Watch List, SC Rare). June-August. Sw. NC south to nw. SC and ne. GA, a Southern Appalachian endemic. Wilbur (1995) showed that Curtis's spelling of the epithet, "buckleii", should be maintained; however, changes in the International Code of Botanical Nomenclature have reversed this (Robson 1996). [= RAB, GW, S, W, V, X, Z; = H. buckleii -- K, orthographic variant]

Hypericum canadense Linnaeus, Canada St. John's-wort Cp (GA, NC, SC, VA), Mt (NC, SC, VA), Pd (NC, VA); bogs, pine savannas, ditches; common (rare in Piedmont and VA Mountains). July-September. Newfoundland and Québec west to MN, south to s. GA, n. FL, and MS; also in Holland and Ireland, where considered by some to be native. Hybrids with \(H\). mutilum and/or \(H\). boreale have been called H. xdissimulatum Bicknell (pro sp.). [= RAB, C, G, GW, K, S, W, X, Z; > H. canadense var. canadense F; >H. canadense var. galiiforme Fernald -- F]

Hypericum cistifolium Lamarck. Cp (GA, NC, SC): pine savannas, wet pine flatwoods; common. June-August. E. NC south to s. FL, west to e. TX. [= RAB, GW, K, V, X, Y, Z; >H. cistifolium - S, in a narrower sense; > H. opacum Torrey \& A. Gray -- S]

Hypericum crux-andreae (Linnaeus) Crantz, St. Andrew's Cross, St. Peter's-wort. Cp, Pd (GA, NC, SC, VA), Mt (GA, NC, SC): dry forests and woodlands, pine flatwoods; common (rare in Piedmont and Mountains). June-October. NY (Long Island) and NJ south to s. FL, west to e. TX, primarily on the Coastal Plain, but scattered inland to w. NC and n. GA, also north in the interior to c. TN, s. KY, c. AR, and se. OK. [= GW, K, W, X, Y; = H. stans (Michaux ex Willdenow) P. Adams \& Robson -- RAB, C, V, Z; = Ascyrum stans Michaux ex Willdenow -- F, G; > Ascyrum stans -- S; > Ascyrum cuneifolium Chapman -- S]

Hypericum densiflorum Pursh, Mountain Bushy St. John's-wort. Mt (GA, NC, VA), Pd (NC, VA), Cp (GA, NC, SC): bogs, streambanks, dry to moist forests, rock outcrops, moist forests, pine savannas; common (rare in the VA Piedmont). June-August. Sw. PA south to n . GA and c. AL in and near the Mountains; NJ south to SC in the Coastal Plain; s. GA west to TX in the Coastal Plain. The related \(H\). lobocarpum Gattinger is more western, extending east to TN; the basis for attribution of \(H\). lobocarpum to "Blue Ridge, N.C." by Small (1933) is unknown. [<H. densiflorum -- RAB, C, GW, K, W, X, Z (also see H. interior); < H. densiflorum var. densiflorum -- F, G (also see H. interior); > H. densiflorum Small - S; > H. glomeratum Small -- S]

Hypericum denticulatum Walter, Coppery St.-John's-wort. Cp (GA, NC, SC, VA), Pd, Mt (NC): savannas, wet pine flatwoods, adjacent ditches, borrow scrapes, blackwater stream shores; common (GA Special Concern, VA Watch List). JulySeptember. S. NJ south to e. GA (McIntosh County) (Sorrie 1998b) on the Coastal Plain; disjunct inland in c. and w. NC, sc. TN, and in s. AL. See discussion under H. virgatum. [=K, S; = H. denticulatum var. denticulatum -- RAB, C, F, G, Z; < H. denticulatum -- GW (also see H. virgatum); = H. denticulatum ssp. denticulatum -- X]

Hypericum drummondii (Greville \& Hooker) Torrey \& A. Gray, Nits-and-lice, Drummond's St.-John's-wort. Pd, Cp (GA, NC, SC, VA), Mt (NC, SC, VA): dry woodlands, woodland borders, fields; uncommon. July-September. MD west to OH, IL, and se. KS, south to panhandle FL and c. TX. [= RAB, C, F, G, GW, K, W, X, Z; = Sarothra drummondii Greville \& Hooker -- S]

Hypericum ellipticum Hooker, Pale St.-John's-wort. Mt (NC?, VA): wet places; rare (NC Watch List, VA Rare).
Newfoundland and Nova Scotia west to w. Ontario, south to CT, NY, MI, and MN, and in the mountains to WV, VA, ne. TN (Johnson County) (Chester, Wofford, \& Kral 1997), and NC (?). The documentation for C's attribution of \(H\). ellipticum to NC is unknown. [= C, F, G, K, V, X]

Hypericum fasciculatum Lamarck, Peelbark St.-John's-wort. Cp (GA, NC, SC): wet pine savannas, beaver ponds, upland depression ponds; uncommon (NC Watch List). May-September. E. NC south to s. FL, west to s. MS. [= RAB, GW, K, V, X, Y, Z; < H. fasciculatum -- S (also see H. nitidum, and also including H. chapmanii P. Adams of the deep south)]

Hypericum frondosum Michaux. Mt (GA, NC*, VA*), Pd (GA), Cp (GA): rock outcrops and rocky woodlands; rare, native in GA, introduced in NC and VA from further south and west. Late May-July. This species is native and widespread as far east as e. TN (Chester, Wofford, \& Kral 1997). [= C, F, G, K, V, W, Y, Z; > H. aureum Bartram -- S; > H. splendens Small -- S]

Hypericum galioides Lamarck. Cp (GA, NC, SC): wet pine savannas, wet pine flatwoods, pools, edges of bottomlands; common. June-August. E. NC south to n . FL, west to se. TX. [= RAB, GW, K, V, X, Y, Z; > H. ambiguum Elliott -- S; > H. galioides - \(S\), in a narrower sense]

Hypericum gentianoides (Linnaeus) Britton, Sterns, \& Poggenburg, Pineweed, Orange-grass. Mt, Pd, Cp (GA, NC, SC, VA): fields, rock outcrops, woodland borders, eroding areas; common. July-October. ME and Ontario west to MN, south to FL and TX. [= RAB, C, F, G, K, W, X, Z; = Sarothra gentianoides Linnaeus -- S]

Hypericum graveolens Buckley, Mountain St.-John's-wort. Mt (NC): grassy balds, grassy openings, forests, at high elevations (1200 m or more); rare (NC Watch List). July-August. Nw. NC and ne. TN south to sw. NC, a Southern Appalachian endemic. This and the related \(H\). mitchellianum (another narrow endemic to the Southern Appalachians) hybridize, forming local hybrid populations with intermediate characteristics (Culwell \{year\}). [= RAB, GW, K, S, W, Z]

Hypericum gymnanthum Engelmann \& A. Gray, Clasping-leaf St.-John's-wort. Cp (GA, NC, SC, VA), Pd (GA, VA), Mt (VA): pine savannas, wet pine flatwoods, sinkhole ponds (Augusta and Rockingham counties, VA), other wet to moist habitats; common (rare in Piedmont). June-September. S. NJ south to n . FL, west to c. TX, and scattered inland in PA, WV, sc. TN, OH, IN, IL, MO, and e. KS; also disjunct in Guatemala (introduced?). [= RAB, C, F, G, GW, K, S, X, Z]

Hypericum harperi R. Keller, Harper's St.-John's-wort. Cp (GA, SC): clay-based Carolina bays, other upland depression ponds, with Taxodium ascendens; rare. July-September. E. and c. SC south to sw. GA and panhandle FL. H. harperi should be sought in sc. and se. NC, where it may well occur. This species has generally been considered a part of \(H\). denticulatum or \(H\). virgatum, but Webb (1980) makes a convincing argument for its recognition, including the ecological differentiation and absence of intermediates or hybrids when growing in proximity to \(H\). denticulatum. See \(H\). virgatum for additional discussion. [=X; <H. denticulatum var. acutifolium -- RAB, Z, in part; < H. denticulatum -- GW, in part; < H. harperi -- K, in part only; < H. acutifolium -- S, in part]

Hypericum hypericoides (Linnaeus) Crantz, St. Andrew's Cross. Cp, Pd (GA, NC, SC, VA), Mt (NC, SC, VA): dry forests and woodlands; common (uncommon in Mountains). May-August. NJ, w. VA, c. KY, se. MO, and c. OK, south to s. FL and e. TX; also in the West Indies, Mexico, and Central America. [= RAB, C, GW, V, W, Y, Z; > Ascyrum hypericoides Linnaeus var. hypericoides -F, G; > Ascyrum hypericoides Linnaeus var. oblongifolium (Spach) Fernald -- F, G; = H. hypericoides ssp. hypericoides -- K, X; > Ascyrum hypericoides Linnaeus -- S; > Ascyrum linifolium Spach -- S]

Hypericum Iloydii (Svenson) P. Adams, Lloyd's St.-John's-wort. Pd (GA, NC, SC, VA), Cp (GA, NC, SC): dry woodlands, sandhills, edges of granitic flatrocks, roadbanks; uncommon. June-September. Sc. VA south to c. GA. [= RAB, K, V, X, Z; = Hypericum galioides Lamarck var. lloydii Svenson]

Hypericum microsepalum (Torrey \& A. Gray) A. Gray ex S. Watson. Cp (GA): moist to wet pine flatwoods; rare. S. GA south to n. FL. [= GW, K, V, X, Y, Z; = Crookea microsepala (Torrey \& A. Gray) Small - S]

Hypericum mitchellianum Rydberg, Blue Ridge St.-John's-wort. Mt (NC, VA): grassy balds, grassy openings, forests seepages, at moderate to high elevations (1000-1900 m or more); rare (NC Watch List, VA Rare). July-August. W. VA, e. WV, and e. TN south to sw. NC, a Southern Appalachian endemic. [= RAB, C, F, G, GW, K, S, W, Z]

Hypericum mutilum Linnaeus var. mutilum, Common Dwarf St.-John's-wort Mt, Pd, Cp (GA, NC, SC, VA): bogs, marshes, other wet habitats; common. June-October. Newfoundland and Québec west to Manitoba, south to s. FL and c. TX; scattered (probably as an adventive) farther west in North America, in Central and South America, and Europe. Hybrids with H. canadense have been called \(H\). ×dissimulatum Bicknell (prosp.). [=F; <H. mutilum -- RAB, C, G, GW, K, S, W, Z; = H. mutilum ssp. mutilum -X]

Hypericum mutilum Linnaeus var. latisepalum Fernald, Southern Dwarf St.-John's-wort. Cp (GA, SC): marshes and other wet habitats; rare. June-October. Se. SC south to peninsular FL, west to TX (and, according to F, north to s. NJ). Hybrids with H. canadense have been called H. xdissimulatum Bicknell (pro sp.). [=F; < H. mutilum -- RAB, G, GW, K, S, W, Z; = H. mutilum ssp. latisepalum (Fernald) N. Robson -- X]

Hypericum myrtifolium Lamarck, Myrtle-leaf St.-John's-wort. Cp (GA, SC): ponds; common (rare north of GA). Small (1933) reports this species from SC; this distribution is now documented by a specimen from Jasper Co., SC (P. McMillan, pers. comm.). Se. SC south to sc. FL, west to se. MS, a Southeastern Coastal Plain endemic. [= GW, K, S, V, X, Y, Z]

Hypericum nitidum Lamarck. Cp (GA, SC): pine savannas; rare (NC Rare, SC Rare). June-August. C. SC south to panhandle FL, west to sw. AL. [= RAB, GW, K, V, Y, Z; H. nitidum ssp. nitidum - X]

Hypericum nudiflorum Michaux ex Willdenow. Pd, Cp (GA, NC, SC, VA), Mt (GA, NC): streambanks, moist forests; common (uncommon in VA Piedmont). June-July. Se. VA south to panhandle FL, west to e. TX, s. AR, and se. OK; disjunct in Cumberland Plateau of TN. [= RAB, C, F, G, S, W, V, X, Y; < H. nudiflorum -- GW, K, Z (also see H. apocynifolium of the deep South)]

Hypericum perforatum Linnaeus, European St. John's-wort. Pd (GA, NC, SC, VA), Mt, Cp (NC, SC, VA): fields, pastures, roadsides, woodland borders; common, introduced from Europe. June-September. See Duncan (1985) for documentation for GA [= RAB , C, F, G, K, S, W, Z; = H. perforatum ssp. perforatum - X]

Hypericum prolificum Linnaeus, Shrubby St-John's-wort. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): bogs, seepages, rocky forests, rock outcrops; common (rare in Coastal Plain). June-October. NY west to s. MI and MN, south to GA and LA. [= RAB, C, G, K, W, S, V, X, Z; = H. spathulatum (Spach) Steudel -- F]

Hypericum pseudomaculatum Bush. Cp, Pd (GA, SC), Mt (GA): wet, moist, or dry forests; rare. June-September. SC south to panhandle FL, west to TX, north in the interior to e. TN, c. IL, s. MO, and c. OK. [= RAB, C, G, K, S, Z; = H. punctatum Lamarck var. pseudomaculatum (Bush) Fernald -- F]

Hypericum punctatum Lamarck, Spotted St.-John's-wort. Mt, Pd, Cp (GA, NC, SC, VA): fields, woodland borders; common. June-September. Québec west to MN, south to c. peninsular FL and TX. [= RAB, C, G, K, W, Z; = H. punctatum var. punctatum -F; > H. punctatum - S; >H. subpetiolatum Bicknell ex Small -- S]

Hypericum setosum Linnaeus. Cp (GA, NC, SC, VA): pine savannas, wet pine flatwoods, boggy areas, adjacent ditches, fireplow lines, and scrapes; common (VA Rare). May-September. Se. VA south to c. peninsular FL, west to se. TX. [= RAB, C, F, G, GW, K, S, X, Z]

Hypericum species 1 Weakley, Radfords' St. John's-wort. Pd (NC): shallow circumneutral soil mats of granitic domes in the Brushy Mountains; rare (NC Watch List). Apparently endemic to the Brushy Mountains of Alexander and Wilkes counties, NC. This taxon, included in H. denticulatum var. acutifolium by Webb (1980), differs from typical \(H\). virgatum in being profusely branched from the medial and upper nodes (rather than being little if at all branched, and then only from the uppermost nodes), in having leaves with acuminate (rather than acute to obtuse) apices, and electrophoretically (Webb 1980). Additionally, these plants have numerous bracteal leaves along the inflorescence branches (vs. few or none), the punctate glands of the foliage are large and oval, resembling those of \(H\). denticulatum (vs. small and round), and the punctate glands are distributed on the lower leaf surface and stem (vs. lower leaf surface only). It may be notable that these same outcrops are phytogeographically interesting, with other disjunct and weakly differentiated races (see Allium cuthbertii). Further study is planned. [< H. virgatum included in concept of \(H\). virgatum (= \(H\). denticulatum var. acutifolium, H. denticulatum ssp. acutifolium) by most earlier authors]

Hypericum species 2 LeBlond. Cp (GA, NC, SC?): wet pine savannas, over ultisols or alfisols; rare? June-September. [included in concept of \(H\). tenuifolium (=reductum) by earlier authors]

Hypericum stragulum P. Adams \& Robson. Mt, Pd (GA, NC, SC, VA), Cp (NC, VA): dry rocky or sandy woodlands; common (uncommon in Coastal Plain). May-August. MA (Nantucket I.), NY (Long Island), west to s. PA, s. OH, s. IN, s. IL, c. MO, se. KS, and c. OK, south to ne. NC, c. SC, c. GA, n. AL, n. MS, n. LA, and c. TX. [= C, V, W, Z; = H. stragalum -- RAB, misspelling; = Ascyrum hypericoides Linnaeus var. multicaule (Michaux ex Willdenow) Fernald -- F, G; = H. hypericoides (Linnaeus) Crantz ssp. multicaule (Michaux ex Willdenow) Robson -- K, X]

Hypericum suffruticosum P. Adams \& Robson, Pineland St.-John's-wort. Cp (GA, NC, SC): pine savannas and flatwoods; common (rare in NC and SC) (NC Rare). April-June. Se. NC south to c. peninsular FL, west to se. LA. [= RAB, K, V, X, Y, Z; = Ascyrum pumilum Michaux -- S]

Hypericum tenuifolium Pursh, Sandhill St.-John's-wort. Cp (GA, NC, SC): pine flatwoods, pine savannas, sandhills; common. June-September. Se. NC south to c. peninsular FL, west to panhandle FL and se. AL. Robson (1996) indicates that the older name \(H\). tenuifolium Pursh has now been adequately shown to apply to this taxon. [=X; = H. reductum (Svenson) P. Adams -RAB, GW, K, V, Y, Z; < H. aspalathoides Willdenow -- S (also including \(H\). brachyphyllum)]

Hypericum tetrapetalum Lamarck. Cp (GA): wet pinelands and in depressional wetlands (open or dominated by Taxodium ascendens); uncommon. E. GA (within a few counties of se. SC), south to s. FL, west to panhandle FL. [= GW, K, V, X, Y; = Ascyrum tetrapetalum (Lamarck) Vail - S]

Hypericum virgatum Lamarck. Pd, Mt (GA, NC, SC, VA), Cp (GA, SC): woodlands, rock outcrops, woodland borders; common (VA Watch List). Late June-September. MD west to s. OH, s. IN, and s. IL, south to c. NC, c. SC, sw. GA, panhandle FL, s. MS, and se. LA. Though treated by most recent authors as a variety of \(H\). denticulatum, H. virgatum is better considered as a distinct species. Webb (1980) recognized \(H\). harperi as a separate species (it had previously been considered a part of \(H\). virgatum), and continued to recognize this taxon as a variety of \(H\). denticulatum. However, based on the nature of the punctate glands, size of seeds, inland distribution, etc., it appears that \(H\). virgatum is more distantly related to \(H\). denticulatum and \(H\). harperi than they are to one another; recognition at the species level is warranted for \(H\). virgatum. As pointed out by Webb, H. denticulatum is primarily tetraploid \((\mathrm{n}=24)\), while \(H\). virgatum and \(H\). harperi are (as far as is known) strictly diploid. Additionally, the aberrant populations from granitic outcrops in the Brushy Mountains of Alexander and Wilkes counties, NC referred by Webb (1980) to this taxon are distinct, and more closely allied to \(H\). denticulatum and \(H\). harperi. See Hypericum species 1 for additional discussion. [= K; < H. denticulatum Walter var. acutifolium (Elliott) Blake -- RAB, C, F, G, W, Z (also see H. harperi); > H. denticulatum var. recognitum Fernald \& Schubert -- RAB, F; < H. denticulatum -- GW; < H. acutifolium Elliott -- S (also see H. harperi); \(=H\). denticulatum ssp. acutifolium (Elliott) N. Robson -- X]

Hypericum ascyron Linnaeus ssp. pyramidatum (Aiton) N. Robson, American Great St.-John's-wort. The species is of e. North America and e. Asia; ssp. pyramidatum occurs from Québec west to MN, south to s. PA (Rhoads \& Klein 1993), MD (Robson 2000), and WV (Kartesz 1999). [= X; < H. ascyron Linnaeus -- K; = H. pyramidatum Aiton -- C, F, G] \{not yet keyed\} \{section Roscyna\}

Hypericum brachyphyllum (Spach) Steudel. Cp (GA, SC?): ponds and wet pinelands; common. E. GA (near SC) south to s. FL, west to s. MS. Also reported from SC (Kartesz 1999); needs confirmation. [= GW, K, V, X, Y, Z; < H. aspalathoides - S] \{not yet keyed\}

Hypericum dolabriforme Ventenat, Glade St. John's-wort. Mt (GA): limestone glades and barrens; rare (GA Special Concern). In nw. GA (Jones \& Coile 1988) and e. TN (Chester, Wofford, \& Kral 1997); this species should be sought in sw. VA. [= C, F, G, K, S, V, X, Z] \{not yet keyed\}

Hypericum interior Small, Interior Bushy St. John's-wort. Mt (GA): E. and c. TN, nw. GA south to c. AL. Perhaps best treated as a variety of \(H\). densiflorum. [= S; <H. densiflorum - K, V, X, Z; ? H. revolutum R. Keller] \{not yet keyed\}

Hypericum lobocarpum Gattinger. Streambanks, river bottoms, pinelands. C. TN (Chester, Wofford, \& Kral 1997) and MS west to s. IL, se. OK, e. TX; credited to SC by Robson (1996), based on specimens debated and dismissed by Adams (1973). Late May-September. [= C, K, S, V, X, Z; = H. densiflorum var. Iobocarpum (Gattinger) Svenson - F, G; < H. densiflorum -- GW] \{not yet keyed\}

Hypericum majus (A. Gray) Britton. South to nw. PA (Rhoads \& Klein 1993), NJ, DE, and OH (Kartesz 1999). [= C, F, G, K, X]
Hypericum species 3 J. Allison, Georgia St, John's-wort. Cp (GA): seepage bogs, roadside ditches; rare (GA Special Concern). Apparently endemic to the Altamaha Grit region of the GA Coastal Plain. \{not yet keyed\}

Hypericum sphaerocarpum Michaux, Barrens St. John's-wort. Mt (GA): limestone barrens; rare (GA Special Concern). East to GA (GAHP 2003), e. and c. TN (Chester, Wofford, \& Kral 1997), sw. PA (Rhoads \& Klein 1993). [= C, F, G, K, V, X, Z; > H. turgidum Small - S; > H. sphaerocarpum var. turgidum (Small) Svenson] \{not yet keyed\}

\section*{Triadenum Rafinesque (Marsh St-John's-wort)}

A genus of \(6-10\) species, herbs, of e. North America and e. Asia. Although Triadenum has sometimes formerly been included in Hypericum, Robson (1977) and others consider it to be more closely related to the tropical Asian shrub Cratoxylum Blume.
References: Adams (1973)=Z.
1 Leaves narrowed to the cuneate or broadly cuneate (rarely truncate) base.
2 Lower leaves sessile; sepals acute; leaves lacking translucent or dark glands or punctae ............... T. tubulosum
2 Lower leaves petiolate; sepals obtuse; leaves with translucent glands and dark punctae
T. walteri

1 Leaves clasping, cordate, or subcordate at the base.
3 Sepals \(5-8 \mathrm{~mm}\) long at maturity, acute or acuminate; styles \(1.8-3 \mathrm{~mm}\) long (best seen in fruit) ............ T. virginicum
3 Sepals 2.5-5 mm long at maturity, obtuse or acute; styles \(0.5-1(-1.5) \mathrm{mm}\) long (best seen in fruit) . . . . . . . . . . T. fraseri
Triadenum fraseri (Spach) Gleason, Marsh St.-John's-wort. Mt (NC, VA): bogs, peaty wetlands; rare (VA Rare). July-August. Newfoundland and Québec west to MN, south to NY, PA, w. VA, ne. TN, w. NC, OH, n. IN, and NE. Closely related to \(T\). virginicum and reduced to a variety of (or included in) that species by some authors. [= C, G, K; = Hypericum virginicum Linnaeus var. fraseri (Spach) Fernald -- F; < T. virginicum -- W, Z, in part; = Hypericum fraseri Spach]

Triadenum tubulosum (Walter) Gleason, Marsh St.-John's-wort. Cp (GA, NC, SC, VA), Pd (VA): bogs, peaty wetlands, drawdown sloughs along rivers; uncommon (GA Rare, VA Rare). August-September. Se. VA south to n. FL, west to LA, and north in the interior to se. and c. TN, s. IL and s. OH. [= C, G, GW, K, Z; = Hypericum tubulosum Walter -- RAB; = Hypericum tubulosum Walter var. tubulosum -- F; = T. longifolium Small -- S]

Triadenum virginicum (Linnaeus) Rafinesque, Marsh St.-John's-wort. Cp, Mt (GA, NC, SC, VA), Pd (GA, VA): bogs, peaty wetlands; common (rare in Mountains and Piedmont). July-September. Nova Scotia west to OH and s. Ontario, south to FL and MS, mostly on the Coastal Plain but scattered inland. [= C, G, GW, K, S; = Hypericum virginicum Linnaeus -- RAB; = Hypericum virginicum var. virginicum -- F; < T. virginicum -- W, Z, in part only (also see T. fraseri)]

Triadenum walteri (J.G. Gmelin) Gleason, Marsh St.-John's-wort. Cp, Pd, Mt (GA, NC, SC, VA): swamp forests and marshes; common (uncommon in VA Piedmont, rare in VA Mountains). August-September. MD south to n. FL, west to e. TX, north in the interior to s. MO, s. IL, and OH. [= C, G, GW, K, W, Z; = Hypericum walteri J.G. Gmelin -- RAB; = Hypericum tubulosum Walter var. walteri (J.G. Gmelin) Lott -- F; = T. petiolatum (Walter) Britton -- S]

\section*{ILLICIACEAE A.C. Smith 1947 (Star-anise Family)}

A family of 1 genus and about 42 species, shrubs and trees, of temperate and subtropical se. Asia and se. North America (se. United States, Cuba, Haiti, and e. Mexico). The family is most closely related to the Schisandraceae and Winteraceae. References: Keng in Kubitzki, Rohwer, \& Bittrich (1993).

\section*{Illicium Linnaeus 1759 (Star-anise)}

A genus of about 42 species, shrubs and trees, of temperate and subtropical se. Asia and se. North America (se. United States, Cuba, Haiti, and e. Mexico). References: Vincent in FNA (1997); Keng in Kubitzki, Rohwer, \& Bittrich (1993).

1 Flowers 2-5-5 cm across; tepals 21-33, red-maroon (rarely white or pinkish); leaves tips acute to acuminate .... I. floridanum
1 Flowers 0.8-1.2 cm across; tepals 11-16, yellowish green; leaf tips obtuse or rounded . ...................... . . parviflorum
Illicium floridanum Ellis, Florida Star-anise. Cp (GA): acid ravines and small stream swamps; rare (GA Endangered). Sw. GA west to e. LA. [= FNA, GW, K, S]
* Illicium parviflorum Michaux ex Ventenat, Swamp Star-anise, Yellow Anise-tree. Cp (GA): cultivated and persistent; rare (GA Special Concern). April-June. This species occurs in swampy forests, evergreen hammocks, and bayheads and is endemic to scattered localities in central FL; it is in the horticultural trade and has been introduced in various places, including sw. and se. GA. [= FNA, K, S]

\section*{ITEACEAE (Sweetspire Family)}

A family of 1 genus and about 20 species, shrubs, of e. Asia, e. North America, and Mexico.

Itea Linnaeus (Virginia-willow, Sweetspire, Tassel-white)
Variously treated in a very broadly-conceived Saxifragaceae (RAB, F, G, GW, W), a less comprehensive Grossulariaceae (C, K), a narrow Escalloniaceae, or a very narrow (single genus) Iteaceae (S), the relationships of Itea remain problematic. Recent molecular
data suggest that the relationship between Itea and other woody "saxifragaceous" genera (including Escallonia) is only distant (Morgan \& Soltis 1993). Itea is here conservatively treated in a narrow Iteaceae. The remainder of the genus (about 20 species) is found in e. Asia and w. Malaysia; the only close relative of our species is I. japonica Oliver, of Japan. References: Spongberg (1972); Morgan \& Soltis (1993); Bohm et al. (1999).

Identification notes: Sometimes confused needlessly with Clethra, whose much more coarsely serrate, obovate leaves contrast with the serrulate, elliptic leaves of Itea. Also often confused with Leucothoe racemosa in vegetative condition.

Itea virginica Linnaeus, Virginia-willow, Sweetspire, Tassel-white. Cp (GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC SC): moist forests and thickets, especially along the banks of small streams; common (uncommon in Piedmont and Mountains). May-June. S. NJ south to FL and west to e. TX, north in the interior (especially in the Mississippi Embayment) to s. IL and se. MO. [= RAB, C, F, K, G, GW, S, W]

\section*{JUGLANDACEAE (Walnut Family)}

A family of about 8 genera and 60 species, trees and shrubs, mostly temperate. References: Stone in FNA (1997); Elias (1972); Stone in Kubitzki, Rohwer, \& Bittrich (1993).

1 Fruit with husk dehiscent into 4 valves; pith of twigs continuous; leaves with (3-) 5-17 (-19) leaflets, the largest usually the terminal or final 2 lateral; nut with shell smooth, ridged, or irregularly wrinkled (but not deeply furrowed); terminal buds with imbricate or valvate scales

Carya
1 Fruit with husk indehiscent; pith of twigs chambered (not always developing until autumn of the first year's growth); leaves with (7-) 11-19 (-23) leaflets, the largest usually about halfway up the leaf; nut with shell deeply furrowed in a complex corrugated pattern; terminal buds with imbricate scales

Juglans

> Carya Nuttall (Hickory)
> (by A.S. Weakley \& R.K. Peet)

A genus of about 18 species, trees, of e. North America (south into s. Mexico), and e. Asia. Carya in our area is separated into two sections, section Apocarya (C. aquatica, C. cordiformis, C. illinoinensis) and section Carya (C. alba, C. carolinae-septentrionalis, C. glabra, C. laciniosa, C. myristiciformis, C. ovalis, C. ovata, C. pallida). The southeastern United States is the center of diversity of Carya. Our three-state area includes 11 of 13 North American species (including the naturalized C. illinoinensis and lacking only a more southern species, C. floridana Sargent of peninsular FL, and a south-central species, C. texana Buckley of sc. United States), and 11 of 18 species worldwide. Section Rhamphocarya includes a single Asian species. The remaining 4 species in the genus are all in section Apocarya: C. palmeri Manning of Mexico and 3 Asian species.
C. cordiformis, C. aquatica, C. illinoinensis, C. myristiciformis, C. laciniosa, C. ovata, and C. carolinae-septentrionalis are diploids, with \(n=16\). C. pallida, C. glabra, C. ovalis, and C. alba are tetraploids with \(n=32\) (Stone 1961). As suggested by Stone et al. (1969), it seems possible that reticulate evolution involving extant or extinct diploid species is responsible for some of the difficulties in the C. glabra-ovalis complex. Many hybrids have been described, but some are questionable. Additionally, Hardin \& Stone (1984) state that "most of these hybrids are localized and have not led to introgressive populations, or at least none that have been recognized".

Ecologically, Carya is one of the more diverse and ubiquitous genera of trees in our area, surpassed in number of species, abundance, and ecological amplitude only by Quercus and Pinus. This has led to a long tradition of describing large parts of our area (in particular the Piedmont) as being characterized by "oak-hickory" or "oak-pine-hickory" forests (e.g. Küchler 1964; Greller 1988; Schafale \& Weakley 1990; Skeen, Doerr, \& Van Lear 1993). Ware () and others have recently questioned this tradition, pointing out that Carya only rarely dominates or codominates, primarily in specialized circumstances (such as in soils with greater cation concentrations, derived from mafic rocks).

The association of many (but certainly not all) species of hickories with soils with high base status was noted in print as early as 1820 in an account of the landscape of North Carolina. "The sandy pine barrens, and all the lands on which pine is the exclusive growth, are unfriendly to agriculture; but where the pine is intermixed with oak and hickory, the soil is good. Some of our strongest lands have tall pine, mixed not only with hickory and oak, but also with walnut and cherry, and such trees that indicate the best soil. Where hickory prevails, the land is strong" (Guthrie 1820).

Note that the C. glabra-C. ovalis portion of this treatment is tentative. In our area, this group has been variously treated as consisting of between 1 and 10 (or more) taxa. For testing, we present here a plausible middle ground treatment in the key and species accounts (4 taxa). References: Stone in FNA (1997); Stone \& Hardin in SE (in prep.); Hardin (1992); Hardin \& Stone (1984); Elias (1972); Stone, Adrouny, \& Flake (1969); Stone (1961); Mohlenbrock (1986); Sargent (1918); Manning (1950); Hardin (1952); Little (1969); Harrar \& Harrar (1962); Stone in Kubitzki, Rohwer, \& Bittrich (1993). Key based in part on Stone \& Hardin in SE (in prep.).

Identification notes: Surface vestiture of leaves and bud scales is useful in distinguishing species of Carya. Some use of these characters can be made with a \(10 \times\) or \(20 \times\) hand lens; better still is a dissecting microscope. It is important to understand the different trichome types mentioned in the key (terminology follows Hardin 1990 and Hardin \& Stone 1984). Short acicular trichomes are simple, unicellular trichomes tapered to a pointed tip, 0.10-0.35 mm long and with rough walls. Long acicular
trichomes ("solitary" of Hardin \& Stone 1984) are similar to short acicular, but are much larger, 0.45-1.6 mm long, and have smooth walls. Fasciculate trichomes are multicellular and have 2-8 straight or curled rays radiating a clustered base. Multiradiate trichomes are similar to fasciculate, but have 8-17 rays, the inner (and usually more upright) rays attached basally above the outer (and usually more spreading) rays. Capitate glandular trichomes are unicellular or multicellular, and are distinguished by their bulbous or expanded tip; they are usually 0.02-0.1 mm long. Peltate scales are flat or dome-shaped shields or disks, slightly to strongly glandular, (sometimes regularly or irregularly lobed) and can be either sessile or stalked (they are often referred to as scales, resin dots, peltate glands, or lepidote scales). On the lower surfaces of leaflets, peltate scales are of two types: large peltate scales are \(0.08-0.3 \mathrm{~mm}\) in diameter and are round, with smooth or slightly irregular margins, while small peltate scales are \(0.025-0.12 \mathrm{~mm}\) in diameter and are either round, irregularly lobed or regularly 2 - or 4-lobed.

1 Terminal buds with 4-6 valvate scales; leaves with 7-13 (-19) leaflets, these symmetrical to strongly falcate; fruit sutures narrowly winged.
2 Leaves with 7-9 (-11) leaflets, these symmetrical to slightly falcate; fasciculate trichomes with 2-4 rays; terminal bud elongate, flattened, \(9-19 \mathrm{~mm}\) long, bright orangey yellow to dull orange-tan; [common and widely distributed tree in our area, typically in floodplain and slope forests]
C. cordiformis

2 Leaves with (7-) 9-19 leaflets, these slightly to strongly falcate; fasciculate trichomes with 2-8 rays.
3 Leaves with (7-) 9-11 (-15) leaflets; bark shaggy; lateral petiolules 0-2 mm long; nut flattened in cross-section; kernel bitter; [native, of swamp forests, primarily in the Coastal Plain]
C. aquatica

3 Leaves with 11-19 leaflets; bark scaly, with small exfoliating plates; lateral petiolules 0-7 mm long; nut round in crosssection; kernel sweet; [introduced, frequently cultivated, long persistent, and occasionally naturalized]

1 Terminal buds with 6-15 imbricate scales; leaves with (3-) 5-9 (-11) leaflets, these symmetrical to slightly falcate; fruit sutures not winged.
4 Bark shaggy (on large trees separating in segments to a meter in length); leaves with (3-) 5 (-7) leaflets; serrations of the leaflets densely (or only moderately) ciliate when young, most densely so just below the tooth apex, the hairs sloughing with age but leaving a subapical tuft of white trichomes on at least some teeth.
5 Twigs slender, hardened first-year growth or second-year growth 1-3 mm in diameter; terminal bud 6-15 mm long, glabrous to sparsely puberulent (except for ciliate fringe on the scales), reddish-brown (usually turning black on drying); lower surface of leaflets nearly glabrous, except for tufts of trichomes in the main vein axils, and only slightly lepidote with a few, scattered scales, the large peltate scales yellow and round, the small peltate scales brown, 2and 4-lobed; terminal leaflet 2-5 (-6) cm wide
C. carolinae-septentrionalis

5 Twigs stout, hardened first-year growth or second-year growth (2.5-) 3-6 mm in diameter; terminal bud 9-18 mm long, tomentose, tan to brown (rarely turning black on drying); lower surface of leaflets moderately to densely hirsute with acicular and fasciculate hairs (sometimes the hairs more or less limited to the main veins), and also moderately lepidote, the large peltate scales yellow and round, the small peltate scales dark brown and mostly round; terminal leaflet (4-) 6-15 cm wide
C. ovata

4 Bark tight (the ridges typically forming an interlocking diamond pattern), scaly, or shaggy (when shaggy, the separated segments normally much less than a meter long); leaves with (3-) 5-9 (-11) leaflets; serrations of the leaflets glabrous or ciliate, but lacking subapical tufts of trichomes.
6 Twigs stout; terminal buds 8-20 mm long; leaves with (5-) 7-9 (-11) leaflets; lower surface of leaflets densely hirsute with a mixture of acicular (single), fascicled (2-8 rays), and multiradiate (8-many rays) hairs; small peltate scales of the lower surface of leaflets all round; fruit husk \(4-13 \mathrm{~mm}\) thick; nuts slightly to strongly 4 -angled toward the apex. \(7 \quad\) Bark tight; petiole hirsute; leaflet apex acute; lower surface of leaflets densely hirsute with acicular (single) and abundant 2-8-rayed fascicled and multiradiate hairs; fruit husk glabrous, with pustulate bumps; fruit \(3.5-5 \mathrm{~cm}\) long; nut 2.5-3.5 cm long; [common in our area]
C. alba

7 Bark shaggy; petiole hirtellous; leaflet apex acuminate; lower surface of leaflets hirsute with acicular (single), 26 -rayed fascicled, and occasional multiradiate hairs; fruit husk pubescent, lacking pustulate bumps; fruit 4-7 cm long; nut \(3-6 \mathrm{~cm}\) long; [rare in our area]
C. laciniosa

6 Twigs slender; terminal buds 3-15 mm long; leaves with (3-) 5-7 (-9) leaflets; lower surface of leaflets mostly glabrous, except for along the midrib and primary veins, and sometimes hirsute on the surface with acicular (single) and infrequent fascicled (2-8 rays) hairs (lacking multiradiate trichomes); small peltate scales of the lower surface of leaflets of various types, 4 -lobed and/or irregular scales often more frequent than round scales; fruit husk 2-5 mm thick; nuts not 4-angled toward the apex.
8 Terminal bud 4-10 mm long, predominantly lepidote (also pubescent); leaves with (5-) 7 (-9) leaflets; lower surface of spring leaflets densely lepidote with 4 -lobed, irregular, and round peltate scales, giving the undersurface a reflective, silvery-tan or bronze sheen.
9 Lepidote scales initially silver, soon turning bronze, and giving the buds, young twigs, and undersurface of the leaves a metallic bronze sheen; [of calcareous swamps, bottomlands and slopes of the Coastal Plain of se. NC and e. SC]
C. myristiciformis

9 Lepidote scales silvery-tan; [of upland and usually acidic frests and woodlands, widespread in our area] ..
C. pallida

8 Terminal bud 5-15 mm long, predominantly pubescent (also sparsely lepidote); leaves with (3-) 5-7 (-9) leaflets; lower surface of spring leaflets slightly to densely lepidote with irregular and round peltate scales (4-lobed peltate scales uncommon).
10 Fruit husk spitting to base at maturity along 2-4 sutures; leaves with (5-) 7 leaflets, pubescent beneath; petiole reddish; fruits typically ellipsoidal; bark tight or often scaly or somewhat shaggy . . . . . . . C. ovalis
10 Fruit husk indehiscent at maturity or tardily splitting to base along 1 suture; leaves with (3-) 5 (-7) leaflets, glabrous to pubescent beneath; petiole usually green; fruits ellipsoidal, pyriform, or subglobose; bark tight.

11 Rachis (and also often the petiole and lower surfaces of leaflets) densely pubescent
C. glabra var. hirsuta

11 Rachis, petiole, and lower surfaces of leaflets glabrous or glabrescent.
12 Husk of fruit 1.5-2.5 mm thick; fruit ellipsoidal, subglobose, to obovoid, 1.5-3.5 cm long; terminal leaflet usually 8-17 cm long; [primarily of the Piedmont and Mountains] . . C. glabra var. glabra
12 Husk of fruit about 3.5 mm thick; fruit pyriform, 2.5-5 cm long; terminal leaflet usually \(20-25 \mathrm{~cm}\) long; [primarily of the Coastal Plain]
C. glabra var. megacarpa

Carya alba (Linnaeus) Nuttall ex Elliott, Mockernut Hickory, White Hickory. Pd, Cp, Mt (NC, SC, VA), \{GA\}: forests and woodlands; common. April-May; October. MA west to IN and IA, south to FL and TX. One of the most common forest trees of much of our area. There has been confusion and controversy for several centuries over the specific epithet. The oldest basionym available is Juglans alba Linnaeus, which apparently included disparate elements, including this taxon and C. ovata. Following a more circumscribed typification by Crantz in 1766, the epithet "alba" should have been applied to this taxon, but continued to be applied in various ways. Rehder (1945) proposed that \(C\). alba should be considered a nomen ambiguum, but agreed that it applied correctly to what has often been called C. tomentosa. He argued that the use of \(C\). alba should be rejected "in order to avoid confusion and ambiguity." However, C. alba has not been officially rejected, its application appears to be nomenclaturally clear, and there is no alternative under the International Code of Botanical Nomenclature (Greuter 1988) to its use. For further discussion see Rehder (1945), Howard \& Staples (1983), and Wunderlin, Hansen, \& Hall (1985). [= K; = C. tomentosa (Lamarck ex Poiret) Nuttall -- RAB, C, F, FNA, G, W; = Hicoria alba (Linnaeus) Britton -- S]

Carya aquatica (Michaux f.) Nuttall, Water Hickory, Bitter Pecan. Cp (NC, SC, VA), Pd (SC); \{GA\}: swamp forests, where flooded during the winter months; uncommon. April-May; October. Se. VA south to c. peninsular FL, west to e. TX, north inland to se. MO, s. IL, and se. OK. [= RAB, C, F, FNA, G, GW, K; = Hicoria aquatica (Michaux f.) Britton -- S]

Carya carolinae-septentrionalis (Ashe) Engler \& Graebner, Carolina Shagbark Hickory, Carolina Hickory. Pd (NC, SC, VA); \(\{G A\}\) : upland flats, especially those weathered from mafic rocks and with shrink-swell soils dominated by montmorillonitic clays, less typically on slopes and bottomlands; uncommon (rare in VA). April-May; October. Sc. VA (Halifax County) south to GA, AL, and MS, and inland northwards to c. TN and sc. KY. First reported for VA by Wieboldt et al. (1998). The taxonomic status of C. carolinae-septentrionalis has been controversial, with some workers reducing it to variety of \(C\). ovata or not recognizing it at all. It seems to us morphologically and ecologically distinctive and to represent an independent evolutionary lineage. Hardin \& Stone (1984) found differences in trichomes, and in a study of nut oils, Stone, Adrouny, \& Flake (1969) found C. ovata "surprisingly distant" from C. carolinae-septentrionalis. There are reports that the two taxa are also phenologically separated, C. carolinae-septentrionalis leafing out about two weeks earlier than C. ovata, when growing together in the c. Piedmont of NC. Though usually ecologically and/or geographically segregated, the two species sometimes occur together or in close proximity to one another; they maintain their distinctness. [= RAB, C, G, K; = C. ovata (P. Miller) K. Koch var. australis (Ashe) Little -- FNA; = Hicoria carolinaeseptentrionalis Ashe -- S; = C. ovata var. carolinae-septentrionalis (Ashe) Reveal; = C. australis Ashe]

Carya cordiform is (Wangenheim) K. Koch, Bitternut Hickory. Mt, Pd, Cp (GA, NC, SC, VA): forests and woodlands, especially in rich, moist alluvial or slope forests; common. April; October. ME and s. Québec west to MN and NE, south to panhandle FL and e. TX. [= RAB, C, F, FNA, G, GW, K, W; = Hicoria cordiformis (Wangenheim) Britton -- S]

Carya glabra (P. Miller) Sweet var. glabra, Pignut Hickory. Mt, Pd, Cp (GA, NC, SC, VA): forests and woodlands; common. April-May; October. C. glabra ranges from s. NH west to s. MI, se. IA, and se. KS, south to c. peninsular FL and e. TX; the ranges of the varieties are poorly known. [=F, G; < C. glabra -- RAB, C, FNA, GW, K; < C. glabra var. glabra -- W; > Hicoria glabra (P. Miller) Britton var. glabra -- S; > Hicoria microcarpa (Nuttall) Britton -- S]

Carya glabra (P. Miller) Sweet var. hirsuta (Ashe) Ashe, Hairy Pignut Hickory. Mt, Pd? (GA, NC, SC, VA): forests and woodlands; common? April-May; October. Var. hirsuta is apparently primarily Appalachian, variously described as being endemic to the Southern Appalachians or ranging north to s. NH. It needs additional taxonomic assessment. [<C. glabra -- RAB, C, FNA, GW, K; = C. ovalis (Wangenheim) Sargent var. hirsuta (Ashe) Sargent -- F; = Hicoria glabra (P. Miller) Britton var. hirsuta Ashe - S; < C. glabra var. glabra -- W]

Carya glabra (P. Miller) Sweet var. megacarpa (Sargent) Sargent, Coastal Pignut Hickory. Cp (GA, NC, SC, VA?): maritime forests and other forests of the outer Coastal Plain; uncommon? April-May; October. Var. megacarpa is apparently primarily a tree of the se. United States Coastal Plain, ranging from s. NY south to FL, west to TX, and north in the interior to s. IL. It needs additional taxonomic assessment. [= F, G; < C. glabra -- RAB, C, FNA, GW, K; =? Hicoria austrina Small - S]

Carya illinoinensis (Wangenheim) K. Koch, Pecan. Cp, Pd (GA, NC, SC, VA): persistent around dwellings and in pecan orchards, escaped to suburban woodlands, rural forest edges and floodplains; commonly cultivated, rarely naturalized. April-May; October. Native to the sc. United States, now more widespread in the se. United States as a result of cultivation. The spelling of the specific epithet has been a source of controversy. [= C, FNA, K; = C. illinoensis -- RAB, F, G, GW, orthographic variant; = Hicoria pecan (Marshall) Britton -- S]

Carya laciniosa (Michaux f.) G. Don, Kingnut Hickory, Big Shellbark Hickory. Mt (GA), Cp, Pd (NC): moist, circumneutral, alluvial levee forests along brownwater rivers of the Coastal Plain (NC), streams of the Piedmont (NC) and Mountains (GA); rare (NC Rare). April-May; October. NY and s. Ontario west to IA, south to NC, nw. GA, MS, and OK. This species is sometimes planted, but occurs native in nw. GA, along the Roanoke River (Halifax and Northampton counties, NC) and New Hope Creek (Durham County, NC). [= RAB, C, F, FNA, G, GW, K, W; = Hicoria laciniosa (Michaux f.) Sargent -- S]

Carya myristiciformis (Michaux f.) Nuttall, Nutmeg Hickory. Cp (GA, NC, SC): nonriverine swamps over calcareous substrates, including calcareous clays and coquina limestone ("marl"), oak flatwoods; rare (GA Special Concern, NC Threatened, SC Rare). April; October. Se. NC south to SC, and from wc. AL west to e. TX and se. OK (apparently absent in GA); and disjunct in Mexico (Nuevo Léon and Tamaulipas). The bronze sheen of the leaflets of this species is diagnostic. First reported for NC by Leonard (1971b). [= FNA, K; = C. myristicaeformis -- RAB, GW, orthographic variant; = Hicoria myristicaeformis (Michaux f.) Britton -- S, orthographic variant]

Carya ovalis (Wangenheim) Sargent, Red Hickory. Mt, Pd, Cp (NC, SC, VA), \{GA\}: forests and woodlands; common. AprilMay; October. MA west to WI, south to GA, MS, and MO. [= RAB, C, F, K; C. ovalis var. obcordata (Muhlenberg \& Willdenow)

Sargent -- F, G; C. ovalis var. obovalis Sargent -- F, G; C. ovalis var. odorata (Marshall) Sargent -- F, G; C. glabra -- FNA, in part; C. glabra (P. Miller) Sweet var. odorata (Marshall) Little -- W]

Carya ovata (P. Miller) K. Koch, Common Shagbark Hickory. Mt, Pd, Cp (NC, VA), \{GA\}: rich moist bottomlands, slopes, occasionally on dry upland flats; uncommon. May; October. S. ME and s. Québec west to MN and NE, south to GA and TX; also disjunct in Mexico. [= RAB, C, F, G, GW, K, W; > C. ovata var. ovata - F; > C. ovata var. pubescens Sargent -- F; = C. ovata var. ovata -- FNA; = Hicoria ovata (P. Miller) Britton -- S]

Carya pallida (Ashe) Engler \& Graebner, Sand Hickory, Pale Hickory. Cp, Pd (NC, SC, VA), Mt (NC, SC), \{GA\}: dry sandy or rocky forests and woodlands; common. April-May; October. S. NJ south to FL, west to TX, inland in the interior to w. NC, KY, s. IL, and AR. [= RAB, C, F, FNA, G, K, W; = Hicoria pallida Ashe -- S]

Carya texana Buckley is reported to occur as far east as KY, TN, and GA (Kartesz 1999), an eastern extent not reported by FNA. \{investigate\} [=K; C. texana var. arkansana (Sargent) Little - C] \{not yet keyed\}

\section*{Juglans Linnaeus (Walnut)}

A genus of about 21 species, trees and shrubs, of Mediterranean Europe to e. Asia, and North America to Andean South America Stanford, Harden, \& Parks (2000) present a molecular phylogeny and a discussion of biogeography; our two species are distantly related within the genus, with J. nigra most closely related to sw. North American J. microcarpa and J. major, and J. cinerea most closely related to several e. Asian species. References: Whittemore \& Stone in FNA (1997); Stanford, Harden, \& Parks (2000); Stone \& Hardin in SE (in prep.); Stone in Kubitzki, Rohwer, \& Bittrich (1993); Stanford (1998).

1 Lower surface of the leaflets densely hirsute with 4-8-rayed fascicled hairs; fruit ellipsoid, densely pubescent with reddishbrown glandular hairs; leaf scars with a velvety ridge along the upper margin; leaves with (7-) 11-17 leaflets; pith dark brown; terminal buds 12-18 mm long; bark of mature trees pale; [section Trachycaryon] \(\qquad\) J. cinerea

1 Lower surface of the leaflets hirsute with single and 2-rayed fascicled hairs; fruit spherical or nearly so, lepidote with peltate scales and occasional glandular hairs; leaf scars without a velvety ridge along the upper margin; leaves with (9-) 15-19 (-23) leaflets; pith light brown; terminal buds \(8-10 \mathrm{~mm}\) long; bark of mature trees dark; [section Rhysocaryon] \(\qquad\) J. nigra

Juglans cinerea Linnaeus, Butternut, White Walnut. Mt (GA, NC, SC, VA), Pd (NC, SC, VA), Cp (VA): moist, nutrient-rich forests; uncommon (US Species of Concern, GA Special Concern, NC Watch List, SC Rare, VA Watch List). April-May; October. New Brunswick west to MN, south to n . GA and AR. This tree, formerly common, is afflicted with butternut canker disease, which now threatens its continued existence. [= RAB, C, F, FNA, G, K, W; = Wallia cinerea (Linnaeus) Alefeld -- S]

Juglans nigra Linnaeus, Black Walnut. Mt, Pd, Cp (GA, NC, SC, VA); moist, nutrient-rich forests; common (uncommon in the Coastal Plain of NC and SC). April; October. MA west to MN, south to nw. FL and TX. The dark brown wood is famous for cabinetry and other uses; it is one of the most prized of North American hardwoods. The nuts, though difficult to crack, are prized for their intense flavor. The husk is used as a dye. Country people dehusk the nuts by putting them in dirt or gravel driveways where the passage of car tires removes the husk but does not crack the nut. [= RAB, C, F, FNA, G, K, W; = Wallia nigra (Linnaeus) Alefeld -- S]

\section*{KRAMERIACEAE (Krameria Family)}

A family of a single genus and about 15-18 species, herbs, shrubs, and trees, of warm (and usually dry) parts of s. North America to South America. References: Robertson (1973); Simpson et al. (2004).

\section*{Krameria Linnaeus (Ratany)}

A genus of about 15 species, herbs, shrubs, and trees, hemiparasitic by haustoria. References: Robertson (1973)=Z.

Krameria lanceolata Torrey, Trailing Ratany, Sandspur. Cp (GA): sandhills; uncommon. AR, TX, and s. KS west to se. CO, se. AZ, Chihuahua, and Coahuila; disjunct eastwards in the Coastal Plain of FL and GA (east to Bulloch, Bryan, Evans, and Emanuel counties, GA). [= K, Z; K. spathulata Small -- S]

\section*{LAMIACEAE or LABIATAE (Mint Family)}

A family of about 230-250 genera and 6700-7170 species, herbs, shrubs, vines, and trees, cosmopolitan. The placement in the Lamiaceae of several genera traditionally placed in Verbenaceae (e.g. Clerodendrum) is strongly supported by several lines of evidence. References: Harley et al. in Kadereit (2004).
subfamily Viticoideae: Vitex.
subfamily Ajugoideae: Ajuga, Clerodendrum, Teucrium, Trichostema.
subfamily Scutellarioideae: Scutellaria.
subfamily Lamioideae: Galeopsis, Lamiastrum, Lamium, Leonurus, Macbridea, Marrubium, Physostegia, Sideritis, Stachys, Synandra.
subfamily Nepetoideae:
tribe Elsholtzieae: Collinsonia, Elsholtzia, Mosla, Perilla.
tribe Mentheae:
subtribe Salviinae: Rosmarinus, Salvia
subtribe Menthinae: Blephilia, Clinopodium, Conradina, Cunila, Dicerandra, Hedeoma, Hyssopus, Lycopus, Mentha, Monarda, Origanum, Piloblephis, Prunella, Pycnanthemum, Thymus.
subtribe Nepetinae: Agastache, Dracocephalum, Glechoma, Meehania, Nepeta.
incertae sedis: Melissa
tribe Ocimeae:
subtribe Hyptidinae: Hyptis.
subtribe Ociminae: Ocimum.
incertae sedis: Callicarpa.

\section*{Acinos}
(see Clinopodium)

\section*{Agastache Clayton ex Gronovius 1762 (Giant-hyssop)}

A genus of about 22 species, herbs, of c. and e. Asia, and North America to Mexico. References: Vogelmann (1985); Lint \& Epling (1945); Harley et al. in Kadereit (2004).

1 Leaves densely white tomentose below; corolla blue; [cultivated as an ornamental and rarely naturalized] . . . [A. foeniculum] 1 Leaves glabrous to villous beneath, appearing green; corolla yellow, greenish-yellow, or pinkish; [native].

2 Corolla yellow or greenish-yellow; calyx lobes obtuse or subacute, 1-1.5 mm long at anthesis; calyx lobes and bracts green; midstem internodes glabrous or minutely pubescent; lower surface of the leaf pubescent on the veins and surface

Corolla pinkish; calyx lobes acute or acuminate, 2-2.5 mm long at anthesis; calyx lobes and bracts with white or pink margins; midstem internodes at least sparsely long-pubescent; lower surface of the leaf pubescent mainly on the veins

Agastache nepetoides (Linnaeus) Kuntze, Yellow Giant-hyssop. Pd (NC, SC, VA), Cp (NC, VA), Mt (GA, NC, VA): woodlands and forests, generally over calcareous or mafic rocks; uncommon (GA Special Concern, NC Watch List). JulySeptember; September-October. VT west to MN, south to nw. GA and OK. In our area, this species occurs mostly in the Piedmont. [= RAB, C, F, G, K, S, W]

Agastache scrophulariifolia (Willdenow) Kuntze, Purple Giant-hyssop. Mt (GA, NC, VA), Pd (NC, VA): rich woodlands and forests, bottomlands; uncommon (GA Special Concern). July-September; September-October. VT west to MN, south to NC, e. TN, n. GA, and e. KS. [= K; A. scrophulariaefolia -- RAB, C, F, G, S, W, an orthographic variant; A. scrophulariaefolia var. mollis (Fernald) Heller -- F]
* Agastache foeniculum (Pursh) Kuntze, Lavender Giant-hyssop, native of w. North America, is cultivated as an ornamental and naturalized in scattered locations in PA (Rhoads \& Klein 1993), KY (Kartesz 1999), and elsewhere. [= C, F, G, K]

Ajuga Linnaeus (Bugle, Bugleweed)
A genus of about 40-50 species, herbs, of the temperate Old World. References: Harley et al. in Kadereit (2004)

1 Leaves deeply cleft into narrow segments; corolla yellow; annual . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. chamaepitys
1 Leaves entire to shallowly lobed; corolla blue (to white or pink); perennial.
2 Plants not stoloniferous; stems hairy all around . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [A. genevensis]
2 Plants stoloniferous; stems hairy in lines . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. reptans
* Ajuga chamaepitys (Linnaeus) Schreber, Yellow Bugle, Ground-pine Bugle. Cp (VA): disturbed areas; rare, introduced. May-September. [= C, F, G, K]
* Ajuga reptans Linnaeus, Carpet Bugle. Pd, Mt (NC, VA), Cp (VA): lawns and roadsides; commonly cultivated, uncommonly established. March-June. [= RAB, C, F, G, K]
* Ajuga genevensis Linnaeus, Standing Bugle, is cultivated and rarely escaped in ne. North America, at least as far south as PA (Rhoads \& Klein 1993) and MD (Kartesz 1999). [= C, F, G, K]

\section*{Blephilia Rafinesque 1819 (Woodmint, Pagoda-plant)}

A genus of 3 species, herbs, of e. North America. References: Simmers \& Kral (1992)=Z; Harley et al. in Kadereit (2004).
1 Stem glabrate below the middle; leaf lower surface glabrous or with a few unicellular hairs on the midvein; [of moist forests over limestone in n. AL]
. . [B. subnuda]
1 Stem strongly pubescent below the middle; leaf lower surface distinctly pubescent, at least on the larger nerves; [of various moist to dry forests, woodlands, and meadows, collectively widespread in our area].

2 Lobes of the lower lip of the calyx linear, approaching the sinuses of the upper lip; outer bracteoles acute; leaves with rounded to acutish tips (rather Prunella-like); petioles 1-7 (-12) mm long; stem canescent, rarely with intermixed long trichomes; [primarily in the Piedmont]
. B. ciliata
2 Lobes of the lower lip of the calyx deltoid, not reaching the sinuses of the upper lip; outer bracteoles long-acuminate; leaves with acuminate to acute tips (rather Monarda-like); petioles \(9-42 \mathrm{~mm}\) long; stem densely to sparsely pubescent with long, spreading trichomes; [primarily in the Mountains)
B. hirsuta

Blephilia ciliata (Linnaeus) Bentham. Pd, Mt (GA, NC, SC, VA), Cp (NC, SC, VA): woodlands, meadows, forests, usually in circumneutral soils (over diabase, limestone, etc.); uncommon. May-early July; August-October. MA and WI south to c. GA and AR. [= RAB, C, F, G, K, S, W, Z]

Blephilia hirsuta (Pursh) Bentham. Mt, Pd (NC, VA), \{GA\}: rocky or alluvial forests, montane forests up to at least 5000 feet elevation; common (VA Watch List). Late June-October; August-November. Québec and MN south to NC, AL, and AR. [= RAB, C, F, G, K, S, W, Z; B. hirsuta var. hirsuta - F, K]

Blephilia subnuda R.W. Simmers \& Kral is endemic (so far as is known) to the Cumberland Plateau of nc. AL (Jackson and Madison counties). [=K, Z]

\section*{Calamintha \\ (see Clinopodium)}

Callicarpa Linnaeus 1753 (Beautyberry)
A genus of about 140 species, small trees, shrubs, and lianas, mainly tropical and subtropical. References: Moldenke (1980)=Z; Harley et al. in Kadereit (2004).

1 Leaves 2-6.5 (-7) cm long, glabrous or nearly so beneath (except on the midrib); peduncles 10-20 mm long .... C. dichotoma
Callicarpa americana Linnaeus, Beautyberry, American Beautyberry, French-mulberry. Cp (GA, NC, SC, VA), Pd, Mt (GA, NC, SC): maritime forests, other forests (especially with sandy or rocky soils), disturbed areas; common (rare in Mountains). JuneJuly; August-October (persisting into the winter). MD and AR south to FL, TX, Mexico; West Indies. [= RAB, C, F, G, K, S, W] * Callicarpa dichotoma (Loureiro) K. Koch, Chinese Beautyberry. Pd (NC, VA), Cp, Mt (NC), \{SC\}: roadsides, powerline rights-of-way, woodland edges, suburban woodlands, bogs; uncommon. September-November. This species is beginning to spread more rapidly in our area. [= RAB, C, K]
* Callicarpa japonica Thunberg, Japanese Beautyberry, is reported for Durham Co., NC (Moldenke 1980). [= K, Z] \{not yet keyed; add synonymy\}

Chaiturus Willdenow 1787
* Chaiturus marrubiastrum (Linnaeus) Reichenbach, Horehound Motherwort. Mt, Pd (VA): disturbed areas; rare, introduced from Europe and n. Asia. June-September. [= K; Leonurus marrubiastrum Linnaeus - C, F, G, S]

\section*{Clerodendrum Linnaeus (Glory-bower)}

A genus of about 400-500 species, trees and shrubs, mostly tropical and warm temperate, e. and w. hemispheres. References: Steane et al. (1999); Hsiao \& Lin (1995); Steane, de Kok, \& Olmstead (2004); Harley et al. in Kadereit (2004).
* Clerodendrum bungei Steudel. Pd (GA, SC), Cp (GA): roadsides and suburban woodlands; rare, introduced from e. Asia. August-September. First reported from South Carolina by Hill \& Horn (1997); also reported for our area by W. Duncan (pers. comm.). [= K]
* Clerodendrum indicum (Linnaeus) Kuntze, Tubeflower, Turk's-turban. Cp (GA, SC): disturbed areas, roadsides; rare, introduced from the Malaysian Archipelago. August-October; November-December. [=K; Clerodendron indicum -- RAB, orthographic variant]
* Clerodendrum trichotomum Thunberg var. ferrugineum Nakai, Harlequin Glory-bower. Pd, Mt (NC), \{GA\}: roadsides, streambanks; rare, cultivated and strongly naturalized, native of e. Asia. [= K]
* Clerodendrum japonicum (Thunberg) Sweet is also cultivated and may be encountered in our area. It is naturalized in MD (Staff of the Bailey Hortorium 1976). [= K]

A genus of about \{??\} 20 species (as here circumscribed), herbs and shrubs, of temperate and subtropical areas of the \(w\). and \(e\). hemispheres. References: Cantino \& Wagstaff (1998) =Y; Shinners (1962a) =Z; Shinners (1962f)=X. Key adapted in part from Z.

1 Plant a shrubby perennial, not flowering the first year; [of sandy or rocky habitats of the Coastal Plain and Piedmont, from s. NC southwards].
2 Corolla bright scarlet, 27-50 mm long; calyx 8-18 mm long
C. coccineum

2 Corolla light lavender or pink with darker spots, \(10-20 \mathrm{~mm}\) long; calyx \(6.0-7.5 \mathrm{~mm}\) long.
3 Leaves ovate or elliptic, sharply serrate, not revolute; leaves distinctly petioled; leaf surfaces glabrous
C. georgianum

3 Leaves linear to linear-elliptic, entire, strongly revolute; leaves subsessile; leaf surfaces minutely and densely pubescent
C. ashei

1 Plant an herbaceous to suffrutescent perennial, often flowering the first year; [of various habitats, collectively widely distributed in our area].
4 Stem glabrous or pubescent at the nodes only; leaves of flowering stems linear to oblanceolate; [native, of limestone glades, barrens, and bluffs].
5 Plant stoloniferous, bearing leafy stolons with ovate leaves; leaves of the flowering stems 1-2 cm long, 1-5 mm wide, entire
C. arkansanum

5 Plant not bearing leafy stolons; leaves of the flowering stems oblanceolate, 2.5-5 cm long, 5-17 mm wide, with several teeth on each side
[C. glabellum]
4 Stem pubescent; leaves of flowering stems elliptic to ovate; [alien or native, generally of disturbed or weedy situations]. 6 Axillary flower clusters sessile, dense.

7 Whorls with 8 or fewer flowers; calyx 4.5-7 mm long; corolla 7-10 mm long . . . . . . . . . . . . . . . . . . . . C. acinos 7 Whorls with more than 8 flowers; calyx \(7-10 \mathrm{~mm}\) long; corolla \(12-22 \mathrm{~mm}\) long C. vulgare

6 Axillary flower clusters peduncled, contracted cymes.
8 Calyx 6.0-10.2 mm long, the hairs inside the throat barely or not exserted; blades of larger stem leaves 2-5 cm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. ascendens
8 Calyx 2.8-6.0 mm long, the hairs inside the throat exserted, prominent; blades of the larger stem leaves 0.8-2.4 cm long
C. calamintha
* Clinopodium acinos (Linnaeus) Kuntze, Mother-of-thyme, Basil-thyme. Mt (VA): cultivated, rarely escaped or persisting; rare, introduced from Europe. [= Satureja acinos (Linnaeus) Scheele -- C, F, G; = Acinos arvensis (Lamarck) Dandy -- K]

Clinopodium arkansanum (Nuttall) House, Arkansas Calamint. Mt (VA): dry limestone glades; rare (VA Rare). Ontario west to MN, south to w. NY, nw. PA, w. VA, WV, IL, c. TN, and s. WI; also in MO, OK, AR, and TX. There appears to be confusion about the identities and distributions of this taxon and C. glabellum. [=K, Y; = Satureja glabella (Michaux) Briquet var. angustifolia (Torrey) Svenson -- C, G; = Satureja arkansana (Nuttall) Briquet -- F; < Calamintha arkansana (Nuttall) Shinners - GW, in part (see also Clinopodium glabellum); = Calamintha arkansana (Nuttall) Shinners -- Z; < Clinopodium glabellum (Michaux) Kuntze -- S, in part; = Clinopodium arkansanum (Nuttall) House -- Y]
* Clinopodium ascendens (Jord.) Samp., Common Calamint. Cp (VA): rich calcareous slope; rare, introduced from Europe.

August. [= Calamintha sylvatica Bromf. ssp. ascendens (Jord.) P.W. Ball -- K; Calamintha officinalis -- Z]
Clinopodium ashei (Weatherby) Small, Ashe's Calamint, Ashe's Savory, Ohoopee Dunes Wild Basil. Cp (GA): xeric sandhills; rare (GA Threatened). Peninsular FL and disjunct in e. GA (Candler and Tatnall counties). [= K, S, Y; = Calamintha ashei (Weatherby) Shinners-- Z; = Satureja ashei Weatherby]

Clinopodium calamintha (Linnaeus) Stace, Lesser Calamint, Basil-thyme. Mt, Pd, Cp (NC, VA), \{GA\}: disturbed areas; common (rarer in NC), introduced from Europe. July-October. [Satureja calamintha (Linnaeus) Scheele var. nepeta (Linnaeus) Briquet -- RAB, F, G, W; = Satureja calamintha (Linnaeus) Scheele -- C; > Satureja calamintha var. calamintha -- F; > Satureja calamintha var. nepetoides (Jord.) Briquet -- F, G; > Satureja calamintha var. glandulosa (Riquien) Briquet -- F; > Calamintha nepeta (Linnaeus) Savi ssp. nepeta -- K; > Calamintha nepeta ssp. glandulosa (Riquien) P.W. Ball -- K; = Clinopodium nepeta (Linnaeus) Kuntze -- S; > Calamintha officinalis Moench - Z; > Calamintha nepeta (Linnaeus) Savi -- Z]

Clinopodium coccineum (Nuttall ex Hooker) Kuntze, Scarlet Calamint, Scarlet Wild Basil, Red Mint Shrub. Cp (GA): sandhills and flatwoods; uncommon. E. GA south to FL and west to s. MS. [= K, S, Y; = Calamintha coccinea (Nuttall ex Hooker) Bentham -- Z; = Satureja coccinea (Nuttall ex Hooker) Bertolini]

Clinopodium georgianum Harper, Georgia Calamint. Cp, Pd (GA, NC, SC): longleaf pine sandhills, dry rocky woodlands; rare (NC Rare). July-September. S. NC south to FL and west to LA. [= K, S, Y; = Satureja georgiana (Harper) Ahles -- RAB; = Calamintha georgiana (Harper) Shinners -- Z]

Clinopodium vulgare Linnaeus, Wild Basil. Mt, Pd, Cp (NC, VA): pastures, roadbanks, forests, thin soils around rock outcrops; common. July-September. Newfoundland to Manitoba, south to NC, sc. TN, and KS, scattered in the west, widespread in Europe. Plants in our area may reflect both native and introduced genotypes. [=K, S, Y, Z; = Satureja vulgaris (Linnaeus) Fritsch -RAB, C, F, G, W; > Satureja vulgaris var. diminuta (Simon) Fernald \& Wiegand -- F; > Satureja vulgaris var. neogaea Fernald -- F; > Clinopodium vulgare var. neogaea (Fernald) C.F. Reed]

Clinopodium brownei (Sw.) Kuntze, Browne's Savory. Cp (GA): floodplain forests; rare (GA Special Concern). In sw. GA (Jones \& Coile 1988). [= K; > Micromeria pilosiuscula (A. Gray) Small -- S; > Micromeria brownei (Sw.) Bentham var. pilosiuscula A. Gray - GW, X] \{not yet keyed\}

Clinopodium dentatum (Chapman) Kuntze, of GA and FL. [= K; = Satureja dentata (Chapman) Briquet; = Calamintha dentata Chapman] \{not yet keyed; add to synonymy\}

Clinopodium glabellum (Michaux) Kuntze. Dry-mesic to mesic shaley forests, limestone barrens of c. KY, c. TN, MO, AR, and c. AL. Reports of this for VA (Kartesz 1999) are apparently based on confusion with Clinopodium arkansanum. [= Y; = Satureja
glabella (Michaux) Briquet var. glabella -- C; = Clinopodium glabellum (Michaux) Kuntze -- K; < Calamintha arkansana (Nuttall) Shinners - GW, in part; < Clinopodium glabellum (Michaux) Kuntze -- S, in part; = Calamintha glabella (Michaux) Bentham] * Clinopodium gracile (Bentham) Kuntze, Slender Wild Basil, introduced in s. AL, FL, LA (Kartesz 1999; Woods, Diamond, \& Searcy 2003) and MS (S. Leonard, pers. comm. 2005). [= K] \{not yet keyed; add to synonymy\}

\section*{Collinsonia Linnaeus 1753 (Horsebalm, Richweed, Stoneroot)}

A genus of about 4 species, perennial herbs, of e. North America. References: Peirson, Cantino, \& Ballard (in prep.)=Y; Shinners (1962b) \(=\) Z; Harley et al. in Kadereit (2004). Key adapted from Y and Z.

1 Inflorescence an unbranched thyrse, the lower nodes with (3-) 6 flowers per node; floral bracts absent; pedicels flattened at base; leaves (2-) 4 (-6), the 4 upper (or only) leaves subverticillate; flowers light pink to lavender; flowering April-June; [subgenus Micheliella]
C. verticillata

1 Inflorescence a panicle (rarely unbranched), the flowers 2 per node; floral bracts present, minute to large; pedicels not enlarged basally; leaves 6 or more, opposite; flowers cream to yellow; flowering July-September; [subgenus Collinsonia]

Fertile stamens 4; fresh plants with anise scent; [of GA southwards and westwards]
C. anisata

2 Fertile stamens 2; fresh plants with lemon scent; [collectively widespread in our area].
3 Blades of the larger stem leaves 4.0-10.5 cm long, with 5-15 teeth on each margin, glabrous or hispidulous on the main veins beneath; plant from a small, rounded tuber-like crown, to 6 cm long and 5 cm in diameter . . C. tuberosa
3 Blades of the larger stem leaves \(8-25 \mathrm{~cm}\) long, with 11-42 teeth on each margin, glabrous or variously pubescent beneath; plant from an elongate, woody, rhizome-like crown, to 15 cm long.
4 Calyx 2-5 mm long; calyx teeth lance-subulate to narrowly lanceolate; flowers 8-13 mm long ... C. canadensis
4 Calyx 4.5-7 mm long; calyx teeth broadly lanceolate; flowers 12-17 mm long . . . . . . . . . . . . . . . . . . . . . C. sp. 1

Collinsonia anisata Sims, Southern Horsebalm, Anise Horsebalm. Pd, Cp (GA): rich forests; uncommon. Late JulySeptember; September-October. C. GA south and west to Panhandle FL and west to s. MS, on the Piedmont and Coastal Plain Based on an unpublished study by Jess A. Peirson, this species is apparently distinct, but Shinners's concept of it included hybrids with C. canadensis and aberrant C. canadensis. [= Y; Collinsonia serotina Walter \(-K, Z\), in part; Collinsonia serotina Walter -W ; C. canadensis var. punctata (Elliott) A. Gray -- F, in part misapplied; C. punctata Elliott -- S; Micheliella anisata (Sims) Briquet -- S]

Collinsonia canadensis Linnaeus, Richweed, Northern Horsebalm. Mt, Pd, Cp (GA, NC, SC, VA): cove forests, rich forests, especially over calcareous or mafic substrates; common. Late July-September; September-October. Québec, MI, and WI south n. FL and LA. [= RAB, C, F, G, K, S, W, Z; C. canadensis - Y, in part (also see C. tuberosa)]

Collinsonia sp. 1, Florida Horsebalm. Cp (GA, SC): rich woods; rare. July-September; September-October. S. SC (Barnwell County) to e. LA, on the Coastal Plain. This entity is under study; it may warrant specific status as its range does not fully correspond with that of its putative parents, and it occurs at sites independent of them. [Collinsonia anisata Sims \(\times\) canadensis Linnaeus -- Y; Collinsonia serotina - K, Z, in part]

Collinsonia tuberosa Michaux, Stoneroot. Pd (GA, NC, SC), Mt (GA): rich forests, over calcareous or mafic substrates; rare (NC Watch List). Late July-September; September-October. C. NC west to c. TN, south to n. GA and MS (or LA?). An unpublished study by Jess A. Peirson concludes that C. tuberosa should be merged into C. canadensis. [= RAB, K, S, W, Z; C. canadensis - Y, in part; C. canadensis Linnaeus var. tuberosa (Michaux) A. Wood]

Collinsonia verticillata Baldwin, Whorled Horsebalm. Pd (GA, NC, SC, VA), Mt (GA): rich forests, ranging from moist (cove) forests to rather dry oak forests over mafic or calcareous rocks; rare (NC Rare, SC Rare, VA Rare). Late April-early June; JuneJuly. S. VA west to e. TN, south to w. NC, nw. SC, c. GA, and MS; disjunct in s. OH. The range is strangely scattered and fragmented. [= RAB, C, G, K, W, Y, Z; Micheliella verticillata (Baldwin) Briquet -- F, S]

\section*{Conradina A. Gray 1870}

A genus of 6 species, shrubs and suffrutescent herbs, of temperate se. North America. References: Shinners (1962)=Z; Harley et al. in Kadereit (2004).

1 Leaves densely gray-pubescent above and below . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [C. canescens]
1 Leaves green above, glabrous or inconspicuously short-pubecsent.
2 Plants upright to 8 dm tall; calyx tube glabrous or minutely and inconspicuously puberulent; [of the Coastal Plain of Panhandle FL and s. AL]
[C. glabra]
2 Plants decumbent, rooting at the nodes; calyx tube densely short-pubescent and also pilose with longer glandular hairs; [of the Cumberland Plateau of KY and TN] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [C. verticillata]

Conradina canescens A. Gray, Gray Rosemary. Sandhills, scrub, flatwoods. January-May. Panhandle FL and s. AL west to s. MS. [=K, Z; > C. canescens - S, in a narrower sense; > C. puberula Small - S]

Conradina glabra Shinners, Apalachicola Rosemary. Sandhills. Panhandle FL and s. AL. [= K, Z]
Conradina verticillata Jennison, Cumberland Rosemary. Endemic to flood-scoured cobble bars of the Cumberland Plateau area of ne. TN and se. KY. It has an odor similar to rosemary, and showy purplish flowers. [= K, Z; = C. montana Small -- S]

A genus of about 15 species, herbs, from e. North America to South America. References: Harley et al. in Kadereit (2004).

Cunila origanoides (Linnaeus) Britton, Stone-mint, American-dittany, Wild-oregano. Mt (GA, NC, SC, VA), Pd (NC, SC, VA), Cp (NC, VA): dry rocky slopes, other dry slopes; common (rare in NC Coastal Plain). S. NY and PA west to MO, south to c. SC, n. GA, OK, and ne. TX (Singhurst \& Holmes 2004). [= RAB, C, F, G, K, W; = Mappia origanoides (Linnaeus) House -- S]

Dicerandra Bentham 1830
A genus of 9 species, herbs, endemic to se. North America. References: Huck (1987)=Z; Huck (1984)=Y; Huck \& Chambers (1997); Harley et al. in Kadereit (2004).

1 Corolla tubular, straight or slightly curved; superior lobe cucullate (hoodlike); stamens and style arching under the hooded upper lobe of the corolla, included or slightly exserted beyond its apex; filaments inserted at 2 levels within the corolla; odor of fresh plant cinnamon-like, spicy; [section Lecontea].
2 Corolla tube ca. 18 mm long, the orifice ca. 2 mm wide; leaves (15-) avg. 25 ( -45 ) mm long, linear, the margins entire; [of s. SC south through much of the Coastal Plain of GA] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . D. odoratissima

2 Corolla tube \(>20 \mathrm{~mm}\) long, the orifice ca. 4 mm wide; leaves (19-) avg. 40 ( -55 ) mm long, narrowly oblong, the margins often dentate; [endemic to McIntosh County, GA]
D. radfordiana

1 Corolla funnel-shaped, the tube geniculate; superior corolla lobe a lobed, flaring standard; stamens and style exserted, the stamens either widely flaring to the sides or declined along the lower lobe of the corolla; filaments inserted at the same level within the corolla; odor of fresh plant minty; [section Dicerandra].
3 Cymes epedunculate; flowers nearly sessile in compact verticils; pollen white to pale yellow; anther spurs obtuse to barely acute, with domes of minute hairs . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [D. densiflora]
3 Cymes on peduncles 3-6 mm long; flowers on pedicels (3-) avg. 5 (-9) mm long; pollen bright yellow; anther spurs acuminate, glabrous.
4 Leaves linear; cymes 3 -flowered; corolla white to pale purple; anthers vivid yellow; [widespread in the Coastal Plain of GA south to ne. FL and s. AL] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . D. linearifolia var. linearifolia 4 Leaves narrowly rhombic; cymes 5-7-flowered; corolla purplish red to vivid purple; anthers strongly reddish brown; [of extreme s. GA south into e. Panhandle FL and ne. FL] .
D. linearifolia var. robustior

Dicerandra linearifolia (Elliott) Bentham var. linearifolia. Cp (GA): sandhills and flatwoods; uncommon. Mid September-late November. W. and ec. Coastal Plain of GA south to ne. FL and s. AL. This taxon is hexaploid. [= K, Y, Z; < D. linearifolia -- S]

Dicerandra linearifolia (Elliott) Bentham var. robustior R.B. Huck. Cp (GA): sandhills and flatwoods; uncommon. Late September-late November. Sc. Coastal Plain of GA (Brooks, Echols, Lowndes counties) (Huck 1987) south to e. Panhandle FL and ne. FL. This taxon is tetraploid. [= K, Y, Z; < D. linearifolia -- S]

Dicerandra odoratissima Harper. Cp (GA, SC): sandhills; uncommon (SC Rare). Late August-early October. S. SC south to se. GA. This taxon is tetraploid. [= RAB, K, S, Y, Z]

Dicerandra radfordiana R.B. Huck, Radford's Dicerandra. Cp (GA): dry flatwoods and sandhills; rare (GA Special Concern). September-October. Endemic to e. GA (McIntosh County). This species was postulated to be a polyploid derivative of \(D\). odoratissima by Huck (1984, 1987); later study has shown that this is not the case (Huck \& Chambers 1997). Both taxa are tetraploid. [= K, Y, Z]

Dicerandra densiflora Bentham, reported for GA by Small (1933), but this report is apparently in error. Huck (1987) regards it as endemic to n . peninsular FL. October-early November. This taxon is tetraploid. [=K, S, Y, Z]

Dracocephalum Linnaeus 1753 (Dragon's-head)
(see also Physostegia)
A genus of about 45-70 species, herbs, of Eurasia and North America. References: Harley et al. in Kadereit (2004).
* Dracocephalum parviflorum Nuttall, Dragon's-head. Pd (NC): cultivated ground; rare, native west of the Appalachians. May-July; July-September. [= C, F, G, K; = Moldavica parviflora (Nuttall) Britton -- RAB]

Elsholtzia Willdenow 1790
A genus of about 35-40 species, herbs, of temperate e. hemisphere. References: Harley et al. in Kadereit (2004).
* Elsholtzia ciliata (Thunberg) Hylander. Mt (NC): disturbed areas; rare, introduced from Asia. First reported for NC by Leonard (1971b). [= C, F, G, K]

Galeopsis Linnaeus 1753 (Hemp-nettle)
A genus of about 10 species, herbs, of Eurasia. References: Stace (1997)=Z; Harley et al. in Kadereit (2004). Key adapted from Stace (1997).

1 Stem with soft, appressed hairs; stem not swollen at the nodes
[G. ladanum var. ladanum]
1 Stem with rigid, bristly hairs; stem swollen at the nodes.
2 Terminal lobe of lower lip of corolla clearly emarginate and also convex (the sides revolute); corolla 13-16 mm long . . . .

2 Terminal lobe of the lower lip of the corolla entire to very slightly emarginate, essentially planar, not revolute; corolla 13-20 (-25) mm long
[G. tetrahit]
* Galeopsis bifida Boenninghausen, Bifid Hemp-nettle. Mt (NC): streamsides, pastures, roadsides; rare, introduced from Eurasia. July-frost. [= K, Z; < G. tetrahit -- RAB, S, in the broad sense (apparently including G. bifida); = G. tetrahit Linnaeus var. bifida (Boenninghausen) Lejeune \& Courtois -- C, F, G]
* Galeopsis ladanum Linnaeus var. ladanum, Red Hemp-nettle is naturalized in ne. North America, south at least to se. PA (Rhoads \& Klein 1993) and may occur in our area. [= F, K; G. ladanum Linnaeus var. angustifolia (Ehrhart ex Hoffmann) Wallroth -C, G, misappied]
* Galeopsis tetrahit Linnaeus, Common Hemp-nettle is naturalized in ne. North America and may occur in our area. Some of the material reported from our area may be this taxon. [= Z; = G. tetrahit var. tetrahit -- C, F, G; > G. tetrahit var. tetrahit -K , in a narrower sense]

\section*{Glechoma Linnaeus 1753 (Gill-over-the-ground)}

A genus of about 4-10 species, herbs, of temperate Eurasia. References: Harley et al. in Kadereit (2004).
* Glechoma hederacea Linnaeus, Gill-over-the-ground, Ground-ivy. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): lawns, gardens, disturbed areas; common, introduced from Eurasia. Late March-June; May-July. [= C, K; = Glecoma hederacea -- RAB, S, W, misspelled; > G. hederacea var. hederacea - F; > G. hederacea var. micrantha Moricand -- F; > Glecoma hederacea var. parviflora (Bentham) House -- G]

Hedeoma Persoon 1807 (American Pennyroyal)
A genus of about 38-42 species, herbs, of North America, Central America, and South America. References: Irving (1980)=Z; Harley et al. in Kadereit (2004).

1 Leaves elliptic, 4-11 mm wide, slightly to strongly crenate; nutlets subspherical, 0.7-1.0 mm long, 0.6-0.9 mm wide, the surface smoothish, mottled, not glaucous; [subgenus Hedeoma] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . H. pulegioides
1 Leaves linear to narrowly elliptic, 1-4 mm wide, entire; nutlets narrowly ovoid, 1.0-1.3 mm long, 0.4-0.6 mm wide, the surface areolate and strongly glaucous; [subgenus Saturejoides].
2 Calyx teeth convergent, closing the orifice at maturity; bracteoles subtending the individual flower pedicels 1-2 mm long, about \(1 / 2\) as long as the pedicel; leaves (5.0-) avg. 7.7 (-11.0) mm long, (1.2-) avg. \(2.2(-4.0) \mathrm{mm}\) wide, \(3-5 \times\) as long as wide ......................................................................................... . [H. drummondil]
2 Calyx teeth spreading (the upper) to slightly convergent (th lower), not closing the orifice at maturity; bracteoles subtending the individual flower pedicels (1.5-) \(2.5-6 \mathrm{~mm}\) long, generally as long as or longer than the pedicel; leaves (11.0-) avg. 16.4 (-21.0) mm long, (1.0-) avg. \(2.2(-3.0) \mathrm{mm}\) wide, \(>5 \times\) as long as wide H. hispida
*? Hedeoma hispida Pursh, Rough Pennyroyal. Pd (GA, SC, VA), Mt, Cp (GA): disturbed areas, pastures, granitic flatrocks; rare, apparently adventive from further south and west. Irving (1980) shows no collections of H. hispida closer to our area than e. panhandle FL, c. AL, nc. TN, and s. OH; it may be recently arrived in our area or previously overlooked. First reported for SC by Hill \& Horn (1997). [= C, F, G, K, Z]

Hedeoma pulegioides (Linnaeus) Persoon, American Pennyroyal. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): dry soils of woodlands, roadbanks, woods-roads, especially common in shaly parts of the VA mountains; common (uncommon to rare in the Carolinas). Late July-October. Nova Scotia, s. Québec, s. Ontario, MI, WI, and IA south to c. SC, c. GA, and AR. The fragrant oil is apparently very similar to that of the European Pennyroyal, Mentha pulegium Linnaeus. The oil is a powerful insect repellant and insecticide, often used on pets to repel fleas. It is also poisonous to humans, however, at least in substantial quantities. It is sometimes used as a tea; native Americans are reputed to have used it as an abortion inducer. This plant should be used with great caution, if at all. [= RAB, C, F, G, K, S, W, Z]

Hedeoma drummondii Bentham. East to MS and AL, where it occurs in black belt prairies. [= K, Z]

\section*{Hyptis Jacquin 1786 (Cluster Bushmint)}

A genus of about 280-300 species, herbs and shrubs, of warm temperate, subtropical, and tropical America. References: Harley et al. in Kadereit (2004).

1 Leaves lanceolate, narrowed to a narrowly cuneate, subpetiolar base; flowers borne in large, globose heads, 1.5-2.5 cm across, borne on peduncles \(2-6 \mathrm{~cm}\) long
H. alata

1 Leaves ovate, narrowed to a broadly cuneate to truncate base and well-developed petiole (4-6 cm long on larger leaves); flowers borne in irregular verticillate spikes, sessile to pedunculate on peduncles 1-2 mm long
H. mutabilis

Hyptis alata (Rafinesque) Shinners, Musky Mint, Cluster Bushmint. Cp (GA, NC, SC): wet pine savannas, margins of swamp forests, wet powerline rights-of-way, ditches; common. Late June-September. Ne. NC south to FL, west to se. TX; also in the West Indies. [= RAB, GW, K; H. radiata Willdenow -- S]

Hyptis mutabilis (A. Richard) Briquet Cp (GA, SC, VA); rare, perhaps only a waif, introduced from South America. This species is naturalized in disturbed wetlands from e. GA south to s. FL, west to se. LA. [= GW, K, S]

Hyssopus Linnaeus 1753 (Hyssop)
A genus of 2-5 species, herbs, of s. Europe to c. Asia. References: Harley et al. in Kadereit (2004).
* Hyssopus officinalis Linnaeus, Hyssop. \{NC\} Reported for NC (see G and S); documentation not known. Introduced from Eurasia. July-October. [= RAB, C, F, G, K, S]

\section*{Isanthus Rafinesque}
(see Trichostema)

\section*{Lamiastrum Heister ex Fabricius 1759 (Yellow Archangel)}

A monotypic genus, an herb, of w. Europe to Iran, often included in Lamium. The generic name may be illegitimate. References: Mennema (1989) \(=\) Z; Harley et al. in Kadereit (2004).
* Lamiastrum galeobdolon (Linnaeus) Ehrendorfer \& Polatschek, Yellow Archangel. Pd (VA): disturbed areas; rare, introduced from Europe and e. Asia. Several subspecies are recognized in Europe. [= K; = Lamium galeobdolon (Linnaeus) Linnaeus -- Z; = Galeobdolon luteum Hudson]

Lamium Linnaeus 1753 (Dead-nettle, Henbit)
A genus of about \(17-40\) species, herbs, of \(n\). Africa and Eurasia. References: Mennema (1989)=Z; Harley et al. in Kadereit (2004).
1 Corolla yellow; anthers glabrous; bracts present, reflexed \(\qquad\) [see Lamiastrum galeobdolon]
1 Corolla blue or white; anthers with tufts of hairs; bracts absent or present (if present not reflexed).
2 Perennial, with rhizomes or stolons; corolla 18-35 mm long, the tube curved; leaves all petioled; [section Lamiotypus]. 3 Corolla white; leaves not blotched with white; lower corolla lip with 2-3 teeth on each side; pollen light yellow L. album ssp. album 3 Corolla pinkish-purple (rarely white); leaves usually marked with white; lower corolla lip with 1 tooth on each side; pollen orange . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . L. maculatum
2 Annual, lacking rhizomes or stolons; corolla 10-18(-20) mm long, the tube straight; leaves all petioled or upper leaves sessile and clasping.
4 Leaves subtending flower clusters sessile; [section Amplexicaule] . . . . . . . . . . L. amplexicaule var. amplexicaule 4 Leaves all petiolate; [section Lamium].

5 Leaves subtending whorls deeply serrate, with many teeth \(>2 \mathrm{~mm}\) long; nutlets (2.5-) 2.7-3.0 (-3.3) mm long ..

5 Leaves subtending whorls crenate-serrate, with teeth < 2 mm long; nutlets (2.0-) 2.2-2.5 (-2.8) mm long ....
. L. purpureum var. purpureum
* Lamium album Linnaeus ssp. album, White Dead-nettle, Snowflake. (VA): disturbed areas; rare, introduced from Eurasia. April-September. Reported from our area (VA) by many earlier manuals; not documented in Harvill et al. (1992). [= Z; < L. album -C, \(F, G, K]\)
* Lamium amplexicaule Linnaeus var. amplexicaule, Henbit, Henbit Dead-nettle. Cp, Pd, Mt (GA, NC, SC, VA): lawns, fields, roadsides, disturbed areas, gardens, pastures; common, introduced from Eurasia and n. Africa. January-December. [= \(Z\); < \(L\). amplexicaule -- RAB, C, F, G, K, W]
* Lamium dissectum With., Cutleaf Dead-nettle. Mt (NC), Pd (VA): lawns, fields, roadsides, disturbed areas; rare, introduced from Eurasia. April-May. This taxon is apparently an allopolyploid derivative ( \(2 n=36\) ), resulting from hybridization of \(L\). purpureum and another species, perhaps L. amplexicaule. Because of its allopolyploid status, this taxon should not be treated as a variety of \(L\). purpureum. It is, however, possible that some individuals identified here may be sterile hybrids \((2 n=18)\). [ \(L\). hybridum Villars -RAB, C, F, G, misapplied; = L. purpureum Linnaeus var. incisum (Willdenow) Persoon -- K, Z]
* Lamium maculatum Linnaeus, Spotted Dead-nettle. Pd, Mt (NC?, VA): lawns, fields, roadsides, disturbed areas; rare, introduced from Eurasia. April-September. [= RAB, C, F, G, K, Z]
* Lamium purpureum Linnaeus var. purpureum, Red Dead-nettle, Purple Dead-nettle. Mt, Pd (GA, NC, SC, VA), Cp (NC, VA): lawns, fields, roadsides, disturbed areas, pastures; common, introduced from Eurasia. March-October. Other varieties are found in the Old World. [=K, Z; = L. purpureum -- RAB, C, F, G, W, in a narrow sense]

A genus of about 9 species, herbs, shrubs, and small trees, of sub-Saharan Africa. References: Iwarsson \& Harvey (2003)=Z.
* Leonotis nepetifolia (Linnaeus) Aiton f. var. nepetifolia, Lion's-ears, Lightning-rod-plant. Cp, Pd (GA, NC, SC): pastures, disturbed areas; uncommon, introduced from s. Africa. Late August-October. [= Z; < L. nepetifolia -- K, infraspecific taxa not distinguished; <L. nepetaefolia -- RAB, S, orthographic variant, and infraspecific taxa not distinguished]

\section*{Leonurus Linnaeus 1753 (Motherwort)}
(also see Chaiturus)
A genus of 25 species, herbs, of temperate Eurasia. Though L. marrubiastrum and L. sibiricus are documented in our area only from VA, they are also documented from south of our area; they likely will be found to occur in all four states.

1 Calyx strongly 5-angled, the lower 2 lobes deflexed; upper corolla lip white-villous; leaves lacerately toothed and the larger shallowly lobed
L. cardiaca

1 Calyx slightly 5-angled, no lobes notably deflexed; upper corolla lip with densely and finely puberulent; leaves either entire to few-toothed (but not lobed) or deeply 3-parted, the 3 divisions further lacerately toothed or lobed.
2 Leaves entire to few-toothed (but not lobed) . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [see Chaiturus marrubiastrum]
2 Leaves deeply 3-parted, the 3 divisions further lacerately toothed or lobed . . . . . . . . . . . . . . . . . . . . . . . . . L. sibiricus
* Leonurus cardiaca Linnaeus, Motherwort, Lion's-tail. Pd (SC, VA), Mt (GA, VA), Cp (VA), \{NC\}: roadsides, pastures,
disturbed areas; common, introduced from c. Asia. May-August; July-October. Nelson (1993) reports the occurrence of this species in SC. [= RAB, C, F, G, S, W; L. cardiaca ssp. cardiaca -- K]

Leonurus sibiricus Linnaeus, Siberian Motherwort. Cp (VA): disturbed areas; rare, introduced from Asia. May-September. [= C, F, G, K, S]

Lycopus Linnaeus 1753 (Bugleweed, Water-horehound)
A genus of about 10-14 species, herbs, of temperate Eurasia, North America, and Australia. References: Sorrie (1997)=Z; Harley et al. in Kadereit (2004). Key adapted from Sorrie.

1 Calyx lobes acute at the apex, shorter than or equaling the nutlets.
2 Plant without tubers; leaf base tapered to a long, winged petiole; corolla lobes 4, erect; leaf teeth (6-) avg. 8.6 (-11) per side.......................................................................................... . L. virginicu
2 Plant usually with tubers; leaf base subsessile or tapered to a short, winged petiole; corolla lobes 4 or 5 , all or some spreading; leaf teeth (2-) avg. 5.0 (-7) per side.
3 Corolla lobes 4, one erect and three spreading; nutlet tubercles well-developed, deeply toothed; leaf teeth (2-) avg. 4.5 (-6) per side; [of the fall-line sandhills of NC and SC] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . L. cokeri 3 Corolla lobes 5, spreading; nutlet tubercles weakly developed, undulate; leaf teeth (4-) avg. 5.4 (-7) per side; [of the Mountains, upper Piedmont, and VA Coastal Plain]
L. uniflorus

1 Calyx lobes acuminate to subulate-tipped, much exceeding the nutlets.
4 Nutlet tubercles not developed or only weakly so.
5 Calyx 2.0-3.3 mm long; stems and branches glabrous to sparsely pubescent with hairs less than 0.5 mm long; leaf teeth sharply acute to short-acuminate
L. americanus

5 Calyx 3.0-4.5 mm long; stems and branches densely to sparsely pubescent with hairs 0.5-1.6 mm long; leaf teeth blunt to acute
L. europaeus
\(4 \quad\) Nutlet tubercles well developed.
6 Leaves evidently petiolate, the petioles narrowly winged
L. rubellus

6 Leaves sessile or subsessile.
\(7 \quad\) Leaves ovate to lanceolate, usually rounded at the base, scarcely reduced upwards on the stem L. amplectens
7 Leaves lanceolate to linear, cuneate at the base, upper leaves conspicuously narrower (and often also shorter) than the lower leaves
L. angustifolius

Lycopus americanus Muhlenberg ex W. Barton, American Bugleweed. Cp (NC, SC, VA), Pd (NC, VA), Mt (GA, VA): marshes, bottomlands; common (GA Special Concern). June-November. Newfoundland west to British Columbia, south to FL and CA. [= RAB, C, GW, K, S, W, Z; >L. americanus var. americanus - F, G; >L. americanus var. longii Benner -- F, G; >L. americanus var. scabrifolius Fernald -- F]

Lycopus amplectens Rafinesque, Clasping Water-horehound. Cp (GA, NC, SC), Mt? (NC?), \{VA\}: clay-based Carolina bays, other moist habitats; uncommon (NC Watch List). June-November. MA south to FL; disjunct inland around the Great Lakes and (allegedly) in w. NC. [= RAB, C, GW, K, W, Z; > L. amplectens var. amplectens - F, G; > L. amplectens var. pubens (Britton) Fernald -- F, G; > L. pubens Britton -- S ; > L. sessilifolius A. Gray -- S]

Lycopus angustifolius Elliott, Narrowleaf Bugleweed, Southern Bog Water-horehound. Cp (GA, NC, SC, VA): bogs, marshes; uncommon (NC Watch List). June-November. Se. VA south to FL, west to e. TX, north in the interior to s. TN and s. MO. [= C, Z; = L. rubellus Moench var. angustifolius (Elliott) Ahles -- RAB, GW; L. rubellus Moench var. lanceolatus Benner -- F; <L. rubellus -- G, K, W, in part]

Lycopus cokeri Ahles ex Sorrie, Coker's Bugleweed, Carolina Bugleweed. Cp (NC, SC): sandhill pocosins, boggy streamheads, seepage bogs; uncommon (NC Watch List). July-November. Endemic to the fall-line sandhill region of sc. NC and SC. See Sorrie (1997) for a detailed discussion of this species. [= RAB, K, Z; <L. uniflorus Michaux -- GW, in part] * Lycopus europaeus Linnaeus, Gypsywort, European Bugleweed. Cp (NC, VA): marshes, ditches; uncommon, introduced from Europe. June-November. [= RAB, C, G, K, S, Z; > L. europaeus var. europaeus - F; > L. europaeus var. mollis (Kern.) Briq. -F]

Lycopus rubellus Moench, Stalked Bugleweed. Cp (GA, NC, SC, VA), Pd (NC, SC, VA), Mt (GA, VA): marshes, swamp forests, bottomlands; common. June-November. ME west to MI, south to FL and \(T X\). \([=C, S, Z ;=L\). rubellus var. rubellus -- RAB, GW; < L. rubellus -- G, K, W, in part (also see L. angustifolius); > L. rubellus - S, in a narrower sense; > L. velutinus Rydberg -- S]

Lycopus uniflorus Michaux, Northern Bugleweed. Mt (NC, SC, VA), Pd (NC, VA): bogs, seeps, wet forests; common. JulyOctober. Newfoundland west to AK, south to w. NC, AR, and CA. [= RAB, C, F, G, S, W, Z; < L. uniflorus -- GW, in part (see also \(L\). cokeri); > L. uniflorus var. uniflorus -- K]

Lycopus virginicus Linnaeus, Virginia Bugleweed. Cp, Pd, Mt (GA, NC, SC, VA): swamps, bottomlands, other wet habitats; common. July-November. MA west to PA, s. IN, MO, and OK, south to n. FL and e. TX. [= RAB, C, F, G, GW, K, S, W, Z]

In the Great Lakes and St. Lawrence River regions, hybrid swarms involving L. americanus and L. europaeus are numerous (Webber \& Ball 1980). However, to date there is no evidence that these species have hybridized within the Flora region.

\section*{Macbridea Elliott ex Nuttall 1818 (Birds-in-a-nest, Macbridea)}

A genus of 2 species, herbs, of se. North America. References: Harley et al. in Kadereit (2004).
Macbridea caroliniana (Walter) Blake, Carolina Birds-in-a-nest, Carolina Macbridea. Cp (GA, NC, SC): swamp forests, especially in sphagnous seepage areas away from direct flooding, savanna edges, ditches; rare (US Species of Concern, GA Special Concern, NC Proposed Threatened). July-November. Se. NC to s. GA; reported but undocumented from n. FL, AL, and MS. Apparently rare throughout its range. [= RAB, GW, K; = M. pulchra Elliott -- S]

Marrubium Linnaeus 1753 (Horehound)

A genus of about 30-40 species, herbs, of Mediterranean Europe and Asia. References: Harley et al. in Kadereit (2004).
* Marrubium vulgare Linnaeus, Horehound. Mt (GA, NC, SC, VA), Pd (NC, SC, VA): fencerows, disturbed places; uncommon, introduced from Eurasia. Used for cough-syrups in folk medicine. [= RAB, C, F, G, K, S, W]

\section*{Meehania Britton 1894 (Meehania)}

A genus of 2-6 species, herbs, ours in temperate e. North America, and the other species in e. Asia. References: Harley et al. in Kadereit (2004).

Meehania cordata (Nuttall) Britton, Meehania. Mt (NC, VA): moist, rocky, forested slopes; uncommon (NC Rare, VA Watch List). Late May-June; June-July. A Central and Southern Appalachian endemic: sw. PA and OH south to nw. NC and ne. TN. [= RAB, C, F, G, K, S, W]

\section*{Melissa Linnaeus 1753 (Balm)}

A genus of 3-4 species, herbs, from Europe to Iran and c. Asia. References: Harley et al. in Kadereit (2004).
* Melissa officinalis Linnaeus, Lemon Balm, Common Balm. Mt, Pd (NC, SC, VA), Cp (VA): disturbed areas; rare, introduced from w. Asia. [= RAB, C, F, G, K, S, W]

\section*{Mentha Linnaeus 1753 (Mint)}

A genus of about 20-25 species, herbs, of temperate Eurasia. References: Stace (1997)=Z; Harley et al. in Kadereit (2004). Key largely adapted from C and Stace (1997).

1 Flowers in axillary verticils subtended by ordinary foliage leaves, and separated by internodes of ordinary length.
2 Calyx glabrous throughout, or pubescent towards the tips only; calyx 2-3.5 mm long; plants usually sterile; fresh plant usually with spearmint odor or flavor . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . M. Mgracilis
2 Calyx pubescent throughout its length; calyx 1.5-2.5 mm long; plants usually fertile; fresh plant usually with a rather unpleasant odor of flavor.
3 Leaves subtending the inflorescence mostly broadly rounded at the base; leaves of the inflorescence relatively narrow; [alien].
M. arvensis var. arvensis

3 Leaves subtending the inflorescence mostly cuneate at the base; leaves of the inflorescence relatively broad; [native, though often in weedy situations]
M. arvensis var. canadensis

1 Flowers in terminal spikes or heads, the subtending leaves absent or distinctly smaller than the foliage leaves.
4 Inflorescence a terminal globose to ovoid head of 1-3 verticils.
5 Pedicels, calyx, and leaves pubescent; plants usually fertile . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . M. aquatica
5 Pedicels and clayx glabrous, leaves glabrous or nearly so; plants usually sterile . . . . . . . M. . . piperita var. citrata
4 Inflorescence a spike of several to many verticils.
6 Bracteal leaves much longer than the flowers, resembling the foliage leaves, but smaller or narrower . . M. . \(\mathbf{x}\) gracilis
6 Bracteal leaves linear to laneolate, little surpassing the flowers.
\(7 \quad\) Calyx tube glabrous; leaves glabrous, or with scattered hairs on the lower surface.
8 Petioles of the min leaves 4-15 mm long; spikes stout; plants sterile; fresh plant with peppermint odor or flavor. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . M. . . \({ }^{\text {piperita var. piperita }}\)
8 Petioles of the main leaves \(0-3 \mathrm{~mm}\) long; spikes slender; plants fertile; fresh plant with spearmint odor or flavor . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . .
9 Leaves \(2-3 \times\) as long as wide, broadly cuneate to rounded at the base; leaf serrations sharp; leaf surface nearly planar . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . M. Iongifolia
9 Leaves \(1-2 \times\) as long as wide, broadly roundec to subcordate at the base; leaf serrations rounded; leaf surface strongly rugose
M. suaveolens
[Note: The distribution, habitats, phenology, and abundance of all Mentha species need herbarium investigation]
* Mentha aquatica Linnaeus, Water Mint, Lemon Mint. introduced from Europe. [= C, Z; M. aquatica -- K, in part only (also see Mentha \(\times\) citrata)]
* Mentha arvensis Linnaeus var. arvensis, Field Mint. introduced from Europe. [= C; M. gentilis Linnaeus -- RAB; M. arvensis Linnaeus -- Z, in a narrow sense; M. arvensis ssp. arvensis; M. arvensis - K, infraspecific taxa not distinguished]

Mentha arvensis Linnaeus var. canadensis (Linnaeus) Kuntze, Canada Mint. [=C; M. arvensis -- RAB, misapplied; M.
canadensis Linnaeus; M. arvensis Linnaeus ssp. canadensis (Linnaeus) H. Hara; M. arvensis - K, infraspecific taxa not distinguished]
* Mentha ×gracilis Sole (pro sp.) [Mentha arvensis \(\times\) spicata], Spearmint. \{NC, SC, VA\}: introduced from Europe. [= K, Z; M. cardiaca (S.F. Gray) Gerarde ex Baker -- RAB; M. gentilis Linnaus (pro sp.) -- C]
* Mentha longifolia (Linnaeus) Linnaeus, Horse Mint. introduced from Europe. [= RAB, C]
* Mentha \(\times\) piperita Linnaeus (pro sp.) var. citrata (Ehrhart) Briq. (pro sp.) [Mentha aquatica \(\times\) spicata], Lemon Mint. introduced from Europe. [= Z; M. ×citrata Ehrhart -- C; M. aquatica -- K, in part]
* Mentha \(\times\) piperita Linnaeus (pro sp.) var. piperita [Mentha aquatica \(\times\) spicata], Peppermint. introduced from Europe. [= C, K, Z; M. piperita Linnaeus -- RAB]
* Mentha spicata Linnaeus, Spearmint. introduced from Europe. [= RAB, C, K, Z]
* Mentha suaveolens Ehrhart, Apple Mint, Pineapple Mint, Round-leaved Mint. introduced from Europe. [= C, K, Z]
* Mentha pulegium Linnaeus, European Pennyroyal, introduced in MD, PA, and NJ (Kartesz 1999). [= K] \{not yet keyed\}

\section*{Micromeria Bentham}
(see Clinopodium)

\section*{Moldavica}
(see Dracocephalum)

\section*{Monarda Linnaeus (Bergamot)}

A genus of about 12-20 species, herbs, of North America. Many of our species are cultivated, especially M. didyma in various selected forms. Additional studies are needed on a number of taxonomic problems in Monarda. Most of the varieties recognized above have been considered valid by a succession of workers; they do seem to describe morphologically distinguishable (if not entirely discrete) entities which make phytogeographic sense. References: McClintock \& Epling (1942)=Z; Scora (1967)=Y; Fosberg \& Artz (1953)=X; Gill (1977); Prather \& Keith (2003); Harley et al. in Kadereit (2004).

1 Flowers in 2-6 glomerules, terminal and at 2-5 successive nodes down the stem; stamens included; leaves lanceolate to narrowly elliptic, usually broadest near the middle and tapered to a cuneate base, (2.5-) 3-8x as long as wide.
2 Calyx lobes attenuated into a spinose awn 2-7 mm long; corolla white to pink; inner bracts subtending the flowers \(4-9 \mathrm{~mm}\) wide, abruptly acuminate into a spinose bristle . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . M. citriodora var. citriodora
2 Calyx lobes narrowly to broadly triangular, acute or long-acuminate but not awned; corolla yellow, spotted with purple; inner bracts \(8-14 \mathrm{~mm}\) wide, acuminate.
3 Lower leaf surface moderately to densely silvery-tomentose; stem densely villous with spreading or downwardlycurved coarse hairs, lacking coarse, horizontal bristles and short downwardly-curved hairs
M. punctata var. villicaulis

3 Lower leaf surface pubescent mainly on the midvein and other main veins, appearing green; stem pubescent with short downwardly-curved hairs, also with coarse, horizontal bristles and/or upwardly-curved hairs
4 Stem with many coarse horizontal bristles, also pubescent with short, downwardly-curved hairs; leaves (40-) 50-\(70(-95) \mathrm{mm}\) long, \(10-28 \mathrm{~mm}\) wide (at least some over 15 mm wide), averaging ca. \(3 \times\) as long as wide
M. punctata var. arkansana

4 Stem with few or no coarse horizontal bristles, also pubescent with a mixture of upwardly-curved and downwardly-curved hairs; leaves (25-) 35-55 (80) mm long, 5-17 mm wide (the widest very rarely over 15 mm wide), averaging ca. \(4 \times\) as long as wide
M. punctata var. punctata

1 Flowers in \(1(-2)\) glomerule, terminal (rarely also 1 at the next node down the stem); stamens exserted; leaves ovate to ovatelanceolate, broadest near the rounded, truncate, or subcordate base, 1.5-3 (-4)× as long as wide
5 Corolla \(30-45 \mathrm{~mm}\) long, scarlet-red, (3-) 4-8 mm broad at the expanded portion of the throat; [primarily of mountain seepages, streambanks, and boggy places]
M. didyma

5 Corolla 14-33 (-36) mm long, white, lavendar, or purple, 1-3 (-4) mm broad at the expanded portion of the throat; [of various habitats, usually dryish to mesic].
6 Leaves deltoid-ovate to ovate, 2-6 cm wide, usually ca. \(2 \times\) as long as wide; orifice of the calyx glabrous to slightly hirsute with a few long hairs; upper lip of the corolla 5-8 mm long and not bearded ( \(M\). clinopodia) or 13-16 mm long and slightly bearded (M. media) near its apex; outer surface of the corolla glabrous to evenly pubescent with short curled hairs.
7 Corolla white, greenish, or pale pink, the lower lip purple-spotted; outer bracts subtending the inflorescence green or pale (rarely with a purplish midvein); upper lip of the corolla 5-8 mm long, not bearded . M. clinopodia \(7 \quad\) Corolla deep purple, the lower lip usually not spotted; outer bracts subtending the inflorescence purple to red; upper lip of the corolla 13-16 mm long and slightly bearded near its apex . . . . . . . . . . . . . . . . . . . . M. media
6 Leaves narrowly-deltoid, ovate-lanceolate to lanceolate, \(1-4 \mathrm{~cm}\) wide, usually ca. \(3 \times\) as long as wide; orifice of the calyx densely hirsute with numerous erect, stiff, white hairs; upper lip of the corolla prominently bearded near its apex; outer surface of the corolla evenly pubescent with short curled hairs.
8 Corolla deep purple; middle lobe of the lower corolla lip 4-6 mm long; outer bracts subtending the inflorescence reddish \(\qquad\) M. fistulosa var. rubra

8 Corolla lavendar, rose, or nearly white; middle lobe of the lower corolla lip 2-4 mm long; outer bracts subtending the inflorescence green (rarely the midvein only reddish).
9 Plants 10-30 cm tall; leaves subcoriaceous, glabrous, dark green, shiny; calyx 5-8 mm long, the lobes conspicuously pustulate-glandular; [of limestone glades and barrens] . . . . . . . . M. . fistulosa var. brevis
9 Plants 30-130 cm tall; leaves herbaceous, pubescent, light to medium green, not shiny; calyx 7-11 mm long, the lobes not pustulate-glandular; [of various habitats].
10 Pubescence of the petioles and lower leaf surface hirsute or villous, the trichomes spreading, 1-3 mm long
M. fistulosa var. fistulosa

10 Pubescence of the petioles and lower leaf surface canescent, the trichomes appressed (sometimes also with an admixture of longer, spreading trichomes)
M. fistulosa var. mollis
* Monarda citriodora Cervantes ex Lagasca y Segura var. citriodora, Lemon Bergamot. Cp (GA, SC): disturbed places: rare, introduced from a native range centered in TX. June-July; July-August. [= Y; < M. citriodora -- RAB, F, G; = M. citriodora ssp. citriodora var. citriodora -- K; ? M. dispersa -- S; = M. citriodora ssp. citriodora -- Z]

Monarda clinopodia Linnaeus, Basil Bergamot. Mt, Pd (NC, SC, VA): mesic, forested slopes; common. Late MaySeptember; July-October. NJ, w. NY, and IL, south to n . GA and c. AL (some of the range perhaps accountable to cultivation). There appear to be a number of chemical races in M. clinopodia which may warrant taxonomic status. [= RAB, C, F, G, K, S, W, Y, Z; = M. fistulosa Linnaeus var. clinopodia (Linnaeus) Cooperrider]

Monarda didyma Linnaeus, Bee-balm, Oswego Tea. Mt (NC, SC, VA), Pd (NC, VA), Cp (NC): seepage slopes, periglacial boulderfields with abundant seepage, streambanks, boggy places, usually in strong to moderately filtered sunlight; common, rare in Piedmont, rare in Coastal Plain (where introduced only) (SC Rare). July-September; September-October. ME west to MI, south to PA and OH , and in the Appalachians south to sw. NC, se. TN, and ne. GA (part of the northern range is likely only by introduction). McClintock \& Epling (1942) describe 2 forms of M. didyma: the "broad-leaved form," with leaves averaging 9.2 cm long and 5.2 cm wide and corollas averaging 35 mm long, ranging south to sc. PA and ne. WV, and the "narrow-leaved form," with leaves averaging 11.8 cm long and 4.4 cm wide and corollas averaging 39 mm long, occurring throughout the range of the species. Further study seems warranted. [= C, F, G, K, S, W, Y, Z; M. didyma -- RAB (also see M. media)]

Monarda fistulosa Linnaeus var. brevis Fosberg \& Artz, Smoke Hole Bergamot, Cedar Glade Bergamot. Mt (VA): limestone outcrops, cliffs, barrens, and glades, and on limestone talus; rare (US Species of Concern). June-August; July-October. Apparently endemic to w. VA and e. WV. This variety is seemingly very distinct (Kimball et al. 2002). It had been collected only a very few times prior to the work of Bartgis (1993), who found it to be a characteristic plant of limestone barrens and woodlands in localized areas in the Ridge and Valley Province of WV. It flowers about a month earlier than M. fistulosa in the vicinity (Bartgis, pers. comm.). [= X, Y; M. fistulosa ssp. brevis (Fosberg \& Artz) Scora, comb. nov. ined. -- K; < M. fistulosa -- W]

Monarda fistulosa Linnaeus var. fistulosa, Appalachian Bergamot. Mt, Pd (NC, VA): moist wooded slopes, roadsides, woodland edges, old fields; common. June-September; August-October. CT south to sw. NC, nearly or entirely limited to the Appalachians. I have interpreted var. fistulosa and var. mollis somewhat differently than some previous workers. A more coherent geographic pattern is achieved by limiting var. fistulosa to plants with spreading hairs only. \([=F, X, Y ;<M\). fistulosa -- RAB, W, infraspecific taxa not distinguished; = M. fistulosa ssp. fistulosa var. fistulosa -- K; < M. fistulosa var. fistulosa -- C, G, Z (also see var. mollis); = M. fistulosa -- S (in the narrow sense)]

Monarda fistulosa Linnaeus var. mollis (Linnaeus) Bentham, Eastern Bergamot. Mt, Pd (NC, SC), \{GA, VA\}: moist wooded slopes; common. June-September; August-October. See comments under var. fistulosa. ME west to MN, south to GA, AL, and se.

TX. [= F, X, Y; < M. fistulosa -- RAB, W; < M. fistulosa var. fistulosa -- C, G, Z; = M. fistulosa ssp. fistulosa var. mollis (Linnaeus) Bentham -- K; > M. mollis Linnaeus -- S ; > M. scabra Beck -- S]

Monarda fistulosa Linnaeus var. rubra A. Gray, Purple Bergamot. Mt (NC, VA), \{GA\}: moist slope forests; rare (NC Watch List). ME to NJ, and from nw. NC to n. GA, in the Appalachians. Perhaps native only in the Southern Appalachians. A problematic taxon; see M. media for comments. [= X, Y, Z; < M. fistulosa -- RAB, W; = M. fistulosa ssp. fistulosa var. rubra A. Gray - K; < M. media -- C, F, S]

Monarda media Willdenow, Purple Bee-balm. Mt (NC), \{GA, VA\}: grassy balds, moist slopes, mostly at high elevations; rare (NC Watch List). July-September; September-October. VT west to IN, south to w. MD; disjunct in w. NC and sw. TN, part of the range perhaps the result of cultivation. M. media is a problematic taxon, especially in combination with M. fistulosa var. rubra. Many have suggested that M. media is the result of hybridization or introgression of M. didyma with either M. fistulosa or M. clinopodia, or both (see Scora 1967). Scora (1967) implies that M. media consists of hybrids, backcrosses, and "introgressive elements" involving all three pairwise combinations, and the three-way combination, but that M. fistulosa var. rubra is not of hybrid origin. Needed are studies of M. media, M. fistulosa var. rubra, and their possible parents which go beyond the herbarium and determine the genetics, origin, and population structure of these taxa. It seems best for the moment to recognize (or to attempt to!) M. media and \(M\). fistulosa var. rubra in order to foster additional observation and study, hopefully leading to a more definite understanding of their taxonomic status(es). [= G, K, Z; < M. didyma -- RAB; < M. media -- C, F, S (also see M. fistulosa var. rubra); = M. \(\times\) media Willdenow (prosp.) -- W, Y]

Monarda punctata Linnaeus var. arkansana (McClintock \& Epling) Shinners, Arkansas Horse-mint. Mt (NC), \{GA\}: dryish forests over mafic rock; rare (NC Watch List). McClintock \& Epling (1942) map and discuss this taxon as endemic to AR and immediately adjacent TX, but mention that "a specimen collected near Columbus, Polk County, North Carolina (Townsend, 1897) is scarcely different from subsp. arkansana." Scora (1967) treats var. arkansana as similarly endemic, though he cites (but does not map) a specimen from Cherokee County, GA and annotated (following the publication of his paper) a later collection from Polk County, NC as var. arkansana. The Polk County, NC material is manifestly var. arkansana and might be considered merely aberrant or a chance introduction, were it not for its repeated collection and the phytogeographic interest of the Blue Ridge Escarpment of Polk County, which harbors numerous Ozarkian and other Midwestern disjuncts, such as Veratrum woodii. [= Y; < M. punctata -- RAB, S, W; = M. punctata ssp. punctata var. arkansana (McClintock \& Epling) Shinners -- K; = M. punctata ssp. arkansana McClintock \& Epling -- Z]

Monarda punctata Linnaeus var. punctata, Eastern Horse-mint. Cp, Pd, Mt (NC, SC, VA): maritime forests, dunes, roadsides, rocky or sandy woodlands; common, uncommon in Piedmont and Mountains. Late July-September; September-October. [= C, F, Y; < M. punctata -- RAB, S, W; = M. punctata ssp. punctata -- G, Z; = M. punctata ssp. punctata var. punctata -- K]

Monarda punctata Linnaeus var. villicaulis (Pennell) Palmer \& Steyermark, Hairy-stem Horse-mint. Cp (NC): disturbed areas, rare, perhaps only adventive in our area. August; October. NY west to MN, south to n. IN and s. MO. [= C, F, Y; < M. punctata -- RAB, S, W; = M. punctata ssp. villicaulis Pennell -- G, Z; = M. punctata ssp. punctata var. villicaulis (Pennell) Palmer \& Steyermark -- K]

Monarda bradburiana Beck. East to c. TN (Chester, Wofford, \& Kral 1997), KY, and AL. [= K] \{not yet keyed; add synonymy\} Monarda russeliana Nuttall ex Sims, White Beebalm. East to AL and KY. [= K] \{not yet keyed; add synonymy\}

\section*{Mosla (Bentham) Buchanan-Hamilton ex Maximowicz 1875 (Mosla)}

A genus of about 10-22 species, of e. Asia. References: Harley et al. in Kadereit (2004).
* Mosla dianthera (Buchanan-Hamilton ex Roxburgh) Maximowicz, Mosla. Mt (GA, NC): disturbed areas; rare, introduced from e. Asia. August-September. This species is becoming a noxious weed west of our area (in KY and TN); it should be expected to become more widespread in our area. [= RAB, F, K; = Orthodon dianthera (Buchanan-Hamilton) Handel-Mazzetti -- C]

Nepeta Linnaeus 1753 (Catnip, Catmint)

A genus of about 250 species, herbs, of Eurasia and n. Africa. References: Harley et al. in Kadereit (2004).
* Nepeta cataria Linnaeus, Catnip, Catmint. Mt (GA, NC, VA), Pd (NC, VA), Cp (NC, SC, VA): fencerows, barnyards, disturbed areas; uncommon, introduced from Eurasia. [= RAB, C, F, G, K, S, W]

\section*{Ocimum Linnaeus 1753 (Basil)}

A genus of about 65 species, herbs and shrubs, of warm temperate and tropical areas. References: Harley et al. in Kadereit (2004).
* Ocimum basilicum Linnaeus, Basil. Cp, Pd (GA, NC, SC): commonly cultivated in gardens, rarely persistent for short times around gardens or as a waif on trash-heaps, probably not persistent; commonly cultivated, rarely persistent, introduced from tropical Asia and tropical Africa. [= C, G, K, S]

Origanum Linnaeus 1753 (Oregano, Marjoram)
A genus of about \(36-40\) species, herbs and dwarf shrubs, of Eurasia. References: Harley et al. in Kadereit (2004).
* Origanum vulgare Linnaeus, Wild Marjoram. Mt (NC, VA): cultivated in gardens, persistent around gardens or as a waif; commonly cultivated, rarely persistent, introduced from Eurasia. July-September. [= RAB, C, G, K, S]

Perilla Linnaeus 1764 (Perilla, Beefsteak-plant)
A genus of about 1-6 species, herbs, of s. and e. Asia. References: Harley et al. in Kadereit (2004).
* Perilla frutescens (Linnaeus) Britton, Perilla, Beefsteak-plant. Pd, Mt, Cp (GA, NC, SC, VA): moist disturbed areas; common, introduced from India. August-October; October-December. Two varieties are sometimes recognized. Var. crispa (Bentham) Deane (leaves purple above and below; leaf margins laciniate-dentate and also crisped) and var. frutescens (leaves purple below; leaf margins dentate, not crisped). These probably represent cultivars more than taxonomically distinct entities. [= RAB, C, G, S, W; > P. frutescens var. frutescens - F, K; > P. frutescens (Linnaeus) Britton var. crispa (Bentham) Deane]

Physostegia Bentham 1829 (Obedient-plant)
A genus of about 12 species, perennial herbs, of North America. References: Cantino (1982)=Z; Harley et al. in Kadereit (2004). Key adapted from \(Z\) and GW.

1 Leaves, 1 or more of them, conspicuously or inconspicuously clasping the stem.
2 Perennating buds borne directly on the primary rhizome or at the ends of short, vertical secondary rhizomes (horizontal secondary rhizomes lacking), the plant thus forming clumps . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Ph. purpurea
2 Perennating buds borne at the ends of elongate, horizontal, secondary rhizomes, the plant thus forming clonal patches. 3 Uppermost pair of leaves below the terminal raceme usually considerably larger than the floral bracts, the next pair of leaves down the stem (1.5-) 2.0-12.8 cm long and 0.3-2x as long as the internode above; principal stem leaves usually widest at or below the middle of the blade. Ph. leptophylla
3 Uppermost pair of leaves below the terminal raceme often no larger than the floral bracts, the next pair of leaves down the stem 0.4-3.2 cm long, generally \(0.1-0.3 \times\) as long as the internode above; principal stem leaves usually widest at or above the middle of the blade

Ph. purpurea
1 Leaves petiolate or sessile, none of them clasping the stem.
4 All or most of the largest leaves sharply serrate; apex of the leaves acute to attenuate.
5 Perennating buds usually borne directly on the primary rhizome or at the ends of short, vertical secondary rhizomes (horizontal secondary rhizomes usually lacking), the plant thus forming clumps; nonglandular trichomes of the raceme axis less than \(0.1(-0.13) \mathrm{mm}\) long; sterile floral bracts usually present below flowers; flowers (16-) \(18-37 \mathrm{~mm}\) long

Ph. virginiana ssp. praemorsa
5 Perennating buds usually borne at the ends of elongate, horizontal, secondary rhizomes, the plant thus forming clonal patches; nonglandular trichomes of the raceme axis frequently \(0.15(0.20) \mathrm{mm}\) long; sterile floral bracts usually not present below flowers; flowers (13-) 14-28 mm long . . . . . . . . . . . . . . . . Ph. virginiana ssp. virginiana
4 Half or more of the larger leaves bluntly toothed to entire; apex of the leaves obtuse, or acute to attenuate.
6 Uppermost pair of leaves below the terminal raceme often no larger than the floral bracts, the next pair of leaves down the stem \(0.4-3.2 \mathrm{~cm}\) long, generally \(0.1-0.3 \times\) as long as the internode above \(\ldots \ldots\). . . . . . . . . Ph. purpurea
6 Uppermost pair of leaves below the terminal raceme usually considerably larger than the floral bracts, the next pair of leaves down the stem (1.5-) \(2.0-12.8 \mathrm{~cm}\) long and \(0.3-2 \times\) as long as the internode above.
7 Leaves (some of them) present at or after anthesis usually petiolate, the petioles often more than 2 cm long, the petiolate leaves typically the lowest and among the largest leaves present \(\qquad\) Ph. Ieptophylla 7 Leaves present at or after anthesis usually sessile (rarely a few petiolate, but these with petioles less than 2 cm long and the petiolate leaves usually not among the largest leaves present) . . . Ph. virginiana ssp. virginiana

Physostegia leptophylla Small, Tidal Marsh Obedient-plant, Swamp Obedient-plant. Cp (GA, NC, SC, VA): bottomland hardwood forests, swamps, tidal freshwater or slightly brackish (oligohaline) marshes, rarely wet savannas (GA); uncommon (GA Threatened, SC Rare, VA Watch List). Late May-early August; June-September. Se. VA south to sc. peninsular FL, west to sw. GA and panhandle FL. P. leptophylla is a tetraploid; Cantino (1982) suggests that this species may be an allotetraploid, perhaps originating from P. purpurea \(\times\) virginiana. [ \(\quad\) C, GW, K, Z; Dracocephalum purpureum (Walter) McClintock ex Gleason -- RAB, G, in part; P. denticulata (Aiton) Britton -- F, misapplied; P. aboriginorum Fernald -- F]

Physostegia purpurea (Walter) Blake, Savanna Obedient-plant. Cp (GA, NC, SC): wet savannas, savanna-swamp ecotones, ditches adjacent to former pinelands; uncommon. Late May-early August; June-September. Ec. NC south to s. FL, west to sw. GA and panhandle FL. Cantino (1982) discusses clinal variation within P. purpurea. [= GW, K, Z; Dracocephalum purpureum (Walter) McClintock ex Gleason -- RAB, in part only (also see P. leptophylla); P. obovata (Elliott) Godfrey ex Weatherby -- F]

Physostegia virginiana (Linnaeus) Bentham ssp. praemorsa (Shinners) Cantino, Southern Obedient-plant. Mt, Pd, Cp (NC, SC, VA), \{GA\}: woodlands, glades, seepages, especially over calcareous or mafic rock; common. July-October. OH west to \(n\). IL, south to c. NC, n. FL, TX, NM, and Mexico. [= K, W, Z; Dracocephalum virginianum Linnaeus -- RAB, G, in part, infraspecific taxa not recognized; \(P\). virginiana var. arenaria Shimek -- C; \(P\). virginiana var. virginiana -- \(F\), in part; \(P\). virginiana var. speciosa -- \(F\), in part; \(P\). virginiana -- GW, in part, infraspecific taxa not recognized]

Physostegia virginiana (Linnaeus) Bentham ssp. virginiana, Northern Obedient-plant. Mt, Pd, Cp (NC, SC, VA), \{GA\}: streambanks, seepages, marshes, grassy balds (native occurrences usually over mafic or calcareous rocks), other open or semiopen moist to wet habitats, disturbed areas, ditches; rare as a native, more common as an escape from cultivation. July-October. Native from Québec west to Manitoba, south to e. VA, nc. TN, and ne. KS; escaped elsewhere (as in most of our area). Cantino
(1982) discusses ambiguous plants from a zone of intergradation between the 2 subspecies in sw. NC, n. GA, ne. AL, e. TN, and sc. KY. Moreover, garden escapes show some intermediacy between the 2 subspecies, and Cantino (1982) suggests that cultivars are likely inter-subspecific hybrids, stating "because the genetic background of modern cultivars is unknown, they cannot be reasonably placed in either subspecies and should not be identified below the species level." \([=K, Z\); Dracocephalum virginianum Linnaeus -RAB, G, in part, infraspecific taxa not recognized; \(P\). virginiana var. virginiana -- \(C\); \(P\). virginiana var. virginiana -- \(F\), in part; \(P\). virginiana var. speciosa (Sweet) A. Gray -- F, in part; P. virginiana var. granulosa (Fassett) Fernald -- F; P. virginiana -- GW, in part, infraspecific taxa not recognized]

Physostegia angustifolia Fernald, Narrowleaf Obedient-plant. Cp (GA): calcareous openings; rare (GA Special Concern). In sw. GA (Jones \& Coile 1988). [= K] \{not yet keyed\}

Physostegia intermedia (Nuttall) Engelmann \& A. Gray. Widespread in Coastal Plain of GA. [= K] \{not yet keyed\}

\section*{Piloblephis Rafinesque 1838}

A monotypic genus, a shrub, of se. North America. References: Harley et al. in Kadereit (2004).
Piloblephis rigida (Bartram ex Bentham) Rafinesque, Florida Pennyroyal. Cp (GA): xeric oak scrub, with Quercus myrtifolia; rare (GA Special Concern). S. GA to FL. [= K; = Pycnothymus rigidus (Bartram ex Bentham) Small - S; = Satureja rigida Bartram ex Bentham]

\section*{Prunella Linnaeus 1753 (Self-heal, Heal-all)}

A genus of about 4-7 species, herbs, of \(n\). temperate areas. References: Harley et al. in Kadereit (2004).
1 Upper leaves pinnatifid; flowers creamy yellow or white (rarely pale blue) . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. Iaciniata
1 Upper leaves entire to obscurely toothed; flowers blue-violet (rarely pink or whitish).

* Prunella laciniata (Linnaeus) Linnaeus, Cutleaf Self-heal. Mt (NC?, VA), \{GA\}: disturbed areas; rare, introduced from Eurasia. [= RAB, C, G, K, S]

Prunella vulgaris Linnaeus var. lanceolata (W. Barton) Fernald, American Self-heal. \{Mt, Pd, Cp (NC, SC, VA): disturbed areas, pastures, roadsides, bottomland forests; other forests and woodlands; common. April-December. Additional herbarium work is needed to determine the relative ranges, distributions, habitats, and abundances of the two varieties.\} Newfoundland west to AK, south to NC, SC?, TN, MO, KS, NM, AZ, and CA. [= C, F, G; < P. vulgaris -- RAB, S, W, infraspecific taxa not distinguished; = \(P\). vulgaris ssp. lanceolata (W. Barton) Hultén -- K]
* Prunella vulgaris Linnaeus var. vulgaris, Eurasian Self-heal. \{Mt, Pd, Cp (NC, SC, VA): disturbed areas, pastures, roadsides, bottomland forests; other forests and woodlands; common. April-December. Additional herbarium work is needed to determine the relative ranges, distributions, habitats, and abundances of the two varieties. The possible recognition of var. hispida also needs assessment\} Introduced from Eurasia. Var. hispida Bentham, considered to have been originally e. Asian, is alleged to be widespread in se. United States. It differs from P. vulgaris var. vulgaris in having the "stems, petioles, and often the lower surfaces of leaves densely villous-hispid" (vs. "only sparingly and not conspicuously pilose" -- F). [< P. vulgaris -- RAB, S, W, infraspecific taxa not distinguished; < P. vulgaris var. vulgaris -- C, F, G, in a narrower sense; < \(P\). vulgaris var. hispida Bentham -\(\mathrm{C}, \mathrm{F}, \mathrm{G} ;=P\). vulgaris ssp. vulgaris -- K\(]\)

Pycnanthemum Michaux 1803 (Mountain-mint, Wild-basil)

A genus of 20-25 species, herbs, of temperate North America. Pycnanthemum remains a complicated and difficult group, with speciation apparently having proceeded by allopolyploidy, autoploidy, and aneuploidy. Numerous aberrant forms and (probably) sterile hybrids complicate identification and understanding. References: Chambers (1993); Grant \& Epling (1943)=Z; Chambers \& Hamer (1992) \(=\mathrm{Y}\); Harley et al. in Kadereit (2004).

1 Leaves 1-15 mm wide (to 30 mm wide in \(P\). setosum), mostly more than \(3 \times\) as long as wide (except in \(P\). nudum); calyx lobes not tipped with a tuft of long, jointed bristles (except \(P\). clinopodioides).
2 Longer calyx lobes \(1.5-5 \mathrm{~mm}\) long, attenuate-aristate, stiff, whitened; [of Coastal Plain pinelands, rarely in Mountain bogs with Coastal Plain affinities].
3 Principal stem leaves 5-15 mm wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. flexuosum
3 Principal stem leaves \(10-30 \mathrm{~mm}\) wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. setosum
2 Longer calyx lobes 0.5-1.6 mm long, deltoid to narrowly triangular, not notably stiff (except in \(P\). tenuifolium) or whitened; [widespread in our area, but mainly of the Piedmont and Mountains].
4 Leaves 10-15 mm wide (or more often even wider, to 25 mm wide, in \(P\). clinopodioides); longer calyx lobes 0.7-1.6 mm long, tipped with a few long ( \(1-3 \mathrm{~mm}\) ) jointed bristles ( \(P\). clinopodioides) or not tipped ( \(P\). nudum). jointed bristles.
6 Leaves glabrous on the lower and upper surface, with 2-3 pairs of lateral veins; stems glabrous on the faces and angles (rarely with a few small upwardly-curled hairs on the angles).
7 Leaves \(5-15 \mathrm{~mm}\) wide, \(1-2.5 \times\) as long as wide; calyx lobes and inner bracts of the inflorescence herbaceous
P. nudum

7 Leaves \(1-4(-5.5) \mathrm{mm}\) wide, \(8-15 \times\) as long as wide; calyx lobes and inner bracts of the inflorescence semispinose, their tips subulate, thickened, and stiff P. tenuifolium

6 Leaves pubescent at least on the lower surface along the midrib and main veins; leaves with 4-5 pairs of lateral veins; stems glabrous or pubescent on the faces, pubescent on the angles.
8 Stems pubescent on the angles only (or distinctly less pubescent on the faces); leaves \(3-10 \mathrm{~mm}\) wide P. virginianum

8 Stems pubescent on the faces and angles, the hairs distributed more-or-less evenly; leaves \(8-12(-15) \mathrm{mm}\) wide.
9 Longer calyx teeth \(1.0-1.5 \mathrm{~mm}\) long; bracts of the inflorescence and leaves glabrous or very sparsely pubescent on the upper surface
P. torreyi

9 Longer calyx teeth \(0.5-1.0 \mathrm{~mm}\) long; bracts of the inflorescence (and usually also the leaves) canescent on the upper surface . . . . . . . . . . . . . . . . . . . . . . . . . P. verticillatum var. verticillatum
1 Leaves broad, \(15-40 \mathrm{~mm}\) wide, mostly \(1.5-3 \times\) as long as wide; calyx lobes usually tipped with a tuft of long, jointed bristles (except \(P\). curvipes, \(P\). muticum, \(P\). setosum).
10 Bracts of the inflorescence glabrous (or very sparsely pubescent) on the upper surface, the margins long-ciliate; calyx lobes and upper part (at least) of the tube with long spreading hairs (independent of the apical tufts) ..... P. montanum
10 Bracts of the inflorescence puberulent on the upper surface, the margins not ciliate; calyx lobes and tube variously glabrous or puberulent (independent of the apical tufts).
11 Calyx lobes not tipped with a tuft of long, jointed bristles.
12 Calyx lobes \(1.5-3 \mathrm{~mm}\) long, attenuated into a subulate tip; [of the Coastal Plain]
P. setosum

12 Calyx lobes 0.5-1.2 mm long, triangular to narrowly triangular, acute to acuminate, but not subulate; [collectively widespread in our area].
13 Petioles 5-15 mm long; inflorescence corymbose, loose, the branches apparent; [of dry rocky woodlands, in sw. NC, w. SC, and southward] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. curvipes
13 Petioles 0-3 mm long; inflorescence capitate, tight, the branches within the clusters not apparent; [of moist habitats, widespread in our area]
P. muticum

11 Calyx lobes usually tipped with a tuft of long, jointed bristles.
14 Calyx not distinctly bilabiate, all of the calyx lobes about the same length, the sinuses about the same depth.

15 Longer calyx lobes \(2.5-3 \mathrm{~mm}\) long; [of the Coastal Plain] . . . . . . . . . . . . . . . . . . . . . . P. monotrichum
14 Calyx distinctly bilabiate, the lower 2 lobes \(1.5-2.5 \times\) longer than the upper 3 lobes, and separated from each other and the upper 3 lobes by deeper sinuses.
16 Leaves lanceolate, (10-) 15-25 mm wide, more than \(3 \times\) as long as wide ........... P. clinopodioides 16 Leaves ovate, \(13-50 \mathrm{~mm}\) wide, less than \(3 \times\) as long as wide.

17 Leaves of the lower and middle stem with lower surfaces glabrate, glandular-punctate, similar in color to the dark green upper surface; calyx 5-7 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. beadlei
17 Leaves of the lower and middle stems with lower surface canescent, distinctly paler than the dark green upper surface; calyx \(3-6.5 \mathrm{~mm}\) long.
18 Calyx lobes broadly triangular, their apices obtuse, acute, or somewhat acuminate; calyx tube more than \(2 \times\) as long as the longest (lower) calyx lobes.
19 Pubescence of the stem of dense, very small downwardly-curved hairs, usually mixed with scattered longer and spreading hairs \(P\). incanum var. incanum
19 Pubescence of the stem of sparse, coarse, downwardly-curved hairs \(P\). incanum var. puberulum
18 Calyx lobes narrowly triangular, their apices acuminate to attenuate; calyx tube \(1-2 \times\) as long as the longest (lower) calyx lobes.
20 Mericarps 0.5-1.3 mm long, with a smooth surface, glabrous or with a few short hairs at the tip . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. Ioomisii
20 Mericarps 1.2-1.5 mm long, with a rugose or pitted surface, densely pubescent at the tip. 21 Stems and lower leaf surfaces canescent, the short hairs often intermixed with longer, spreading ones \(P\). pycnanthemoides var. pycnanthemoides 21 Stems and lower leaf surfaces with coarse, spreading hairs only

Pycnanthemum beadlei (Small) Fernald, Beadle's Mountain-mint. Mt (NC, SC, VA), Pd (NC): forests, woodland borders; uncommon (Ga Special Concern, VA Watch List). August-September. A Southern Appalachian endemic: sw. VA and ne. TN south to sw. NC, nw. SC, and n. GA. A tetraploid species \((\mathrm{n}=38)\), probably an allotetraploid derived from \(P\). montanum \(\times\) muticum. [= C, K, W, Y, Z; < P. incanum -- RAB, in part; = Koellia beadlei Small -- S]

Pycnanthemum clinopodioides Torrey \& A. Gray. Cp, Pd (NC, VA): forests, woodland borders; rare (NC Watch List, VA Rare). July-September. MA south to NC, mostly on the Coastal Plain. A tetraploid species \((\mathrm{n}=38)\). Probably an allotetraploid hybrid. [= C, F, K, Y, Z; < P. verticillatum -- RAB, in part; = Koellia clinopodioides (Torrey \& Gray) Kuntze -- S]

Pycnanthemum curvipes (Greene) E. Grant \& Epling, Tennessee Mountain-mint, Stone Mountain Mountain-mint. Mt (GA, NC), Pd (GA): dry rocky woodlands and rock outcrops (granite or mafic); rare (GA Special Concern). June-August. Sw. NC and se. TN south nc. GA and n . AL; disjunct in nc. TN (Chester, Wofford, \& Kral 1997). A diploid species ( \(\mathrm{n}=20\) ). [=K, Y, Z; = Koellia curvipes Greene -- S]

Pycnanthemum flexuosum (Walter) Britton, Sterns, \& Poggenburg, Savanna Mountain-mint. Cp (NC, SC, VA), Mt (NC): moist to wet pine savannas, pocosin margins, mountain bogs, seepage areas on low elevation granite domes; common (rare in Mountains). June-September; September-October. Se. VA south to n. FL, west to s. AL on the Coastal Plain; disjunct inland in bogs and rock outcrops of sw. NC with Coastal Plain affinities and in sc. TN. A diploid species ( \(\mathrm{n}=18\) ). Sometimes mistaken in vegetative condition for Eupatorium leucolepis, P. flexuosum can be distinguished by its square stem and aromatic odor. Koellia hugeri Small, alleged to differ details of the calyx, was established for the plants of bogs of the Blue Ridge; it apparently is not morphologically segregated from other variation within the species (Grant \& Epling 1943). [= RAB, C, F, K, W, Y; P. hyssopifolium Bentham -- G, GW, Z; < Koellia hyssopifolia (Bentham) Britton -- S; < Koellia hugeri Small -- S]

Pycnanthemum incanum (Linnaeus) Michaux var. incanum. Mt, Pd (NC, VA): forests and woodland borders; common (uncommon in NC). Late June-August; September-October. VT west to s. OH and s. IL, south to nc. NC, w. NC, and nc. TN. A tetraploid species \((\mathrm{n}=38)\). [ \(=\mathrm{F}, \mathrm{K}\); \(\ll P\). incanum -- RAB, infraspecific taxa not distinguished, and also see \(P\). beadlei, \(P\). loomisii, \(P\). pycnanthemoides; < P. incanum -- C, G, W, Y, infraspecific taxa not distinguished; < Koellia incana (Linnaeus) Kuntze -- S, infraspecific taxa not distinguished; ? Koellia dubia (Gray) Small -- S; P. incanum -- Z, in the narrow sense; P. incanum (Linnaeus) Michaux ssp. incanum]

Pycnanthemum incanum (Linnaeus) Michaux var. puberulum (E. Grant \& Epling) Fernald. Mt (NC, SC), Pd (NC): forests and woodland borders; rare. Late June-August; September-October. WV and NC south to FL and AL. A tetraploid species ( \(\mathrm{n}=\) 38). [= F, K; << P. incanum -- RAB, infraspecific taxa not distinguished (and also see P. beadlei, P. loomisii, P. pycnanthemoides); < \(P\). incanum -- C, G, W, Y, infraspecific taxa not distinguished; < Koellia incana (Linnaeus) Kuntze -- S, infraspecific taxa not distinguished; P. puberulum E. Grant \& Epling -- Z]

Pycnanthemum loomisii Nuttall, Loomis's Mountain-mint. Pd, Mt (NC, SC, VA), Cp (NC, VA): forests and woodland borders; rare (VA Watch List). Late June-August; September-October. VA west to IL, south to n . FL. A diploid species ( \(\mathrm{n}=19\) ). [= C, K, Y, \(Z\); < \(P\). incanum -- RAB, in part; = P. incanum var. loomisii (Nuttall) Fernald -- F; < pycnanthemoides var. pycnanthemoides -- G , in part; = \(P\). incanum (Linnaeus) Michaux ssp. loomisii (Nuttall) Hamer]

Pycnanthemum monotrichum Fernald. Cp (VA): sandy woodlands; rare (VA Rare). Allegedly endemic to se. VA. Perhaps only a hybrid or else likely more widespread and merely overlooked. [= F, G, K]

Pycnanthemum montanum Michaux, Appalachian Mountain-mint. Mt (NC, SC, VA): balds, woodlands, forests, and forest edges; uncommon (Va Watch List). June-August; September-October. W. VA and WV south through w. NC and e. TN to nw. SC and \(n\). GA, a Southern Appalachian endemic. A diploid species \((n=20)\). [= RAB, C, F, G, K, Y, Z; = Koellia montana (Michaux) Kuntze -- S]

Pycnanthemum muticum (Michaux) Persoon. Mt, Cp, Pd (NC, SC, VA): bogs, wet meadows, moist to wet forests; common (uncommon in Piedmont). June-August; September-October. MA west to MI and MO, south to FL and LA. A diploid, tetraploid, and hexaploid (?) species ( \(\mathrm{n}=20,40\), ca. 54). [ \(=\) RAB, C, F, G, GW, K, Y; = Koellia mutica (Michaux) Kuntze -- S]

Pycnanthemum nudum Nuttall, Smooth Mountain-mint. Cp (SC): wet pine flatwoods; rare. Se. SC south to n. FL and se. AL. Small (1933) attributes this species to NC; the documentation is unknown (and doubtful). This is a diploid species ( \(n=20\) ). [= GW, K, Z; = Koellia nuda (Nuttall) Kuntze -- S]

Pycnanthemum pycnanthemoides (Leavenworth) Fernald var. pycnanthemoides. Mt, Pd (NC, SC, VA): forests and woodland borders; common. July-August. VA and IL south to w. SC and n. GA. A tetraploid species ( \(\mathrm{n}=36\) ). [=F, K; << \(P\). incanum -- RAB, in part; < P. pycnanthemoides -- C, Y, infraspecific taxa not distinguished; < P. pycnanthemoides var. pycnanthemoides -- G, in part only (also see P. loomisii); < Koellia pycnanthemoides (Leavenworth) Kuntze -- S, infraspecific taxa not distinguished; P. tullia Bentham -- Z; P. incanum (Linnaeus) Michaux ssp. pycnanthemoides (Leavenworth) Hamer]

Pycnanthemum pycnanthemoides (Leavenworth) Fernald var. viridifolium Fernald. Mt, Pd (NC, SC, VA), Cp (NC, VA): forests and woodland borders; uncommon. July-August. VA and WV south to ec. GA and AL. A tetraploid species ( \(\mathrm{n}=36\) ). [= F G, K; P. incanum -- RAB, in part; P. pycnanthemoides -- C, Y, infraspecific taxa not distinguished; Koellia pycnanthemoides (Leavenworth) Kuntze -- S, infraspecific taxa not distinguished; ? Koellia dubia (A. Gray) Small -- S; P. viridifolium (Fernald) E. Grant \& Epling -- Z; P. incanum (Linnaeus) Michaux ssp. pycnanthemoides (Leavenworth) Hamer]

Pycnanthemum setosum Nuttall. Cp (GA, NC, SC, VA): dry pinelands; uncommon (rare in VA) (NC Watch List, VA Rare). Mid June-August; August-October. NJ south to GA (FL?), on the Coastal Plain. See Wieboldt et al. (1998) for discussion of the taxonomy and rarity of this species. A tetraploid species ( \(\mathrm{n}=38\) ), probably an allotetraploid derived from \(P\). flexuosum \(\times\) muticum [= RAB, C, F, G, GW, K, Y; P. umbratile Fernald -- F, G; Koellia aristata (Michaux) Kuntze -- S; P. aristatum Michaux -- Z]

Pycnanthemum tenuifolium Schrader. Mt, Pd, Cp (NC, SC, VA), \{GA\}: bogs, wet meadows, moist to wet forests; common. June-August; September-October. ME west to MN, KS, and OK, south to FL and TX. A diploid and tetraploid species ( \(\mathrm{n}=20\) and 40). [= RAB, C, F, GW, K, W, Y; P. flexuosum -- G, Z, misapplied; Koellia flexuosa -- S, misapplied]

Pycnanthemum torreyi Bentham, Torrey's Mountain-mint. Mt (NC, SC, VA), Pd, Cp (VA), \{GA?\}: dry rocky woodlands, over mafic, ultramafic, or calcareous rocks, dry powerline rights-of-way; rare (NC Rare, VA Rare). NH west to IL, south to NC. A tetraploid and hexaploid species ( \(\mathrm{n}=40\) and ca. 60). [= C, F, G, Y, Z; P. verticillatum -- RAB, in part; \(P\). torrei - K, orthographic variant; P. torrei var. leptodon (Gray) Boomhour -- F; Koellia leptodon (Gray) Small -- S]

Pycnanthemum verticillatum (Michaux) Persoon var. verticillatum. Mt (NC, SC, VA), Pd (NC, VA), Cp (VA): upland rocky woodlands; common. July-September. Var. verticillatum ranges from VT west to MI, south to NC and KY. Var. pilosum (Nuttall) Cooperrider ranges from s. Ontario west to MI and IA, south to TN, AR, and OK. It differs in having the stems thickly (vs. thinly pubescent), the lower surface of the leaves evenly pubescent (vs. pubescence chiefly restricted to the midrib). It should be sought in our area. A tetraploid species ( \(\mathrm{n}=38-39\) ). [= C, K; P. verticillatum -- RAB, in part only (also see \(P\). clinopodioides, \(P\). torrei); \(P\).
verticillatum -- F, G, Y, Z, in the narrow sense; Koellia verticillata (Michaux) Kuntze -- S; Koellia leptodon (A. Gray) Small -- S; P. verticillatum -- W, infraspecific taxa not distinguished]

Pycnanthemum virginianum (Linnaeus) T. Durand \& B.D. Jackson ex B.L. Robinson \& Fernald, Virginia Mountain-mint. Mt ( \(G A, N C, V A\) ), Pd (NC, VA), Cp (VA?, NC?): wet meadows and marshes over calcareous or mafic rocks; uncommon (rare in VA Piedmont and VA Coastal Plain) (GA Special Concern, NC Watch List). June-September; September-October. ME west to ND, south to NC, nw. GA, \(n\). AL, and OK. A tetraploid species \((\mathrm{n}=40)\). [= RAB, C, F, G, GW, K, W, Y, Z; Koellia virginiana (Linnaeus) MacMillan -- S]

Pycnanthemum albescens Torrey \& A. Gray, White-leaved Mountain-mint. Pd (GA): open, mesic forests; rare (GA Special Concern). Reported for NC by Small, as Koellia albescens. It is known from nc. GA (Jones \& Coile 1988). [= K; = Koellia albescens (Torrey \& A. Gray) Kuntze - S] \{not yet keyed; add synonymy\}

Pycnanthemum floridanum E. Grant \& Epling, north to e. GA. [= K] \{not yet keyed; add synonymy\}
Pycnanthemum verticillatum (Michaux) Persoon var. pilosum (Nuttall). \{GA\}. In c. TN, and reported from a single county in e. TN (Chester, Wofford, \& Kral 1997), in se. PA (Rhoads \& Klein 1993), and WV (K99). [= C, K; P. pilosum Nuttall] \{not yet keyed; add synonymy

\section*{Rosmarinus Linnaeus (Rosemary)}

A genus of 2-3 species, herb/shrubs, of Mediterranean Europe. Closely related to Salvia (Walker et al. 2004), and probably to be combined there. References: Harley et al. in Kadereit (2004).
* Rosmarinus officinalis Linnaeus, Rosemary. Cp, Pd (NC, SC): gardens; commonly cultivated, rarely persistent or established, introduced from Mediterranean Europe. November-December. [= K]

\section*{Salvia Linnaeus 1753 (Sage, Clary)}

A genus of about 900 species, shrubs and herbs, almost cosmopolitan. Walker et al. (2004) have determined that Salvia as traditionally circumscribed is polyphyletic. References: Epling (1938)=Z; Walker et al. (2004).

1 Leaves predominantly basal.
2 Veins of the 3 upper calyx lobes parallel, the lobes themselves minute and widely-spaced (more than 1 mm between the 2 lateral teeth), separated by flattish sinuses; basal leaves lobed; [native, though weedy, common throughout our area] ..
S. Iyrata

2 Veins of the 3 upper calyx lobes converging, the lobes themselves minute and spaced within a distance of 1 mm ; basal leaves lobed or toothed; cauline leaves toothed (rarely lobed); [alien weeds, rarely naturalized in our area].
3 Upper corolla-lip strongly arched; leaves serrate . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. pratensis

3 Upper corolla-lip straight; leaves lobed S. verbenacea

1 Leaves predominantly cauline, not lobed.
4 Leaves lanceolate, linear, or narrowly elliptic, the base cuneate to attenuate.
5 Leaves canescent, gray; [introduced, rarely persistent from cultivation in gardens]
S. officinalis

5 Leaves puberulent, green; [native, of dry woodlands from sc. NC southwards and westwards].
6 Stem usually with sparse, antrorse or somewhat spreading pubescence; calyx with antrorse hairs limited to major veins; flowers of mature inflorescences spaced out, most internodes elongate and ranging up to \(25(-34)\) mm ; [plants of Atlantic and Gulf Coastal Plain and adjacent piedmont, from south-central NC to central FL to southeast LA]
S. azurea var. azurea

6 Stem usually with dense, retrorse pubescence; calyx with dense antrorse pubescence; flowers of mature inflorescences densely arranged, internodes between flowers very short, only the lowermost 1-3 internodes elongate and ranging up to \(12(-17) \mathrm{mm}\); [plants of inland and prairie sites, ranging from IL, IA, NE, and eastern CO south to nw. AL, ne. MS, LA, southeastern and central TX]
S. azurea var. grandiflora

4 Leaves rhombic-ovate, the base cordate, truncate, or broadly cuneate.
\(6 \quad\) Petiole not clearly differentiated from the leaf blade (leaf tissue decurrent on the petiole for most or all its length); corolla blue; [native, of woodlands]
S. urticifolia

6 Petiole clearly differentiated from the leaf blade; corolla blue, white, or scarlet; [introduced, weedy, rare]
7 Corolla scarlet; larger leaves \(3-6.5 \mathrm{~cm}\) long
S. coccinea

7 Corolla blue or whitish; leaves (8-) 12-20 cm long
S. sclarea

Salvia azurea Michaux ex Lamarck var. azurea, Azure Sage. Cp, Pd (GA, NC, SC), Mt (GA): sandy or rocky woodlands; common (NC Rare). Late August-October; October-November. S. NC south to panhandle FL, west to TX. [= K; S. azurea -- RAB, S , infraspecific taxa not distinguished]
*? Salvia coccinea P.J. Buchoz ex Etlinger, Scarlet Sage. Cp (GA, SC), Pd (GA): disturbed areas; rare, perhaps only introduced (at least in SC) from farther south and west. May-November. [= RAB, G, K, S]

Salvia lyrata Linnaeus, Lyreleaf Sage. Cp, Pd, Mt (GA, NC, SC, VA): lawns, roadsides, woodlands; common. April-May; May-July. CT west to MO, south to FL and TX. A common and familiar weed. [= RAB, C, F, G, K, S, W]
* Salvia officinalis Linnaeus, Garden Sage. Cp (VA): cultivated as a garden herb, rarely persistent; rare, introduced from Europe. [= C, G, K]
* Salvia pratensis Linnaeus, Meadow Sage, Meadow Clary. Cp (VA): fields and disturbed areas; rare, introduced from Europe. [= C, G, K]

Salvia sclarea Linnaeus, Clary. Mt (NC?, VA): cultivated as a garden herb, rarely persistent; rare, introduced from Europe. [= C, \(G, K, S\) ]

Salvia urticifolia Linnaeus, Nettle-leaf Sage. Pd, Mt (GA, NC, SC, VA), Cp (GA, VA): woodlands and glades, usually over mafic or calcareous rocks; uncommon (rare in Coastal Plain). April-June; May-July. PA west to w. KY, south to SC, c. GA, and AL. Quite showy when in flower. [= RAB, C, F, G, K, S, W, Z]
* Salvia verbenacea Linnaeus, Wild Clary. Mt (VA), \{GA, NC?\}: fields and disturbed areas; rare, introduced from Europe. [= C, G, K, S]

Salvia azurea Michaux ex Lamarck var. grandiflora Bentham. \{GA\}: IL, IA, NE, and eastern CO south to nw AL, ne MS, LA, southeastern and central TX. [= K; S. pitcheri Torrey ex Bentham -- C; = S. azurea Michaux ex Lamarck var. grandiflora Bentham -K; = S. azurea ssp. pitcheri (Torrey ex Bentham) Epling] \{not yet keyed; add synonymy\}

Salvia chapmanii A. Gray. AL and FL. Uncertain status. [= K, S] \{add to key; add synonymy\}
* Salvia reflexa Hornemann, Lanceleaf Sage, Mintweed. In c. TN (Chester, Wofford, \& Kral 1997). The apparent ascription by C of S. reflexa Hornemann to "N.C." is a typographic error for "N.D." This species is, however, sometimes adventive as far east as WV. [= C, K, Z] \{not yet keyed\}

Salvia verticillata Linnaeus, Whorled Clary, is introduced as far south as scattered locations in PA (Rhoads \& Klein 1993), MD, and WV (Kartesz 1999). [= C, K] \{not yet keyed\}

Satureja
(also see Clinopodium)

Scutellaria Linnaeus 1753 (Skullcap) (contributed by Bruce A. Sorrie and Alan S. Weakley)

A genus of about 350-360 species, herbs and shrubs, almost cosmopolitan. References: Pittman (1988)=Z; Collins (1976)=Y; Epling (1942)=X; Leonard (1892); Harley et al. in Kadereit (2004).

Identification notes: Recognizable for the "tractor seat"-shaped protuberance on the upper calyx.

1 Flowers axillary, bracts resembling stem leaves; stem leaves sessile or petioles <4 mm.
2 Corollas 12-32 mm long
Sc. galericulata
2 Corollas \(5-10 \mathrm{~mm}\) long.
3 Lower leaves hastate; plants glabrous . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Sc. racemosa
3 Lower leaves ovate or deltoid-ovate; plants puberulent or pubescent.
4 Stems glabrate, the pubescence ascending, curled or appressed, eglandular.
5 Median leaves 10-15 mm long; corolla 6.5-9 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Sc. leonardii
5 Median leaves 20-40 mm long; corolla 8-10 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Sc. nervosa
4 Stems obviously hairy, pubescence spreading, glandular or not (or both).
6 Lower leaf surface with glandular hairs only; leaf veins tending to anastomose along leaf margins . . . . . . .
.... . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Sc. australis
6 Lower leaf surface with glandular hairs or eglandular; leaf veins usually unbranched along margins . . . . .

1 Flowers in racemes, bracts much reduced (not leaf-like); stem leaf petioles \(>4 \mathrm{~mm}\)
7 Corolla tube glabrous within or sparsely hairy, lacking a sharply defined ring of hairs at bend of tube (non-annulate).
8 Racemes secund.
9 Corollas ca. 6 mm long; racemes terminal and axillary . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Sc. lateriflora
9 Corollas ca. 10 mm long; racemes terminal or terminating axillary branches . . . . . . . . . . . . . . . . Sc. saxatilis
8 Racemes not secund, flowers on more than one side of axis.
10 Stems and petioles with ascending hairs; at least some racemes from axillary branches; mid to upper leaves truncate basally . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Sc. saxatilis
10 Stems and petioles with spreading or retrorse hairs; racemes terminal or in panicles; mid to upper leaves strongly cordate.
11 Margins of lower lip cleft and erose; lower lip with large lateral auricles (flabelliform)
[Sc. ovata ssp. bracteata]
11 Margins of lip entire; lip undulate or weakly auriculate.
12 Lower lip entirely white with a few blue spots; leaf surface smooth with sparse glandular hairs .....
. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Sc. ovata ssp. ovata
12 Lower lip blue with two longitudinal white bands; leaf surface rugose, usually densely glandular hairy (but may be eglandular).
13 [of the Ridge and Valley (especially shale barrens) of VA, WV, MD]
Sc. ovata ssp. rugosa var. rugosa
13 [of the Blue Ridge (moist talus slopes) of NC, TN] . . . . . . . . . . . . Sc. ovata ssp. rugosa var. 1

7 Corolla tube with sharply defined ring of hairs (annulus) at bend of tube.
14 At least some upper leaves entire.
15 Leaves with stipitate glands . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Sc. multiglandulosa
15 Leaves without stipitate glands.
16 Corolla glabrous, lower lip with immaculate white central band; leaf bases long-attenuate
Sc. glabriuscula
16 Corolla short pilose, lower lip with blue spots or lines on white central band; leaf bases cuneate to deltoid.

17 Lowest pedicels of main axis of inflorescence \(>4 \mathrm{~mm}\), or if less, then subtending bracts \(<13 \mathrm{~mm} \ldots\)..
17 Lowest pedicels \(<4 \mathrm{~mm}\), or if more, then bracts \(>13 \mathrm{~mm} \ldots . . \mathrm{m}_{\mathrm{m}}\). . . . . . . . . . . . . . . . . . . . . . . . . Sc. integrifolia
14 All leaves serrate or crenate.
18 Second internode below base of inflorescence stipitate glandular.
19 Corollas 24-33 mm long and upper surfaces of leaves punctate glandular . . . . . . . . . Sc. pseudoserrata 19 Corollas 14-23 mm long, or if longer, then upper surfaces of leaves eglandular.

20 Corollas 25-36 mm long; bracts elliptic to oblanceolate, apices acute ............. . Sc. montana 20 Corollas \(14-23 \mathrm{~mm}\); bracts obovate to broadly oblanceolate, apices obtuse.

21 Bases of upper leaves cuneate to rounded; corollas 14-18 (-21) mm . . Sc. elliptica var. hirsuta

18 Second internode below base of inflorescence eglandular. 22 Corollas \(>21 \mathrm{~mm}\) long*.

28 Stems glabrous or glabrate below inflorescence; calyces eglandular; [of the Mountains and Piedmont] Sc. serrata
28 Stems canescent below inflorescence; calyces stipitate glandular or punctate glandular.
29 Lower lip with \(20+\) blue spots; calyces stipitate glandular; [of peninsular FL and sGA]
Sc. arenicola
29 Lower lip lacking blue spots; calyces punctate glandular; [of s SC-se GA; disjunct to c AL] .....
\(\qquad\) 22 Corollas <21 mm long*.

23 Calyces densely to sparsely canescent, eglandular or with punctate glands (stipitate glands may also be present).
24 Leaves softly villous beneath; calyces and bracts eglandular ......... Sc. incana var. incana 24 Leaves glabrate, with appressed hairs on veins.

25 Stems canescent; calyces and bracts densely punctate glandular Sc. incana var. australis
25 Stems glabrate (rarely puberulent); calyces and bracts eglandular
Sc. incana var. punctata
23 Calyces pilose with spreading stipitate glandular hairs.
26 Bracts with stipitate glands; leaves eglandular . . . . . . . . . . . . . . . . . Sc. elliptica var. elliptica 26 Bracts without stipitate glands; leaves densely punctate glandular.

27 Corollas 19-22 mm long; [of the Mountains of AL] . . . . . . . .
[Sc. alabamensis]
27 Corollas 11-16 mm long; [of the Coastal plain of SC and GA] ........... Sc. altamaha
*Note: in key break 22b, corollas of \(S\). alabamensis may reach 22 mm long; its calyces are both stipitate glandular and punctate glandular, thus differing from S. arenicola and S. mellichampii. In key break 22a, corollas of S. mellichampii may be as short as 21 mm ; its calyces are punctate glandular only, unlike \(S\). incana var. australis which has both punctate glands and stipitate glands on calyces.

Scutellaria altamaha Small, Altamaha Skullcap. Cp (GA), ?? \{NC, SC\}: sandy deciduous forests; rare (GA Special Concern). [ \(=\mathrm{K}, \mathrm{S}, \mathrm{Y}\) ]

Scutellaria arenicola Small, Sandhill Skullcap. Cp (GA): sandy scrub; rare (GA Special Concern). Endemic to GA and FL (Kartesz 1999). [= K, S, Y]

Scutellaria australis (Fassett) Epling, Southern Skullcap. \{GA, NC, SC, VA\}. [=X; < S. parvula -- RAB, S, in part, misapplied; = S. parvula Michaux var. australis Fassett -- K]

Scutellaria elliptica Muhlenberg ex Sprengel var. elliptica. \(\{G A, N C, S C, V A\}\). [=C, K, Y; S. elliptica -- RAB, infraspecific taxa not distinguished; S. ovalifolia - S, infraspecific taxa not distinguished]

Scutellaria elliptica Muhlenberg ex Sprengel var. hirsuta (Short \& Peter) Fernald. \{GA, NC, VA\}. [= C, K, Y; S. elliptica -RAB, infraspecific taxa not distinguished; S. ovalifolia - S, infraspecific taxa not distinguished]

Scutellaria galericulata Linnaeus, Hooded Skullcap. Mt (NC, VA): \{habitat not known\}. The NC occurrence is based on a single specimen from the 19th century. Reported recently from MD (Steury, Tyndall, \& Cooley 1996). [= C, K, X; S. epilobiifolia A. Hamilton - S]

Scutellaria glabriuscula Fernald, Georgia Skullcap. \{GA\}: In GA, AL, MS, and FL. [= K, S, Y]
Scutellaria incana Biehler var. incana. (NC?, SC?, VA). [=C, K, Y; S. incana -- RAB, S, infraspecific taxa not distinguished; S. incana - X]

Scutellaria incana Biehler var. punctata (Chapman) C. Mohr. (NC, SC, VA). [= C, K, Y; S. incana -- RAB, S, infraspecific taxa not distinguished; S. punctata (Chapman) Leonard - X]

Scutellaria integrifolia Linnaeus. [= C, K, S, Y; S. integrifolia var. hispida Bentham - RAB; S. integrifolia var. integrifolia RAB]

Scutellaria lateriflora Linnaeus, Mad Dog Skullcap. Cp, Pd, Mt (NC, SC, VA): alluvial forests, bogs, seeps, marshes; common. July-frost. [= RAB, C, S; S. lateriflora var. lateriflora -- K]

Scutellaria leonardii Epling, Shale-barren Skullcap, Glade Skullcap. Mt (GA, VA), Pd (NC, VA): limestone glades, diabase barrens; rare (GA Special Concern). April-May; May-June. [= C, X; S. parvula -- RAB, in part, misapplied; S. parvula Michaux var. missouriensis (Torrey) Goodman \& Lawson - K; S. ambigua Nuttall - S; = S. parvula Michaux var. leonardii (Epling) Fernald]

Scutellaria mellichampii Small, Mellichamp's Skullcap. Cp (GA), ?? (NC, SC): sandy deciduous forests; rare (GA Special Concern). In e. GA (Jones \& Coile 1988). [= RAB, S, X, Y; S. incana Biehler var. australis (Epling) Collins, comb. nov. ined. -- K; S. altamaha Small ssp. australis Epling]

Scutellaria montana Chapman, Large-flowered Skullcap. Mt (GA): mesic hardwood (or hardwood-shortleaf pine) forests; rare (US Threatened, GA Endangered). In se. TN (Chester, Wofford, \& Kral 1997) and in nw. GA (Jones \& Coile 1988). [= K, S, Y]

Scutellaria multiglandulosa (Kearney) Small ex Harper. \{SC, GA\}. SC (Abbeville and Anderson counties) to e. GA (Jones \& Coile 1988). [= K, S, Y]

Scutellaria nervosa Pursh, Bottomland Skullcap, Veined Skullcap. Pd (NC), \{GA, SC, VA\}; alluvial forests, mesic forests; rare (GA Special Concern). May-June; June-July. [= RAB, K, S; S. nervosa var. nervosa -- C; S. nervosa var. calvipes Fernald -- C]

Scutellaria ocmulgee Small, Ocmulgee Skullcap. Cp (GA): bluff forests and other mesic hardwood forests; rare (GA Threatened). [= K, S, Y]

Scutellaria ovata Hill ssp. bracteata (Bentham) Epling. East to AL and FL (and eastwards to GA and beyond?). [= K, X; S. ovata var. bracteata Bentham; > Scutellaria ovata Hill ssp. cuthbertii (Alexander) Epling - K, X; > S. cuthbertii Alexander - S; S. ovata ssp. bracteata (Bentham) Epling var. bracteata - Z] \{add synonymy\}

Scutellaria ovata Hill ssp. ovata var. ovata. \{GA, NC, SC, VA\}. [= Z; S. ovata ssp. ovata -- K; S. ovata - RAB, S, infraspecific taxa not distinguished; S. ovata var. ovata -- C; S. ovata var. calcarea (Epling) Gleason - C; S. ovata var. versicolor (Nuttall) Fernald - C; S. ovata ssp. calcarea Epling - X; S. ovata ssp. versicolor (Nuttall) Epling - X; Scutellaria ovata Hill ssp. venosa Epling - K, X]

Scutellaria ovata Hill ssp. rugosa (Wood) Epling var. rugosa. Mt (VA): [> K, X; Scutellaria ovata Hill ssp. pseudoarguta Epling - K, X; S. ovata - RAB, S, infraspecific taxa not distinguished; S. ovata var. ?? -- C; S. ovata ssp. rugosa (Wood) Epling var. rugosa - Z; Scutellaria ovata Hill ssp. virginiana Epling - K, X]

Scutellaria ovata Hill ssp. rugosa (Wood) Epling var. 1, Appalachian Skullcap. \{GA, NC, VA\}. [Scutellaria arguta Buckley -C, K, S, X; "S. ovata Hill ssp. rugosa (Wood) Epling var. arguta (Buckley) Pittman" - Z (not published)]

Scutellaria parvula Michaux, Dwarf Skullcap. (SC, VA). In c. TN and scattered locations in e. TN (Chester, Wofford, \& Kral 1997). [= X; = S. parvula var. parvula -- C, K; < S. parvula - S, in part (also including S. australis)]

Scutellaria pseudoserrata Epling. Mt, Pd (GA), \{NC?, SC\}. Also in e. TN (Chester, Wofford, \& Kral 1997), nc. and c. GA (Jones \& Coile 1988). Cultivated in Highlands, Macon Co., NC. [= K, X, Y]
* Scutellaria racemosa Persoon, South American Skullcap. Cp (SC), Pd (NC), \{GA\}: disturbed areas, introduced from South America. Reported from FL, AL, GA, and SC by Kral (1981). Krings \& Neal (2001a, 2001b) report it for Chatham Co., NC and discuss its occurrence in se. United States. [= K]

Scutellaria saxatilis Riddell, Rock Skullcap. Mt (GA, NC, SC, VA): June-August. [= RAB, C, K, S, X, Z]
Scutellaria serrata Andrzedowski, Showy Skullcap, Serrate Skullcap. (GA, NC, SC, VA). Mid May-late June. [= RAB, C, K, \(\mathrm{S}, \mathrm{X}, \mathrm{Y}]\)

Scutellaria alabamensis Alexander. AL (Epling 1942, Kartesz 1999). [= K, S, X, Y]

\section*{Sideritis Linnaeus}

A genus of about 140-150 species, herbs and shrubs, of temperate Eurasia. References: Harley et al. in Kadereit (2004).
Sideritis romana Linnaeus, Ironwort, is introduced and naturalized as far south as PA (Rhoads \& Klein 1991, Cronquist 1991) and WV (Cronquist 1991). [= C, K] \{add synonymy\}

Stachys Linnaeus 1753 (Hedge-nettle)
(contributed by John B. Nelson)

A genus of about 300 species, herbs and shrubs, mainly temperate, nearly cosmopolitan (except Australia and New Zealand). References: Nelson (1981)=Z; Nelson \& Fairey (1979); Mulligan \& Munro (1989); Pringle (2002); Harley et al. in Kadereit (2004).

Keying Note: This treatment will be revised substantially.

\section*{Key 1}

1 Fruiting calyx lobes deltoid to broadly triangular.
2 Stem sides pubescent.
3 Petioles short to absent, blades mostly rounded to truncate; top of blooming stem stiff, erect . . . . . . . . . S. eplingii
3 Petioles well developed, blades commonly cordate at the base; top of blooming stem frequently flexuous, somewhat

2 Stem sides glabrous.

4 Leaf margins serrate or serrulate, but always with sharp teeth; nodes not bearded; stem angles with scattered, swollen-based, short, retrorse trichomes (not spreading pubescent); [plants of the Mountains or upper Piedmont] .
S. latidens

4 Leaf margins finely crenate; nodes bearded; stem angles abundantly pubescent with 3-celled, spreading hairs; [of the lower Piedmont of NC]
S. species 1

1 Fruiting calyx lobes lanceolate, narrowly triangular, or nearly subulate.

\section*{5 Leaf blades linear to lanceolate.}

6 Stem sides with at least moderate pubescence on the highest sterile internode, moderately to densely pubescent on higher internodes; lower leaf surface abundantly pubescent to velvety-pilose
S. pilosa

6 Stem sides without pubescence, except for internodes within the inflorescence, which may bear light villous or glandular hairs; lower leaf surface glabrous or pubescent, but not velvety.
7 Leaf blade margins entire to crenate; plants generally glabrous
S. hyssopifolia

7 Leaf blade margins serrulate with at least a few teeth; plants glabrous or pubescent.
8 Stems strict or sparingly branched; leaves sessile or barely petioled, the blades crenate to serrate with shallow teeth . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. aspera
8 Stems frequently branched from the upper nodes; leaves obviously petioled, the blades sharply toothed
\(5 \quad\) Leaf blades wider, oblong to elliptic.
9 Petioles poorly developed, essentialy absent
S. tenuifolia

9 Petioles obvious, frequently \(1 / 5\) the length of the blade.
10 Leaf blades sharply serrate, nearly dentate; stem angles abundantly pubescent with spreading or somewhat retrorse, long (to 3 mm ) hairs
S. clingmanii

10 Leaf margins crenate to serrulate, but never dentate; stem angles glabrous or pubescent (if the latter, then with scattered, stiffish, retrorse hairs).
11 Plant producing thick, segmented, tuber-like rhizomes; stem sides and calyx usually strongly glandular; [weedy, mostly on the Coastal Plain]
S. floridana

11 Plant producing slender rhizomes; stem sides and calyx usually scarcely glandular, or glabrous; [not weedy, mostly of the Piedmont and Mountains].
12 Calyx usually abundantly pubescent with stiff, eglandular hairs; fruiting calyx lobes straight
S. hispida

12 Calyx usually glabrous to sparingly pubescent; fruiting calyx lobes frequently curved or curling
S. tenuifolia

\section*{Key 2 (Alternate Key)}

1 Petioles obvious (at least some of those in the middle portion of the stem at least \(1 / 5\) as long as the leaf blade).
2 Calyx tubes glandular.
3 Leaf blade margins strongly serrate (dentate or nearly so); stem angles copiously pubescent with long (to 3 mm ), spreading hairs.
3 Leaf blade margins mostly crenate; stem angles glabrate or pubescent with mostly short, retrorse hairs.
4 Calyx lobes about as long as the tube, lanceolate; leaf blades never greater than 3 cm wide ..... S. floridana
4 Calyx lobes shorter than the tube, deltoid; leaf blades frequently more than 3 cm wide .......... S. cordata
2 Calyx not glandular, or very slightly so.
5 Calyx glabrous to sparsely pubescent; petioles well-developed, especially in shade forms ........... . S. tenuifolia
5 Calyx variously hairy, but at least hispidulous, frequently strongly hispid; petioles short or long.
\(6 \quad\) Petioles usually well developed; blade margins commonly dentate
S. clingmanii

6 Petioles frequently short to nearly absent; blade margins toothed, but never dentate . . . . . . . . . . . S. hispida
1 Petioles short or absent.
7 Leaves linear-lanceolate to narrowly lanceolate, usually widest at or near the base; leaf margins entire to crenulate, rarely serrulate, and then mostly toward the apex.
8 Corolla very pale pink to white; leaf blades abundantly pubescent below with appressed hairs, the surface softvelvety
S. pilosa

8 Corolla dark pink; leaf blades variously pubescent or glabrate, but never velvety.
9 Leaf blades narrow, 3-6 mm wide; plants generally glabrous to moderately pubescent; blade margins entire to obscurely crenulate S. hyssopifolia

9 Leaf blades broader, \(5-8 \mathrm{~mm}\) wide; plants frequently hispidulous or at least moderately pubescent, or
abundantly hairy; blade margins crenulate to serrulate
S. aspera

7 Leaves ovate to elliptic, widest near the center or toward the apex, oblong; leaf margins crenate to sharply serrate for nearly the entire length.
10 Stem sides commonly pubescent above . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. eplingii
10 Stem sides glabrous, the angles pubescent.
11 Fruiting calyx lobes lanceolate, about half as long as the calyx tube
S. hispida

11 Fruiting calyx lobes deltoid or triangular, shorter than half the length of the calyx tube.
12 Leaf margins serrate or serrulate, but always with sharp teeth; nodes not bearded; stem angles with scattered, swollen-based, short, retrorse trichomes (not spreading pubescent); [of the Mountains or upper Piedmont]
S. latidens

12 Leaf margins finely crenate; nodes bearded; stem angles abundantly pubescent with 3-celled, spreading hairs; [of the lower Piedmont of NC]
S. species 1

Stachys aspera Michaux, Rough-leaved Hedge-nettle. Cp, Pd (GA, NC, SC, VA), Mt (VA): moist or wet sandy soil of savannas, marshes, or swamp forests; uncommon (VA Rare). June-August; August-September. [= C, G; S. hyssopifolia Michaux var. ambigua A. Gray -- RAB, F, GW, K; S. hyssopifolia -- C, in part, infraspecific taxa not distinguished; S. ambigua (A. Gray) Britton -- S; S. grayana House]

Stachys clingmanii Small, Clingman's Hedge-nettle. Mt (NC), Cp? (VA?), \{SC?\}: cove forests, especially periglacial boulderfields, mostly at high elevations (and see comments below); rare (NC Rare). June-August; September-October. A narrow Southern Appalachian endemic, known only from sw. NC and se. TN. Some plants similar to and perhaps referable to this species occur in Surry County VA (calcareous bushy thickets and ravines) and in IN. [= C, F, G, K, S, W, Z; S. clingmanii -- RAB, presumably in part only (also see S. nuttallii)]

Stachys cordata Riddell, Heart-leaved Hedge-nettle, Nuttall's Hedge-nettle. Mt (GA, NC, VA), Pd (NC, VA): moist forests, especially alluvial bottomlands or over calcareous rocks; uncommon (rare in NC) (GA Rare, NC Watch List). June-August; September-October. Primarily montane, but extending east to Stokes County, North Carolina. See Pringle (2002) for a discussion of nomenclature. [= C, S; S. nuttallii Shuttleworth ex Bentham -- K, W, Z; presumably included in S. clingmanii -- RAB (not equal to S. nuttallii -- RAB); S. subcordata Rydberg -- C, G; S. riddellii House -- F, G; S. salvioides Small -- S]

Stachys eplingii J. Nelson, Epling's Hedge-nettle. Mt (GA, NC, SC, VA): mesic forests, bogs, wet meadows over calcareous or mafic substrates; rare (GA Rare, NC Rare, VA Rare). June-August; August-September. This species has a scattered and sporadic range in the southern and central Appalachians, occurring also in the Ozarks. See Nelson \& Fairey (1979) for a discussion of the nomenclatural change. [= C, GW, K, W, Z; S. nuttallii -- RAB, F, G, S, misapplied]
* Stachys floridana Shuttleworth ex Bentham, Florida Betony, Rattlesnake-weed. Cp, Pd (GA, NC, SC, VA): disturbed sites, roadsides; uncommon, probably not native, introduced from Florida. April-July; May-August. The common name "Rattlesnakeweed" refers to the moniliform rhizomes. [= RAB, GW, K, S, Z]

Stachys hispida Pursh, Hispid Hedge-nettle. Mt (NC, VA), Pd, Cp (VA), ?? (GA): wet meadows and mesic forests; uncommon (GA Rare). A highly variable taxon. [= C, G; S. tenuifolia Willdenow var. hispida (Pursh) Fernald -- F; S. tenuifolia var. tenuifolia -- K, Z, in part]

Stachys hyssopifolia Michaux var. hyssopifolia, Hyssop-leaved Hedge-nettle. Cp, Pd (GA, NC, SC, VA), Mt (VA): moist soils of savannas, marshes, seasonally flooded sinkhole ponds, roadside ditches; uncommon (VA Watch List). June-August; August-September. [<C, G, S, W, infraspecific taxa not distinguished; > S. hyssopifolia var. hyssopifolia - RAB, F, GW, K, Z; > S. hyssopifolia var. ambigua A. Gray - Z; S. atlantica Britton]

Stachys latidens Small ex Britton, Broad-toothed Hedge-nettle. Mt, Pd (GA, NC, SC, VA): mesic forests in coves and on mountain slopes, mountain pastures and forest edges; common (GA Rare, SC Rare). June-August; September-October. [= RAB, C, F, G, S; S. tenuifolia Willdenow var. latidens (Small ex Britton) J. Nelson -- K, W, Z; S. tenuifolia -- GW, in part]

Stachys pilosa Nuttall, Woundwort. Mt, Pd (VA), Cp (SC): marl fens, roadsides, banks of waterfowl impoundments; rare, possibly adventive in part from further west, but some populations at least native. [S. palustris Linnaeus var. pilosa (Nuttall) Fernald -- C, G; S. palustris Linnaeus ssp. pilosa (Nuttall) Epling -- K; S. pilosa var. arenicola (Britton) Mulligan \& Monroe]

Stachys species 1, Yadkin Hedge-nettle. Pd (NC, VA): in sandy alluvium along forest edges in river floodplain; rare.
Stachys tenuifolia Willdenow, Smooth Hedge-nettle. Mt (NC), Pd (VA), Cp (NC, SC, VA): wooded alluvial river bottoms, swamp forests, and roadsides; rare (NC Watch List). June-August; September-October. [=RAB, G, S; S. tenuifolia var. tenuifolia -C, F, K, W, Z; S. tenuifolia var. tenuifolia - K, Z, in part (also see S. hispida); S. tenuifolia var. perlonga Fernald -- F, K, Z; S. tenuifolia var. platyphylla Fernald -- F; S tenuifolia -- GW, in part only]
* Stachys annua (Linnaeus) Linnaeus. Reported for VA (Kartesz 1999). [= K]
* Stachys arvensis (Linnaeus) Linnaeus. Reported for VA (Kartesz 1999). [= K]
* Stachys byzantina K. Koch ex Scheele. Reported for VA (Kartesz (1999). [= K]

Stachys crenata Rafinesque. Reported for AL, KY, FL (Kartesz 1999). [= K]
* Stachys germanica Linnaeus. reported for VA, TN, FL (Kartesz 1999). [= K]

Stachys hyssopifolia Michaux var. Iythroides (Small) J. Nelson. (GA Rare). [= Z]
Stachys palustris Linnaeus. South to MD, PA, NJ. [= K]
\{Add S. subcordata.\}

\section*{Synandra Nuttall 1818 (Synandra)}

A monotypic genus, an herb, of e. North America. References: Cantino (1985); Harley et al. in Kadereit (2004).
Synandra hispidula (Michaux) Baillon, Synandra, Gyandotte Beauty. Mt (NC, VA): moist, rich forests; rare (NC Rare, VA Rare). Late April-May; May-June. A broad Appalachian endemic: s. OH west to s. IL, south to sw. VA, w. NC, and n. AL. [= RAB, C, F, G, K, S, W]

\section*{Teucrium Linnaeus 1753 (Germander)}

A genus of about 100-250 species, herbs and shrubs, nearly cosmopolitan in distribution. References: Harley et al. in Kadereit (2004).

Teucrium canadense Linnaeus var. canadense. \(\{\mathrm{GA}, \mathrm{NC}, \mathrm{SC}, \mathrm{VA}\}\). [ \(=\mathrm{C}, \mathrm{F}, \mathrm{G}, \mathrm{K} ; T\). canadense -- RAB, GW, W, infraspecific taxa not distinguished; T. littorale Bicknell -- S]

Teucrium canadense Linnaeus var. hypoleucum Grisebach. \{GA, NC, SC\}. [= K; T. canadense -- RAB, GW, W, infraspecific taxa not distinguished; T. nashii Kearney -- S]

Teucrium canadense Linnaeus var. occidentale (A. Gray) McClintock \& Epling. (VA). Reported for VA (Kartesz 1999). \{investigate\} Occurs at least as far south and east as PA (Rhoads \& Klein 1993). [= C, G, K; T. occidentale A. Gray var. occidentale -- F; T. occidentale A. Gray var. boreale (Bicknell) Fernald -- F]

Teucrium canadense Linnaeus var. virginicum (Linnaeus) Eaton. [= C, F, G, K; T. canadense -- RAB, GW, W, infraspecific taxa not distinguished; T. canadense -- in the sense of S]

Teucrium cubense Jacquin var. cubense. AL. [= K] \{add to key; add synonymy\}

\section*{Thymus Linnaeus (Thyme)}

A genus of about 220-350 species, herbs and shrubs, of temperate Eurasia. References: Harley et al. in Kadereit (2004).
* Thymus praecox Opiz ssp. arcticus (Dur.) Jalas, Mother-of-Thyme. Pd (NC), \{GA\}: commonly cultivated and sometimes escaped or persisting; rare, introduced from Eurasia. July-September. [= K; Th. serpyllum Linnaeus, misapplied -- RAB, C, F, G] * Thymus pulegioides Linnaeus, Lemon Thyme. (VA). [= K]

\section*{Trichostema Linnaeus 1753 (Blue Curls)}

A genus of about 18 species, shrubs, annual and perennial herbs, of temperate North America (especially diverse in w. North America, with a second center of diversity in se. North America). References: Weakley (in prep.) =Z; Harley et al. in Kadereit (2004).

1 Calyx lobes essentially equal; stamens straight, less than 10 mm long; leaves acute to slightly acuminate, the two main lateral veins reconnecting to the midvein; [section Orthopodium] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . T. brachiatum
1 Calyx strongly bilabiate; stamens strongly arched, \(12-20 \mathrm{~mm}\) long; leaves obtuse, the two main lateral veins not reconnecting to the midvein; [section Trichostema].
2 Plants annual; larger leaves \(3-7 \mathrm{~cm}\) long (including the petiole); plants with long internodes near the base, near-basal branches absent, the best-developed branches from the mid or upper stem; hairs on the upper stem long ( \(0.5-2.0 \mathrm{~mm}\) long) or short (0.1-0.4 mm long); [collectively widespread, in a wide variety of habitats, primarily inland, though occasionally occurring as a weed in coastal areas].
3 Leaves \(2.5-4 \times\) as long as wide; longer hairs of the upper stem (0.3-) \(0.5-2.0 \mathrm{~mm}\) long
T. dichotomum 3 Leaves \(5-15 \times\) as long as wide; longer hairs of the upper stem 0.1-0.3 (-0.4) mm long . . . . . . . . . . . . . . T. setaceum
2 Plants perennial; larger leaves \(1-4 \mathrm{~cm}\) long (including the petiole); plants with short internodes near the base, near-basal branches well-developed, these often branching again; hairs on the upper stem short (0.1-0.4 mm long); [restricted to barrier islands, coastal peninsulas, and other maritime situations within 10 km of the ocean].
4 Anthers lemon yellow; leaves ovate-rhombic, 1-1.5 X as long as wide; corolla lavender (definitely with a pinkish tint); bark on older stems dark, tight; plants 1-4 dm tall, forming a tight, compact, hemispheric bush; [of maritime dunes, grasslands, and forest openings from 10 km north of Cape Hatteras (Dare County, NC) south to near Cape Romain (Georgetown County, SC]
T. species 1

4 Anthers blue; leaves spatulate, the petiole relatively well-developed, 1.5-3 X as long as wide; corolla bluish (lacking a well-developed pinkish tint); bark on older stems yellow to tan, somewhat papery; plants 3-7 dm tall, often gangly and irregularly shaped; [of maritime dunes, grasslands, and coastal scrub from e. GA around the FL peninsula west to s. MS]
T. species 2

Trichostema brachiatum Linnaeus, Glade Blue Curls, False Pennyroyal. Mt (GA, NC, VA), Pd (NC, SC, VA): shale barrens, outcrops of calcareous or mafic rock, diabase barrens, disturbed rocky areas; uncommon (NC Rare). August-September. VT and s. Ontario west to MN and NE, south to c. NC, nw. GA, AL, TX, and AZ. Morphology, pollen, and phytogeography suggest the plausible recognition of Trichostema section Orthopodium as Isanthus, a genus distinct from section Trichostema (which includes all other eastern North American species). [= W; = Isanthus brachiatus (Linnaeus) Britton, Sterns, \& Poggenburg -- C, F, K, S; > Isanthus brachiatus var. brachiatus -- G]

Trichostema dichotomum Linnaeus, Common Blue Curls. Cp, Pd, Mt (GA, NC, SC, VA): dry woodlands, disturbed areas, thin soils around rock outcrops; common. August-November. Widespread in e. North America. [= RAB, C, K, S, W, Z; > T. dichotomum var. dichotomum \(-\mathrm{F} ;>\) T. dichotomum var. puberulum Fernald \& Griscom -- \(\mathrm{F} ;=T\). dichotomum var. dichotomum -- G]

Trichostema setaceum Houttuyn, Narrowleaf Blue Curls. Pd, Mt, Cp (GA, NC, SC, VA): thin soils around rock outcrops especially granite flatrocks, dry sandy soils of the Coastal Plain; uncommon (NC Watch List, VA Rare). August-November. CT west to OH, south to FL and TX, primarily on the Coastal Plain. [= RAB, C, F, K, W, Z; = T. dichotomum var. lineare (Walter) Pursh -- G; \(=T\). lineare W alter -- S ]

Trichostema species 1, Dune Blue Curls, Carolina Blue Curls. Cp (NC, SC): dunes on barrier islands, vegetated with perennial grasses (especially Uniola paniculata), openings in maritime scrub; rare (US Species of Concern, NC Rare). AugustNovember. Endemic to barrier islands from slightly north of Cape Hatteras, NC south to North Island, Georgetown County, SC, north of Cape Romain. When growing together, the flowering period of \(T\). species 1 is about 2-3 weeks later than that of \(T\).
dichotomum. Despite a considerable overlap of blooming period, only one hybrid has been seen, and that in common-garden cultivation in the Piedmont. [= Z]

Trichostema species 2, Florida Blue Curls. Cp (GA): maritime dunes, grasslands, and coastal scrub; uncommon. E. GA around the FL peninsula west to s. MS. [= Z]

Vitex Linnaeus 1753 (Chaste Tree)
A genus of about 250 species, trees and shrubs, tropical to temperate. References: Harley et al. in Kadereit (2004).
1 Leaves palmately compound; plant an upright small tree . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . V. agnus-castus
1 Leaves simple; plant a sprawling and spreading shrub/vine V. rotundifolia
* Vitex agnus-castus Linnaeus, Chaste Tree. Cp (GA, NC, VA), Pd (GA, NC, VA), Mt (VA): pastures, woodland edges, suburban woodlands; rare, introduced from Mediterranean Europe. June-July. [= RAB, C, G, S; V. agnus-castus var. agnus-castus -- K]

Vitex rotundifolia Linnaeus f., Beach Vitex, Roundleaf Chaste-tree. Cp (GA?, NC, SC): coastal dunes; uncommon, planted for ornament and stabilization and now spreading aggressively as an invasive species. See Roecker \& Socha (2004) for additional information. The runners are reported to reach 10 m in length. [= K]

\section*{LARDIZABALACEAE Decaisne 1839 (Lardizabala Family)}

A family of about 8 genera and 35 species, shrubs and vines, primarily Asian, but also in s. South America. References: Thieret \& Kartesz in FNA (1997); Cheng-Yih \& Kubitzki in Kubitzki, Rohwer, \& Bittrich (1993).

Akebia Decaisne 1837 (Akebia)
A genus of 5 species, vines, of temperate e. Asia. References: Cheng-Yih \& Kubitzki in Kubitzki, Rohwer, \& Bittrich (1993).
* Akebia quinata (Houttuyn) Decaisne, Five-leaf, Five-leaf Akebia, Chocolate-vine. Mt, Pd (NC, SC, VA), Cp (GA): escaped from cultivation to roadbanks, suburban woodlands, and floodplains; rare, native of Japan, China, and Korea, potentially invasive and difficult to eradicate. April-June; June-July. [= RAB, C, F, FNA, K]

\section*{LAURACEAE (Laurel Family)}

A family of about 50 genera and 2500-3500 species, trees and shrubs, of tropical, subtropical, and (rarely) warm temperate regions. References: van der Werff in FNA (1997); van der Werff \& Richter (1996); Rohwer in Kubitzki, Rohwer, \& Bittrich (1993).

1 Leaves evergreen; flowers perfect; [tribe Perseeae].
2 Leaves glabrous, bright green, with yellow callosities in the principal vein axils; crushed leaves with the odor of camphor .

2 Leaves pubescent to glabrate, dark green, without yellow callosities in the principal vein axils; crushed leaves with the odor of bay

Persea
1 Leaves deciduous; flowers imperfect; [tribe Laureae].
3 Some of the leaves with 1-2 (-5) rounded lobes; small to medium trees . . . . . . . . . . . . . . . . . . . . . . . . . . . . Sassafras
3 None of the leaves lobed; medium to large shrubs.
4 Leaves \(4-16 \mathrm{~cm}\) long, \(2-6 \mathrm{~cm}\) wide, obovate, ovate, or broadly elliptic . . . . . . . . . . . . . . . . . . . . . . . . . . . Lindera
4 Leaves 1.2-4 cm long, 0.5-1.5 (-1.9) cm wide, narrowly elliptic . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Litsea

\section*{Cinnamomum Schaeff 1760 (Cinnamon)}

A genus of about 350 species, trees and shrubs, of e. and se. Asia, Oceania, and tropical America. References: Rohwer in Kubitzki, Rohwer, \& Bittrich (1993).
* Cinnamomum camphora (Linnaeus) J. PresI, Camphortree. Cp (GA, NC, SC): disturbed areas; rare, native of eastern Asia, planted as an ornamental and rarely escaped to adjoining areas, such as in Southern Pines, Moore County, NC. April-May. Reported as escaped and apparently naturalized in South Carolina by Hill \& Horn (1997). [= FNA, K; = Camphora camphora (Linnaeus) Karsten -- S]

\section*{Laurus Linnaeus 1753 (Laurel, Bay)}

A genus of 1-2 species, trees, of Mediterranean Europe, the Canary Islands, Madeira, and the Azores. References: Rohwer in Kubitzki, Rohwer, \& Bittrich (1993).

Laurus nobilis Linnaeus, Laurel, Bay, native to the Mediterranean region of Europe and the bay leaf of commerce, is planted as an ornamental and spice, but is not known to escape in our area.

\section*{Lindera Thunberg 1783 (Spicebush, Benzoin)}

A genus of about 100 species, trees and shrubs, of tropical and temperate Asia, Australia, and e. North America. References: Wofford (1983)=Z; Steyermark (1949); McCartney, Wurdack, \& Moore (1989); Rohwer in Kubitzki, Rohwer, \& Bittrich (1993).

1 Leaves typically with a thick, subcoriaceous texture (though sometimes thinner in texture if growing in shade), 4-8 cm long, 2-3.5 cm wide, narrowly obovate to oblanceolate, pubescent and strongly whitened below; leaves and bark aromatic, the odor lemony
L. subcoriacea

1 Leaves with a thin, membranous texture, 6-16 cm long, 2-6 cm wide, obovate, elliptic, or ovate, glabrous to pubescent below, but not strongly whitened; leaves and bark strongly aromatic, the odor spicy or like sassafras.
2 Leaf base widely cuneate to rounded; leaves narrowly ovate, reticulate-rugose, with an acute apex, pubescent above, drooping, fragrant when crushed with an odor like sassafras; shrubs colonial, short (to 2 m tall) ......... L. melissifolia
2 Leaf base cuneate; leaves widely obovate, plane (not rugose), with a short-acuminate apex, glabrous above, borne horizontally, spicy-fragrant when crushed; shrubs not colonial, often multi-stemmed from base, short to tall (to 5 m tall).

Lindera benzoin (Linnaeus) Blume var. benzoin, Smooth Northern Spicebush. Mt (GA, NC, VA), Pd (VA): rich alluvial forests, mesic forests on slopes with circumneutral soils, bottomlands, swamps; common. March-April; August-September. The species is widespread in e. North America; var. benzoin is northern, ranging south to VA and MO, and in the mountains to GA. Where occurring on upland slopes, \(L\). benzoin is an excellent indicator of base-rich soils, generally derived from calcareous sedimentary rocks or mafic metamorphic or igneous rocks. [= C, F, G, K; < L. benzoin -- RAB, FNA, GW, W, Z, infraspecific taxa not distinguished; < Benzoin aestivale (Linnaeus) Nees -- S, infraspecific taxa not distinguished]

Lindera benzoin (Linnaeus) Blume var. pubescens (Palmer \& Steyermark) Rehder, Hairy Northern Spicebush. Mt, Pd, Cp (GA, NC, SC, VA): rich alluvial forests, mesic forests on slopes with circumneutral soils, bottomlands, swamps; common. MarchApril; August-September. Var. pubescens is the more southern of the two varieties, ranging through much of se. North America, north to se. VA, sw. VA, s. OH, MI, and MO. Where occurring on upland slopes, L. benzoin is an excellent indicator of base-rich soils. [= C, F, G, K; < L. benzoin -- RAB, FNA, GW, W, Z, infraspecific taxa not distinguished; < Benzoin aestivale (Linnaeus) Nees -- S, infraspecific taxa not distinguished]

Lindera melissifolia (Walter) Blume, Southern Spicebush, Pondberry. Cp (GA, NC, SC), Pd (NC): wet flats and depressions, generally with pocosin shrubs; rare (US Endangered, GA Endangered, NC Endangered, SC Rare). March-April; August-September. This species is southern in range, with a very scattered distribution in se. and c. NC, e. SC, e. \& sw. GA, nw. FL, sw. AL (?), nw. MS, se. MO-AR, and se. AR-LA (recent collections unknown from FL, AL, and LA). It is nearly extirpated in NC, currently known only from three populations, in Sampson, Bladen, and Cumberland counties. A historic record from Orange County, NC (in the lower Piedmont), collected by Elisha Mitchell in 1820 and 1822, appears to be bonafide (McVaugh, McVaugh, \& Ayers 1996). [= RAB, F, FNA, GW, K, Z; = Benzoin melissaefolium (Walter) Nees -- S]

Lindera subcoriacea B.E. Wofford, Bog Spicebush. Cp (GA, NC, SC, VA), Pd (NC): peaty seepage bogs in headwaters of blackwater streams, in the sandhills and immediately adjacent Piedmont, with other pocosin shrubs; rare (US Species of Concern, GA Special Concern, NC Endangered, SC Rare, VA Rare). March-April; July-August. The overall range of this newly described species is still poorly known; it appears to be a Southeastern Coastal Plain endemic, ranging from se. VA (perhaps s. NJ) south to FL and west to LA. Occurring in our area primarily in a scattering of small populations in the fall line Sandhills of NC and SC, with an outlier or two in "Piedmont pocosins" just west of the Sandhills. Distinctive characteristics of sun-grown plants include the rounded apex of the leaf, the leaf strongly whitened beneath and borne in an ascending to even appressed position in relation to the twigs, and a typically fastigiate or virgate branching pattern, with multiple stems or branches ascending vertically and nearly parallel to one another. Shade plants have a different form. [= FNA, K, Z]

\section*{Litsea Lamarck 1792 (Pondspice)}

A genus of about 400 species, trees and shrubs, of warm temperate and tropical areas, especially se. Asia and Australia. The genus is very heterogeneous and probably needs division into more natural groups. References: Rohwer in Kubitzki, Rohwer, \& Bittrich (1993).

Litsea aestivalis (Linnaeus) Fernald, Pondspice. Cp (GA, NC, SC, VA): margins of limesink ponds and Carolina bays, less commonly in wet depressions dominated by shrubs; rare (US Species of Concern, GA Threatened, NC Rare, SC Rare, VA Rare). March-April; May-June. A Southeastern Coastal Plain endemic: e. MD (Dorchester County) and se. VA (York and Isle of Wight counties) south to \(n\). FL (and allegedly also in LA, based on an old and poorly labeled specimen). The fine, zigzag twigs are distinctive. It grows to 6 m tall, characteristically forming a rounded bush. [= RAB, F, FNA, GW, K]

Persea P. Miller 1754 (Bay)
A genus of about 200 species, trees and shrubs, of Asia and America. The avocado is a member of this genus, Persea americana P. Miller. References: Godfrey (1988); Clewell (1985); Rohwer in Kubitzki, Rohwer, \& Bittrich (1993).

1 Twigs glabrous or glabrate; lower surfaces of leaves with minute, silvery to shining-golden hairs (the color depending on age), appressed to the surface; peduncles \(1-3 \mathrm{~cm}\) long
P. borbonia

1 Twigs densely rusty-pubescent; lower surfaces of leaves with longer, rusty, often crooked hairs, not appressed, especially evident along the midrib and principal veins; peduncles \(4-7 \mathrm{~cm}\) long
P. palustris

Persea borbonia (Linnaeus) Sprengel, Red Bay. Cp (GA, NC, SC): dunes, maritime forests, in dry sandy soils on barrier islands, known only north to Carteret County, NC; rare. May-June; September-October. E. NC (Carteret County) south to FL and west to se. TX; reports of the species north of NC are in error. This species is rare in our area and becoming rarer with the destruction of most maritime forests for the construction of vacation homes and tourist accomodations. [= FNA, G, GW, K; < P. borbonia -- RAB, F, in part only (see also P. palustris); = Tamala borbonia (Linnaeus) Rafinesque -- S; = P. borbonia var. borbonia]

Persea palustris (Rafinesque) Sargent, Swamp Bay. Cp (GA, NC, SC, VA): swamps, pocosins, bay forests, maritime forests, generally in wet peaty soils, but also in fairly dry, sandy soils in maritime forests; common. May-June; September-October. A Southeastern Coastal Plain endemic: DE, e. MD, and se. VA south to FL and west to se. TX. Though variable in amount of hairs on the leaves, the hairs of \(P\). palustris are always of a distinctly different character than those of \(P\). borbonia. [= C, FNA, G, GW, K; \(<P\). borbonia -- RAB, F, in part; = Tamala pubescens (Pursh) Small -- S ; = P. borbonia var. pubescens (Pursh) Little]

\section*{Sassafras Presl 1825 (Sassafras)}

A genus of 3 species, trees, of temperate e. Asia (2 species) and e. North America (1 species). References: Rohwer in Kubitzki, Rohwer, \& Bittrich (1993).

Sassafras albidum (Nuttall) Nees, Sassafras. Pd, Mt, Cp (GA, NC, SC, VA): a wide variety of forests, old fields, disturbed areas, fencerows; common. March-April; June-July. Widespread in e. United States. The original source of "root beer." [= RAB, C, F, FNA, G, K, W; >S. albidum var. molle (Rafinesque) Fernald -- F; > S. albidum var. albidum - F]

LEITNERIACEAE (Corkwood Family) (see SIMAROUBACEAE)

\section*{LENTIBULARIACEAE (Bladderwort Family)}

A family of 3 genera and about 270-320 species, insectivorous herbs, cosmopolitan. References: Fischer et al. in Kadereit (2004).
1 Leaves ovate or elliptic, in a basal rosette; carnivory via the viscid-slimy upper leave surfaces; flowers solitary on bractless peduncles . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Pinguicula
1 Leaves or leaf segments linear, borne along a subterranean or submersed stem; carnivory via specialized bladder-like traps; flowers in (1-) many-flowered racemes, each flower pedicel subtended by a bract . . . . . . . . . . . . . . . . . . . . . . . . . Utricularia

\section*{Pinguicula Linnaeus 1753 (Butterwort)}

A genus of about 46-80 species, herbs, of America, Mediterranean Europe, and circumboreal America and Eurasia. References: Schnell (2002b)=Z; Godfrey \& Stripling (1961); Wood \& Godfrey (1957); Schnell (1980a); Fischer et al. in Kadereit (2004). Key based in part on GW.

1 Expanded corolla less than 1.5 cm across; palate not exserted from the throat of the corolla; rosettes usually \(2-4 \mathrm{~cm}\) in diameter; flowers usually white to pale violet (rarely medium violet); seeds 0.4 mm long \(\qquad\)
1 Expanded corolla more than 1.8 cm across; palate markedly exserted from the throat of the corolla; rosettes usually 5-10 ( -15 ) cm across; corolla yellow, violet, or white; seeds (0.4-) 0.5-0.8 mm long.
2 Corolla yellow . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. Iutea

\section*{2 Corolla lavender-blue or white.}

3 Hairs on the lower portion of the scape elongated, pointed, multicellular, nonglandular, transitioning upwards to 1celled glandular hairs; expanded portion of corolla markedly "veiny" (darker along the veins); [of se. NC southwards]

3 Hairs throughout scape glandular; expanded portion of corolla not "veiny;" [collectively of sw. GA southwards].
4 Fresh leaves dull red or reddish green; corolla lobes ca. \(2 \times\) as long than broad, the lobes notched almost \(1 / 2\) their length . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [P. planifolia]
4 Fresh leaves bright yellow-green; corolla lobes ca. \(1 \times\) as long than broad, the lobes notched about \(1 / 4\) their length
P. primuliflora

Pinguicula caerulea Walter, Blue Butterwort. Cp (GA, NC, SC): pine savannas and wet pine flatwoods, mostly in the outer Coastal Plain, rarely extending inland to seepages and sandhill-pocosin ecotones in the fall-line Sandhills of NC and SC; uncommon. April-May. Se. NC (Carteret and Johnston counties) south to s. FL, west to e. panhandle FL. Schnell (1980a) discusses populations with white corollas. [= RAB, GW, K, S, Z; Pinguicula elatior Michaux]

Pinguicula lutea Walter, Yellow Butterwort. Cp (GA, NC, SC): pine savannas and wet pine flatwoods, mostly in the outer Coastal Plain, rarely extending inland to seepages and sandhill-pociosin ecotones in the fall-line Sandhills of SC; uncommon (NC Watch List). Late March-May. Se. NC (Pender and New Hanover counties) south to s. FL, west to e. LA. [= RAB, GW, K, S, Z]

Pinguicula primuliflora Wood \& Godfrey, Clearwater Butterwort. Cp (GA): clearwater streams and seeps; rare (GA Threatened). Sw. GA, s. AL, Panhandle FL, and s. MS. [= GW, K, Z]

Pinguicula pumila Michaux, Small Butterwort. Cp (GA, NC, SC): pine savannas and wet pine flatwoods; uncommon (rare in NC) (NC Rare). April-May. Se. NC (Carteret and Pender counties) south to s. FL, west to se. TX; and in the Bahamas. [= RAB GW, K, S, Z]

Pinguicula planifolia Chapman, Chapman's Butterwort. S. AL, nw. FL, and s. MS. [= GW, K, S, Z]

\section*{Utricularia Linnaeus 1753 (Bladderwort)}

Utricularia, as monographed by Taylor (1989), consists of 214 species in 35 sections, with a nearly cosmopolitan distribution. In our area, 14 or 15 species in 5 sections are known to occur. References: Taylor (1989)=Z; Schnell (2002b)=Y; Müller \& Borsch (2005); Fischer et al. in Kadereit (2004). Key based in part on Z and GW.

1 Flowers white or cream-white, 1-3 mm long; inflorescence peduncles very reduced, the pedicels appearing to arise direstly from the stolons; traps \(0.3-0.8 \mathrm{~mm}\) long; plants floating unattached in water (sometimes deposited land by dropping water, but then the principal branch systems stranded on the soil surface); capsules ca. 1 mm long, fusiform, indehiscent, with 1 seed; seeds essentially smooth, unornamented; leaves absent; [section Utricularia] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . U. olivace
1 Flowers yellow, pink, or purple (sometimes fading whitish), (2-) \(5-20 \mathrm{~mm}\) long; inflorescence peduncles well-developed, the inflorescence clearly a raceme; traps \(0.2-5.0 \mathrm{~mm}\) long (less than 0.7 mm long only in the terrestrial species (see key lead 2); plants attached (with principal branch systems within the soil), or floating unattached in water (sometimes deposited on land by dropping water, but then the principal branch systems stranded on the soil surface); capsules 1-8 mm long, globose, subglobose, or ovoid, with many seeds; seeds reticulate, papillose, echinate, multi-angled, or winged (rarely more-or-less smooth); leaves present (sometimes absent in the terrestrial species).
2 Plants attached (with principal branch systems within the soil); leaves absent or simple, linear, grass-like aerial leaves; bladders \(0.2-1.1 \mathrm{~mm}\) long, most or all on a plant usually less than 1.0 mm long; seeds reticulate-alveolate (also angled in U. resupinata), 0.20-0.25 mm long.

3 Flowers pink; inflorescence 1 (-2)-flowered; bract at base of the pedicel tubular, attached circumferentially around the stem; aerial leaves (when present) terete, septate; [very rare in our area]; [section Lecticula] . . . . . . . U. resupinata 3 Flowers yellow (sometimes fading whitish); inflorescence (1-) 2-15-flowered; bract at base of the pedicel peltate or ovate, attached on one side of the stem; aerial leaves (when present) flattened, not septate; [collectively common in our area].
4 Bracts subtending the pedicels peltate (attached near their middles), unattached at either end; pair of bracteoles absent; spur of the corolla oriented forwards, more-or-less appressed to the lower lip; aerial leaves (when present) with subacute to obtuse apex; [section Setiscapella] . . . . . . . . . . . . . . . . . . . . . . . . . . . . U. subulata
4 Bracts subtending the pedicels ovate (attached at their bases), free only at their upper end; pair of bracteoles associated with each bract present, linear to lanceolate; spur of the corolla oriented downwards or backwards, at approximately a right angle to the lower lip; aerial leaves (when present) with acute apex; [section Stomoisia].
5 Corolla 1.5-2.0 cm long; spur 8-12 mm long; raceme usually short, the (1-) 2-6 flowers crowded together,
all of them chasmogamous . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . U. cornuta
5 Corolla 0.25-1.5 cm long; spur 5-7 (-9) mm long; raceme usually elongate, the (1-) 2-15 flowers wellspaced, often the lower (sometimes all) cleistogamous and much smaller than the chasmogamous flowers
. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . U. juncea
2 Plants floating unattached in water (sometimes deposited on land by dropping water, but then the principal branch systems stranded on the soil surface); leaves present and dissected into linear segments; bladders 0.7-5.0 mm long, most or all on a plant more than 1.0 mm long; seeds papillose, reticulate, ridged, angled, or winged, 0.5-2.0 mm long.
6 Flowers purple; leaves divided into verticillate segments with terminal traps; [section Vesiculina] . . . . . U. purpurea
6 Flowers yellow; leaves divided into alternate segments with lateral traps; [section Utricularia].
\(7 \quad\) Peduncle with whorl of inflated leaf-like organs (floats).
8 Floats 4-7, not fused basally to one another, fusiform, tapering gradually to base and apex from a widest point near the middle; leaves with the 2 primary divisions unequal; bracts of the scape longer than broad, entire; flowers (6-) 9-14 (-17) per scape; apex of corolla spur bifid . . . . . . . . . . . . . . . . . . . . . . . U. inflata
8 Floats (5-) 6-8 (-10), fused basally to one another, cylindrical, more-or-less parallel-sided through most of their length, tapering abruptly to base and apex; leaves with the 2 primary divisions equal; bracts of the scape broader than long, the apex slightly to strongly 3-lobed; flowers (1-) 3-4 (-7) per scape; apex of corolla spur usually entire (rarely bifid).
U. radiata

7 Peduncle without whorl of inflated leaf-like organs (floats).
9 Main axes distinctly flattened in cross-section, up to 10 mm wide . . . . . . . . . . . . . . . . . . . . . . . U. foliosa
9 Main axes round in cross-section.
10 Lower lip of corolla 3-lobed; seeds disk-shaped, not angular or winged; inflorescences of 2 types, the chasmogamous on erect peduncles \(5-25 \mathrm{~cm}\) long bearing 2-8 flowers, the cleistogamous without a peduncle, the solitary pedicels borne directly on the stolons, \(0.5-2 \mathrm{~cm}\) long, deflexed U. geminiscapa
10 Lower lip of corolla entire or slightly irregular, not 3-lobed; seeds angular or winged; inflorescences of 1 type (erect, chasmogamous).

11 Upper corolla lip smaller than the lower, entire; capsule circumscissilely dehiscent; seeds 0.7-1.0 mm long, 4-6-angled; corolla without stipitate glands on its external surface.
12 Leaves of one kind only, divided into numerous capillary segments bearing lateral traps; bracts scarcely auriculate; plant distinctly aquatic, floating in water and only rarely stranded; [of the Coastal Plain] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . U. macrorhiza
12 Leaves of 2 or 3 kinds, some divided into capillary or narrowly linear segments and bearing few or no traps, others divided into fewer capillary segments and bearing more-or-less numerous traps; bracts distinctly auriculate; plants typically in boggy situations, in shallow water or frequently stranded; [either of the Mountains at high elevations or of various physiographic provinces northwards].
13 Broadest leaf segments with 9-20 lateral setae (use \(10 \times\) magnification); spur of corolla cylindrical, distinctly longer than wide, the apex distinctly curved forwards [U. intermedia] 13 Broadest leaf segments lacking lateral setae; spur of corolla shortly saccate to broadly conical, wider than long, the apex not curved forwards
Upper corolla lip larger than the lower, obscurely 3-lobed; capsule laterally 2 -valved or indehiscent; seeds \(0.8-2.5 \mathrm{~mm}\) long, lenticular, with an irregular, lobed, or continuous wing; corolla (or at least the spur) with a few to many short stipitate glands (sometimes patchily distributed).
13 Vegetative shoots of 2 kinds, some bearing leafy segments and few or no traps, others bearing reduced segments and more-or-less numerous traps; seeds \(1.0-2.5 \mathrm{~mm}\) long, with an irregularly deeply lobed or partial wing.
14 Plant anchored in mud up to 100 cm below water surface; green leafy shoots up to 40 cm long and 5 cm wide; peduncle flexuous, to 100 cm long, only the uppermost ca. 10 cm emergent
U. floridana

14 Plant in shallow water or stranded; green leafy shoots usually not more than 10 cm long and 2 cm wide; peduncle erect, straight, to 30 cm long, the uppermost \(10-25 \mathrm{~cm}\) emergent
U. striata

13 Vegetative shoots uniform, all bearing rather sparsely divided leaf segments bearing traps, seeds \(0.8-1.1 \mathrm{~mm}\) long, with a continuous, circumferential wing, slightly to irregularly lobed.
14 Lower corolla lip 8-10 mm long, about equalling or slightly shorter than the conical 5-9 mm long spur; leaves usually forked twice
U. biflora

14 Lower corolla lip 5-6 mm long, exceeding the blunt 3.5-4.5 mm long spur; leaves usually forked once
U. gibba

Utricularia biflora Lamarck, Longspur Creeping Bladderwort. Cp (GA, NC, SC, VA), Pd, Mt (GA): ponds, lakes, and diches; common. June-October. This species may not be distinct from U. gibba (which see for discussion). E. MA south FL, west to TX and OK. [= RAB, C, F, G, GW, W; = U. pumila Walter -- S, apparently misapplied; <U. gibba -- K, Y, Z, in part]

Utricularia cornuta Michaux, Horned Bladderwort. Cp (GA, NC, SC), Mt (GA, NC), Pd (GA): shores of limesink ponds (dolines), mountain bogs; rare (NC Watch List). (May-September. Newfoundland and Québec west to n. Ontario, Alberta, and MN, south to s. FL and e. TX; also in the Bahamas and Cuba. Taylor (1989) states that where sympatric with U. juncea, U. cornuta flowers much earlier. [= RAB, C, F, G, GW, K, W, Y, Z; Stomoisia cornuta (Michaux) Rafinesque -- S]

Utricularia floridana Nash, Florida Bladderwort. Cp (GA, NC, SC): in deep water of natural Carolina bay lakes, other natural lakes, and limesink ponds (dolines); rare (NC Rare, SC Rare). July-August. Se. NC south to c. peninsular FL, west to panhandle FL and sw. GA. [= GW, K, S, Y, Z]

Utricularia foliosa Linnaeus, Flatstem Bladderwort. Cp (GA, NC): in deep water of natural lakes and ponds; rare. Se. NC south to s. FL, west to TX (Brown \& Marcus 1998); West Indies, South America, Africa. This species is reported for NC by Taylor (1989). See GW for a detailed description of this species. [= GW, K, S, Y, Z]

Utricularia geminiscapa Benjamin, Two-flowered Bladderwort, Hidden-fruited Bladderwort. Cp (NC, VA), Mt (VA): beaver ponds, mucky seepages; rare (NC Rare, VA Watch List). Newfoundland and Québec west to n. MI and n. WI, south to PA and sc. NC. [= C, F, G, K, W, Y, Z]

Utricularia gibba Linnaeus, Shortspur Creeping Bladderwort. Cp (GA, NC, SC, VA), Mt (GA, NC, VA), Pd (SC, VA): ponds, lakes, and diches; uncommon. May-September. Québec west to WI, south to FL and LA; also in the West Indies and Central America and apparently in the Old World. Taylor (1989) includes U. biflora in U. gibba. Other authors have expressed doubts about the distinction, including RAB ("doubtfully distinct"). Taylor suggests that "further research is clearly indicated, but to be at all meaningful, it must be conducted on a worldwide basis." I have here, for the moment, retained the 2 traditionally recognized species, though intermediates will be encountered. [= RAB, C, F, G, S, W; <U. gibba -- K, Y, Z, in part only (also see U. biflora)]

Utricularia inflata Walter, Swollen Bladderwort, Inflated Bladderwort. Cp (GA, NC, SC, VA), Mt (NC): ponds, lakes, ditches; common. May-November. NJ south to s. FL, west to e. TX; disjunct in WA (probably introduced). Also disjunct in an artificial pond in Henderson County, NC (Carl Sandburg Home National Historic Site). [= C, G, GW, K, S, Y, Z; = U. inflata var. inflata -- RAB, F]

Utricularia juncea M. Vahl, Southern Bladderwort. Cp (GA, NC, SC, VA), Pd (NC): shores of limesink ponds (dolines), borrow pits, wet sands; uncommon (VA Rare). July-September. NY (Long Island) and NJ south to FL, west to e. TX and se. AR; also in the West Indies, Central America and South America. [= RAB, C, F, G, GW, K, Y, Z; > Stomoisia juncea (M. Vahl) Barnhart -- S; > Stomoisia virgatula Barnhart -- S]

Utricularia macrorhiza Le Conte, Greater Bladderwort. Cp (NC, SC, VA): pools and ponds; rare (NC Watch List, VA Watch List). May-September. Newfoundland west to AK, south to NC, SC, FL, TX, CA, and Mexico; also in e. Asia. See Taylor (1989) for a discussion of the differences between this species and U. vulgaris of Europe and w. Asia, with which it has often been combined or associated as a variety. [=K, S, Y, Z; U. vulgaris Linnaeus -- RAB, C, F, G, misapplied to American plants]

Utricularia minor Linnaeus, Lesser Bladderwort, Small Bladderwort. Mt (NC): mountain bog at about 1400 meters elevation; rare (NC Rare). Circumboreal, south in North America to NJ, PA, IN, IL, IA, NE, CO, UT, NV, and CA; disjunct in w. NC. [=C, F, G, K, W, Y, Z]

Utricularia olivacea Wright ex Grisebach, Dwarf Bladderwort, Minute Bladderwort. Cp (GA, NC, SC, VA): in floating mats (often algal) in water of limesink ponds (dolines), artificial lakes or beaver ponds; rare (NC Threatened, SC Rare, VA Rare). September-October. NJ south to FL, west to s. AL and s. MS (Sorrie \& Leonard 1999), in the Coastal Plain; also in the West Indies (Cuba), Central America, and South America. [= RAB, GW, K, Y, Z; Biovularia olivacea (Wright ex Grisebach) Kam. -- S]

Utricularia purpurea Walter, Purple Bladderwort. Cp (GA, NC, SC, VA): in water of ponds, ditches, other slow-moving water; uncommon (VA Rare). May-September. Nova Scotia and Québec west to MN, south to NY, n. IN, s. MI, and WI, and on the Coastal Plain south to s. FL, west to se. TX; also in Mexico, the West Indies, and Central America. [= RAB, C, F, G, GW, K, Y, Z; Vesiculina purpurea (Walter) Rafinesque -- S]

Utricularia radiata Small, Floating Bladderwort, Small Swollen Bladderwort. Cp (GA, NC, SC, VA), Mt (VA): ponds, depression ponds, lakes, and ditches; uncommon (VA Watch List). May-November. Nova Scotia south to s. FL, west to TX; disjunct in w. VA, w. TN, nw. IN; reports of this species in Cuba and South America are apparently in error. [= C, G, GW, K, S, W, Y, Z; U. inflata var. minor Chapman -- RAB, F]

Utricularia resupinata B.D. Greene ex Bigelow, Northeastern Bladderwort, Resupinate Bladderwort. Cp (GA, NC): shores of natural lakes; rare (NC Rare). Nova Scotia west to nw. WI, south (irregular and scattered in part) to FL and sw. GA; also in the Bahamas (Sorrie \& LeBlond 1997). Although "the curious gap in the North American range" [NC, SC, and VA] (Taylor 1989) is no longer strictly a gap, \(U\). resupinata does appear to have a strangely bimodal range, with a center of distribution in ne. United States and se. Canada and a second extending from se. United States south into the West Indies and Central America. [= C, F, G, GW, K, Y, Z; Lecticula resupinata (B.D. Greene) Barnhart -- S]

Utricularia striata Le Conte ex Torrey, Fibrous Bladderwort. Cp (GA, NC, SC, VA), Mt (VA): ponds, lakes, and ditches; uncommon (VA Rare). May-November. Se. MA south to FL, west to e. TX and e. OK. [=K, Y, Z; U. fibrosa Walter -- RAB, C, F, G, GW, S, of uncertain application and likely misapplied]

Utricularia subulata Linnaeus, Slender Bladderwort, Zigzag Bladderwort. Cp (GA, NC, SC, VA), Mt (GA, NC, VA), Pd (GA, NC): moist sands or peats of various kinds of acidic wetlands, including wet pine savannas and flatwoods, shores of limesink ponds (dolines), borrow pits, ditches; common (VA Watch List). March-July (-later). In North America primarily in the Coastal Plain, from Nova Scotia and e. MA south to s. FL, west to TX, north in the interior to TN and AR; also in the West Indies, Central America, South America, Africa, and Asia. Taylor (1989) terms this "the most widespread of Utricularia species." [= RAB, C, F, G, GW, K, W, Y, Z; > Setiscapella subulata (Linnaeus) Barnhart -- S; > Setiscapella cleistogama (A. Gray) Barnhart -- S]

Utricularia intermedia Hayne, Northern Bladderwort. South to se. PA (Rhoads \& Klein 1993), DE, and MD (Kartesz 1999). The report from sc. GA (Jones \& Coile 1988) is in error. [= C, F, G, K, Y, Z]

\section*{LEPUROPETALACEAE (Lepuropetalon Family) (see PARNASSIACEAE)}

\section*{LIMNANTHACEAE (False-mermaid Family, Meadow-foam Family)}

A family of 2 genera and 8 species, herbs, of temperate North America. References: Bayer \& Appel in Kubitzki \& Bayer (2003).

Floerkea Willdenow 1801 (False-mermaid)

A peculiar and monotypic genus, an annual herb, endemic to North America.

Floerkea proserpinacoides Willdenow, False-mermaid. Pd, Mt (VA): moist, rich floodplain forests; rare (VA Watch List). April-May. Nova Scotia and Québec west to British Columbia, south to n. VA, TN, and CA. [= C, F, G, K, S, W]

\section*{LINACEAE (Flax Family)}

A family of about 14 genera and 250-350 species, trees, vines, shrubs, and herbs, cosmopolitan. References: Robertson (1971)=Y.

\section*{Linum Linnaeus (Flax)}

A genus of about 180 species, herbs, of temperate and subtropical areas. References: Rogers (1984)=Z; Rogers (1963) \(=\mathrm{Y}\).

1 Petals blue; capsule 6-10 mm long; [section Linum].
2 Inner sepals with minutely ciliate margins; stigmas slender, elongate; capsule 6-10 mm long .......... L. usitatissimum
2 Inner sepals entire; stigmas capitate; capsule 5-7 mm long.
3 Flowers homostylous (flowers with stigmas at about the level to slightly above the anthers) . . [L. lewisii var. Iewisii]
3 Flowers heterostylous (some flowers with stigmas below the anthers, others with stigmas well above the anthers) ..
1 Petals yellow; capsules 1-4 mm long; [section Linopsis].

4 Inner and outer sepals all very conspicuously glandular-toothed; annual; leaves with 2 brownish glands flanking the attachment to the stem; styles united basally for (0.2-) 0.5-1.2 (-1.8) mm ; [section Linopsis, subsection Rigida].
5 Sepals 2.3-3.5 mm long, acute; inflorescence consisting of 1 or more elongate and racemiform branches; dried plants dark, purple-dotted L. harperi

5 Sepals (3.1-) 3.6-5 (-7.3) mm long, acuminate; inflorescence an open panicle; dried plants pale green . L. sulcatum 4 Outer sepals entire (very rarely sparsely glandular-toothed), inner sepals entire or sparsely to conspicuously glandular-toothed; perennial; leaves without brownish glands flanking the attachment to the stem; styles free; [section Linopsis, subsection Linopsis].

6 Fruit as long as broad or longer, its apex acute, apiculate, or obtuse, (2-) 2.2-3.2 (-3.3) mm long; leaves mostly 1.34.3 mm wide.

7 Leaves (1.2-) 2.3-4.3 (-5.6) mm wide, mostly \(25-50\) below the inflorescence; septa of the fruit sparsely but conspicuously ciliate; false septa incomplete; fruit apex acute, the exposed portions purple ... L. intercursum
7 Leaves (1.0-) 1.3-2.0 (-3.2) mm wide, mostly 50-120 below the inflorescence; septa of the fruit glabrous; false septa virtually complete; fruit apex rounded to apiculate, the exposed portions purple or yellow.
8 Fruit pyriform, (2.0-) 2.3-2.8 (-3.0) mm long, 1.7-2.6 mm in diameter, the apex rounded, the exposed portions purple; seeds (1.6-) 1.7-2.0 (2.1) mm long; anthers averaging 0.8 mm long
L. floridanum var. floridanum

8 Fruit ovate, (2.8-) 3.0-3.2 (-3.3) mm long, 2.5-3.1 mm in diameter, the apex minutely apiculate, the exposed portions yellow; seeds 2.1-2.4 mm long; anthers averaging 1.2 mm long

\section*{L. floridanum var. chrysocarpum}

6 Fruit broader than long, its apex depressed, flattened, or broadly rounded, (1.3-) 1.5-2.1 (-2.3) mm long; leaves mostly 1.9-9.3 mm wide.
9 Margins of the inner sepals with conspicuous stalked glands; mature fruits of dried specimens usually adhering to the plant L. medium var. texanum

9 Margins of the inner sepals glandless, or with a few inconspicuous, sessile glands; mature fruits of dried specimens usually shattering and falling freely.
10 Inflorescence paniculate, the lower inflorescence branches not elongate, their tips not nearly reaching the tips of the upper inflorescence branches; branchlets striate-ridged; leaves mostly opposite (usually to beyond the midpoint from the base of the plant to the first inflorescence branch) \(\qquad\) L. striatum

10 Inflorescence corymbose, some (at least) of the lower branches of the inflorescence elongate, their tips nearly equalling the tips of the upper inflorescence branches; branchlets terete or nearly so; leaves mostly alternate (usually the opposite leaves of the lower stem not extending beyond the midpoint from the base of the plant to the first inflorescence branch)
L. virginianum

Linum floridanum (Planchon) Trelease var. chrysocarpum Rogers, Yellow-fruited Yellow Flax. Cp (GA, NC, SC): wet savannas; rare (NC Watch List). June-October. Se. NC south to s. FL and west to s. MS. [=K, Y, Z; < L. virginianum var. floridanum Planchon -- RAB, in part; < L. floridanum -- GW, infraspecific taxa not distinguished; < Cathartolinum floridanum (Planchon) Small -- S, infraspecific taxa not distinguished]

Linum floridanum (Planchon) Trelease var. floridanum, Florida Yellow Flax. Cp (GA, NC, SC): savannas, sandhill seeps; common. June-October. E. NC south to s. FL and west to LA, also in the West Indies, essentially limited to the Coastal Plain. [= K, Y, Z; < L. virginianum var. floridanum Planchon -- RAB, in part only (also see L. floridanum var. chrysocarpum and L. intercursum); < L. floridanum -- C, F, G, GW, infraspecific taxa not distinguished; < Cathartolinum floridanum (Planchon) Small -- S, infraspecific taxa not distinguished]

Linum harperi Small, Harper's Grooved Flax. Cp (GA): dry pinelands; rare (GA Special Concern). This is a rare taxon of longleaf pine woodlands or savannas in w. FL, sw. GA, and c. AL. It is probably distinct from L. sulcatum at the species level, needing additional study. [= L. sulcatum Riddell var. harperi (Small) Rogers -- K, Y, Z; = Cathartolinum harperi (Small) Small - S]

Linum intercursum Bicknell, Bicknell's Yellow Flax. Pd, Mt (GA, NC, SC, VA), Cp (NC, VA): dry to moist places; common. June-October. MA south to c. TN, nw. GA, and c. AL; from MA to MD, nearly restricted to the Coastal Plain, in VA, NC, SC, GA, AL, and se. TN, however it is primarily on the Piedmont and Mountains. It also occurs disjunctively in \(n\). IN near the Great Lakes. [= C, F, G, K, W, Y, Z; < L. virginianum var. floridanum (Planchon) -- RAB, in part only; = Cathartolinum intercursum (Bicknell) Small -- S]

Linum medium (Planchon) Britton var. texanum (Planchon) Fernald, Texas Yellow Flax. Cp, Pd, Mt (GA, NC, SC, VA): dry to moist places; common (rare in Mountains). Var. texanum ranges from s. ME MI, and n. IL south to c. FL and TX, and in the West Indies. Var. medium is limited to area around the Great Lakes. [= C, F, GW, K, W, Y, Z; < L. virginianum var. medium Planchon -RAB; < L. medium -- G, infraspecific taxa not distinguished; < Cathartolinum medium (Planchon) Small -- S]

Linum striatum Walter, Ridgestem Yellow Flax. Mt, Cp, Pd (GA, NC, SC, VA): bogs, seepages, other wet places, often growing in Sphagnum; common. June-October. MA, PA, MI, and IL south to w. FL, LA, and e. TX. [= RAB, C, G, GW, K, W, Y, Z; L. striatum var. striatum -- F; = Cathartolinum striatum (Walter) Small -- S]

Linum sulcatum Riddell, Grooved Yellow Flax. Mt (GA, VA), Pd (NC): dry calcareous places in the mountains of VA (where also somewhat weedy in adjacent disturbed areas), diabase barrens in the Piedmont of NC; rare (NC Rare, VA Watch List). MayAugust. Primarily a species of the Great Plains of s. Manitoba, ND, and MN south through SD, IA, WI, NE, MO, IL, KS, and MO to OK, L. sulcatum occurs farther east as a rare disjunct on glades or barrens over rocks such as limestone or diabase. [=RAB, C, F, G, W; = Linum sulcatum Riddell var. sulcatum -- K, Y, Z; = Cathartolinum sulcatum (Riddell) Small -- S; = Mesynium sulcatum (Riddell) A. \& D. Löve]
* Linum usitatissimum Linnaeus, Common Flax. Pd, Cp (NC, SC, VA): disturbed places; rare, native of Europe. This is the flax of commerce, used both for its fiber, the source of flax, and the oil expressed from its seeds (linseed oil). [= RAB, C, F, G, K, S, Z]

Linum virginianum Linnaeus, Virginia Yellow Flax. Mt, Pd (GA, NC, SC, VA), Cp (VA): dry or moist places; uncommon. June-October. MA, NY, Ontario, MI, and IL south to SC, GA, AL, and MO. [=C, F, G, GW, K, W; = L. virginianum var. virginianum -- RAB; = Cathartolinum virginianum (Linnaeus) Reichenbach -- S]

Linum lewisii Pursh var. lewisii, Prairie Flax, a western blue-flowered species, occurs as a disjunct at Smoke Hole Caverns, WV, and several adjacent counties. [= K; < L. perenne -- C, apparently misapplied to WV material; < L. lewisii -- F, infraspecific taxa not distinguished; <L. perenne Linnaeus var. lewisii (Pursh) Eaton \& J. Wright -- G; < Adenolinum lewisii (Pursh) A. \& D. Löve] * Linum perenne Linnaeus, Perennial Flax, is cultivated and "rarely naturalized along roadsides" in scattered locations in PA (Rhoads \& Klein 1993) and reported tentatively for VA (Kartesz 1999). [= K; < L. perenne -- C (but also see L. lewisii)]

\section*{LINNAEACEAE (Twinflower Family)}

Various segregate families (or reassignments) of taxa traditionally placed in the Caprifoliaceae have been proposed, including the transfer of Sambucus and Viburnum to the Adoxaceae, placement of Diervilla and Weigela in the Diervillaceae (Backlund \& Pyck 1998), placement of Abelia, Linnaea, and Kolkwitzia in the Linnaeaceae (Backlund \& Pyck 1998), and retention of Lonicera, Symphoricarpos, and Triosteum in a much more narrowly circumscribed Caprifoliaceae. Alternatively, all these taxa could be included in the Caprifoliaceae, along with Dipsacaceae and Valerianaceae, as a very broadly circumscribed Caprifoliaceae. References: Backlund \& Pyck (1998).

1 Trailing shrubby herb; [native]
[Linnaea]
1 Upright shrub; [planted and persistent or weakly naturalizing].
2 Sepals oblanceolate, the larger > 1 mm wide; fruit and ovaries free, not hirsute . . . . . . . . . . . . . . . . . . . . . . . . . . Abelia
2 Sepals lanceolate to linear, \(<1 \mathrm{~mm}\) wide; fruit and ovaries fused in pairs, densely hirsute ............... Kolkwitzia

\section*{Abelia R. Brown}

A genus of about 30 species, shrubs, primarily of s. and e. Asia.
* Abelia ×grandiflora (André) Rehder [chinensis x uniflora]. Cp (NC): suburban thickets; commonly planted in our area; sometimes persistent or rarely weakly naturalizing, parent species natives of China. [=K]

\section*{Kolkwitzia Graebner (Beautybush)}

A monotypic shrub, of c. China.
* Kolkwitzia amabilis, Beautybush. Mt (NC): disturbed areas; planted as an ornamental shrub, rarely naturalized from plantings, native of china. [= K]

\section*{Linnaea Linnaeus (Twinflower)}

A monotypic genus, a trailing weak shrub, circumboreal

Linnaea borealis Linnaeus ssp. americana (Forbes) Hultén ex Clausen, American Twinflower, is documented by an early specimen (1892) from Sevier County, TN, presumably from the Great Smoky Mountains. This population (not recently seen) is disjunct from more northern areas. L. borealis ssp. americana also occurs in several counties in WV along or near the VA border, and the species might be expected in high elevation or cold sites in nw. VA. [=K; L. borealis var. longiflora Torrey \(-\mathrm{C}, \mathrm{G}\); \(=\) L. borealis var. americana (Forbes) Rehder -- F; < L. borealis - W, infraspecific taxa not distinguished; = L. americana Forbes; L. borealis ssp. longiflora (Torrey) Hultén]

LOGANIACEAE (Logania Family)
(also see GELSEMIACEAE, TETRACHONDRACEAE, and SCROPHULARIACEAE)
As here rather narrowly interpreted, Loganiaceae consists of 12 genera (Mitreola, Logania, and Mitrasacme) and about 300 species, herbs and subshrubs, of tropical, subtropical, and warm temperate areas of the Old and New Worlds. Genera in our area other than Mitreola which have traditionally been considered components of the Loganiaceae now are clearly better placed in the small families Tetrachondraceae (Polypremum), Gelsemiaceae (Gelsemium), and Scrophulariaceae (Buddleja), more closely related to other families (such as Rubiaceae) than to Loganiaceae sensu stricto (Struwe, Albert, \& Bremer 1994). The affinities of Spigelia appear to be with a small group of tropical and subtropical genera, the largest of which is Strychnos. Struwe, Albert, \& Bremer (1994) treated this group as the family Strychnaceae, based on a cladistic analysis of data. A later, more thorough analysis suggested that Strychnaceae is best recombined with Loganiaceae (Backlund, Oxelman, \& Bremer 2000). References: Rogers (1986).

\section*{Mitreola Linnaeus (Miterwort)}

A genus of about 6 species, herbs, tropical, subtropical, and warm temperate. References: Nelson (1980); Rogers (1986)=Z.
1 Leaves \(2-8 \mathrm{~cm}\) long petiolate or sessile and tapering to a cuneate base . . . . . . . . . . . . . . . . . . .............. M. petiolata
1 Leaves \(1-4 \mathrm{~cm}\) long, sessile, the base rounded.

Mitreola angustifolia (Torrey \& A. Gray) J.B. Nelson, Narrow-leaved Miterwort. Cp (GA, SC): clay-based Carolina bays, other Coastal Plain depressional wetlands; rare (GA Special Concern). June-August. Se. SC south to n. FL, and west to s. AL and se. MS (Sorrie \& Leonard 1999). [= GW; < M. sessilifolia -- K, Z, in part; = Cynoctonum angustifolium (Torrey \& A. Gray) Small -- S]

Mitreola petiolata (J.F. Gmelin) Torrey \& A. Gray, Caribbean Miterwort. Cp, Pd (GA, NC, SC, VA), Mt (GA): swamps, marshes, ditches, other wet habitats; uncommon (rare in the Piedmont) (VA Rare). July-September; September-November. Se. VA south to FL and west to AR and c. TX, north in the interior to nw. GA and c. and se. TN; Mexico, the West Indies, and n. South America. [= GW, K; = Cynoctonum mitreola (Linnaeus) Britton -- RAB, C, F, G, S]

Mitreola sessilifolia (J.F. Gmelin) G. Don, Small-leaved Miterwort. Cp (GA, NC, SC), Pd (GA, VA): wet savannas, pocosins, ditches, margins of limesink depressions (dolines); common (VA Rare). Late June-August; September-October. Se. VA south to FL, west to e. TX, and in the Bahama Islands. [= GW; = Cynoctonum sessilifolium J.F. Gmelin -- RAB, C, F, G, S; < M. sessilifolia -\(\mathrm{K}, \mathrm{Z}\), in part only (also see M. angustifolia)]

\section*{Spigelia Linnaeus (Pinkroot)}

A genus of about 50 species, herbs, of tropical and warm temperate America. References: Gould (1996)=Z; Rogers (1986)=Y.
1 Corolla scarlet on the outer surface, yellow on the inner surface . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. marilandica
1 Corolla light pink to white on the outer and inner surfaces.
2 Corolla 36-50 mm long; pistil 24-27 mm long; sepals 8-11 mm long; inflorescence with 2-4 flowers; [of dolomitic glades in Bibb Co. AL]
[S. gentianoides var. alabamensis]
2 Corolla 25-30 mm long; pistil 17-19 mm long; sepals 4-6 mm long; inflorescence with 3-8 flowers; [of pine savannas of Panhandle FL]
[S. gentianoides var. gentianoides]
Spigelia marilandica (Linnaeus) Linnaeus, Pinkroot, Wormgrass. Mt (GA, NC, SC), Pd, Cp (GA, SC): woodlands and forests, usually on circumneutral soils; common. May-June; late June-July. SC, sw. NC (Cherokee Co. and Macon Co.), and TN west to s. IN and OK, south to FL and TX; some floras allege its occurrence north to MD, NJ, and PA. S. marilandica likely occurs in sw. VA. [= RAB, C, F, G, K, S, W]

Spigelia gentianoides Chapman ex Alphonse de Candolle var. alabamensis K. Gould. Dolostone glades of Bibb County, AL (Gould 1996, Allison \& Stevens 2001). [= K, Z]

Spigelia gentianoides Chapman ex Alphonse de Candolle var. gentianoides. Pine savannas. FL Panhandle. [= K, Z; = S. gentianoides -- S, Y (var. alabamensis not discovered at the time)]

\section*{LYTHRACEAE (Loosestrife Family)}

A family of about 27 genera and 600 species, herbs, shrubs, and trees, primarily tropical (a few warm temperate). References: Graham (1975)=Z. Keys adapted, in large part, from Z.

1 Plant woody or suffrutescent, a shrub or a small tree 1-10 m tall (with peeling, cinnamon-colored bark); petals present, showy, \(8-20 \mathrm{~mm}\) long.
2 Flowers in axillary clusters; aquatic shrubs with arching suffrutescent or woody stems; leaves opposite or whorled Decodon
2 Flowers in terminal panicles; terrestrial shrubs or small trees with erect woody stems; leaves alternate to subopposite . . .
. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Lagerstroemia

1 Plant not woody, an herb 0.1-1.2 m tall; petals absent or present, inconspiscuous or showy, 1-10 mm long.
3 Stems pubescent.
4 Floral tube (hypanthium) swollen obliquely at its base; capsule dehiscing longitudinally along the upper surface ....
.................................................................................................... . Cuphea
4 Floral tube (hypanthium) symmetrical; capsule dehiscing septicidally at the apex . . . . . . . . . . . . . . . . . . . Lythrum
3 Stems glabrous.
5 Floral tube cylindric to turbinate, about \(2 \times\) as long as wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Lythrum
5 Floral tube campanulate to globose, about \(1 \times\) long as wide.

Flowers or fruits solitary in the leaf axils (never more than 1 per axil).
7 Capsule indehiscent; petals 0; sepals 4, broadly triangular, lacking intersepalary appendages; seeds spatulate or oblanceolate, about 1 mm long, minutely granular on one face and smooth on the other Didiplis
7 Capsule dehiscing septicidally; petals 4; sepals 4 ( -6 ), triangular, with intersepalary appendages of size about equal to the calyx lobes; seeds hemispheric, about 0.3 mm long, the surface very finely reticulate . .

Rotala
\{add Punica and Trapa to key\}

Ammannia Linnaeus (Toothcup)
A genus of about 25 species, herbs, cosmopolitan. References: Graham (1985)=Y; Graham (1975)=Z. Key based on \(Y\)
1 Style included in fruit, thick, \(0.5-1.0 \mathrm{~mm}\) long (much shorter than the ovary); calyx lobes obtuse, often with the apices minutely mucronate; petals 0,1 , or 4 , pale pink to white, to 1 mm long and 1 mm wide
A. Iatifolia

1 Style exserted in fruit, filiform, \(1.5-3.0 \mathrm{~mm}\) long (equal to or longer than the ovary); calyx lobes triangular, with acute apices; petals 4 (-5), deep rose-purple or pale lavender, ca. 2 mm long and 2 mm wide.
2 Inflorescence usually a short- or long-pedunculate cyme (sometimes reduced); flowers ususlly > 3 per axil; petals deep rose-purple; fruits \(3.5-5 \mathrm{~mm}\) in dimaeter A. coccinea

2 Inflorescence sessile; flowers usually 1-3 per axil; petals pale lavender; anthers yellow; fruits 4-6 mm in diameter
[A. robusta]
Ammannia coccinea Rottböll. \(\mathrm{Cp}, \mathrm{Pd}, \mathrm{Mt}\) (GA, NC, SC, VA): marshy areas, ditches, exposed muddy river shores and banks, other wet places; uncommon (VA Watch List). July-October. NJ, OH, IN, IL, IA, and SD south to FL and TX; disjunct in CA; south through Mexico and Central America to n. South America. [= RAB, C, F, GW, K, S, W, Y, Z; > A. coccinea ssp. purpurea (Lamarck) Koehne -- G; > A. coccinea - F, GW, S, Z, in part (apparently also including A. robusta)]

Ammannia latifolia Linnaeus. Cp (GA, NC, SC, VA): tidal marshes, wet places, ditches; uncommon. July-September. NJ south to s. FL and west to TX (mostly on the coastal plain), and also in the West Indies, Yucatan, Central America, and South America. All plants in North America north of Florida have flowers with petals; most plants from FL south through the West Indies into Central and South America have flowers without petals. Graham (1985) considered these forms; additional study is warranted. The name A. koehnei Britton is available for the petaliferous North American plant should its recognition prove warranted. [= C, GW, \(\mathrm{K}, \mathrm{W}, \mathrm{Y}, \mathrm{Z}\); > A. teres Rafinesque -- RAB, G; > A. teres var. teres - F; > A. teres var. exauriculata (Fernald) Fernald -- F; > A. latifolia - S; > A. koehnei Britton -- S]

Ammannia robusta Heer \& Regel. OH and British Columbia south to w. KY, w. TN, LA, TX, CA, Mexico, and Belize; West Indies; introduced in NJ and n . South America. [= C, K, Y; > A. coccinea - F, GW, S, Z, in part]

Cuphea P. Browne (Waxweed)

A genus of about 260 species, herbs, of America. References: Graham (1975)=Z
1 Floral tube green, 4.5-6 mm long, glabrous inside; stamens much shorter than the floral tube; petioles to 8 mm long, often very short
C. carthagenensis

1 Floral tube purple-green, 6-10 mm long, villous inside; stamens equal to or exceeding the the floral tube; petioles to 20 mm
long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. viscosissima
* Cuphea carthagenensis (Jacquin) J.F. Macbride. Cp (GA, NC, SC), Pd (GA): marshes, ditches, wet places; common, native of South America. June-September. [= GW, K, Z; = C. carthagensis -- RAB (a misspelling); = Parsonsia balsamona (Chamisso \& Schlechtendahl) Standley -- S]

Cuphea viscosissima Jacquin. Pd, Mt (GA, NC, SC, VA), Cp (VA): dry or wet places; uncommon. July-October. NH west to IA and KS, south to c. GA, LA, and e. OK. [= RAB, C, GW, K, W, Z; = C. petiolata (Linnaeus) Koehne -- F, G; = Parsonsia petiolata (Linnaeus) Rusby -- S]
* Cuphea procumbens Gómez Ortega is reported for NC by Small (1933). Graham (1975) considers this Mexican species to be represented in se. United States only by "garden escapes that do not persist." \{not keyed\} [= K, Z; = Parsonsia procumbens (Gómez Ortega) Heller -- S]

Decodon J.F. Gmelin (Water-oleander, Water-willow)
A monotypic genus, a weak shrub, endemic to e. North America. References: Graham (1975)=Z.

Decodon verticillatus (Linnaeus) Elliott, Water-oleander, Water-willow, Swamp Loosestrife, Peatweed. Cp (GA, NC, SC, VA), Mt (GA, VA): natural lakes, limesink ponds, peatlands, peaty swamps, not known in the Piedmont or Mountains of NC or SC, but scattered in the Ridge and Valley of VA; common. July-September. Nova Scotia, Ontario, and MN south to c. peninsular FL and e. TX. The lower stems are spongy in texture. [= RAB, GW, K, S, W, Z; > D. verticillatus var. verticillatus - C, F, G; > D. verticillatus var. laevigatus Torrey \& Gray -- C, F, G]

\section*{Didiplis Rafinesque (Water-purslane)}

A monotypic genus, an herb, endemic to e. North America. Perhaps better merged into Lythrum. References: Graham (1975)=Z.
Didiplis diandra (Nuttall ex Augustin de Candolle) Wood, Water-purslane. Cp (NC, VA), Pd (SC): stagnant water of pools, streams, and old beaverponds; rare (NC Rare, VA Rare). April-August. VA, IN, and WI south to NC, MS, and LA. [= C, G, GW, K, S, Z; = Peplis diandra Nuttall ex Augustin de Candolle -- RAB, F; Lythrum]

Lagerstroemia Linnaeus (Crape-myrtle)
A genus of about 53 species, trees, of tropical se. Asia and Australia. References: Graham (1975)=Z.
* Lagerstroemia indica Linnaeus, Crape-myrtle. Cp, Pd (GA, NC, SC): commonly cultivated, persistent around old plantings, weakly spreading; rare (in the wild), native of Asia. June-September. [= C, K, S, Z]

\section*{Lythrum Linnaeus (Loosestrife)}

A genus of about 36 species, herbs, cosmopolitan. References: Graham (1975)=Z.
1 Flowers numerous in terminal spike-like thyrses; stamens usually 12; leaves opposite or whorled ............. L. salicaria
1 Flowers solitary or paired in axils; stamens usually (4-) 6; leaves opposite or alternate.
2 Leaves opposite throughout, mostly shorter than to as long as the internodes, 1-4 mm wide .............. L. lineare
2 Leaves opposite below, alternate above, mostly longer than the internodes, 2-14 mm wide.
3 Floral tube \(3-4 \mathrm{~mm}\) long; petals \(2-3 \mathrm{~mm}\) long; calyx appendages about the same length as the calyx lobes; branch leaves abruptly and definitely reduced in size relative to the stem leaves, and widely spaced; [of sw. GA southwards] L. curtissii

3 Floral tube 5-6 mm long; petals 5-6 mm long; calyx appendages about \(2 \times\) as long as the calyx lobes; branch leaves gradually reduced relative to the stem leaves, dense and overlapping; [collectively widespread in our area].
4 Leaves ovate to lanceolate, widest at a point \(1 / 6\) to \(1 / 2\) of the way from the base to the apex, the base rounded to subcordate; stems mostly slender, to 8 dm tall; bracteoles mostly at the base of the pedicel . . . . . L. alatum
4 Leaves lanceolate to linear-lanceolate, widest at a point \(1 / 3\) to \(2 / 3\) of the way from the base to the apex, the base cuneate, often narrowly so; stems stout, to 13 dm tall; bracteoles mostly on the upper pedicel, immediately below the floral tube
L. lanceolatum

Lythrum alatum Pursh, Northern Winged Loosestrife. Mt (GA, VA), Pd (VA): calcareous meadows, marl fens, and disturbed wet calcareous places; rare (VA Rare). June-September. ME, NY, MI, and ND south to n. and w. VA, e. TN, nw. GA, n. AL, n.. AR, ne. OK, and CO. [=F, S, W; = L. alatum var. alatum -- C, G, GW, K, Z]

Lythrum curtissii Fernald, Curtiss's Loosestrife. Cp (GA): calcareous swamps; rare (GA Threatened). June-early September. Sw. GA south to Panhandle FL; the report from Emanuel County, GA (Jones \& Coile 1988) is in error. [= GW, K, S, Z]

Lythrum lanceolatum Elliott, Southern Winged Loosestrife. Cp, Pd (GA, NC, SC, VA): moist to wet places; uncommon (VA Rare). May-September. Se. VA, se. NC, SC, GA, AL, MS, n. AR, and OK south to s. FL, s. TX, and in the West Indies. Although Graham (1975) argues that \(L\). lanceolatum should be reduced to a variety of \(L\). alatum, her evidence can also be interpreted as warranting specific status. [= RAB, F, S; = L. alatum Pursh var. lanceolatum (Elliott) Torrey \& A. Gray ex Rothrock -- C, G, GW, K, Z]

Lythrum lineare Linnaeus, Narrowleaf Loosestrife. Cp (GA, NC, SC, VA): nearly fresh, brackish, and saline marshes; uncommon. July-October. NJ south to FL and west to TX. [= RAB, C, F, G, GW, K, S, Z]
* Lythrum salicaria Linnaeus, Purple Loosestrife. Mt, Pd (NC, VA), Cp (VA): wet places; uncommon, native of Eurasia. JuneSeptember. An extremely noxious weed in the ne. United States, aggressively colonizing and coming to dominate a wide variety of freshwater wetlands, sometimes to the near exclusion of native vegetation. [=RAB, C, G, K, W, Z; > L. salicaria var. salicaria - F; > L. salicaria var. gracilior Turczaninow -- F; > L. salicaria var. tomentosum (P. Miller) Augustin de Candolle -- F]

\section*{Punica Linnaeus (Pomegranate)}

A genus of 2 species, trees, of Mediterranean Europe and w. Asia. Sometimes treated in the monogeneric family Punicaceae; here included in Lythraceae, following Angiosperm Phylogeny Group (2003). References: Zohary \& Hopf (1994).
* Punica granatum Linnaeus, Pomegranate, is reported as cultivated on Hatteras Island (Dare County, NC) (Brown 1959). It is probably not established, but may be persistent. This species has been cultivated in the Old World at least since the 3rd millenium B.C. [= K, S]

\section*{Rotala Linnaeus (Toothcup)}

A genus of about 44 species, wetland herbs, of temperate to tropical areas. References: Graham (1975)=Z.
Rotala ramosior (Linnaeus) Koehne. Cp, Pd, Mt (GA, NC, SC, VA): marshes, ditches, exposed drawdown muds and silts; common. June-October. Widespread in e. North America, also in the West Indies, Central America, South America, and on the west coast of the United States and Mexico. [= RAB, C, GW, K, S, W, Z; > R. ramosior var. ramosior -- F, G; > R. ramosior var. interior Fernald \& Griscom - F, G]

\section*{Trapa Linnaeus (European Water-chestnut)}

A genus of 1 highly polymorphic or up to 15 more narrowly defined species, annual aquatic herbs, native of the Old World. Oftwn placed in a monogeneric family, Trapaceae. References: Angiosperm Phylogeny Group (2003).

Trapa natans Linnaeus, European Water-chestnut, Water-caltrop. Cp (VA): farm ponds and other stagnant or slow-moving water; rare, introduced from Eurasia and Africa. June-September. [= C, F, G, K]

\section*{MAGNOLIACEAE (Magnolia Family)}

A family of about 7 genera and 223 species, trees and shrubs, tropical and warm temperate, of e. and se. Asia, and from e. North America south through West Indies and Central America to Brazil. References: Hardin (1972); Hardin \& Jones (1989)=Z; Meyer in FNA (1997); Figlar \& Nooteboom (2004); Frodin \& Govaerts (1996); Nooteboom in Kubitzki, Rohwer, \& Bittrich (1993); Kim et al. (2001).
```

1 Leaves about as broad as long, (2-) 4 (-8)-lobed; fruit a 2-seeded, indehiscent samara; [subfamily Liriodendroideae] . . . . . . .

```

\section*{Liriodendron}

1 Leaves longer than broad, not lobed (in some species the leaves auriculate-cordate basally); fruit a cone-like aggregate, each follicle dehiscing to reveal the scarlet seed, at first connected to the follicle by a thread-like strand; [subfamily Magnolioideae] .

Magnolia

\section*{Liriodendron Linnaeus (Tulip-tree)}

A genus of 2 species, trees, relictually distributed, with L. tulipifera in e. North America and L. chinense (Hemsley) Sargent in c. China and n. Vietnam. References: Nooteboom in Kubitzki, Rohwer, \& Bittrich (1993); Weakley \& Parks (in prep.), abbreviated as Z.

1 Leaves large, 4-8-lobed, the terminal lobes acute; [of the Mountains, Piedmont, and Coastal Plain (especially brownwater rivers and mesic bluffs and slopes)]. \(\qquad\) L. tulipifera var. tulipifera

1 Leaves small, \(0-4\)-lobed, the terminal lobes obtuse to broadly rounded; [of the Coastal Plain, especially fire-maintained, acidic, and peaty sites]
L. tulipifera var. 1

Liriodendron tulipifera Linnaeus var. tulipifera, Tulip-tree, Yellow Poplar, Whitewood. Mt, Pd, Cp (GA, NC, SC, VA): mesic forests, cove forests in the Mountains to at least 1500 m in elevation, bottomland forests and swamps; common. April-June; September-October. Widespread in e. North America. An important timber tree in the Southern Appalachians. [= Z; <L. tulipifera -RAB , C, F, FNA, G, GW, K, S, W, Z, infraspecific taxa not distinguished]

Liriodendron tulipifera Linnaeus var. 1, Coastal Plain Tulip-tree, Southern Yellow Poplar. Cp (GA, NC, SC, VA): blackwater swamps, streamhead pocosins in the fall-line sandhills; uncommon. April-June; September-October. Its occurrence in firemaintained, acid soil habitats in the Coastal Plain is surprising to people used to Liriodendron as a tree of mesic, rich soil forests. It is, however, a typical species of streamhead pocosins in the fall-line sandhills, growing with Pinus serotina, Nyssa biflora, and Acer rubrum, and often with scorch marks twenty feet up the trunk. [ \(\quad\) Z; < L. tulipifera -- RAB, C, F, FNA, G, GW, K, S, W, Z, infraspecific taxa not distinguished]

Magnolia Linnaeus (Magnolia, Cucumber-tree)
A genus of about 130 species, trees and shrubs, of e. Asia (Himalayas and Sri Lanka to Japan and w. Malaysia) and America (e. North America to West Indies, Central America, and South America). Molecular phylogenetics show Magnolia virginiana and \(M\). grandiflora as closely related in a New World primarily subtropical clade, M. macrophylla in a clade with its close relatives, M. fraseri and \(M\). pyramidata together, \(M\). acuminata as basal in a clade that is otherwise Asian (equivalent to subgenus Yulania), and \(M\). tripetala grouped in another clade that is otherwise Asian (Azuma et al. 2001). The sections used follow Figlar \& Nooteboom
(2004). References: Tobe (1998)=Y; Spongberg (1998)=X; Frodin \& Govaerts (1996)=V; Azuma, Thien, \& Kawano (1999); Azuma et al. (2001); Figlar \& Nooteboom (2004); Nooteboom in Kubitzki, Rohwer, \& Bittrich (1993); Kim et al. (2001); Hunt (1998).

1 Leaves cordate-auriculate at base; [subgenus Magnolia].
2 Leaves glaucous and finely appressed-pubescent beneath; buds and twigs pubescent; [subgenus Magnolia, section Macrophylla] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . M. macrophylla
2 Leaves green and glabrous beneath; buds and twigs glabrous; [subgenus Magnolia, section Auriculata].
3 Stamens 8-15 mm long; leaves (most of them) over 25 cm long; conelike aggregate fruit 6.5-11 (-14) cm long . . . . M. fraseri

3 Stamens 4-8 (-10.5) mm long; leaves (most of them) less than 25 cm long; conelike aggregate fruit 3.5-5.5 (-6) cm
long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . M. pyramidat
1 Leaves cuneate to rounded (subcordate) at base.
4 Leaves evergreen, coriaceous in texture, glossy dark green above as if varnished, rusty tomentose or green beneath; [subgenus Magnolia, section Magnolia] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . M. grandiflora
4 Leaves variably evergreen to deciduous, herbaceous or subcoriaceous in texture, medium green above with a slightly glossy or dull finish; glaucous or green beneath.
5 Leaves evergreen to deciduous, aromatic when fresh, 8-20 cm long, elliptic, strongly glaucous beneath; [subgenus Magnolia, section Magnolia].
6 Leaves evergreen; previous year's stems densely pubescent; mature leaves with pubescent midveins; flowers opening near sundown (2-5 hours later than var. virginiana); medium to large tree, to >20 m tall; [of the Gulf Coast and inland, north and east to s. SC (e. NC?)] . . . . . . . . . . . . . . . . . . . . . . . . M. virginiana var. australis
6 Leaves evergreen to deciduous (at least tardily); previous year's stems glabrous; mature leaves with few hairs along the midvein below; flowers opening mid-afternoon; shrub to multi-stemmed small tree, to 10 m (rarely to 15 m ) tall; [of the Atlantic Coastal Plain and inland, south and west to s. SC and w. NC]

\section*{M. virginiana var. virginiana}

5 Leaves deciduous, non-aromatic, 10-50 cm long, either ovate or lance-obovate, green beneath.
\(7 \quad\) Leaf base cuneate-attenuate; leaves \(15-50 \mathrm{~cm}\) long, broader towards the tip, borne clustered on the end of the twig; buds glabrous; [subgenus Magnolia, section Rhytidospermum, subsection Rytidospermum] . M. tripetala
7 Leaf base rounded to subcordate (often cuneate to widely cuneate in M. acuminata var. subcordata); leaves 1030 cm long, broader near the middle or towards the base, borne scattered along the twig; buds pubescent; [subgenus Yulania, section Yulania, subsection Tulipastrum].
8 Twigs of the current year glabrous; petals greenish or greenish-yellow; medium to large tree
M. acuminata var. acuminata

8 Twigs of the current year pubescent, or at least with persistent hair-bases, petals golden-yellow above, light-yellow below; small tree (rarely larger) . . . . . . . . . . . . . . . . . . . . . . . . M. acuminata var. subcordata

Magnolia acuminata (Linnaeus) Linnaeus var. acuminata, Cucumber-tree, Cucumber Magnolia. Mt, Pd (GA, NC, SC, VA): mesic to subxeric forests, especially (but by no means strictly) over mafic or calcareous rocks, up to at least 1550 m (where growing with Betula alleghaniensis, Abies fraseri, Picea rubens, and Sorbus americana), ultramafic outcrop barrens (where codominant with Pinus rigida and Quercus alba); common (rare in Piedmont). April-May; July-August. Widespread in e. North America, primarily in or near the Appalachians. The recognition of two varieties is uncertain (see discussion below). [=C, F, G, V, W, X, Y; <M. acuminata -- RAB, FNA, K, Z, in part; = Tulipastrum acuminatum (Linnaeus) Small -- S]

Magnolia acuminata (Linnaeus) Linnaeus var. subcordata (Spach) Dandy, Yellow Cucumber-tree, Showy Cucumber Magnolia. Pd (GA, NC, SC): moist to dry slopes and bottomlands over mafic or calcareous rocks; uncommon. Var. subcordata ranges from sc. NC south to \(A L\), in the lower Piedmont in our area. It has been treated variously as a variety, a species, or merged with M. acuminata. Coker (1943) discusses its history, distribution, and taxonomic status. Additional study is needed. [= V, X, Y; < M. acuminata -- RAB, FNA, K, W, Z, in part; = Tulipastrum cordatum (Michaux) Small -- S; = Magnolia cordata Michaux]

Magnolia fraseri Walter, Fraser Magnolia, Earleaf Umbrella-tree. Mt, Pd (GA, NC, SC, VA): mesic forests; common (uncommon in upper Piedmont only). April-May; July-August. A Southern Appalachian endemic: KY and w. VA south through w. NC and e. TN to nw. SC, n. GA, and ne. AL. [= RAB, C, F, FNA, G, K, S, W, Z; = M. fraseri var. fraseri - V, X; = M. fraseri ssp. fraseri-Y]

Magnolia grandiflora Linnaeus, Southern Magnolia, Bull Bay. Cp, Pd (GA, NC, SC, VA): maritime forests, mesic Coastal Plain bluffs and flats, bottomlands, now also widely naturalized, spreading from cultivation into wet to mesic forests; common as an introduction (rare in the Piedmont), rare as a native species in NC (NC Watch List). May-June; October. Curtis (1860) states that "the northern limit of this tree is in Brunswick County, south of the Cape Fear; but it flourishes in cultivation through all the lower part of the State." The pre-Columbian range apparently from se. NC south to FL, west to e. TX, now somewhat expanded by naturalization. This is, of course, the classic "southern magnolia," along with live oak (Quercus virginiana), and bald-cypress (Taxodium distichum), one of the totem trees of the Deep South. [= RAB, C, FNA, GW, K, S, V, Y, Z]

Magnolia macrophylla Michaux, Bigleaf Magnolia. Pd (GA, NC, SC), Mt (VA), Cp (GA, SC*): mesic forests, primarily over limestone, other calcareous sedimentary rocks (calcareous shales, sandstones, etc.), or mafic rocks (east of the Blue Ridge); rare (NC Rare, SC Rare, VA Rare). May-June; July-August. The range of this species is often stated in such a way as to imply that it is a tree of the southern mountains. Actually, it avoids the Southern Blue Ridge, reaching its greatest abundance in the sedimentary rock Appalachians west of the Blue Ridge, particularly the Cumberland Plateau, and occurs east of the Blue Ridge only as a rare disjunct. M. macrophylla ranges from s. OH and sw. VA south through e. TN to w. GA, west to AL, MS, n. LA, and se. AR (Sundell et al. 1999); disjunct on Crowleys Ridge in ne. AR (population now extirpated), c. and nc. SC, and e. SC (where probably not native). The leaves are up to 1.1 meter long and 3.5 dm wide. See Williams (1999) for additional information about the discovery and
nomenclature of this species. The Gulf Coast endemic Magnolia ashei Weatherby is related and is sometimes treated as a variety or subspecies of M. macrophylla. [= RAB, C, F, FNA, G, K, S, W, Z; = M. macrophylla ssp. macrophylla - V, X, Y]

Magnolia pyramidata Bartram, Pyramid Magnolia. Cp (GA, SC): mesic forests, especially of bluffs and ravines; rare (GA Watch List, SC Rare). April-May; August. A Southeastern Coastal Plain endemic: c. SC south to panhandle FL, west to e. TX. Sometimes treated as avariety or subspecies of \(M\). fraseri, to which it is clearly closely related, but the distributional and morphological differences are discrete and Itherefore prefer specific status. [= RAB, FNA, K, S, Z; = M. fraseri Walter var. pyramidata (Bartram) Pampinini \(-\mathrm{V}, \mathrm{X} ;=\mathrm{M}\). fraseri Walter ssp. pyramidata (Bartram) E. Murray - Y]

Magnolia tripetala (Linnaeus) Linnaeus, Umbrella Magnolia, Umbrella-tree. Pd, Mt, Cp (GA, NC, SC, VA): mesic forests; common (uncommon in Mountains and Coastal Plain). April-May; July-October. Centered in the Southern Appalachians, but avoiding higher elevations, and therefore occurring primarily "around" the Blue Ridge; ranging from sc. and sw. PA, s. OH, s. IN south to SC, GA, nw. FL, AL, and MS; also disjunct in the Ouachita Mountains of c. AR and e. OK. [= RAB, C, F, FNA, G, K, S, W, V, X, Y, Z]

Magnolia virginiana Linnaeus var. australis Sargent, Southern Sweet Bay. Cp (GA, NC?, SC), Pd (GA), Mt (GA): pocosins, bay forests, and swamps in the Coastal Plain, streamhead pocosins, swamps, and sandhill seeps in the Sandhills, bogs and peaty swamps in the Piedmont and Mountains; common (rare in Piedmont and Mountains). April-July; July-October. Primarily a species of the Southeastern Coastal Plain: s. SC (se. NC?) south to s. FL, and west to e. TX, rarely extending into adjacent, more interior provinces. Morphological, molecular, and chemical studies have shown strong variation in M. virginiana, but the patterns are not clear based on the limited current studies (Azuma, Thien, \& Kawano 1999). Tobe (1998), McDaniel (1966), and Figlar (pers. comm. 2005) recommend the recognition of two varieties; additional study is needed. [=F, Y; < M. virginiana -- RAB, C, FNA, G, GW, K, S, \(\mathrm{V}, \mathrm{W}, \mathrm{X}, \mathrm{Z}\), infraspecific taxa not distinguished]

Magnolia virginiana Linnaeus var. virginiana, Northern Sweet Bay. Cp (GA, NC, SC, VA), Pd (NC, VA), Mt (VA): pocosins, bay forests, and swamps in the Coastal Plain, streamhead pocosins, swamps, and sandhill seeps in the Sandhills, bogs and peaty swamps in the Piedmont; common (rare in Piedmont and Mountains). April-July; July-October. Se. MA south to w. NC, s. SC, and e. GA. [=F, Y; < M. virginiana -- RAB, C, FNA, G, GW, K, S, V, W, X, Z, infraspecific taxa not distinguished]

\section*{MALVACEAE (Mallow Family)}

Malvaceae has always been difficult to circumscribe cleanly, relative to members of such families as Sterculiaceae and Tiliaceae. Molecular evidence now adds to morphologic evidence that traditional circumscriptions of these families are highly polyphyletic. Bayer et al. (1999) present a new classification of an expanded Malvaceae, with 9 subfamilies recognized. If circumscribed broadly (as here) to include Sterculiaceae and Tiliaceae, a family of about 243 genera and 4000-4500 species, herbs, shrubs, and trees, of cosmopolitan distribution, but especially diverse in the tropics and subtropics. This family includes several economically important species, including cacao or chocolate, Theobroma cacao Linnaeus, and cola, Cola acuminata R. Brown. References: Whetstone (1983)=Z; Bayer et al. (1999); Bayer \& Kubitzki in Kubitzki \& Bayer (2003).

\section*{Subfamily Byttnerioideae: Melochia}

Subfamily Grewioideae: Triumfetta

\section*{Subfamily Malvoideae:}

Tribe Gossypieae: Gossypium
Tribe Hibisceae: Abelmoschus, Hibiscus, Kosteletzkya, Malvaviscus, Pavonia
Tribe Malveae: Abutilon, Alcea, Althaea, Anoda, Callirhoe, Iliamna, Malva, Malvastrum, Modiola, Napaea, Sida

Subfamily Sterculioideae: Firmiana

Subfamily Tilioideae: Tilia

\section*{Abelmoschus Medikus 1787 (Okra, Gumbo)}

A genus of about 15 species, herbs, of the Old World tropics. Perhaps better included in a broadly circumscribed Hibiscus (Pfeil \& Crisp 2005).
* Abelmoschus esculentus (Linnaeus) Moench, Okra, Gumbo. Cp, Pd (GA, NC, SC, VA): frequently cultivated in gardens, rarely persistent or self-seeding the year following; common (in cultivation), rare (as an escape), introduced from Africa. The young capsules are a famous component of southern cooking. [=K, S; Hibiscus esculentus Linnaeus -- F]

Abutilon P. Miller 1754 (Indian-mallow, Indian-hemp)
A genus of about 100-160 species, herbs, of tropical and warm temperate areas. References: Fryxell (2002)=Z.
* Abutilon theophrasti Medikus, Velvetleaf, Pie-marker, Butterprint. Cp (GA, NC, VA), Pd (NC, SC, VA), Mt (GA, NC, SC, VA): fields, roadsides, disturbed areas; common, introduced from s. Asia. June-October. [=F, G, K, W, Z; = A. theophrastii -- RAB, orthographic variant; = Abutilon abutilon (Linnaeus) Rusby -- S]

\section*{Alcea Linnaeus 1753 (Hollyhock)}

A genus of about 50-60 species, warm temperate Eurasian (Mediterranean Europe to c. Asia).
* Alcea rosea Linnaeus, Hollyhock. Cp, Pd, Mt (NC, VA) \(\{G A\}\) : roadsides, dumps, frequently cultivated, less commonly escaped or persistent; rare, introduced from Eurasia. Late May-August (rarely later). [=K; = Althaea rosea (Linnaeus) Cavanilles -RAB, C, F, G]

\section*{Althaea Linnaeus 1753 (Marsh-mallow)}

A genus of about 12 species, herbs, Eurasian.
* Althaea officinalis Linnaeus, Marsh-mallow. Cp (VA): marshes; rare, introduced from Europe. The roots of this plant were the original source of the mucilaginous paste used to make marshmallows (which are now made with a synthetic mucilage). [= C, \(F\), G, K]

\section*{Anoda Cavanilles 1785 (Anoda)}

A genus of about 24 species, herbs, of sw. North America, Central America, and South America. References:
* Anoda cristata (Linnaeus) Schlechtendahl, Spurred Anoda. Cp (VA), Pd (GA, NC, SC, VA): disturbed areas; rare, introduced from sw. United States, Central and South America. July-October. [= F, G, K; A. crista -- C, orthographic variant; A. cristata var. brachyanthera (Reichenbach) Hochreutiner -- F]

\section*{Callirhoe Nuttall 1821 (Poppy-mallow)}

A genus of about 9 species, herbs, of North America. References:
1 Principal leaves triangular, not cleft; peduncles several-flowered . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. triangulata
1 Principal leaves deeply 5 -cleft; peduncles 1 -flowered.

* Callirhoe involucrata (Torrey \& A. Gray) A. Gray var. involucrata, Purple Poppy-mallow. Pd (VA): disturbed areas; rare, presumably adventive from midwestern United States. [= C, G, K]
*? Callirhoe triangulata (Leavenworth) A. Gray, Clustered Poppy-mallow. Cp (GA, ?NC): sandy scrub; rare (GA Special Concern). Possibly adventive from midwestern United States. [= C, G, K; Callirrhoe triangulata -- S, orthographic variant]

Callirhoe alcaeoides (Michaux) A. Gray, Pale Poppy-mallow, of calcareous prairies, glades, and other open habitats, ranges east to c. TN (Chester, Wofford, \& Kral 1997), IL, KY, and AL (Kartesz 1999). [= C, F, G, K]
*? Callirhoe digitata Nuttall, Finger Poppy-mallow. Mt (GA): prairies; rare (GA Special Concern), possibly adventive. [= K] \{not yet keyed; add synonymy\}

Callirhoe papaver (Cavanilles) A. Gray, Woods Poppy-mallow. Cp (GA): forest openings; rare (GA Special Concern). Sw. GA (Jones \& Coile 1988) west to TX (Kartesz 1999). [= K] \{not yet keyed; add synonymy\}

Firmiana Marsili (Chinese Parasol-tree, Phoenix Tree)
A genus of about 12 species, trees, of Africa and Asia. References: Brizicky (1966) \(=\mathrm{Y}\).
* Firmiana simplex (Linnaeus) W. Wight, Chinese Parasol-tree, Phoenix Tree. Cp, Pd (GA, NC, SC, VA): planted and occasionally naturalized nearby; rare, native of se. Asia, probably China. [= C, K, Y, Z; = F. platanifolia (Linnaeus f.) Schott \& Endlicher -- RAB, S]

Gossypium Linnaeus 1753 (Cotton)
A genus of about 40-50 species, herbs, shrubs, and trees, of warm temperate to tropical areas.
* Gossypium hirsutum Linnaeus, Upland Cotton. Cp (GA, NC, SC, VA): frequently cultivated crop, especially in sandy soils of the Coastal Plain, rarely adventive or a waif; common (as a crop), rare (as an adventive), introduced from tropical America. [= C, G; G. hirsutum var. hirsutum -- K; G. herbaceum Linnaeus -- F, S; G. barbadense Linnaeus]

\section*{Hibiscus Linnaeus 1753 (Hibiscus, Rose-mallow)}

A genus of about 200-300 species, trees, shrubs, and herbs, of tropical to warm temperate areas. References: Wise \& Menzel (1971). Key based in part on GW.

1 Woody shrub, the stems usually solitary from a creeping rhizome
H. syriacus

1 Herb (sometimes robust and to as tall as 3.5 m ), often several from ground level, from a crown or taproot.
2 Annual from a taproot, to 0.5 m tall; calyx inflated at maturity; capsule 1.0-1.3 cm long; petals \(1.5-4 \mathrm{~cm}\) long; leaves 2-6 cm long, deeply cleft
H. trionum

2 Perennial from a crown, usually 0.7-3.5 m tall; calyx not inflated at maturity; capsule 1.7-3.5 cm long; leaves 4-25 cm long, deeply cleft, hastate-lobed, or not at all lobed or cleft.
3 Leaves and stems harshly scabrous; calyx lobes each with an elongate purplish nectary on the back; [of pine savannas and dry sandy soils of maritime forest edges, from se. NC southwards] . . . . . . . . . . . . . . H. aculeatus
3 Leaves and stems glabrous, softly pubescent, or slightly scabrous; calyx lobes lacking nectaries; [of marshes and swamps (sometimes cultivated in drier soils), collectively widespread in our area].
4 Stem glabrous; leaves glabrous; leaves either palmately 3-5-lobed, or prominently halberd-lobed at the base (uncommonly unlobed).
5 Leaves either palmately 3-5-lobed; petals bright scarlet . . . . . . . . . . . . . . . . . . . . . . . . . . . H. coccineus
5 Leaves halberd-lobed at the base (uncommonly unlobed); petals pink or white with a purplish base H. Iaevis

4 Stem pubescent at least when young; leaves pubescent on at least one surface; leaves unlobed or slightly lobed towards the tip.
6 Upper leaf surface densely pubescent; capsule densely pubescent.
7 Leaf blades 3-lobed . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . H. grandiflorus 7 Leaf blades unlobed .............................................. H. moscheutos ssp. incanus
6 Upper leaf surface glabrous or very sparsely pubescent; capsule glabrous.
8 Petals white or creamy, with a red or purple base; flower stalk bearing a leaf well above the base (often about halfway along its length) . . . . . . . . . . . . . . . . . . H. moscheutos ssp. moscheutos 8 Petals pink (rarely white), with or without a red or purple base; flower stalk without a leaf, borne in the axil of a leaf
H. moscheutos ssp. palustris

Hibiscus aculeatus Walter, Savanna Hibiscus, Comfort-root. Cp (GA, NC, SC): pine savannas, dry sandy soils of maritime forest edges; uncommon (rare north of SC) (NC Rare). June-August; July-September. Se. NC south to sc. peninsular FL, west to LA. [= RAB, GW, K, S]

Hibiscus coccineus Walter, Scarlet Hibiscus. Cp (GA, *NC, *SC, *VA), *Pd (*NC): marshes, swamp forests, roadside swales, cultivated as an ornamental in yards; rare, presumably introduced from further south, but sometimes appearing native. Native in FL, s. GA, and s. AL. [= GW, K, S]

Hibiscus grandiflorus Michaux, Large-flowered Hibiscus. Cp (GA): tidal marshes, lakeshores, wet flatwoods and savannas; rare (GA Special Concern). E. GA (Chatham Co., adjacent to the SC border) (Jones \& Coile 1988) south to s. FL, west to e. LA. [= GW, K, S]

Hibiscus laevis Allioni, Smooth Rose-mallow, Halberd-leaved Marsh-mallow, Showy Hibiscus. Cp, Pd (GA, NC, SC, VA), Pd (GA), Mt (VA): freshwater marshes, exposed riverbanks, sandbars; common. June-August; August-October. S. PA south to FL, west to TX; north in the interior to around the Great Lakes. [= C, K, W; H. militaris Cavanilles -- RAB, F, G, GW, S]

Hibiscus moscheutos Linnaeus ssp. incanus (Wendland f.) Ahles, Eastern Rose-mallow. Cp (GA, NC, SC): marshes; rare. June-September; July-October. S. MD south to c. peninsular FL, west to e. TX. [= RAB, GW; < H. moscheutos var. moscheutos -C, in part; = H. incanus Wendland f. -- G, S; < H. moscheutos ssp. moscheutos -- K, in part]

Hibiscus moscheutos Linnaeus ssp. moscheutos, Eastern Rose-mallow. Cp, Pd, Mt (GA, NC, SC, VA): marshes; common. June-September; July-October. MD west to s . IN, south to n. FL, and se. TX. [= RAB, GW, W; H. moscheutos var. moscheutos -C, in part; H. moscheutos Linnaeus -- F, G, in the narrow sense; < H. moscheutos ssp. moscheutos -- K, in part; H. oculiroseus Britton -- S]

Hibiscus moscheutos Linnaeus ssp. palustris (Linnaeus) R.T. Clausen, Eastern Rose-mallow. Cp (NC): marshes; rare. June-September; July-October. E. MA south to e. NC; also around the Great Lakes in NY, OH, IN, MI, IL, and Ontario. [= RAB, GW, W; H. moscheutos var. moscheutos -- C, in part; = H. palustris Linnaeus -- F, G; < H. moscheutos ssp. moscheutos -- K, in part; H. moscheutos -- S]
* Hibiscus syriacus Linnaeus, Rose-of-Sharon, Althaea. Pd (GA, NC, SC, VA), Cp, Mt (NC, SC, VA): escaped or persistent after cultivation, often spreading by rhizomes; uncommon, introduced from e. Asia. June-September; August-October. [= RAB, C, F, G, K, S, W]
* Hibiscus trionum Linnaeus, Flower-of-an-hour. Pd (GA, NC, SC, VA), Mt (NC, SC, VA), Cp (VA): fields, roadsides, disturbed areas; common, introduced from Europe. [= RAB, C, G, K, W; = Trionum trionum (Linnaeus) Wooton \& Standley -- S]

Hibiscus lasiocarpos Cavanilles, east to c. TN (Chester, Wofford, \& Kral 1997), AL, KY, and GA (F, Kartesz 1999). [= F, S; = Hibiscus moscheutos Linnaeus ssp. lasiocarpos (Cavanilles) O.J. Blanchard - K] \{not yet keyed; add to synonymy\}

\section*{Iliamna Greene 1906 (Globe-mallow)}

A genus of 7 species, perennial herbs, of North America. The appropriate taxonomic treatment of the species of lliamna in our area is unsettled and controversial. Additionally, some authors (such as Mabberley 1997) include lliamna in Sphaeralcea. References: Porter \& Wieboldt in Terwilliger (1991)=Z.

1 Leaves 5-7-lobed, the lobes narrowly triangular, the sinuses acute; flowers odorless; plant to ca. 1 m in height; [sandstone outcrops on ridgetop] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . I. cor
1 Leaves 5-7-lobed, the lobes broadly triangular or deltoid, the sinuses obtuse; flowers fragrant; plant to ca. 2.5 m in height; [of river shores and along railroads]
I. remota

Iliamna corei Sherff, Peters Mountain Mallow. Mt (VA): in shallow soil in crevices of outcroppings of Clinch sandstone, near the summit of Peters Mountain; rare (US Endangered, VA Endangered). June-August; July-October. Endemic to the summit of Peters Mountain, Giles County, VA. [= F, Z; < I. remota -- C, G, W, in part; < I. rivularis (Douglas ex Hooker) Greene var. rivularis -\(K\), in part]

Iliamna remota Greene, Kankakee Globe-mallow. Mt (VA): shores and gravel bars along rivers, and along railroad embankments; rare (VA Rare). June-August; July-October. Considered by some to be introduced only in our area. [= F, Z; < I. remota -- C, G, W, in part only (also see I. corei); < I. rivularis (Douglas ex Hooker) Greene var. rivularis -- K, in part]

\section*{Kosteletzkya K. Presl 1835 (Seashore-mallow)}

A genus of about 15-30 species, herbs, of North America, sub-Saharan Africa, and Madagascar. Perhaps better included in a broadly circumscribed Hibiscus (Pfeil \& Crisp 2005).

1 Hairs of the fruit 0.5-1.0 (-1.5) mm long; flowering calyx mostly 6-10 mm long, the bractlets mostly 2.5-6 mm long; petals mostly \(1.8-3 \mathrm{~cm}\) long; [of VA northwards] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . K. virginica var. aquilonia
1 Hairs of the fruit 1.2-2.4 mm long; flowering calyx mostly 8-13 mm long, the bractlets mostly 6-10 mm long; petals mostly \(3.2-\) 4.5 mm long; [throughout our area] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . K. virginica var. virginica

Kosteletzkya virginica (Linnaeus) K. Presl ex A. Gray var. aquilonia Fernald, Northern Seashore-mallow. Cp (VA): brackish to freshwater tidal marshes; common. July-October. NY (Long Island) south to VA. While geographic trends are readily apparent, the recognition of infraspecific taxa is made problematic by the non-correlation of various characters. [= C, F, G; < Kosteletskya virginica -- RAB, infraspecific taxa not distinguished and orthographic variant; < K. virginica -- GW, K, infraspecific taxa not distinguished; K. virginica -- S, in part]

Kosteletzkya virginica (Linnaeus) K. Presl ex A. Gray var. virginica, Southern Seashore-mallow. Cp (GA, NC, SC, VA): brackish to freshwater tidal marshes; common. July-October. DE south to FL, west to TX; also in the West Indies. [= C, F, G; < Kosteletskya virginica -- RAB, infraspecific taxa not distinguished and orthographic variant; <K. virginica -- GW, K, infraspecific taxa not distinguished; K. virginica var. althaeifolia Chapman -- F, G; K. virginica -- S, in part; K. althaeifolia (Chapman) Rusby -- S]

\section*{Malva Linnaeus (Mallow)}

A genus of about 40 species, herbs, of temperate Eurasia and montane Africa.
1 Upper leaves deeply 5-7-lobed, the sinuses cut over halfway to the middle; petals 2-3.5 cm long; erect perennial
............
1 Upper leaves less deeply lobed, rarely to as deep as halfway to the middle; petals \(0.5-2.5 \mathrm{~cm}\) long; prostrate to erect annual or biennial.
2 Epicalyx of 3 oblong-ovate bractlets; petals reddish purple, 2.0-2.5 cm long; biennial, erect, usually not branched at the base . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . M. sylvestris
2 Epicalyx of 3 linear or narrowly lanceolate bractlets; petals white or pink, 0.6-1.2 cm long; annual, sprawling, usually branched at the base.
\begin{tabular}{|c|c|c|}
\hline 3 & Petals about \(2 \times\) as long as the sepals & M. neglecta \\
\hline 3 & Petals about \(1 \times\) as long as the sepals & M. rotundifolia \\
\hline
\end{tabular}
* Malva moschata Linnaeus, Musk Mallow, Rose Mallow. Mt (NC, VA), Pd (VA): pastures, roadsides, barnyards; rare, introduced from Europe. Late May-August. [= RAB, C, F, G, K, W]
* Malva neglecta Wallroth, Common Mallow, Cheeses. Mt, Pd (GA, NC, VA), Cp (VA) \{SC\}: pastures, roadsides, barnyards; rare, introduced from Europe. April-October. [= RAB, C, F, G, K, W; M. rotundifolia -- S, misapplied]
* Malva rotundifolia Linnaeus, Small Mallow, Dwarf Mallow, Cheeses. Mt (VA): pastures, roadsides, barnyards; rare, introduced from Europe. [= C, F, G, K, S; M. pusilla, misapplied]
* Malva sylvestris Linnaeus, Common Mallow, High Mallow, Cheeses. Cp, Pd (NC, SC, VA), Mt (VA): pastures, roadsides, barnyards; rare, introduced from Europe. May-July. [= RAB, C, F, G, K, S, W; > M. sylvestris var. sylvestris - F, G; > M. sylvestris var. mauritiana (Linnaeus) Boissier -- F, G]
* Malva parviflora Linnaeus. SC, MD, FL, etc. [= K] \{not yet keyed; add synonymy\}
* Malva verticillata Linnaeus is reported as an introduction as far south as s. PA (Rhoads \& Klein 1993), MD, and WV (Kartesz 1999). [= K; > M. verticillata var. verticillata - C, F, G; > M. verticillata var. crispa Linnaeus - C, F, G] \{not yet keyed; add synonymy\}

\section*{Malvastrum A. Gray 1849}

A genus of 14 species, herbs, of tropical and warm temperate areas. References: Bates (1967).
Malvastrum hispidum (Pursh) Hochr. Mt (VA): limestone barrens; rare (VA Rare). July-August; August-October. KY, w. VA (Lee Co.), and c. TN, west to IA, KS, and OK. Discovered in our area in 1994 by J.C. Ludwig (Fleming \& Ludwig 1996). [= C, K; Malvastrum angustum A. Gray -- G, S; Sphaeralcea angusta (A. Gray) Fernald -- F; = Sidopsis hispidum (Pursh) Rydberg; = Sida hispida Pursh]
* Malvastrum coromandelianum (Linnaeus) Garcke, introduced, south to se. PA (Rhoads \& Klein 1993) and NJ (Kartesz 1999). [= K]

\section*{Malvaviscus Fabricius 1759 (Wax-mallow)}

A genus of \(3-4\) species, herbs, of tropical and subtropical areas. Perhaps better included in a broadly circumscribed Hibiscus (Pfeil \& Crisp 2005).
* Malvaviscus drummondii Torrey \& A. Gray, Wax-mallow, Turk's-cap Mallow. Cp (GA, NC, SC): disturbed areas; rare, probably introduced from further south. July-October. First reported for NC and SC by Leonard (1971b). [=S; = M. arboreus Dillenius ex Cavanilles var. drummondii (Torrey \& A. Gray) Schery - K; = Hibiscus drummondii (Torrey \& A. Gray) M.J. Young]
* Malvaviscus arboreus Dillenius ex Cavanilles. Reported for NC (K). [= M. arboreus var. arboreus -- K; = Hibiscus malvaviscus Linnaeus] \{not yet keyed; investigate; add synonymy\}

Melochia Linnaeus (Chocolate-weed)
A genus of about 54 species, of tropical regions, especially America. References: Brizicky (1966)=Y.
1 Petioles \(>1.5 \mathrm{~cm}\) long; pubescence of the stem and leaves sparse, of stellate, forked, and/or simple hairs; cymes terminal on primary and secondary branches
M. corchorifolia

1 Petioles < 1 cm long; pubescence of the stem and leaves dense (tomentose), of stellate hairs; cymes in upper leaf axils . . M. spicata
* Melochia corchorifolia Linnaeus, Chocolate-weed. Cp (GA, NC, SC): sandy fields, especially in low, wet places; uncommon, introduced from the Old World tropics. [= RAB, GW, K, S, Y, Z]
* Melochia spicata (Linnaeus) Fryxell. Cp (GA): disturbed areas; rare, introduced from tropical America. In GA (Kartesz 1999) and FL (Brizicky 1966). [= K; = Riedlea hirsuta (Cavanilles) Alphonse de Candolle \(-\mathrm{S} ;=\) Melochia villosa (P. Miller) Fawcett \& Rendle - Y] \{not yet keyed\}

Modiola Moench 1794 (Bristly-mallow)
A monotypic genus, an herb, of North America, Central America, and South America.
Modiola caroliniana (Linnaeus) G. Don, Bristly-mallow. Cp, Pd (GA, NC, SC, VA): lawns, roadsides, disturbed areas, pondshores; uncommon (adventive in part of its range in our area). Late March-June (sometimes later). Ranging as a native from SC south to FL, west to TX, south into the tropics. [= RAB, C, F, G, GW, K, S]

Napaea Linnaeus 1753 (Glade-mallow)
A monotypic genus, an herb, of temperate c. North America.

Napaea dioica Linnaeus, Glade-mallow. Mt (VA): floodplains; rare (US Species of Concern, VA Rare). June-August. PA and IA south to sw. VA and s. IL. The original distribution of this scarce species is difficult to determine. See the interesting discussion of this species' occurrence in VA in Wieboldt et al. (1998). [= C, F, G, K]

\section*{Pavonia Cavanilles 1787}

A genus of about 150 species, of tropical and subtropical areas. Perhaps better included in a broadly circumscribed Hibiscus (Pfeil \& Crisp 2005).

1 Leaves hastate; calyx lobes broadly ovate; carpels un-awned; [introduced species of disturbed habitats] ......... P. hastata
1 Leaves ovate; calyx lobes lanceolate; carpels with 3 apical awns up to 10 mm long; [rare native] . . . . . . . . . . . . . . P. spinifex
* Pavonia hastata Cavanilles, Swampmallow. Cp (GA): disturbed areas; rare, introduced from tropical America. In se. GA (Jones \& Coile 1988). [= K, S]

Pavonia spinifex (Linnaeus) Cavanilles, Gingerbush. Cp (SC): hammocks; rare. Reported for the vicinity of Charleston, SC on the basis of a specimen collected by Bachman (Chapman 1878). Small (1933) considers this species as likely native, at least in FL. [= K, S; Hibiscus spinifex Linnaeus]

\section*{Sida Linnaeus 1753 (Sida)}

A genus of about 100 species, shrubs and herbs, of tropical, subtropical, and warm temperate areas. References: Fryxell (1985) \(=\) Z; Fuertes, Fryxell, \& Jansen (2003); Siedo (1999) \(=\) Y; Verdcourt (2004)=X. Key adapted in part from Z.

1 Leaves deeply palmately lobed; plants 1-2 (-4) m tall; petals white; [section Pseudonapaea, to be removed from Sida] ...... .

Sida acuta Burman f., Broomweed. Cp (GA, SC): disturbed areas; rare, introduced from the Tropics. June-October. [= K, Z; S. carpinifolia Linnaeus f. -- RAB, S]

Sida elliottii Torrey \& A. Gray var. elliottii, Coastal Plain Sida. Cp (GA, NC, SC, VA), Pd (NC), Mt (GA): stream banks, sandy openings, pineland pond margins, limestone glades and barrens; uncommon (GA Special Concern). July-October. Var. elliottii ranges from se. VA south to \(n\). FL, west to LA and north in the interior to \(c\). TN and se. MO. A second variety, var. parviflora Chapman, occurs in Peninsular FL, se. TX, and through montane e. Mexico to Guatemala. S. inflexa, of se. VA and ne. NC, is alleged to differ as follows: S. inflexa with calyx \(7-10 \mathrm{~mm}\) long, leaves elliptic to narrowly elliptic, 4-20 mm wide, (3-) \(4-10 \times \mathrm{as}\) long as wide (vs. S. elliottii var. elliottii with calyx \(5-7 \mathrm{~mm}\) long; leaves narrowly lanceolate to linear, \(1.5-7 \mathrm{~mm}\) wide, \(10-20 \times\) as long as wide). [= Y; S. elliottii -- RAB, C, F, G, K, S, Z, infraspecific taxa not distinguished; S. inflexa Fernald - F, K, Z]

Sida hermaphrodita (Linnaeus) Rusby, Virginia Sida, Virginia-mallow. Mt, Pd (VA): sandy or rocky areas along riverbanks; rare. July-August. C. PA and MD west to s. OH, south to DC, WV, w. VA, and ne. TN; disjunct in nw. OH, ne. IN, and s. MI (where presumably native) and with additional collections from e. MA, NY (Long Island), and s. NJ (where probably adventive) (Sp[ooner et al. 1985). Fryxell (1985) comments that this species is so different from the rest of the genus that "one might plausibly argue that it be elevated to generic rank." A molecular phylogenetic analysis suggests that its affinities are not with Sida, but with the South American Sidasodes (Fuertes, Fryxell, \& Jansen 2003). Spooner et al. (1985) provide a detailed review of the species. [= C, F, G, K, S, W, Z]
* Sida rhombifolia Linnaeus var. rhombifolia, Arrowleaf Sida. Cp (GA, NC, SC, VA), Pd (GA, NC, SC), Mt (GA, SC): roadsides, fields, gardens, disturbed areas; common. April-October. Verdcourt (2004) discusses variation in this taxon, and suggests that "studies throughout the entire range of the species will necessitate recognition of more than one species." He recognizes 6 varieties in e. Africa, aside from the Linnaean var. rhombifolia (with type in Jamaica). [=X; < S. rhombifolia -- RAB, C, F, G, K, S, W, Z, infraspecific taxa not distinguished]
* Sida spinosa Linnaeus, Prickly Sida, Prickly-mallow, False-mallow. Cp, Pd, Mt (GA, NC, SC, VA): disturbed areas, wet fields; common, introduced from the Tropics. June-November. [= RAB, C, F, G, K, S, W, Z]

Sida cordifolia Linnaeus. AL and FL. [= K] \{not yet keyed; add synonymy\}

Sphaeralcea St.-Hil.
(see lliamna)

A genus of about 25-45 species, trees, of temperate regions of North America, Europe and Asia. Hardin's (1990) treatment of American Tilia seems a practical and reasonable approach based on our current knowledge; it gives taxonomic status to the more distinctive (and geographically based) elements of variation, while recognizing the intergradational nature of the variation. Further investigation of this complex group is, however, warranted. References: Hardin (1990)=Z. Key adapted from Hardin (1990).

1 Lower leaf surfaces puberulent with bulbous glands, acicular trichomes, and (rarely) sparsely scattered stellate trichomes; fruiting peduncles and pedicels glabrous or sometimes puberulent
T. americana var. americana

1 Lower leaf surfaces usually tomentose or becoming puberulent, with bulbous glands, acicular trichomes, and a predominance of stellate or fasciculate trichomes; fruiting peduncles and pedicels stellate-tomentulose (becoming puberulent in age).
2 Lower leaf surfaces pale or whitish, densely stellate tomentose with appressed, sessile-stellate trichomes obscuring the surface (rarely becoming puberulent with age but with some stellate trichomes persisting along major veins, the margin, and/or the apex; lateral buds \(5-8 \mathrm{~mm}\) long; pericarp 0.8-1.0 mm thick
T. americana var. heterophylla

2 Lower leaf surfaces grayish or brownish, loosely but densely tomentose with fasciculate and/or stipitate-stellate trichomes, either remaining tomentose or becoming puberulent, or puberulent from emergence and green beneath; lateral buds 3-5 mm long; pericarp 0.5-0.6 mm thick
T. americana var. caroliniana

Tilia americana Linnaeus var. americana, Northern Basswood. Mt (NC, VA): rich coves and slopes; rare (NC Watch List). June; August-September. New Brunswick and Manitoba south to w. NC and OK. [= C, K, Z; = T. americana -- RAB, F, G, W; > T. neglecta Spach -- F, S; > T. glabra Ventenat -- S; > T. truncata Spach -- S]

Tilia americana Linnaeus var. caroliniana (P. Miller) Castig., Southern Basswood, Carolina Basswood. Cp, Pd (GA, NC, SC): mesic forests, in the outer Coastal Plain usually associated with shell deposits, Indian shell middens, or underlying coquina limestone ("marl"); uncommon. June-July; July-August. NC south to FL and west to OK and c. TX. [= K, Z; > T. caroliniana P. Miller -- RAB, S; > T. floridana Small -- RAB, F, S; > T. georgiana Sargent -- S; > T. littoralis Sargent -- S]

Tilia americana Linnaeus var. heterophylla (Ventenat) Loudon, Mountain Basswood, White Basswood, Linn. Mt, Pd, Cp (GA, NC, SC, VA): rich coves and mesic slopes, often one of the most abundant trees in Southern Appalachian cove forests; common, rare in Coastal Plain. June; July-August. Centered in the Southern Appalachians: sw. PA and WV south to c. NC, wc. GA, FL panhandle, and west as disjunct populations to the Ozarkian Highlands of s. MO and n. AR. [= C, K, Z; = T. heterophylla Ventenat -RAB, F, G, S, W; > T. heterophylla - G, in a narrower sense; > T. monticola Sargent -- G; > T. australis Small - S; > T. eburnea Ashe -- S; > T. lasioclada Sargent -- S; > T. michauxii Nuttall -- S; > T. venulosa Sargent]

Several European species are planted as street or yard trees; they differ from the native species in having smaller leaves (usually 412 cm long vs. \(8-20 \mathrm{~cm}\) long) and lacking staminodes. Three of the more commonly planted species are \(T\). platyphyllos Scop., \(T\). cordata P. Miller, and T. ×vulgaris Hayne [cordata \(\times\) platyphyllos]. Planted material should be identified by using appropriate manuals of cultivated species.

\section*{Triumfetta Linnaeus}

A genus of about 70-150 species, trees, shrubs, and herbs, of tropical regions.
* Triumfetta semitriloba Jacquin. \(\mathrm{Cp}(\mathrm{GA})\) : disturbed areas; rare, introduced from further south. In sw. GA (Jones \& Coile 1988) and FL. [= K, S]

\section*{MARTYNIACEAE (Martynia Family)}

A family of 5 genera and about 16 species, herbs, tropical and subtropical. Bretting \& Nilsson (1988) present evidence for maintaining the Martyniaceae as distinct from the Pedaliaceae. References: Ihlenfeldt in Kadereit (2004).

\section*{Proboscidea Schmidel 1763 (Unicorn-plant)}

A genus of about 9 species, herbs, of warm temperate to subtropical America. References: Thieret (1977)=Y; Bretting \& Nilsson (1988) \(=\) Z; Ihlenfeldt in Kadereit (2004).
* Proboscidea louisianica (Miller) Thellung, Unicorn-plant, Devil's-claw, Cow Catcher. Pd (GA, NC, SC), Cp (GA, VA): disturbed areas; rare, introduced from farther west and south (apparently native to the Mississippi valley). The curious fruits are unmistakable. [=RAB, F, GW, Y; = P. louisiana -- C, G, orthographic variant; = Martynia louisiana Miller -- S; > P. Iouisianica ssp. louisianica -- K, Z]

A family of about 200 genera and 4500-5000 species, trees, shrubs, vines, and herbs, of tropical, subtropical, and warm temperate areas.

Rhexia Linnaeus (Meadow-beauty)
(contributed by Richard J. LeBlond)
A genus of about 15 species, herbs, of North America. Rhexia is the only genus of the Melastomataceae to occur in North America north of s. FL. References: Kral \& Bostick (1969)=Z; Bounds (1987); Wurdack \& Kral (1982); Snyder (1996).

Identification notes: measurements of the hypanthium are to the base of the calyx lobes.
1 Anthers straight, ca. 2 mm long.
2 Stem internodes with at least some hairs; leaves oblong, linear, or spatulate; petals yellow ................ Rh. Iutea
2 Stem internodes glabrous; leaves ovate, suborbicular, or widely elliptic; petals lavender-rose to pink.
3 Calyx segments blunt to acute; floral tube glandular-pubescent; surface of seeds irregularly ridged .... Rh. nuttallii
3 Calyx segments acuminate-aristate; floral tube nearly glabrous except along the calyx lobes; surface of seeds pebbled

Rh. petiolata
1 Anthers curvate, \(5-11 \mathrm{~mm}\) long.
3 Stem nodes and internodes glabrous; stem and foliage blue-green . . . . . . . . . . . . . . . . . . . . . . . . . . Rh. alifanus
3 Stem nodes and usually also the internodes hirsute; stem and foliage green.
4 Sepal lobes aristate, the awn-tip 0.5-1.5 mm long, and also with flaring, yellowish, stiff hairs 3-5 mm long Rh. aristata
4 Sepal lobes obtuse to acuminate, not aristate, the hairs shorter and not yellowish or stiff.
5 Leaves 1-5 (-8) mm wide, linear, linear-elliptic, narrowly oblong, or narrowly spatulate.
6 Petals lavendar-rose, (10-) 15-20 (-25) mm long; mature hypanthium 10-14 mm long, with glandular hairs; marginal nerves of leaf abaxial surface either absent or obscure and discontinuous . . . . . . Rh. cubensis 6 Petals white to pink (-rose-purple), (7-) 9-14 mm long; mature hypanthium 6-10 mm long, glabrous or sparsely glandular-hairy; marginal nerves of leaf abaxial surface prominent . . Rh. mariana var. exalbida 5 Leaves (5-) 7-20 (-35) mm wide, lanceolate, elliptic, or ovate.

7 Four stem faces at mid-stem about equal, almost flat, the angles sharp or winged.
8 Roots tuberous; stem angles at mid-stem conspicuously winged; hypanthium 7-10 mm long, the neck shorter than the body . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Rh. virginica
8 Roots not tuberous; stem angles sharp to narrowly winged; hypanthium 10-12 mm long, the neck as long as or longer than the body . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Rh. mariana var. ventricosa
7 Four stem faces at mid-stem markedly unequal, one pair of opposite faces broader, convex, darker green, the narrower pair concave or flat, pale.
9 Mature hypanthium 6-10 (-11) mm long, glandular-setose; petals 12-15 (-18) mm long, glabrous on the lower surface; anthers \(5-8 \mathrm{~mm}\) long . . . . . . . . . . . . . . . . . . . . . . . Rh. mariana var. marian
9 Mature hypanthium (9-)10-15 (-20) mm long, glabrous or glabrate; petals (18-) 20-25 mm long, glandular-hairy on the lower surface (best seen in bud); anthers \(8-11 \mathrm{~mm}\) long . . ...... \(\boldsymbol{R} \boldsymbol{R}\). nashii

\section*{Alternate Key based largely on vegetative characters}

1 Stem internodes glabrous.
2 Stem nodes as well as internodes glabrous, leaf margins entire or remotely low-toothed apically, glabrous . . Rh. alifanus
2 Stem nodes hirsute, leaf margins toothed, the teeth often tipped with hairs.
3 Longest leaves \(1.5(-2) \mathrm{cm}\) long, ovate or suborbicular . . . . . . . . . . . . . . . . . . . . . . . . Rh. nuttallii or Rh. petiolata 3 Longest leaves more than 2 cm long, lanceolate, elliptic, or ovate.

4 Rhizomes present, roots not tuberiferous or spongy-thickened . . . . . . . . . . . . . . Rh. mariana var. ventricosa 4 Rhizomes absent, roots tuberiferous or spongy-thickened.

5 Stem leaves gradually reduced upwards . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Rh. virginica
5 Stem leaves gradually lengthening from the base to mid-stem . . . . . . . . . . . . . . . . . . . . . . . Rh. aristosa
1 Stem internodes (and nodes) hirsute or glandular-hairy.
6 Leaves linear, narrowly elliptic, or broadest above the middle.
7 Plant bushy-branched . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Rh. Iutea
\(7 \quad\) Plant simple below the cymose inflorescence.
8 Mature hypanthium 10-14 mm long, with glandular hairs; petals lavendar-rose, 1.5-2.0 cm long . . Rh. cubensis 8 Mature hypanthium 6-10 mm long, glabrous or sparsely glandular-hairy; petals white, 1.2-1.5 cm long

Rh. mariana var. exalbida
6 Leaves lanceolate, elliptic, or ovate, broadest at or below the middle.
9 Four stem faces at mid-stem about equal, almost flat, the angles sharp or winged.
10 Rhizomes present, roots not tuberiferous or spongy-thickened .............. Rh. mariana var. ventricosa
10 Rhizomes absent, roots tuberiferous or spongy-thickened . . . . . . . . . . . . . . . . . . . . . . . . . . . . Rh. virginica
9 Four stem faces at mid-stem markedly unequal, one pair of opposite faces broader, convex, darker green, the narrower pair concave or flat, pale.

11 Mature hypanthium 6-10 mm long, glandular-hairy; petals 1.2-1.5 cm long, glabrous on the lower surface Rh. mariana var. mariana
11 Mature hypanthium 10-15 mm long, glabrous or glabrate; petals 2.0-2.5 cm long, glandular-hairy on lower surface (best seen in bud)

Rh. nashii

Rhexia alifanus Walter, Smooth Meadow-beauty. Cp (GA, NC, SC): pine flatwoods and savannas, pocosins borders, more able to tolerate merely moist soils than other Rhexia species; common. May-September. A Southeastern Coastal Plain species: e. NC south to n . FL and west to se. Texas. Our tallest and showiest Rhexia: the unbranched (unless injured), wandlike stems, with strongly ascending, bluish-green, generally entire leaves make this species unmistakeable. [= RAB, GW, K, S, Z]

Rhexia aristosa Britton, Awned Meadow-beauty, Bristly Meadow-beauty. Cp (GA, NC, SC): clay-based Carolina bays, depression meadows, and limesink ponds (dolines); rare (US Species of Concern, GA Special Concern, NC Threatened, SC Rare, VA Rare). June-September. This species has a very local and disjunct range extending (strictly on the Coastal Plain) from NJ south to AL. The long yellowish bristles at the summit of the calyx/hypanthium are diagnostic. [= RAB, C, F, G, GW, K, S, Z]

Rhexia cubensis Grisebach, West Indies Meadow-beauty. Cp (GA, NC, SC): limesink ponds (dolines); rare (NC Rare). June-September. Se. NC south to s. FL and west to sw. MS; also in the West Indies. [= RAB, GW, K, S, Z]

Rhexia lutea Walter, Yellow Meadow-beauty, Golden Meadow-beauty. Cp (GA, NC, SC): wet pine flatwoods and savannas, seepage slopes, and bogs; uncommon. April-July (and later in response to growing-season fire). A Southeastern Coastal Plain species: e. NC south to \(n\). FL and west to se. TX. The only yellow-flowered Rhexia and also our bushiest species. [= RAB, GW, K, S, Z]

Rhexia mariana Linnaeus var. exalbida Michaux, White Meadow-beauty. Cp, Pd (GA, NC, SC): wet pine flatwoods and savannas, wet meadows, ditches, and wet roadsides; uncommon. June-September. NC south to FL and west to MS. Merging into Rh. mariana var. mariana from FL westward, var. exalbida appears quite distinct in NC, and it here recognized for convenience. The white flowers and linear leaves are diagnostic. [= RAB; Rh. lanceolata -- S; < Rh. mariana var. mariana -- GW, K, Z, in part]

Rhexia mariana Linnaeus var. mariana, Maryland Meadow-beauty, Dull Meadow-beauty, Pale Meadow-beauty. Cp, Pd, Mt (GA, NC, SC, VA): pine flatwoods, wet meadows, bog margins, ditches, wet roadsides, often weedy; common. May-October. E. MA south to FL, west to TX, and north to s. IN and IL. [= RAB, G, W; < Rh. mariana var. mariana -- F, GW, K, Z, in part only (also see \(R h\). mariana var. exalbida); > Rh. mariana var. leiosperma Fernald \& Griscom -- F; Rh. delicatula Small -- S]

Rhexia mariana Linnaeus var. ventricosa (Fernald \& Griscom) Kral \& Bostick, Swollen Meadow-beauty. Cp (NC, SC, VA), Pd (NC, VA): pine flatwoods and savannas, clearings in cypress-hardwood swamps, ditches, wet roadsides; uncommon. JuneSeptember. NJ south to SC. This variety is closely related to Rh. mariana var. interior (Pennell) Kral \& Bostick, occurring west of the mountains. Gleason \& Cronquist (1991) prefer to retain Rh. interior Pennell at the species level and hedge relative to the distinctiveness of \(R h\). ventricosa. [= GW, K, W, Z; = Rh. ventricosa Fernald \& Griscom -- RAB, F; <Rh. interior Pennell -- C]

Rhexia nashii Small, Hairy Meadow-beauty. Cp (GA, NC, SC, VA), Pd (GA, NC, SC): wet pine flatwoods and savannas; pondshores, bogs, marshes, ditches, wet roadsides; common (uncommon in Piedmont). May-October. Primarily a Southeastern Coastal Plain species: e. VA south to s. FL and west to se. LA. [= GW, K, S, Z; = Rh. mariana var. purpurea Michaux -- RAB, F, G]

Rhexia nuttallii C.W. James, Nuttall's Meadow-beauty. Cp (GA): pine flatwoods, bogs; rare (GA Special Concern). Coastal Plain of se. GA west to FL Panhandle, south to s. peninsular FL. [= GW, K, Z; = Rh. serrulata Nuttall -- S]

Rhexia parviflora Chapman, Small-flowered White Meadow-beauty. Cp (GA): limesink pond margins; rare (GA Special Concern). Occurs in sw. GA (Mitchell County) south into Panhandle FL. [= GW, K, S, Z]

Rhexia petiolata Walter, Ciliate Meadow-beauty, Short-stemmed Meadow-beauty. Cp (GA, NC, SC, VA), Pd (GA, SC): wet pine flatwoods and savannas, pocosin borders, and ditches; common (VA Rare). June-September. May-October. A Southeastern Coastal Plain endemic: se. VA south to \(n\). FL and west to se. TX. The flowers are sessile, the petals ascending. [= RAB, C, G, GW, K, Z; = Rh. ciliosa Michaux -- F, S]

Rhexia virginica Linnaeus, Virginia Meadow-beauty, Deergrass, Handsome Harry, Wing-stem Meadow-beauty. Mt, Cp, Pd (GA, NC, SC, VA): wet pine flatwoods and savannas, pond shores, bogs, and ditches; common (uncommon in NC Piedmont and NC Coastal Plain). May-October. E. Canada and WI south to n. FL and TX. [= C, G, GW, K, W, Z; > Rh. virginica var. purshii (Sprengel) C.W. James -- RAB; >Rh. virginica var. virginica - RAB, F; >Rh. virginica var. septemnervia (Walter) Pursh -F ; = Rh. stricta Pursh -- S]

Rhexia \(\times\) brevibracteata Snyder [Rh. aristosa \(\times\) virginica] is known as a natural hybrid from the Coastal Plain of NJ (Snyder 1996). \{not keyed\}

Rhexia mariana Linnaeus var. interior (Pennell) Kral \& Bostick. Moist to wet areas, ditches, prairies. S. IN, s. IL, s. MO, and se. KS south to c. AL, c, MS, n. LA, and se. OK. [= GW, K, Z; < Rh. interior - C; = Rh. interior Pennell - F, G] \{add to key; add synonymy\}

Rhexia salicifolia Kral \& Bostick, Willowleaf Meadow-beauty. Drawdown zones of Coastal Plain depression ponds and interdune swales. S. AL and FL Panhandle. [= GW, K, Z] \{add to key; add synonymy\}

\section*{MELIACEAE (Mahogany Family)}

A family of about 50 genera and 565 species, trees and shrubs, of tropical and subtropical areas. The only native member of the family in e. North America is Swietenia mahogani (Linnaeus) Jacquin (West Indian Mahogany), a very valuable timber tree which ranges north to s. FL. References: Miller (1990)=Z in the synonymy.

A genus of 3 species, trees, of the Old World tropics.
* Melia azedarach Linnaeus, Chinaberry, Carolina Mahogany, Umbrella-tree, Pride-of-India. Cp, Pd (GA, NC, SC, VA), Mt (NC): disturbed areas, abandoned rural yards and fields; common (rare in the Mountains), native to se. Asia, commonly cultivated in our area (mainly in the Coastal Plain) and commonly escaped. April-May; September-October. Rural children often play with the bony drupes, which are poisonous if ingested. [= RAB, C, F, G, K, S, Z]

\section*{MENISPERMACEAE (Moonseed Family)}

A family of about 72 genera and 450 species, vines, shrubs, trees, and herbs, ot tropical, subtropical, and warm temperate areas. References: Rhodes in FNA (1997); Kessler in Kubitzki, Rohwer, \& Bittrich (1993).

1 Leaves asymmetrically peltate (the stem attached 1-5 mm in from the leaf margin); stamens 12-24; petals 6-9; fruit bluishblack; [tribe Menispermeae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Menispermum
1 Leaves not peltate, usually cordate (the stem attached at the leaf margin); stamens 6 or 12 ; petals 6 or 0 ; fruit red or bluishblack.
2 Leaves 3-7-lobed, the sinuses usually deep, the lobes acute; stamens 12; petals 0; fruit bluish-black, 13-25 mm long; [tribe Tinosporeae]

Calycocarpum
2 Leaves entire to 3-lobed, the sinuses always shallow, the lobes (if present) broadly rounded; stamens 6; petals 6; fruit red, \(5-8 \mathrm{~mm}\) long; [tribe Menispermeae]

Cocculus

Calycocarpum (Nuttall) Spach (Cupseed)
A monotypic genus, a woody vine, of e. North America. References: Kessler in Kubitzki, Rohwer, \& Bittrich (1993).
Calycocarpum lyonii (Pursh) A. Gray, Cupseed, Lyonia-vine. Cp (GA, SC), Pd, Mt (GA): floodplain forests; rare. May-June. Ranging from nw. GA, s. IN, and MO, south to se. SC, e. GA, Panhandle FL, and LA; some of the easternmost occurrences may be adventive or introduced. [= C, F, FNA, G, K, S]

\section*{Cocculus A.P. deCandolle (Coralbeads, Snailseed)}

A genus of 8 species, woody vines, shrubs, and trees, of tropical, subtropical, and warm temperate regions of North America, Central America, Africa, Madagascar, India, Malaysia, and the Philippines. References: Kessler in Kubitzki, Rohwer, \& Bittrich (1993).

Cocculus carolinus (Linnaeus) A.P. deCandolle, Coralbeads, Carolina Moonseed, Snailseed, Red Moonseed. Cp, Pd, Mt (GA, NC, SC, VA): moist to dry forests and thickets; common (rare in VA and in the Mountains of GA, NC, and SC). June-August. VA south to \(F L\), west to \(T X\), north in the interior to \(s\). IN and MO. Its occurrences in VA may be primarily adventive. [= RAB, C, F, FNA, G, K, W; = Epibaterium carolinum (Linnaeus) Britton -- S]

Menispermum Linnaeus (Moonseed)

A genus of 2-4 species, vines, of temperate e. North America and temperate e. Asia. References: Kessler in Kubitzki, Rohwer, \& Bittrich (1993).

Menispermum canadense Linnaeus, Moonseed, Yellow Parilla. Pd, Cp (GA, NC, SC, VA), Mt (GA, NC, VA): moist nutrientrich forests, especially on floodplains or lower slopes; common. June-August. Québec west to Manitoba, south to GA and OK. [= RAB, C, F, FNA, G, K, S, W]

\section*{MENYANTHACEAE (Buckbean Family)}

A family of about 5 genera and 40 species, wetland herbs, of cosmopolitan distribution. References: Wood (1983b)=Z.
```

Leaves trifoliate; inflorescence a raceme . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Menyanthes
Leaves simple; inflorescence an umbel . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Nymphoides

```

Menyanthes Linnaeus (Buckbean, Bogbean)
The genus is monotypic, an herb, circumboreal.

Menyanthes trifoliata Linnaeus, Buckbean, Bogbean. Mt (NC, VA): mountain bogs at high elevations over amphibolite (in the Blue Ridge), boggy marshes over calcareous rocks (in the Ridge and Valley); rare (NC Threatened, VA Rare). May-June. This circumboreal species is widespread in \(n\). North America and \(n\). Eurasia, ranging south in North America to NJ, VA, IN, MO, and CA, and disjunct to Long Hope Valley, Watauga County, NC. The NC populations are disjunct about 400 km from the next nearest populations in VA. McDowell (1984) reported the first documentation of the species for NC. [= C, G, K, W, Z; > M. trifoliata var. minor Rafinesque -- F]

\section*{Nymphoides Hill (Floating Heart)}

A genus of about 20 species, aquatic herbs, cosmopolitan. References: Burks (2002).
Identification notes: As the scientific name indicates, the leaves of Nymphoides bear a superficial resemblance to those of Nymphaea. The leaves of Nymphoides are more cordate, the two basal lobes more rounded, rather than having a rather sharp corner or angle. Nymphoides cordata has much smaller leaves than Nymphaea, while the thick texturing of Nymphoides aquatica is very unlike the glossy smoothness of Nymphaea.

1 Flowers yellow; floating stems usually with multiple leaves; capsules 12-25 mm long . . . . . . . . . . . . . . . . . . . . . . N. peltata
1 Flowers white; floating stems with single leaves; capsules \(3-14 \mathrm{~mm}\) long.
2 Leaves 5-15 cm wide, roughly pebbled below, thick in texture; stems 1.3-2.5 mm in diameter a few cm below the inflorescence, with conspicuous red spots; tuberous roots of floating clusters stout, blunt-tipped; seeds conspicuously papillate; capsule \(10-14 \mathrm{~mm}\) long
N. aquatica

2 Leaves \(3-7 \mathrm{~cm}\) wide, smooth below, thin in texture; stems \(0.6-0.9 \mathrm{~mm}\) in diameter a few cm below the inflorescence, rarely spotted with red; tuberous roots of floating clusters slender, with pointed tips; seeds smooth (rarely papillate); capsule 4-5 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . N. . cordata

Nymphoides aquatica (Walter ex J.F. Gmelin) Kuntze, Big Floating Heart, Banana Floating Heart. Cp (GA, NC, SC, VA): limesink ponds (dolines), other acidic and nutrient-poor water-filled depressions, sluggish streams, beaverponds, primarily in the Outer and Middle Coastal Plain; uncommon (VA Rare). Late April-September. A Southeastern Coastal Plain endemic: NJ south to FL and west to TX. [= RAB, C, F, GW, K, S, Z; = N. aquaticum - G, orthographic variant]

Nymphoides cordata (Elliott) Fernald, Little Floating Heart. Cp (GA, NC, SC): upland depression ponds, sluggish streams, beaverponds, primarily in the fall-line Sandhills; uncommon (NC Watch List). Widespread (though in many parts of its range local) in e. North America, from Newfoundland and Ontario south to FL and LA. [= RAB, C, F, GW, K, Z; = N. cordatum - G, orthographic variant; \(N\). lacunosa (Ventenat) Kuntze -- S, misapplied]
* Nymphoides peltata (S.G. Gmelin) Kuntze, Yellow Floating Heart. Pd (NC): ponds; rare, introduced from Europe. This European native is sparingly naturalized in e. North America. It is sold for cultivation in water gardens, and will likely become more widely naturalized. [= C, F, K; = N. peltatum - G, orthographic variant]

\section*{MIMOSACEAE (Mimosa Family) (see FABACEAE)}

\section*{MOLLUGINACEAE (Carpetweed Family)}

A family of about 13-14 genera and 120-125 species, herbs, of tropical and warm temperate areas. References: Vincent in FNA (2003b); Boetsch (2002)=Z; Endress \& Bittrich in Kubitzki, Rohwer, \& Bittrich (1993).

\section*{Mollugo Linnaeus (Carpetweed)}

A genus of about 35 species, annual herbs, of tropical and subtropical regions of both hemispheres, introduced in temperate regions. References: Endress \& Bittrich in Kubitzki, Rohwer, \& Bittrich (1993).

Mollugo verticillata Linnaeus, Carpetweed, Indian-chickweed. Cp, Pd, Mt (GA, NC, SC, VA): fields, disturbed areas, drawdown zones on river- and pond-shores; common, introduced from tropical America. May-November. [= RAB, C, F, FNA, G, GW, K, S, W, Z]

A family of about 38 genera and 1100 species, trees, shrubs, vines, and herbs, of tropical, subtropical, and (few) warm temperate areas. References: Wunderlin in FNA (1997); White in SE (in prep.); Rohwer \& Berg in Kubitzki, Rohwer, \& Bittrich (1993).

1 Herb, 0.3-1.0 m tall; stem without latex; [tribe Moreae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Fatoua
1 Shrub or tree, at maturity over 1 m tall; stem bearing translucent to milky-white latex.
2 Stipules connate, the stipule scar encircling the twig; inflorescence a syconium (the flowers borne on the inner walls of the fleshy receptacle); [tribe Ficeae] Ficus
2 Stipules free, the stipule scar not encircling the twig; inflorescence a spike, head, or catkin (the flowers borne exposed on a contracted or elongated axis or receptacle); [tribe Moreae].
3 Leaves entire, unlobed or shallowly 3-lobed; stems usually thorny.
4 Fruit 2-3 cm in diameter; petioles 5-20 mm long; leaves 3-7 (-10) cm long . . . . . . . . . . . . . . . . . . . . . Cudrania
4 Fruit 10-15 cm in diameter; petioles 30-50 mm long; leaves 6-20 cm long . . . . . . . . . . . . . . . . . . . . . Maclura
3 Leaves serrate, often also 3-15-lobed (the lobes sometimes deep); stems not thorny.
5 Stems and leaves hirsute; leaves alternate, opposite, and whorled . . . . . . . . . . . . . . . . . . . . . Broussonetia
5 Stems and leaves glabrous to pubescent; leaves alternate . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Morus

\section*{Broussonetia L'Héritier ex Ventenat 1799 (Paper Mulberry)}

A genus of about 8 species, trees, shrubs, and vines, of tropical and subtropical Asia and Madagascar. References: Endress \& Bittrich in Kubitzki, Rohwer, \& Bittrich (1993).
* Broussonetia papyrifera (Linnaeus) L'Héritier ex Ventenat, Paper Mulberry. Pd, Cp, Mt (GA, NC, SC, VA): urban lots, disturbed areas, roadsides; common, native of e. Asia. April. [= RAB, C, F, FNA, G, K, W; = Papyrius papyriferus (Linnaeus) Kuntze -- S]

\section*{Cudrania Trécul 1847 (Cudrania)}

A genus of 1-several species, shrubs, of Asia. References: Endress \& Bittrich in Kubitzki, Rohwer, \& Bittrich (1993).
* Cudrania tricuspidata (Carrière) Bureau ex Lavallée, Cudrania. Pd (NC), Cp (GA): escaped and naturalized from plantings; rare, native of China and Korea, where cultivated as a food for silkworms. July. Naturalized in Orange County, NC, in McIntosh Co. GA (Jones \& Coile 1988), and perhaps elsewhere in our area, where recommended as a hedge plant since at least 1940 (Rehder 1940). [= FNA, K; = Maclura tricuspidata Carrière]

\section*{Fatoua Gaudichaud-Beaupré 1830 (Crabweed)}

A genus of 2-3 species, herbs or weak shrubs, of Asia, Madagascar, and Australia. References: Vincent (2004)=Y; Massey (1975) \(=\) Z; Miller \& Wood (2003); Kral (1981b); Endress \& Bittrich in Kubitzki, Rohwer, \& Bittrich (1993).
* Fatoua villosa (Thunberg) Nakai, Crabweed, Mulberry-weed, Foolish-weed. Pd (GA, NC, SC, VA), Cp (GA, SC): disturbed areas, vegetable and flower gardens; rare, native of Asia (apparently se. Asian islands). July-November. As reported by Massey (1975) and Vincent (2004), Fatoua was first reported in the United States (Louisiana) in the early 1960's. As of 2004, its distribution in North America had spread to include 28 states and the District of Columbia, including most states except the Great Plains and Rocky Mountains had spread (Vincent 2004, Sundell et al. 1999, Miller \& Wood 2003. Since all early collections seem to be in and around greenhouses and nurseries, it is likely that it has been introduced in horticultural material, perhaps repeatedly (Kral 1981b). Fatoua appears to have become a fairly aggressive weed in eastern North America. It can be expected to continue to spread, and has the potential to become noxious. It has alternate, ovate leaves with cordate bases, borne on long petioles (about as long as the leaf blade), the inflorescences are dense cymes borne on peduncles in the axils of leaves. Pubescence of the stem and foliage is uncinulate, giving the plant a "tacky" feel. An excellent illustration appears in Correll \& Correll (1982). [= FNA, K, Y, Z]

\section*{Ficus Linnaeus 1753 (Fig)}

A genus of about 750 species, trees, shrubs, and vines, of tropical, subtropical, and warm temperate areas. References: Endress \& Bittrich in Kubitzki, Rohwer, \& Bittrich (1993).

1 Leaves lobed; [shrub to small tree] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . F. carica 1 Leaves unlobed; [climbing, vining shrub] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [F. pumila]
* Ficus carica Linnaeus, Edible Fig, Garden Fig. Cp (GA, NC, SC, VA), Pd (GA, NC, SC): grown for its fruits, persistent from plantings, persisting and naturalizing particularly on barrier islands, where it sometimes forms thickets on dunes, or otherwise in the outer Coastal Plain, where proximity to the ocean ameliorates cold winter temperatures; rare, native of w. Asia. May-August; JulyOctober. This is the common cultivated fig, grown for its fruit in the Mid-east for millenia. [= RAB, F, FNA, K, S]

Ficus pumila Linnaeus, Climbing Fig. Cp (GA): disturbed areas; rare, introduced from s. Asia. Reported for GA (Wunderlin in FNA 1997). [= FNA, K]

\section*{Maclura Nuttall 1818 (Osage-orange)}

A monotypic genus (or sometimes broadened to include Cudrania and other genera), a tree, of sc. North America. References: Endress \& Bittrich in Kubitzki, Rohwer, \& Bittrich (1993).
* Maclura pomifera (Rafinesque) C.K. Schneider, Osage-orange, Bow-wood, Bois-d'arc, Hedge-apple. Cp, Pd, Mt (GA, NC, SC, VA): fields, hedgerows, forests, naturalized from extensive planting in the eighteenth and nineteenth centuries, native of TX, OK, AR, and LA. April-May; October. Maclura is a monotypic genus. The large fruits are unmistakeable: yellowish-green, grapefruit-sized, and wrinkled, reminiscent of a giant, spherical mulberry fruit. The wood is extremely heavy, fine-grained, a bright yellow-orange when fresh, but darkening with age, famous for making bows and rarely used in cabinetry. [=RAB, C, F, FNA, G, K, W; = Toxylon pomiferum Rafinesque ex Sargent -- S]

\section*{Morus Linnaeus 1753 (Mulberry)}

A genus of about 10-15 species, trees, of warm temperate, subtropical, and tropical areas. References: Endress \& Bittrich in Kubitzki, Rohwer, \& Bittrich (1993).

1 Upper leaf surface glossy, glabrous or slightly scabrous; lower leaf surface glabrous, or slightly pubescent on the veins and in the vein axils only; ripe fruits black, purple, red, pink, or white . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . M. alba
1 Upper leaf surface dull, scabrous; lower leaf surface pubescent on the veins, veinlets, and the surface between the veins; ripe fruits black or purple . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . M. \(\boldsymbol{r}\).
* Morus alba Linnaeus, White Mulberry, Silkworm Mulberry, Russian Mulberry. Cp, Pd, Mt (GA, NC, SC, VA): disturbed areas, vacant lots, roadsides, moist forests; uncommon, native of e. Asia. March-May; May-June. [= RAB, C, F, FNA, G, GW, K, S, W; M. nigra Linnaeus -- S, misapplied as to our material; >M. alba var. tatarica (Linnaeus) Seringe]

Morus rubra Linnaeus, Red Mulberry. Cp, Pd, Mt (GA, NC, SC, VA): bottomland forests, mesic slopes, disturbed areas, suburban woodlands; common. April-May; May-June. MA, VT, NY, MI, WI, and se. SD south to s. FL and w. TX, and into Mexico. The fruits are very variable in quality from tree to tree. M. rubra is the only member of the Moraceae native to our area. [= RAB, C, F, G, GW, K, S, W; > M. rubra var. rubra -- K]

\section*{MYRICACEAE Blume 1829 (Bayberry Family)}

A family of about 3-5 genera and 55 species, trees and shrubs, nearly cosmopolitan. See Morella for discussion of our 3 genera. References: Bornstein in FNA (1997); Wilbur (1994)=Z; Elias (1971b) \(=\) Y; Kubitzki in Kubitzki, Rohwer, \& Bittrich (1993).

1 Leaves oblong or linear-lanceolate, pinnatifid, stipulate; fruit in a bristly involucre formed by 8 bractlets ......... Comptonia
1 Leaves mostly obovate or oblanceolate, entire or toothed (especially apically), estipulate; fruit either exposed and densely waxy (Cerothamnus), or partially enclosed in 2 wing-like bractlets (Myrica).
2 Fruit spherical, densely waxy, exposed (the 4-6 bractlets small and inconspicuous); terminal buds present; aments inserted on old wood mainly below the leaves; [in our area, common and in the Coastal Plain, Mountains, and Piedmont] Morella
2 Fruit flattened, not waxy, partially enclosed in 2 wing-like bractlets; terminal buds lacking; aments inserted at the summit of the branchlets of the preceding year; [in our area, very rare and restricted to bogs in the Mountains]

Myrica

Comptonia L'Heritier ex Aiton 1789 (Sweet-fern)
A monotypic genus, a shrub, of e. North America, known as fossils from a much broader area. References: Bornstein in FNA (1997); Kubitzki in Kubitzki, Rohwer, \& Bittrich (1993).

Comptonia peregrina (Linnaeus) J.M. Coulter, Sweet-fern. Mt (GA, NC, SC, VA), Pd, Cp (NC, VA): in the mountains on xeric ridges at low to medium elevations, usually in fire-maintained habitats, also in xeric and fire-maintained habitats on monadnocks in the upper Piedmont and in dry, sandy sites in the lower Piedmont and fall-line sandhills; common (rare in Piedmont and Coastal Plain) (GA Special Concern, SC Rare). April; August-September. Widespread in ne. North America, south to sc. and w. NC, w. SC, ne. GA, and nc. TN; much more common in the northern parts of its range. [= RAB, C, FNA, K, S, W; > Comptonia peregrina var. asplenifolia (Linnaeus) Fernald -- F, Y; > Comptonia peregrina var. peregrina - F, Y; > Myrica asplenifolia Linnaeus var. asplenifolia -- G; > Myrica asplenifolia var. tomentosa (Chevallier) Gleason -- G]

Guide to the Flora of the Carolinas, Virginia, and Georgia, Working Draft of 10 June 2005 -- MYRICACEAE

Wilbur (1994) makes a compelling case for the recognition of three genera among eastern North American Myricaceae, and for application of the name Myrica to Myrica gale. The typification of the genus Myrica with Myrica gale Linnaeus has been confirmed (Brummitt 1999); thus, the familiar southeastern species placed by many authors in Myrica must take another name. Wilbur (1994) prefers to treat our species as subgenus Cerothamnus (Tidestrom) Wilbur of genus Morella Loureiro; subgenus Morella is restricted to e. Asia, the Philippines, and Malaysia, and differs in a number of ways from subgenus Cerothamnus, including its fleshy and succulent, rather than waxy and hard, berries. Small maintained Cerothamnus at the generic level. Wilbur's inclusion of Cerothamnus in Morella may well be warranted (and is followed here), but I disagree with his provisional decision to include the taxon treated below as Morella pumila in Morella cerifera, and the taxon treated below as Morella pensylvanica in Morella caroliniensis, though their appropriate rank may be questioned. References: Bornstein in FNA (1997); Wilbur (1994)=Z; Wilbur (2002); Kubitzki in Kubitzki, Rohwer, \& Bittrich (1993).

1 Fresh leaves odorless when crushed; flowers unisexual, the staminate and pistillate flowers on different plants; leaves usually entire; [of s. GA south and west]; [subgenus Cerothamnus, series Faya] . . . . . . . . . . . . . . . . . . . . . . . . . . . . Morella inodora
1 Fresh leaves aromatic when crushed; flowers bisexual, staminate and pistillate on the same plant; leaves usually serrate, at least near the tip; [collectively widespread in our area]; [subgenus Cerothamnus, series Cerothamnus].
2 Leaves oblanceolate (generally narrowly so), most of them \(0.5-1.5 \mathrm{~cm}\) wide, \(4-6 \times\) as long as wide, evergreen; mature fruits \(2.0-3.5 \mathrm{~mm}\) in diameter.
3 Medium shrub to small tree (usually 2-10 m tall), not stoloniferous; leaves of fertile branches 4-9 cm long, \(8-20 \mathrm{~mm}\) wide; [of a wide range of wetland habitats, including wet Coastal Plain pinelands] . . . . . . . . . . . . . . Morella cerifera
3 Small shrub (usually less than 1 m tall), strongly stoloniferous; leaves of fertile branches \(1.5-4 \mathrm{~cm}\) long, 3-8 mm wide; [restricted to Coastal Plain pinelands (or areas formerly so)] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Morella pumila
2 Leaves elliptic to broadly oblanceolate, most of them \(1.5-4 \mathrm{~cm}\) wide, \(2-4 \times\) as long as wide, evergreen to deciduous; mature fruits \(3.0-7.0 \mathrm{~mm}\) in diameter.
4 Leaves subcoriaceous and more or less evergreen, not revolute (or slightly so if sun-grown), the larger ones usually about 9 cm long and 3.5 cm wide, with punctate glands dense on the lower surface and nearly or entirely absent on the upper surface; fruits \(3-4.5 \mathrm{~mm}\) in diameter, the fruit wall glabrous or sparsely glandular, the warty protuberances glandular; twigs densely hairy to rarely glabrous; older branches blackish; [of various boggy habitats, widespread in our area]

Morella caroliniensis
4 Leaves coriaceous, tardily deciduous, often revolute, the larger ones about 6 cm long and 2 cm wide, with punctate glands fairly dense on both surfaces; fruits 4-6 (-7) mm in diameter, the fruit wall and warty protuberances densely hirsute when young; twigs glabrous to sparsely hairy; older branches whitish gray; [usually of dunes, from Dare County, NC northwards]

Morella pensylvanica

Morella caroliniensis (P. Miller) Small, Pocosin Bayberry, Evergreen Bayberry. Cp (GA, NC, SC, VA), Pd (GA, NC, SC): pocosins, wet savannas and pine flatwoods, sandhill seepage bogs, and other peaty or sandy-peaty wetlands; common. April; August-October. Primarily limited to the Southeastern Coastal Plain, from NJ south to FL and west to TX and AR. [= K; Myrica heterophylla Rafinesque -- RAB, C, FNA, W, Y; > Myrica heterophylla var. heterophylla - F; > Myrica heterophylla var. curtissii (Chevallier) Fernald -- F; < Myrica pensylvanica -- G; < Cerothamnus carolinensis -- S (also see Morella pensylvanica); < Morella caroliniensis (P. Miller) Small -- Z (also see Morella pensylvanica)]

Morella cerifera (Linnaeus) Small, Common Wax-myrtle, Southern Bayberry. Cp (GA, NC, SC, VA): interdune swales (where often dominant), pocosins, brackish marshes, other wet to moist habitats, now also widely planted (including in the Piedmont) as an ornamental or landscaping shrub; common. April; August-October. Widespread in the Coastal Plain of Southeastern United States: NJ south to FL and west to TX. Our most common Morella, and also the largest, sometimes becoming a small tree, to at least 10 m tall and 20 cm DBH. See Morella pumila for a discussion of the controversial taxonomy of Morella cerifera and Morella pumila. [= Myrica cerifera Linnaeus var. cerifera -- RAB, Y; < Myrica cerifera -- C, FNA, GW (also see C. pumilus); = Myrica cerifera -- F, G; = Cerothamnus ceriferus (Linnaeus) Small -- S; < Morella cerifera (Linnaeus) Small -- K, Z (also see Morella pumila)]

Morella inodora (Bartram) Small, Odorless Bayberry. Cp (GA): acid wetlands, especially in wooded, acid, streamhead "bogs" and bayheads, often associated with Magnolia virginiana, Persea palustris, Cyrilla racemiflora, Cliftonia monophylla, and Woodwardia areolata; rare (GA Special Concern). A Southeastern Coastal Plain endemic: se. GA west to s. MS. [= K, Z; = Myrica inodora Bartram -- FNA, GW, Y; = Cerothamnus inodorus (Bartram) Small -- S]

Morella pensylvanica (Mirbel) Kartesz, Northern Bayberry. Cp (NC, VA): dunes, sometimes even on the foredune and stoloniferously colonizing the upper beach, more typically behind the foredune on secondary dunes and sandy flats, often growing intermixed with Morella cerifera, but able to occupy drier sites higher on the dunes, from VA north, also ranging inland in sandy situations; uncommon (restricted in NC to barrier islands of Dare and Currituck counties, but locally common there). April; AugustOctober. This species reaches its southern limit at Avon (Kinnakeet), Dare County, NC. On interdune flats, it often grows intermixed with Morella cerifera, but is readily distinguished (even at a distance) by its stoloniferous growth (appearing as dome-shaped clones \(3-20 \mathrm{~m}\) in diameter), stouter twigs, and tardily deciduous leaves. The twigs of this species are noticeably stouter than those of Morella cerifera; measured at 10 cm from the twig tips, they are (2-) \(3-5 \mathrm{~mm}\) in diameter, those of Morella cerifera ca. 1.5-2.5 mm. [= K; = Myrica pensylvanica Loiseleur -- RAB, C, F, FNA, GW, Y; < Myrica pensylvanica -- G (also see Morella heterophylla); < Cerothamnus carolinensis -- S (also see Morella pensylvanica); < Morella caroliniensis (P. Miller) Small -- Z; = Cerothamnus pensylvanicus (Mirbel) Moldenke]

Morella pumila (Michaux) Small, Dwarf Bayberry, Dwarf Wax-myrtle. Cp (GA, NC, SC, VA): savannas, pine flatwoods, relatively moist to extremely dry sites in sandhills (under Quercus laevis and Q. geminata); common (VA Rare). April; August-October. A Southeastern Coastal Plain endemic: se. VA south to FL and west to LA (or TX). Some authors dismiss the distinction between this taxon and Morella cerifera as merely environmental, while others treat the two as distinct at the varietal or
specific level. In our area at least, they appear to be genetically distinct. They often occur in close proximity (though somewhat different habitats), seeming to maintain their distinctiveness. There are some observations that there is a phenologic difference, with Morella pumila peak flowering 3 weeks later than Morella cerifera (J. Townsend, pers. comm. 2002). Though the issue remains unresolved, I do not think that the stoloniferous growth of Morella pumila is only a fire response; I here maintain the two as distinct, pending further research. A varietal distinction would probably best reflect the relationship of these two taxa, but the appropriate combinations at the varietal level are not available in either Cerothamnus or Morella. [= Myrica cerifera Linnaeus var. pumila Michaux -- RAB, Y; < Myrica cerifera -- C, FNA, GW; = Myrica pusilla Rafinesque -- F, G; = Cerothamnus pumilus (Michaux) Small -S; < Morella cerifera (Linnaeus) Small -- K, Z]

Myrica Linnaeus 1753 (Sweet Gale)
A genus of two species, shrubs, of temperate and subarctic regions of North America and Eurasia. References: Bornstein in FNA (1997); Kubitzki in Kubitzki, Rohwer, \& Bittrich (1993).

Myrica gale Linnaeus, Sweet Gale. Mt (NC): peaty bogs; rare (NC Endangered Species). April; August-September. A circumboreal species, south in North America to NJ, PA, MI, MN, and OR, disjunct from PA and NJ to Henderson County, NC, where considered extirpated at one time, as a result of the destruction of the famous East Flat Rock Bog. This shrub has been relocated at a single site, where it is abundant in a small area (less than 0.25 hectare). [= C, FNA, G, GW, K, S, W, Y; = Gale palustris Chevallier -- RAB; > Myrica gale var. gale -- F]

\section*{MYRSINACEAE R. Brown (Myrsine Family)}

The traditional families Primulaceae, Myrsinaceae, and Theophrastaceae have been repartitioned by Källersjö, Bergqvist, \& Anderberg (2000) in order to create monophyletic groups. References: Källersjö, Bergqvist, and Anderberg (2000); Ståhl \& Anderberg in Kubitzki (2004).

1 Leaves alternate (or with some opposite or subopposite); flowers white.
2 Flowers axillary, nearly sessile; leaves \(3-10 \mathrm{~mm}\) long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Anagallis
2 Flowers in a terminal raceme, pedicellate, the flowers closely spaced, touching, the inflorescence thus appearing cylindrical, and generally drooping at the tip (similar to Saururus cernuus); leaves longer; [introduced, rarely naturalized in upland situations]

Lysimachia clethroides
1 Leaves opposite or whorled; flowers yellow, white, pink, red, or blue.
3 Leaves in a single terminal whorl; petals 7 . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Trientalis
3 Leaves opposite or whorled (if whorled, with several to many whorls); petals 0 or 5.
4 Leaves more than 2 cm long (sometimes less in L. nummularia, and then orbicular, about as wide as long); flowers yellow

Lysimachia
4 Leaves less than 2 cm long (and distinctly longer than wide); flowers red, blue, white, or pink.
5 Flowers on long pedicels; corolla present . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Anagallis
5 Flowers nearly sessile; corolla absent . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Glaux

Anagallis Linnaeus 1753 (Pimpernel)
(also see Centunculus)
A genus of 20-28 species, herbs, mostly Old World. References: Ståhl \& Anderberg in Kubitzki (2004)
1 Leaves alternate; flowers subsessile, on thick pedicels 0.3-1.0 mm long; leaf blades 3-10 mm long ............. A. minima
1 Leaves opposite (occasionally in whorls of 3); flowers pedicellate, on slender pedicels \(10-25 \mathrm{~mm}\) long; leaf blades \(5-30 \mathrm{~mm}\) long.
2 Flowers red (rarely white); pedicels usually longer than the leaves . . . . . . . . . . . . . . . . . . . . . A. arvensis var. arvensis
2 Flowers blue; pedicels usually shorter than the leaves . . . . . . . . . . . . . . . . . . . . . . . . . . [A. arvensis var. caerulea]
* Anagallis arvensis Linnaeus var. arvensis, Scarlet Pimpernel, Common Pimpernel. Cp (GA, NC, SC, VA), Pd (GA, NC, VA), Mt (VA): lawns, fields, disturbed areas; common, introduced from Europe. April-November. [=C, G; < A. arvensis -- RAB, F, GW, W , in part, infraspecific taxa not distinguished; = A. arvensis ssp. arvensis -- K, in the narrow sense; = A. arvensis ssp. arvensis -- S\(]\)

Anagallis minima (Linnaeus) E.H. Krause, Chaffweed, False-pimpernel. Cp, Mt (GA, SC), Pd (GA, VA): ditches, wet disturbed areas, savannas, pond margins; uncommon (rare in Mountains, rare in VA). March-June. This species occurs in widely scattered areas, nearly cosmopolitan. [= GW, K; = Centunculus minimus Linnaeus -- RAB, C, F, G, S, W]
* Anagallis arvensis Linnaeus var. caerulea (Schreber) Grenier \& Godron, Blue Pimpernel, is reported as introduced in PA, KY, OH , and other scattered states north and west of our area (Kartesz 1999). [ \(=\mathrm{C}, \mathrm{G} ;<\mathrm{A}\). arvensis -- RAB, F, GW, W, in part, infraspecific taxa not distinguished; = A. arvensis Linnaeus ssp. foemina (P. Miller) Schinz \& Thellung -- K; =A. arvensis ssp. coerulea Hartman -- S]
* Anagallis monellii Linnaeus is reported as a waif for Fairfax County, VA by Harvill et al. (1992) and Shetler \& Orli (2000). Not keyed. [= K]

\section*{Centunculus Linnaeus} [see Anagallis]

\section*{Glaux Linnaeus 1753 (Sea-milkwort)}

A monotypic genus, of north temperate coasts of the Old and New Worlds. Glaux appears to be embedded within Lysimachia and should be merged into that genus (Hao et al. 2004). References: Hao et al. (2004); Ståhl \& Anderberg in Kubitzki (2004).

Glaux maritima Linnaeus, Sea-milkwort. Cp (VA): saline coastal habitats; rare. June-July. The species is interruptedly circumboreal, in North America from Québec south to VA on the east coast, and from British Columbia south to OR on the west coast, also inland in w. North America, from Saskatchewan south to NM. G suggests that G. maritima is introduced near its southern limit in the east. [= C, K; > G. maritima var. maritima -- F, G]

\section*{Lysimachia Linnaeus 1753 (Loosestrife)}

A genus of about 150 species, herbs (rarely shrubs), cosmopolitan. Hao et al. (2004) showed that the traditional subgeneric classification of Lysimachia is highly artificial, and that Glaux is embedded within Lysimachia. References: Coffey \& Jones (1980) \(=\) Z; Hao et al. (2004); Ståhl \& Anderberg in Kubitzki (2004). Key partly adapted from Z.

1 Leaves alternate; flowers white, in a terminal raceme, the tip often lax
L. clethroides

1 Leaves opposite or whorled; flowers yellow, borne variously.

\section*{2 Leaves nearly round; plant trailing, rooting at nodes . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . L. nummularia}

2 Leaves linear, lanceolate, elliptic, or ovate; plant erect (or trailing and rooting at the nodes in L. radicans, which has lanceolate leaves).
3 Flowers in a terminal raceme or panicle, subtended by bracts much smaller than the stem leaves.
4 Inflorescence a terminal panicle
4 Inflorescence a terminal raceme.
5 Leaves narrowly ovate, broadest near the base, with 3 prominent veins . . . . . . . . . . . . L. asperulifolia
5 Leaves linear to lanceolate, broadest near the middle, with 1 prominent vein.
6 Leaves linear to narrowly lanceolate, (1-) 2-4 (-8) mm wide; sepals stipitate-glandular . . . L. Ioomisii
6 Leaves lanceolate to elliptic, 7-20 mm wide; sepals glabrous.
7 Flowers in part (the lower) in the axils of well-developed leaves . . . . . . . . . . . . . L. . \(\mathbf{x}\) producta
7 Flowers all in the axils of much reduced linear bracts . . . . . . . . . . . . . . . . . . . . . . L. terrestris
3 Flowers axillary, all or most of them subtended by leaves similar in shape to (though often somewhat smaller than) stem leaves not subtending flowers (or with flowers in axillary, peduncled, densely-flowered racemes in \(L\). thyrsiflora).
8 Flowers in peduncled axillary racemes in the axils of midstem leaves; petals linear to lanceolate, ca. 5 mm long and ca. 1 mm wide, much surpassed by the stamens . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [L. thyrsiflora]
8 Flowers solitary, all or most of them subtended by leaves similar in shape to (though often somewhat smaller than) normal stem leaves; petals lanceolate to ovate, as long or longer than the stamens.
9 Stem leaves whorled (in adult plants); leaves "punctate" with sinuous, elongate markings.
10 Petals yellow, marked with black lines; sepals \(2.5-5 \mathrm{~mm}\) long . . . . . . . . . . . . . . . . . . . L. quadrifolia
10 Petals plain yellow, not marked with black lines; sepals \(5.5-9 \mathrm{~mm}\) long . . . . . . . . . . . . L. punctata 9 Stem leaves opposite; leaves not "punctate."

11 Mid-cauline leaves with petioles ciliate their entire length.
12 Mid-cauline leaves 1-2 mm wide; flowers 7-14 mm across; [of ne. AL] . . . . . . . . . [L. graminea]
12 Mid-cauline leaves \(4-60 \mathrm{~mm}\) wide; flowers \(11-26 \mathrm{~mm}\) across; [collectively widespread].
13 Mid-cauline leaves ovate to lanceolate, \(17-60 \mathrm{~mm}\) wide; sepals with 3 (or 6 ) usually reddish-brown veins \(\qquad\)
\(\qquad\)
13 Mid-cauline leaves lanceolate to linear, 4-23 mm wide; sepals without reddish-brown veins. 14 Cilia of the petiole extending onto the base of the leaf blade; leaf blade lanceolate to linear, typically about \(8-12 \times\) as long as wide, cuneate at the base; sepal venation inconspicuous or apparently absent; capsules 2-4.5 mm in diameter . . . L. lanceolata
14 Cilia of the petiole not extending onto the leaf blade; leaf blade lanceolate to ovate, typically \(2-4 \times\) as long as wide, rounded to cuneate at the base; sepal venation conspicuous; capsules \(4-6.5 \mathrm{~mm}\) in diameter L. hybrida 11 Mid-cauline leaves with petioles pubescent only along basal portion.

15 Rhizomes absent, new shoots arising from crown of rootstock . . . . . . . . . . . . . . . . . . . L. tonsa
15 Rhizomes present, new shoots arising from the rhizome.
16 Plant reclining or trailing, rooting at the nodes . . . . . . . . . . . . . . . . . . . . . . . . L. radicans

\section*{Flora of the Carolinas, Virginia, and Georgia, Working Draft of 12 April 2004 - MYRSINACEAE}

16 Plant erect, not rooting at the nodes
17 Leaf blades linear to narrowly lanceolate, typically \(8-14 \times\) as long as wide, cuneate to tapering at the base, with a prominent midrib; sepals not conspicuously veined, 1-2 mm wide
L. quadriflora

17 Leaf blades ovate to lanceolate, typically \(2-4 \times\) as long as wide, rounded to cuneate at the base, with the midrib not prominent; sepals conspicuously veined, \(0.5-4 \mathrm{~mm}\) wide
L. hybrida

Lysimachia asperulifolia Poiret, Pocosin Loosestrife, "Roughleaf Loosestrife". Cp (NC, SC): low pocosins, high pocosins, streamhead pocosins, savanna-pocosin ecotones, sandhill-pocosin ecotones; rare (US Endangered, NC Endangered, SC Rare). May-June; August-October. Endemic to the Coastal Plain of NC and SC. L. asperulifolia is a very distinctive species, easily recognized vegetatively by its whorls of sessile, rounded-based, acuminate, bluish-green (to yellowish-green when shaded or otherwise stressed) leaves. The leaves of \(L\). asperulifolia are not rough; the common name "roughleaf loosestrife" is a misnomer, apparently based on a mistranslation of the specific epithet, the translator assuming that "asperulifolia" meant "rough-leaved." The epithet actually refers to the perceived similarity of the leaves to those of the European Asperula odorata (treated in this work as Galium odoratum), Sweet Woodruff, a plant with which Poiret would have been very familiar. The leaves of \(G\). odoratum are similar to those of \(L\). asperulifolia in their whorled disposition. Franklin (2001) studied the biology of this rare species. [= K; = L. asperulaefolia -- RAB, GW, S (an orthographic variant)]

Lysimachia ciliata Linnaeus, Fringed Loosestrife. Pd, Mt, Cp (GA, NC, SC, VA): mesic forests, especially bottomlands and coves dominated by hardwoods; common. June-August; August-October. Newfoundland west to AK, south to GA, AL, MS, AR, KS, NE, CO, NM, UT, ID, and OR. [= RAB, C, F, GW, K, W, Z; = Steironema ciliatum (Linnaeus) Baudo -- G, S]

Lysimachia clethroides Duby. Mt (NC): roadsides (cultivated and rarely persistent or escaped); rare, introduced from Japan. July-August. Collected in the Mountains of NC (Macon County), escaped from cultivation; it is also reported as naturalized in Grundy County, TN (Chester, Wofford, \& Kral 1997, Kral 1981). It differs from our other species in its white flowers, in a dense terminal spike (often with secund tip) and alternate leaves. [= C, G, K]

Lysimachia fraseri Duby, Fraser's Loosestrife. Mt (GA, NC, SC): hardwood forests, forest edges and roadbanks, thin soils around rock outcrops, usually flowering only when exposed to extra sunlight by a tree-fall light gap or other canopy opening; rare (GA Rare, NC Endangered, SC Rare). June-August; September-October. W. NC and e. TN south to n. SC, n. GA, and AL; disjunct in s. IL and nw. TN (Stewart County) (Chester, Wofford, \& Kral 1997). This rare species is limited in NC to the mountains south of the Asheville Basin, especially in the escarpment gorges of Macon and Jackson counties. Potentially the largest and coarsest of our Lysimachia (up to 2 meters tall), L. fraseri usually occurs as much smaller seedlings and non-flowering individuals. When a tree-fall light gap occurs, individuals flower and fruit. Even seedlings can be separated from the more common and widespread \(L\). quadrifolia by the following characteristics (all best observed at \(10 \times\) ): leaves with a narrow, translucent red border, upper internodes of the stem glandular-puberulent, and backlighted leaf without sinuous, translucent lineations (L. quadrifolia: leaves without red border, upper internodes sparsely pubescent with longer, nonglandular hairs, or rarely a few of the hairs with slightly bulbous tips, and backlighted leaf with numerous sinuous, translucent lineations). [= RAB, GW, K, S, W]

Lysimachia hybrida Michaux, Lowland Loosestrife. Cp (NC, SC, VA), Mt, Pd (NC, VA): mesic hardwood forests, wet areas; rare (NC Watch List, VA Watch List). June-August; September-October. ME and s. Québec west to Alberta and WA, south irregularly to n . FL, AR, NE, and AZ. [= C, F, K, W, Z; = L. lanceolata var. hybrida (Michaux) A. Gray -- RAB, GW; = Steironema hybridum (Michaux) Rafinesque ex B.D. Jackson -- G, S]

Lysimachia lanceolata Walter, Lanceleaf Loosestrife. Mt, Pd, Cp (GA, NC, SC, VA): mesic to relatively dry forests, forest edges, roadbanks, primarily on circumneutral soils; uncommon. June-August; September-October. NJ, PA, OH, MI, and WI south to GA, panhandle FL, AL, MS, LA, and ne. TX. [=C, F, K, W, Z; = L. lanceolata var. lanceolata -- RAB, GW; = Steironema lanceolatum (Walter) Gray -- G, S; = Steironema heterophyllum (Michaux) Baudo -- S]

Lysimachia loomisii Torrey, Carolina Loosestrife. Cp (GA, NC, SC): moist to wet savannas, pocosin ecotones; uncommon (GA Special Concern). May-June; August-October. Endemic to the outer and middle Coastal plain of NC, SC, and e. GA. [= RAB, GW, K, S]
* Lysimachia nummularia Linnaeus, Creeping Charlie, Creeping Jenny, Moneywort. Pd (GA, NC, SC, VA), Mt, Cp (NC, SC, VA): lawns, pastures, seepages, other moist, disturbed places; common (uncommon south of VA), introduced from Europe. MayJuly; August-September. The leaves have many minute, maroon dots. [= RAB, C, F, G, GW, K, S, W]

Lysimachia xproducta (A. Gray) Fernald (pro sp.). Mt (NC, VA), Pd (VA), Cp (NC): moist areas; rare. May-July; AugustOctober. This is a fertile hybrid of L. quadrifolia and L. terrestris, sometimes occurring in the apparent absence of one or both parents. [= RAB , C, K; = L. producta (A. Gray) Fernald -- G, S]

\section*{* Lysimachia punctata Linnaeus, Large Loosestrife, Spotted Loosestrife. Mt (NC): disturbed areas; rare, introduced from} Eurasia. June-July; August? First found in NC in 1985 (Weakley in prep.). [= C, F, G, K]

Lysimachia quadriflora Sims, Smooth Loosestrife, Four-flowered Loosestrife. Mt (GA, VA), Pd? (NC?): wet meadows and calcareous fens, stream banks; rare (NC Watch List, VA Rare). July-September. MA, s. Ontario, MI, and ND south to w. VA, WV, nw. GA, AL, and AR; mainly north and west of the Ohio River, very rare and scattered in or east of the Appalachians. Reported for c. NC by Coffey \& Jones (1980). [= C, F, K, W, Z; = Steironema quadriflora (Sims) Hitchcock -- G]

Lysimachia quadrifolia Linnaeus, Whorled Loosestrife. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): a wide variety of forests and openings, including pine savannas of the outer Coastal Plain, ranging from moist to very dry; common (uncommon in Coastal Plain south of VA). May-August; August-October. ME west to WI and MN, south to SC, c. GA, AL, and TN. Although the species normally has whorled leaves, immature and small plants often have opposite leaves only. See L. fraseri for discussion of vegetative features useful in distinguishing the two species. [= RAB, C, F, G, GW, K, S, W]

Lysimachia radicans Hooker, Trailing Loosestrife. Mt (VA), Cp (NC?, VA): moist forests, swamps; rare (VA Rare). JuneAugust. The main distribution of this species is in the Mississippi Embayment, from MO and w. TN south to s. AL, MS, AR, LA, and
e. TX; disjunct occurrences in VA and (allegedly) e. NC are curious. The report for NC is from a species list for Nags Head Woods, Dare County; it is unpublished and apparently not documented by an herbarium specimen. [= C, F, K, W, Z; = Steironema radicans (Hooker) A. Gray -- G, S]

Lysimachia terrestris (Linnaeus) Britton, Sterns, \& Poggenburg, Bog-candles, Swamp-candles. Mt (GA, NC, SC, VA), Pd, Cp (NC, SC, VA): bogs, wet meadows, and swamp forests; uncommon. May-July; August-October. Newfoundland west to MN and Saskatchewan, south to SC, GA, e. TN, and sc. TN. [= RAB, C, G, GW, K, S, W; L. terrestris var. terrestris -- F]

Lysimachia tonsa (Wood) Wood ex Pax \& R. Knuth, Southern Loosestrife, Appalachian Loosestrife. Pd (GA, NC, SC, VA), Mt (GA, VA): upland forests, especially over calcareous or mafic rocks; rare (NC Watch List, VA Watch List). May-July; AugustOctober. Sc. VA and KY south to SC, wc. GA, and e. TN. The range is centered on the Southern Appalachians, but the species is essentially absent from the higher mountains -- a "doughnut range." [= RAB, C, F, K, W, Z; =? Steironema intermedium Kearney -G; = Steironema tonsum (Wood) Bicknell ex Britton -- S]
* Lysimachia barystachys Bunge is reported from a single county in nc. GA (Jones \& Coile 1988). [= K] \{investigate; not yet keyed\}

Lysimachia graminea (Greene) Handel-Mazzetti, Grassleaf Yellow-loosestrife. Endemic to ne. AL. [= K, Z; = Steironema gramineum Greene - S]
* Lysimachia japonica Thunberg, introduced, is reported for WV (Kartesz 1999). [= K] \{investigate; not yet keyed\}

Lysimachia thyrsiflora Linnaeus, Tufted Loosestrife, ranges south to NJ, PA, OH, and MO (Kartesz 1999), and MD (from Big Marsh, Kent County) (Steury, Tyndall, \& Cooley (1996). [= C, K; = Naumburgia thyrsiflora (Linnaeus) Duby] \{not yet keyed; add synonymy\} * Lysimachia vulgaris Linnaeus, Garden Loosestrife, is introduced and naturalized south at least to se. and sc. PA (Rhoads \& Klein 1993), WV, KY, MD, and NJ (Kartesz 1999). [= C, K] \{not yet keyed; add synonymy\}

Another hybrid has been reported: \(\mathrm{L} \times r\) radfordii Ahles, a hybrid of \(L\). loomisii \(\times\) quadrifolia. It is intermediate between its parents.

\section*{Trientalis Linnaeus 1753 (Starflower)}

A genus of 2 species, herbs, north temperate. References: Ståhl \& Anderberg in Kubitzki (2004).
Identification notes: Trientalis can be recognized by its terminal whorl of leaves ( \(4-10 \mathrm{~cm}\) long), the one to several white flowers borne on terminal, slender pedicels, each flower typically with 7 petals (inconspicuously united at the bases), each petal acuminate. The plant is reminiscent of a white-flowered Lysimachia with only one whorl of leaves.

Trientalis borealis Rafinesque ssp. borealis, Starflower. Mt (GA, NC, VA): northern hardwood forests, rich slope forests, often in second-growth areas; uncommon in VA, rare farther south (GA Endangered, NC Rare). May-June. This northern species, widespread in the mountains of VA, and known from a few locations in n. GA and ne. TN (Chester, Wofford, \& Kral 1997), was first located in NC only in 1988 (Dellinger 1989). "The attractive white corollas, usually with 7 petals united only at the very base, are open in the late spring and they drop intact - like fallen stars" (Voss 1996). [ \(=\mathrm{K}\); < T. borealis -- C, F, G, W, infraspecific taxa not distinguished]

NELUMBONACEAE Dumortier 1829 (Lotus-lily Family)
A family of 1 genus and 2 species, aquatic herbs, of temperate and subtropical e. North America and e. Asia. References: Wiersema in FNA (1997); Williamson \& Schneider in Kubitzki, Rohwer, \& Bittrich (1993).

Nelumbo Adanson 1763 (Lotus-lily, Lotus, Sacred-lotus, Sacred-bean)
A genus of 2 species, aquatic herbs, of temperate and subtropical e. North America and e. Asia. References: Williamson \& Schneider in Kubitzki, Rohwer, \& Bittrich (1993).

Identification note: Nelumbo can be immediately distinguished in vegetative condition from the other "pads" (Nymphaea, Nuphar, and Nymphoides) by its peltate leaves.

1 Petals yellow; mature fruits ('nuts') usually less than \(1.25 \times\) as long as wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . N. Iutea
1 Petals pink or white; mature fruits ('nuts') usually more than \(1.5 \times\) as long as wide . . . . . . . . . . . . . . . . . . . . . . . . . N. nucifera
Nelumbo Iutea Willdenow, Yonkapin, American Lotus-lily, Yellow Lotus, Water-chinquapin, Pond-nuts. Cp (GA, NC, SC, VA), Pd (VA), Mt (GA, VA): ponds, natural lakes; uncommon. June-September. NY and s. Ontario west to MN and IA, south to s. FL and e. TX, and south into the West Indies and Mexico. [= RAB, C, F, FNA, G, GW, K, S, W; N. pentapetala (Walter) Fernald] * Nelumbo nucifera Gaertner, Sacred-lotus, Oriental Lotus-lily, Pink Lotus. Cp (NC, SC), Pd (NC), Mt (GA): ponds and lakes; rare, introduced from Asia. June-September. [= RAB, C, F, FNA, G, GW, K]

A family of about 31 genera and 400 species, trees, shrubs, vines, and herbs, of tropical, subtropical, and (less commonly) warm temperate regions, especially diverse in the New World. References: Bogle (1974)=Z; Spellenberg in FNA (2003b); Bittrich \& Kühn in Kubitzki, Rohwer, \& Bittrich (1993).

1 Flowers less than 3 mm long, lacking involucral bracts subtending the petaloid calyx
Boerhavia
1 Flowers more than 10 mm long, with involucral bracts (simulating a calyx) subtending the petaloid calyx . . . . . . . . . . Mirabilis

\section*{Boerhavia Linnaeus 1753 (Spiderling)}

A genus of about 20-40 species, annual and perennial herbs, of tropical, subtropical, and warm temperate regions of the Old and New World. References: Spellenberg in FNA (2003b); Bogle (1974)=Z; Bittrich \& Kühn in Kubitzki, Rohwer, \& Bittrich (1993).

1 Fruit rounded at apex, stipitate-glandular; perennial . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . B. coccinea
1 Fruit flat at the apex, glabrous; annual . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . B. erecta
* Boerhavia coccinea P. Miller, Wineflower. Cp (NC, SC, VA): disturbed areas, adventive on ballast; rare, introduced from tropical America. June-September. Contrary to the statement in RAB that this species is "apparently not established," it is well established on the Wilmington (New Hanover County, NC) waterfront. [= RAB, FNA, K; = Boerhaavia coccinea -- S, orthographic variant]

Boerhavia diffusa Linnaeus, Red Spiderling, Spreading Hogweed. Cp (SC): [=FNA, K, Z]
Boerhavia erecta Linnaeus, Erect Spiderling. Cp, Pd (GA, NC, SC): sandy fields, roadsides, disturbed areas; uncommon. May-October. NC south to FL, west to TX and AZ, perhaps only introduced in our area. [= RAB, FNA, K, Z; = Boerhaavia erecta -G, S, orthographic variant]
\{disentangle coccinea and diffusa; rewrite key\}

Mirabilis Linnaeus 1753 (Umbrella-wort, Four-o'clock)
A genus of about 55-60 species, annual and perennial herbs, of warm temperate America and s. Asia. References: Spellenberg in FNA (2003b); Le Duc (1995); Bittrich \& Kühn in Kubitzki, Rohwer, \& Bittrich (1993).

1 Petaloid calyx with a narrow tube \(3-4 \mathrm{~cm}\) long, the spreading portion to 5 cm in diameter; involucre with 1 flower, not expanding in fruit; [section Mirabilis] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . M. Malapa
1 Petaloid calyx with a broad tubeless than 0.5 cm long, the spreading portion less than 1.5 cm in diameter; involucre with 3-5 flowers, expanding in fruit; [section Oxybaphus].
2 Leaves cuneate at the base, 2.5-6x as long as wide; [native, of dry sandy habitats in s. SC southwards] . ..... M. albida
2 Leaves cordate at the base, \(1-2 \times\) as long as wide; [introduced, of disturbed habitats] . ............... M. nyctaginea
Mirabilis albida (Walter) Heimerl, Wild Four-o'clock, Pale Umbrella-wort. Cp (GA, SC): sandhills, adjacent disturbed sandy soils; rare (GA Special Concern). May-August. S. SC south to GA, west to TX, north in the interior to c. TN, IA, and KS. [= RAB, C, F, K, Z; = Oxybaphus albidus (Walter) Sweet -- G; = Allionia albida Walter -- S]
* Mirabilis jalapa Linnaeus, Garden Four-o'clock, Marvel-of-Peru. Cp (GA, NC, SC, VA), Pd (NC, SC, VA): disturbed areas, or persistent at former garden sites; uncommon, introduced from tropical America. June-November. [= RAB, C, F, G, K, S, Z]
* Mirabilis nyctaginea (Michaux) MacMillan, Heart-leaved Umbrella-wort, Wild Four-o'clock. Mt, Pd (NC, VA), Cp (VA): railroad embankments, other disturbed areas; rare, introduced from c. North America. June-October. [= RAB, C, F, K, W, Z; = Oxybaphus nyctagineus (Michaux) Sweet -- G; = Allionia nyctaginea Michaux -- S]

Mirabilis linearis (Pursh) Heimerl var. linearis. Manitoba and Alberta, south to TN, MS, and CA; scattered elsewhere in e. North America by introduction. [= FNA; < M. linearis - C, F, K; < Oxybaphus linearis (Pursh) B.L. Robinson - G] \{not yet keyed\}

\section*{NYMPHAEACEAE R.A. Salisbury 1805 (Water-lily Family)}

A family of 6 genera and about 75 species, aquatic herbs, cosmopolitan. References: Wiersema \& Hellquist in FNA (1997); Schneider \& Williamson in Kubitzki, Rohwer, \& Bittrich (1993); Les et al. (1999).

1 Flowers nearly spherical, 2-5 cm in diameter; sepals 6 (in our species), petaloid, green to yellow, incurved; petals many, inconspicuous, scalelike or staminodial; leaves often of 2 types, the submersed leaves (when present) thinner in texture than the floating or emersed leaves; floating or emersed leaves having \(60-90 \%\) of their surface area with vasculature derived from the midrib; rhizome with triangular or winged leaf scars; [subfamily Nupharoideae] Nuphar
1 Flowers hemispheric, 4-20 cm across; sepals 4, greenish, inconspicuous; petals spreading and ascending, white or yellow, showy; leaves of 1 type, floating; floating leaves having 25-40 \% of their surface area with vasculature derived from the midrib; rhizome with circular leaf scars; [subfamily Nymphaeoideae]

Nymphaea

\section*{Flora of the Carolinas, Virginia, and Georgia, Working Draft of 10 June 2005 -- NYMPHAEACEAE}

Nuphar J.E. Smith 1809 (Spatterdock, Yellow Pondlily)
A genus of about 16 species, aquatic herbs, of north temperate areas. Beal (1956) recognized 8 taxa of Nuphar in North America, which he treated as subspecies of the European N. lutea. Voss's (1985) statement (about the genus in Michigan) "our plants are quite easily distinguished ... and they are treated here as closely related species" applies equally (or better!) in our area. References: Beal (1956)=Z; Wiersema \& Hellquist in FNA (1997); Padgett (1999)=Y; Schneider \& Williamson in Kubitzki, Rohwer, \& Bittrich (1993). Key based in large part on FNA.

1 Sepals 5 (or 5-6 in N. rubrodisca); stigmatic disc red; fruit deeply contricted below the stigmatic disc; leaf blades 3.5-25 cm long; [section Nuphar].
2 Anthers 1-3 mm long; stigmatic disc with 6-10 deep crenations; stigmatic rays terminating 0-0.2 mm from the margin of the disc; constriction below disc 1.5-5 mm in diameter; leaf sinus \(2 / 3\) or more the length of the midrib; leaf blades 3.5-10 ( -13 ) cm long
[N. microphylla]
2 Anthers (2-) 3-6 mm long; stigmatic disc with 8-15 shallow crenations; stigmatic rays terminating 0-1.6 mm from the margin of the disc; constriction below disc 5-10 mm in diameter; leaf sinus ca. 1/2 the length of the midrib; leaf blades 525 cm long
[N. rubrodisca]
1 Sepals 6-9 (-12); stigmatic disc yellow, green, or sometimes reddish; fruit slightly or not at all constricted below the stigmatic disc; leaf blades 7-50 cm long; [section Astylus].
3 Floating leaf blades \(2-6 \times\) as long as wide, the sinus less than \(1 / 4\) as long as the midrib; thin-textured submersed leaves often more abundant than the floating leaves; [of blackwater or tidal streams, rivers, and lakes of the Coastal Plain, se. VA, e. NC, e. SC, Panhandle FL, s. AL].
4 Floating leaf blades \(2-3 \times\) as long as wide; stigmatic rays linear, mostly terminating 1-2 mm from the edge of the disk; [blackwater streams and rivers, Panhandle FL and s. AL] .
[N. ulvacea]
4 Floating leaf blades \(3-6 \times\) as long as wide, the sinus less than \(1 / 4\) as long as the midrib; stigmatic rays elliptic, terminating \(<1 \mathrm{~mm}\) from the edge of the disk; [of blackwater or tidal streams, rivers, and lakes of the Coastal Plain of se. VA to e. SC]
N. sagittifolia

3 Floating leaf blades \(1-2 \times\) as long as wide, the sinus more than \(1 / 3\) as long as the midrib; floating or emersed leaves more abundant than submersed leaves; [collectively of various habitats and distributions, but not as above].
5 Leaf petiole flattened on the upper (adaxial) surface and winged along the margins; fruit usualy purplish; sepals red or maron at the base adaxially
[N. variegata]
5 Leaf petiole terete or slightly flattened, not winged; fruit usually greenish or yellowish; sepals yellow or red at the base adaxially.
6 Lower leaf surface glabrous to sparsely pubescent; leaves 7-30 cm wide, the lobes acute to broadly rounded;
leaves mostly emersed . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . N. advena

6 Lower leaf surface densely pubescent; leaves 20-45 cm wide, the lobes broadly rounded; leaves mostly floating

\section*{N. orbiculata}

Nuphar advena (Aiton) R. Brown ex Aiton f., Broadleaf Pondlily. Cp, Pd, Mt (GA, NC, SC, VA): lakes, ponds, natural depression ponds, old millponds, slow-flowing rivers (blackwater and brownwater); common. April-October. The most widespread and common Nuphar in e. North America, ranging from ME west to WI, south to s. FL, Cuba, TX, and n. Mexico. See N. sagittifolia for discussion of the two taxa. [= C, FNA; = Nuphar luteum (Linnaeus) Sibthorp \& J.E. Smith ssp. macrophyllum (Small) E.O. Beal -RAB, GW, W, Z; > Nuphar advena-F, G; > Nuphar fluviatile (Harper) Standley -- F, G; > Nuphar puteorum Fernald - F; = Nuphar lutea J.E. Smith ssp. advena (Aiton) Kartesz \& Gandhi -- K; > Nymphaea advena Aiton -- S; > Nymphaea chartacea Miller \& Standley - S; > Nymphaea fluviatilis Harper -- S; = Nuphar advena ssp. advena - Y]

Nuphar orbiculata (Small) Standley. Cp (GA): quiet waters in blackwater swamps; uncommon (GA Watch List). A Southeastern Coastal Plain endemic: FL north to ne. GA. [= FNA; = Nuphar lutea ssp. orbiculata (Small) E.O. Beal -- K; > Nymphaea orbiculata Small - S; > Nymphaea bombycina (Miller \& Standley) Standley - S; = Nuphar advena (Aiton) Aiton f. ssp. orbiculata (Small) D. Padgett - Y; = Nuphar luteum ssp. orbiculatum (Small) E.O. Beal -- Z]

Nuphar sagittifolia (Walter) Pursh, Narrowleaf Pondlily, Bonnets. Cp (NC, SC, VA): blackwater streams, rivers, and lakes, in swift, sluggish, or stagnant water, extending downriver into freshwater tidal areas; uncommon (NC Rare, VA Rare). April-October. Endemic to our area: e. VA south to ne. SC, very conspicuous and locally abundant on shallow bars along rivers such as the Northeast Cape Fear, Black, and Waccamaw, and forming dense colonies in Lake Waccamaw. Apparent hybrids with N. advena have been named Nuphar \(\times\) interfluitans Fernald. The submersed leaves have somewhat the texture and appearance of a thin leaf lettuce or the marine alga Ulva. This species appears to be closely related to N. ulvacea (Miller \& Standley) Standley of blackwater rivers of panhandle FL, another phytogeographic connection between se. NC and panhandle FL. DePoe \& Beal (1969) and Beal \& Southall (1977) argue that this taxon and N. advena intergrade clinally, with N. advena inland and N. sagittifolia in the outer Coastal Plain, and that the two taxa are maintained by water temperatures. This ignores the fact that the two taxa often occur in close proximity to one another in both the inner and outer Coastal Plain. The frequency of so-called intermediates has also been exaggerated; few populations will present any difficulties in identification. I prefer to treat these taxa as species, with rare hybridization or introgression. [= C, FNA; = Nuphar luteum (Linnaeus) Sibthorp \& J.E. Smith ssp. sagittifolium (Walter) E.O. Beal -RAB, GW, Z; = Nuphar sagittifolium -- F, G, an orthographic variant; = Nuphar lutea J.E. Smith ssp. sagittifolia (Walter) E.O. Beal -K; = Nymphaea sagittifolia Walter -- S]

Nuphar microphylla (Persoon) Fernald. Nova Scotia, Québec, and Manitoba south to s. NJ, se. PA, MI, IL, and MN. [= C, FNA, Y; = Nuphar microphyllum - F, G; = Nuphar lutea ssp. pumila (Timm) E.O. Beal -- K; = Nuphar pumila Timm; = Nuphar luteum
```

ssp. pumilum (Timm) E.O. Beal - Z]

```

Nuphar rubrodisca Morong. New Brunswick, Québec, and Ontario south to NJ, PA, MI, and MN. [= FNA; = Nuphar \(\times\) rubrodisca Morong -- C; = Nuphar \(\times\) rubrodiscum Morong - F; = Nuphar rubrodiscum - G; = Nuphar lutea J.E. Smith ssp. rubrodisca (Morong) Hellquist \& Wiersema - K]

Nuphar ulvacea (G.S. Miller \& Standley) Standley, Sea-lettuce Pondlily. Blackwater streams of Panhandle FL and s. AL. [= FNA; = Nuphar luteum (Linnaeus) Sibthorp \& J.E. Smith ssp. ulvaceum (G.S. Miller \& Standley) E.O. Beal - GW, K; = Nymphaea ulvacea G.S. Miller \& Standley - S]

Nuphar variegata Durand in G.W. Clinton. Widespread in ne. North America, south to DE, PA, OH, IN, IL, IA, and NE. [= C, FNA; = Nuphar variegatum - F, G; = Nuphar lutea ssp. variegata (Durand) E.O. Beal -- K; = Nuphar luteum ssp. variegatum (Durand) E.O. Beal -- Z]

Nymphaea Linnaeus 1753 (Water-lily)
A genus of about 50 species, aquatic herbs, cosmopolitan. References: Wiersema in FNA (1997); Schneider \& Williamson in Kubitzki, Rohwer, \& Bittrich (1993).

1 Petals yellow; plants producing stolons . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . N. mexicana
1 Petals white (to pink); plants not producing stolons . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . N. odorata ssp. odorata
Nymphaea mexicana Zuccarini, Banana Water-lily, Yellow Water-lily. Cp (GA, NC, SC): sluggish or stagnant waters; rare, scattered in occurrence and possibly introduced from further south, but the introduction agents may well be wild ducks, such as canvasbacks. June-September. Ne. NC south to s. FL, west to TX, also in sw. US and the New World tropics. [= RAB, FNA, K; = Castalia flava (Leitner) Greene -- S]

Nymphaea odorata W.T. Aiton ssp. odorata, White Water-lily. Cp, Pd (GA, NC, SC, VA), Mt (NC, SC, VA): ponds, sluggish waters; common (uncommon in Piedmont and Mountains). June-September. Newfoundland west to Manitoba, south to FL and TX; also scattered in the w. United States. N. odorata is polymorphic, leading to the naming of numerous species, subspecies, and varieties (see synonymy for a few of the named entities). Wiersema in FNA (1997) recognize ssp. odorata (all of our plants) and ssp. tuberosa (Paine) Wiersema \& Hellquist, more western and northern. Other named entities warrant further evaluation. N. odorata var. gigantea [= Castalia lekophylla Small] occurs on the Coastal Plain, and is considered to differ from var. odorata in its larger leaves (1.5-6 dm in diameter vs. 0.5-2.5 dm), larger flowers (mostly more than 15 cm wide vs. mostly less than 10 cm ), and leaves upturned at the margins (vs. flat). N. odorata var. minor [= Castalia minor (Sims) Nyar] is considered to differ from var. odorata in its generally smaller size, leaves \(5-11 \mathrm{~cm}\) in diameter, flowers mostly less than 8 cm wide (vs. mostly more than 9 cm wide); it may be merely a dwarfed form of extremely nutrient-limited waters of the Coastal Plain. [= FNA, K; < N. odorata -- RAB; >< N. odorata var. odorata -- C; > N. odorata var. odorata - F, G; > N. odorata var. gigantea Tricker -- C, F, G; > N. odorata var. stenopetala Fernald -- F; > Castalia odorata (W.T. Aiton) Wood -- S; > Castalia minor (Sims) Nyar -- S; > Castalia lekophylla Small -S]

Nymphaea odorata W.T. Aiton ssp. tuberosa (Paine) Wiersema \& Hellquist. South to MD, DE, NJ, PA. [= K; < N. odorata var. odorata - C; = N. tuberosa Paine - F, G]

\section*{NYSSACEAE (Tupelo Family)}

A family of 1-3 genera and 8-12 species, trees and shrubs, of e. Asia, se. Asia, e. North America, and Central America. The circumscription and recognition of this family has been controversial; Nyssaceae has sometimes been included in a broadly circumscribed Cornaceae, but this appears to be phylogenetically incorrect (Xiang et al. 2002). References: Xiang et al. (2002).

\section*{Nyssa Linnaeus (Tupelo, Sour Gum, Black Gum)}

A genus of about 8-10 species, trees and shrubs, of e. North America, e. Asia, se. Asia, and Central America. The only taxon other than those in our area is \(N\). ursina Small [ \(N\). sylvatica Marshall var. ursina (Small) Wen \& Stuessy], a 2-5 m tall shrub or small tree related to \(N\). biflora and endemic to panhandle FL. The only other members of the genus are 2-4 e. and se. Asian species and a recently discovered species of Costa Rica (Hammel \& Zamora 1990, Wen \& Stuessy 1993). References: Burckhalter (1992)=Z; Wen \& Stuessy (1993)=Y; Eyde (1966)=X.

Identification notes: Nyssa sylvatica is often mistaken (especially as seedlings, saplings, or fire-sprouts) for Diospyros virginiana, because of their similar, alternate, glossy-green, acuminate leaves. Nyssa can be distinguished by its three vascular bundle scars per leaf scar (vs. one Diospyros), leaves often with a few irregular teeth (vs. never toothed), leaves pale to medium green beneath (vs whitish-green beneath), leaves lacking dark glands on the midrib above and the outer petiole (vs. present), and leaves glabrous or nearly so below (vs. glabrate to tomentose with curly hairs) (McKenney 1967).

1 Petioles of mature leaves \(3-6 \mathrm{~cm}\) long; leaves to 30 cm long and 15 cm wide, at least the larger on a tree normally over 8 cm wide, often with a few irregular teeth, these typically located near the widest part of the blade ................. N. aquatica
1 Petioles of mature leaves \(0.5-2.0(-2.5 \mathrm{~cm})\) long; leaves to 18 cm long and 10 cm wide, the largest leaves on a tree rarely more
than 7 cm wide, generally entire, rarely with a few irregular teeth, these typically located towards the leaf apex.
2 Fruits 20-40 mm long, yellow, orange, or red when mature, the stone winged; pistillate flowers and fruits 1 per peduncle; trees often multiple-trunked, the trunks crooked; mature leaves densely pubescent beneath
N. ogeche

2 Fruits \(6-15 \mathrm{~mm}\) long, blue-black when mature, the stone slightly ridged to nearly smooth; pistillate flowers (1-) 2-5 per peduncle; trees typically single-trunked, the trunk fairly straight; mature leaves glabrous to pubescent beneath.
3 Pistillate flowers and fruits (1-) 2 (-3) per peduncle; leaves with thick texture, rather stiff, typically widest beyond the middle, the apex typically obtuse, the margins entire (rarely with a few teeth on vigorous sprouts); trunk swollen or buttressed at base; bark of large trees rough, a vertical ridge-furrow pattern most prominent; [trees of swamps with periodic or seasonal flooding; mostly on the Coastal Plain]
N. biflora

3 Pistillate flowers and fruits (2-) 3-5 (-8) per peduncle; leaves with thin texture, pliable, typically widest near the middle, the apex typically acuminate, the margins often with a few irregular teeth near the apex (though sometimes an entire tree with no toothed leaves); trunk not swollen or buttressed at base (even when growing in moist or wet habitats); bark of large trees rough, divided by deep vertical and horizontal furrows into a pattern of squarish checks; [trees of dry to mesic upland forests, less commonly in bottomlands or other wetlands, where flooding occurs at most occasionally and is of short duration; throughout our area]
N. sylvatica

Nyssa aquatica Linnaeus, WaterTupelo, Tupelo Gum, Cotton Gum. Cp (GA, NC, SC, VA): river swamps, where inundated for substantial periods of time; common. April-May; September-October. Se. VA south to panhandle FL, west to se. TX, north in the Mississippi Embayment to se. MO, s. IL, and e. KY, primarily on the Coastal Plain, but with scattered locations in other physiographic provinces, such as in sc. TN. [= RAB, C, F, GW, K, S, X, Y, Z; = N. uniflora Wangenheim -- G]

Nyssa biflora Walter, Swamp Tupelo, Water Gum, Swamp Black Gum. Cp (GA, NC, SC, VA), Pd (GA, NC, SC): blackwater river swamps, depressions in pinelands, pocosins, either where inundated for substantial periods of time or in more-or-less permanently saturated organic peaty soils; common (rare in Piedmont). April-June; August-October. NJ south to s. FL, west to e. TX, primarily on the Coastal Plain, but scattered inland to c. NC, w. SC, c. TN, se. MO, and c. AR. [=G, K, S, Z; = N. sylvatica Marshall var. biflora (Walter) Sargent -- RAB, C, F, GW, X, Y]

Nyssa ogeche Bartram ex Marshall, Ogeechee Lime, Ogeechee Tupelo, Ogeechee Plum. Cp (GA, SC): river swamps and wet forests with peaty soils, also in upland depression ponds; common, rare north of GA (SC Rare). April; August-October. A Southeastern Coastal Plain endemic: se. SC south to c. peninsular FL, west to s. AL. [= RAB, GW, K, X, Y, Z; > N. acuminata Small -- S; > N. ogeche - S, in a narrow sense]

Nyssa sylvatica Marshall, Sour Gum, Black Gum, Pepperidge. Mt, Pd, Cp (GA, NC, SC, VA): dry or mesic upland forests, less commonly in bottomlands, pine savannas, or upland depressions, where occasionally inundated briefly; common. April-June; August-October. S. ME west to MI and se. WI, south to c. peninsular FL, west to e. TX and e. OK. N. sylvatica is quite variable in morphology and ecology, at least some of the morphologic variation correlated with geography and ecology. The status of varieties recognized by previous authors (such as F) needs reassessment. In the Mountains of our area N. sylvatica is typically found in dry woodlands, such as pine-oak/heath, with xerophytic species such as Pinus virginiana and Quercus montana. In the outer Coastal Plain of the Carolinas, N. sylvatica often occurs in wet savannas with Pinus serotina, where often mistaken (because of the wetland habitat) for \(N\). biflora. The leaves turn a brilliant orange-red in fall (often a few on any tree turning prematurely in July or August). [= G, K, S, Z; > N. sylvatica var. sylvatica -- RAB, C, F, GW, X, Y; > N. sylvatica var. dilatata Fernald -- F; > N. sylvatica var. caroliniana (Poiret) Fernald]

\section*{OLEACEAE (Olive Family)}

A family of about 25 genera and 600-615 species, trees and shrubs, nearly cosmopolitan, but centered in Asia. References: Hardin (1974) \(=\) Z; Green in Kadereit (2004).

1 Leaves pinnately compound; fruit a samara; small to large tree; [tribe Oleeae, subtribe Fraxininae] .............. Fraxinus 1 Leaves simple; fruit a drupe or capsule; shrub to small tree.

2 Flowers bright yellow, showy; fruit a many-seeded capsule; [tribe Forsythieae] . . . . . . . . . . . . . . . . . . . . . . . . Forsythia
2 Flowers white, lilac, or purplish; fruit a drupe or 4-seeded capsule.
3 Leaves cordate or truncate at the base; fruit a 4-seeded capsule; corolla lobes shorter than the tube; flowers lilac or white, in terminal panicles; [tribe Oleeae, subtribe Ligustrinae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Syringa
3 Leaves cuneate to rounded at the base; fruit a drupe; corolla lobes either shorter or longer than the tube; flowers white or greenish-white, in terminal or lateral panicles or fascicles.
4 Corolla absent; calyx minute or lacking; flowers in axillary fascicles; [tribe Oleeae, subtribe Oleinae] Forestiera 4 Corolla present (often conspicuous and showy); calyx present; flowers lateral or terminal panicles.

5 Corolla lobes elongate, much longer than the corolla tube; [tribe Oleeae, subtribe Oleinae]. Chionanthus 5 Corolla lobes short, no longer than the corolla tube.

6 Inflorescence a many-flowered terminal panicle; leaves generally ovate, elliptic or lanceolate (widest below or at the middle); [tribe Oleeae, subtribe Ligustrinae]

Ligustrum
6 Inflorescence a few-flowered axillary panicle; leaves generally oblanceolate or obovate (widest above the middle); [tribe Oleeae, subtribe Oleinae]

Osmanthus
\{add Jasminum \}

A genus of controversial circumscription, either of only 3 species, limited to se. North America and e. Asia, or (if including Linociera) of about 60-100 species, primarily tropical. Ch. pygmaeus Small is endemic to scrub in peninsular FL. References: Hardin (1974) \(=Z\).

Chionanthus virginicus Linnaeus, Fringe-tree, Old Man's Beard. Pd, Mt, Cp (GA, NC, SC, VA): dry, mesic, or wet forests and woodlands, granitic flatrocks and domes, glades and barrens over various rocks (including granite, greenstone, etc.), swamp forests in the Coastal Plain, rarely pocosins; common. April-May; July-September. NJ, s. PA, s. OH, and MO south to n. FL and e. TX. Ch. virginicus in our area shows a diversity of morphology and correlated habitat that suggests the possible presence of two taxa. Swamp- and pocosin-inhabiting populations in the outer Coastal Plain have leaves \(4-8 \times\) as long as wide and seem very different than Piedmont dry woodland populations with leaves \(1-2 \times\) as long as wide; further and more careful study is needed. Ch. virginicus is a traditional southern yard plant, often used as a "specimen plant," very showy in spring, particularly when grown to its full size. [= RAB, C, F, G, GW, K, S, W, Z]

\section*{Forestiera Poiret 1812 (Forestiera)}

A genus of about 15-20 species, shrubs, of sw. and se. North America, Central America, and the West Indies. References: Anderson (1985) \(=\) Y; Godfrey (1988) \(=X\); Hardin (1974)=Z; Johnston (1957)=Q; Green in Kadereit (2004).

1 Leaves (6-) 7-8 (-9) cm long, long-acuminate or acuminate (rarely acute) at the apex, the tip sharply pointed; [of swamp forests, sloughs, and ponds] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . F. Facuminata
1 Leaves 1.5-7 (-8) cm long, obtuse at the apex, or if short-acuminate the ultimate tip blunt; [of shell middens and calcareous bluffs].
2 Leaves evergreen, glabrous above, glabrous and punctate below; leaf margins entire . . . . F. segregata var. segregata
2 Leaves deciduous, at least sparsely pubescent on the midrib above, pubescent and non-punctate below.
3 First-year twigs pubescent, the pubescence evenly distributed (not in 2 lines); petioles moderately pubescent; flowering in early spring from buds on twigs of the previous season; leaves \(5-7\) ( -8 ) cm long .......... . F. godfreyi
3 First-year twigs pubescent, the pubescence in 2 lines on either side of the twig; petioles glabrous (or with a very few hairs; flowering in mid-late summer, the flowers in leaf axils; leaves mostly \(2-5 \mathrm{~cm}\) long . . . . . . . . . . . F. Iigustrina

Forestiera acuminata (Michaux) Poiret, Swamp-privet. Cp (GA, SC): swamp forests, especially over calcareous substrates; uncommon. March; May-June. SC south to \(n\). \(F L\), west to \(T X\), north in the interior to \(K Y\), e. and \(c\). TN, \(I N\), \(I L, M O\), and \(K S\). [= RAB, C, F, G, GW, K, S, Q, X, Y, Z]

Forestiera godfreyi L.C. Anderson, Godfrey's Forestiera. Cp (GA, SC): shell middens, maritime forests over shell substrate; rare (GA Special Concern). Mid January-February; April-May. Se. SC (Beaufort and Charleston counties) to e. GA and n. FL. [=K, X, Y; < F. pubescens Nuttall -- S, in part (apparently)]

Forestiera ligustrina (Michaux) Poiret in Lamarck, Southern-privet. Cp, Pd (GA, SC): upland forests and slopes along streams, mostly on shell middens or calcareous rocks; rare (SC Rare). E. SC south to \(n\). FL, west to se. TX, north in the interior to c. TN and KY. [= K, S, Q, X, Z]

Forestiera segregata (Jacquin) Krug \& Urban var. segregata, Florida-privet. Cp (GA, SC): calcareous scrub, shell middens, maritime forests and thickets; rare (GA Special Concern, SC Rare). Se. SC south to s. FL, and in the West Indies. Var. pinetorum (Small) M.C. Johnston is restricted to s. FL. [= K, Q, Z; F. porulosa (Michaux) Poiret -- S; F. globularis Small -- S; F. segregata -- X, infraspecific taxa not distinguished]

\section*{Forsythia Vahl 1804 (Forsythia, Golden-bells)}

A genus of about 7-9 species, shrubs, of e. Asia and se. Europe. References: Hardin (1974)=Z; Green in Kadereit (2004).
1 Mature branches hollow or irregularly pith-filled between the nodes; leaves oblong-ovate, toothed or 3-parted; branches arching when well-developed
F. suspensa

1 Mature branches cross-septate (chambered) between the nodes; leaves oblong-lanceolate, toothed; branches upright
* Forsythia suspensa (Thunberg) Vahl, Weeping Forsythia. Pd (GA, NC, VA), Mt (VA): waste places, vacant lots, suburban woodlands; commonly planted and persistent, rarely escaped (native of China). [= C, G, K, Z]
* Forsythia viridissima Lindley, Greenstem Forsythia. Pd (GA, NC, VA), Cp, Mt (VA): waste places, vacant lots, suburban woodlands; commonly planted and persistent, rarely escaped (native of China). [= C, G, K, W, Z]

\section*{Fraxinus Linnaeus 1753 (Ash)}

A genus of about 45-65 species, trees, mostly north temperate (Asia, North America, Europe). References: Hardin \& Beckmann (1982) \(=\) Z; Miller (1955) \(=\) Y; Green in Kadereit (2004).

1 Young twigs 4-angled or narrowly 4-winged; [trees of calcareous woodlands in the Mountains of sw. VA] . . F. quadrangulata 1 Young twigs terete (rounded in cross-section); [trees of various habitats, collectively widespread in our area].

Lateral leaflets sessile; calyx absent . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . F. nigra
Lateral leaflets with petiolules (1-) 3-20 mm long; calyx present, persisting as a minute cup at the base of the fruits.
3 Leaves minutely papillose beneath (best seen at magnification of \(40 \times\) or more), and sometimes also pubescent, more-or-less strongly whitened; wing of the samara decurrent only onto the upper 1/3 (or less) of the samara body
F. americana

3 Leaves glabrous to pubescent beneath (never papillose), green; wing of the samara decurrent onto \(1 / 2\) (or more) of the samara body.
4 Petiolules of the lowermost leaflets 1-9 mm long, all but 1-2 mm narrowly winged; samara mostly less than 7 mm wide; calyx \(0.5-1.5 \mathrm{~mm}\) long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . F. pennsylvanic
4 Petiolules of the lowermost leaflets \(3-20 \mathrm{~mm}\) long, not winged (except \(F\). caroliniana); samara mostly more than 7 mm wide; calyx 1-6 mm long.
5 Body of samara flattened, winged the full length of the samara body; calyx 1 mm long; leaf scars slightly notched; small tree, often multi-trunked F. caroliniana

5 Body of samara terete or subterete, winged about \(1 / 2\) the length of the samara body; calyx 2.5-6 mm long; leaf scars deeply notched; medium to large tree, typically single-trunked
F. profunda

Fraxinus americana, White Ash, American Ash. Mt, Pd, Cp (GA, NC, SC, VA): mesic slopes, rich cove forests, dryish calcareous or mafic glades and woodlands (with Juniperus virginiana var. virginiana and Carya glabra); common (rare in Coastal Plain of NC, SC, and GA). April-May; August-October. Nova Scotia west to MN, south to FL and TX. A valuable timber tree. The division into 2 taxa, var. americana and var. biltmoreana, needs further study. \([=C, K, W, Z ;>F\). americana Linnaeus var. americana -- RAB, F, G; > F. americana Linnaeus var. biltmoreana (Beadle) J. Wright ex Fernald - RAB, F, G; >F. americana var. microcarpa A. Gray -- F; >F. americana -- S, Y, in the narrow sense; >F. biltmoreana Beadle -- S, Y]

Fraxinus caroliniana P. Miller, Water Ash, Pop Ash, Carolina Ash. Cp, Pd (GA, NC, SC, VA): deeply to shallowly flooded swamps; common (rare in Piedmont). May; July-October. Se. VA south to FL, west to TX, primarily on the Coastal Plain. A small tree, sometimes very abundant (and nearly the only subcanopy species) as the understory in Taxodium-Nyssa swamps. [= RAB, C, G, GW, K, Y, Z; >F. caroliniana var. caroliniana - F; > F. caroliniana var. oblanceolata (M.A. Curtis) Fernald \& Schubert -- F; >F. caroliniana var. cubensis (Grisebach) Lingelsh. -- F; > F. caroliniana - S, in a narrow sense; > F. pauciflora Nuttall -- S]

Fraxinus nigra Marshall, Black Ash. Mt, Pd (VA): seepage swamps and mountain streambanks; rare (VA Watch List). AprilMay; August-October. Newfoundland and Québec west to Manitoba, south to DE, VA, IN, and IA. [= C, F, G, K, W, Y, Z]

Fraxinus pennsylvanica Marshall, Green Ash, Red Ash. Cp, Pd, Mt (GA, NC, SC, VA): bottomlands and swamps, especially along brownwater rivers and streams; common. April-May; August-October. Nova Scotia west to Alberta, south to FL and TX. Variation in this species (see synonymy) needs further study. [=C, GW, K, W, Z; > F. pennsylvanica var. subintegerrima (Vahl) Fernald -- RAB, F, G; > F. pennsylvanica var. pennsylvanica - RAB, F, G; > F. pennsylvanica var. austinii Fernald -- F; > F. darlingtonii Britton -- S; > F. pennsylvanica - S, in a narrow sense; > F. smallii Britton -- S; F. pennsylvanica ssp. pennsylvanica -- Y]

Fraxinus profunda (Bush) Bush, Pumpkin Ash. Cp, Pd (GA, NC, SC, VA), Mt (NC): swamps, primarily along blackwater rivers and streams; common (rare in Piedmont and Mountains). April-May; August-October. S. NJ south to n. FL, west to LA, mostly on the Coastal Plain, north in the interior to w. NC, sc. TN, e. AR, se. MO, s. IL, IN, OH, sc. MI, ne. PA, and w. NY. This species has a peculiar distribution; see McCormac, Bissell, \& Stine (1995) for additional discussion. The nomenclature is controversial. [= C, GW, K, S, W, Z; F. tomentosa Michaux f. -- RAB, F, G, Y; F. michauxii Britton -- S]

Fraxinus quadrangulata Michaux, Blue Ash. Mt (GA, VA): mesic to dry calcareous woodlands and forests; rare (GA Special Concern, VA Watch List). April; July-October. S. Ontario west to s. MI and e. KS, south to sw. VA, e. TN, nw. GA, n. AL, and OK. [ \(=\mathrm{C}, \mathrm{F}, \mathrm{G}, \mathrm{K}, \mathrm{S}, \mathrm{Y}, \mathrm{Z}]\)

\section*{Jasminum Linnaeus 1753 (Winter Jasmine)}

A genus of about 200 species, shrubs and woody vines, of tropical (and rarely temperate) Eurasia. References: Green in Kadereit (2004)
* Jasminum mesnyi Hance, Japanese Jasmine, is planted and often persists. Reported for GA (K). [= K]
* Jasminum nudiflorum Lindley, Winter Jasmine, is commonly planted and often persists. It has green stems and yellow flowers. Reported for GA (K). [= K]

\section*{Ligustrum Linnaeus 1753 (Privet)}

A genus of about 40 species, shrubs and trees, of the Old World. I have here largely followed Hardin (1974), though, as he points out, "the taxonomy and nomenclature of our plants seem uncertain in a few cases" and "it is difficult to determine which are really naturalized in our area." It is possible that not all the species treated below are truly naturalized, and that taxonomic changes will be needed. References: Hardin (1974)=Z; Green in Kadereit (2004). The key is based closely on Hardin (1974).

1 Twigs pubescent.
2 Corolla tube equalling or shorter than the corolla lobes.
3 Flowers sessile or subsessile
L. quihoui
```

    3 Flowers pedicellate.
        4 Twigs densely pubescent; leaves pubescent on the midrib beneath . . . . . . . . . . . . . . . . . . . . . L. Linense
        4 Twigs minutely puberulent; leaves glabrous . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . L. vulgare
    2 Corolla tube slightly longer than or up to }3\times\mathrm{ as long as the corolla lobes.
    5 Pedicels pubescent; calyx pubescent . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . L. obtusifolium
    5 Pedicels glabrous; calyx glabrous or slightly pubescent at the base.
        6 Leaves 2-6 cm long; twigs conspicuously pubescent . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . L. amurense
        6 Leaves 4-10 cm long; twigs minutely puberulent . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . L. japonicum
    1 Twigs glabrous.
7 Corolla tube equalling or shorter than the corolla lobes.
8 Leaves persistent or tardily deciduous, 6-15 cm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . L. Iucidum
8 Leaves deciduous, 3-6 cm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . L. vulgare
7 Corolla tube slightly longer than or up to 3x as long as the corolla lobes.
L Leaves persistent and glossy, rounded or broadly cuneate at the base; corolla tube slightly longer than the corolla
lobes . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . .

9 Leaves deciduous or semi-evergreen, cuneate at the base; corolla tube ca. 3x as long as the corolla lobes
L. ovalifolium

* Ligustrum amurense Carrière, Amur Privet. Pd (NC, VA), Cp,Mt (VA {SC}: disturbed places; rare, native of n. China. [=
RAB, C, F, G, K, Z]
* Ligustrum japonicum Thunberg, Japanese Privet. Cp (GA,NC,SC,VA), Pd (NC, VA): disturbed places; rare, native of
Japan and Korea. [= RAB, K, Z]
Ligustrum Iucidum Aiton f., Glossy Privet. Cp (NC): disturbed places; rare, native of China, Japan, and Korea. This species
is superficially similar to L. japonicum; the lateral leaf veins are translucent in this species. [= K, S, Z]
Ligustrum obtusifolium Siebold \& Zuccarini. Cp, Pd (NC,VA), Mt (VA): disturbed places; uncommon, native of Japan. [= C,
F,G, K, Z]
Ligustrum ovalifolium Hasskarl, California Privet. Cp, Pd (NC, VA): disturbed places; rare, native of Japan. [= RAB, C, F, G,
K, S, Z]
* Ligustrum quihoui Carrière, Wax-leaved Privet. Cp (NC, VA): disturbed places; rare, native of China. [= K, Z]
* Ligustrum sinense Loureiro, Chinese Privet. Cp, Pd,Mt (GA,NC,SC, VA): moist forests, especially alluvial bottomlands;
common, native of China. This species is one of the most noxious of our weeds, choking out native vegetation in hundreds of
square kilometers of land in our area. The rapidity with which it has engulfed southern wetlands is hinted at by Small's (1933)
mention of it only as "an escape in southern Louisiana." [= RAB, C, G, GW, K, S, W, Z]
* Ligustrum vulgare Linnaeus, Common Privet. Cp,Pd (NC,VA): disturbed places; rare, native of Europe and n. Africa. [= C,
F,G,K,S,Z]

```

Osmanthus Loureiro 1790 (Wild Olive, Devilwood)
A genus of about \(15-32\) species, shrubs and trees, of se. Asia (most species) and se. North America. References: Hardin (1974)=Z; Green in Kadereit (2004).

Osmanthus americanus (Linnaeus) Bentham \& Hooker f. ex A. Gray, Wild Olive, Devilwood. Cp (GA, NC, SC, VA): maritime forests and (in GA, SC, and extreme s. NC) dry, sandy forests well inland, and reported for wet habitats as well further south; uncommon (VA Rare). April-May; August-October. Se. VA south to FL, west to LA; also in Mexico. O. megacarpus Small, sometimes treated as a variety, O. americanus var. megacarpus (Small) P.S. Greene, is endemic to pine scrub in peninsular FL and differs primarily in having a larger fruit. The very hard, tough, and unsplittable wood is the inspiration for the common name "Devilwood." O. americanus is a conspicuous element of maritime forests in most of our area, readily recognizable by the flattened twigs characteristic of the family, and the opposite (often a few subopposite), glossy, evergreen leaves. [= RAB, F, G, GW; = O. americanus var. americanus -- C, K, Z; = Amarolea americana (Linnaeus) Small -- S]

\section*{Syringa Linnaeus 1753 (Lilac)}

A genus of about 20-23 species, shrubs, from s. Europe to se. Asia. References: Hardin (1974)=Z; Green in Kadereit (2004).
* Syringa vulgaris Linnaeus, Lilac. Mt (NC, VA): commonly planted, persistent and naturalizing around old farms; rare, native of se. Europe. [= C, F, G, K, Z]

\section*{ONAGRACEAE (Evening-primrose Family)}

A family of about 18 genera and 650 species, herbs, shrubs, and rarely trees, cosmopolitan (especially of temperate and subtropical America). References: Munz (1965)=X; Crisci et al. (1990).

1 Flowers 2-merous, the petals white; fruits with uncinate trichomes; leaves opposite, decussate, borne spreading at right angles
to the stem, mostly ovate, on petioles mostly \(0.5-8 \mathrm{~cm}\) long
Circaea
1 Flowers (3-) 4 (-7)-merous, the petals yellow, pink, or white (or absent); fruits lacking uncinate trichomes; leaves alternate (rarely opposite). not decussate, usually ascending or appressed (rarely spreading at right angles to the stem), mostly lanceolate, mostly sessile or subsessile.
2 Fruit indehiscent; seeds 1-6 per capsule, 1.5-3.5 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Gaura
2 Fruit dehiscent; seeds (10-) 50-many per capsule, 0.3-2 mm long.
3 Seeds with an elongate coma at one end (wind-dispersed); petals pink or white.
4 Leaves all alternate; flowers numerous in a terminal raceme (with small bracts); flower buds reflexed, the flowers held horizontally or ascending; petals \(10-20 \mathrm{~mm}\) long; stigma 4-lobed; plants 10-30 dm tall . Chamerion
4 Leaves all or at least the lowermost opposite; flowers few, axillary, or in poorly developed, leafy racemes; flower buds not reflexed, the flowers ascending; petals \(2-8 \mathrm{~mm}\) long (except \(10-15 \mathrm{~mm}\) long in \(E\). hirsutum); stigma capitate (except 4-lobed in E. hirsutum); plants 1-20 dm tall

Epilobium
3 Seeds not comose (gravity-dispersed); petals yellow or absent (rarely white or pink).
5 Calyx tube not extended beyond the summit of the ovary; sepals persistent on the capsule (rarely deciduous); stamens 4, 8, or 10-14; petals yellow or absent; [primarily of wetlands] . . . . . . . . . . . . . . . . . . . . . Ludwigia
5 Calyx tube extended beyond the summit of the ovary; sepals deciduous; stamens 8 ; petals yellow (rarely pink or white); [primarily of uplands]

Oenothera
\{add Calylophus to key\}

\section*{Calylophus Spach}

Calylophus serrulatus (Nuttall) Raven, east to w. KY. [= K; = Oenothera serrulata Nuttall] \{add to synonymy; add to genus key\}

\section*{Chamerion (Rafinesque) Rafinesque (Fireweed)}

There is increasingly strong evidence for the recognition of this group of plants as a genus separate from Epilobium. References: Mosquin (1966)=Z; Holub (1972)=Y; Munz (1965)=X.

Chamerion platyphyllum (Daniels) Löve \& Löve, Great Willow-herb, Fireweed. Mt (NC, VA): grassy balds, roadsides, disturbed areas; uncommon (NC Rare). July-September. Chamerion platyphyllum has a circumboreal distribution; it is a member of a circumboreal complex, consisting of several related taxa that differ in chromosome number, a variety of morphological characters, and distribution. The tetraploid Chamerion platyphyllum is generally more southern, extending south in North America to NJ , montane w. NC and ne. TN, n. IN, MN, SD, AZ, NM, and CA; it may be more appropriately treated as a variety or subspecies of Ch. angustifolium. The diploid Chamerion angustifolium (Linnaeus) Holub is arctic and boreal, extending south in North America to New Brunswick, Québec, Ontario, alpine WY, and British Columbia. The hexaploid is Chamerion danielsii D. Löve. [<E. angustifolium -RAB, G, GW, W, infraspecific taxa not distinguished; = E. angustifolium var. canescens A. Wood -- C; ><E. angustifolium var. angustifolium -- F, X; >E. angustifolium var. platyphyllum (Daniels) Fernald - F; = Chamerion angustifolium (Linnaeus) Holub ssp. circumvagum (Mosquin) Kartesz - K; < Chamaenerion angustifolium (Linnaeus) Scopoli -- S; < Chamerion angustifolium (Linnaeus) Holub -- Y; = Epilobium angustifolium Linnaeus ssp. circumvagum Mosquin -- Z]

\section*{Circaea Linnaeus (Enchanter's-nightshade)}

A genus of \(7-8\) species, herbs, of temperate and boreal regions of the Northern Hemisphere. References: Boufford (1982)=Z; Munz (1965)=X; Averett \& Boufford (1985); Skvortsov (1979). Key based on Z.

Identification notes: Sometimes confused in vegetative condition with Phryma.
1 Flowers opening before elongation of the raceme axis, therefore clustered and corymbiform at the apex of the raceme, borne on erect or ascending pedicels; plant 5-25 (-30) cm tall; fruits clavate, 2.0-2.5 mm long, 0.7-1.2 mm thick, 1-locular
C. alpina ssp. alpina

1 Flowers opening after elongation of the raceme axis, more or less loosely spaced, borne on spreading pedicels; plants (12-) \(20-100 \mathrm{~cm}\) tall; fruits obovoid to pyriform, 2.8-3.9 (-4.5) mm long, 1.5-3.6 mm thick, 2-locular, or the fruits sterile and aborting shortly after anthesis, 1-2-locular when present.

All, or nearly all, ovaries developing to maturity; fruit with corky-thickened ribs separated by deep grooves c. canadensis All ovaries aborting shortly after anthesis (very rarely a few persistent after anthesis); fruit (when somewhat persistent) with low ribs and shallow grooves
C. alpina ssp. alpina \(\times\) canadensis

Circaea alpina Linnaeus ssp. alpina, Alpine Enchanter's-nightshade. Mt (GA?, NC, VA): moist organic soil at high elevations (especially in spruce-fir and northern hardwood forests), rocky seepages, in spray behind waterfalls, at dripping cliff bases; uncommon. June-September. C. alpina is treated by \(Z\) as a circumboreal complex of six subspecies. Ssp. alpina is itself circumboreal, in North America ranging from Newfoundland and Labrador, west to AK, south to MD, w. NC, e. TN, n. GA (?), KY, n. IL, MN, MT, and WA, disjunct in montane sites southwards in the w. United States, such as the Black Hills of SD, and isolated
montane sites in CO, AZ, and NM. Another subspecies occurs in w. North America, and four subspecies occur in humid and montane parts of Asia. [= K, X, Z; < C. alpina -- RAB, F, G, GW, S, W; = C. alpina var. alpina -- C]

Circaea alpina ssp. alpina \(\times\) canadensis, Hybrid Enchanter's-nightshade. Mt (NC, VA): mesic, nutrient-rich forests; rare. June-August. C. alpina ssp. alpina \(\times\) canadensis is reported to occur frequently in the absence of one or both of its parents ( \(Z\), Skvortsov 1979), and is therefore treated separately and keyed here. It ranges from Newfoundland west to Ontario and MN, south to w. NC, OH, and WI. It appears to be rare in our area, but should be sought more carefully. Recognition of \(C\). canadensis (Linnaeus) Hill as distinct from C. lutetiana renders the hybrid binomial name C. \(\times\) intermedia inappropriate for North American plants, since it is the hybrid of C. alpina ssp. alpina and the European C. Iutetiana. [= C. \(\times\) intermedia Ehrhart (pro sp.) -- RAB, C, K, \(\mathrm{W}, \mathrm{X}, \mathrm{Z}\), misapplied as to our material if C. canadensis is accepted as a species; >C. canadensis var. canadensis -F , misapplied; \(>\) C. canadensis var. virginiana Fernald - F; = C. canadensis (Linnaeus) Hill -- G, misapplied]

Circaea canadensis (Linnaeus) Hill, Canada Enchanter's-nightshade. Mt (GA, NC, VA), Pd (GA, NC, SC, VA), Cp (GA, NC, VA): mesic, nutrient-rich forests; common (SC Rare). June-August. Nova Scotia and New Brunswick west to se. Manitoba and ND, south to e. NC, c. SC, s. GA, LA, OK, and NE. The systematics of this taxon is controversial, and the best treatment is still unclear. Most recently \(Z\) has treated C. lutetiana as a circumboreal complex of 3 subspecies, including the North American ssp. canadensis (Linnaeus) Ascherson \& Magnus, the primarily Asian ssp. quadrisulcata (Maximowicz) Ascherson \& Magnus, and the European ssp. lutetiana. Other authors have preferred varietal status for the 3 entities, full species status, no formal status at all (C. Iutetiana as a polymorphic complex), or associating the more similar pair (North American and Asian) as 2 subspecies separate from the European at specific rank. Boufford (1982) and Averett \& Boufford (1985) show convincingly that separate taxonomic status for the three entities is warranted, and that ssp. canadensis is more closely related to ssp. quadrisulcata. The question of the appropriate taxonomic level remains. Boufford (1982) states that "although subspp. canadensis and quadrisulcata are placed in C. Iutetiana, this might not ultimately prove to be the best treatment." Later, flavonoid data showed strong differences between the three taxa, stronger than the differences between many of the other species in the genus (Averett \& Boufford 1985). Morphologic differences between the three taxa are fairly subtle but appear to be consistent. Given the morphological and chemical differences and the allopatric distribution on different continents, recognition of 3 species seems likely warranted. The complicated synonymy is perhaps an example of a too-zealous attempt to have nomenclature reflect subtleties of relationship and evolutionary divergence, our understanding of which is unclear and changeable. [=F; = C. lutetiana Linnaeus ssp. canadensis (Linnaeus) Ascherson \& Magnus -- RAB, K, W, X, Z; = C. lutetiana var. canadensis Linnaeus -- C; C. quadrisulcata (Maximowicz) Franchet \& Savatier var. canadensis (Linnaeus) Hara -- F, G; C. canadensis var. virginiana Fernald -- F; C. latifolia Hill -- S; = C. quadrisulcata ssp. canadensis (Linnaeus) Löve \& Löve]

\section*{Epilobium Linnaeus (Willow-herb)}
(see also Chamerion)
Epilobium is a large genus (ca. 200 species), distributed primarily in boreal and alpine latitudes and elevations. All five of the species in our area reach or approach their southern limits in eastern North America here. There is increasing opinion that \(E\). angustifolium and its relatives should be distinguished at the generic level from Epilobium, as Chamerion. References: Munz (1965)=Z.

Epilobium ciliatum Rafinesque ssp. ciliatum, American Willow-herb. Mt (NC, VA): bogs, seeps, disturbed wet places (such as moist edges of logging roads); uncommon (NC Rare). June-September. Newfoundland and Labrador west to AK, south to VA, w. NC, ne. TN, IN, IA, CA, TX, Mexico, Central America; disjunct in Chile and Argentina. [=K; <E. ciliatum -- RAB, W; = E. ciliatum
var. ciliatum -- C ; \(>\) E. ciliatum -- \(\mathrm{F}, \mathrm{X}\), in a narrower sense; \(>E\). glandulosum Lehm. var. adenocaulon (Hausskn.) Fernald -- \(F\); \(>E\). adenocaulon Hausskn. var. adenocaulon -- G, Z]

Epilobium coloratum Biehler, Bronze Willow-herb, Eastern Willow-herb. Mt (GA, NC, SC, VA), Pd, Cp (NC, VA): seepages, moist open places; common (rare in Coastal Plain of NC). June-September. ME west to MN, south to NC, n. GA, AL, AR, and TX. There are some difficulties in distinguishing this species and \(E\). ciliatum in our area. [= RAB, C, F, G, GW, K, S, W, Z]

Epilobium leptophyllum Rafinesque, Narrowleaf Willow-herb, American Marsh Willow-herb. Mt (NC, VA): bogs, seepages, and boggy meadows; rare (NC Watch List, VA Rare). July-October. Newfoundland and Mackenzie west to British Columbia, south to w. NC, ne. TN, KS, and CA. [= RAB, C, F, G, GW, K, W, Z]

Epilobium strictum Muhlenberg ex Sprengel, Northeastern Willow-herb, Downy Willow-herb, Soft Willow-herb. Pd (VA): moist places; rare (VA Rare). Québec west to MN, south to n. VA, OH, and n. IL. The single record is regarded as questionable. [= C, F, G, K, Z]
* Epilobium hirsutum Linnaeus, Hairy Willow-herb, introduced from Eurasia, ranges south to s. PA (Rhoads \& Klein 1993) and WV (Kartesz 1999). [= C, F, G, K, Z]

Epilobium palustre Linnaeus, Marsh Willow-herb, ranges south to DE and ne. PA (Rhoads \& Klein 1993). [= C, K; > E. palustre var. palustre -- F, G, Z]

\section*{Gaura Linnaeus (Gaura)}

A genus of about 21 species, herbs, of North America. The flowers of all our species open about sunset and wither early the following morning. The genus is rather weedy; other western species may be expected to turn up in our area as adventive weeds. References: Raven \& Gregory (1972)=Z; Munz (1965)=X.

1 Pedicels 2-4 mm long; fruit with a stipe at maturity; clumped or matted perennials from woody rhizomes or rootstocks; [of sandy habitats of SC and GA southwards].
2 Clumped perennial; petals \(4-10 \mathrm{~mm}\) long; body of the fruit \(5-10 \mathrm{~mm}\) long; stipe of the fruit \(0.5-4.5 \mathrm{~mm}\) long ... G. filipes 2 Mat-forming perennial; petals \(7-15 \mathrm{~mm}\) long; body of the fruit \(8-15 \mathrm{~mm}\) long; stipe of the fruit \(2-8 \mathrm{~mm}\) long ... G. sinuata
1 Pedicels \(0-1 \mathrm{~mm}\) long; fruit without a stipe; annual, winter annual, or biennial; [collectively of various habitats and more widespread in our area.
3 Sepals 2-3.5 mm long; petals 1.5-3 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . G. parviflora
3 Sepals \(2.5-12 \mathrm{~mm}\) long; petals \(2.5-9 \mathrm{~mm}\) long.
4 Sepals \(2.5-8 \mathrm{~mm}\) long; leaves \(0.1-1.3 \mathrm{~cm}\) wide, the widest rarely over 1 cm wide; flowers 3-4-merous (often mixed on a plant); fruits 3-4-angled (often mixed on a plant); [of the outer Coastal Plain of GA, NC, and SC].. G. angustifolia
4 Sepals \(8-13 \mathrm{~mm}\) long; leaves \(0.3-2.5 \mathrm{~cm}\) wide, the larger nearly always more than 1 cm wide; flowers 4 -merous; fruits 4-angled; [primarily of the Mountains and Piedmont of NC, SC, and VA, extending to the Coastal Plain of GA and SC]
G. biennis

Gaura angustifolia Michaux, Southeastern Gaura. Cp (GA, NC, SC): open woodlands, sandy fields, roadsides, primarily in the outer Coastal Plain; common. May-September. E. NC (Dare County) south to s. FL, west to e. TX, endemic to the Coastal Plain. [= RAB, K, S, Z; > G. angustifolia var. angustifolia -- X]

Gaura biennis Linnaeus, Biennial Gaura, Northeastern Gaura. Mt (NC, SC, VA), Pd (GA, NC, VA), Cp (GA, SC): roadsides, woodlands, streambanks, disturbed areas; common. June-October. MA and NY west to WI, se. MN, and IA, south to sw. NC, c. GA (Jones \& Coile 1988), sc. TN, and c. IL. [= RAB, K, S, W, Z; G. biennis var. biennis -- C, F, G, X]

Gaura filipes Spach, Threadstalk Gaura. Cp (GA, SC), Pd, Mt (GA): sandy fields, disturbed areas, and clearings; common. April-July. SC west to \(n\). TN and s. IN, south to ne. FL and e. LA. [= RAB, C, G, K, W, Z; > G. filipes var. filipes -- F, X; > G. filipes var. major Torrey \& A. Gray -- F, X; = G. michauxii Spach -- S]
* Gaura parviflora Douglas ex Lehmann, Small-flowered Gaura. Cp (GA, SC), Pd (GA): sandy fields, disturbed areas, and clearings; rare, introduced from further west. May-July. IN and IL west to WA, south to MS, and Mexico; apparently introduced eastwards to MA, TN, GA, and SC. Kartesz's (1999) adoption of G. mollis as the name for this taxon has been rejected (Wagner \& Hoch 2000, Brummitt 2001). [= RAB, F, G, S, Z; = G. mollis James -- K; > G. parviflora var. parviflora -- X; > G. parviflora var. lachnocarpa Weatherby -- X]
* Gaura sinuata Nuttall ex Seringe, Texas Gaura. Cp (GA, SC), Pd (GA): sandy fields, disturbed areas, and clearings; uncommon, introduced from further west. April-June. AR and OK south to s. TX, introduced eastward to SC and FL. [= RAB, K, X, Z]

Gaura drummondii (Spach) Torrey \& A. Gray. Disjunct eastwards in GA (Kartesz 1999). [= K] \{not yet keyed\}
Gaura longiflora Spach. East to MD, PA, KY, TN, and AL (Kartesz 1999). [= K; = G. biennis Linnaeus var. pitcheri Torrey \& A. Gray - C, F, G, X; > G. filiformis Small - S; > G. longiflora - S] \{not yet keyed\}

\section*{Ludwigia Linnaeus (Seedbox, Water-primrose, Water-purslane)}

A genus of about 82 species, herbs and shrubs, cosmopolitan. References: Peng (1989)=Z; Munz (1965)=X; Nesom \& Kartesz (2000)=Q; Zardini, Gu, and Raven (1991)=V; Peng (1984, 1986, 1988); Peng \& Tobe (1987); Raven (1963); Munz (1938, 1944); Eyde (1977, 1978, 1981); Raven \& Tai (1979); Duke (1955). Key based in part on GW, Z, and Q.
1 Leaves opposite; plants creeping (rooting at the nodes); [section Dantia] ..... Key A
1 Leaves alternate; plants erect or ascending (not rooting at the nodes), or creeping (rooting at the nodes).
2 Stamens 8-14; sepals 4-7; petals 4-7; [of various habits, including annual and perennial herbs and shrubs, variously erect, ascending, creeping, or forming floating mats] Key B
2 Stamens 4; sepals 4; petals 0-4; [perennial herbs, with erect ascending flowering stems] Key C

\section*{Key A - Ludwigia with opposite leaves}

1 Pedicels of flowers and fruits 5-35 mm long.
2 Petals \(7-11 \mathrm{~mm}\) long; pedicels of capsules \(15-35 \mathrm{~mm}\) long, longer than the leaves L. arcuata
2 Petals \(4-5 \mathrm{~mm}\) long; pedicels of capsules \(5-16 \mathrm{~mm}\) long, shorter than to equalling the leaves ..... L. brevipes
1 Pedicels of flowers and fruits \(0-3 \mathrm{~mm}\) long.
3 Stems, leaves, capsules, and calyx densely hirsute; seeds dark reddish-brown, 0.3-0.4 mm long L. spathulata
3 Stems, leaves, capsules, and calyx glabrous to sparsely puberulent; seeds tan, 0.4-0.8 mm long
4 Petals 0; floral tubes and capsules with 4 longitudinal dark green bands; bractlets (borne at or near base of floraltube) absent or present, if present then \(0-1 \mathrm{~mm}\) long4 Petals 4 ; floral tubes and capsules lacking green banding; bractlets (borne at or near base of floral tube) present, 2-4mm longL. repens

\section*{Key B - Ludwigia with alternate leaves, \(8-14\) stamens, 4-7sepals, and 4-7 petals}

1 Sepals 4; stamens 8; seeds in 2-several vertical series in each locule, free of endocarp tissue.
2 Internodes of the stem conspicuously winged on the angles by 2 decurrent wings running down from each leaf base; petals \(0.6-1.2 \mathrm{~cm}\) long; capsule \(1.0-2.0 \mathrm{~cm}\) long, 4 -angled or 4 -winged; [section Myrtocarpus] . . . . . . . . . . L. decurren
2 Internodes of the stem not winged on the angles (or very faintly so); petals 1.0-5.0 cm long; capsule (1.5-) \(2-5 \mathrm{~cm}\) long, obtusely 4 -angled; [section Macrocarpon].
3 Petals (1.5-) 3-5 cm long; sepals ca. 10 mm wide at base
L. bonariensis

3 Petals \(1-2 \mathrm{~cm}\) long; sepals \(3-5 \mathrm{~mm}\) wide at base
L. octovalvis

1 Sepals 5 (-7); stamens \(10(-14)\); seeds in 1 vertical series in each locule, loosely embraced or embedded in endocarp tissue.
4 Stems erect; floral tube much longer than the pedicel; seeds loosely embraced by a corky, horseshoe-shaped segment of endocarp; [section Seminuda]
L. leptocarpa

4 Stems (at least the lower portions) decumbent, creeping, or floating in mats (the flowering stems more-or-less erect in \(L\). grandiflora and L. hexapetala); floral tube much shorter than the pedicel; seeds embedded in the woody endocarp; [section Oligospermum].
5 Flowering stems decumbent, floating, or creeping; stem and leaves glabrous or glabrescent; petals mostly 1-1.5 cm long; anthers 1-1.7 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . L. peploides var. glabrescens
5 Flowering stems more-or-less erect; stem and leaves sparsely to densely pubescent with long soft hairs; petals (1.2-) \(1.6-3 \mathrm{~cm}\) long; anthers \(2.5-3.5 \mathrm{~mm}\) long.
6 Sepals (6-) 8-11 (-14) mm long; primary leaves \(5-8.5 \mathrm{~cm}\) long, \(7-11 \mathrm{~mm}\) wide, usually linear-lanceolate, usually widest below the middle; petals (1.2-) 1.6-2.0 (-2.6) cm long; style 4.7-6.7 (-8.2) mm long; stems densely villous
L. grandiflora ssp. grandiflora

6 Sepals (8-) 12-19 mm long; primary leaves \(5.5-13 \mathrm{~cm}\) long, \(9-18 \mathrm{~mm}\) wide, usually narrowly elliptic to oblanceolate, usually widest above the middle; petals (1.5-) 2.0-2.9 (-3) cm long; style (5.8-) 6-10 mm long; stems sparsely to densely villous (rarely glabrous)
L. grandiflora ssp. hexapetala

\section*{Key C - Ludwigia with alternate leaves, 4 stamens, 4 sepals, and \(0-4\) petals}

1 Pedicels 2-15 mm long; capsules subglobose to spheric or cubic, about as long as wide, box-like, 4-angled, dehiscence by an apical pore (later sometimes also irregularly loculicidal); petals present, 4-15 mm long, persistent or caducous; roots fascicled, fusiform, tuberous; plants lacking basal, stoloniform shoots; [section Ludwigia].
2 Leaves cuneate at base; pedicels 2-5 mm long; nectary discs at base of style flattish, inconspicuous; [widespread in our area, in a wide variety of habitats] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . L. alternifolia
2 Leaves rounded or truncate at base; pedicels 4-15 mm long; nectary discs at base of style domed, prominent; [nearly restricted to the Coastal Plain, primarily of pinelands].
3 Styles 6-10 mm long; plants glabrous, glabrescent, or pubescent with very short hairs; sepals strongly reflexed in fruit L. virgata

3 Styles 1.5-3 mm long; plants glabrescent or pubescent with short to long, spreading to shaggy hairs; sepals strongly reflexed, spreading, or ascending in fruit.
4 Sepals narrowly deltoid, broadest at or near the base, \(3-4 \times\) as long as wide, ascending or spreading in fruit; plants glabrescent to hirtellous with long spreading hairs
L. hirtella

4 Sepals ovate, broadest near the middle, ca. \(2 \times\) as long as wide, strongly reflexed in fruit; plants pubescent with relatively short, appressed to spreading hairs
L. maritima

1 Pedicels 0-1 (-5) mm long; capsules subglobose, obconic, or obpyramidal, about as long as wide or longer than wide, circular
to quadrangular in cross-section, dehiscence irregularly loculicidal; petals absent or present, if present (L. linearis, L. linifolia) then \(0-6 \mathrm{~mm}\) long and caducous; roots fibrous or rhizomatous; plants frequently with basal, stoloniform shoots; [section Microcarpium].
5 Capsules cylindrical, narrowly obconical, or narrowly obpyramidal, at least 2.5-5× as long as broad; petals present or absent.
6 Primary leaves of the flowering stems narrowly elliptical, 6-12 (-20) mm wide; petals absent
L. glandulosa
6 Primary leaves of the flowering stems linear, 1.5-5 mm wide; petals present.

7 Sepals (3.3-) 4-7 mm long; lateral and marginal veins obscure on lower leaf surface; seeds reddish brown; capsules cylindric, parallel-sided through most of their length, not grooved; anthers 0.5-1.1 mm long.
L. linifolia

7 Sepals 2.3-5 (-5.6) mm long; lateral and marginal veins distinct on lower leaf surface; seeds yellowish; capsules elongate obpyramidal, tapering through most or all of their length, with a shallow longitudinal groove on each face; anthers \(1.1-2 \mathrm{~mm}\) long.
8 Sepals 2.3-4 mm long, acuminate, the surfaces densely and minutely papillose, the papillae 0.02-0.05 mm long and appressed; capsules 5-8.5 (-10) mm long, 2-4 ( -5 ) mm in diameter; pedicels \(0-0.4 \mathrm{~mm}\) long; seed surface cells elongate parallel to the seed length (as seen at \(20 \times\) or more); anthers 1.1-1.6 mm long
L. linearis var. linearis

8 Sepals 3-5 (-5.6) mm long, elongate-acuminate to cuspidate, the surfaces densely minutely strigillose, the hairs 0.06-0.10 mm long and appressed to ascending; capsules \(5-10(-12) \mathrm{mm}\) long, 3-5.5 mm in diameter; pedicels \(0-3.5(-5) \mathrm{mm}\) long; seed surface cells elongate transverse to the seed length, or irregular (as seen at \(20 \times\) or more); anthers (1.1-) 1.3-2 mm long ....................... . . Linearis var. puberula 5 Capsules subglobose, obovoid, or broadly obpyramidal, 1-1.5 \(\times\) as long as broad; petals absent.

9 Flowers in compact, headlike or elongate spikes, the inflorescence lacking well-developed leaves; stems rarely branched; rhizomes often present
L. suffruticosa

9 Flowers axillary in the axils of well-developed leaves; stems usually much branched; rhizomes absent.
10 Plants densely pubescent throughout.
11 Sepal apex elongate-acuminate or subcuspidate, reflexed; pubescence of stems and leaves hirtellous (the hairs spreading); seed surface cells suborbicular (as seen at \(20 \times\) or more); anthers 0.6-0.9 (-1.3 mm long; style 1-2 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . L. pilosa
11 Sepal apex acuminate, ascending; pubescence of stems and leaves strigillose (the hairs appressed) or hirtellous (the hairs spreading); seed surface cells elongate; anthers 0.3-0.8 mm long; style 0.25-1 (-1.25) mm long.
12 Plants hirtellous; capsules oblong-obovoid; sepals greenish on the upper surface; bracteoles (1.5-) 24.3 mm long, borne at or near the base of the capsule; seed surface cells elongate transverse to the
seed length; anthers \(0.3-0.35 \mathrm{~mm}\) long; style \(0.25-0.5 \mathrm{~mm}\) long
L. ravenii

12 Plants strigillose; capsules subglobose; sepals yellowish on the upper surface; bracteoles \(0.5-1.5 \mathrm{~mm}\) long, usually borne on the short pedicel; seed surface cells in patches, some patches with cells elongate parallel to seed length, others with cells transverse to seed length, others with cells diagonal (rather resembling a badly laid-out parque floor); anthers \(0.5-0.8 \mathrm{~mm}\) long; style \(0.55-1(-1.25) \mathrm{mm}\)
long
L. sphaerocarpa

10 Plants glabrous or subglabrous throughout.
13 Primary leaves of the flowering stems \(4-17 \mathrm{~mm}\) long, \(1.5-10 \mathrm{~mm}\) wide, mostly obovate-spatulate and 1.5\(3 \times\) as long as wide; capsules \(1-1.5(-2) \mathrm{mm}\) long, containing 10-20 dark reddish-brown seeds; plants typically \(1-4 \mathrm{dm}\) tall
L. microcarpa

13 Primary leaves of the flowering stems (18-) 30-110 mm long, 2-10 (-20) mm wide, mostly elliptic, lanceolate, oblanceolate, or linear and 4-20× as long as wide; capsules 1.8-2-7 mm long, containing 40500 light brown, yellowish, or tan seeds; plants typically 3-10 dm tall.
14 Capsules obpyramidal, the corners narrowly winged with wings 0.3-0.9 mm wide; bracteoles 1.5-4.7 mm long.
15 Stems often distinctly ridged or winged; sepals creamy-white, nearly as long as the capsule; capsule wall bulging out longitudinally between the wings; seed surface cells elongate parallel to the seed length
L. alata

15 Stems nearly smooth or slightly ridged; sepals greenish, about \(1 / 2\) as long as the capsule; capsule wall flat between the wings; seed surface cells suborbicular
. L. lanceolata
14 Capsules, the corners not winged; bracteoles either \(0.5-1.5 \mathrm{~mm}\) or 3.5-6.5 (-8) mm long.
16 Bracteoles 3.5-6.5 (-8) mm long; sepals green, the apex long-acuminate, reflexed; capsules oblong-obovoid; seed surface cells elongate parallel to the seed length; [known from our area only in the Piedmont of VA]
L. polycarpa

16 Bracteoles \(0.5-1.5 \mathrm{~mm}\) long; sepals yellowish, the apex acuminate, ascending capsules subglobose; seed surface cells in patches, some patches with cells elongate parallel to seed length, others with cells transverse to seed length, others with cells diagonal (rather resembling a badly laid-out parque floor); [of the Coastal Plain of GA, NC, SC, and VA in our area]
L. sphaerocarpa

Ludwigia alata Elliott, Winged Seedbox. Cp (GA, NC, SC, VA): interdune ponds, freshwater to slightly brackish (oligohaline) marshes; rare (NC Rare, VA Rare). June-September. Se. VA south to s. FL, west to se. LA; disjunct in Jamaica. This species is a
hexaploid ( \(n=24\) ). One third of the genome of \(L\). alata is apparently derived from \(L\). microcarpa or its ancestor (Peng 1988). [= RAB , C, F, G, K, Z; > L. alata -- GW, in part only (also see L. lanceolata); > L. alata - S, in a narrower sense; > L. simulata Small -S]

Ludwigia alternifolia Linnaeus, Alternate-leaf Seedbox. Mt, Pd, Cp (GA, NC, SC, VA): ditches, marshes, open wet places, disturbed wet places; common. May-October. MA west to s. Ontario, s. MI, IA, and KS, south to n. FL and e. TX. [= RAB, G, GW, K, S, W; > L. alternifolia var. alternifolia -- C, F; > L. alternifolia var. pubescens E.J. Palmer \& Steyermark - C, F]

Ludwigia arcuata Walter. C p (GA, SC): marshes or submerged in water of natural coastal plain ponds; rare. JuneSeptember. SC south to s. FL, west to panhandle FL and s. AL. [= RAB, GW, K; = Ludwigiantha arcuata (Walter) Small -- S] * Ludwigia bonariensis (M. Micheli) Hara. Cp (NC, SC): freshwater tidal marshes and adjacent disturbed areas; rare, apparently introduced from tropical America. June-September. Locally abundant in disturbed edges of freshwater tidal marshes near Wilmington, NC, perhaps introduced on ship's ballast. Material from Wilmington apparently has larger flowers than material of L. bonariensis elsewhere; its source and appropriate taxonomic treatment uncertain and needing further study. First reported for SC by Leonard (1971b). [= RAB, GW, K; = Jussiaea neglecta Small -- S]

Ludwigia brevipes (B.H. Long ex Britton, A. Braun, \& Small) Eames, Long Beach Seedbox, Coastal Plain Water-purslane. Cp (GA, NC, SC, VA): pondshores, low wet places, interdunal swales, gravel pits, and ditches; rare (NC Watch List, VA Rare). JuneSeptember. NJ south to e. GA (Jones \& Coile 1988), in the Coastal Plain. [= RAB, C, F, G, GW, K]

Ludwigia decurrens Walter, Wingstem Water-primrose. Cp, Pd, Mt (GA, NC, SC, VA): swamp forests, ditches; common (rare in VA Mountains). June-October. MD, w. VA, WV, s. IN, s. IL, and MO, south to s. FL and TX; also in tropical America. [= RAB, C, GW, K, W; = Jussiaea decurrens (Walter) Augustin de Candolle -- F, G, S]

Ludwigia glandulosa Walter, Small-flowered Seedbox. Cp (GA, NC, SC, VA), Pd (GA, NC, SC): low forests, marshes, ditches; common (VA Watch List). June-September. E. MD south to n. FL, west to e. TX, north in the interior to c. TN, w. KY, s. IN, s. IL, se. MO, c. AR, and se. OK, primarily on the Southeastern Coastal Plain. A related species, treated by Peng as L.glandulosa ssp. brachycarpa (Torrey \& A. Gray) Peng, ranges from sw. LA north and west to s. OK and c. TX. This species is tetraploid ( \(\mathrm{n}=\) 16). [<L. glandulosa -- RAB, C, F, G, GW, S, in a broader sense; = L. glandulosa ssp. glandulosa -- K, Z] * Ludwigia grandiflora (Michaux) Greuter \& Burdet ssp. grandiflora, Showy Water-primrose. Cp (GA, SC): ponds, lakes, sluggish waters of ditches or streams; rare. May-September. Se. SC south to FL, west to TX; disjunct in MO, Guatemala, and in s. South America. This taxon is hexaploid ( \(n=24\) ). See Zardini, Gu, and Raven (1991) and Nesom \& Kartesz (2000) for additional information. [= Q; < L. uruguayensis (Cambessedes) Hara -- RAB, C, GW, K (also see L. hexapetala); = L. grandiflora (Michaux) Zardini, Gu, \& Raven - V]
* Ludwigia grandiflora (Michaux) Greuter \& Burdet ssp. hexapetala (Hooker \& Arnott) Nesom \& Kartesz, Common Waterprimrose. Cp (NC, SC), Pd (GA, NC, VA), Mt (VA): ponds, lakes, sluggish waters of ditches or streams; uncommon (but often locally abundant). May-September. NC south to FL, west to OK and TX; also in CA, Europe, South America, Mexico; also introduced farther north in North America. This taxon is decaploid ( \(n=40\) ). See Zardini, Gu, and Raven (1991) and Nesom \& Kartesz (2000) for additional information. [= Q; < L. uruguayensis (Cambessedes) Hara -- RAB, C, GW, K, W, in part (also see L. grandiflora); < Jussiaea uruguayensis Cambessedes -- F, G; Jussiaea michauxiana Fernald -- F; = L. hexapetala (Hooker \& Arnott) Zardini, Gu, \& Raven - V]

Ludwigia hirtella Rafinesque, Rafinesque's Seedbox. Cp (GA, NC, SC, VA), Pd (GA), Mt (GA, NC): savannas, rarely in mountain bogs; common (VA Rare). June-September. Ranging from s. NJ south to panhandle FL, west to e. TX, north in the interior to KY, c. TN, AR, and se. OK. [= RAB, C, F, G, GW, K, S, W]

Ludwigia lanceolata Elliott, Lanceleaf Seedbox. Cp (GA, NC, SC): interdune ponds, open wet areas; rare (NC Rare). August-September. Se. NC south to c. peninsular FL, west to panhandle FL. This species is tetraploid ( \(n=16\) ). [=RAB, K, S, \(Z ;<\) L. alata -- GW, in part]

Ludwigia leptocarpa (Nuttall) Hara, Water-willow. Cp (GA, NC, SC, VA), Pd (GA, VA), Mt (GA): riverbanks, marshes, and ditches; common, uncommon in VA (VA Watch List). June-September. VA south to c. peninsular FL, west to e. TX, north in the interior to se. MO and s. IL; and in tropical America. [= RAB, C, GW, K, W; = Jussiaea leptocarpa Nuttall -- F, G, S]

Ludwigia linearis Walter var. linearis, Eastern Narrowleaf Seedbox. Cp (GA, NC, SC, VA), Pd (GA, NC, SC): savannas; common. June-September. Var. linearis ranges from s. NJ south to c. peninsular FL, west to se. LA, extending inland to the Cumberland Plateau of nc. AL and c. TN. Var. linearis is here interpreted to be equivalent to Peng's subglabrous morph. Peng (1989) declines to recognize infraspecific taxa in L. linearis, but his discussion makes clear that 2 distinctive entities are present, as characterized by orientation of seed surface cells and characters of leaves, bracteoles, pedicels, sepals, stigmas, and styles (see key). The orientation of seed surface cells, recognized as a distinctive character in other difficult species pairs (such as \(L\). alata and L. lanceolata) is the most reliable character separating the 2 varieties. This species is diploid ( \(n=8\) ). \([<L\). linearis -- RAB, C, F, G, GW, K, S, W, Z, in part, infraspecific taxa not distinguished]

Ludwigia linearis Walter var. puberula Engelmann \& A. Gray, Western Narrowleaf Seedbox. Cp (GA, NC, SC, VA), Pd (GA, SC): savannas, interdunal swales; uncommon. June-September. Var. puberula ranges primarily from c. AL west to c. AR, south to e. TX, with intergradational material extending as far north and east as n. FL and e. NC. Var. puberula is here interpreted to include Peng's intermediate morph, densely strigillose morph, and completely glabrous morph (Peng 1989). As pointed out by Peng (1989), the glabrous morph is exactly like the densely strigillose morph except for the absence of pubescence. They often grow together, have essentially the same distribution, and may differ only at a single allele. Peng's intermediate morph is heterogeneous; some likely being truly intermediate between (and possibly hybrid derivatives of) the two varieties here recognized, while others clearly belong to var. puberula (based on surface cell orientation and floral characteristics) and merely have an amount of pubescence intermediate between the densely strigillose and completely glabrous morphs. [<L. linearis -- RAB, C, F, G, GW, K, S, W, Z, in part, infraspecific taxa not distinguished]

Ludwigia linifolia Poiret in Lamarck, Flaxleaf Seedbox. Cp (GA, NC, SC), Pd (NC): limesink ponds (dolines) and Taxodium ascendens savannas; rare (NC Rare). June-September. Nc. NC south to s. FL, west to s. MS; disjunct in Tabasco, Mexico. This species is diploid \((n=8)\). [= RAB, GW, K, S, Z]

Ludwigia maritima Harper, Harper's Seedbox. Cp (GA, NC, SC): savannas; common. June-September. E. NC south to s. peninsular FL, west to e. LA. [= RAB, GW, K, S]

Ludwigia microcarpa Michaux, Small-fruited Seedbox. Cp (GA, NC, SC), Pd (GA, NC), Mt (GA): in circumneutral or alkaline soils of moist places, over calcareous rock, mafic rock, shell hash, or brackish sands, such as in maritime wet grasslands, savannas and adjacent ditches over coquina limestone ("marl"), and wet clay flats over diabase, often in roadside ditches; uncommon. JulyOctober. Ne. NC south to s. FL, west to se. TX (Brown \& Marcus 1998); disjunct inland on calcareous or mafic rocks in nc. NC, n. GA, n. AL, c. TN, and sc. MO; also in the Bahamas, Cuba, and Jamaica. This species is diploid ( \(n=8\) ). [=RAB, F, GW, K, S, W, Z]

Ludwigia octovalvis (Jacquin) Raven. Cp (GA, NC, SC): marshes, disturbed areas; rare. May-September. Se. NC south to s. FL, west to TX; and widespread in tropical America. [= GW; > L. octovalvis spp. octovalvis -- K; > L. octovalvis ssp. sessiliflora (M. Micheli) Raven - K; > Jussiaea angustifolia Lamarck -- S; > Jussiaea scabra Willdenow - S]

Ludwigia palustris (Linnaeus) Elliott, Common Water-purslane. Cp, Pd, Mt (GA, NC, SC, VA): moist to wet disturbed areas; common. May-October. Widespread in North America, Eurasia, and Africa. [= RAB, C, GW, K, W; > L. palustris var. americana (Augustin de Candolle) Fernald \& Griscom -- F, G; > L. palustris var. nana Fernald \& Griscom -- F; = Isnardia palustris Linnaeus -S]
*? Ludwigia peploides (Humboldt, Bompland, \& Kunth) Raven var. glabrescens (Kuntze) Shinners. Cp (GA, NC, VA), Mt (VA), Pd (GA, SC, VA): pools, ditches, disturbed places; rare. May-September. PA, VA and NC south and west to FL and AZ, widespread in the West Indies, Central and South America. Doubtfully native in all or part of our area. [= RAB, C; L. peploides ssp. peploides -- GW; Jussiaea diffusa Forskl. -- S; Jussiaea grandiflora Michaux -- S; = Jussiaea repens Linnaeus var. glabrescens Kuntze -- F, misapplied; Jussiaea repens -- G, misapplied; = L. peploides ssp. glabrescens (Kuntze) Raven -- K; < L. peploides -- W, infraspecific taxa not distinguished]

Ludwigia pilosa Walter, Hairy Seedbox. Cp (GA, NC, SC, VA), Pd (NC, VA): ditches, wet places; common, rare in VA (VA Rare). June-October. Se. VA south to \(n\). FL, west to se. TX, restricted to the Coastal Plain except for disjunct occurrences inland in NC, VA, and \(n\). AL. This species is tetraploid \((\mathrm{n}=16)\). [ \(=K, W, Z ;<\). pilosa -- RAB, C, F, G, GW, S (also see L. ravenii)]

Ludwigia polycarpa Short \& Peter. Pd (VA): \{habitat\}; rare (VA Watch List). June-September; July-October. MA, CT, and w. VT west to s. Ontario, MI, WI, MN, and c. NE, south to C. VA, KY, s. IL, s. MO, and e. KS. This species is tetraploid ( \(n=16\) ). [= C, F, G, GW, K, S, Z]

Ludwigia ravenii Peng, Raven's Seedbox. Cp (NC, SC, VA): savannas, swamps, marshes, wet open places; rare (NC Watch List, VA Rare). June-October. Se. VA south to ne. FL (no known records for GA), restricted to the Coastal Plain. For further information, see Peng (1984, 1988, 1989). This species is tetraploid ( \(n=16\) ). [ \(=K, Z ;<L\). pilosa -- RAB, C, F, G, GW, S (included within concept of \(L\). pilosa by most earlier authors)]

Ludwigia repens Forster, Creeping Seedbox. Cp (GA, NC, SC, VA), Pd (GA): ditches, pools, and streams; uncommon (VA Rare). June-September. Se. VA south to s. FL, west to TX and n. Mexico, north in the interior to TN, MO, and OK; also in CA, Bermuda, and the West Indies. Reveal et al. (2003) propose the name L. repens for nomenclatural conservation with a conserved type; if this proposal is not accepted, L. natans Elliott will become the name of this species. [= RAB, GW, K; Ludwigia natans Elliott -- F, G; Isnardia repens -- S]

Ludwigia spathulata Torrey \& A. Gray, Southern Water-purslane. Cp (GA, SC), Pd (GA): sinkhole ponds, cypress-gum ponds, depression meadows, boggy shores; rare (GA Special Concern, NC Rare, SC Rare). June-October. SC south to panhandle FL and s. AL. [= RAB, GW, K; Isnardia spathulata (Torrey \& A. Gray) Small -- S]

Ludwigia sphaerocarpa Elliott, Globe-fruited Seedbox. Cp (GA, NC, SC, VA): boggy areas, pools, ditches; rare (NC Watch List, VA Rare). June-September. E. MA south to n. FL, west to e. TX, primarily on the Coastal Plain, spottily distributed in that range, and also disjunct in w. NY, sc. TN, s. IN, and nw. IN and ne. IL. This species is tetraploid ( \(n=16\) ). Peng (1989) considers it likely that \(L\). sphaerocarpa is of allopolyploid origin, one or both of its parents now extinct. [= RAB, C, GW, K, S, Z; > L. sphaerocarpa var. sphaerocarpa \(-F, G ;>L\). sphaerocarpa var. jungens Fernald \& Griscom -- F, G]

Ludwigia suffruticosa Walter, Shrubby Seedbox. Cp (GA, NC, SC): periodically to seasonally flooded portions of limesink ponds (dolines) and clay-based Carolina bays; rare north of SC (NC Rare). June-October. Se. NC south to s. peninsular FL, west to panhandle FL and se AL. This species is tetraploid ( \(n=16\) ). Peng (1989) reports that "with its whitish creamy sepals, which are very showy in the dense flower aggregates, the cross-pollinating L. suffruticosa successfully attracts many insects, mostly bumblebees, honeybees, and wasps." [= RAB, GW, K, S, Z; L. capitata Michaux]

Ludwigia virgata Michaux, Savanna Seedbox. Cp (GA, NC, SC, VA): wet savannas; common (VA Rare). June-September. Se. VA south to s. peninsular FL, west to panhandle FL and se. AL. [= RAB, C, F, GW, K, S]

Ludwigia peruviana (Linnaeus) Hara, in s. GA (Jones \& Coile 1988). Reported for NC (Kartesz 1999). \{investigate\} [=K; Jussiaea peruviana Linnaeus]

The following natural hybrids are known, not necessarily in our area. Hybrids are generally recognizable from their intermediate morphology and usual association with their two parents. However some hybrids resemble one parent much more than the other, and some hybrids are found in populations independent (and even disjunct) from one or both parents. Allopolyploidy may have had a major role in the evolution of this genus, especially section Microcarpium, which has a majority of polyploid species.
L. alata \(\times\) pilosa. Pentaploid, sterile.
L. alata \(\times\) suffruticosa. Pentaploid, sterile.
L. arcuata \(\times\) pilosa.
L. glandulosa \(\times\) linearis. Triploid, sterile.
L. glandulosa \(\times\) palustris. Triploid, sterile.
L. glandulosa \(\times\) pilosa. Tetraploid, fertile.
L. glandulosa \(\times\) sphaerocarpa. Tetraploid, fertile.
L. lanceolata \(\times\) pilosa \([=\) L. \(\times\) simulata Small (prosp.)]. Tetraploid, fertile.
L. lanceolata \(\times\) suffruticosa. Tetraploid, fertile. Frequent south of our area.
L. linearis \(\times\) sphaerocarpa. Triploid, sterile.
L. microcarpa \(\times\) palustris.
L. pilosa \(\times\) ravenii. Tetraploid, fertile.
L. pilosa \(\times\) sphaerocarpa. Tetraploid, fertile. Frequent.
L. pilosa \(\times\) suffruticosa. Tetraploid, fertile.
L. polycarpa \(\times\) sphaerocarpa. Tetraploid, fertile.

\section*{Oenothera Linnaeus (Evening-primrose)}
(also see Calylophus)
A genus of about 124 species, herbs, of America (especially temperate regions). This treatment provisional, with further revision likely, especially in the Oe. fruticosa-Oe. tetragona-Oe. pilosella complex. References: Dietrich, Wagner, \& Raven (1997)=Z; Dietrich \& Wagner (1988) \(=\) Y; Munz (1965)=X; Straley (1977) \(=\) V. Keys adapted in part from those references.

1 Ovary essentially terete; fruit terete or with 4 rounded ridges; stamens equal in length (except in Oe. speciosa). 2 Flowers white or pink; flower buds nodding; [section Hartmannia]

Oe.speciosa 2 Flowers yellow; flower buds erect; [section Oenothera]

3 Fruit linear, nearly isodiametric through its length; seeds borne ascending in the locules, rounded or fusiform, more or less regularly pitted; [section Oenothera, subsection Raimannia].

\section*{4 Petals acute to rounded at the apex.}

5 Inflorescence dense, with more than 2 flowers per spike opening each day; leaves gray-green . . . . . . . . [Oe. clelandii]
5 Inflorescence lax, 1-2 flowers per spike opening on each day; leaves green . . . . . . . . . . . Oe. curtissii 4 Petals truncate to emarginate at the apex.

6 Nonflowering portion of stems stiff, densely strigillose or sometimes also villous; leaves gray-green, densely strigillose, usually subentire to shallowly dentate (rarely lyrate); [in maritime situations].
7 Sepals 2.0-3.3 cm long; petals 2.5-4.5 cm long; stigma elevated above the anthers at anthesis; capsule 2.5-5.5 cm long; rosette leaves \(5-14 \mathrm{~cm}\) long, \(1-2 \mathrm{~cm}\) wide

Oe. drummondii ssp. drummondii
7 Sepals 0.3-1.1 cm long; petals 0.45-1.6 cm long; stigma surrounded by the anthers at anthesis;
capsule \(1.5-4.5 \mathrm{~cm}\) long; rosette leaves \(4-8 \mathrm{~cm}\) long, \(0.7-1.0 \mathrm{~cm}\) wide
Oe. humifusa
6 Nonflowering portion of stem not stiff, moderately to sparsely strigillose to sometimes densely villous, and also more orless glandular puberulent; leaves green, sparsely to moderately strigillose and usually villous, deeply lobed to dentate (rarely some of them subentire); [in inland disturbed situations].
8 Petals 2.5-4 cm long; style 4-7.5 cm long; stigma lobes well elevated above the anthers at anthesis
Oe. grandis
8 Petals 0.5-2.2 cm long; style 2-5 cm long; stigma lobes surrounded by the anthers at anthesis
Oe. laciniata
3 Fruit thickest near the base, tapering to the apex; seeds borne horizontally in the locules, angled-prismatic, not regularly pitted; [section Oenothera, subsection Oenothera].
\(9 \quad\) Stigma elevated above the anthers at anthesis; petals 2.5-5 cm long.
10 Cauline leaves \(0.4-1.0 \mathrm{~cm}\) wide; apex of the inflorescence curved; free sepal tips subterminal, usually spreading; capsules spreading at nearly right angles to the stem, long-attenuate toward apex, usually conspicuously arcuate

Oe. argillicola
10 Cauline leaves \(1.5-6 \mathrm{~cm}\) wide; apex of the inflorescence erect; free sepal tips terminal, erect; capsules erect or slightly spreading, gradually attenuate toward the apex.
11 Upper stem, ovary, floral tube, and sepals always conspicuously pubescent, usually with at least some red-pustulate hairs; bracts green, persistent; sepals often flushed with red, or red-striped .....

11 Upper stem, ovary, floral tube, and sepals often apparently glabrous without magnification; pustulate hairs absent, or if present not red (in fresh material); bracts often pale-green and deciduous; sepals yellowish green, or flushed with some red

Oe. grandiflora
9 Stigma surrounded by or below the anthers at anthesis; petals 0.7-2.5 (-3) cm long.
12 Plant appearing exclusively appressed-pubescent (as seen without magnification).
13 Apex of the inflorescence curved; free sepal tips subterminal in bud, erect to spreadin; dry capsules usually rusty brown

Oe. oakesiana
13 Apex of the inflorescence erect; free sepal tips erect in bud; dry capsules gray-green or dull green.
14 Leaves green to pale green; stems, ovary, floral tube, and sepals sparsely appressed-pubescent
Oe.biennis
14 Leaves dull green to gray-green; stems, ovary, floral tube, and sepals densely appressedpubescent . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Oe. villosa ssp. villosa
12 Plant appearing either glabrous or with a mixture of long pustular hairs and appressed pubescence (as seen without magnification).

\section*{Flora of the Carolinas, Virginia, and Georgia, Working Draft of 10 June 2005 -- ONAGRACEAE}

15 Apex of inflorescence curved; free sepal tips subterminal in bud.
16 Plant (at least the lower portions) predominantly strigillose; leaves dull green to gray-green; dry capsules rusty brown \(\qquad\) Oe. oakesiana
16 Plant predominantly erect-pubescent or appearing glabrous (as seen without magnification); leaves usually bright green; dry capsules usually dark green or black

Oe. parviflora
15 Apex of inflorescence erect; free sepal tips terminal or subterminal in bud.
17 Inflorescence conspicuously pubescent
Oe. biennis
17 Inflorescence glabrous (or appearing so without magnification).
18 Free sepal tips terminal in bud; petals 1.4-2.5 (-3) cm long; bracts caducous, pale green; capsules dull green when dry; petals fading yellowish-white to translucent .... Oe. nutans
18 Free sepal tips subterminal in bud; petals 0.8-1.5 (-2) cm long; bracts persistent, green; capsules usually black or dark green when dry; petals fading pale yellow, usually opaque

Oe. parviflora
1 Ovary 4-angled or 4-winged (at least near its tip); fruit sharply 4-angled or 4-winged; stamens of two lengths (except Oe. triloba and Oe. macrocarpa ssp. macrocarpa).
19 Leaves all basal, pinnatifid; [section Lavauxia] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Oe. triloba
19 Leaves in part cauline, entire or toothed.
20 Petals \(50-70 \mathrm{~mm}\) long; flowers opening in the evening; wings of the fruit \(10-25 \mathrm{~mm}\) wide; [section Megapterium] . .
[Oe. macrocarpa ssp. macrocarpa]
20 Petals \(3-30 \mathrm{~mm}\) long; flowers opening in the day; wings of the fruit \(<3 \mathrm{~mm}\) wide; [section Kneiffia]
21 Cauline leaves linear, less than 1 mm wide; petals \(3-5(-7) \mathrm{mm}\) long; floral bracts shorter than the subtended ovaries; mature fruits ellipsoid-rhomboid, 4-6 mm long; annual; [section Kneiffia, subsection Peniophyllum]

Oe. linifolia
21 Cauline leaves lanceolate to ovate, more than 1 mm wide; petals \(5-30 \mathrm{~mm}\) long; floral bracts longer than the subtended ovaries; mature fruits clavate to oblong-elliptic, 8-20 mm long; perennial; [section Kneiffia, subsection Kneiffia].
22 Petals 5-10 mm long; inflorescence usually nodding . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Oe. perennis 22 Petals \(15-30 \mathrm{~mm}\) long; inflorescence usually erect.

23 Plant conspicuously pilose-hirsute with hairs 1-3 mm long; free sepal tips 1-4 mm long, divergent.. Oe. pilosella
23 Plant either with shorter or appressed pubescence, of glandular or nonglandular hairs; free sepal tips 0-2 (-6) mm long, divergent or not.
24 Capsules oblong, widest near the middle, usually abruptly tapered to a stipe 0.1-3 (-7) mm long; hairs of the ovary and capsule predominantly glandular (or the ovary glabrous); leaves subglabrous or sparsely pubescent, more or less dentate.
25 Petals (20-) 25-35 mm long; cauline leaves lanceolate to ovate, 2-7 cm long, 1-3 cm wide, often glaucous beneath . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Oe. tetragona var. fraseri
25 Petals 12-20 (-25) mm long; cauline leaves linear to lanceolate, 2-7 cm long, 0.5-1.0 (-1.5) cm wide

Oe. tetragona var. tetragona
24 Capsules clavate, widest above the middle, gradually tapered to a stipe \(3-10 \mathrm{~mm}\) long; hairs of the ovary and capsule nonglandular (or with a mixture of glandular and nonglandular hairs); leaves generally pubescent, subentire.
26 Petals 15-30 mm long; stems 7-12 dm tall, freely branched, slightly pubescent; cauline leaves lanceolate, \(5-12 \mathrm{~cm}\) long, \(0.5-1.5 \mathrm{~cm}\) wide; [of tidal marshes, usually with spongy lower stems and adventitious roots where regularly submerged] . . . . . . . . . . Oe. riparia
26 Petals (8-) 15-22 mm long; stems 1-8 dm tall, less branched (unless mowed, grazed, or otherwise damaged), more pubescent; cauline leaves 2-6 (-8) cm long, 0.2-1.0 (-1.2) cm wide.
27 Capsule vestiture a mixture of glandular and nonglandular hairs.
28 Cauline leaves not velutinous, \(5-10 \times\) as long as wide
Oe. tetragona var. brevistipata
28 Cauline leaves velutinous, \(2-4 \times\) as long as wide.
29 Petals 7-12 mm long; leaves lance-oblong, obtuse; [of barrens of TN, KY, and AL] . . . . . . . . . . . . . . . . . . . . . . . . . . . . [Oe. tetragona var. sharpi
29 Petals 15-20 mm long; leaves lanceolate, acute; [of the Atlantic Coastal Plain]

Oe. tetragona var. velutina
27 Capsule vestiture strictly nonglandular.
30 Free sepal tips \(1-3 \mathrm{~mm}\) long, often arching; calyx strigose
. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Oe. fruticosa var. unguiculata
30 Free sepal tips less than 1 mm long; calyx various.
31 Capsule body 6-11 mm long, the pubescence rather coarse
Oe. fruticosa var. fruticosa
31 Capsule body \(3-5 \mathrm{~mm}\) long, the pubescence very fine.
32 Capsule body 3.5-4 mm long, strigose-pilose; [of Coastal Plain bogs] .
Oe. fruticosa var. microcarpa

32 Capsule body 4-5 mm long; very finely strigillose; [of Piedmont rock outcrops] . . . . . . . . . . . . . . . . . . . . . Oe. fruticosa var. subglobosa

Oenothera argillicola Mackenzie, Shale-barren Evening-primrose. Mt (VA): shale barrens and woodlands; uncommon. Sc. PA south through MD to e. WN and w. VA (south to Montgomery County). [= C, F, G, H, K, W, Z; > Oe. argillicola var. argillicola -X; > Oe. argillicola var. pubescens Core \& Davis -- X]

Oenothera biennis Linnaeus, Common Evening-primrose. Mt, Pd, Cp (GA, NC, SC, VA): fields, pastures, roadsides, disturbed areas; common. June-October. Ranging widely in e. North America and Europe, and scattered in w. North America. [= \(\mathrm{H}, \mathrm{K}, \mathrm{W}, \mathrm{Z}\); < Oe. biennis -- RAB, G, S (also see Oe. nutans); = Oe. biennis var. biennis -- C, F; > Oe. biennis var. biennis - F, in a narrower sense; > Oe. biennis var. pycnocarpa (Atkinson \& Bartlett) Wiegand -- F; > Oe. biennis ssp. caeciarum Munz -- X; > Oe. biennis ssp. centralis Munz -- X]

Oenothera curtissii Small. Cp (GA, SC): sandhills, sandy fields; rare. May-September. Se. SC south to n. peninsular FL, west to s. AL. Closely related to Oe. rhombipetala, which is restricted to the Great Plains, with scattered occurrences east to AR, IL, and MI. [= K, Y; < Oenothera rhombipetala Nuttall ex Torrey \& A. Gray -- RAB, F, X, misapplied; = Raimannia curtissii Rose -- S]

Oenothera drummondii Hooker ssp. drummondii, Drummond's Evening-primrose. Cp (NC, SC): sandy ocean beaches; rare, perhaps only introduced or adventive from the Gulf Coast. April-October. Ssp. drummondii ranges from se. NC south to s. FL, west to se. TX, and south to Tamaulipas and Vera Cruz. Ssp. thalassiphila (Brandegee) W. Dietrich \& W.L. Wagner is restricted to the southern tip of Baja California. [= Y; < Oe. drummondii -- RAB, K; < Raimannia drummondii (Hooker) Rose ex Sprague \& Riley -- S; = Oe. drummondii var. drummondii -- X]

Oenothera fruticosa Linnaeus var. fruticosa, Southern Sundrops. Cp, Pd (GA, NC, SC, VA), Mt (GA, NC, VA): dry forests and woodlands, glades, and rock outcrops; common. April-August. MA west to IN, south to FL and LA. [= F, G, X; < Oe. fruticosa -- RAB, C; < Oe. fruticosa ssp. fruticosa -- H, K, V, W; > Oe. fruticosa var. linearis (Michaux) S. Watson -- F; > Oe. fruticosa var. humifusa Allen -- F, G, X; > Kneiffia fruticosa (Linnaeus) Raimann -- S; >Kneiffia arenicola Small -- S; >Kneiffia semiglandulosa Pennell -- S]

Oenothera fruticosa Linnaeus var. microcarpa Fernald, Small-fruited Sundrops. Cp (NC, SC, VA): boggy depressions. April-August. E. MD south to e. SC. [=F, X; < Oe. fruticosa -- RAB, C; < Oe. fruticosa ssp. fruticosa -- H, K, V]

Oenothera fruticosa Linnaeus var. subglobosa (Small) Munz, Flatrock Sundrops. Pd (GA): granite flatrocks and domes; rare. GA to AL. [= X; < Oe. fruticosa -- RAB, C; < Oe. fruticosa ssp. fruticosa -- H, K, V; = Kneiffia subglobosa Small -- S]

Oenothera fruticosa Linnaeus var. unguiculata Fernald, Southern Sundrops. Cp (NC, SC, VA): sandhills, moist to wet loamy savannas; uncommon. April-August. Se. VA south to e. SC. [=F, X; < Oe. fruticosa -- RAB, C; < Oe. fruticosa ssp. fruticosa -- H, K, V]
* Oenothera glazioviana Micheli in Martius, Garden Evening-primrose. Cp, Pd, Mt (GA, NC, SC, VA): disturbed areas; uncommon. This species apparently arose as a garden hybrid, and has been widely cultivated and naturalized nearly worldwide. [= K, Z; = Oe. erythrosepala Borbás -- X]

Oenothera grandiflora L'Héritier ex Aiton. Cp, Pd, Mt (GA?, NC, SC): disturbed areas; uncommon. June-October. VT west to KY, south to c. peninsular FL and s. MS. [=F, K, X, S, Z]

Oenothera grandis (Britton) Smyth. Cp (NC): roadsides; rare, introduced from further west. March-July. The native range of this species is centered in KS, OK, and TX. [=K, X, Y; = Oe. laciniata Hill var. grandiflora (S. Watson) B.L. Robinson -- RAB, F, G]

Oenothera humifusa Nuttall, Seabeach Evening-primrose, Spreading Evening-primrose. Cp (GA, NC, SC, VA): coastal sand dunes; common. Early May-October. S. NJ south to s. FL, west to s. LA, along the coast. [=RAB, C, F, G, H, K, X, Y; = Raimannia humifusa (Nuttall) Rose -- S]

Oenothera laciniata Hill, Cutleaf Evening-primrose. Cp, Pd, Mt (GA, NC, SC, VA): disturbed areas; common. FebruaryOctober. ME west to ND, south to s. FL and TX; also in CA. [ \(=\mathrm{K}, \mathrm{W} ;=\) Oe. laciniata var. laciniata \(-\mathrm{RAB}, \mathrm{C}, \mathrm{F}, \mathrm{G} ;=\mathrm{Raimannia}\) laciniata (Hill) Rose -- S; = Oe. Iaciniata ssp. laciniata -- X]

Oenothera linifolia Nuttall, Threadleaf Sundrops, Flaxleaf Sundrops. Pd (GA, NC, SC, VA*), Cp (GA, SC), Mt (GA): dry openings and fields; rare (SC Rare, VA Watch List). C. VA west to s. IL and se. KS, south to panhandle FL and se. TX. Occurrences east of the Mississippi River may be mainly or entirely adventive. Belden et al. (2004) discuss the Virginia occurrence. [= RAB , C, F, G, K, W, V, X; = Peniophyllum linifolium (Nuttall) Pennell -- S]

Oenothera nutans Atkinson \& Bartlett. Mt, Pd (GA?, NC, SC?, VA): roadsides, openings, forest edges, pastures; common (NC Watch List, VA Watch List). July-October. ME west to MI, south to n. FL, s. AL, and s. MO. [=K, Z; < Oe. biennis - RAB, G, S; \(=\) Oe. biennis Linnaeus var. austromontana (Munz) Cronquist -- C; = Oe. biennis var. nutans (Atkinson \& Bartlett) Wiegand -- F; = Oe. austromontana (Munz) Raven, Dietrich, \& Stubbe -- H, W; = Oe. biennis ssp. austromontana Munz -- X]

Oenothera oakesiana (A. Gray) Robbins ex S. Watson \& Coulter. Cp (NC, VA), Pd, Mt (VA): disturbed areas, roadsides; uncommon (VA Watch List). Nova Scotia west to Manitoba, south to e. NC, sc. VA, PA, n. IN, n. IL, and s. MN. [= G, K, Z; = Oe. parviflora Linnaeus var. oakesiana (A. Gray) Fernald -- C, F; = Oe. parviflora ssp. parviflora var. oakesiana (A. Gray) Fernald -- X]

Oenothera parviflora Linnaeus, Small-flowered Evening-primrose. Mt, Pd (NC, VA), Cp (NC, SC, VA): fields, disturbed areas; uncommon. May-September. Nova Scotia west to Manitoba, south to NC, TN, KY, and MO. Reported for GA (GANHP). [= RAB, G, K, W, Z; > Oe. parviflora var. parviflora -- C, F; > Oe. parviflora var. angustissima (R.R. Gates) Wiegand -- F; > Oe. parviflora ssp. parviflora var. parviflora -- X; > Oe. parviflora ssp. angustissima (R.R. Gates) Munz -- X]

Oenothera perennis Linnaeus, Little Sundrops. Mt (NC, SC, VA), Pd (NC, VA), Cp (VA): bogs, sphagnous seeps; uncommon (rare south of VA) (NC Rare, SC Rare). May-August. Nova Scotia west to Manitoba, south to w. NC, nw. SC, KY, and MO. [= RAB, C, G, K, W, X; > Oe. perennis var. perennis -- F; = Kneiffia perennis (Linnaeus) Pennell -- S]

Oenothera pilosella Rafinesque, Midwestern Evening-primrose. Mt, Pd, Cp (VA): disturbed areas; rare. NH west to Ontario, south to s. VA, KY, n. AL, c. MS, and c. LA. Oe. sessilis (Pennell) Munz, treated by Straley (1977) as Oe. pilosella ssp. sessilis (Pennell) Straley, seems sufficiently distinct to be recognized as a species; it is restricted to Mississippi River Alluvial Plain. [= F, G, X ; = Oe. pilosella ssp. pilosella -- \(\mathrm{C}, \mathrm{K}, \mathrm{V} ;>\) Kneiffia pratensis Small -- S ; \(=\) Oe. fruticosa Linnaeus var. hirsuta Nuttall ex Torrey \& A .

Gray]
Oenothera riparia Nuttall, Riverbank Evening-primrose. Cp (NC, SC): tidal marshes; rare (NC Rare). June-July. Se. VA (?) south to se. NC and e. SC. Distinct from Oe. fruticosa. Present in the freshwater tidal portions of the Waccamaw, Northeast Cape Fear, Black, Greater Pee Dee, and Cape Fear (?) rivers. [< Oe. fruticosa -- RAB; < Oe. fruticosa ssp. fruticosa -- K, V; = Kneiffia riparia (Nuttall) Small -- S; = Oe. tetragona Roth ssp. glauca (Michaux) Munz var. riparia (Nuttall) Munz -- X]
* Oenothera speciosa Nuttall, White Evening-primrose. Cp, Pd, Mt (GA, NC, SC, VA): roadsides and fields, also cultivated as an ornamental; common (rare in Mountains), introduced from further west. May-August. [= RAB, C, F, G, K, W, X; = Hartmannia speciosa (Nuttall) Small -- S]

Oenothera tetragona Roth var. brevistipata (Pennell) Munz. Mt, Pd (GA, NC, SC, VA), Cp (VA): dry forests and woodlands, roadsides; common. May-August. SC and KY, south to GA and MS. Should perhaps be considered more closely related to Oe. fruticosa (where placed in synonymy by Straley), if it is determined to be valid. [ \(=\mathrm{G}\); < Oe. tetragona -- RAB, C; < Oe. fruticosa Linnaeus ssp. fruticosa -- H, K, V, W; = Kneiffia brevistipata Pennell -- S; = Oe. tetragona ssp. tetragona var. brevistipata -- X]

Oenothera tetragona Roth var. fraseri (Pursh) Munz, Appalachian Sundrops. Mt (GA, NC, SC, VA), Pd (NC, SC, VA), Cp (VA): dry to moist forests and woodlands, roadsides; common. May-August. NY and PA, south to nw. SC and n. GA. This is the more montane and high elevation variant of Oe. tetragona. [=F, G, X; < Oe. tetragona -- RAB, C; > Oe. tetragona var. hybrida (Michaux) Fernald -- F; > Oe. tetragona var. latifolia (Rydberg) Fernald -- F; < Oe. fruticosa Linnaeus ssp. glauca (Michaux) Straley -- H, K, V, W; > Kneiffia glauca (Michaux) Spach -- S; > Kneiffia hybrida (Michaux) Small -- S; > Kneiffia latifolia Rydberg -- S; = Oe. tetragona ssp. glauca var. glauca -- X]

Oenothera tetragona Roth var. tetragona, Northern Sundrops. Mt, Pd (NC, SC, VA), Cp (VA): dry forests and woodlands, roadsides; common. May-August. Newfoundland west to MI, south to e. VA and MO. [= F; < Oe. tetragona -- RAB, C; < Oe. tetragona var. tetragona -- G; < Oe. fruticosa Linnaeus ssp. glauca (Michaux) Straley -- H, K, V, W; = Kneiffia tetragona (Roth) Pennell -- S; = Oe. tetragona ssp. tetragona var. tetragona -- X]

Oenothera tetragona Roth var. velutina (Pennell) Munz. Cp (VA): dry sandy soils. Se. NY (Long Island) south to se. VA. Should perhaps be considered more closely related to Oe. fruticosa (where placed in synonymy by Straley), if it is determined to be valid. [= F, G; < Oe. tetragona -- RAB, C; < Oe. fruticosa Linnaeus ssp. fruticosa -- H, K, V, W; = Kneiffia velutina Pennell - S; = Oe. tetragona ssp. tetragona var. velutina -- X]

Oenothera triloba Nuttall, Stemless Evening-primrose. Mt (GA, VA): limestone glades, \{habitat not known in VA\}; rare, perhaps only introduced, though native into eastern KY and TN (GA Watch List). [ \(=\mathrm{C}, \mathrm{F}, \mathrm{G}, \mathrm{H}, \mathrm{K}, \mathrm{X}\); = Lavauxia triloba (Nuttall) Spach -- S]
* Oenothera villosa Thunberg ssp. villosa. Mt, Pd (VA): disturbed areas; uncommon, apparently naturalized in our area from an original distribution in the Great Plains. [= K, Z; ? Oe. strigosa (Rydberg) Mackenzie \& Bush -- G; ? Oe. biennis var. canescens Torrey \& A. Gray -- C, F; ? Oe. strigosa (Rydberg) Mackenzie \& Bush ssp. canovirens (Steele) Munz -- X]
* Oenothera clelandii W. Dietrich, Raven, \& W.L. Wagner. Reported for SC (Kartesz 1999). \{investigate\} Centered in IL and WI, ranging east, probably mostly as introductions, to NJ, WV, KY. [= C, K, Y; < Oe. rhombipetala, misapplied]

Oenothera macrocarpa Nuttall ssp. macrocarpa, Wingfruit Evening-primrose, occurs as a disjunct in c. TN. [=K; < Oe. missouriensis Sims -- F; < Oe. macrocarpa Nuttall -- C, G; = Oe. missouriensis Sims var. missouriensis -- X; ? Megapterium missouriense (Sims) Spach]

Oenothera tetragona Roth var. sharpii Munz. Known from the Eastern Highland Rim of TN, AL, and KY. [< Oe. tetragona -RAB, C; < Oe. tetragona var. tetragona-- G; < Oe. fruticosa Linnaeus ssp. fruticosa -- H, K, V, W; = Oe. tetragona ssp. tetragona var. sharpii -- X]

Many hybrids are known.

\section*{OROBANCHACEAE (Broomrape Family)}

A family of about 96 genera and 2060 species, root-parasitic herbs lacking chlorophyll (Orobanchaceae sensu stricto) and chlorophyllose hemi-parasites (formerly placed in the Scrophulariaceae), of temperate and subtropical regions of the Northern Hemisphere (Manen et al. 2004). References: Thieret (1971); Olmstead et al. (2001); Fischer in Kadereit (2004).
tribe Gerardieae: Agalinis, Aureolaria, Dasistoma, Macranthera, Seymeria.
tribe Orobancheae: Epifagus, Orobanche.
tribe Buchnereae, "subtribe Buchneriinae": Buchnera, Striga.
tribe Cymbarieae: Schwalbea.
"tribe Castillejeae": Castilleja.
tribe Rhinantheae: Conopholis, Melampyrum, Pedicularis.

1 Plants lacking chlorophyll (parasitic), variously pink, purple, brown, or white.
2 Stem paniculately branched; flowers dimorphic, those low in the inflorescences small, pistillate, and fertile, those high in the inflorescence larger, apparently perfect but functionally staminate

Epifagus
2 Stem simple (rarely few-branched); flowers all alike.
3 Calyx deeply cleft on the lower side; stamens exserted Conopholis
3 Calyx either nearly regular, or deeply cleft above and below into 2 lateral halves; stamens included Orobanche
1 Plants with chlorophyll (hemiparasitic), with foliage and stems normally green.

A genus of about 40 species, hemiparasitic herbs, of tropical and warm temperate regions of America. References: Canne (1979); Hays (1998b); Pennell (1935)=P.

1 Perennial, from horizontal rootstalk bearing slender, scaly rhizomes; corollas 3-4 cm long; [of Carolina bays, cypress savannas, limesink ponds] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. Iinifolia
1 Annual, with 1-several fibrous roots from the stem base; corollas less than 3 cm long (except sometimes \(A\). fasciculata and \(A\). purpurea).
2 Stem retrorse-hispid; leaves lanceolate to ovate, usually lobed at the base; [of mafic glades and woodlands]
2 Stem ascending scabridulous or glabrous; leaves linear or filiform, entire.
3 Leaves reduced to scales less than 2.5 mm long, plant thus appearing leafless . . . . . . . . . . . . . . . . . . A. aphylla 3 Leaves not scale-like, at least 8 mm long.

4 Pedicels less than \(1.5 \times\) as long as the calyx, mostly 1-5 mm long at anthesis, mostly less than 8 mm long in fruit.
5 Plants fleshy; [of saline or brackish marshes and salt flats].
6 Pedicels usually longer than or equalling the leaflike bracts; corollas 15-20 mm long; anther cells 1.82.3 mm long, usually long-lanose; [of Princess Anne County, VA, southwards]
A. maritima var. grandiflora

6 Pedicels usually less than or equalling the leaflike bracts; corollas 12-17 mm long; anther cells 1.3-1.8 mm long, glabrous or somewhat pubescent; [of the Delmarva Peninsula northwards]
A. maritima var. maritima

5 Plants not fleshy; [not inhabiting saline habitats, though some species may be found in freshwater interdune swales].
7 Stems appearing copiously leafy because of the well-developed fascicles of axillary leaves; [inhabiting dry to moist, often ruderal, habitats]
A. fasciculata

7 Stems not copiously leafy, the axillary fascicles absent or poorly developed; [inhabitating moist to wet natural habitats].
8 Branches spreading or ascending; stems more-or-less scabridulous; corollas 18-38 mm long
8 .................................................................... . A. purpurea
4 Pedicels more than \(2.5 \times\) as long as the calyx, mostly \(5-20 \mathrm{~mm}\) long at anthesis, mostly more than 10 mm long in fruit.
9 Living plants dull green, usually suffused with much purplish pigment; leaves at least 20 mm long; dried plants dark, sometimes blackish; dried calyx deep purple, the veins obscure (difficult to see even at \(10 \times\) ). 10 Upper lip of the corolla arched forward over the stamens, greatly reducing the opening of the throat; corolla throat glabrous or glabrate within; [of the Piedmont and Mountains] . . . . . . . . . . . A. tenuifolia
10 Upper lip of the corolla erect or reflexed, the throat open; corolla throat densely long-hairy within; [of the Coastal Plain].
11 Branches widely spreading or laxly ascending; pedicels at least \(4 \times\) as long as the leaflike bracts; anterior filaments \(5-5.5 \mathrm{~mm}\) long; [of Berkeley and Beaufort counties, SC, southwards] . A. laxa 11 Branches ascending to somewhat spreading; pedicels less than \(3 \times\) as long as the leaflike bracts; anterior filaments \(7-9 \mathrm{~mm}\) long; [widespread]
A. setacea

9 Living plants light green or glaucescent, usually with no purple pigment; leaves less than \(15(-20) \mathrm{mm}\) (except \(A\). decemloba, with leaves \(15-25 \mathrm{~mm}\) long); dried plants not dark, but turning pale yellowish green; dried calyx pale yellowish green, the veins distinct and obvious without magnification.
12 Corolla throat within lacking 2 yellow lines; leaves widen distally to obtuse tips; stem and branches distinctly rough-scabridulous to the touch
12 Corolla throat with 2 prominent yellow lines; leaves taper to acute or acuminate tips; stem and branches not (or very slightly) scabridulous.
13 Corolla 10-15 mm long, its lobes emarginate or retuse; [of the Piedmont and Mountains, and rarely the upper Coastal Plain]
13 Corolla \(15-20 \mathrm{~mm}\) long, its lobes entire to slightly emarginate; [of the Coastal Plain, from e. NC southwards]

Agalinis aphylla (Nuttall) Rafinesque, Scale-leaf Agalinis. Cp (GA, NC, SC): wet pine savannas; rare (GA Special Concern). [= RAB, GW, K, S; = Gerardia aphylla Nuttall -- P]

Agalinis auriculata (Michaux) S.F. Blake, Earleaf Foxglove. Pd (SC, VA): glades, barrens, and disturbed clearings over mafic rocks, such as diabase and gabbro; rare (US Species of Concern, SC Rare, VA Rare). August; September. Ranging from OH west to MN, south to \(n\). AL, AR, and TX; also rarely disjunct east of the Blue Ridge, in NJ, n. VA, and nc. SC. In Lewis County, KY (D. White, pers. comm.). Sometimes treated in the monotypic genus Tomanthera. [= C, K; = Tomanthera auriculata (Michaux) Rafinesque -- G, P, S; = Gerardia auriculata Michaux -- F]

Agalinis decemloba (Greene) Pennell. (GA): dry clayey or sandy woodlands; rare (GA Special Concern). [=RAB, S; <A. obtusifolia -- C, K, in part; = Gerardia decemloba Greene -- F, P]

Agalinis fasciculata (Elliott) Rafinesque. Cp (GA, NC, SC, VA), Pd (GA, SC, VA): . [= RAB, C, S; > Gerardia fasciculata Elliott -- F; > Gerardia racemulosa Pennell -- F, P; < A. fasciculata (Elliott) Rafinesque -- GW, K, in part; > Gerardia fasciculata ssp. typica -- P]

Agalinis laxa Pennell. Cp (GA, SC): . [= K, S; A. divaricata (Chapman) Pennell -- GW; = Gerardia laxa (Pennell) Pennell -- P]
Agalinis linifolia (Nuttall) Britton. Cp (GA, NC, SC, VA?): . [= RAB, C, GW, K, S; = Gerardia linifolia Nuttall -- F, P]
Agalinis maritima (Rafinesque) Rafinesque var. grandiflora (Bentham) Shinners. Cp (GA, NC, SC, VA): Se. VA south to FL, west to TX and Tamaulipas; and in the West Indies. [= K, S; <A. maritima -- RAB, C, GW, infraspecific taxa not distinguished; = Gerardia maritima Rafinesque var. grandiflora Bentham -- F; = Gerardia maritima ssp. grandiflora (Bentham) Pennell -- P; A. spiciflora]

Agalinis maritima (Rafinesque) Rafinesque var. maritima. Cp (NC, VA): S. ME south to se. VA and NC. [= K; <A. maritima -- RAB, C, GW, infraspecific taxa not distinguished; = Gerardia maritima Rafinesque var. maritima -- F; = Gerardia maritima ssp. typica -- P]

Agalinis obtusifolia Rafinesque. Cp (GA, NC, SC, VA), Pd (GA, NC, VA): . [=RAB, GW; < A. obtusifolia -- C, K, in part (also see A. decemloba and A. tenella); = Gerardia obtusifolia (Rafinesque) Pennell -- F, P]

Agalinis paupercula (A. Gray) Britton var. paupercula. \{puzzling record in Harvill et al. 1992) (check specimen)\}. [= K; A. purpurea (Linnaeus) Pennell var. parviflora (Bentham) B. Boivin -- C; = Gerardia paupercula (A. Gray) Britton var. paupercula -- F; = Gerardia paupercula var. typica -- P]

Agalinis plukenetii (Elliott) Rafinesque. Cp, Pd (GA), Mt (SC): In extreme se. TN (Polk County) (Chester, Wofford, \& Kral 1997) and scattered in GA (e.g. Baldwin and Laurens counties). [ \(=\mathrm{K}, \mathrm{S}\); = Gerardia plukenetii Elliott -- P]

Agalinis purpurea (Linnaeus) Pennell. Cp, Pd, Mt (GA, NC, SC, VA): . [= RAB, K, S; A. purpurea var. purpurea -- C; = Gerardia purpurea Linnaeus -- F, P; < A. purpurea -- GW, in part (also see A. virgata)]

Agalinis setacea (J.F. Gmelin) Rafinesque. Cp, Pd, Mt (GA, NC, SC, VA). [= RAB, C, K, S; = Gerardia setacea J.F. Gmelin -F, P]

Agalinis tenella Pennell. Cp (GA, NC, SC), Pd (SC): (NC Rare). [= RAB, \(\mathrm{S} ;<\mathrm{A}\). obtusifolia -- K; = Gerardia tenella (Pennell) Pennell -- P]

Agalinis tenuifolia (Vahl) Rafinesque var. tenuifolia. Mt, Pd, Cp (GA, NC, SC, VA): \([=K, S ;<A\). tenuifolia \(--\mathrm{RAB}, \mathrm{C} ;=\) Gerardia tenuifolia Vahl var. tenuifolia -- F]

Agalinis virgata Rafinesque. \(\mathrm{Cp}(\mathrm{GA}, \mathrm{NC}, \mathrm{SC}\) ): pine savannas; rare. [= RAB, \(\mathrm{S} ;<\operatorname{A}\). fasciculata (Elliott) Rafinesque -K ; < A. purpurea (Linnaeus) Pennell -- GW, in part]

Agalinis acuta Pennell, MA south to Baltimore County, MD. [= C, K; = Gerardia acuta Pennell -- F, P] \{not yet keyed\}
Agalinis divaricata (Chapman) Pennell, Pineland Agalinis. Cp (GA): sandhills; rare (GA Special Concern). Decatur County, GA. [= K, S; = Gerardia divaricata (Chapman) Pennell -- P] \{not yet keyed\}

Agalinis filicaulis (Bentham) Pennell, Spindly Agalinis. Cp (GA): wet pine savannas; rare (GA Special Concern). Tattnall County, GA. [= K, S; = Gerardia filicaulis (Bentham) Chapman -- P] \{not yet keyed\}

Agalinis filifolia (Nuttall) Rafinesque, Seminole Agalinis. Cp (GA): dry longleaf pine savannas; rare (GA Special Concern). East to Liberty County, GA. [= K, S; = Gerardia filifolia Nuttall -- P] \{not yet keyed\}

Agalinis gattingeri (Small) Small ex Britton, in c. TN, east to e. TN (Rhea and Scott counties) (Chester, Wofford, \& Kral 1997). Reported for NC (Kartesz 1999). \{investigate\} [= K, S; = Gerardia gattingeri Small -- P]

Agalinis georgiana (C.L. Boynton) Pennell, Crisp and Lowndes counties, GA. [=S; < A. fasciculata -- K, in part; = Gerardia georgiana C.L. Boynton -- P]

Agalinis harperi Pennell in Small, Glynn County, GA and east to McIntosh County, GA as A. pinetorum. See Hays (1998a) who has established the nomenclatural priority of \(A\). harperi. Reported for SC (Kartesz 1999). \{investigate\} [=S; A. pinetorum Pennell -- K, S; A. delicatula Pennell; = Gerardia harperi (Pennell in Small) Pennell -- P] \{not yet keyed\}

Agalinis heterophylla (Nuttall) Small ex Britton, east to GA. [= K]
Agalinis oligophylla Pennell, east to sc. TN (Coffee and Warren counties) (as A. pseudaphylla) (Chester, Wofford, \& Kral 1997). [= K, S; Gerardia pseudaphylla (Pennell) Pennell -- P; A. pseudaphylla (Pennell) Shinners; A. pseudophylla (Pennell) Shinners, an orthographic variant]

Agalinis pulchella Pennell, Coffee and Ware counties, GA. \{Nomenclatural and typification problems\} [= K, S; ?Gerardia pulchella Pennell -- P]

Agalinis skinneriana (A. Wood) Britton. Coffee County, TN (Chester, Wofford, \& Kral 1997). [=K; = Gerardia skinneriana A. Wood -- P]

Agalinis tenuifolia (Vahl) Rafinesque var. leucanthera (Rafinesque) Pennell. Cp (GA): savannas; rare (GA Special Concern). [=K]

Agalinis tenuifolia (Vahl) Rafinesque var. macrophylla (Bentham) Blake. [=K, S; = Gerardia tenuifolia Vahl ssp. macrophylla (Bentham) Pennell -- P]

Agalinis tenuifolia (Vahl) Rafinesque var. polyphylla (Small) Pennell. Pd (GA): granitic flatrocks; uncommon? Endemic to granite flatrocks in GA. [= K, S; = Gerardia tenuifolia Vahl ssp. polyphylla (Small) Pennell -- P; = Gerardia polyphylla Small]

Aureolaria Rafinesque (Oak-leach, False-foxglove)
A genus of about 10 species, hemiparasitic herbs, of e. North America and Mexico. References: Pennell (1935)=P.

1 Plant pubescent (especially on the calyx, corolla, capsule, and lower stem) with glandular hairs; annual; seeds \(0.8-1.0 \mathrm{~mm}\) long, not winged.
5 Calyx tube hemispherical, glandular-hirsute to glandular-lanate on the outer surface; capsule ovoid; trichomes of the leaves usually glandular, at least in part; leaf lobes usually acute . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Au. pectinata
5 Calyx tube turbinate, glandular-puberulent on the outer surface; capsule ellipsoid; trichomes of the leaves usually nonglandular; leaf lobes usually obtuse.
6 Pubescence of the upper stem entirely non-glandular; calyx lobes 6-10 mm long . . Au. pedicularia var. pedicularia
6 Pubescence of the upper stem at least in part glandular (sometimes densely glandular); calyx lobes 6-16 mm long.
7 Glandular pubescence of the upper stem dense and long; calyx lobes 8-16 mm long
Au. pedicularia var. austromontana
7 Glandular pubescence of the upper stem short, scattered among the nonglandular hairs; calyx lobes 6-10 mm long

Au. pedicularia var. intercedens
1 Plant glabrous or pubescent with nonglandular hairs; perennial; seeds \(1.3-2.7 \mathrm{~mm}\) long, winged.
2 Capsule pubescent; inflorescence, pedicels, and/or calyx pubescent with nonglandular hairs; pedicels 1-3 mm at anthesis; flowering May-July . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Au. virginica
2 Capsule glabrous; inflorescence, pedicels, and calyx glabrous (or pubescent with nonglandular hairs in Au. patula); pedicels \(1-25 \mathrm{~mm}\) long at anthesis; flowering August-September.
3 Inflorescence, pedicels, and calyx pubescent (at least sparsely so); pedicels slender, ca. 0.5 m in diameter
3 Inflorescence, pedicels and calyx glabrous; pedicels stout, ca. 1 mm in diameter.
4 Lower leaves entire to serrate (or with only a few shallow lobes at the base of the leaf); pedicels \(1-8 \mathrm{~mm}\) long at anthesis, straight; corolla 3.0-4.0 cm long; capsule \(10-15 \mathrm{~mm}\) long; stem not glaucous . . . . . . . . Au. Iaevigata
4 Lower leaves pinnately lobed, the lobes themselves usually serrate, the sinuses extending over half of the distance to the midrib; pedicels \(4-25 \mathrm{~mm}\) long at anthesis, upwardly curved; corolla \(3.5-6 \mathrm{~cm}\) long; capsule 1220 mm long; stem slightly to strongly glaucous.
5 Calyx lobes 2-5 mm long; corolla 3.5-4.0 cm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . Au. flava var. flava 5 Calyx lobes 5-14 mm long; corolla 3.5-6.0 cm long . . . . . . . . . . . . . . . . . . . . Au. flava var. macrantha

Aureolaria flava (Linnaeus) Farwell var. flava, Eastern Smooth Oak-leach. Pd, Mt, Cp (GA, NC, SC, VA): oak forests and woodlands; common. August-September; September-October. ME west to MN, south to GA, FL, and AL. Var. reticulata (Rafinesque) Pennell, of the southeastern Coastal Plain, needs additional study. It is alleged to differ in its lower leaves entire, dentate, or divided less than \(1 / 2\) way to the midrib (vs. deeply pinnatifid-divided). [ \(=\mathrm{C}, \mathrm{G}, \mathrm{K} ;<\mathrm{A}\). flava -- RAB, W; > Gerardia flava Linnaeus var. flava -- F; > Gerardia flava var. reticulata (Rafinesque) Cory -- F; > A. flava ssp. typica -- P; ><A. flava ssp. flava -- S; > A. flava ssp. reticulata (Rafinesque) Pennell -- \(\mathrm{P}, \mathrm{S}]\)

Aureolaria flava (Linnaeus) Farwell var. macrantha Pennell, Midwestern Smooth Oak-leach. Mt (NC): oak forests and woodlands; rare. S. Ontario and MO south to e. WV, e. TN, w. NC (Fernald 1950), n. AL, and e. LA. August-September; September-October. [= C, G, K; < A. flava -- RAB, W; = Gerardia flava Linnaeus var. macrantha (Pennell) Fernald -- F; A. flava ssp. macrantha Pennell -- P ; ><A. flava ssp. flava -- S , in part]

Aureolaria laevigata (Rafinesque) Rafinesque, Appalachian Oak-leach. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): oak forests and woodlands; common (uncommon in Piedmont, rare in Coastal Plain). August-September; September-October. PA west to s. OH, south to SC and GA, primarily a Central and Southern Appalachian endemic, but extending into adjacent provinces, and, rarely, even the Coastal Plain. [= RAB, C, G, K, P, S, W; = Gerardia laevigata Rafinesque -- F]

Aureolaria patula (Chapman) Pennell, Cumberland Oak-leach. Mt (GA): rich alluvial forests; rare (GA Special Concern). August-October; September-October. C. KY south through TN to nw. GA, and approaching w. NC and sw. VA. [= C, G, K, P, S]

Aureolaria pectinata (Nuttall) Pennell, Southern Oak-leach. Cp, Pd, Mt (GA, NC, SC): turkey oak sandhills, other dry oak forests and woodlands; common (uncommon in Piedmont and Mountains). May-September; September-October. NC south to FL, west to LA, inland north to AR and MO. Related to \(A\). pedicularia, but much more southerly in distribution. \([=R A B, K ;=A\). pedicularia (Linnaeus) Rafinesque var. pectinata (Nuttall) Gleason -- C, G; = Gerardia pectinata (Nuttall) Bentham -- F; > A. pectinata ssp. eurycarpa (Pennell) Pennell -- P, S; > A. pectinata ssp. transcedens (Pennell) Pennell -- P, S; > A. pectinata ssp. typica -- P; > A. pectinata ssp. pectinata -- S ; < A. pedicularia -- W]

Aureolaria pedicularia (Linnaeus) Rafinesque var. austromontana Pennell, Appalachian Annual Oak-leach. Mt (GA, NC, SC, VA), Pd (NC, SC): oak forests and woodlands; common. September-October; November. Sw. VA and se. KY south to nw. SC, ne. GA, and e. TN. The various varieties recognized need additional study; the variation may be too clinal to be practically recognized taxonomically. [= C, G, K; <A. pedicularia -- RAB; = Gerardia pedicularia Linnaeus var. austromontana (Pennell) Fernald -- F; = A. pedicularia ssp. austromontana (Pennell) Pennell -- P, S; < A. pedicularia -- W]

Aureolaria pedicularia (Linnaeus) Rafinesque var. intercedens Pennell. Mt (NC?, VA): oak forests and woodlands; rare. September-October; November. MA west to w. NY, south to w. VA and s. WV. [= G, K; < A. pedicularia -- RAB; = Gerardia pedicularia Linnaeus var. intercedens (Pennell) Fernald -- F; = A. pedicularia ssp. intercedens (Pennell) Pennell -- P; \(<A\). pedicularia -- W]

Aureolaria pedicularia (Linnaeus) Rafinesque var. pedicularia, Northern Annual Oak-leach. Pd, Cp (NC, VA), Mt (VA): oak forests and woodlands; common. September-October; November. ME west to NY and e. MN, south to e. NC, WV, and n. IL. [= C, G, K; < A. pedicularia -- RAB; = Gerardia pedicularia Linnaeus var. pedicularia -- F; > A. pedicularia ssp. caesariensis Pennell -- S; > A. pedicularia ssp. carolinensis Pennell -- \(\mathrm{P}, \mathrm{S}\); < A. pedicularia -- W]

Aureolaria virginica (Linnaeus) Pennell, Downy Oak-leach, Virginia Oak-leach. Cp, Pd, Mt (GA, NC, SC, VA): oak forests and woodlands; common. May-July; August-September. MA west to MI, south to FL and AL. [= RAB, C, G, K, W; = Gerardia
virginica (Linnaeus) Britton, Sterns, \& Poggenburg - F; > A. virginica - P, S; > A. microcarpa Pennell -- P, S]

\section*{Buchnera Linnaeus (Bluehearts)}

A genus of about 100 species, hemiparasitic herbs, of tropical and warm temperate regions of the Old and New Worlds. The taxonomy of this genus is poorly understood. The plants are root hemi-parasites, apparently not particular about the host species. References: Pennell (1935)=P.

Identification notes: Our 2 species are difficult to distinguish, and seem to intergrade to some degree. Further study is needed. The foliage turns black on drying.

1 Corolla tubes 10-14 mm long when fully-developed; calyces 6-7 mm long, pubescent throughout with short or long, straight to antrorsely-appressed, simple or minutely callous-based hairs; capsules \(6-8 \mathrm{~mm}\) long, equalling or slightly longer than the calyces; mid-stem leaves ovate-lanceolate, widest at or below the middle, irregularly and coarsely toothed; [of calcareous or mafic glades and barrens of the Piedmont and Mountains]
1 Corolla tubes 6-10 mm long when fully-developed; calyces \(4-5(-6) \mathrm{mm}\) long, pubescent throughout or only on the upper \(1 / 3\) with short, crisped, antrorse, callous-based hairs; capsules \(4-6(-6.5) \mathrm{mm}\) long, longer than the calyces; mid-stem leaves oblong to oblanceolate, widest at or above the middle, entire or remotely and finely toothed; [of acid, sandy habitats of the Coastal Plain]

Buchnera americana Linnaeus, American Bluehearts. Mt, Pd (GA, NC, VA), Cp (GA?, VA): dry (seasonally moist) rocky, gravelly, or clayey soil of limestone glades, glades over mafic rock (such as diabase, gabbro, etc.), wet meadows, sandy roadsides; rare (GA Special Concern, NC Rare, VA Rare). July-September; August-October. NY and s. Ontario west to MI, IL, MO, and s. KS, south to c. NC, GA, and TX. In addition to the key characters given, B. americana is overall a larger and more robust plant than \(B\). floridana, though both are quite variable in size, depending on the conditions in which they grow. B. americana has apparently declined very greatly in our area, probably owing to fire suppression in its habitats. [= RAB, C, F, G, GW, P, S, W; < B. americana -K (also see B. floridana)]

Buchnera floridana Gandoger, Florida Bluehearts. Cp (GA, NC, SC): pine savannas, flatwoods, seepage bogs, sandy roadsides; uncommon. April-October; May-November. Se. VA (?) south to s. FL, west to TX, and in the West Indies. [= RAB, GW, S; < B. americana -- K; < B. floridana - P (also see B. longifolia); > B. floridana - S; > B. breviflora Pennell -- S]

Buchnera longifolia Kunth, in GA, AL, and MS (Kartesz 1999). [= K; < B. floridana - P; = B. elongata Sw. - S] \{not yet keyed\}

\section*{Castilleja Mutis ex Linnaeus f. (Indian Paintbrush)}

A genus of about 200 species, hemiparasitic herbs, primarily of w. North America, with a few species also in e. North America, Eurasia, Central America, and Andean South America. References: Pennell (1935)=P. Key based on Allison \& Stevens (2001).

1 Bracts deeply lobed, red (rarely yellow), mostly more than 2 cm long; [widespread in our area] . . . . . . . . . . . . . . . C. coccinea 1 Bracts mostly entire, yellow, less than 2 cm long; [endemic to c. AL] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [C. kraliana]

Castilleja coccinea (Linnaeus) Sprengel, Eastern Indian Paintbrush. Mt (GA, NC, SC, VA), Pd (NC, SC, VA), Cp (NC, SC): woodlands, fens, barrens, rock outcrops, meadows, wet pastures, grassy openings, usually over mafic rocks; uncommon, rare in Coastal Plain (GA Special Concern, SC Rare, VA Watch List). April-May; May-June. Widespread in e. North America. [= RAB, C, F, G, GW, K, P, S, W]

Castilleja kraliana J. Allison, Cahaba Paintbrush, is endemic to dolomitic Ketona glades in Bibb Co., c. AL (Allison \& Stevens 2001).

\section*{Conopholis Wallroth (Squawroot)}

A genus of 2 species, parasitic herbs, of e. North America and sw. North America south to Central America. The other species is \(C\). alpina Liebmann, ranging from AZ, NM, and TX south to Panama, and divided into two varieties. References: Haynes (1971)=Z; Thieret (1971) \(=\mathrm{Y}\).

Conopholis americana (Linnaeus) Wallroth, Squawroot. Mt, Pd, Cp (GA, NC, SC, VA): rich, moist forests, under Quercus species; common (rare in Coastal Plain, rare in Piedmont south of VA). March-June. Nova Scotia west to WI and south to c. peninsular FL, AL, and TN. Haynes (1971) discusses the nature of the parasitism. Conopholis apparently germinates near an oak root, forms a parasitic connection to the root, resulting in the formation of a gall consisting of both Quercus and Conopholis tissue. The gall can be up to 25 cm in diameter, and lasts for many years, repeatedly sending up flowering shoots. It is believed that the gall exists underground for some years prior to first flowering. [= RAB, C, F, G, K, S, W, Y, Z]

A monotypic genus, a hemiparasitic herb, endemic to se. North America. The genus is sometimes spelled 'Dasystoma.' References: Pennell (1935)=P.

Dasistoma macrophylla (Nuttall) Rafinesque, Mullein Foxglove. Pd (SC), Mt (GA, VA): xeric to dry-mesic woodlands and bluffs, over limestone or diabase; rare (GA Special Concern, SC Rare, VA Rare). July-September. WV, OH, s. WI, IA, and NE, south to w. VA, nc. SC, nw. GA, c. AL, MS, LA, and nc. TX. First reported for VA by Wieboldt et al. (1998). [= RAB, C, G, K, P, S; = Seymeria macrophylla Nuttall -- F, GW; = Dasystoma macrophylla, an orthographic variant]

Epifagus Nuttall (Beechdrops)
Epifagus is a monotypic genus, parasitic herb on the roots of Fagus, of e. North America. References: Thieret (1971)=Z.
Epifagus virginiana (Linnaeus) W. Barton, Beechdrops. Mt, Pd, Cp (GA, NC, SC, VA): moist to rather dry forests under Fagus grandifolia; common. September-November. Nova Scotia west to WI, south to FL and LA. [= RAB, C, F, G, K, W, Z; = Leptamnium virginianum (Linnaeus) Rafinesque -- S]

\begin{abstract}
Macranthera Nuttall ex Bentham (Flameflower)
A monotypic genus, a hemiparasitic herb, of se. North America. References: Pennell (1935)=P.
\end{abstract}

Macranthera flammea (Bartram) Pennell, Flameflower, Hummingbird-flower. Cp (GA): pitcherplant bogs; rare (GA Special Concern). July-September. Nearly restricted to the East Gulf Coastal Plain (e. GA west to se. LA), but ranging east to the Atlantic Coastal Plain of e. GA (Bullock County), within a county of the SC border. [= GW, K, P, S]

\section*{Melampyrum Linnaeus (Cow-wheat)}

A genus of about 35 species, hemiparasitic herbs, of temperate regions of North America and Eurasia. References: Pennell (1935)=P

1 Lowermost bracteal leaves entire or nearly so, or the uppermost with a few short basal teeth; leaves (2-) 10-30 mm wide, the widest leaves on a plant usually over 10 mm wide; plants usually simple or with 4 (rarely more) branches; internodes of the midstem usually 4-6 cm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . M. Iineare var. Iatifolium
1 Lowermost bracteal leaves generally with a few prominent sharp teeth or segments; leaves 2-10 mm wide; plants usually with numerous branches (often 10 or more); internodes of the midstem usually 1-3 cm long.
2 Teeth of the middle and upper bracts shorter than the width of the undivided portion of the bracts; leaves lanceolate, (2-) \(5-10 \mathrm{~mm}\) wide; [widespread in our area] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . M. lineare var. americanum
2 Teeth of the middle and upper bracts commonly about as long as the width of the undivided portion of the bracts; leaves linear to lanceolate, 2-6 (-8) mm wide; [of the Coastal Plain]
M. lineare var. pectinatum

Melampyrum lineare Desrousseaux var. americanum (Michaux) Beauverd, Common Cow-wheat. Mt (NC, VA), Cp (VA): dry soils; uncommon? May-July; August-September. Québec west to MN, south to VA, NC, and TN. Our 3 varieties are quite distinctive in morphology and have distinctive geographic ranges; they seem worthy of distinction from one another at the varietal level, at least. The fourth variety, var. lineare, is more northern, ranging from Labrador west to British Columbia, south to New England, n . MI, and n . MN. It is similar to var. latifolium in its entire bracteal leaves, but overall is more like var. americanum, differing in the bracteal teeth and in its linear leaves, rarely over 5 mm wide. The distinction between var. americanum and var. lineare may not be worth making; if combined (as by \(K\) ), the correct name is var. lineare. \([=C, F, G\); < M. lineare -- RAB, W; <M. lineare var. lineare -- K; < M. lineare var. typicum -- P; < M. lineare -- S (in the narrow sense)]

Melampyrum lineare Desrousseaux var. latifolium Barton, Appalachian Cow-wheat. Mt (GA, NC, SC, VA): dry soils in ridgetop woodlands, in thin soils around rock outcrops; common. Late April-July; August-September. MA and NY south to n. GA, mostly in the Appalachians. [= C, F, G, K, P; <M. lineare -- RAB, W; = M. latifolium (Barton) Muhlenberg ex Britton - S]

Melampyrum lineare Desrousseaux var. pectinatum (Pennell) Fernald, Pine-barren Cow-wheat. Cp (VA): dry sandy areas; rare. May-July; August-September. E. MA to se. VA, on the Coastal Plain. [= C, F, G, K, P; < M. lineare -- RAB, W]

Orobanche Linnaeus (Cancer-root, Broomrape)
A genus of about 150 species, parasitic herbs, of mainly north temperate regions. References: Musselman (1982)=Z; Thieret (1971) \(=\) Y; Manen et al. (2004).

1 Flowers solitary on a long pedicel (appearing as a scape, the true stem entirely underground or nearly so); [section Gymnocaulis]

1 Flowers several-many, sessile or subsessile in a dense spike.
2 Calyx 5-lobed, the lobes subequal, all well-developed . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . O. Iudoviciana
2 Calyx 2-4-lobed, rarely 5-lobed, but then the fifth lobe minute and much smaller than the other lobes; [section Orobanche].
3 Calyx divided to the base into 2 lateral halves, these usually 2 -lobed, the 4 lobes long-attenuate or caudate \(\mathbf{O}\). \(\boldsymbol{m}\) inor
3 Calyx tubular, with \(4(-5)\) lobes about the length of the calyx tube
O. ramosa
*? Orobanche ludoviciana Nuttall, Prairie Broomrape. Pd, Mt (VA): pastures, parasitic on composites, often with clovers; rare, uncertain whether native or introduced from farther west (VA Watch List). OH, IN, Saskatchewan, and CA, south to TX and \(n\). Mexico. [= F, G, Z; > O. Iudoviciana var. Iudoviciana -- C; > O. Iudoviciana ssp. Iudoviciana -- K]
* Orobanche minor J.E. Smith, Lesser Broomrape. Cp (GA, NC, VA), Pd, Mt (NC, VA): cultivated fields, parasitic on various hosts, especially Trifolium; rare, introduced from Eurasia. [= RAB, C, F, G, K, S, Z]
* Orobanche ramosa Linnaeus, Branching Broomrape. Mt (NC): habitat in our area not known; rare (known in our area only from a single collection in 1884), introduced from Asia. As discussed by Musselman (1984), the identity is somewhat presumptive, and the precise location uncertain. [= C, F, G, K]

Orobanche uniflora Linnaeus, Cancer-root. Mt, Pd, Cp (GA, NC, SC, VA): sandy streambanks and riverbanks, rich forests; uncommon (SC Rare). April-May. Ranging nearly throughout s. Canada and the United States. [= RAB, F, G, K, W, Z; O. uniflora var. uniflora -- C; = Thalesia uniflora (Linnaeus) Britton -- S]

\section*{Pedicularis (Wood-betony, Lousewort)}

A genus of about 350 species, hemiparasitic herbs, of temperate regions of c. and e. Asia, Europe, w. North America, e. North America, and Andean South America. References: Pennell (1935)=P.

1 Inflorescence 1-4 dm tall; stem leaves alternate; stem pubescent, at least near the inflorescence; flowering April-May P. canadensis

1 Inflorescence 4-10 dm tall; stem leaves opposite; stem glabrous; flowering August-October ................. P. Ianceolata
Pedicularis canadensis Linnaeus, Eastern Lousewort, Wood-betony. Mt, Pd, Cp (NC, SC, VA): moist to dry forests and woodlands, streambanks; common (rare in the Coastal Plain). April-May; May-July. ME, Québec, and Manitoba south to FL, TX, and n . Mexico. Var. dobbsii Fernald, alleged to differ in having nearly solitary flowering stems and stoloniform basal offsets, needs additional study. [= RAB, C, G, GW, P, S, W; > P. canadensis var. canadensis - F; > P. canadensis var. dobbsii Fernald - F; > P. canadensis ssp. canadensis -- K]

Pedicularis lanceolata Michaux, Swamp Lousewort. Mt (NC, VA), Pd, Cp (VA): springheads and swampy areas, over calcareous or mafic rocks; rare (NC Rare, VA Watch List). August-October; September-October. Widespread in ne. North America, south to NC, e. TN, w. TN, and MO. [= RAB, C, F, G, GW, K, P, S, W]

\section*{Schwalbea Linnaeus (Chaffseed)}

The genus is monotypic, a hemiparasitic herb, of se. North America. References: Pennell (1935)=P.
Schwalbea americana Linnaeus, Chaffseed. Cp (GA, NC, SC, VA): savannas, sandhill-pocosin ecotones (in the uphill portions), mesic loamy-soil slopes or swales in sandhill longleaf pine woodlands; rare (US Endangered, GA Endangered, NC Endangered, SC Rare, VA Rare). May-June; August. Formerly rather widespread in e. North America, primarily in the Coastal Plain, from e. MA, south to FL and west to TX, and disjunct in the Cumberland Mountains of KY and TN. The species is now limited to a few scattered sites in NJ, NC, SC, and FL. It appears to require high fire frequency, especially during the growing season, perhaps related to its establishment ecology. The tiny seeds are hyaline-winged. [= RAB, C, F, G, GW, K, P; >S. americana-P; > S. australis Pennell -- P, S]

\section*{Seymeria Pursh (Seymeria)}

A genus of about 25 species, herbs, of \(s\). North America (including Mexico). References: Pennell (1935)=P.
1 Corolla glabrous on its outer surface; leaf segments linear, less than 0.5 mm wide; stem glabrous or puberulent; seeds wingless (though with ridges) . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. cassioides
1 Corolla pubescent externally; leaf segments lanceolate, 1-2 mm wide; stem pubescent; seeds 3-4-winged

\section*{S. pectinata ssp. pectinata}

Seymeria cassioides (J.F. Gmelin) Blake, Senna Seymeria. Cp (GA, NC, SC, VA), Pd (GA, SC): dry to moist pinelands, wet pine savannas, sandhills, other dry woodlands; common, rare in VA (VA Rare). August-October. Se. VA south to c. peninsular FL, west to LA; disjunct in nc. AL and se. TN (Chester, Wofford, \& Kral 1997). [= RAB, C, F, G, GW, K, P; = Afzelia cassioides J.F. Gmelin -- S]

Seymeria pectinata Pursh ssp. pectinata, Comb Seymeria. Cp (GA, NC, SC): dry pinelands, sandhills; rare (NC Rare). July-

October. Ssp. pectinata ranges from se. NC south to c. peninsular FL, west to s. MS, a Southeastern Coastal Plain endemic. Ssp. peninsularis (Pennell) Pennell ranges from n. peninsular FL south to s. FL. [= K; < S. pectinata -- RAB; = S. pectinata ssp. typica -P ; = Afzelia pectinata (Pursh) Kuntze ssp. pectinata -- S]

\section*{Striga Loureiro (Witchweed)}

A genus of about 40 species, hemiparasitic herbs, of tropical to temperate regions of the Old World.
* Striga asiatica (Linnaeus) Kuntze, Witchweed. Cp (NC, SC): cultivated fields, parasitic on the roots of corn and other grasses; rare, introduced from the Old World. A serious weed, Striga has been the subject of eradication efforts and quarantine policies since its appearance in our area. [= K; S. lutea Loureiro -- RAB]

\section*{Tomanthera Rafinesque}
(see Agalinis)

\section*{OXALIDACEAE (Wood-sorrel Family)}

A family of 5-6 genera and 600-775 species, herbs, shrubs, vines, and small trees, nearly cosmopolitan (especially temperate). References: Cocucci in Kubitzki (2004).

Oxalis Linnaeus 1753 (Wood-sorrel, Oxalis)
A genus of about 500-700 species, herbs, shrubs, and vines. References: Ward (2004)=Z; Eiten (1963)=Y; Lourteig (1979)=X; Cocucci in Kubitzki (2004).

1 Plant acaulescent; leaves basal; flowers white, pink, or purple.
2 O. montana
2
3 O. rubra
3 O. violacea
1 Plant caulescent; leaves alternate; flowers yellow.
4
4
corniculata var. corniculata, corniculata var. atropurpurea, corymbosa, dillenii ssp. dillenii, dillenii ssp. filipes, grandis, priceae ssp. colorea, priceae ssp. priceae, [priceae ssp. texana], stricta
* Oxalis corniculata Linnaeus var. atropurpurea Planchon. [= Z; O. corniculata - RAB, C, K, Y, infraspecific taxa not distinguished]
* Oxalis corniculata Linnaeus var. corniculata, Creeping Wood-sorrel. [= Z; O. corniculata - RAB, C, K, Y, infraspecific taxa not distinguished]

Oxalis corymbosa Augustin de Candolle. \{GA, SC\}. See Kartesz (1999). [= Z; Oxalis debilis Kunth var. corymbosa (Augustin de Candolle) Lourteig -- K]

Oxalis dillenii Jacquin ssp. dillenii, Southern Yellow Wood-sorrel. [= Y, Z; O. dillenii - C, K, infraspecific taxa not distinguished; O. dillenii -- RAB; O. florida var. florida -- RAB]

Oxalis dillenii Jacquin ssp. filipes (Small) Eiten, Southern Yellow Wood-sorrel. [= Y, Z; O. dillenii - C, K, infraspecific taxa not distinguished; O. florida Salisbury var. filipes (Small) Ahles -- RAB]

Oxalis grandis Small, Great Yellow Wood-sorrel. \{GA, NC, SC, VA\} [= RAB, C, K, Y]
Oxalis montana Rafinesque, American Wood-sorrel, White Wood-sorrel. Mt (GA, NC, VA): spruce-fir forests, northern hardwood forests, at high elevations; uncommon (GA Special Concern). Closely related to the Eurasian O. acetosella, and sometimes treated as merely a geographic phase. [= K; O. acetosella Linnaeus -- RAB, C]

Oxalis priceae Small ssp. colorea (Small) Eiten. \{GA, NC, SC\} [=K, Y; O. florida Salisbury var. recurva (Elliott) Ahles -- RAB]
Oxalis priceae Small ssp. priceae. \{GA\}. In TN, GA (Eiten 1963). [= K, Y; O. macrantha (Trelease) Small, misapplied]
* Oxalis rubra St. Hilaire. \{GA, NC, SC, VA\} [= RAB, K; O. articulata Savigny ssp. rubra (St. Hilaire) Lourteig]

Oxalis stricta Linnaeus, Common Yellow Wood-sorrel. [= RAB, C, K, Y, Z; O. fontana Bunge; O. europaea Jord.]
Oxalis violacea Linnaeus, Violet Wood-sorrel. \{GA, NC, SC, VA\}: dry forests. [= RAB, C, K, Z; Sassia violacea (Linnaeus) Holub]

Oxalis illinoensis Schwegman, Illinois Wood-sorrel. KY, IN, and IL. [= K]
Oxalis priceae Small ssp. texana (Small) Eiten. In GA (GANHP, Kartesz 1999); not in GA (Ward 2004). [= K, Y]

\section*{Paeonia Linnaeus (Peony)}
* Paeonia lactiflora Pallas, Peony, is "cultivated and occasionally persisting around old home sites" at least as far south as sc. and se. PA (Rhoads \& Klein 1993). [= K]

\section*{PAPAVERACEAE A.L. de Jussieu 1789 (Poppy Family)}

References: Kiger in FNA (1997); Kadereit in Kubitzki, Rohwer, \& Bittrich (1993).
1 Flowering stem scapose, leaves basal only; petals 8-16, white; [subfamily Chelidonioideae] . . . . . . . . . . . . . . . . Sanguinaria
1 Flowering stem with leaves at least low on the stem; petals 0-6, purple, red, orange-red, orange, yellow, cream.
2 Inflorescence a panicle; petals absent; [subfamily Chelidonioideae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Macleaya 2 Inflorescence not a panicle; petals present, 4-6.

3 Leaves and fruits prickly; [subfamily Papaveroideae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Argemone 3 Leaves and fruits not prickly.

4 Sepals connate; leaves ternately dissected into linear segments; sap watery; [subfamily Eschscholzioideae] .
Eschscholzia
4 Sepals separate; leaves pinnately lobed; sap yellow, orange, or milky.
5 Flowers several in a terminal umbel; [subfamily Chelidonioideae].
6 Stigma lobes, placentae, and capsule valves 2; style very short; fruit linear, glabrous .. Chelidonium
6 Stigma lobes, placentae, and capsule valves (2-) 3-4; style ca. 1 cm long; fruit ellipsoid, pubescent
5 Flowers solitary, terminal.
7 Fruit 15-30 cm long, 2-locular (the partitions complete), dehiscent by elongate valves; stigmatic lobes 2; [subfamily Chelidonioideae] .

Glaucium
7 Fruit 1-8 cm long, 4-20-locular (the partitions incomplete), dehiscent by small valves beneath the stigmatic disc; stigmatic lobes 4-20; [subfamily Papaveroideae] . . . . . . . . . . . . . . . . . . . . . . Papaver

\section*{Argemone Linnaeus 1753 (Prickly-poppy)}

A genus of about 32 species, annual and perennial herbs, of North America, West Indies, Central America, South America, and Hawaii. References: Ownbey in FNA (1997); Kadereit in Kubitzki, Rohwer, \& Bittrich (1993).

1 Flowers white to pink; latex white or nearly clear . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. albiflora ssp. albiflora
1 Flowers yellow to cream; latex yellow
1 Flowers yellow to cream; latex yellow . . . . . . . . . . ......................................................... A. mexicana
Argemone albiflora Hornemann ssp. albiflora, Carolina-poppy, White Prickly-poppy. Cp (GA, NC, SC): sandy roadsides and disturbed areas; uncommon. April-May (sporadically later). This species is apparently native to southeastern United States, presumably including our area. The species' weediness suggests, however, that it may be merely adventive in our area. [= FNA, K; A. albiflora -- RAB, C, infraspecific taxa not distinguished; A. alba Lestib. f. -- G, S, misapplied]

Argemone mexicana Linnaeus, Mexican-poppy, Mexican Prickly-poppy. Cp (GA, NC, SC): sandy roadsides and disturbed areas; rare, native of s. FL, West Indies, and maybe Mexico and Central America. April-May (sporadically later). [= RAB, C, FNA, G, K]

\section*{Chelidonium Linnaeus 1753 (Greater-celandine)}

A monotypic genus, a perennial herb, of temperate Eurasia. References: Kiger in FNA (1997); Kadereit in Kubitzki, Rohwer, \& Bittrich (1993).
* Chelidonium majus Linnaeus, Greater-celandine, Rock-poppy, Swallow-wort. Mt (NC, VA), Pd, Cp (VA): moist slopes, shaded roadsides, rocky forests; common (rare south of VA), introduced from Eurasia. April-July. [= RAB, C, F, FNA, G, S, W; Ch. majus var. majus -- K]

\section*{Eschscholzia Chamisso 1820 (California-poppy)}

A genus of about 12 species, annual and perennial herbs, of sw. North America and n. Mexico. References: Clark in FNA (1997); Kadereit in Kubitzki, Rohwer, \& Bittrich (1993).
* Eschscholzia californica Chamisso ssp. californica, California-poppy. Cp (GA, NC, SC), Pd (NC, SC): roadsides, disturbed areas; uncommon, introduced from w. North America. May-August. [= FNA, K; Eschscholtzia californica -- RAB, F, infraspecific
taxa not distinguished and orthographic variant]

Glaucium P. Miller 1754 (Horned-poppy)
A genus of about 23 species, annual and perennial herbs, of temperate Europe and w. Asia. References: Kiger in FNA (1997); Kadereit in Kubitzki, Rohwer, \& Bittrich (1993).
* Glaucium flavum Crantz, Yellow Horned-poppy, Sea-poppy. Cp, Pd (VA): disturbed areas; rare, introduced from Mediterranean Europe. June. [= C, F, FNA, G, K]

\section*{Macleaya R. Brown 1826 (Plume-poppy)}

A genus of 2 species, perennial herbs, of e. Asia. References: Kiger in FNA (1997); Kadereit in Kubitzki, Rohwer, \& Bittrich (1993).
* Macleaya cordata (Willdenow) R. Brown, Plume-poppy, Tree-celandine. Pd, Cp (VA), Mt (NC): moist streambanks, persistent or escaped from cultivation; rare, introduced from e. Asia. Reported as naturalized in TN by Kral (1981). [=C, F, FNA, G, K] \{check Castanea 38: 114-116, 302-304 for SC report\}

\section*{Papaver Linnaeus 1753 (Poppy)}

A genus of about 80 species, annual and perennial herbs, of temperate Northern Hemisphere. References: Kiger \& Murray in FNA (1997); Kiger (1975)=Z; Kadereit in Kubitzki, Rohwer, \& Bittrich (1993).

1 Upper cauline leaves not clasping the stem.
2 Ovaries and capsules sparsely to densely setose-pubescent; [section Argemonidium].
3 Capsules oblong to clavate, sparsely setose with weak hairs . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [P. argemone]
3 Capsules obovoid-ellipsoid to subglobose, densely setose with strong hairs . . . . . . . . . . . . . . . . . . . P. hybridum
2 Ovaries and capsules glabrous.
4 Flowers more than 10 cm across; perennial; [section Macrantha] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. Prientale 4 Flowers less than 10 cm across; annual; [section Rhoeadium].

5 Capsule 2-3× as long as broad; stigmatic lobes 5-9 . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. dubium
5 Capsule 1-1.5× as long as broad; stigmatic lobes 8-15 . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. rhoeas
* Papaver dubium Linnaeus, Long-headed Poppy. Mt, Pd, Cp (NC, SC, VA): roadsides, fields, disturbed areas; uncommon, introduced from Europe. April-June. [= RAB, C, F, FNA, G, K, S, W, Z]
* Papaver hybridum Linnaeus, Rough Poppy. Mt (NC) \{SC\}: disturbed areas; rare, introduced from Eurasia. May-June. [= RAB, FNA, K, Z]
* Papaver orientale Linnaeus, Oriental Poppy. Cp (VA): rare, introduced from sw. Asia. [= FNA, G, K, Z]
* Papaver rhoeas Linnaeus, Corn Poppy, Field Poppy, Red Poppy, Shirley Poppy, Common Poppy. Mt (VA), Pd (NC, VA) \{SC\}: disturbed areas; rare, introduced from Eurasia and n. Africa. May. [= RAB, C, F, FNA, G, K, Z]
* Papaver somniferum Linnaeus, Opium Poppy, Common Poppy. Pd (NC, VA), Cp, Mt (NC): disturbed areas; rare, introduced from Mediterranean Europe and Asia Minor. May-June. [= RAB, C, F, FNA, G, K, S, Z]
* Papaver argemone Linnaeus is reported from PA (Rhoads \& Klein 1993, Kiger \& Murray in FNA 1997), VA, and MD (Kiger \& Murray in FNA 1997). \{herbarium verification\} [= FNA]

Other species are cultivated and may be found in our area persistent, escaped, as waifs, or as naturalized populations.

Sanguinaria Linnaeus 1753 (Bloodroot)
A monotypic genus, a perennial herb, of e. North America. References: Kiger in FNA (1997); Kadereit in Kubitzki, Rohwer, \& Bittrich (1993).

Sanguinaria canadensis Linnaeus, Bloodroot, Red Puccoon. Mt, Pd, Cp (GA, NC, SC, VA): moist nutrient-rich forests; common (uncommon in Coastal Plain of GA, NC, and SC). March-April; April-May. Nova Scotia west to MN and Manitoba, south to FL and OK. Var. rotundifolia, more southern and the primary form in our area, has leaves less lobed than the more northern var. canadensis; leaf shape variability within populations makes it impractical to recognize infraspecific taxa. [= RAB, C, F, FNA, G, K, S, W; S. canadensis var. rotundifolia (Greene) Fedde -- F]

A genus of 2-5 species, perennial herbs, of e. North America and e. Asia. References: Kiger in FNA (1997); Kadereit in Kubitzki, Rohwer, \& Bittrich (1993).

Stylophorum diphyllum (Michaux) Nuttall, Celandine-poppy, Woods-poppy. Mt (GA, VA): moist forests over calcareous rocks (such as limestone); rare (GA Rare, VA Rare). March-April. W. PA (where perhaps only introduced) to s. MI and WI, south to sw. VA, e. TN, nw. GA, sc. TN, and AR. [= C, F, FNA, G, K, S, W]

\section*{PARNASSIACEAE (Grass-of-Parnassus Family)}

A family of 2 genera and about 16 species, herbs, of largely north temperate and arctic areas. Numerous anomalous features separate Parnassia from the Saxifragaceae; affinities with the Droseraceae, Clusiaceae, Celastraceae, and other families have been suggested. Considering the uncertainties of its relationships, Parnassia is best treated as a family, the Parnassiaceae, as suggested by numerous workers as early as 1821, and increasingly accepted in recent decades. The very distant relationship of Parnassia to the Saxifragaceae (sensu stricto) has been strongly reaffirmed by molecular analyses (Morgan \& Soltis 1993, Soltis et al. 2000, Savolainen et al. 2000). References: Simmons in Kubitzki (2004).

1 Plants diminutive, rosettes less than 3 cm across; winter annual ....................................... Lepuropetalon
1 Plants larger, rosettes over 8 cm across; perennial from rhizomes . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Parnassia

\section*{Lepuropetalon Elliott 1817 (Lepuropetalon)}

A monotypic genus, of se. North America, Mexico, c. Chile, and Uruguay. Sometimes treated as part of a broad and polymorphic Saxifragaceae, Lepuropetalon has often been associated with Parnassia in the Parnassiaceae. Morgan \& Soltis (1993) suggest a close relationship of Lepuropetalon and Parnassia, as well as the "distant relationship between both genera and the Saxifragoideae." The affinities of Lepuropetalon with Parnassia remain uncertain, however, as emphasized by Gastony \& Soltis (1977) in their analysis of chromosomes and partially reiterated by Morgan \& Soltis (1993). Lepuropetalon is here treated in the Parnassiaceae, as supported by molecular analyses (Soltis et al. 2000, Savolainen et al. 2000). References: Ward \& Gholson (1987); Spongberg (1972); Gastony \& Soltis (1977); Wilbur (1988b); Simmons in Kubitzki (2004).

Lepuropetalon spathulatum Elliott, Lepuropetalon. Pd (GA, SC), Cp (GA, NC, SC): in moist open areas, such as seepage on granitic flatrocks, ditches, seasonally wet depressions; rare (SC Rare). February-April. Se. NC and SC south to GA, west to e. TX and Mexico; also in Chile and Uruguay. As indicated by Ward \& Gholson (1987), Lepuropetalon is more common than collections would indicate; the rosettes are 0.5-2 (-3) cm across, the greenish flowers are 2-3 mm across. It has been considered "the smallest terrestrial angiosperm" (Morgan \& Soltis 1993). Its apparently greater abundance in the western portion of its range, where largely found by a few botanists "who have made determined efforts to establish its range" (Ward \& Gholson), and in habitats such as granitic flatrocks, which have overall received close scrutiny, may be more a reflection of its diminutive size and early season of occurrence than of its real distribution and abundance. The recent increase in collections, mostly in disturbed or humanmaintained habitats, also suggests a possible increase in abundance (and range?) from its original state. It should be more vigorously sought in our area. The presence of lines of red glandular dots on the leaves and sepals is a helpful diagnostic character. [= RAB, GW, K, S; Pyxidanthera spatulata Muhlenberg, nomen nudum, not validly published]

\section*{Parnassia Linnaeus 1753 (Grass-of-Parnassus, Parnassia)}

A genus of \(15-70\) species, herbs, primarily of arctic and north temperate areas. Our species (especially \(P\). caroliniana) are among the most southerly of the genus in distribution. Parnassia (all species) are among the most beautiful of our native plants. From a distance the white flowers are attractive but not extraordinary; when observed closely, though, the delicate tracery of the green veins on the waxy white petals is astonishing. References: Gastony \& Soltis (1977); Spongberg (1972); GW; Simmons in Kubitzki (2004).

Identification notes: Note that the five staminodia are (in our species) deeply three-lobed to the base, thus appearing as 15 .
1 Leaf blades reniform, as wide or wider than long, the base strongly cordate; staminodia shorter than the stamens [note that the stamens elongate after the staminodia; thus at a certain early stage the stamens of \(P\). asarifolia may be shorter than the staminodia; check several flowers]
P. asarifolia

1 Leaf blades ovate, longer than wide, the base rounded, broadly cuneate, truncate, or cordate; staminodia longer than the stamens ( \(P\). caroliniana and \(P\). grandifolia), or shorter than the stamens ( \(P\). glauca).
2 Staminodia shorter than the stamens; [of NJ, PA, and OH northwards]
2 Staminodia longer than the stamens; [of NJ (?), VA, WV, MO southwards].
3 Main parallel veins of each petal (9-) 11-17 (counted at a point halfway between the base and the apex and ignoring short laterals), usually not dilated towards the apex of the petal; outer- or basal-most main vein branching pseudodichotomously several times; rhizome horizontal, long-creeping, the leaves scattered or loosely clustered, tending to form clonal patches to several \(m\) in diameter; ovary white; [of Coastal Plain pinelands] . . . P. caroliniana
3 Main parallel veins of each petal 5-9 (counted at a point halfway between the base and the apex and ignoring short
laterals), often strongly dilated towards the apex of the petal; outer- or basal-most main vein with numerous short laterals on the outer side, extending to the petal margin with few or no branchings; rhizome erect, short, the leaves strongly clustered, not forming large clonal patches; ovary green, sometimes white towards the base; [primarily of the Mountains, rarely also disjunct in the Coastal Plain]
P. grandifolia

Parnassia asarifolia Ventenat, Kidney-leaved Grass-of-Parnassus, Appalachian Grass-of-Parnassus, Brook Parnassia. Mt (GA, NC, SC, VA), Pd (GA, VA), Cp (VA): bogs, sphagnous seeps, brookbanks, generally in more acidic habitats than \(P\). grandifolia, up to elevations over 6,000 feet; uncommon, rare in VA Piedmont and Coastal Plain (SC Rare). (July-) August-October. VA, WV, and AR south to GA and TX, primarily in the Appalachian and Ozarkian highlands. [= RAB, C, F, G, GW, K, S, W]

Parnassia caroliniana Michaux, Carolina Grass-of-Parnassus, Savanna Parnassia, Eyebright. Cp (NC, SC): wet longleaf pine, pond pine, or pond cypress savannas (especially but not strictly where shallowly underlain by coquina limestone), sandhill seepage bogs; rare (US Species of Concern, NC Endangered, SC Rare). September-November (-December). Se. and sc. NC south through SC to the Panhandle of FL, the distribution (at least now) fragmented and disjunctive. In NC, locally common in three small areas, centered around Maple Hill (Pender and Onslow counties), Old Dock (Columbus and Brunswick counties), and the Green Swamp (Brunswick County). Following Michaux's discovery of the species it was apparently not reported again in the Carolinas until found by H.A. Rankin near Hallsboro. His comments, quoted in Alexander (1934) are interesting. "What if our savannas are sometimes steaming, it is the condition necessary for the development for many wonderful plants which find here their most congenial surroundings. But Grass-of-Parnassus does not star the meadows during the steaming season, instead, by local tradition, the 'Eyebright,' its local name, times its first flowers to come just two weeks before frost ... As a matter of fact, I saw the first flowers this year on October 12th and our first frost came the morning of the 25 th. Its chosen habitat is the wet savannas and hundreds of acres may be seen liberally dotted with its white stars, but it finds its best development in the lower places, and here it often almost covers the ground. Today, November 1st, it is in its prime and is the most conspicuous flower on many acres and in one little depression less than two feet in diameter I counted seventy-two flowers and buds." With the extensive destruction of our wet savannas (by conversion to pine tree farms, agriculture, and developed areas) and fire suppression, very few such places now remain. [= RAB, GW, K, S]

Parnassia grandifolia Augustin de Candolle, Bigleaf Grass-of-Parnassus, Limeseep Parnassia, Undine. Mt (GA, NC, SC, VA), Cp (NC): fens, gravelly seepages, primarily or solely over calcareous, mafic, or ultramafic rocks, in the outer Coastal Plain in seepage over marl on nearly vertical river bluffs on the Cape Fear River; rare (GA Special Concern, NC Rare, SC Rare, VA Rare). September-October. NJ (?), VA, WV, and s. MO south to n. GA, Panhandle FL, s. MS (Sorrie \& Leonard 1999), AR, and e. TX, primarily in the Appalachian and Ozarkian highlands. The discovery of populations of this species in Brunswick and Columbus counties, NC, was remarkable. In the Panhandle of FL and the West Gulf Coastal Plain of LA and TX it also occurs in wet savannas and pitcherplant bogs (MacRoberts, MacRoberts, \& Jackson 2004), in FL sometimes in close proximity to P. caroliniana; Parnassia in Coastal Plain savannas should not necessarily be assumed to be P. caroliniana. [= RAB, C, F, G, GW, K, S, W]

Parnassia glauca Rafinesque, American Grass-of-Parnassus, ranges south to NJ, s. PA (Rhoads \& Klein 1993), OH, IN, IA, and SD (Kartesz 1999). [= C, F, G, K]

\section*{PASSIFLORACEAE (Passionflower Family)}

A family of about 17 genera and 575 species, vines, shrubs, and trees, of tropical and warm temperate regions, especially America.

\section*{Passiflora Linnaeus (Passionflower)}

A genus of about 430-520 species, vines, shrubs, and trees, of tropical and warm temperate America and Asia. References: Ulmer \& MacDougal (2004)=Z.

1 Leaves entire, herbaceous in texture; petioles without 2 glands near the junction of the petiole and the blade; berry \(0.8-1.5 \mathrm{~cm}\) Iong; [subgenus Decaloba; supersection Decaloba] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. Iutea var. Iutea
1 Leaves serrulate, thick and subcoriaceous in texture; petioles with 2 glands near the junction of the petiole and the blade; berry \(2-7 \mathrm{~cm}\) long.
2 Petals blue (to nearly white), 30-40 mm long; berry 4-7 cm long; calyx subtended by 3 bracts; [native, widespread and common in our area]; [subgenus Passiflora; supersection Passiflora] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. incarnata
2 Petals white to yellowish, 6-8 mm long; berry 2-3 cm long; calyx not subtended by bracts; [introduced, very rare in our area]; [subgenus Decaloba; supersection Bryonioides] P. morifolia

Passiflora incarnata Linnaeus, Maypops. Cp, Pd, Mt (GA, NC, SC, VA): roadsides, fencerows, thickets, fields; common. May-July (-later); July-October. N. VA and sw. PA west to OK, south to FL and TX. Certainly one of our most interesting and beautiful flowers. [= RAB, C, F, G, K, S, W, Z]

Passiflora Iutea Linnaeus var. Iutea, Yellow Passionflower. Cp, Pd, Mt (GA, NC, SC, VA): woodlands, forests, thickets; common. June-September; August-October. Var. lutea ranges from PA, WV, and TN south to FL and AL. Var. glabriflora, differing in the calyx, petioles, and stems glabrous (vs. pilose in var. lutea) is more western, ranging from OH west to OK, south to AL and TX. [= C, F, G; P. Iutea -- RAB, K, S, W, Z, infraspecific taxa not distinguished]
* Passiflora morifolia Masters. Pd (SC): thickets; rare, introduced from South America. May-July; July-October. [= RAB, K, Z; P. warmingii Masters -- S]
* Passiflora gracilis Jacquin ex Link is reported for SC (Kartesz 1999). \{investigate - not in SC Plant Atlas\} [= K] \{not yet keyed\}

\section*{PAULOWNIACEAE (Paulownia Family)}

There has been disagreement over whether Paulownia is best placed in Scrophulariaceae, Bignoniaceae, or its own family, Paulowniaceae; superficially it closely resembles Catalpa of the Bignoniaceae. Armstrong (1985) concluded that Paulownia's affinities lie with the Scrophulariaceae, based on floral anatomy, embryo morphology, and seed morphology. A molecular study by Spangler \& Olmstead (1999) conclude that Paulownia is best retained in its own family. Manning (2000) concurs with its removal from Bignoniaceae. Molecular evidence supports that it is sister to the reconstituted Orobanchaceae. References: Spangler \& Olmstead (1999), Manning (2000).

\section*{Paulownia Siebold \& Zuccarini (Princess-tree)}

A genus of 6 species, trees, of e. Asia. References: Armstrong (1985).
* Paulownia tomentosa (Thunberg) Siebold \& Zuccarini ex Steudel, Princess Tree, Empress Tree, Paulownia. Cp, Pd, Mt (GA, NC, SC, VA): roadsides, disturbed areas, roadcuts, forests; common, introduced from China. April-May; September-October. Paulownia is becoming something of a nuisance, showing an ability to invade pristine woodlands. The very soft wood is highly prized in Asia. The leaves of stump sprouts can reach very large sizes (at least to 80 cm long and wide). The woody capsules are persistent, and the densely tomentose, tan flower buds are conspicuous through the winter. [= RAB, C, F, G, K, S, W]

PENTHORACEAE (Ditch-stonecrop Family)
A family of one genus and 2 species, herbs, of e. North Americaand e. Asia. Penthorum has been variously placed in the Crassulaceae, Saxifragaceae, or in the Penthoraceae. Haskins \& Hayden (1987) concluded that Penthorum was best treated in a monogeneric Penthoraceae, a conclusion based on extensive anatomical evidence. Among those who do not favor a monotypic family, there is nearly evenly divided opinion between the Crassulaceae and Saxifragaceae; this in itself perhaps supports segregation in the Penthoraceae. Molecular evidence supports the recognition of the Penthoraceae, and suggests closer affinities with the Haloragaceae than with either the Crassulaceae or the Saxifragaceae (Morgan \& Soltis 1993).

\section*{Penthorum Linnaeus (Ditch-stonecrop, Penthorum)}

A genus of 2 species, herbs, of e. North America and e. and se. Asia. The only other species in the genus is \(P\). chinense Pursh, of e. Russia, China, Korea, and Japan. References: Haskins \& Hayden (1987)=Z.

Penthorum sedoides Linnaeus, Ditch-stonecrop, American Penthorum. Pd, Cp, Mt (GA, NC, SC, VA): shores, drawdown areas, moist forests, moist disturbed areas, ditches; common. June-October. Widespread in e. North America. [= RAB, C, F, G, GW, K, S, W, Z]

PHRYMACEAE (Lopseed Family)
As radically circumscribed, a family of about 20 genera and 240 species, herbs, cosmopolitan. References: Lee et al. (1996)=Z; Thieret (1972); Wagstaff \& Olmstead (1997); Fischer in Kadereit (2004); Cantino in Kadereit (2004).
tribe Microcarpeae: Micranthemum (Hemianthus).
tribe Mimuleae: Mazus, Mimulus.
tribe Phrymeae: Phryma.
tribe ??: Lindernia

\section*{Lindernia Allioni (False-pimpernel)}

A genus of about 80 species, of warm temperate and subtropical regions of the Old and New Worlds. Probably not a member of Plantaginaceae (Albach, Meudt, \& Oxelman 2005). References: Cooperrider \& McCready (1975)=Z; Qualls (1984)=Y; Lewis (2000)=X.

1 Fertile stamens 4; calyx lobes connate at anthesis for more than \(1 / 2\) their length, later separating; [section Torenioides] . . . . . .

1 Fertile stamens 2 (with 2 staminodia without anthers, or with rudimentary anthers); calyx lobes distinct to the base at anthesis and after; [section Brachycarpae].

2 Pedicels shorter than or about as long as the subtending leaves . . . . . . . . . . . . . . . . . . . . . . . . . L. dubia var. dubia
2 Pedicels longer than the subtending leaves (or bracteal leaves in some species).
3 Leaves nearly orbicular; stems creeping . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . L. grandiflora
3 Leaves distinctly longer than wide; stems erect (sometimes decumbent at the base and rooting if knocked down by water).
4 Leaves not glandular punctate; seeds \(2-3 \times\) as long as wide ................... . L. dubia var. anagallidea
4 Leaves glandular punctate; seeds ca. \(1 \times\) as long as wide.
5 Leaves primarily in a basal rosette, leaves of the stem strongly reduced upwards to bracts; capsule (1.8-) 3.4-7 mm long; [primarily of seepage of flatrocks] . . . . . . . . . . . . . . . . . . . L. monticola ("monticola" form)

5 Leaves primarily on the stem, not conspicuously reduced upwards; capsule 1.4-3.4 mm long; [of stream or river banks] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . L. monticola ("saxicola" form)
* Lindernia crustacea (Linnaeus) F. Mueller. Cp (GA, SC), Pd (SC), \{NC\}: lawns; uncommon, introduced from Malaysia. September. [= RAB, GW, K, P, X, Y]

Lindernia dubia (Linnaeus) Pennell var. anagallidea (Michaux) Cooperrider. Cp, Pd, Mt (GA, NC, SC, VA): wet sandy or muddy areas; common (rare in Mountains). June-September. Nearly throughout North America, Central America, and South America. The extensive and essentially coincident ranges of the two varieties of \(L\). dubia suggests that they may be merely forms, as suggested by Voss (1996). [= C, K, X, Y, Z; = L. anagallidea (Michaux) Pennell -- RAB, F, G, GW, P; = Ilysanthes inequalis (Walter) Pennell -- S; < L. dubia -- W]

Lindernia dubia (Linnaeus) Pennell var. dubia. Cp, Pd, Mt (GA, NC, SC, VA): wet sandy or muddy areas; common. MayNovember. Nearly throughout North America, Central America, and South America. [=C, X, Y, Z; = L. dubia (Linnaeus) Pennell -RAB, GW; > L. dubia var. dubia -- F, G, K; > L. dubia var. riparia (Rafinesque) Fernald -- F, G; > L. dubia var. inundata Pennell -- F, G, K; > L. dubia var. major (Pursh) Pennell -- P; > L. dubia var. typica -- P; = llysanthes dubia (Linnaeus) Barnhart -- S; < L. dubia -W; = Gratiola dubia Linnaeus]

Lindernia grandiflora Nuttall. Cp (GA): depressional wetlands; rare. S. GA south to s. FL. [= GW, K, P, X, Y; = Ilysanthes grandiflora (Nuttall) Bentham -- S]

Lindernia monticola Muhlenberg ex Nuttall, Flatrock Pimpernel, Riverbank Pimpernel. Pd, Mt (GA, NC, SC), Cp (GA): in seasonal seepage on granitic flatrocks, and on river-scoured siliceous rocks; rare (GA Endangered - "saxicola", NC Watch List). April-June (-September). Nc. and sw. NC south to ne. FL and ec. AL. L. saxicola appears to be merely a form of \(L\). monticola, the leafy stems the result of the basal leaves being covered by silt deposited by floodwaters (Qualls 1984; Lewis 2000); this needs additional study. [= K, X; > L. monticola - RAB, GW, P, W, Y; > L. saxicola M.A. Curtis -- RAB, P, W, Y; > Ilysanthes monticola (Muhlenberg ex Nuttall) Rafinesque -- S; > Ilysanthes saxicola (M.A. Curtis) Chapman -- S]

Lindernia diffusa (Linnaeus) Wettstein, is reported for SC by Kartesz (1999) on the basis of specimens at NCU, but the specimens so labelled are actually L. dubia. \{not keyed\}

\section*{Mazus Loureiro}

A genus of \(10-15\) species, herbs, of Asia to Australia.
1 Plant stoloniferous, perennial; corolla ca. 15 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . M. miquelii
1 Plant not stoloniferous, annual; corolla 7 -10 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . M. pumilus
* Mazus miquelii Makino. Pd (NC): lawns; rare, introduced from e. Asia. April-June. [= \(\mathrm{C}, \mathrm{K} ;=\) M. miguelii-RAB, misspelling; ? M. reptans N.E. Brown]

Mazus pumilus (Burmann f.) Steenis. Cp, Pd (GA, NC, SC, VA): lawns; rare, introduced from e. Asia. December-June. [= C, K; ? M. japonicus (Thunberg) Kuntze -- RAB, F, G, P]

\section*{Micranthemum Michaux}

The appropriate generic treatment is unclear. If treated (as here) as including Hemianthus, a genus of about 14 species, of tropical to warm temperate America.

1 Calyx lobes uneven, 3 of the sinuses extending about halfway to the base of the calyx, the lowermost sinus extending to the base . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . M. micranthemoides 1 Calyx lobes even, all of the sinuses reaching nearly to the base of the calyx . . . . . . . . . . . . . . . . . . . . . . . . . M. umbrosum

Micranthemum micranthemoides (Nuttall) Wettstein, Nuttall's Micranthemum. Cp (VA): muddy, freshwater intertidal shores; rare, possibly extinct (US Species of Concern, VA Rare). NY (Hudson River) south to VA (Chesapeake Bay, Potomac River, James River). [= F, K; = Hemianthus micranthemoides Nuttall -- C, G, P]

Micranthemum umbrosum (J.F. Gmelin) Blake, Shade Mudflower. Cp (GA, NC, SC, VA): shallow pools, stagnant streams, wet depressions in swamp forests; uncommon (VA Rare). May-October. Se. VA south to FL, west to TX, and south into tropical America. [= RAB, C, F, G, GW, K, P; = Globifera umbrosa J.F. Gmelin -- S]

\section*{Mimulus Linnaeus (Monkey-flower)}

A genus of about 150 species, herbs and shrubs, of w. North America, s. Africa, Asia, and e. North America. Mimulus reaches its greatest diversity in w. North America. References: Grant (1924)=Z.

1 Corolla yellow; stem viscid glandular-pubescent; plant usually 2-4 dm tall
M. moschatus

1 Corolla blue; stem glabrous; plant usually 3-15 dm tall; [section Mimulus].
2 Leaves petiolate (the upper sessile or nearly so); pedicels \(2-15 \mathrm{~mm}\) long; stem with 4 winged angles ........ M. alatus
2 Leaves sessile; pedicels \(20-45 \mathrm{~mm}\) long; stem with 4 rounded angles . . . . . . . . . . . . . . . . . M. ringens var. ringens
Mimulus alatus Aiton, Winged Monkey-flower. Cp, Pd (GA, NC, SC, VA), Mt (GA, VA): marshes, bottomlands, ditches; common. July-November. MA and CT west to s. MI and s. IA, south to panhandle FL and TX. [= RAB, C, F, G, GW, K, P, S, W, Z]

Mimulus moschatus Douglas ex Lindley, Muskflower, Musky Monkey-flower. Mt (NC, VA): streambanks, brookbanks, saturated soil of springs; rare (NC Watch List, VA Rare). July; August. Newfoundland and Québec west to MI, south to w. VA, WV, NC, and MI, and in w. North America. The native/naturalized status of M. moschatus in e. North America is controversial. Some at least of our populations appear to be native, not occurring in situations where likely to have been introduced. [= RAB, C, F, G, P, W; > M. moschatus var. moschatus -- K]

Mimulus ringens Linnaeus var. ringens, Allegheny Monkey-flower. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): marshes, bogs, wet meadows, bottomlands; common. June-September. Nova Scotia and Québec west to Saskatchewan, south to c. GA, LA, OK , and CO. [= G, K; < M. ringens -- RAB, C, GW, S, W; > M. ringens var. minthodes (Greene) A.L. Grant -- F, Z; > M. ringens var. ringens \(-\mathrm{F}, \mathrm{Z}\); \(=\mathrm{M}\). ringens var. typica -- P\(]\)

\section*{Phryma Linnaeus 1753 (Lopseed)}

A genus of 1-2 species, herbs, of e. North America and Asia. The disjunct populations have been variously treated as species, varieties, or races. References: Lee et al. (1996)=Z; Thieret (1972); Wagstaff \& Olmstead (1997); Cantino in Kadereit (2004).

Phryma leptostachya Linnaeus var. leptostachya, American Lopseed. Mt, Pd, Cp (GA, NC, SC, VA): bottomland forests, nutrient-rich slopes, in the Coastal Plain primarily in places underlain by coquina limestone ("marl", and essentially absent from the more acidic portions of the NC Coastal Plain); common (uncommon in Coastal Plain). June-August; August-October. The species is interpreted as occurring disjunctly in e. North America and e. Asia. Var. leptostachya ranges from Québec west to Manitoba, south to FL and TX; var. asiatica Hara occurs in e. Asia. The fruits "lopped down" against the stem are unmistakable. [= Z; <Ph. leptostachya -- RAB, C, G, K, S, W; > Ph. leptostachya var. leptostachya - F; > Ph. leptostachya var. confertifolia Fernald -- F]

\section*{PHYLLANTHACEAE Martinov (Leaf-flower Family)}

References: Webster (1994); Chase et al. (2002).
\begin{tabular}{|c|c|c|}
\hline 1 & Woody shrub; stamens 5-6 & [Leptopus] \\
\hline 1 & Annual herb; stamens 3 & Phyllanthus \\
\hline
\end{tabular}

\section*{Leptopus Dcne. (Maidenbush)}

Generic boundaries uncertain at this time (Wurdack et al. 2004). References: Wurdack et al. (2004).
Leptopus phyllanthoides (Nuttall) G.L. Webster, Maidenbush. Disjunct in AL from a main distribution in the Ozarks (AR, MO, OK) and TX. [= K; Andrachne phyllanthoides (Nuttall) Coulter - F, G]

\section*{Phyllanthus Linnaeus (Leaf-flower)}

A genus of about 600-833 species, trees, shrubs, and herbs, of tropical, subtropical and warm temperate regions of the Old and New Worlds. Heterogeneous and perhaps to be divided. References: Rossignol, Rossignol, \& Haicour (1987)=Z; Webster (1970) \(=\) Y; Govaerts, Frodin, \& Radcliffe-Smith (2000)=X.

1 Plant with leaves uniformly distributed on the stem and branches, alternate and distichous; flowers produced on ultimate and penultimate orders of branches, the ultimate branches not deciduous; [subgenus Isocladus]

Ph. caroliniensis ssp. caroliniensis
1 Plant lacking leaves on the main stem, the penultimate order of branches with scales borne in spiral phyllotaxy, the ultimate order of branches deciduous, bearing normal leaves alternately and distichously; flowers produced only on the ultimate, deciduous branches.
2 Stamens 5, filaments free; fruiting pedicels capillary, 3-7 mm long; seeds densely papillose; [subgenus Kirganelia] . . . . Ph. tenellus

2 Stamens 3, filaments connate into a column 0.1-0.15 mm long; fruiting pedicels thick, 0.5 mm long; seeds with 12-15 transverse ridges and sometimes 1-3 pits; [subgenus Phyllanthus]

Ph. urinaria ssp. urinaria
Phyllanthus caroliniensis Walter ssp. caroliniensis, Carolina Leaf-flower. Cp, Pd, Mt (GA, NC, SC, VA): roadsides, moist woodlands, forests, and fields, often in seasonally wet, muddy places; common (rare in VA Mountains). July-November. PA and IL south to FL and TX, and south to Argentina and Paraguay, the original range not clear, likely introduced in part of the area. Ssp. saxicola (Small) G.L. Webster (sometimes treated as a species) is restricted to s. FL, the Bahamas, and Greater Antilles. [=K, X, Y; < Ph. caroliniensis -- RAB, F, G, W; = Ph. caroliniensis var. caroliniensis -- C; < Ph. carolinensis -- GW, orthographic error; = Ph. caroliniensis -- S, sensu stricto]
* Phyllanthus tenellus Roxburgh, Mascarene Island Leaf-flower. Pd (GA, NC), Cp (GA, NC, SC): disturbed areas, in and around greenhouses; rare, native to the Mascarene Islands. This species appeared in FL in the 1920's, s. GA in the 1940's, SC in the 1950's, NC in the 1960's, and TN in the 1970's (Kral 1981). [= GW, K, Y; ? Ph. amarus -- RAB, misapplied (misidentified); > Ph. tenellus var. tenellus - X]
* Phyllanthus urinaria Linnaeus ssp. urinaria, Chamber Bitter. Cp (GA, NC, SC, VA): gardens and roadsides, apparently preferring nitrogen-rich soils; rare, introduced from tropical Southeast Asia, now scattered in the tropics and subtropics of both hemispheres. March-November. This species appeared in the 1940's to 1960's in FL, GA, AL, LA, TX, and NC, and in the 1970's in TN (Kral (1981). [= X, Z; < Ph. urinaria -- GW, K, Y]
* Phyllanthus fraternus G.L. Webster, introduced in SC (Kartesz 1999). \{investigate\} [= K, X]

Several other species have been previously but erroneously reported for our area. Phyllanthus amarus Schumacher, Gale-of-wind, Carry-me-seed, reported by RAB for NC and SC, was misidentified and actually represents Ph. tenellus (Webster 1970); see above. Reports of Ph. niruri Linnaeus from NC and SC also proved to be Ph. tenellus (Webster 1970). Phyllanthus pentaphyllus Wright, Fivepetal Leaf-flower, unlikely to be correctly labeled from Darlington County, SC (as also indicated by RAB), is likewise here excluded.

\section*{PHYTOLACCACEAE R. Brown 1818 (Pokeweed Family)}

A family of about 18 genera and 70 species, herbs, shrubs, vines, and trees, of tropical and warm temperate regions, especially America. References: Nienaber \& Thieret in FNA (2003b); Rohwer in Kubitzki, Rohwer, \& Bittrich (1993).

\section*{Phytolacca Linnaeus 1753 (Pokeweed)}

A genus of about 25 species, herbs, shrubs, and trees, of tropical and warm temperate regions. References: Caulkins \& Wyatt (1990) \(=\) Z; Hardin (1964a) \(=\) Y; Rogers (1985) \(=\) X; Nienaber \& Thieret in FNA (2003b); Rohwer in Kubitzki, Rohwer, \& Bittrich (1993).

1 Fruiting pedicels (6-) 7-12 (-15) mm long; raceme (not including the peduncle) 10-20 (-25) cm long, divergent or drooping in flower and fruit (or erect in flower); [widespread in our area] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Ph. americana
1 Fruiting pedicels (2-) 4-6 (-7) mm long; raceme (not including the peduncle) (3-) 6-9 (-13) cm long, erect (rarely divergent) in flower and fruit; [restricted in our area to maritime areas]

Ph. rigida
Phytolacca americana Linnaeus, Common Pokeweed. Pd, Mt, Cp (GA, NC, SC, VA): in a wide variety of natural and disturbed habitats, usually associated with exposed mineral soil; common. May-frost. An abundant "native weed" occurring throughout e. North America, P. americana is widely dispersed by birds and quickly colonizes exposed mineral soil even in undisturbed forests, such as on tree-fall tip-up mounds or flood scours. It is most abundant, however, as a weed of urban, suburban, and agricultural disturbances. The berries and mature stems are poisonous; the young stems have been used as a potherb and the purple berries as a source of ink. [=C, F, G, S, W, X, Y; <Ph. americana -- RAB, GW (also see Ph. rigida); = Ph. americana var. americana -- FNA, K, Z]

Phytolacca rigida Small, Maritime Pokeweed. Cp (GA, NC, SC, VA): dune slacks, dune slopes, edges of tidal marshes, disturbed areas on barrier islands, xeric sandhills; rare (NC Watch List). May-frost. DE (reportedly), se. VA south to FL and west to TX in the Southeastern Coastal Plain. In the northern parts of area, in NC and VA, P. rigida is rather rare, limited to the vicinity of the coast, and less weedy than P. americana. Caulkins and Wyatt (1990) reduce Ph. rigida to a variety of Ph. americana, but it seems distinct at the species level, at least in our area. [ \(=\mathrm{S}, \mathrm{X}, \mathrm{Y} ;<\operatorname{Ph}\). americana -- RAB, GW; = Ph. americana var. rigida (Small) Caulkins \& Wyatt -- FNA, K, Z]

PIPERACEAE C.A. Agardh 1824 (Pepper Family)
A family of about 5-8 genera and 3000 species, shrubs, herbs, trees, and vines, of tropical and subtropical areas. References: Tebbs in Kubitzki, Rohwer, \& Bittrich (1993).

Peperomia Ruiz \& Pavón 1794 (Peperomia)

A genus of about 1000 species, of tropical and subtropical regions, especially America. References: Boufford in FNA (1997); Boufford (1982)=Z; Tebbs in Kubitzki, Rohwer, \& Bittrich (1993).
* Peperomia pellucida (Linnaeus) Kunth. Cp (GA): disturbed areas; rare, introduced. P. pellucida has been collected escaped from cultivation in FL, LA, and GA (in the vicinity of Savannah). Boufford (1982) describes the species as showing "weedy tendencies" in the southeastern United States, where "first collected in 1957," and states that "it will be interesting to see if this plant will continue to expand its range". [= FNA, K, Z]

\section*{PITTOSPORACEAE (Pittosporum Family)}

A family of about 9-11 genera and 150-200 species, trees, shrubs, and vines, of tropical and warm temperate Old World. References: Judd (1996).

Pittosporum Banks ex Solander (Pittosporum)
A genus of about 100-150 species, trees and shrubs, of tropical and warm temperate Old World. References: Judd (1996)=Z.
* Pittosporum tobira (Thunberg) Aiton f., Japanese Pittosporum, Australian Laurel. Cp (GA?, NC, SC?): frequently planted on barrier islands, at least persisting and apparently naturalizing; rare, introduced from Japan and China. Various cultivars are seen, including ones with variegated leaves. This species is one of the more common landscaping plants used on developed barrier islands. The revolute, obovate leaves are characteristic. [=K, X]

\section*{PLANTAGINACEAE (Plantain Family)}

As newly and radically recircumscribed, a family of about 120 genera. References: Albach, Meudt, \& Oxelman (2005); Olmstead et al. (2001); Schwarzbach in Kadereit (2004); Fischer in Kadereit (2004).
"subfamily Antirrhinoideae"
"tribe Cheloneae": Chelone, Collinsia, Penstemon.
"tribe Antirrhineae": Antirrhinum, Chaenorrhinum, Cymbalaria, Kickxia, Linaria, Misopates, Nuttallanthus.
"subfamily Gratioloideae":
"tribe Gratioleae":
"subtribe Gratiolinae": Amphianthus, Bacopa, Gratiola, Mecardonia, Scoparia, Sophronanthe. "subtribe Dopatriinae": Limnophila.
"tribe Limoselleae": Limosella.
"tribe Stemodieae": Leucospora.
"subfamily Digitalidoideae":
"tribe Digitalideae": Digitalis.
"tribe Veroniceae": "subtribe Veroniciinae": Veronica, Veronicastrum.
tribe Plantaginae: Plantago.
tribe Callitricheae: Callitriche
NOT in Plantaginaceae: Lindernia, Mazus, Micranthemum

\section*{Amphianthus Torrey (Pool-sprite)}

A monotypic genus, an herb, endemic to se. North America. References: Hilton \& Boyd (1996); Patrick, Allison, \& Krakow (1995).
Identification notes: Amphianthus somewhat resembles Callitriche, but has floating leaves in single pairs rather than in a whorl.
Amphianthus pusillus Torrey, Pool-sprite, Snorkelwort. Pd (GA, SC): vernal pools on granitic flatrocks; rare (US Threatened, GA Threatened, SC Rare). April. Endemic to granitic flatrocks of ec. AL, nc. GA (17 counties), and sc. SC. Hilton \& Boyd (1996) discuss the ecology and population ecology of this remarkable plant in detail. [= RAB, GW, K, P, S]

Antirrhinum Linnaeus (Snapdragon)
(also see Misopates)
A genus of about 20 species, herbs, of Mediterranean Europe. References: Sutton (1988)=Z.
1 Corolla 25-40 mm long; calyx lobes ovate; leaves to 15 mm wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. majus
1 Corolla 10-13 mm long; calyx lobes linear; leaves to 5 mm wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [A. orontium]
* Antirrhinum majus Linnaeus, Common Snapdragon. Mt, Pd (VA): cultivated, rarely persistent or naturalized; rare, introduced from Mediterranean Europe. July. [= C, G, K, P, Z]

Antirrhinum orontium Linnaeus, Lesser Snapdragon, is introduced at least far south as se. PA (Rhoads \& Klein 1993) and KY (Pennell 1935). [= C, K, P, Z]

\section*{Bacopa Aublet (Water-hyssop)}

A genus of about 50 species, herbs (mostly aquatic or at least wetland), of tropical, subtropical, and warm temperate regions of the Old and New Worlds. References: Schuyler (1989)=Z; Fernald (1942).

1 Leaves obovate to oblanceolate, cuneate at the base, 1-veined (or with 1-2 additional obscure veins), 3-8 mm wide; stems glabrous; fresh plants not aromatic . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . B. monnieri
1 Leaves mostly orbicular to ovate (or sometimes obovate in the very rare \(B\). repens), rounded to clasping at the base, 3-9veined; stems pubescent or puberulent, at least when young (check at growing tips) or glabrous (in tidal forms of \(B\).
innominata); fresh plants aromatic or not.
2 Fresh plants strongly aromatic when bruised; corolla pale to bright blue, 9-13 mm long; calyx subtended by 2 subulate bractlets; stamens 4 . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . B. caroliniana
2 Fresh plants not aromatic when bruised; corolla predominantly white (in some species slightly pink or marked with yellow), 2-10 mm long; calyx not subtended by bractlets; stamens 2 or 4.
3 Corolla 4-10 mm long, white with a yellow throat; capsule ca. 5 mm long . . . . . . . . . . . . . . . . . . . . . B. rotundifolia
3 Corolla 2-5 mm long, white or pink, without a yellow throat; capsule 2-3 mm long.
4 Leaves strongly clasping, mostly ovate; stamens 2 (or very rarely 4); [native] . . . . . . . . . . . . . . B. innominata
4 Leaves only slightly clasping, mostly obovate; stamens 4 ; [a very rare introduction] ............... B. repens
Bacopa caroliniana (Walter) B.L. Robinson, Blue Water-hyssop, Sweet Water-hyssop, Carolina Water-hyssop. Cp (GA, NC, SC, VA), Pd (GA, SC): wet shores, tidal muds; common, rare north of SC (NC Watch List, VA Rare). May-September. Se. VA south to s. FL, west to e. TX; disjunct in KY. The strongly fragrant stems and leaves are unique. [= RAB, C, F, G, GW, K, W; Hydrotrida caroliniana (Walter) Small -- P, S]

Bacopa innominata (Gómez Maza) Alain, Tropical Water-hyssop. Cp (GA, NC, SC, VA): freshwater tidal muds, shallow water; rare (NC Rare, SC Rare, VA Endangered). June-September. MD south to c. peninsular FL, and in the West Indies and Central America. B. stragula Fernald has been considered a rare endemic of tidal areas in VA and MD, differing from B. innominata in its glabrous stems (vs. pubescent), smaller flowers (the corolla less than 3 mm long vs. more than 3 mm long), and shorter, glabrous pedicels \(3-6 \mathrm{~mm}\) long (vs. pubescent and to 8 mm long). Schuyler (1989) concluded that \(B\). stragula is an intertidal form of \(B\). innominata, the morphologic differences induced by the flooding regime. Additional work, perhaps involving growth under experimental conditions or chemical or molecular studies, is needed to corroborate Schuyler's conclusion. See Schuyler (1989), \(F\), and Fernald (1942) for further discussion. [= C, GW, K, Z; B. cyclophylla Fernald -- RAB; B. stragula Fernald -- F, G; Herpestis rotundifolia Gaertner f. -- P, S; ? Macuillamia obovata Rafinesque -- P]

Bacopa monnieri (Linnaeus) Wettstein, Monnier's Water-hyssop. Cp (GA, NC, SC, VA): freshwater tidal marshes, muddy shores, streams and pools; uncommon (VA Watch List). E. VA south to s. FL, west to c. TX, and in the West Indies and the New World subtropics and tropics. [= RAB, C, F, G, GW, K; Bramia monnieri (Linnaeus) Drake -- P, S]
* Bacopa repens (Swartz) Wettstein, South American Water-hyssop. Cp (SC): freshwater pools; rare, presumably introduced from its native range in the New World tropics. [= RAB, GW, K; Macuillamia repens (Swartz) Pennell -- P, S]

Bacopa rotundifolia (Michaux) Wettstein, Midwestern Water-hyssop. Cp (NC, VA): tidal muds, shallow water of large natural lake; rare (NC Watch List, VA Rare). June-September. IN and IA west to ND and MT, south to AL and AZ; disjunct in e. MD, e. VA, and ne. NC, where apparently native (though C considers introduced). Known in NC only from Lake Mattamuskeet, Hyde County, where not seen since 1929. B. simulans Fernald has been considered a rare endemic of tidal areas in VA and MD. It is alleged to differ from \(B\). rotundifolia in its glabrous to glabrescent stems (vs. pubescent), more succulent condition, smaller leaves (the larger 1-2 cm long and \(0.6-1.5 \mathrm{~cm}\) wide vs. \(2-3.5 \mathrm{~cm}\) long and \(1.5-2.7 \mathrm{~cm}\) wide), smaller flowers (corolla \(3-4 \mathrm{~mm}\) long vs. 6-10 mm long). Schuyler (1989) concluded that \(B\). simulans is an intertidal form of \(B\). rotundifolia, the morphologic differences the result of differences in inundation. Additional work, perhaps involving growth under experimental conditions or chemical or molecular studies, is needed to corroborate Schuyler's conclusion. See Schuyler (1989), F, and Fernald (1942) for further discussion. [= C, F, G, GW, K, Z; B. simulans Fernald -- F, G; Macuillamia rotundifolia (Michaux) Rafinesque -- P, S]

\section*{Callitriche Linnaeus 1753 (Water-starwort)}

A genus of 20-50 species, annual and perennial herbs of aquatic, wetland, and upland habitats, nearly cosmopolitan. This genus should be included in a greatly expanded Plantaginaceae. References: Angiosperm Phylogeny Group (2003); Crow \& Hellquist (2000) \(=\) Z; Fassett (1951); Erbar \& Leins in Kadereit (2004). Key based on Z.

Callitriche heterophylla Pursh ssp. heterophylla. (GA, NC, SC, VA): [= K; C. heterophylla -- RAB, C, F, G, GW, S, W, Z, infraspecific taxa not distinguished]

Callitriche palustris Linnaeus. (VA) [= C, F, K, S; C. verna Linnaeus -- G, W, Z]
Callitriche pedunculosa Nuttall. (NC). east to NC (Kartesz 1999), KY, c. TN (Chester, Wofford, \& Kral 1997), and AL. [= K;

\section*{C. nuttallii Torrey -- Z]}

Callitriche peploides Nuttall. (GA, SC): [= RAB, GW, K, S]
* Callitriche stagnalis Scopoli. (VA): [= C, F, G, K, Z]

Callitriche terrestris Rafinesque emend. Torrey. (GA, NC, SC, VA): [=C, GW, K, S, W, Z; C. deflexa A. Braun -- RAB; C. deflexa var. austinii (Engelmann) Hegelmann -- F, G]

Chaenorrhinum (Augustin de Candolle ex Duby) Reichenbach (Dwarf Snapdragon, Lesser Toadflax)
A genus of about 21 species, herbs, of Mediterranean Europe. References: Sutton (1988)=Z.
* Chaenorrhinum minus (Linnaeus) Lange ssp. minus, Dwarf Snapdragon, Lesser Toadflax. Mt, Cp (VA), Pd (GA, NC, VA): disturbed areas; common, rare south of VA, introduced from Eurasia. June-November. [= Z; Chaenorrhinum minus -- C, F, G, K, P, W, infraspecific taxa not distinguished]

\section*{Chelone Linnaeus (Turtlehead)}

A genus of about 4 species, perennial herbs, of e. North America. References: Nelson, Elisens, \& Benesh (1998).
Identification notes. The four fertile stamens are inserted on either side of the corolla near its base and are flattened and conspicuously pilose. The single staminodium (the color of which is used in the key) is much shorter (often only a few mm long), and is inserted uppermost on the corolla near its base.

1 Leaves sessile; flowers distinctly 4-ranked; staminodium purple; corolla purple . . . . . . . . . . . . . . . . . . . . . . . Ch. cuthbertii
1 Leaves with petioles \(0.5-1.5 \mathrm{~cm}\) long (or subsessile in Ch. glabra); flowers less distinctly 4-ranked; staminodium white or green; corolla purple or white.
2 Petioles \(1.5-4 \mathrm{~cm}\) long; leaf blade rounded at the base; leaf blades averaging ca. \(2 \times\) as long as wide, \(4-8 \mathrm{~cm}\) wide; staminodium white; corolla purple Ch. Iyonii
2 Petioles 0.1-1.5 cm long; leaf blade cuneate at the base; staminodium white or green; leaf blades averaging \(3 \times\) (or more) as long as wide, 1-6 cm wide; corolla purple or white.
3 Corolla white (or tinged with purple near the summit); staminodium green . . . . . . . . . . . . . . . . . . . . . . . Ch. glabra
3 Corolla purple throughout; staminodium white . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Ch. obliqua
Chelone cuthbertii Small, Cuthbert Turtlehead. Mt (GA, NC, SC, VA), Pd (NC), Cp (NC, VA): bogs, sphagnous swamps, seeps; uncommon (GA Special Concern). Late July-September; September-October. This species has a curious, disjunct distribution: Mountains and rarely upper Piedmont of w. NC and n. GA, and Coastal Plain of se. VA and ne. NC. The species is diploid (Nelson, Elisens, \& Benish 1998). [= RAB, C, F, G, GW, F, K, P, S, W]

Chelone glabra Linnaeus, White Turtlehead. Mt, Pd, Cp (GA, NC, SC, VA): streambanks, seeps, swamp forests; common. August-October; September-November. Newfoundland and MN south to GA and AL. The named varieties are intergrading and the characters used to distinguish them do not correlate well. The species is diploid (Nelson, Elisens, \& Benish 1998). [=RAB, C, F, GW, K, S, W; Ch. glabra var. dilatata Fernald \& Wiegand -- F, P; Ch. glabra var. elatior Rafinesque -- F, G, P, S; Ch. glabra var. elongata -- F, G, P, S; Ch. glabra var. ochroleuca Pennell \& Wherry -- F, G, P, S; Ch. glabra var. glabra -- F, G, S; Ch. glabra var. chlorantha (Pennell \& Wherry) Pennell -- P; Ch. glabra var. typica -- P; Ch. chlorantha Pennell \& Wherry -- S; Ch. montana (Rafinesque) Pennell \& Wherry -- S; Ch. montana var. elatior (Rafinesque) Small -- S]

Chelone lyonii Pursh, Appalachian Turtlehead. Mt, Pd (NC, SC): cove forests, spruce-fir forests, balds, streambanks; uncommon. July-September; October. W. NC and e. TN south to nw. SC. The species is diploid (Nelson, Elisens, \& Benish 1998). [= RAB, C, GW, K, W; Ch. lyoni -- F, G, P, S, orthographic variant]

Chelone obliqua Linnaeus, Purple Turtlehead. Cp (GA, NC, SC, VA), Pd, Mt (GA, NC, SC): streambanks, swamp forests; uncommon. October; November. MD and MN south to AL, w. TN, and MO. A tetraploid race is restricted to the southern Blue Ridge; plants in the remainder of the distribution are hexaploid (Nelson, Elisens, \& Benish 1998). [= RAB, C, GW, F, G, S, W; Ch. obliqua var. obliqua - K; Ch. obliqua var. typica -- P; Ch. obliqua var. erwiniae Pennell \& Wherry -- K, P]

Collinsia Nuttall (Blue-eyed Mary)
A genus of about 20 species, herbs, of North America (especially diverse in w. North America).
Collinsia verna Nuttall, Eastern Blue-eyed Mary. Mt (VA): nutrient-rich, moist bottomlands and forested slopes; rare (VA Rare). April-May. NY west to s. WI, south to w. VA, nc. TN (Chester, Wofford, \& Kral 1997), KY, and AR. [= C, F, G, K, P, S, W]

> Cymbalaria Hill (Kenilworth-ivy)

A genus of about 9 species, herbs, of Europe west to c. Asia. References: Sutton (1988)=Z.
* Cymbalaria muralis P.G. Gaertner, B. Meyer, \& Scherbius ssp. muralis, Kenilworth-ivy. Mt, Pd (VA): naturalized on walls and rock outcrops near plantings; rare, native of Eurasia. May-August. The other two subspecies, both villous throughout (vs. glabrous or with a few scattered hairs in ssp. muralis) are Mediterranean and are not known to be naturalized in North America. [= Z; C. muralis -- C, F, G, K, P, infraspecific taxa not distinguished; C. cymbalaria (Linnaeus) Wetts.; Linaria cymbalaria (Linnaeus) P. Miller]

Digitalis Linnaeus (Foxglove)
A genus of about 19 species, herbs, of Europe west to central Asia. Famous as the source of the drug digitalis, a cardiac glycoside.
1 Corolla 2-3 cm long, the lower median lobe much longer than the others . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . D. lanata
1 Corolla 4-5.5 cm long, the lower median lobe only slightly longer than the others [D. purpurea]
* Digitalis lanata Ehrhart, Grecian Foxglove, Hairy Foxglove. Pd (SC): naturalized along roadside; rare, introduced from Mediterranean Europe. May-June. Reported for South Carolina by Hill \& Horn (1997). [= C, F, G, K, P]
* Digitalis purpurea Linnaeus, Digitalis, Common Foxglove, is introduced and established at scattered locations as far south as PA (Rhoads \& Klein 1993). [= C, P; D. purpurea var. purpurea - K; D. purpurea var. alba - K]

\section*{Gratiola Linnaeus (Hedge-hyssop)}

A genus of about 20 species, herbs, of temperate regions (and tropical mountains) of the Old and New Worlds.
1 Flowers and fruits sessile or subsessile, the pedicels < 1 mm long; perennial.
2 Leaves linear-subulate; corolla \(2-3 \times\) as long as the calyx; [Sophronanthe] . . . . . . . . . . . . [see Sophronanthe hispida]
2 Leaves ovate; corolla 1-1.5 \(\times\) as long as the calyx; [Tragiola] . . . . . . . . . . . . . . . . . . . . . . [see Sophronanthe pilosa]
1 Flowers and fruits on definite pedicels; annual or perennial; [Gratiola].
3 Leaves cuneate at the base; annual.
4 Pedicels stout, erect, 1-5 (-12) mm long
G. virginiana
4 Pedicels slender, spreading, \(10-45 \mathrm{~mm}\) long.
5 Corolla 15-20 mm long; leaves oval or oblanceolate . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . G. floridana
5 Corolla 8-12 mm long; leaves elliptic, rhombic-lanceolate, or lanceolate . . . . . . . . . . . . . . . . . . G. neglecta

3 Leaves clasping or subclasping-rounded at the base; perennial.
\(6 \quad\) Calyx subtended by \(0(-1)\) bractlet; corolla lobes white; corolla tube greenish yellow, conspicuously veined G. ramosa
6 Calyx subtended by 2 bractlets; corolla lobes white or yellow-orange; corolla tube greenish yellow and conspicuously veined, or orange and not conspicuously veined.
7 Corolla lobes and tube yellow-orange (very rarely white), not conspicuously veined; sepals and flower stalks sparsely or not at all glandular-puberulent . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . G. aure 7 Corolla lobes white to lavender, corolla tube greenish yellow, usually conspicuously veined; sepals and flower stalks densely glandular-puberulent.
8 Leaves triangular to lanceolate, margins entire, or with a few teeth towards the tip; corolla veined with brown lines; sepals linear-lanceolate
G. brevifolia

8 Leaves oblong-ovate to ovate (or linear-lanceolate in submersed forms), finely dentate; corolla veined with purple lines; sepals lanceolate to oblong-lanceolate . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . G. viscidula

Gratiola aurea Pursh, Yellow Hedge-hyssop, Golden-pert. Cp (GA, NC, SC): blackwater river banks, pondcypress savannas in Carolina bays; uncommon. May-September. Newfoundland and Québec south in the Coastal Plain to panhandle FL; disjunct around the Great Lakes and inland in NY, Ontario, IL, and ND. [= RAB, C, F, G, GW, K, S; G. lutea Rafinesque var. typica -- P; G. lutea var. obtusa (Pennell) Pennell -- P]

Gratiola brevifolia Rafinesque. Cp (GA, SC): wet places; rare. E. SC and e. GA, south to panhandle FL, west to e. TX and se. OK; disjunct in c. TN. [= GW, K, P, S]

Gratiola floridana Nuttall. Mt, Pd, Cp (GA): \{habitats\}; uncommon. Ne. GA and se. TN (in counties adjacent to NC) (Chester Wofford, \& Kral 1997), south to e. GA (in counties adjacent to SC) (Jones \& Coile 1988), panhandle FL, AL, and MS. [= GW, K, P, S]

Gratiola neglecta Torrey, Mud-hyssop. Cp (NC, SC, VA), Pd, Mt (GA, NC, SC, VA): ditches, wet areas, bottomlands; common. May-July. Québec and ME west to British Columbia, south to GA, TX, and AZ. [= RAB, C, G, GW, K, P, S, W; G. neglecta var. neglecta -- F]

Gratiola ramosa Walter. Cp (GA, NC, SC): wet pine savannas, marshes, pond margins; ditches; common. May-June. Se. NC south to s. FL, west to sw. LA; disjunct in e. MD. [= RAB, C, F, G, GW, K, P, S]

Gratiola virginiana Linnaeus. \(\mathrm{Cp}, \mathrm{Pd}(\mathrm{GA}, \mathrm{NC}, \mathrm{SC}, \mathrm{VA})\), Mt (GA): sluggish streams, bogs, wet areas; common. March-May. NJ west to OH and IA and KS, south to c. peninsular FL and e. TX. Var. aestuariorum Pennell, of s. NJ south to e. VA, is alleged to differ in being shorter, with more rounded leaves, short pedicels ( \(<2 \mathrm{~mm}\) long), a shorter calyx and corolla, and a smaller capsule; it is likely merely a stunted aquatic form, but needs additional study (see F and P for additional details). [= RAB, C, F, G, GW, K, P, S, W; G. virginiana var. aestuariorum Pennell -- F, K, P]

Gratiola viscidula Pennell. Cp, Pd (NC, SC, VA), Mt (GA, NC, SC): bogs, wet areas, ditches, margins of Coastal Plain ponds; common (uncommon in Mountains). June-November. DE, MD and e. VA, south to c. SC and ne. GA; disjunct in s. OH, WV, e. TN, MO, and n. FL. Spooner (1984) studied infraspecific taxa recognized in G. viscidula and determined that they did not warrant recognition. [= RAB, C, F, G, GW, K, S, W; G. viscidula var. viscidula -- G; G. viscidula var. shortii Pennell -- G, P; G. viscidula var. typica -- P]

Kickxia Dumortier (Fluellen, Cancerwort)

A genus of about 47 species, herbs, of Mediterranean Europe west to c. Asia. References: Sutton (1988)=Z.

1 Leaves triangular-ovate or hastate, truncate at the base; pedicels glabrous through much of their length (typically, but see

1 Leaves round-ovate, rounded to cordate at the base; pedicels villous throughout their length . . . . . . . . . . . . . . . . . K. spuria
* Kickxia elatine (Linnaeus) Dumortier, Sharp-leaved Fluellen. Pd (NC, SC, VA), Mt (NC, VA), Cp (VA) \{GA\}: disturbed areas; uncommon, introduced from Eurasia. May-November. Two subspecies are recognized by Sutton; both may be naturalized in our area. Ssp. elatine has the stems slender (to 1.5 mm thick), sparingly (if at all) branched, pedicels mostly 15-25 mm long, 0.1-0.2 mm in diameter, glabrous except for immediately below the calyx. Ssp. crinita (Mabille) W. Greuter in W. Greuter \& Rech. f. has the stems more robust (usually 1.5-3.5 mm thick), often much-branched, pedicels mostly 5-12 mm long, \(0.25-0.35 \mathrm{~mm}\) in diameter, often villous their entire lengths. [= RAB, C, F, G, K, P, S]
* Kickxia spuria (Linnaeus) Dumortier, Round-leaved Fluellen, Female Fluellen. Cp (NC): disturbed areas; rare, introduced from s. Europe. July. [= RAB, C, F, G, K, P, S; K. spuria ssp. spuria -- Z]

\section*{Leucospora Nuttall (Leucospora)}

A monotypic genus, an herb, of North America. Leucospora may not be distinct from Stemodia.
* Leucospora multifida (Michaux) Nuttall, Leucospora, Narrowleaf Paleseed. Cp (NC), \{GA, VA\}: moist to wet, sandy margins of an artificial depressional wetland; rare (NC Watch List). S. Ontario west to IA and KS, south to nw. GA, AL, LA, and e. TX; scattered occurrences further east (as in e. NC, FL, KY, TN, and se. PA) probably represent recent introductions. [= C, G, GW, K, P, S; Conobea multifida (Michaux) Bentham -- F; Stemodia multifida (Michaux) Sprengel]

\section*{Limnophila R. Brown}

A genus of about 37 species, of tropical regions of the Old World.
* Limnophila sessiliflora (Vahl) Blume. Cp (GA): \{habitat\}; rare. Reported as introduced in sw. GA (Jones \& Coile 1988). [= K]

Limosella Linnaeus (Mudwort, Awl-leaf)
A genus of about 11 species, aquatic herbs, of cosmopolitan distribution.

Limosella australis R. Brown, Mudwort, Awl-leaf. Cp (NC, VA): fresh or slightly brackish tidal flats; rare (NC Rare, VA Rare). June. Newfoundland and Québec south along the Atlantic Coast to se. VA and extreme ne. NC. This plant is very inconspicuous, though locally abundant. [= K; L. subulata Ives -- RAB, C, F, G, GW, P]

Linaria P. Miller (Yellow-toadflax)
(also see Nuttallanthus)
A genus of about 150 species, of temperate regions of Eurasia. References: Sutton (1988)=Z.
* Linaria vulgaris P. Miller, Butter-and-eggs, Yellow Toadflax, Wild-snapdragon. Mt (GA, NC, SC, VA), Pd (GA, NC, VA), Cp (NC, VA): fields, pastures, roadsides, disturbed areas; common (uncommon in Piedmont of NC, rare in Coastal Plain of NC), introduced from Europe. [= RAB, C, F, G, K, P, W, Z; Linaria linaria (Linnaeus) Karsten -- S]
* Linaria maroccana Hooker f., Moroccan Toadflax. Introduced in VA and WV. [= K] \{investigate; not yet keyed; add synonymy\}

A genus of about 80 species, of warm temperate and subtropical regions of the Old and New Worlds. Probably not a member of Plantaginaceae (Albach, Meudt, \& Oxelman 2005). References: Cooperrider \& McCready (1975)=Z; Qualls (1984)=Y.

1 Fertile stamens 4; calyx lobes connate at anthesis for more than \(1 / 2\) their length, later separating; [section Torenioides] . . . . . . ................................................................................................. L. crustacea
1 Fertile stamens 2 (with 2 staminodia without anthers, or with rudimentary anthers); calyx lobes distinct to the base at anthesis and after; [section Brachycarpae].
2 Pedicels shorter than or about as long as the subtending leaves . . . . . . . . . . . . . . . . . . . . . . . . . . L. dubia var. dubia
2 Pedicels longer than the subtending leaves (or bracteal leaves in some species).
3 Leaves nearly orbicular; stems creeping . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . L. grandiflora

3 Leaves distinctly longer than wide; stems erect (sometimes decumbent at the base and rooting if knocked down by water).
4 Leaves not glandular punctate; seeds \(2-3 \times\) as long as wide . . . . . . . . . . . . . . . . . L. dubia var. anagallidea
4 Leaves glandular punctate; seeds ca. \(1 \times\) as long as wide.
5 Leaves primarily in a basal rosette, leaves of the stem strongly reduced upwards to bracts; capsule (1.8-) 3.4-7 mm long; [primarily of seepage of flatrocks] . . . . . . . . . . . . . . . . . . . L. monticola ("monticola" form)

5 Leaves primarily on the stem, not conspicuously reduced upwards; capsule 1.4-3.4 mm long; [of stream or river banks] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . L. monticola ("saxicola" form)
* Lindernia crustacea (Linnaeus) F. Mueller. Cp (GA, SC), Pd (SC), \{NC\}: lawns; uncommon, introduced from Malaysia. September. [= RAB, GW, K, P, Y]

Lindernia dubia (Linnaeus) Pennell var. anagallidea (Michaux) Cooperrider. Cp, Pd, Mt (GA, NC, SC, VA): wet sandy or muddy areas; common (rare in Mountains). June-September. Nearly throughout North America, Central America, and South America. The extensive and essentially coincident ranges of the two varieties of \(L\). dubia suggests that they may be merely forms, as suggested by Voss (1996). [= C, K, Y, Z; L. anagallidea (Michaux) Pennell -- RAB, F, G, GW, P; Ilysanthes inequalis (Walter) Pennell -- S; L. dubia -- W, infraspecific taxa not distinguished]

Lindernia dubia (Linnaeus) Pennell var. dubia. Cp, Pd, Mt (GA, NC, SC, VA): wet sandy or muddy areas; common. MayNovember. Nearly throughout North America, Central America, and South America. [=C, Y, Z; L. dubia (Linnaeus) Pennell -- RAB, GW, in a narrow sense; L. dubia var. dubia -- F, G, K, in the narrow sense; L. dubia var. riparia (Rafinesque) Fernald -- F, G; L. dubia var. inundata Pennell -- F, G, K; L. dubia var. major (Pursh) Pennell -- P; L. dubia var. typica -- P; Ilysanthes dubia (Linnaeus) Barnhart -- S; L. dubia -- W, infraspecific taxa not distinguished; Gratiola dubia Linnaeus]

Lindernia grandiflora Nuttall. Cp (GA): depressional wetlands; rare. S. GA south to s. FL. [= GW, K, P, Y; llysanthes grandiflora (Nuttall) Bentham -- S]

Lindernia monticola Muhlenberg ex Nuttall, Flatrock Pimpernel, Riverbank Pimpernel. Pd, Mt (GA, NC, SC), Cp (GA): in seasonal seepage on granitic flatrocks, and on river-scoured siliceous rocks; rare (GA Endangered - "saxicola", NC Watch List). April-June (-September). Nc. and sw. NC south to ne. FL and ec. AL. L. saxicola appears to be merely a form of L. monticola, the leafy stems the result of the basal leaves being covered by silt deposited by floodwaters (Qualls 1984); this needs additional study. [= RAB, GW, K, P, W, Y; L. saxicola M.A. Curtis -- RAB, P, W, Y; Ilysanthes monticola (Muhlenberg ex Nuttall) Rafinesque -- S; llysanthes saxicola (M.A. Curtis) Chapman -- S]

Lindernia diffusa (Linnaeus) Wettstein, in SC (Kartesz 1999). \{investigate\} [=K] \{not yet keyed\}

Mecardonia Ruiz \& Pavón (Mecardonia)
A genus of about 10 species, of tropical, subtropical, and warm temperate regions of America.
1 Peduncles more than 10 mm long; sepals less than 2 mm wide . . . . . . . . . . . . . . . . . . . . . . M. acuminata var. acuminata
1 Peduncles to 10 mm long; sepals more than 2 mm wide . . . . . . . . . . . . . . . . . . . . . . . . . [M. acuminata var. microphylla]
Mecardonia acuminata (Walter) Small var. acuminata, Mecardonia. Cp, Pd (GA, NC, SC, VA), Mt (GA): marshes, ditches, bottomland forests, wet disturbed areas; common. July-September; August-October. DE and MD south to s. FL, west to e. TX, north in the interior to KY, TN, and MO. The long, ascending pedicels are distinctive. The plant blackens on drying. \([=K, S ; M\). acuminata -- RAB, C, G, GW, infraspecific taxa not distinguished; Bacopa acuminata (Walter) B.L. Robinson -- F; Pagesia acuminata (Walter) Pennell ssp. typica -- P]

Mecardonia acuminata (Walter) Small var. microphylla (Rafinesque) Pennell. Cp (GA): margins of Coastal Plain ponds; rare (GA Special Concern). Sc. GA south to panhandle FL and west to e. LA. [= K, S; M. acuminata -- GW, infraspecific taxa not distinguished; Pagesia acuminata (Walter) Pennell ssp. microphylla (Rafinesque) Pennell -- P]

\section*{Misopates Rafinesque (Weasel's-snout)}

A genus of about 8 species, herbs, of Mediterranean Europe and \(n\). Africa west to c. Asia.
* Misopates orontium (Linnaeus) Rafinesque, Weasel's-snout, Lesser Snapdragon. Pd (VA): cultivated, persistent or possibly naturalized; rare, introduced from Eurasia. [= K; Antirrhinum orontium Linnaeus -- C, G]

\title{
Flora of the Carolinas, Virginia, and Georgia, Working Draft of 10 June 2005 -- PLANTAGINACEAE
}

\section*{Nuttallanthus D.A. Sutton (American-toadflax)}

A genus of 4 species, herbs, of North and South America. Sutton (1988) separates these three species, along with N. subandinus (Diels) D.A. Sutton, of Bolivia, Chile, Ecuador, Peru, and Uruguay, from Linaria on the basis of "the corolla with the abaxial lip greatly exceeding the adaxial lip; the palate weakly developed and scarcely occluding the tube; the spur very slender or absent and the prismatic seeds with 4-7 longitudinal ridges." Nuttalanthus is American; Linaria is Eurasian. References: Sutton (1988)=Z. Key based on \(Z\).

1 Infructescence axis zigzag; fruiting pedicels densely glandular pubescent, 5-13 mm long, \(2 \times\) or more as long as the calyx
N. floridanus

1 Infructescence axis straight or nearly so; fruiting pedicels glabrous or with a few scattered glandular hairs, 2-6 (-9) mm long, less than \(1 \times\) as long as the calyx.
2 Corolla 8-11 (-13) mm long (measured from the tip of the spur to the apex of the adaxial lip), the abaxial lip 2-6 mm long; seeds longitudinally ridged, the intervening faces smooth or with sparse low tubercles . . . . . . . . . . . . . N. canadensis
2 Corolla 14-22 mm long (measured from the tip of the spur to the apex of the adaxial lip), the abaxial lip 6-11 mm long; seeds densely tuberculate, not longitudinally ridged . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . N. texanus

Nuttallanthus canadensis (Linnaeus) D.A. Sutton, Common Toadflax. Cp, Pd, Mt (GA, NC, SC, VA): in a wide variety of natural and disturbed habitats, especially common and weedy in disturbed sites such as roadsides and fields, also common and apparently native in thin soil of rock outcrops; common. March-May. Sutton (1988) comments that there is substantial variation in this species not taxonomically explained. [=K, Z; Linaria canadensis (Linnaeus) Dumortier -- RAB, W, in part (also see N. texanus); Linaria canadensis var. canadensis -- C, F, G, S; Linaria canadensis (Linnaeus) Dumortier -- P, in the narrow sense]

Nuttallanthus floridanus (Chapman) D.A. Sutton, Florida Toadflax. Cp (GA): dry, sandy places; uncommon. E. GA south to FL and west to MS. [= K, Z; Linaria floridana Chapman -- P, S]
* Nuttallanthus texanus (Scheele) D.A. Sutton, Texas Toadflax. Cp (GA, NC, SC, VA), Pd (NC, SC): disturbed soils of roadsides and fields; uncommon, introduced from further southwest. March-May. Ranging as a native species in sc. and sw. North America and in temperate South America; introduced elsewhere (as in our area). [=K, Z; Linaria canadensis (Linnaeus) Dumortier -- RAB, W, in part; Linaria canadensis var. texana (Scheele) Pennell -- C, F, G, S; Linaria texana Scheele -- P]

\section*{Penstemon Schmidel (Beard-tongue, Penstemon)}

A genus of about 250 species, perennila herbs and shrubs, of w. North America, e. North America, and (a single species) ne. Asia. References: Clements, Baskin, \& Baskin (1998)=Z. Key based in part on Z.

1 Cauline leaves bipinnatifid; basal leaves sessile; [section Dissecti] . . . . . . . . . . . . . . . . . . . . . . ............. P. dissectus
1 Cauline leaves entire or toothed; basal leaves petioled.
2 Inflorescence with many nodes; anther cells dehiscing by short proximal slits; [section Multiflori] . . . . . . . . P. multiflorus
2 Inflorescence with<10 nodes; anther cells dehiscing their entire length.
\(3 \quad\) Corolla glandular-pubescent within; [section Tubiflori] . . . . . . . . . . . .
4 Throat of corolla more-or-less closed by a palate formed by the upward arch of the corolla lip.
5 Buds yellow-purple; corolla violet-purple with white lobes (fading white when dried); leaves essentially glabrous . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. hirsutus
5 Buds yellow; corolla creamy white; leaves pubescent . . . . . . . . . . . . . . . . . . . . . . . . . . . [P. tenuiflorus]
4 Throat of corolla open.
6 Corolla differentiated (above the calyx) into a basal tube and a dilated or inflated throat, with little ridging of the floor; anterior lobes of the corolla essentially equalling the posterior lobes.
7 Corolla white, lined with purple.
8 Stems pubescent; inflorescence glabrous or slightly glandular-pubescent . . . . . [P. alluviorum]
8 Stems glabrous; inflorescence glandular-pubescent . . . . . . . . . . . . . . . . . . . . . . . . . P. digitalis 7 Corolla purple to violet.

9 Sepals long-attenuate, to 12 mm long; leaves finely serrate; corolla 20-35 mm long P. calycosus

9 Sepals less than 8 mm long; leaves obscurely serrate; corolla lobes strongly deflexed; corolla
15-22 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. Iaevigatus
6 Corolla only gradually and slightly dilated upwards, the floor strongly ridged; anterior lobes of the corolla projecting beyond the posterior lobes.
10 Peduncles strongly ascending, the inflorescence therefore narrow; corolla reddish-purple \(\boldsymbol{P}\). australis 10 Peduncles spreading, the inflorescence therefore relatively broad; corolla white to violet or purple.

11 Leaves velvety pubescent; corolla white with fine purple lines . . . . . . . . . . . . . . . P. pallidus 11 Leaves pubescent, but not velvety; corolla violet or purple.

12 Basal leaves truncate or cordate at base; lower bracts of inflorescence foliose, slightly smaller than the cauline leaves . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. smallii 12 Basal leaves cuneate at base; lower bracts of inflorescence reduced, much smaller than

\section*{Flora of the Carolinas, Virginia, and Georgia, Working Draft of 10 June 2005 -- PLANTAGINACEAE}
the cauline leaves.
13 Cauline leaf blades wide, ovate-lanceolate to ovate . . . . . . . . . . . . . . P. canescens
13 Cauline leaf blades narrow, acute to acuminate . . . . . . . . . . . . . . . . . . . P. Iaxiflorus
Penstemon australis Small, Southern Beardtongue, Sandhill Beardtongue. Cp (GA, NC, SC, VA), Pd (GA, NC, SC), Mt (GA, SC): sandhills, dry sandy roadsides; common. May-July; July-August. Se. VA south to FL, west to AL, primarily on the Coastal Plain, but not uncommon westwards into the Piedmont and lower Mountains, and extending in the interior into c. TN. [=K, P, S, Z; \(P\). australis -- RAB , C, F, G, W, in a broader sense]

Penstemon calycosus Small. Mt (GA, NC, SC, VA): limestone ledges, other woodlands; rare (GA Special Concern). MayJuly. OH and s. MI and IL south to w. VA, GA, and AL. [= F, G, GW, K, P, S, W, Z; P. laevigatus -- C, in part]

Penstemon canescens (Britton) Britton, Appalachian Beardtongue. Mt, Pd (GA, NC, SC, VA), Cp (VA): woodlands, glades, forest edges, roadsides; common. May-July. PA and s. IN south to nc. GA, n. AL, and c. TN. [= RAB, C, K, W, Z; >P. canescens F, G, S; > P. canescens var. typicus -- P; >P. canescens var. brittonorum (Pennell) Pennell -- P; > P. brittonorum Pennell -- S; > P. brevisepalus Pennell -- F, G, P, S]
*? Penstemon digitalis Nuttall ex Sims, Tall White Beardtongue. Mt (NC, SC, VA), Pd, Cp (VA): alluvial forests, moist fields, disturbed areas; common. May-June; July-August. Nova Scotia and ME west to MN and SD, south to e. VA, w. SC, AL, and TX. [= RAB, C, F, G, GW, K, P, S, W, Z]

Penstemon dissectus Elliott, Georgia Beardtongue, Grit Beardtongue. Cp (GA): Altamaha Grit outcrops, sandhills; rare (GA Rare). Endemic to Altamaha Grit outcrops and other sandy areas from e. GA south and west to sw. GA. This species is unmistakable because of its bipinnatifid leaves. [= K, P, S, Z]

Penstemon hirsutus (Linnaeus) Willdenow, Northeastern Beardtongue. Pd, Mt (VA): dry woodlands, forests, and fields; uncommon. May-July. Québec and ME west to MI and WI, south to VA and KY. [= C, F, G, K, P, S, W, Z]

Penstemon laevigatus Aiton, Eastern Beardtongue. Cp, Pd, Mt (GA, NC, SC, VA): low meadows, bottomlands, forest edges; common. May-June; July-August. ME west to MI, south to s. GA, MS, and AR. [= RAB, F, G, GW, K, P, W, Z; P. laevigatus -- C, in part only (also see \(P\). calycosus); P. pentstemon (Linnaeus) MacM. -- S]

Penstemon laxiflorus Pennell. \(\{\mathrm{GA}\}\) : \{habitat \(\}\). C. GA and n . AL west to c. OK and c. TX. [=K, P, Z; P. australis -- S , in part; \(P\). australis Small ssp. laxiflorus (Pennell) Bennett]

Penstemon multiflorus Chapman ex Bentham. Cp (GA): \{habitat\}; uncommon. S. and e. GA south to FL. [=K, P, S, Z]
Penstemon pallidus Small, Eastern White Beardtongue. Cp (GA, NC, VA), Pd, Mt (GA, VA): limestone and shale barrens, other dry, disturbed areas; uncommon (GA Special Concern). May-June. ME west to MN, south to NC, GA, and AR. [= RAB, C, F, G, K, P, S, W, Z]

Penstemon smallii A. Heller, Blue Ridge Beardtongue. Mt (GA, NC, SC): woodlands, cliffs, glades, roadbanks; common (GA Special Concern). May-June; July. A Southern Appalachian endemic, distributed from nw. NC and ne. TN south to nw. SC, n. GA, and \(n\). AL. [= RAB, \(K, P, S, W, Z]\)

Penstemon alluviorum Pennell, Lowland Beardtongue. East to AL, TN, KY. [= C, F, G, K, P, S, Z] \{add synonymy\}
Penstemon tenuiflorus Pennell, Plateau Beardtongue, Limestone Beardtongue, Kentucky Beardtongue. Endemic to the Interior Low Plateau of wc. KY, c. TN, n. AL, extending slightly into the Coastal Plain to the west, and disjunct in the Black Belt of AL and MS. [= C, F, G, K, P, S, Z]

Penstemon tubiflorus Nuttall, Tube Beardtongue. A more western species, reaching its eastern limit in w. TN (Chester, Woffor, \& Kral 1997). It is also known from adventive sites further east, as in e. PA (Rhoads \& Klein 1993). [=S; P. tubaeflorus -- C, F, G, P, Z, orthographic variant; P. tubiflorus var. achoreus Fernald - K; P. tubiflorus var. tubiflorus - K]

\section*{Plantago Linnaeus (Plantain)}

A genus of about 270 species, herbs and rarely shrubs, of cosmopolitan distribution. Harper (1944) discusses at length the interesting issue of the native distributions of the many weedy species of Plantago. The native or introduced status of many of our species is uncertain or controversial. References: Rosatti (1984)=Z; Bassett (1966) \(=Y\); Bassett (1967)=X; Schwarzbach in Kadereit (2004).

\footnotetext{
1 Leaves cauline, opposite; spikes on peduncles from the leaf axils; [section Psyllium]
P. psyllium

1 Leaves basal; spikes on scapes from the base of the plant.
2 Leaves ovate to broadly lanceolate or broadly oblanceolate, distinctly broadened upwards from a petiolar base, the leaves more than 1 cm wide (some species keyed both ways).
3 Leaf venation pinnate, some major veins departing from the midvein well above the leaf base; perennial from thick, fleshy rootstock, typically \(3-8 \mathrm{~cm}\) wide near its summit, with a cavity below (like an inverted bowl), and with 3-10 fleshy roots \(3-15 \mathrm{~mm}\) thick descending or spreading from the bowl rim; capsule 2-4-seeded; scapes hollow and terete; [aquatic or semi-aquatic]; [section Palaeopsyllium]
P. cordata

3 Leaf venation parallel, with all of the major veins separating at the base of the leaf; either perennial from thin, fibrous roots or an erect caudex, or annual from a small taproot; capsule 2-30-seeded; scapes either solid and terete, solid and angled, or hollow and terete; [terrestrial].
4 Leaves broadly ovate-elliptic, the blades \(1-3 \times\) as long as wide, distinctly petiolate; scapes solid and terete; [section Plantago].
5 Fruit 2.5-4 mm long, dehiscent near the middle, the terminal portion about as long as the basal; sepals broadly ovate, ca. \(1.5 \times\) as long as wide, mostly obtuse; petioles usually green and pubescent at the base
}

5 Fruit 4-6 mm long, dehiscent below the middle, the terminal portion about \(2 \times\) as long as the basal; sepals narrowly elliptic, \(2-4 \times\) as long as wide, mostly acute; petioles usually purple and glabrous at the base...

\section*{P. rugelii}

4 Leaves mostly broadly oblanceolate, broadly lanceolate, or spatulate, (3-) 4-10× as long as wide, attenuate to the only somewhat petiolar base; scapes solid and 5 -angled, or hollow (to solid) and terete.
6 Bracts and calyx pubescent, at least on the keels; ephemeral annual, flowering late March-June, and then senescing; [section Virginica]
\(P\). virginica
\(6 \quad\) Bracts and calyx glabrous; perennial, flowering April-November.
7 Spikes very densely flowered, the rachis hidden; scape 5 -angled; [widespread weedy alien]; [section Lancifolia]
P. lanceolata
\(7 \quad\) Spikes loosely flowered, the rachis visible its entire length; scape terete; [rare native of Coastal Plain pinelands and adjacent fire-plow lines and ditches]; [section Palaeopsyllium]
P. sparsiflora

2 Leaves lanceolate or linear, slightly if at all broadened upward, the base not petiolar, the leaves typically less than 1 cm wide.
8 Summer and winter leaves dimorphic, the winter leaves lanceolate (typically submersed), the summer leaves ovate or cordate (emersed except in floods); plant perennial from thick, fleshy rootstock, typically \(3-8 \mathrm{~cm}\) wide near its summit, with a cavity below (like an inverted bowl), and with 3-10 fleshy roots \(3-15 \mathrm{~mm}\) thick descending or spreading from the bowl rim; [aquatic or semi-aquatic]; [section Palaeopsyllium] . . . . . . . . . . . . . . . . . . P. cordata
8 Summer and winter leaves not dimorphic, all leaves lanceolate or linear; plant either perennial from thin, fibrous roots, or annual from a small taproot; [terrestrial].
9 Leaves fleshy; corolla tube pubescent on its outer surface; [of sea beaches] . . . . . P. maritima var. juncoides
9 Leaves herbaceous (though often rather thick and leathery); corolla tube glabrous on its outer surface; [of various habitats, not as above].
10 Bracts of the inflorescence and sepals conspicuously pubescent; annual (rarely biennial), with a taproot; stamens 4.
11 Leaves oblanceolate; [section Virginica] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. virginica
11 Leaves linear; [section Gnaphaloides].
12 Bracts of the lower flowers in the spikes conspicuously exserted, at least \(2 \times\) as long as the subtended flower.
13 Leaves glabrous or puberulent above; longer bracts \(8-30 \mathrm{~mm}\) long; seeds 2.2-3.0 mm long
 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. patagonica
12 Bracts of the lower flowers in the spikes not conspicuously exserted, less than \(2 \times\) as long as the subtended flower.
14 Bracts \(1-2 \times\) as long as the the calyx; seeds \(1.3-1.9 \mathrm{~mm}\) long . . . . . . . . . . . P. patagonica
14 Bracts \(0.5-1 \times\) as long as the calyx; seeds \(2.7-3 \mathrm{~mm}\) long . . . . . . . . . . . . . . P. wrightiana
10 Bracts of the inflorescence glabrous or inconspicuously ciliate-margined; stamens 2 or 4; [annual or perennial].
15 Annual; flowers with 2 stamens; capsule 4-25-seeded; leaves linear, 0.5-5 mm wide; [section Micropsyllium].
16 Capsule mostly 10-25-seeded; seeds \(0.5-0.8 \mathrm{~mm}\) long . . . . . . . . . . . . . . . . . . P. heterophylla
16 Capsule 4 -seeded; seeds \(0.75-1.8 \mathrm{~mm}\) long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. pusilla
15 Perennial; flowers with 4 stamens; capsule 1-2-seeded; leaves lanceolate (or broader), 7-50 mm wide.
17 Spikes very densely flowered, the rachis hidden; scape 5 -angled; [widespread weedy alien]; [section Lancifolia]
P. lanceolata

17 Spikes loosely flowered, the rachis visible its entire length; scape terete; [rare native of Coastal Plain pinelands and adjacent fire-plow lines and ditches]; [section Palaeopsyllium]
P. sparsiflora
* Plantago aristata Michaux, Buckhorn Plantain. Cp, Pd, Mt (GA, NC, SC, VA): disturbed areas, especially dry, barren, exposed soil, such as clay soils denuded by bull-dozing; common, introduced from farther west. Late April-July. [= RAB, C, F, G, K, S, W, Z]

Plantago cordata Lamarck, King-root, Heartleaf Plantain. Pd (NC), Mt (GA, VA), Cp (VA): aquatic or semi-aquatic in streambeds with outcrops of slate, aquatic in tidal estuaries; rare (NC Endangered, VA Rare). March-April; May-June. NY and s. Ontario west to WI, south to w. VA, c. NC, nw. GA, AL, sc. TN, and MO, very scattered and rare in every state in which it occurs, except MO. Characteristically, \(P\). cordata is a very robust plant, the inflorescences often 1 meter in height, and the glabrous leaves with ovate blades to 30 cm long and 20 cm wide, on ascending petioles up to 40 cm long and 2 cm wide; Winter leaves are \(3-10 \mathrm{~cm}\) long, ca. 1 cm wide, and remotely toothed. Spring leaves show a gradual transition from the winter form to the summer form. \(P\). cordata is not known to be extant in VA, where it formerly occurred in the estuary of the Potomac River and in Smyth County in sw. VA. In NC, P. cordata is apparently limited to 2 slate-bottomed streams in s. Davidson County, where it is locally abundant. A recent study of morphological and genetic variability in the species found the 2 NC populations to "represent sites of primary [conservation] concern with unique genetic composition" (Mymudes \& Les 1993). [= RAB, C, F, G, GW, K, S, W, X, Z]

Plantago heterophylla Nuttall, Many-seeded Plantain. Cp (GA, NC, SC, VA), Pd (GA, NC, SC): fields, roadsides, disturbed
areas; common (VA Watch List). March-May. Se. VA and MO south to FL and TX; adventive at scattered sites further north (at least as far north as NY). [= RAB, C, F, G, K, S, W, Y, Z; P. hybrida W. Bart. -- GW]
* Plantago lanceolata Linnaeus, English Plantain, Rib-grass. Cp, Pd, Mt (GA, NC, SC, VA): lawns, roadsides, disturbed areas; common, introduced from Europe. April-November. [= RAB, C, F, G, K, S, W, Z; P. lanceolata var. sphaerostachya Mertens \& Koch -- F, G; P. lanceolata var. angustifolia Poiret -- G]

Plantago major Linnaeus, Common Plantain, Whiteman's-foot. Cp (GA, NC, SC, VA), Pd, Mt (GA, NC, VA): lawns, roadsides, disturbed areas; uncommon, introduced from Europe, possibly also native in ne. North America, possibly as far south as the northern part of our area. June-November. Very variable, and possibly worthy of some of the infraspecific subdivisions suggested by various authors. The Coastal Plain populations associated with the Chesapeake Bay in VA may represent a native, estuarine genotype. [= RAB, C, F, GW, K, S, W, Z; P. major var. major -- F; P. major var. scopulorum Fries \& Broberg -- F; P. major ssp. pleiosperma Pilger var. paludosa Béguinot -- G; P. major ssp. pleiosperma Pilger var. scopulorum Fries \& Broberg -- G; P. major var. intermedia (Augustin de Candolle) Pilger]

Plantago maritima Linnaeus var. juncoides (Lamarck) A. Gray, Seaside Plantain. Cp (VA): salt marshes; rare (VA Rare). Var. juncoides apparently ranges from Greenland and ne. Canada south to e. VA. Other varieties occur in nw. North America and \(n\). Eurasia, the species as a whole is an interruptedly circumboreal plant of ocean shores, also disjunct inland in saline areas. [=K; \(P\). maritima ssp. juncoides (Lamarck) Hultén -- C; P. juncoides Lamarck var. decipiens (Barnéoud) Fernald -- F; P. maritima -- G, infraspecific taxa not distinguished]
* Plantago patagonica Jacquin, Woolly Plantain. Pd (GA, SC), Cp (GA): roadsides; rare. United States and s. South America. May-June. [= C, G, K, Z; P. purshii Roemer \& Schultes -- RAB, F; P. patagonica var. gnaphaloides (Nuttall) A. Gray -- C, G]
* Plantago psyllium Linnaeus, Leafy-stemmed Plantain. Cp, Mt (NC, VA): disturbed areas; rare, inroduced from Europe. June-November. [= C, K, Z; P. psillium -- RAB, orthographic variant; P. indica Linnaeus -- F, G; P. arenaria Waldstein \& Kitaibel] * Plantago pusilla Nuttall, Little Plantain. Cp (NC), Pd (VA) \{GA, SC\}: roadsides, disturbed areas; uncommon, probably introduced from sc. United States (the original range uncertain). March-May. Belden et al. (2004) discuss the Virginia occurrence, on Fort Pickett Military Reservation, Nottoway County. [= C, F, G, K, S, Y, Z; P. pusilla var. major Engelmann -- F, G; P. elongata -GW, in part]

Plantago rugelii Decaisne, American Plantain, Broad-leaved Plantain. Cp, Pd, Mt (GA, NC, SC, VA): roadsides, lawns, disturbed areas; common. June-November. Widespread in e. and c. North America, the original distribution obscure. [= RAB, C, F, G, GW, S, W, Z; P. rugelii var. rugelii -- K; P. rugelii var. asperula Farwell - K]

Plantago sparsiflora Michaux, Pineland Plantain. Cp (GA, NC, SC): wet savannas over calcareous substrates (coquina limestone), now usually found in moister human-created microhabitats adjacent to these sites, such as fire-plow lines, shallow ditches along roadsides, or mowed powerline rights-of-way; rare (US Species of Concern, GA Special Concern, NC Endangered, SC Rare). April-October. Se. NC south to ne. FL, restricted to the Coastal Plain. Harper (1944), with his usual keen understanding of the ecology of southeastern plants, has provided the most succinct and accurate description of the habitat of this plant: "flattish pine-barrens where there is evidently some calcareous material not far from the surface." [= RAB, GW, K, S, X, Z]

Plantago virginica Linnaeus, Virginia Plantain. Cp, Pd, Mt (GA, NC, SC, VA): roadsides, lawns, disturbed areas; common. Late March-June. MA and NY west to SD, south to FL and TX. [= RAB, C, G, K, S, W, Z; P. virginica var. virginica - F; P. virginica var. viridescens Fernald -- F]

Plantago wrightiana Decaisne, Wright's Plantain. Cp (GA, NC, SC), Pd (GA, NC, SC, VA): roadsides, lawns, disturbed areas; common (uncommon in NC). Late April-July. NC, OK, and AZ south to GA, AL, MS, TX, and Mexico, the original distribution unclear. \{The VA distribution is verified by a specimen at NCU\}. [=K, Z; P. hookeriana Fischer \& C.A. Meyer var. nuda (A. Gray) Poe -- RAB, W]

Plantago rhodosperma Dcne., Redseed Plantain, east to KY, TN, and GA. [= C, K] \{not yet keyed; add synonymy\}

\section*{Scoparia Linnaeus (Goat-weed, Sweet-broom)}

A genus of about 20 species, herbs, of tropical and subtropical America.
1 Corolla white; sepals 4, ovate; stem 3-8 dm tall; annual ............................................................... S. dulcis
1 Corolla yellow; sepals 5, lanceolate; stem 1-1.5 dm tall; perennial ................ S. montevidensis var. glandulifera
Scoparia dulcis Linnaeus, Goat-weed, Sweet-broom. Cp (GA, SC): disturbed places; uncommon, rather weedy and the original distribution unclear. May-October. [= RAB, GW, K, P, S]
* Scoparia montevidensis (Sprengel) R.E. Fries var. glandulifera (Fritsch) R.E. Fries. Cp (NC): on ballast; rare, introduced from South America, probably no longer present. [= K, P]

\section*{Sophronanthe Bentham}

The two taxa included here are not part of Gratiola; it remains to be determined whether Tragiola Small \& Pennell should be recognized as distinct from Sophronanthe (Estes, pers. comm. 2004).

\footnotetext{
1 Leaves linear-subulate; corolla \(2-3 \times\) as long as the calyx
S. hispida

1 Leaves ovate; corolla 1-1.5 \(\times\) as long as the calyx
S. pilosa
}

Sophronanthe hispida Bentham ex Lindley. Cp (GA): \{habitat\}; uncommon. E. GA (within a few counties of SC) south to s. FL, and west to MS. [= P, S; = Gratiola hispida (Bentham ex Lindley) Pollard -- GW, K]

Sophronanthe pilosa (Michaux) Small. Cp, Pd (GA, NC, SC, VA), Mt (GA, NC, SC): marshes, wet areas, wet pine savannas; common (rare in Mountains). June-September. NJ south to s. FL, west to e. TX, northwards in the interior to KY, TN, AR, and e. OK. [= S; Gratiola pilosa Michaux= RAB, C, F, G, GW, K, W; Tragiola pilosa (Michaux) Small \& Pennell var. typica -- P; = Tragiola pilosa (Michaux) Small \& Pennell - S]

\section*{Veronica Linnaeus (Speedwell)}

A genus of about 180 species, herbs, nearly cosmopolitan (at least now), most diverse in Europe. The genus appears to be paraphyletic as currently circumscribed (Albach \& Chase 2001). References: Walters \& Webb (1972)=Z. Key partly based on C.
* Veronica agrestis Linnaeus, Field Speedwell. (GA, NC?, VA). [= RAB, C, F, K, P, Z]

Veronica americana Schweinitz ex Bentham, American Speedwell. (NC, SC, VA). [= RAB, C, F, K, P]
Veronica anagallis-aquatica Linnaeus, Water Speedwell. (NC, VA). \{Consider whether C. comata / V. connata / V. catenata should be distinguished\} [= RAB, C, F, K, P, Z; V. comosa Richter - F; V. connata Rafinesque var. typica -- P; V. glandifera Pennell -- P; V. catenata Pennell - P, Z]
* Veronica arvensis Linnaeus, Corn Speedwell, Wall Speedwell. (GA, NC, SC, VA). [= RAB, C, F, K, P, Z]
* Veronica beccabunga Linnaeus, European Brooklime. (VA?). South to MD, WV, and perhaps VA. [= C, F, K, P, Z]
* Veronica chamaedrys Linnaeus, Germander Speedwell. (NC, VA). [= RAB, C, F, K, P; V. chamaedrys ssp.chamaedrys - Z]
* Veronica hederifolia Linnaeus, Ivyleaf Speedwell. (GA, NC, SC, VA). [= K; V. hederaefolia -- RAB, C, F, P, orthographic variant; V. hederifolia ssp. hederifolia -Z]
* Veronica officinalis Linnaeus, Common Speedwell. (GA, NC, SC, VA). [= RAB, C, P, Z; V. officinalis var. officinalis - F, K; V. officinalis var. tournefortii (Vill.) Reichenbach - K]

Veronica peregrina Linnaeus var. peregrina, Common Purslane Speedwell. (GA, NC, SC, VA). [=C, F; V. peregrina ssp. peregrina -- K; V. peregrina -- RAB, Z, infraspecific taxa not distinguished; V. peregrina var. typica -- P]

Veronica peregrina Linnaeus var. xalapensis (Kunth) Pennell, Western Purslane Speedwell. (GA, NC, SC, VA). [= C, F, P; V. peregrina ssp. xalapensis (Kunth) Pennell -- K; V. peregrina -- RAB, Z, infraspecific taxa not distinguished] * Veronica persica Poiret, Bird's-eye Speedwell. (GA, NC, SC, VA) [= RAB, C, F, K, P, Z]
* Veronica polita Fries. (NC, VA). This species is introduced in c. TN (Chester, Wofford, \& Kral 1997), WV, and s. PA (Rhoads \& Klein 1993), FL (Pennell 1935), NC, and VA (Kartesz 1999). It is similar to V. agrestis and has been much confused with it. [= C, F, K, Z; V. didyma Tenore -- P]

Veronica scutellata Linnaeus, Narrowleaf Speedwell. (NC, VA). Ne. TN (Chester, Wofford, \& Kral 1997). [= C, K, P, Z; V. scutellata var. scutellata -- F]
* Veronica serpyllifolia Linnaeus var. serpyllifolia, Thymeleaf Speedwell. (GA, NC, SC, VA). [=C; V. serpyllifolia ssp. serpyllifolia -- K, Z; V. serpyllifolia -- RAB, F, infraspecific taxa not distinguished; V. serpyllifolia -- P , in the narrow sense] * Veronica triphyllos Linnaeus. Pd (NC) (SC). [specimen for NC at NCU] [= RAB, K]
* Veronica austriaca Linnaeus ssp. teucrium (Linnaeus) D.A. Webb, is naturalized at scattered locations in PA (Rhoads \& Klein 1993) and MD (Kartesz 1999). [= K, Z; V. latifolia Linnaeus -- F, P, nomen ambiguum]
* Veronica dillenii Crantz. (VA). [= Z; V. verna, in a broad sense] \{add synonymy\}
* Veronica filiformis J.E. Smith, Creeping Speedwell, in WV, MD, and scattered in PA (Rhoads \& Klein 1993). [= C, F, K, Z] * Veronica longifolia Linnaeus, Longleaf Speedwell, occurs in WV, scattered in PA (Rhoads \& Klein 1993), KY, and in MD (F). [= C, F, K, P, Z]

Veronica serpyllifolia Linnaeus var. humifusa (Dickson) Vahl, may range south to MD (Pennell 1935, Kartesz 1999). [= C; V. serpyllifolia ssp. humifusa (Dickson) Syme -- K, Z; V. humifusa Dickson -- P]

\section*{Veronicastrum Heister ex Fabricius (Culver's-root)}

A genus of 2 species, herbs, of e. North America and e. Asia.
Veronicastrum virginicum (Linnaeus) Farwell, Culver's-root. Mt (GA, NC, VA), Pd (GA, NC, SC, VA): streambanks, bogs, wet meadows, dryish soils in areas with prairie affinities; uncommon (NC Watch List, SC Rare). July-August. VT west to Manitoba, south to nc. and nw. GA, w. FL Panhandle, and LA. Populations seem to be of somewhat sporadic or irregular appearance from year to year. [= RAB, C, F, G, GW, K, P, S, W]

PLATANACEAE Dumortier 1829 (Plane-tree Family)
A family of a single genus and about 7 species (and several addional infrataxa), trees, of North America south to Central America and w. Asia to se. Asia. Probably with a close relationship to the Proteaceae, and perhaps best included there (Angiosperm Phylogeny Group 1998, 2003). References: Kaul in FNA (1997); Kubitzki in Kubitzki, Rohwer, \& Bittrich (1993).

\section*{Flora of the Carolinas, Virginia, and Georgia, Working Draft of June 10, 2005 -- PLUMBAGINACEAE}

Platanus Linnaeus 1753 (Plane-tree, Sycamore)
A genus of about 7 species (and several additional infrataxa), trees, of North America south to Central America and w. Asia to se. Asia. References: Kaul in FNA (1997); Nixon \& Poole (2003)=Z; Kubitzki in Kubitzki, Rohwer, \& Bittrich (1993).

Identification notes: The exposed white inner bark on the middle and upper trunks make Platanus recognizable at long distances, especially in winter.

Platanus occidentalis Linnaeus var. occidentalis, Sycamore, Plane-tree. Pd, Mt, Cp (GA, NC, SC, VA): riverbanks and alluvial forests, streambanks, sometimes weedy on rocky roadcuts; common (in the Mountains present only along the larger rivers, except in the Ridge and Valley of VA, uncommon in the Coastal Plain except along brownwater rivers). April-May; SeptemberNovember. Var. occidentalis ranges from s. ME west to s. Ontario, MI, and MN, south to w. FL and TX; var. palmeri (Kuntze) Nixon \& Poole ex Geerinck occurs from central TX south into Coahuila. One of the largest trees in e. North America, and probably the largest that is widespread in the Piedmont of our area. [ \(=\mathrm{Z} ;<\operatorname{P}\). occidentalis -- RAB, C, FNA, G, GW, K, S, W; > P. occidentalis var. occidentalis - F; > P. occidentalis var. glabrata (Fernald) Sargent -- F]

\section*{PLUMBAGINACEAE (Leadwort Family)}

A family of about 24-27 genera and 650-775 species, shrubs, vines, and herbs, of cosmopolitan distribution. Lledó et al. (1998) and other authors suggest that the portion of the Plumbaginaceae often recognized as tribe Staticeae or subfamily Staticoideae (which includes Limonium) would be better treated as a distinct family. References: Morin in FNA (2005); Lledó et al. (1998); Kubitzki in Kubitzki, Rohwer, \& Bittrich (1993).

Limonium P. Miller (Sea-lavender)
A genus of about 350 species, dwarf shrubs, perennial, and annual herbs, of cosmopolitan distribution. References: Luteyn (1976) \(=\) Z; Smith in FNA (2005); Kubitzki in Kubitzki, Rohwer, \& Bittrich (1993).

Limonium carolinianum (Walter) Britton, Carolina Sea-lavender. Cp (GA, NC, SC, VA): tidal marshes, especially in hypersaline flats; common. August-October. Along the coast from Labrador south to FL, west to TX and ne. Mexico. Various treatments recognize from 1 to 4 taxa in our area. The most recent monographer, Luteyn (1976), recognizes only a polymorphic \(L\). carolinianum -- a treatment followed by most flora authors since. Godfrey \& Wooten (1981) follow Luteyn's treatment, but state "we are not at all confident that Luteyn's treatment is a reasonable one." [= C, FNA, GW, K, Z; > L. carolinianum var. carolinianum -RAB, G ; > L. carolinianum var. obtusilobum (Blake) Ahles -- RAB; > L. nashii Small var. nashii -- RAB, G; > L. nashii Small var. angustatum (A. Gray) Ahles -- RAB; >L. carolinianum -- F, S, in the narrow sense; >L. nashii Small -- F, \(S\), in the narrow sense; > L. carolinianum var. angustatum (A. Gray) Blake -- G; > L. angustatum (A. Gray) Small -- S; > L. obtusilobum Blake -- S]

\section*{PODOSTEMACEAE (Riverweed Family)}

A family of about 47 genera and 280 species, aquatic herbs, of tropical, subtropical, and rarely temperate regions of the New World and Old World.

\section*{Podostemum Michaux (Riverweed)}

A genus of about 18 species, reduced aquatic herbs, of tropical to temperate America.
Identification notes: Podostemum is a curious plant, seeming more like an alga than a vascular plant in color, texture, mode of attachment to substrate (by a fleshy disk), and irregular thalloid branching.

Podostemum ceratophyllum Michaux, Threadfoot, Riverweed. Mt, Pd, Cp (GA, NC, SC, VA): attached to rocks and dams in rapidly or slowly flowing water; common (rare in Coastal Plain). May-July. Nova Scotia, ME, and Québec west to s. Ontario, south to GA, AL, MS, LA, AR, and se. OK, and sometimes interpreted as extending into tropical America. [= RAB, C, F, G, K, W; = Podostemon ceratophyllum - GW, orthographic variant; > Podostemon ceratophyllum - S, orthographic variant; > Podostemon abrotanoides Nuttall -- S]

\section*{POLEMONIACEAE (Jacob's-ladder Family)}

A family of 18 genera and 350-380 species, herbs, vines, and shrubs (rarely trees), mainly of temperate North America, but extending into tropical America and also in Eurasia. References: Wilson (1960); Grant (1997); Grant (1998); Prather, Ferguson, \& Jansen (2000); Wilken in Kubitzki (2004).
```

1 Leaves simple; [tribe Polemoniae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . ........................ Phlox
1 Leaves compound.

```
Leaf segments linear, ca. 1 mm wide; corolla red or yellow; [tribe Gilieae] . . . . . . . . . . . . . . . . . . . . . . . . . . Ipomopsis
Leaf segments ovate or elliptic, \(5-16 \mathrm{~mm}\) wide; corolla blue; [tribe Polemoniae] . . . . . . . . . . . . . . . . . Polemonium

\section*{Ipomopsis Michaux 1803 (Standing-cypress)}

A genus of about 30 species, herbs, mainly of w. North America (1 species in se. North America, 1 in w. South America). References: Grant (1956)=Z; Wilken in Kubitzki (2004).

Ipomopsis rubra (Linnaeus) Wherry, Standing-cypress. Cp (GA, NC, SC), Pd (GA*?, NC*), Mt* (NC*): sandhills, sand rims of Carolina bays, roadbanks, disturbed areas; rare (NC Watch List, SC Rare). June-August; August-September. Sc. NC south to FL, west to TX and OK, spread from cultivation in other areas to the north (including sites in the Piedmont and Mountains of GA and NC). Another example of the affinities of the Sandhill flora to that of the dry sw. United States. [= RAB, K, W, Z; = Gilia rubra (Linnaeus) A.A. Heller -- C, F, G, S]

\section*{Phlox Linnaeus (Phlox)}

A genus of about 70 species, herbs (to subshrubs), of temperate North America (with 1 species in ne. Asia). This treatment is probably no closer to the truth than the diversity of previous ones; some will even consider it a regression, in its (provisional) acceptance of many of Wherry's infraspecific taxa. He studied the genus more carefully than anyone since, and it seems premature to reduce to synonymy without further critical study many of the entities which he recognized. As Wherry (1955) wrote "when it becomes realized how difficult from one another some of them are, the writer will no doubt be classed as a 'splitter;' then workers who revel in drawing up tables of 'synonymy' are going to have a field day. It is deemed of importance, however, to record the presence in nature of all material which may be of value in future studies by cytogenetic, serologic, or other specialized techniques. When multiple taxa get relegated to 'synonymy' under a few comprehensive ones, their very existence is likely to be overlooked." References: Wherry (1955)=Z; Ferguson, Krämer, \& Jansen (1999); Wilken in Kubitzki (2004). Key based on C and Z.

1 Stems woody or suffrutescent, trailing or decumbent; leaves to 25 mm long, to 3 ( -5 ) mm wide, generally with short-shoots or fascicles of leaves in the axils of leaves of the sterile shoots.
2 United portion of the style \(1.5-4 \mathrm{~mm}\) long, the cleft portion \(0.5-2 \mathrm{~mm}\) long.
3 Fertile shoots (10-) \(15-30 \mathrm{~cm}\) tall; upper leaves oblong-lanceolate, up to \(12-25 \mathrm{~mm}\) long, \(1.5-3 \mathrm{~mm}\) wide on sterile shoots, \(2.5-5 \mathrm{~mm}\) wide on fertile shoots; pubescence of the inflorescence mostly with conspicuously glandular tips

Ph. nivalis var. hentzii
3 Fertile shoots (3-) 8-12 (-15) cm tall; upper leaves linear-lanceolate, up to 8-12 mm long, \(0.5-1.5 \mathrm{~mm}\) wide on sterile shoots, \(1.5-3 \mathrm{~mm}\) wide on fertile shoots; pubescence of the inflorescence mostly with finely glandular tips

Ph. nivalis var. nivalis
2 United portion of the style 5-12 mm long, the cleft portion ca. 1 mm long.
4 Inflorescence glandless (rarely glandular); corolla tube ca. 10.5 mm long; petal notch generally ca. 1.0 mm deep (range 0-3.0 mm); [of high elevations] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Ph. subulata var. subulata
4 Inflorescence glandular (rarely glandless); corolla tube ca. \(10.5-12 \mathrm{~mm}\) long; petal notch generally ca. 1.5 mm deep (range 0.5-3.0 mm ); [of low to high elevations].
5 Corolla tube ca. 12 mm long; petal blades ca. 8.5 mm long, ca. 6 mm wide; flowers mostly purple (to pale lavender); [mostly of moderate to high elevation calcareous or mafic rocks] . . . . . Ph. subulata var. australis
5 Corolla tube ca. 10.5 mm long; petal blades ca. 7.5 mm long, ca. 5 mm wide; flowers mostly pale lavender; [mostly of low elevation acidic gneisses and shales] . . . . . . . . . . . . . . . . . . . . . . . . Ph. subulata var. brittonii
1 Stems herbaceous, erect or decumbent; leaves (at least the larger) more than 25 mm long and/or more than 5 mm wide, generally lacking axillary of leaves.
6 Style short, 1-4 mm long, the united portion 1-1.5 (-2)× as long as the cleft portion; stamens shorter than the corolla tube (thus included).
7 Upper leaves alternate; annual; corolla red, white, or variegated; [alien, mostly naturalized in dry sandy soils of roadsides, fields, and disturbed areas] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Ph. drummondii
7 Upper leaves opposite or subopposite; perennial; corolla blue, lavender, or pink; [native, mostly of forests, woodlands, or roadbanks].
8 Sterile shoots rooting at the nodes; leaves broad-elliptic, ca. \(2-3 \times\) as long as wide; sepals acuminate to very slightly awned, the awn \(0-0.5 \mathrm{~mm}\) long; corolla tube glabrous.
9 Petal blade notched, the sinus usually \(0.5-3 \mathrm{~mm}\) deep
Ph. divaricata var. divaricata
9 Petal blade entire . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Ph. divaricata var. laphamii
8 Sterile shoots not rooting at the nodes; leaves lanceolate to linear, ca. \(4-10 \times\) as long as wide; sepals awned, the awn 0.5-3.0 mm long; corolla glabrous, pilose, or glandular-pubescent.
10 Cymes open, the lowest branches elongate, more than 1 cm long; corolla usually glandular-pubescent or pilose (rarely glabrous); pedicels \(1-8(-12) \mathrm{mm}\) long Ph. pilosa ssp. pilosa
10 Cymes compact, the lowest branches short, less than 0.5 cm long; corolla glabrous; pedicels \(1-6 \mathrm{~mm}\) long. 11 Leaves and bracts oblong-elliptic to lanceolate, acute to obtuse (rarely acuminate), the larger 20-40 (50) mm long, \(4-8(-12) \mathrm{mm}\) wide, ca. \(5 \times\) as long as wide; bracts below the inflorescence hiding the calyces

Ph. amoena

11 Leaves and bracts linear to lanceolate, acuminate, the larger \(35-45 \mathrm{~mm}\) long, \(3-5 \mathrm{~mm}\) wide, ca. \(10 \times\) as long as wide; bracts below the inflorescence not hiding the calyces

Ph. lighthipei
6 Style long, (12-) 14-26 mm long, the united portion \(3-30 \times\) as long as the cleft portion; stamens equalling or exceeding the corolla tube (thus in part exserted).
12 Plants forming colonies by rhizomes, stolons, and/or prostrate sterile shoots with evergreen to semi-evergreen leaves; flowering shoots \(1-4(-5) \mathrm{dm}\) tall.
13 Plants with rhizomes and stolons tipped with clustered, evergreen, linear to lanceolate leaves 3-12 cm long, 5-\(10(-12) \mathrm{mm}\) wide

Ph. buckleyi
13 Plants with prostrate sterile shoots with scattered, semi-evergreen, spatulate to obovate leaves \(1.5-4.5 \mathrm{~cm}\) long, \(5-16 \mathrm{~mm}\) wide

Ph. stolonifera
12 Plants not colony-forming by rhizomes or stolons; flowering shoots (3-) 5-20 dm tall.
14 Leaf margin ciliate-serrulate; lateral veins of the leaves readily apparent, these joining to form a connecting vein parallel to the leaf margin.
15 Bracts of the inflorescence pubescent with glandular hairs; corolla tube glabrous; leaves opposite; nodes usually \(8-15\); leaves usually \(2-3 \times\) as long as wide

Ph. amplifolia
15 Bracts of the inflorescence pubescent with non-glandular hairs; corolla tube pubescent (rarely glabrous); leaves subopposite (at least near the inflorescence); nodes usually 15-40; leaves usually \(3-4 \times\) as long as wide

Ph. paniculata
14 Leaf margin smooth or slightly rough; lateral veins of the leaves not readily apparent, not forming a connecting vein parallel to the leaf margin.
16 Flowering shoots arising from decumbent stems; nodes below the inflorescence 3-5
Ph. latifolia
16 Flowering shoots arising from rhizomes; nodes below the inflorescence 7 or more.
17 Cymes several, the lower on rather short and uniform peduncles, thus the inflorescence as a whole subcylindric in outline.
18 Nodes 7-15, well-spaced; upper leaves oblong to ovate, cordate at the base; flowering early summer . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Ph. maculata var. maculata
18 Nodes 16-35, crowded; upper leaves lanceolate to ovate-oblong; truncate to subcordate at the base; flowering late summer . . . . . . . . . . . . . . . . . . . . . . . . . . Ph. maculata var. pyramidalis
17 Cymes solitary or several, if several then the lower on long peduncles, thus the inflorescence as a whole broadly rounded or even flat-topped.
19 Calyx subcampanulate, the sepals narrow with a well-developed midrib, the junction-membranes firm, broad and flat (to slightly plicate-keeled).
20 Main leaves ca. \(12 \times\) as long as wide; sepals \(7-9 \mathrm{~mm}\) long; ultimate cymules 5-7-flowered
Ph. glaberrima var. glaberrima
20 Main leaves ca. \(6 \times\) as long as wide; sepals \(8-12 \mathrm{~mm}\) long; ultimate cymules 3 -flowered.
Ph. glaberrima var. triflora
19 Calyx subcylindric, the sepals fairly broad, with a rather weak midrib, the junction-membranes thin, narrow, becoming markedly plicate-keeled.
21 Largest leaves low on the stem, the leaves markedly reduced upwards in size and also widely spaced . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Ph. carolina ssp. angusta
21 Largest leaves well above the midpoint of the stem, the leaves neither markedly reduced upwards in size nor markedly more widely spaced.
22 Plant (5-) 7.5-20 tall, with (12-) 15-25 nodes below the inflorescence
Ph. carolina ssp alta
22 Plant 4-10 dm tall, with 6-12 (-15) nodes below the inflorescence . . . . . . . . . . . . . .
Ph. carolina ssp. carolina
Phlox amoena Sims, Hairy Phlox, Chalice Phlox. Mt, Pd (GA, NC, SC), Cp (GA, SC): dry woodlands and forests, roadbanks, sandhills; common. April-June; June-July. W. NC west to s. KY, south to n. FL and MS. [= C, F, G, S, W; = Ph. amoena ssp. amoena -- K, Z; < Ph. amoena -- RAB, in part only (also see Ph. lighthipei)]

Phlox amplifolia Britton, Broadleaf Phlox. Mt (GA, NC, VA): moist forests, particularly over mafic rocks; rare (GA Special Concern, NC Watch List, VA Rare). July-August. W. VA west to s. IN and se. MO, south to w. NC, AL, and n. AR. [= RAB, C, F, G, K, S, W, Z]

Phlox buckleyi Wherry, Swordleaf Phlox, Shale-barren Phlox. Mt (VA): shale woodlands and woodland edges, shaley roadbanks; rare (VA Rare). May-June. Endemic to w. VA and e. WV. [= C, F, G, K, W, Z]

Phlox carolina Linnaeus ssp. alta Wherry, Giant Phlox. Mt (GA, NC, SC), Pd (GA, NC): forests, woodlands, woodland borders; common? May-July. C. NC and se. TN south to c. GA. [= K, Z; < Ph. carolina -- RAB, G, S, W, infraspecific taxa not distinguished]

Phlox carolina Linnaeus ssp. angusta Wherry, Narrowleaf Phlox. Cp (SC), Pd, Mt (NC, SC) \{GA\}: woodlands and woodland borders: uncommon? May-October. Sw. NC and e. SC south to panhandle FL, west to e. TX, north in the interior to w. TN, s. IL and s. MO. [= K, Z; < Ph. carolina -- RAB, G, S, W, infraspecific taxa not distinguished]

Phlox carolina Linnaeus ssp. carolina, Thick-leaf Phlox. Mt, Pd, Cp (NC, SC, VA) \{GA\}: woodlands, woodland borders, barrens, and forests; common. May-July. W. NC and s. MO south to panhandle FL and s. MS. [= K, Z; < Ph. carolina -- RAB, G, S, W, infraspecific taxa not distinguished]

Phlox divaricata Linnaeus var. divaricata, Eastern Blue Phlox, Timber Phlox. Mt (GA, NC, VA), Pd, Cp (GA, VA): moist deciduous forests in circumneutral soils; uncommon (rare in VA Coastal Plain). April-May. VT and Québec west to MI, south to NC,

GA, and TN. [= C, F, G; = Ph. divaricata ssp. divaricata \(-\mathrm{K}, \mathrm{Z}\); < Ph. divaricata \(-\mathrm{RAB}, \mathrm{S}, \mathrm{W}\), infraspecific taxa not distinguished]
Phlox divaricata Linnaeus var. laphamii A.W. Wood, Western Blue Phlox. Cp (GA, NC, VA?), Pd, Mt (GA): moist deciduous forests in circumneutral soils; rare. April. WI west to MN, south to GA and TX, and apparently with scattered populations eastward, as along the Roanoke River in NC. [= C, F, G; = Ph. divaricata ssp. Iaphamii (A.W. Wood) Wherry -- K, Z; < Ph. divaricata -- RAB, \(S, W\), infraspecific taxa not distinguished]

Phlox drummondii Hooker, Annual Phlox, Drummond Phlox. Cp (GA, NC, SC, VA), Pd (NC): dry sandy soils of roadsides, fields, disturbed areas; common, introduced from TX. April-July. Wherry recognized 3 subspecies in Ph. drummondii, all endemic to TX; it does not seem meaningful to try to distinguish infraspecific taxa in our area, since our plants are the progeny of various cultivars derived from hybrids and selections of the wild taxa. [= RAB, F, G, S; > Ph. drummondii spp. drummondii -- K, Z]

Phlox glaberrima Linnaeus var. glaberrima, Piedmont Smooth Phlox. Pd (NC, SC, VA), Mt (NC, Cp (SC): wet forests and woodlands, especially bottomlands; uncommon. April-June; June-July. Sc. VA south to c. SC and w. NC, apparently endemic to our area. [= Ph. glaberrima ssp. glaberrima -- RAB, K, Z; < Ph. glaberrima -- C, F, G, S, W, infraspecific taxa not distinguished]

Phlox glaberrima Linnaeus var. triflora (Michaux) Reveal \& Broome, Appalachian Smooth Phlox. Mt (GA, NC, SC, VA), Pd (GA, NC, SC), Cp? (GA?): wet woodlands and forests, especially bottomlands; uncommon. April-June; June-July. MD west to s. OH and s. IN, south to c, NC, c. GA, and n. AL. [= Ph. glaberrima ssp. triflora (Michaux) Wherry -- RAB, K, Z; < Ph. glaberrima -- C, F, G, S, W, infraspecific taxa not distinguished]

Phlox latifolia Michaux, Mountain Phlox, Appalachian Phlox. Mt, Pd (NC, SC, VA): moist forests, woodlands, woodland borders, and barrens; uncommon. May-June; July. PA to NC and ne. TN in the Appalachians; disjunct in OH and IN. [= K; ? Ph. ovata Linnaeus -- RAB, C, F, G, S, W, Z, misapplied]

Phlox lighthipei Small, Lighthipe's Phlox. Cp (GA, SC): dry to moist sandy soils; rare? April-May; June-July. S. SC south to n. FL. [= S; = Ph. amoena ssp. lighthipei (Small) Wherry -- K, Z; < Ph. amoena -- RAB, in part]

Phlox maculata Linnaeus var. maculata, Northern Meadow Phlox. Mt, Pd (NC, SC, VA), \{GA\}: moist forests and openings; uncommon? June-July. S. Québec west to MN, south to c. NC, KY, and IA. [=F, G; = Ph. maculata ssp. maculata -- K, Z; < Ph. maculata -- S, infraspecific taxa not distinguished]

Phlox maculata Linnaeus var. pyramidalis (J.E. Smith) Wherry. Leafy Meadow Phlox. Mt (GA, NC, SC, VA), Pd (NC, VA), Cp (VA): moist forests and openings; uncommon. July-September. PA, OH, s. IN, and se. MO, south to NC, n. GA, and TN. [=Ph. maculata ssp. pyramidalis (J.E. Smith) Wherry -- RAB, K, Z; =? Ph. maculata var. purpurea Fernald -- F; < Ph. maculata -- S, infraspecific taxa not distinguished]

Phlox nivalis Loddiges ex Sweet var. hentzii (Nuttall) Wherry, Trailing Phlox. Pd, Cp (GA, NC, SC, VA): rock outcrops, thin soils of rocky woodlands, roadbanks; common, rare in VA (VA Rare). March-May. Sc. VA west to n. AL, south to c. peninsular FL and s. AL. [= RAB; < Ph. nivalis -- C, F, S, W, in part; < Ph. hentzii -- G, in part only (also see Ph. nivalis var. nivalis); = Ph. nivalis ssp. hentzii (Nuttall) Wherry -- K, Z]

Phlox nivalis Loddiges ex Sweet var. nivalis, Pineland Phlox. Cp, Pd (GA, NC, SC), Mt (NC): sandhills, other dry woodlands, roadbanks; common. March-May. Nc. NC south to panhandle FL. A third taxon, Ph. nivalis ssp. texensis Lundell is endemic in e. TX. [= RAB; < Ph. nivalis -- C, F, S, W, in part (also see Ph. nivalis var. hentzii); < Ph. hentzii -- G, in part; = Ph. nivalis ssp. nivalis -K, Z]

Phlox paniculata Linnaeus, Garden Phlox. Mt (GA, NC, SC, VA), Pd (NC, SC, VA), Cp (NC, VA): streambanks, moist forests, woodlands, and woodland borders; common (rare in Coastal Plain and Piedmont south of VA). July-August; September. S. NY west to IL and MO, south to e. NC, w. SC, n. GA, n. MS, and AR. [= RAB, C, F, G, K, S, W, Z]

Phlox pilosa Linnaeus ssp. pilosa, Downy Phlox. Cp (NC, SC, VA), Pd (NC, VA), Cp (VA): dry to mesic woodlands and forests, roadbanks; uncommon, rare in VA (VA Rare). April-May; May-June. Ssp. pilosa ranges from CT west to WI, IA, and KS, south to c. peninsular FL and TX. Several other subspecies are more southern or western. [=K, Z; Ph. pilosa var. pilosa - C, F, G; < Ph. pilosa -- RAB, S, W, infraspecific taxa not distinguished]

Phlox stolonifera Sims, Creeping Phlox. Mt, Pd (GA, NC, SC, VA): moist forests; uncommon, rare in Piedmont. April-May; May-June. PA and s. OH south to w. NC, n. GA, and e. TN, essentially a Southern and Central Appalachian endemic. This species is sometimes locally abundant, as in parts of Great Smoky Mountains National Park. [= RAB, C, F, G, K, S, W, Z]

Phlox subulata Linnaeus var. australis Wherry, Southern Moss Phlox, Southern Mountain-pink. Mt (NC, VA), Pd (VA): dry and exposed rock outcrops, rocky flood-scoured riversides; uncommon, rare south of VA (NC Rare). April-May. W. VA and e. WV south to w. NC and e. TN; also in OH, w. WV, and n. KY. The varieties of Ph. subulata seem morphologically confluent; they need more study. [<Ph. subulata var. australis - G, in part only (also see var. brittonii); < Ph. subulata -- RAB, W, infraspecific taxa not distinguished; < Ph. subulata var. setacea (Linnaeus) Brand -- C ; < Ph. subulata var. brittonii -- F , in part; = Ph. subulata ssp. australis (Wherry) Wherry -- K, Z; = Ph. subulata -- S]

Phlox subulata Linnaeus var. brittonii (Small) Wherry, Alleghany Moss Phlox, Alleghany Mountain-pink. Mt (VA): dry woodlands and rock outcrops, over a wide variety of rocks, including in and around shale barrens; uncommon? April-May. Sc. PA south through w. MD to w. VA and e. WV. [< Ph. subulata var. setacea -- C, in part; < Ph. subulata var. brittonii -- F, in part only (also see Ph. subulata var. australis); < Ph. subulata var. australis - G; = Ph. subulata ssp. brittonii (Small) Wherry -- K, Z; = Ph. brittonii Small -- S]

Phlox subulata Linnaeus var. subulata, Northern Moss Phlox. Mt (NC): rock outcrops of circumneutral rocks; rare (NC Rare). May. NY west to MI, south to MD and WV, and rarely to w. NC. [ \(=\mathrm{F}\); < Ph. subulata var. subulata -- C, in part only (also see Ph. subulata var. brittonii); = Ph. subulata var. ciliata Wherry -- G; = Ph. subulata ssp. subulata -- K, Z]

Phlox bifida Beck var. bifida. In TN and KY according to Kartesz (1999) but not according to Wherry \{investigate\}. [= Phlox bifida Beck ssp. bifida -- K, Z] \{not yet keyed; add synonymy\}

Phlox bifida Beck var. stellaria (A. Gray) Wherry. In c. TN (Chester, Wofford, \& Kral 1997). [= Phlox bifida Beck ssp. stellaria (A. Gray) Wherry -- K, Z] \{not yet keyed; add synonymy\}

Phlox carolina Linnaeus ssp. turritella Wherry. In SC (Kartesz 1999) \{?\} and GA and southwestwards to FL, AL, MS, and e.

\section*{LA. [=K, Z] \{not yet keyed\}}

Phlox floridana Bentham. Cp (GA): sandhills; common? Sw. GA and se. AL south to FL Panhandle and w. peninsula. [= K, S, Z]

Phlox glaberrima Linnaeus var. interior Wherry. East to KY, TN, AL, and perhaps GA (Kartesz 1999). \{investigate\} [= Phlox glaberrima Linnaeus ssp. interior (Wherry) Wherry -- K, Z; < Ph. glaberrima-C,F,G, S, infraspecific taxa not distinguished] \{not yet keyed\}

Phlox pilosa Linnaeus ssp. deamii Levin. Endemic to IN, KY, and TN. [= K; < Ph. pilosa ssp. pulcherrima - Z, in part] \{not yet keyed; add to synonymy\}

Phlox pilosa Linnaeus ssp. detonsa (A. Gray) Wherry. Cp, Pd (GA): Nw. GA south to c. peninsular FL, west on the Coastal Plain to e. TX. [= K, Z] \{not yet keyed; add to synonymy\}

Phlox pilosa Linnaeus ssp. ozarkana (Wherry) Wherry. East to TN (Kartesz 1999), or to GA (Wherry). \{investigate\} [=K, Z] \{not yet keyed; add to synonymy\}

Phlox pulchra Wherry, Alabama Phlox. Endemic to c. AL. [= K, Z]

\section*{Polemonium Linnaeus 1753 (Jacob's-ladder)}

A genus of about 25 species, of temperate regions of North America and Eurasia. References: Davidson (1950); Wilken in Kubitzki (2004).

1 Stamens exserted 5-7 mm from the corolla; flowers in a compact panicle, the pedicels usually shorter than the calyx; flowering in July . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [P. vanbruntiae]
1 Stamens included in the corolla; flowers in a diffure, corymbiform panicle, the pedicels usually longer than the calyx; flowering in April-May.
2 Inflorescence densely glandular-villous; corolla 8-12 (-13) mm long . . . . . . . . . . . . . . . . . . . . . . . P. reptans var. reptans
2 Inflorescence densely glandular-villous; corolla 12-16 mm long . . . . . . . . . . . . . . . . . . . . . [P. reptans var. villosum]
Polemonium reptans Linnaeus var. reptans, Spreading Jacob's-ladder. Mt (GA, NC, VA), Pd (NC, VA), Cp (VA): moist, nutrient-rich forests, such as bottomlands and rich slopes; uncommon, rare south of VA (NC Watch List). April-May; June. NY west to MN, south to VA, nc. NC, nw. GA, AL, and e. OK. [=C, K; < P. reptans -- RAB, F, G, S, W, infraspecific taxa not distinguished]

Polemonium reptans Linnaeus var. villosum E.L. Braun occurs in the Appalachian Plateau and vicinity, in s. OH and e. KY. [= C, K; < P. reptans -- F, G, infraspecific taxa not distinguished]

Polemonium vanbruntiae Britton occurs in calcareous fens and swamps from ME, VT, and n. NY south to se. PA, sw. PA, and e. WV. [= K; = P. van-bruntiae -- C, F, G, orthographic variant]

\section*{POLYGALACEAE (Milkwort Family)}

A family of ca. 17 genera and 1000 species, trees, shrubs, woody vines, and herbs, nearly cosmopolitan. References: Miller (1971b).

\section*{Polygala Linnaeus (Milkwort)}

A genus of about 500 species, trees, shrubs, and herbs, nearly cosmopolitan in distribution. References: Smith \& Ward (1976)=Z.
Identification notes: Polygala has a distinctive flower structure which can be confusing. The corolla consists of 3 fused petals, partly fused into a tubular form, and also fused with the stamens. The lower petal is called the keel; it is usually boatlike, and also lacerate, fringed, or lobed at its tip. The calyx is 5 -lobed, the lobes usually of 3 distinct sizes. The two lateral sepals are called wings; they are generally large and petaloid (colored like petals). The upper sepal is usually the next largest; the two lower sepals are usually the smallest.

1 Fresh flowers orange, yellow, greenish-yellow, or greenish white (if greenish white, then the inflorescence a terminal manybrached cyme); [subgenus Polygala, series Decurrentes].
2 Inflorescence a dense pom-pom-like raceme, terminating leafy branches.
3 Lobes of lower petal (keel) less than 0.7 mm long; fresh flowers bright orange or bright lemon-yellow; bracts of the inflorescence \(1-3.5 \mathrm{~mm}\) long; plants to 40 cm tall \(\qquad\) P. Iutea

3 Lobes of lower petal (keel) more than 1.5 mm long; fresh flowers lemon-yellow to greenish yellow; bracts of the inflorescence \(4.5-6.5 \mathrm{~mm}\) long; plants to 15 cm tall
P. nana

2 Inflorescence a terminal, many-branched cyme, the many individual branches loosely to densely flowered.
4 Fresh flowers cream-white to greenish-white; [of GA southwards] . . . . . . . . . . . . . . . [P. balduinii var. balduinii]
4 Fresh flowers bright yellow; [collectively widespread in the Coastal Plain of our area].
5 Plants 4.5-12 dm tall, the stem solitary; basal leaves 3.5-14 cm long, linear-lanceolate, about 15-20× as long as wide, persistent as a basal rosette; stem leaves linear-subulate, sharp-tipped, much reduced from the basal leaves, becoming bractlike upwards; seeds glabrous, 0.7-0.9 mm long . . . . . . . . . . . . . . . . . . . . . P. cymosa 5 Plants \(1-4 \mathrm{dm}\) tall, the stems 1 -several from the base; basal leaves \(3-7 \mathrm{~cm}\) long, spatulate, about \(10 \times\) as long as
wide, usually not persistent after flowering; stem leaves narrowly spatulate to linear, blunt-tipped, only slightly reduced from the basal leaves; seeds pubescent, 0.5-0.7 mm long
P. ramosa

1 Fresh flowers pink, purple, white, or green (if green or white, then the inflorescence a simple raceme, not a many-branched cyme).
6 Leaves few, clustered near the tip of the stem; wings \(13-20 \mathrm{~mm}\) long; stamens 6 ; [of moist soils of forests in the Mountains]; [subgenus Chamaebuxus]
P. paucifolia

6 Leaves many, evenly distributed along the stem, or not at least stronglt clustered near the tip; wings less than 10 mm long; stamens 8 ; [collectively of a wide variety of habitats, but generally not as above, either in more open, drier, or nonmontane habitats].
7 Leaves whorled, at least at the principal lower nodes; annual, from a slender taproot; [subgenus Polygala].
8 Racemes 3-6 mm in diameter, pointed in outline.
9 Racemes 2-5 cm long, becoming interrupted below through persistence of the fruits on the axis; wings equalling the fruit . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. ambigua
9 Racemes \(0.5-1.5 \mathrm{~cm}\) long, the fruits falling promptly, thus the inflorescence compact and truncate below; wings shorter than the fruit.
10 Seeds finely pubescent; pedicels \(1 / 4-1 / 3\) as long as the fruit; raceme peduncles \(0.5-4 \mathrm{~cm}\) long P. verticillata var. isocycla

10 Seeds hirsute; pedicels \(1 / 3-1 / 2\) as long as the fruit; raceme peduncles \(2-7 \mathrm{~cm}\) long
P. verticillata var. verticillata

8 Racemes 8-15 mm in diameter, rounded in outline (somewhat rounded in \(P\). hookeri).
11 Racemes loosely flowered, with ca. 10 flowers per cm of length; raceme \(7-12 \mathrm{~mm}\) in diameter, the tip pointed in outline (obconical apically); full raceme (including the portion with dropped fruits) to 6 cm long .
P. hookeri

11 Racemes densely flowered, with ca. 20 flowers per cm of length; raceme \(7--20 \mathrm{~mm}\) in diameter, the tip rounded to truncate in outline; full raceme (including the portion with dropped fruits) to 4.5 cm long.
12 Bracts of the inflorescence ca. 1 mm long; wings \(1.5-2.5 \mathrm{~mm}\) wide, acute or short-mucronate at the tip; raceme peduncle (0.8-) 3-5 cm long
P. brevifolia

12 Bracts of the inflorescence \(1.5-3 \mathrm{~mm}\) long; wings \(3-4 \mathrm{~mm}\) wide, acuminate, the tips cuspidate; raceme peduncle 0-0.8 (-4.0) cm long.
13 Larger leaves (2-) 3-7 mm wide; raceme peduncles 0-0.5 cm long; racemes 7-15 mm in diameter \(P\). cruciata var. aquilonia
13 Larger leaves 1.5-3 (-4) mm wide; raceme peduncles 0-4 cm long; racemes 12-20 mm in diameter . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. cruciata var. cruciata
7 Leaves all alternate; either annual, from a slender taproot, the stems solitary, or biennial to perennial, from a taproot, the stems solitary to several, or perennial, from a thick rhizome, the stems several.
14 Leaves glaucous, somewhat succulent, linear; corolla \(7-10 \mathrm{~mm}\) long, more than \(2 \times\) as long as the wings; [subgenus Polygala] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. incarnata
14 Leaves green, herbaceous, usually broader than linear; corolla less than 5 mm long, roughly equal to or shorter than the wings.
15 Annual, the stems solitary; [subgenus Polygala].
16 Corolla about \(0.5 \times\) as long as the wings . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. sanguinea
16 Corolla about \(1 \times\) as long as the wings.
17 Inflorescence bracts dropping from the axis promptly following flowering .......... P. mariana 17 Inflorescence bracts persistent.

18 Wings \(3-5 \mathrm{~mm}\) long; pedicels \(1.5-2.5 \mathrm{~mm}\) long; racemes \(8-13 \mathrm{~mm}\) in diameter . \(\boldsymbol{P}\). curtissii
18 Wings 2-2.5 mm long; pedicels \(0.5-1.5 \mathrm{~mm}\) long; racemes \(5-6 \mathrm{~mm}\) in diameter. \(\boldsymbol{P}\). nuttallii 15 Perennial or biennial, usually several stems arising together from a rhizome or taproot.

19 Wings white, 2-3 mm long; flowers sessile or subsessile; plants from a thick crown; [subgenus Polygala].
20 Larger leaves mostly \(15-35 \mathrm{~mm}\) wide; capsules \(3.5-4.2 \mathrm{~mm}\) long; seeds \(3.0-3.5 \mathrm{~mm}\) long .... .
. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. senega var. latifolia
20 Larger leaves mostly 2-15 mm wide; capsules 2.5-3.5 mm long; seeds ca. 2.5 mm long ....... .
19 Wings pink, 4-7 mm long; flowers pedicelled; plants from a taproot.
21 Corolla keel entire at the tip; wings \(5-7 \mathrm{~mm}\) long, reniform-orbicular; plants lacking cleistogamous flowers; [subgenus Hebeclada] . . . . . . . . . . . . . P. grandiflora var. grandiflora
21 Corolla keel fringed at the tip; wings 4-6 mm long, elliptic; plants producing cleistogamous flowers in loose subterranean or surficial racemes; [subgenus Polygala].
22 Flowers mostly 1-4 mm apart; racemes elongating to 2-12 cm long; pedicels \(0.5-2.0 \mathrm{~mm}\) long; [more northern in distribution] . . . . . . . . . . . . . . . . . . . . P. polygama var. obtusata
22 Flowers mostly 4-6 mm apart; racemes elongating to \(8-15 \mathrm{~cm}\) long; pedicels \(1.5-3.5 \mathrm{~mm}\) long; [more southern in distribution] ..................... P. polygama var. polygama

Polygala ambigua Nuttall, Loose Milkwort. Mt, Pd, Cp (NC, SC, VA), \{GA\}: fields, woodlands, openings; uncommon. JuneSeptember. ME west to MI, south to GA, AL, and OK. Through most of its range \(P\). ambigua has wings \(1.3-1.7 \mathrm{~mm}\) long; plants from se. VA south to SC and from the Ozarks have wings 2.0-2.6 mm long. These plants have been named as a variety of \(P\).
verticillata, var. dolichoptera Fernald. They may warrant taxonomic recognition, but need additional study, including resolution of our Coastal Plain plants and those of the Ozarks. [= C, G, K, S; P. verticillata Linnaeus var. ambigua (Nuttall) Wood -- RAB, F, K; P. verticillata var. dolichoptera Fernald -- F; P. verticillata -- W, in part]

Polygala balduinii Nuttall var. balduinii, White Milkwort, Baldwin's Milkwort. Cp (GA): wet pine savannas; rare (GA Special Concern). E. GA south to s. FL, west to s. MS; e. TX; Cuba. [= GW; Polygala balduinii - K, in the broad sense; Pilostaxis baldwinii (Nuttall) Small -- S, orthographic variant; Pylostachya balduinii (Nuttall) Small]

Polygala brevifolia Nuttall, Shortleaf Milkwort, Little-leaf Milkwort. Cp (GA, NC, SC, VA): pine savannas, pocosin margins; rare (VA Rare). June-October. NJ south to FL, west to s. MS. [= RAB, C, F, G, GW, K, S]

Polygala cruciata Linnaeus var. aquilonia Fernald \& Schubert, Northern Drumheads. Cp?, Mt (NC, SC, VA): damp or wet soil in openings; uncommon. June-October. ME west to MN, south to e. VA, w. NC, n. AL, and TN. [=F, K; P. cruciata -- RAB, C, G, GW, S, W, infraspecific taxa not distinguished]

Polygala cruciata Linnaeus var. cruciata, Southern Drumheads. Cp (GA, NC, SC, VA): pine savannas, bogs, pocosins; common. June-October. Se. VA south to FL, west to TX, inland north to KY. [=F, K; P. cruciata -- RAB, C, G, GW, S, W, infraspecific taxa not distinguished; P. ramosior (Nash) Small -- S]

Polygala curtissii A. Gray, Appalachian Milkwort. Mt, Pd, Cp (NC, SC, VA), Cp (GA): old fields, thickets, openings; common. June-October. DE and se. PA (Rhoads \& Klein 1993) west to OH, south to SC and MS. [= RAB, C, F, G, K, S, W]

Polygala cymosa Walter, Tall Pinebarren Milkwort. Cp (GA, NC, SC): pond-cypress savannas, Coastal Plain depression ponds, clay-based Carolina bays, other sites with seasonally flooded hydrology; common. May-July. E. NC south to s. peninsular FL, west to s. MS; disjunct in s. DE. [= RAB, C, F, G, GW, K, Z; Pilostaxis cymosa (Walter) Small -- S; Pylostachya cymosa (Walter) Small]

Polygala grandiflora Walter var. grandiflora, Showy Milkwort. Cp (GA, NC, SC): sandhills, dry sandy soils of roadsides and fields; uncommon (NC Rare). May-July. S. NC south to FL, west to s. MS. [= K; P. grandiflora -- RAB, infraspecific taxa not distinguished; Asemeia grandiflora (Walter) Small -- S]

Polygala hookeri Torrey \& A. Gray, Hooker's Milkwort. Cp (NC, SC): pine savannas; rare (NC Rare). June-August. Sw. GA and adjacent panhandle FL, west to s. MS; disjunct in se. NC and ne. SC. [= RAB, GW, K, S]

Polygala incarnata Linnaeus, Pink Milkwort, Procession Flower. Cp, Pd (NC, SC, VA), Mt (NC, VA), \{GA\}: pine savannas, woodlands, fields; common (rare in Mountains). June-July. NY (Long Island) and se. PA (Rhoads \& Klein 1993) west to MI, WI, and IA, south to FL and TX. [= RAB, C, F, G, GW, K, W; Galypola incarnata (Linnaeus) Nieuwland -- S]

Polygala lutea Linnaeus, Orange Milkwort, Red-hot-poker. Cp (NC, SC, VA), Pd (NC), \{GA\}: wet savannas, ditches, bogs, other wet areas; common (rare in Piedmont). April-October. NY (Long Island), se. PA (Rhoads \& Klein 1993), and NJ south to s. peninsular FL, west to e. LA. [= RAB, C, F, G, GW, K, Z; Pilostaxis lutea (Linnaeus) Small -- S; Pylostachya lutea (Linnaeus) Small]

Polygala mariana P. Miller, Maryland Milkwort. Cp (NC, SC, VA), Pd (VA), \{GA\}: bogs, pine savannas, other open wet habitats; common (rare in Piedmont). June-October. S. NJ south to FL, west to TX; disjunct inland in sw. TN (Chester, Wofford, \& Kral 1997). [= RAB, C, F, G, GW, K, S; P. harperi Small -- F, S]

Polygala nana (Michaux) Augustin de Candolle, Dwarf Milkwort, Candyroot. Cp, Pd (SC), Mt (NC), \{GA\}: longleaf pine flatwoods, other open moist areas; rare (NC Watch List, SC Rare). E. GA south to s. peninsular FL, west to e. TX, with scattered populations inland to n. SC, w. NC, nw. GA, n. AL, c. TN (Chester, Wofford, \& Kral 1997), and ne. MS. This species is primarily a Coastal plain species of the deeper south; P. nana may be introduced in parts of our area. [= RAB, GW, K, Z; Pilostaxis nana (Michaux) Rafinesque -- S; Pylostachya nana (Michaux) Rafinesque]

Polygala nuttallii Torrey \& A. Gray, Nuttall's Milkwort. Cp (NC, SC, VA), Pd (NC), Mt (VA), \{GA\}: pocosins, pine savannas, also in depression ponds in Augusta and Rockingham counties, VA; uncommon (rare in Mountains). June-August. MA south to e. FL Panhandle; disjunct inland in w. VA, c. TN (Chester, Wofford, \& Kral 1997), sc. KY, and allegedly c. AR. [= RAB, C, F, G, K, S, W]

Polygala paucifolia Willdenow, Gaywings, Fringed Polygala, Flowering Wintergreen, Bird-on-the-wing. Mt (GA, NC, SC, VA): moist forests at moderate to high elevations; common (SC Rare). April-June; June-September. New Brunswick and Québec west to Saskatchewan, south to CT, NY, WI, and in the Appalachians south to w. NC, nw. SC, n. GA, and e. TN. [= RAB, C, F, G, K, W; Triclisperma paucifolia (Willdenow) Nieuwland -- S]

Polygala polygama Walter var. obtusata Chodat, Northern Bitter Milkwort. Mt, Pd (VA): woodlands and woodland borders; uncommon. May-July; June-July. ME west to MI and MN, south to NJ, w. VA, OH, c. IN, c. IL, and IA. [= C, F, G; P. polygama -RAB, K, S, W, infraspecific taxa not distinguished]

Polygala polygama Walter var. polygama, Southern Bitter Milkwort, Racemed Milkwort. Cp (NC, SC, VA), Pd, Mt (NC, SC), \(\{G A\}\) : sandhills, woodlands, woodland borders; common. May--July; June-July. Se. VA, sw. NC, and AR, south to FL and TX. [= C, F, G; P. polygama -- RAB, K, S, W, infraspecific taxa not distinguished]

Polygala ramosa Elliott, Short Pinebarren Milkwort, Low Pinebarren Milkwort. Cp (NC, SC, VA), Mt (NC), \{GA\}: wet savannas, pocosin margins, bogs; common (VA Rare). June-September. S. NJ south to s. peninsular FL, west to e. TX; disjunct inland (as in Henderson County, NC). [= RAB, C, F, G, GW, K, Z; Pilostaxis ramosa (Elliott) Small -- S; Pylostachya ramosa (Elliott) Small]

Polygala sanguinea Linnaeus, Blood Milkwort, Field Milkwort. Mt (NC, SC, VA), Pd, Cp (NC, VA), GA\}: woodlands, openings, woodland borders; uncommon. June-August. Nova Scotia and MN, south to nw. SC, n. GA, and LA. [= RAB, C, F, G, GW, K, W; P. viridescens Linnaeus -- S]

Polygala senega Linnaeus var. latifolia Torrey \& A. Gray, Seneca Snakeroot. (Mt, Pd (NC, SC, VA): woodlands and openings, especially over calcareous or mafic rocks; uncommon (NC Watch List). May-June. DE, PA, and MN, south to NC, TN, and MO. Trauth-Nare \& Naczi (1998) studied the two varieties of \(P\). senega and concluded that the taxa should be recognized at the specific level. The relative distributions, habitats, and phenology of the two taxa need assessment for our area. [=F, G; P. senega -- RAB, C, K, S, W, infraspecific taxa not distinguished]

Polygala senega Linnaeus var. senega, Seneca Snakeroot. \(\{\mathrm{Mt}, \mathrm{Pd}\) (NC, SC, VA): woodlands and openings, especially over
calcareous or mafic rocks; uncommon (NC Watch List). April-May. Québec west to Alberta, south to n. GA, TN, AR, and SD. The relative distributions, habitats, and phenology of the two taxa need assessment for our area. [= F, G; P. senega -- RAB, C, K, S, W, infraspecific taxa not distinguished]

Polygala verticillata Linnaeus var. isocycla Fernald, Whorled Milkwort. \{Mt, Pd, Cp (NC, SC, VA): dry woodlands, woodland borders, openings, fields; uncommon. June-September. The validity and relative distributions, habitats, phenology of the two varieties needs assessment in the herbarium and the field.\} VT west to Manitoba, south to FL and TX. [= C, F, G, K; P. verticillata var. verticillata -- RAB, in the broad sense; \(P\). verticillata -- \(S\), in the narrow sense, apparently misapplied; \(P\). verticillata -- W, infraspecific taxa not distinguished and apparently also including \(P\). ambigua]

Polygala verticillata Linnaeus var. verticillata, Whorled Milkwort. \(\{\mathrm{Mt}, \mathrm{Pd}, \mathrm{Cp}(\mathrm{NC}, \mathrm{SC}, \mathrm{VA})\) : dry woodlands, woodland borders, openings, fields; uncommon. June-September. The validity and relative distributions, habitats, phenology of the two varieties needs assessment in the herbarium and the field.\} ME west to MI, south to w. VA, w. NC, and TN. [= C, F, G, K; P. verticillata var. verticillata -- RAB, in the broad sense; \(P\). pretzii Pennell -- S ; \(P\). verticillata -- W , infraspecific taxa not distinguished and apparently also including \(P\). ambigua]

Polygala boykinii Nuttall, Boykin's Milkwort. In sc. TN (Chester, Wofford, \& Kral 1997) and sw. GA (Jones \& Coile 1988). [= S; P. boykinii var. boykinii -- K] \{not yet keyed; add synonymy\}

Polygala chapmanii Torrey \& A. Gray, east to GA. [= K] \{not yet keyed; add synonymy\}
Polygala leptostachys Shuttleworth ex A. Gray, Georgia Milkwort. Cp (GA): sandhills; rare (GA Special Concern). In sw. GA (Jones \& Coile 1988). In s. MS (Sorrie \& Leonard 1999). [= K] \{not yet keyed; add synonymy\}

Polygala setacea Michaux, Coastal Plain Milkwort, widespread in the outer Coastal Plain of GA (Jones \& Coile 1988), and also reported by Small (1933) as occurring north to NC. [= GW, K, S] \{not yet keyed; add synonymy\}

\section*{POLYGONACEAE A.L. de Jussieu 1789 (Smartweed Family)}

A family of about 43-48 genera and 1100-1200 species, trees, shrubs, vines, and herbs, cosmopolitan, but especially north temperate. Recent changes in the circumscription of various genera (including Polygonum, Persicaria, Fallopia, etc.) have received strong support from molecular phylogenetic studies (Lamb Frye \& Kron 2003). References: Freeman \& Reveal in FNA (2005); Horton (1972)=Z; Mitchell \& Dean (1978)=Y; Ronse Decraene \& Akeroyd (1988); Brandbyge in Kubitzki, Rohwer, \& Bittrich (1993); Lamb Frye \& Kron (2003).

1 Woody vine, climbing by tendrils; [subfamily Polygonoideae, tribe Coccolobeae] . . . . . . . . . . . . . . . . . . . . . . . . . Brunnichia
1 Herb (sometimes very robust and rather woody), herbaceous vine, or (Fallopia baldschuanica) a somewhat woody vine lacking tendrils.
2 Stem leaves (in our species) whorled; flowers in involucrate heads; ocreae absent; stamens 9; leaves densely whitetomentose on the lower surface; [of xeric situations of shale barrens and sandhills]; [subfamily Eriogonoideae, tribe Eriogoneae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Eriogonum
2 Stem leaves alternate; flowers in various inflorescences (not involucrate); ocreae present; stamens (3-) 5-8 (-9); leaves glabrous or variously pubescent, but not densely white-tomentose; [of various habitats, including xeric ones]; [subfamily Polygonoideae].
3 Tepals 6, in 2 series of 3 each; plants with leaves basally disposed, the largest basal (these withering in some species later in the season); [tribe Rumiceae].
4 Fruit 3-winged; basal leaves very large, 20-40 cm wide; inner and outer tepals similar; [plant cultivated, rarely persistent or escaped] Rheum
4 Fruit 3-angled; basal leaves small to medium in size, \(0.5-15 \mathrm{~cm}\) wide; inner tepals wider than the outer tepals; [plants common, mostly weedy] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Rumex
3 Tepals mostly 5 in a single whorl; plants with leaves along the stem, lacking well-developed basal leaves.
5 Flowers in small clusters or very reduced racemes of 1-5 flowers, borne in the axils of normally sized or reduced leaves; plants erect or sprawling herbs with stems less than 1 m long, from taproots; leaves jointed at base; [tribe Polygoneae] Polygonum
5 Flowers in diffuse axillary panicles, or in terminal or long-peduncled axillary racemes, corymbs, or heads; plants various, either erect or sprawling herbs, or erect, robust, and suffrutescent herbs, or climbing herbaceous or suffrutescent vines, or suffrutescent bushy herbs; leaves not jointed at base (except Polygonella).
6 Leaves cuneate at the base, either linear, spatular, or oblanceolate, mostly less than 4 cm long and 5 mm wide; pedicels jointed at the base; [tribe Polygoneae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Polygonella
6 Leaves cuneate, cordate, or hastate at the base, either lanceolate or ovate, mostly more than 5 cm long and 8 mm wide; pedicels not jointed at the base.
7 Inflorescence corymbiform, terminal; achenes strongly exserted at maturity; tepals almost free, horizontally spreading, white, \(3-4 \mathrm{~mm}\) long; [erect annual, uncommonly cultivated and rarely persistent or escaped]; [tribe Persicarieae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Fagopyrum
7 Inflorescence paniculate, racemiform, or headlike, terminal and axillary; achenes enclosed in the perianth at maturity; tepals fused for much of their length, ascending, pink, green, or white.
8 Outer tepals neither keeled nor winged at maturity; inflorescence of spikelike racemes, heads, or sparse, interrupted racemes; [tribe Persicarieae] . . . . . . . . . . . . . . . . . . . . . . . . . . . Persicaria
8 Outer tepals keeled or winged at maturity; inflorescence a compound panicle of racemes; [tribe Polygoneae].

9 Plants climbing or sprawling, herbaceous to somewhat woody, the stems slender; perianth usually not enlarging in fruit; stigma capitate or peltate . . . . . . . . . . . . . . . . . . . . Fallopia
9 Plants erect, robust (1-4 m tall), woody, the stems generally over 1 cm in diameter, hollow; perianth enlarging in fruit; stigma fimbriate

Reynoutria

\section*{Antigonon Endlicher 1837 (Love-chain, Coralvine)}

A genus of about 6 species, vines, of tropical America. References: Freeman in FNA (2005).
* Antigonon leptopus Hooker \& Arnott, Love-chain, Queen's-jewels, Confederate-vine. Cp (SC): cultivated and persisting; commonly cultivated, rarely persisting or escaping, native of tropical America. [= FNA, K] \{not yet keyed\}

\section*{Brunnichia Banks ex Gaertner 1788 (Buckwheat-vine)}

A genus of 3-4 species, vines, of. e. North America and w. Africa. References: Holmes in FNA (2005); Brandbyge in Kubitzki, Rohwer, \& Bittrich (1993).

Brunnichia ovata (Walter) Shinners, Buckwheat-vine, Eardrop-vine, Ladies'-eardrops, Redvine. Cp (GA, SC, VA*): floodplain forests, swamp forests; rare. June-July; August-September. Ne. SC south to n. FL, west to e. TX, and north in the interior to w. TN, w. KY, s. IL, and se. MO. Introduced in se. VA. [= FNA, GW, K; = B. cirrhosa Gaertner -- RAB, C, F, G, S]

Eriogonum Michaux 1803 (Wild-buckwheat)
A genus of about 250 species, herbs and shrubs, of w. North America (a few in se. North America). Like Astragalus, it is represented in e. North America by a few species restricted to unusually dry habitats. References: Reveal in FNA (2005); Reveal (1989, 2004)=Z; Brandbyge in Kubitzki, Rohwer, \& Bittrich (1993).

1 Basal leaves absent; cauline leaves alternate; [of limestone glades and barrens of KY, TN, and n. AL]; [subgenus Eriogonum]

2 Tepals bright yellow; plants 3-5 dm tall; [of shale barrens of VA and WV]; [subgenus Oligogonum] . . . . . . . . . . . E. allenii
2 Tepals white to pink; plants 4-12 dm tall; [of sandhills of s. NC (at least formerly), SC, and southwards]; [subgenus Eriogonum] E. tomentosum

Eriogonum allenii S. Watson, Shale-barren Wild-buckwheat. Mt (VA): open and sunny situations in shale barrens (and rarely sandstone); rare (VA Watch List). July-August. Endemic to shale barrens of w. VA and e. WV. [= C, FNA, K, W, Z; = E. alleni -- F, G, orthographic variant]

Eriogonum tomentosum Michaux, Sandhill Wild-buckwheat, Southern Wild-buckwheat, Dog-tongue. Cp (GA, NC, SC): sandhills, usually in white sand, primarily in the fall-line Sandhills and on riverine dunes in the middle and upper Coastal Plain; uncommon (NC Rare). Late July-September; September-November. S. NC (at least formerly) south to FL, west to s. AL. There seems no reason to doubt the label data of an 1890's Biltmore Herbarium collection from Bladen County, NC (Pittillo, Horton, \& Herman 1972), as E. tomentosum is fairly common not far away in SC; the species has apparently not been seen in NC since. [= RAB, FNA, K, S, Z]

Eriogonum harperi Goodman, Harper's Wild-buckwheat. Limestone glades and barrens of sc. KY, nc. TN, and n. AL; rare. [E. longifolium Nuttall var. harperi (Goodman) Reveal -- C, FNA, K, Z]

Fagopyrum P. Miller 1754 (Buckwheat)
A genus of about 8-16 species, perennial and annual herbs, of e. Asia and Africa. References: Hinds \& Freeman in FNA (2005); Brandbyge in Kubitzki, Rohwer, \& Bittrich (1993).
* Fagopyrum esculentum Moench, Buckwheat. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): fields, disturbed areas, railroad rights-of-way, escaped from cultivation; rare, introduced from Eurasia. June-November. The latin and common name refer to the similarity of the seeds to beechnuts. [= RAB, C, FNA, G, K, W; = F. sagittatum Gilibert -- F]
* Fagopyrum tataricum (Linnaeus) Gaertner, Tartary Buckwheat. Introduced at scattered locations in n. North America, south to WV (FNA). [= FNA, K] \{not yet keyed; add to synonymy\}

Fallopia Adanson 1763 (Climbing Buckwheat)
(also see Reynoutria)

A genus of about 9-10 species, woody and herbaceous vines, of temperate regions of the Northern Hemisphere. If accepted (as here) as a genus distinct from Polygonum, this group takes the name Fallopia Adanson (1763), which has priority over Tiniaria (1832) and Bilderdykia (1827). Reynoutria is sometimes included. References: Ronse Decraene \& Akeroyd (1988)=X; Brandbyge in Kubitzki, Rohwer, \& Bittrich (1993).

1 Plant woody; inflorescences freely branched, strongly paniculate; [sometimes cultivated, apparently naturalizing] . . . . . . . . . .
F. baldschuanica

1 Plant herbaceous; inflorescences less-branched, usually a reduced panicle with only a few racemose branches; [collectively common and in various natural and disturbed habitats].
2 Ocreae reflexed bristly at the base; perianth white; achene glossy black; [of high elevation openings and woodlands] ...
................................................................................................................. F. cilinodis

2 Ocreae smooth; perianth greenish to yellowish; achene glossy or dull black; [mostly of lower elevations].
3 Achene dull black; outer sepals keeled, not expanding into obvious wings in fruit, the fruit therefore \(3.5-4.5 \mathrm{~mm}\) long (measured from the pedicel joint to the tip); [weedy annual] . . . . . . . . . . . . . . . . F. convolvulus var. convolvulus
3 Achene glossy black; outer sepals expanding into obvious wings in fruit, the fruit therefore \(7-15 \mathrm{~mm}\) long (measured from the pedicel joint to the tip); [native perennial].
4 Perianth 7-10 mm long at maturity (measured from the pedicel joint to the tip); achenes 2-3.5 mm long ...... . F. scandens var. 1

4 Perianth \(10-15 \mathrm{~mm}\) long at maturity (measured from the pedicel joint to the tip); achenes \(3.5-6 \mathrm{~mm}\) long F. scandens var. scandens
* Fallopia baldschuanica (Regel) Holub, Silver-lace-vine, China Fleece-vine. Cp, Pd (SC, VA): disturbed areas; rare, introduced from Asia. [= FNA; > Fallopia aubertii (Henry) Holub - X; > Polygonum aubertii Henry -- C, F, K]

Fallopia cilinodis (Michaux) Holub, Fringed Climbing Buckwheat, Fringed Black Bindweed. Mt (GA, NC, VA): around rock outcrops, in openings, glades, and open woodlands at high elevations; uncommon (VA Watch List). June-September. [=FNA; = Polygonum cilinode Michaux -- RAB, C, K, W, Y, Z; > Polygonum cilinode var. cilinode - F; > Polygonum cilinode var. laevigatum Fernald -- F; = Bilderdykia cilinodis (Michaux) Greene -- S ; = Tiniaria cilinodis (Michaux) Small]
* Fallopia convolvulus (Linnaeus) Á. Löve, Bindweed, Climbing Buckwheat, Black Bindweed, Nimble-will. Cp, Pd, Mt (NC, SC, VA), \(\{\mathrm{GA}\}\) : disturbed areas; common, introduced from Eurasia. May-September. [= FNA, X; = Polygonum convolvulus -- RAB, GW, W, Y, Z; > Polygonum convolvulus Linnaeus var. convolvulus -- C, F, K; > Polygonum convolvulus var. subulatum Lejeune \& Courtois - K; = Bilderdykia convolvulus (Linnaeus) Dumortier -- S; = Tiniaria convolvulus (Linnaeus) Webb \& Moquin-Tandon]

Fallopia scandens (Linnaeus) Holub var. 1, Crested Climbing Buckwheat. Mt, Pd, Cp (NC, SC, VA), \{GA\}: moist to wet open habitats; common (rare in NC) (NC Watch List). July-October. [= Polygonum scandens Linnaeus var. cristatum (Engelmann \& A. Gray) Gleason -- RAB, C, GW, K, Y; = Polygonum cristatum Engelmann \& A. Gray -- F; = Bilderdykia cristata (Engelmann \& A. Gray) Greene - S; < Fallopia scandens -- X, infraspecific taxa not distinguished; < Polygonum scandens -- Z, infraspecific taxa not distinguished; ? Tiniaria cristata (Engelmann \& A. Gray) Small; = Fallopia cristata (Engelmann \& A. Gray) Holub]

Fallopia scandens (Linnaeus) Holub var. scandens, Common Climbing Buckwheat. Mt, Pd, Cp (NC, SC, VA), \{GA\}: moist to wet open habitats; uncommon. July-October. [= Polygonum scandens Linnaeus var. scandens -- RAB, C, GW, K, Y; = Polygonum scandens -- F, W, in the narrow sense; = Bilderdykia scandens (Linnaeus) Greene -- S; < Fallopia scandens -- X, infraspecific taxa not distinguished; < Polygonum scandens -- Z, infraspecific taxa not distinguished; = Tiniaria scandens (Linnaeus) Small]
* Fallopia dumetorum (Linnaeus) Holub, is introduced at least as far south as scattered locations in c. and se. PA (Rhoads \& Klein 1993), WV, KY, TN, and AL. [= FNA; = Polygonum scandens Linnaeus var. dumetorum (Linnaeus) Gleason -- K] \{not yet keyed; add to synonymy\}

Persicaria P. Miller 1754 (Smartweed, Tearthumb, Jumpseed)

A genus of about 150 species, herbs, nearly cosmopolitan (primarily temperate Northern Hemisphere). Several components of this genus may belong elsewhere. References: Hinds \& Freeman in FNA (2005); Park (1988)=X; Brandbyge in Kubitzki, Rohwer, \& Bittrich (1993).

\footnotetext{
1 Stem, petioles, and lower surface of major leaf veins with abundant recurved prickles; [section Echinocaulon]
Key A
1 Stem, petioles, and lower surface of major leaf veins unarmed..... \{not yet completed\}

Persicaria robustior (Small) E.P. Bicknell, Water Smartweed. (VA). [= FNA; Polygonum robustius (Small) Fernald -- C, F, K, \(\mathrm{Y}]\)

Persicaria sagittata (L.) Gross ex Nakai, Arrowleaf Tearthumb, Arrowvine, Scratch-grass. Cp, Pd, Mt (GA, NC, SC, VA) marshes, bogs, beaver impondments, wet thickets; common. May-December. Newfoundland west to Manitoba, south to Panhandle FL and e. TX; China, Manchria, India, Siberia, Korea, and Japan. [= FNA; = Polygonum sagittatum Linnaeus -- RAB, C, G, GW, K, W, Y, Z; > Polygonum sagittatum var. gracilentum Fernald -- F; > Polygonum sagittatum var. sagittatum - F; = Tracaulon sagittatum (Linnaeus) Small -- S; = Truellum sagittatum (Linnaeus) Soják]

Persicaria setacea (Baldwin) Small, Swamp Smartweed. Cp, Pd, Mt (NC, SC, VA), \{GA\}: swamp forests, bottomland forests; common (rare in Piedmont). July-November. [=FNA, S; = Polygonum setaceum Baldwin -- RAB, GW, W, Y, Z; > Polygonum setaceum var. interjectum Fernald -- F, K; > Polygonum setaceum var. tonsum Fernald -- F, K; > Polygonum setaceum var. setaceum - F, K; = Polygonum hydropiperoides Michaux var. setaceum (Baldwin) Gleason - C, G]

Persicaria virginiana (Linnaeus) Gaertner, Jumpseed. Mt, Pd, Cp (GA, NC, SC, VA): floodplains, moist forests; common. Section Tovara consists of 3 species of e. North America and e. Asia; if recognized as genus, the correct name for this species is Antenoron virginianum. [= FNA; = Tovara virginiana (Linnaeus) Rafinesque -- RAB, S; > Tovara virginiana var. glaberrima Fernald -F; > Tovara virginiana var. virginiana - F; = Polygonum virginianum Linnaeus -- C, GW, K, W, Y; > Polygonum virginianum var. virginianum - G; > Polygonum virginianum var. glaberrimum (Fernald) Steyermark - G; = Antenoron virginianum (Linnaeus) Roberty \& Vautier -- Z]
* Persicaria chinensis (Linnaeus) H. Gross, Chinese Knotweed. Introduced in MD and NJ; native of Asia. [= FNA; Polygonum chinense Linnaeus - K] \{not yet keyed; add to synonymy\}

\section*{Polygonella Michaux 1803 (Jointweed)}

A genus of about 9 species, annual, perennial, and suffruticose herbs, of warm temperate e. North America. Ronse De Craene, Hong, \& Smets (2004) suggest that Polygonella should be merged into Polygonum, as section Duravia, subsection Polygonella. References: Freeman in FNA (2005); Nesom \& Bates (1984)=Z; Wunderlin (1981)=Y; Horton (1961)=X; Ronse De Craene, Hong, \& Smets (2004); Brandbyge in Kubitzki, Rohwer, \& Bittrich (1993).

1 Ocreae ciliate; inner perianth segments fimbriate; [subgenus Thysanella]
P. fimbriata

1 Ocreae not ciliate; inner perianth segments not fimbriate; [subgenus Polygonella].
2 Style and stigma (0.4-) 0.5-0.8 (-1.0) mm long at anthesis; inner sepals (1.7-) 1.9-2.5 (-2.9) mm long in flower, (3.1-) 3.34.7 (-6.0) mm long in fruit; perennial; leaves very numerous, (4.0-) 5.2-12.0 (-19.0) mm long, 0.5-0.9 (-1.2) mm wide, nearly as thick as wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. americana
2 Style and stigma 0-0.1 (-0.2) mm long at anthesis; inner sepals (0.6-) 0.7-1.8 (-2.3) mm long at anthesis, (1.6-) 1.7-2.8 (3.6 ) mm in fruit; annual or perennial; leaves (2.5-) 4.4-39.0 (-65.0) mm long, (0.3-) 0.6-5.0 (-8.0) mm wide, wider than thick.
3 Annual, simple to much-branched from above the base; leaves lacking hyaline margins, mostly deciduous before fruiting; ocreae obtuse; achenes \(1.0-1.4 \mathrm{~mm}\) wide.
4 Leaves (0.4-) 0.6-1.0 (-1.2) mm wide; flowers exserted from the ocreolae on pedicels (0.9-) 1.3-1.7 (-2.1) mm long at anthesis; [of the outer Coastal Plain of ne. NC and e.VA northwards] . . . . . . . . . . . . . . . . . . P. articulata 4 Leaves (0.8-) 1.0-5.0 (-8.0) mm wide; flowers barely exserted from the ocreolae on pedicels ca. 0.1 mm long at anthesis; [of the outer Coastal Plain of se. SC southwards] . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. gracilis 3 Perennial, much-branched from near the distinctly woody base; leaves with hyaline margins towards the tip, persistent through fruiting; ocreae obtuse, acute, acuminate, or aristate; achenes (0.7-) 0.8-1.0 (-1.2) mm wide. 5 Tips of the ocreae and ocreolae long-acuminate, (0.7-) 1.0-1.5 mm long; leaves mostly oblanceolate, 4-13 mm long, 0.5-1.2 (-2.1) mm wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. polygama var. croomii 5 Tips of the ocreae and ocreolae obtuse to acute, \(0-0.5 \mathrm{~mm}\) long; leaves mostly spatulate, \(7-30 \mathrm{~mm}\) long, 1.9-6.0 mm wide
P. polygama var. polygama

Polygonella americana (Fischer \& Meyer) Small. Cp (GA, NC, SC), Pd (GA): sandhills, other dry habitats; uncommon (NC Watch List). June-September; August-November. Ranging from sc. NC south to s. GA west to TX and NM, north in the interior to ec. TN (Chester, Wofford, \& Kral 1997), se. MO, and AR, perhaps adventive towards the northern part of the range. [= RAB, F, FNA, G, K, S, X]

Polygonella articulata (Linnaeus) Meisner, Northern Wireweed. Cp (GA?, NC, VA): sandhills, dunes, and other dry, sandy habitats; rare (NC Rare, VA Watch List). September-October; October-November. Ranging from ME and s. Québec west to MN, south on the Coastal Plain to VA and ne. NC, otherwise south to se. PA, NY, s. Ontario, MI, n. IN, n. IL, and e. IA. P. articulata is the only northern member of an otherwise southern and predominantly Coastal Plain genus. Cited for GA in Jones \& Coile (1988); the record seems curious. [= RAB, C, F, FNA, G, K, X; = Delopyrum articulatum (Linnaeus) Small -- S; = Polygonum articulatum Linnaeus]

Polygonella fimbriata (Elliott) Horton, Sandhill Jointweed. Cp (GA): sandhills; uncommon. E. GA (not far from SC) south to panhandle FL. It differs from all our other species in having the inner sepals fimbriate. The related P. robusta (Small) Nesom \& Bates of FL has sometimes been treated as a variety of \(P\). fimbriata. [= FNA, K; = Thysanella fimbriata (Elliott) A. Gray --S ; = Polygonella fimbriata var. fimbriata -- X; = Polygonum fimbriatum Elliott]

Polygonella gracilis (Nuttall) Meisner, Wireweed. Cp (GA, NC, SC): sandhills; uncommon (NC Watch List). Late AugustOctober; October-November. Ranging from sc. NC south to s. FL, west to s. MS, perhaps adventive towards the northern part of the range. [= RAB, FNA, K, X; = Delopyrum gracile (Nuttall) Small -- S; = Polygonum gracile Nuttall]

Polygonella polygama (Ventenat) Engelmann \& A. Gray var. croomii (Chapman) Fernald, Carolina October-flower. Cp (GA,

NC, SC, VA): sandhills, primarily in the fall-line Sandhills and middle Coastal Plain; uncommon. August-October; OctoberNovember. Var. croomii ranges from se. and sc. NC south to SC and GA. Var. croomii occurs mainly in the fall-line Sandhills, scattered as well in the middle Coastal Plain (Robeson and Bladen counties, NC, Dillon and Darlington counties, SC) and rarely the outer Coastal Plain (New Hanover County, NC). In addition to our 2 varieties, var. brachystachya (Meisner) Wunderlin is endemic to peninsular FL; it resembles var. croomii in its narrow leaves, but has the ocrea and ocreola tips short and acute (more like var. polygama). I agree with Nesom \& Bates (1984) that "intermediates occur ... that will have to be arbitrarily identified, but without recognition of the varieties an interesting pattern of variation is obscured." It may even prove that the taxa are valid biological species, and that confusion is only caused by herbarium identifications. [= FNA, Y, Z; < P. polygama -- RAB, K, X, infraspecific taxa not distinguished; \(=P\). croomii Chapman -- S]

Polygonella polygama (Ventenat) Engelmann \& A. Gray var. polygama, Common October-flower. Cp (NC, SC, VA?): sandhills, primarily in the outer Coastal Plain north of SC; common (VA Rare). August-October; October-November. Var. polygama ranges from se. VA (?) south to s. FL, west to se. TX (perhaps absent in GA). In our area, var. polygama occurs in the outer Coastal Plain of VA and NC, extending into the middle Coastal Plain and fall-line Sandhills in SC (Richland, Lexington, and Aiken counties, SC). [= FNA, Y, Z; < P. polygama -- RAB, C, F, G, K, X, infraspecific taxa not distinguished; = P. polygama -- S; = Polygonum polygamum Ventenat]

Polygonella macrophylla Small. Sand pine scrub, coastal dunes. S. AL and Panhandle FL. [= FNA, K, S] \{not yet keyed; add to synonymy\}

Polygonum Linnaeus 1753 (Knotweed)
(also see Fallopia, Persicaria, Reynoutria)
A genus of about 20 species, herbs, of temperate regions of the Northern Hemisphere. References: Costea, Tardif, \& Hinds in FNA (2005); Brandbyge in Kubitzki, Rohwer, \& Bittrich (1993); Costea \& Tardif (2003a)=X.
* Polygonum argyrocoleon Steudel ex Kunze. Cp (NC): disturbed areas; rare, introduced from western North America. MayAugust? Reported for NC by Burk (1961). [= RAB, K, Z]
* Polygonum aviculare Linnaeus ssp. aviculare, Knotweed. Mt, Pd, Cp (NC, SC, VA), \{GA\}: disturbed areas; common. March-November. [=FNA, X; P. aviculare -- RAB, C, K, S, W, Y; Polygonum aviculare var. aviculare -- F, in part; P. aviculare var. vegetum Ledeb. -- F; P. monspeliense Persoon; < P. aviculare -- G, Z, in the broad sense]

Polygonum aviculare Linnaeus ssp. buxiforme (Small) Costea \& Tardif, Small's Knotweed. (SC, VA). [= FNA, X; = Polygonum buxiforme Small -- C, K, S, Y; P. aviculare Linnaeus var. littorale (Link) Mertens -- F; < P. aviculare - G, in part; \(P\). littorale Link]
* Polygonum aviculare Linnaeus ssp. depressum (Meisner) Arcangeli, Dooryard Knotweed. \{GA, NC, SC, VA\}. [= FNA, X; Polygonum arenastrum Boreau - \(\mathrm{C}, \mathrm{K}\); < \(P\). aviculare - G , in part]

Polygonum aviculare Linnaeus ssp. neglectum (Besser) Arcangeli, Needle-leaf Knotweed. Cp (VA): fields, disturbed areas; rare, introduced. Also documented from scattered locations in s. PA (Rhoads \& Klein 1993); DE, NJ, and MD (Kartesz 1999); and WV (as P. aviculare ssp. rurivagum) (Costea \& Tardif 2003). [= FNA; P. bellardii Allioni - K; Polygonum aviculare var. aviculare - F, in part; < P. aviculare - G, in part; Polygonum aviculare Linnaeus var. rurivagum (Jord. ex Boreau) Berher; Polygonum aviculare Linnaeus var. angustissimum Meisner]

Polygonum erectum Linnaeus, Erect Knotweed. Mt, Pd (NC, SC, VA), Cp (VA), \{GA\}: disturbed areas, open places; rare (NC Watch List). June-October; July-October. [= RAB, C, F, FNA, K, S, W, Y, Z]

Polygonum glaucum Nuttall, Seabeach Knotweed. Cp (GA, NC, SC, VA): ocean beaches, sound-side sandy shores, dune bases; rare (GA Special Concern, NC Rare, VA Rare). May-October; June-November. [= RAB, C, F, FNA, K, S, Y, Z]

Polygonum ramosissimum Michaux var. prolificum Small, Longfruit Knotweed, Bushy Knotweed, Prolific Knotweed. Cp (NC?, VA): \{habitat\}; rare (VA Watch List). Also reported for NC (Kartesz 1999). [=K, Y; P. prolificum (Small) B.L.Robinson -- C, F, G; P. exsertum Small -- F; P. ramosissimum -- Z, infraspecific taxa not distinguished; P. ramosissimum ssp. prolificum (Small) Costea \& Tardif - FNA, X]

Polygonum ramosissimum Michaux var. ramosissimum is reported for SC (Kartesz 1999). \{investigate\} [= K, Y; = P. ramosissimum Michaux ssp. ramosissimum - FNA, X; = P. ramosissimum - C, F, G] \{not yet keyed; add synonymy\}

Polygonum tenue Michaux, Glade Knotweed, Slender Knotweed. Pd (NC, SC, VA), Mt (NC, VA), Cp (VA), \{GA\}: glades, barrens, and thin, rocky soils, over various rock types (including granite, diabase, amphibolite, greenstone, and metagabbro); uncommon, rare in NC (NC Watch List). July-September; August-October. [= RAB, C, FNA, S, W, Y, Z; Polygonum tenue var. protrusum Fernald -- F, K; Polygonum tenue var. tenue - F, K]

Polygonum achoreum Blake, south to WV (Kartesz 1999). [= C, F, FNA, G, K] \{not yet keyed\}

\section*{Reynoutria Houttuyn 1777}

A genus of about 15 species, perennial herbs, of temperate e. Asia. Ronse Decraene \& Akeroyd (1988) treat this group as Fallopia section Reynoutria (Houttuyn) Ronse Decraene. This treatment may prove to be better than the recognition of Reynoutria as a genus; either course is compatible with molecular phylogeny (Lamb Frye \& Kron 2003). References: Freeman \& Hinds in FNA (2005); Ronse Decraene \& Akeroyd (1988)=X; Brandbyge in Kubitzki, Rohwer, \& Bittrich (1993); Zika \& Jacobson (2003). Key based on Zika \& Jacobson (2003).

1 Veins of leaf underside with multicellular hairs (as seen at \(20 \times\) magnification; mid-stem leaves with deeply cordate bases; inflorescence much shorter than the subtending mid-branch leaf \(R\). sachalinensis
1 Veins of leaf underside with simple hairs, or merely minutely bumpy-scabrous; mid-stem leaves with truncate to slightly cordate or very broadly V-shaped bases; inflorescence shorter or longer than the subtending mid-stem leaf.
2 Veins of leaf underside with scattered simple, stout-based hairs; mid-branch leaf bases usually slightly cordate; welldeveloped stem leaves usually > 20 cm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . R. \(\times\).
2 Veins of leaf underside minutely scabrous with scattered bumps; mid-branch leaves truncate (to very broadly V-shaped); well-developed stem leaves <18 cm long
R. japonica
* Reynoutria ×bohemica J. Chrtek \& A. Chrtková [Reynoutria japonica x sachalinensis], Bohemian Knotweed, Hybrid Japanese Knotweed. Mt (NC), Pd (VA): disturbed areas, sandbars; rare, introduced from e. Asia. [= Polygonum \(\times\) bohemica (J. Chrtek \& A. Chrtková) P.F. Zika \& A.L. Jacobson - Z; = Fallopia xbohemica (J. Chrtek \& A. Chrtková) J.P. Bailey - FNA]
* Reynoutria japonica Houttuyn, Japanese Knotweed, Japanese Bamboo, Japanese Buckwheat. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA); roadsides, disturbed areas, river banks and sandbars, often forming dense thickets; uncommon, introduced from e. Asia. May-September; August-October. [= Polygonum cuspidatum Siebold \& Zuccarini -- RAB, C, F, K, W, Y, Z; = Fallopia japonica (Houttuyn) Ronse Decraene var. japonica - FNA; = Pleuropterus zuccarinii Small -- S; = Fallopia japonica (Houttuyn) Ronse Decraene -- X]
* Reynoutria sachalinensis (F. Schmidt ex Maximowicz) Nakai, Giant Knotweed, Sachaline. Pd, Cp (VA), Mt (NC): disturbed areas, roadsides; rare, introduced from e. Asia. July-August; August-October. [= Polygonum sachalinense F. Schmidt ex Maximowicz -- RAB, C, F, K, W, Y, Z; = Fallopia sachalinensis (F. Schmidt ex Maximowicz) Ronse Decraene -- FNA, X]

\section*{Rheum Linnaeus 1753 (Rhubarb)}

A genus of about 30-60 species, perennial herbs, of temperate and subtropical Asia and Europe. References: Freeman in FNA (2005); Brandbyge in Kubitzki, Rohwer, \& Bittrich (1993).
* Rheum rhabarbarum Linnaeus, Rhubarb, Pie-plant. Mt (NC, VA): uncommonly cultivated (primarily in gardens in the cooler portions of our area), rarely persistent or escaped; rare, introduced from Europe (though originally native of Asia). July-September. [= K; = Rh. rhabarbicum -- C, misspelled; = Rh. rhaponticum -- G, misapplied]

Rumex Linnaeus 1753 (Dock)

A genus of about 200 species, perennial and annual herbs (and a few shrubs), of cosmopolitan distribution. References: Mosyakin in FNA (2005); Brandbyge in Kubitzki, Rohwer, \& Bittrich (1993).
subgenus Acetosella: acetosella
subgenus Acetosa: acetosa, hastatulus
subgenus Rumex: the rest
* Rumex acetosella Linnaeus, Red Dock, Sheep Sorrel, Sourgrass. Mt, Pd, Cp (GA, NC, SC, VA). [= RAB, C, FNA, G, GW, K, W; >R. acetosella var. acetosella \(-\mathrm{F} ;>R\). acetosella var. pyrenaeus (Pouret) Timbal-Lagrave \(-F ;=A c e t o s e l l a ~ a c e t o s e l l a ~\) (Linnaeus) Small - S; > Acetosella vulgaris (Koch) Fourreau ssp. pyrenaica (Pourret ex Lapeyrouse) Á. Löve]

Rumex altissimus A. Wood, Pale Dock, Tall Dock, Peachleaf Dock. Mt, Pd (GA, NC, SC, VA), Cp (NC). [= RAB, C, F, FNA, G, GW, K, S, W]

Rumex brittanica Linnaeus, Great Water Dock, native species south to VA, PA, NJ, KY (FNA). [= FNA; >R. orbiculatus A. Gray -- C, F, G, W; > R. orbiculatus var. orbiculatus -- K]
* Rumex brownii Campderá, Brown's Dock. Cp (SC), Pd (NC): disturbed areas, floodplains, wool-combing waif; rare, introduced from Australia. [= FNA; = R. brownei - K, orthographic variant]
* Rumex conglomeratus Murray, Clustered Dock. Cp, Pd (GA, NC, SC), Mt (GA), \{VA\}: [= RAB, C, F, FNA, G, GW, K, S] * Rumex crispus Linnaeus ssp. crispus, Curly Dock. Mt, Pd, Cp (GA, NC, SC, VA): common. [= FNA, K; < R. crispus -- RAB, C, F, G, GW, S, W, infraspecific taxa not distinguished]

Rumex fascicularis Small. \{NC\} [= FNA, S; < R. verticillatus Linnaeus - F, G, in part; = R. verticillatus ssp. fascicularis (Small) Á. Löve]

Rumex floridanus Meisner, Florida Dock. Cp (GA, NC, SC): Orangeburg Co. SC (fide SWL). [= FNA, G, S; < R. verticillatus - RAB, C, F, GW; = R. verticillatus Linnaus ssp. floridanus (Meisner) Á. Löve; >R. chrysocarpus Moris - GW, K, misapplied]

Rumex hastatulus Baldwin, Wild Dock. Cp, Pd (GA, NC, SC, VA), Mt (GA, SC). [= RAB, C, F, FNA, G, GW, K, S, W; Acetosa hastatula (Baldwin) Á. Löve]
* Rumex obtusifolius Linnaeus, Bitter Dock. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): common, introduced. [= RAB, C, F, FNA, G, GW, K, S, W]
* Rumex patientia Linnaeus, Patience Dock, Monk's-rhubarb. Mt, Pd (NC, VA): rare, introduced. [= RAB, C, F, FNA, G, K] * Rumex pulcher Linnaeus, Fiddle Dock. Cp, Pd (GA, NC, SC), Mt (SC), \{VA\}: introduced from Eurasia. [= RAB, C, F, FNA, G, GW, K, S, W]
* Rumex stenophyllus Ledebour, Narrowleaf Dock. Cp (SC), introduced from Eurasia. [= FNA, K]

Rumex verticillatus Linnaeus, Swamp Dock. Cp (GA, NC, SC, VA), Pd (NC): tidal freshwater marshes and swamps;
common (rare in Piedmont). [= FNA, S; < R. verticillatus -- RAB, C, F, G, GW, K, W, in part]
* Rumex acetosa Linnaeus, Green Sorrel, introduced and naturalized as a weed at least far south as se. PA (Rhoads \& Klein 1993). [= C, F, FNA, G; = R. acetosa ssp. acetosa -- K; = Acetosa pratensis Miller]
* Rumex cuneifolius Campderá. A rare introduction from South America in AL, FL. [= FNA, S; R. frutescens Thouars -- K, misapplied]
*? Rumex fueginus Philippi, American Golden Dock. (NC?). MD, DE, PA. [=FNA; \(<R\). maritimus Linnaeus -- G, K; \(=R\). maritimus var. fueginus (Philippi) Dusen - F; R. maritimus var. persicarioides (Linnaeus) R.S. Mitchell -- C, misapplied; \(R\). persicarioides Linnaeus -- S, misapplied]
* Rumex paraguayensis Parodi, Paraguayan Dock. \{distribution\}. See Brown \& Marcus (1998). [= FNA, GW, K]
* Rumex sanguineus Linnaeus, Bloody Dock, Red-veined Dock, is introduced at least as far south as se. PA (Rhoads \& Klein 1993), MD, NJ, and AL (Kartesz 1999). [= C, FNA, G, K, S]

Rumex triangulivalvis (Danser) Rechinger f. South to WV, DE, PA, KY. [= FNA; < Rumex salicifolius Weinmann var. mexicanus (Meisner) C.L. Hitchcock -- K; = R. salicifolius var. triangulivalvis (Danser) C.L. Hitchcock -- C; < R. mexicanus Meisner F, G]

\section*{PORTULACACEAE de Jussieu 1789 (Purslane Family)}

A family of about 29 genera and 450-500 species, trees, vines, shrubs, and herbs, primarily of the Southern Hemisphere, but also occurring in North America and e. Asia. Packer in FNA (2003b); References: Carolin in Kubitzki, Rohwer, \& Bittrich (1993).
\{portion only of key\}

1 Leaves obovate or elliptic, 20 mm or more wide; [an introduction, persistent or escaped] . . . . . . . . . . . . . . . . . . . . Talinum

Claytonia Linnaeus 1753 (Spring-beauty)
A genus of about 24 species, perennial herbs, of North America and e. Asia. References: Miller in FNA (2003b); Davis (1966)=Z; Lewis \& Suda (1968); Lewis, Oliver, \& Suda (1967); Carolin in Kubitzki, Rohwer, \& Bittrich (1993).

1 Cauline leaves \(3-6(-11) \mathrm{cm}\) long (including the evident petiole), the blade narrowly diamond-shaped, 2.5-6 (-8)× as long as wide; leaves 10-15 (-30) mm wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. caroliniana
1 Cauline leaves (5-) \(7-20 \mathrm{~cm}\) long (including the poorly differentiated petiole), the blade more than \(8 \times\) as long as wide; leaves 1 -\(10(-20) \mathrm{cm}\) wide.
2 Leaves 1-2 (-4) mm wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. virginica var. acutiflora
2 Leaves (2-) 5-10 (-20) mm wide.
3 Flowers yellow; [known from NJ, MD, and PA] . . . . . . . . . . . . . . . . . . . . . . . . . . . [C. virginica var. hammondiae]
3 Flowers white to pink; [widespread in our area] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. virginica var. virginica
Claytonia caroliniana Michaux, Carolina Spring-beauty. Mt (GA, NC, VA): moist forests, especially northern hardwood forests and cove forests at moderate to high elevations; common. March-May. Ranging from Nova Scotia west to MN, south to w. NC, e. TN, and n. GA. [= RAB, C, F, FNA, G, S, W, Z; > C. caroliniana var. caroliniana -- K; > C. caroliniana Michaux var. lewisii McNeill - K]

Claytonia virginica Linnaeus var. acutiflora Augustin de Candolle, Southern Spring-beauty. Mt, Pd, Cp (GA, NC, SC, VA): \{distributions and habitats of the two varieties need investigation\}. February-April. Ranging from VA west to IL, south to sw. GA and TX. This variety has chromosome numbers of \(n=6, n=7\), and polyploid and polyploid/aneuploid derivatives of those numbers. [= C, K; < C. virginica -- RAB, F, FNA, G, W, infraspecific taxa not distinguished; C. virginica -- S; C. virginica var. simsii (Sweet) R.J. Davis -- Z; C. simsii Sweet]

Claytonia virginica Linnaeus var. virginica, Eastern Spring-beauty. Mt, Pd, Cp (GA, NC, SC, VA): \{distributions and habitats of the two varieties need investigation\}. February-April. Ranging from Nova Scotia west to MN, south to GA and TX. This variety has chromosome numbers of \(n=8\) and polyploid and polyploid/aneuploid derivatives of that number. \([=C, K, Z\); < C. virginica -RAB, F, FNA, G, W, infraspecific taxa not distinguished; C. media (Augustin de Candolle) Link -- S]

Claytonia virginica Linnaeus var. hammondiae (Kalmbacher) J.J. Doyle, W.H. Lewis, and D.B. Snyder, Yellow Spring-beauty, is known from NJ, MD, and PA. This yellow-flowered spring-beauty is apparently not a mere flower color form, and should be recognized as a taxon. Further study is warranted. [=K; < C. virginica - FNA, infraspecific taxa not distinguished]

Montia Linnaeus 1753 (Blinks, Montia)
A genus of about 10 species, annual herbs, of nearly cosmopolitan distribution in temperate regions. References: Miller in FNA (2003b); Carolin in Kubitzki, Rohwer, \& Bittrich (1993).

* Montia fontana Linnaeus, Water Blinks. Cp (VA): wet places; rare, introduced from northern North America and Eurasia. [= FNA; > M. fontana var. fontana-C; > M. fontana ssp. fontana - K]
* Montia linearis (Douglas ex Hooker) Greene, Narrow-leaved Montia. Pd (NC), Cp (VA); lawns, disturbed areas; rare, introduced from western North America. Also in c. TN (Chester, Wofford, \& Kral 1997). [= FNA, K]

Phemeranthus Rafinesque 1814 (Fameflower)

A genus of about 20 species, herbs and dwarf shrubs, of America. Our North American "Talinums" are not closely related to the broad-leaved type of Talinum and are transferred to Phemeranthus (Kiger 2001). Adaptation of our native species of Phemeranthus to different rock substrates is discussed by Ware \& Pinion (1990). References: Kiger in FNA (2003b); Wilson (1932)=X; Ware (1967) \(=\) Y; Kiger (2001) \(=\) Z; Murdy \& Carter (2001)=Q; Carter \& Murdy (1985); Rose \& Standley (1911); Carolin in Kubitzki, Rohwer, \& Bittrich (1993); Hershkovitz \& Zimmer (2000).

1 Leaves obovate or elliptic, 20 mm or more wide; [an introduction, persistent or escaped]
[see Talinum]
1 Leaves linear, terete, 1-2 mm wide; [native].
2 Stamens 4-8; flowers open in late afternoon . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [Ph. parviflorus]
2 Stamens 12-80; flowers variously open from early or late afternoon.
3 Style 2-3.5 mm long, shorter than or about the same length as the stamens; stamens 12-30; flowers open from (3-) 3:30 to 7 p.m. E.D.S.T.

Ph. teretifolius
3 Style \(3.8-7 \mathrm{~mm}\) long; stamens \(25-80\); flowers open from about 1 to 7 p.m. E.D.S.T.
4 Stigma distinctly 3-lobed; mature seeds covered with a dull gray coating; [of calcareous rock outcrops] . . . . . . .
4 Stigma subcapitate; mature seeds brown-black and lustrous; [of noncalcareous rocks]
5 Stamens (40-) 50-80 (-90); [of granite and sandstone from SC southwards]
[Ph. calcaricus]

5 Stamens 25-42; [of mafic and ultramafic rocks, known from nc. NC and w. VA]
Ph. mengesii

Phemeranthus mengesii (W. Wolf) Kiger, Large-flowered Fameflower. Pd (GA, SC), Cp (GA): in shallow soil over felsic rocks (granite) or sandstone (in GA and AL), or Altamaha Grit (GA), where periodically wet by seepage; rare (locally common in GA). June-September. C. SC south to c. GA (where it extends into the Coastal Plain on outcrops of Altamaha Grit), west to \(n\). AL and sc. TN. Ph. mengesii and Ph. parviflorus Nuttall of midwestern of the United States (and disjunct as far east as AL) are apparently the parents of the allotetraploid Ph. teretifolius. Diploid and tetraploid populations are known of this taxon; further investigation is needed to determine if the tetraploids are allotetraploids or autotetraploids. [= Z; Phemeranthus mengesii - FNA, in part (also see Ph. sp. 1); Talinum mengesii W. Wolf -- Q, S, X, Y; Talinum mengesii - K, in part (also see Ph. species 1)]

Phemeranthus species 1. Pd (NC, VA): in periodic seepage on mafic or ultramafic rocks; rare (NC Proposed Endangered). (June?) July-September. This taxon was discovered at a diabase glade in Granville County, NC and ultramafic barrens in Franklin County, VA, floristically rich in other species of disjunct and relict distribution. Further investigations are needed to confirm its chromosome complement and relationship to Ph. teretifolius of nearby granite flatrocks, and to the more southerly Ph. mengesii. It is possible that it is only an unusual form of Ph. mengesii. [Talinum mengesii-K, in part; Phemeranthus mengesii - FNA, in part]

Phemeranthus teretifolius (Pursh) Rafinesque, Appalachian Fameflower. Mt, Pd (GA, NC, SC, VA), Cp (GA): in shallow soil over felsic or mafic rocks (granite, gneiss, schist, granite, diabase, greenstone, sandstone, Altamaha grit), especially where periodically wet by seepage (often in mats of the moss Grimmia); common. June-September. DE, se. PA, and WV, south to se. TN, GA (where it extends into the Coastal Plain on outcrops of Altamaha Grit), and AL, in the Appalachians and adjacent provinces. Ph. teretifolius is an allotetraploid, probably derived from hybridization followed by polyploidization of the diploids Ph. mengesii and Ph. parviflorus. [= FNA, Z; Talinum teretifolium Pursh -- RAB, C, F, G, K, Q, S, W, X, Y]

Phemeranthus calcaricus (S. Ware) Kiger, occurs on calcareous glades, from c. TN south to n . AL. A tetraploid species, probably derived from Ph. calycinus Engelmann. [= FNA, Z; Talinum calcaricum S. Ware -- K, Q, Y]

Phemeranthus parviflorus (Nuttall) Kiger, more western, occurs as an eastern disjunct in n. AL. A diploid species. [= FNA, Z; Talinum parviflorum Nuttall -- C, F, G, K, Q, X, Y; Talinum appalachianum W. Wolf - Y]

Portulaca Linnaeus 1753 (Purslane, Portulaca)
A genus of about 40 species, annual and perennial herbs, nearly cosmopolitan, but especially in tropical, subtropical, and warm temperate regions. Portulaca flowers open only for a few hours each on sunny days (Matthews \& Levins 1985). References: Mathews in FNA (2003b); Matthews \& Levins (1985)=Z; Matthews, Faircloth, \& Allison (1991); Matthews \& Levins (1986); Matthews, Ketron, \& Zane (1992a, 1992b, 1993); Matthews \& Ketron (1991); Carolin in Kubitzki, Rohwer, \& Bittrich (1993). Key based closely on Matthews in FNA (2003b).

1 Plants in flower.
2 Petals yellow, orange, copper, bronze, or white.
3 Flowers more than 25 mm across (single petals more than 15 mm long).

1 Plants in fruit.
9 Capsule encircled by an expanded membranaceous wing.
10 [Native in our area, in thin soil on granitic and sandstone outcrops in SC and GA] . . . . . . . . . . . . . . . . P. Poronata
10 [Introduced cultivar, persistent to weakly spreading from plantings] . . . . . . . . . . . . . . . . . . . . . . . . . P. umbraticola
\(9 \quad\) Capsule not encircled by an expanded membranaceous wing.
11 Leaves flattened in cross-section, more than 2.5 mm wide, obovate to spatulate.
12 Trichomes at nodes conspicuous; seeds round, less than 0.6 mm wide . . . . . . . . . . . . . . . . . . . . . . . \(P\). amilis
12 Trichomes at nodes inconspicuous; seeds elongate, more than 0.6 mm long ................. P. oleracea
11 Leaves terete to hemispherical in cross-section, usually less than 2 mm wide, linear to lanceolate.
13 Nodes and inflorescences with inconspicuous trichomes
P. biloba

13 Nodes and inflorescences with conspicuous trichomes
14 Seeds less than 0.65 mm wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. pilosa
14 Seeds more than 0.65 mm wide.
15 Longest leaves mostly more than 20 mm long; capsules mostly more than 4 mm in diameter; [introduced, usually in obviously disturbed sites] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. grandiflora
15 Longest leaves mostly less than 17 mm long; capsules mostly less than 3.5 mm in diameter; [native, on granitic or diabase flatrocks]
P. smallii
* Portulaca amilis Spegaz., Broadleaf Pink Purslane. Cp (GA, NC, SC, VA), Pd (NC, SC): sandy fields, and other dry, sandy, disturbed habitats; rare, introduced from South America. May-September. Matthews \& Levins (1985) describe the spread of this alien species in North America, apparently from an introduction in North Carolina (the earliest North American collection in 1932 in Robeson County, NC). [= FNA, K, Z]

Portulaca biloba Urban, Grit Purslane. Cp (GA): outcrops of Altamaha Grit; rare (GA Special Concern). This species has been collected repeatedly on outcrops of the Altamaha Grit in s. GA (Matthews, Faircloth, \& Allison 1991); it also occurs in Cuba. Matthews, Faircloth, \& Allison (1991) hypothesize introduction to the United States by hurricane. [= FNA, K]

Portulaca coronata Small, Flatrock Portulaca. Pd (GA, SC), Cp (GA): on or around granitic flatrocks, usually under Juniperus virginiana, and on Altamaha Grit outcrops; rare (GA Special Concern, SC Rare). June-September. SC south to GA, endemic to granitic and sandstone outcrops in the Piedmont and rarely Altamaha grit (sandstone outcrops in the upper Coastal Plain. Matthews \& Levins (1985) includes this taxon in P. umbraticola. Later, Matthews \& Ketron (1991) and Matthews, Ketron, \& Zane (1992) treated our southeastern material as \(P\). umbraticola ssp. coronata. While the distinctive nature of the capsule unifies the southeastern "coronata," southwestern "lanceolata," and Central and South and Central American "umbraticola," the difference in chromosome number and flower color, associated with disjunctly allopatric distributions renders specific recognition equally plausible. [= RAB, S; P. umbraticola Kunth -- Z, in part; P. umbraticola Kunth ssp. coronata (Small) J.F. Matthews \& Ketron -- FNA, K ]

Portulaca grandiflora Hooker, Rose-moss. \(\mathrm{Cp}, \mathrm{Pd}(\mathrm{NC}, \mathrm{SC}),\{\mathrm{GA}, \mathrm{VA}\}\) : in sandy soil or around granitic flatrocks; rare, native of Argentina. [= RAB, C, FNA, G, K, S, Z]
* Portulaca oleracea Linnaeus, Common Purslane, Garden Purslane, Pussley. Mt, Pd, Cp (GA, NC, SC, VA): gardens, disturbed areas, cracks in sidewalks; common, originally native (apparently) of Asia, probably introduced to North America from Europe. May-October. The various subspecies recognized may or may not be taxonomically significant; a decision awaits an analysis of variation worldwide, or, at least, in the native range of the species. In North America, P. oleracea is a widespread, sometimes noxious weed, probably representing numerous introductions of various genotypes, treated as multiple subspecies by some authors. In North America, these genotypes appear to have intermixed; in our area (at least), the recognition of infraspecific taxa has been considered unwarranted, difficult, and unmeaningful (see Matthews, Ketron, \& Zane 1993); see Danin \& Anderson (1986) for a contrasting opinion. During the Great Depression, P. oleracea was eaten extensively in the Valley of Virginia as a potherb. [= RAB, C, F, FNA, G, K, S, W, Z]

Portulaca pilosa Linnaeus, Kiss-me-quick. Cp (GA, NC, SC), Pd (NC, SC): disturbed sandy soils; uncommon. June-October. NC south to FL, west to NM, north in the interior to c. TN, AR, and OK, and in Central America; the native range perhaps obscure. See Matthews, Ketron, \& Zane (1992a) for a further discussion of this species. [= RAB, FNA, K, S, Z]

Portulaca smallii P. Wilson, Small's Portulaca. Pd (GA, NC, SC, VA): in thin soils on granitic and diabase flatrocks, sometimes locally spreading to adjacent fields, mowed areas, or other disturbed areas; rare (NC Threatened, SC Rare, VA Rare).

June-October. Sc. VA south to c. GA. Generally considered an endemic limited to granitic flatrocks, P. smallii also occurs on a diabase flatrock, growing with an interesting mixture of granite flatrock and limestone cedar glade species (LeGrand 1987, Schafale \& Weakley 1990). [= RAB, FNA, K, S, Z]

Portulaca umbraticola Kunth. Pd, Cp (NC, SC): disturbed areas, spreading weakly or persistent following cultivation; rare, native of South America and the West Indies. See \(P\). coronata for further discussion. [P. umbraticola Kunth -- Z, in part; \(P\). umbraticola Kunth ssp. umbraticola -- K]

Talinum Adanson 1763 (Jewels-of-Opar) (also see Phemeranthus)

A genus of about 15 species, herbs, and dwarf shrubs, mainly of Africa but with 2 species of the New World tropics). References: Kiger in FNA (2003b); Wilson (1932)=X; Carolin in Kubitzki, Rohwer, \& Bittrich (1993).
* Talinum paniculatum (Jacquin) Gaertner, Jewels-of-Opar. Pd (GA, NC, SC), Cp (GA): fairly commonly cultivated, locally escaped to disturbed areas and garden edges; rare, introduced from the West Indies. June-September. The broad leaves and robust stature of the plant (to 8 dm tall) give it a very different superficial appearance in comparison to our native species of Phemeranthus. [= FNA, S, X; T. paniculatum var. paniculatum - K]

\section*{PRIMULACEAE (Primrose Family) \\ (see also MYRSINACEAE and SAMOLACEAE)}

As reconstituted, a family of 12-13 genera and about 600 species, herbs, primarily north temperate. Källersjö, Bergqvist, \& Anderberg (2000) and Martins, Oberprieler, \& Hellwig (2003) suggest that the traditional Primulaceae is polyphyletic, and recommend the transfer of several genera to other families, including Lysimachia, Anagallis, Centunculus, Trientalis, and Glaux to Myrsinaceae and Samolus to Theophrastaceae. Dodecatheon and Hottonia remain in Primulaceae s.s. References: Channell \& Wood (1959); Källersjö, Bergqvist, \& Anderberg (2000); Martins, Oberprieler \& Hellwig (2003); Anderberg in Kubitzki (2004).

1 Aquatic; leaves pectinate (deeply pinnatifid into linear segments) . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Hottonia
1 Terrestrial (though sometimes in wetlands or submersed for short periods of time); leaves entire or shallowly toothed.
2 Leaves strictly in a basal rosette or basally disposed (with a basal rosette and smaller stem leaves).
3 Inflorescence an umbel; leaves strictly basal
3 Inflorescence a raceme or a panicle of racemes; larger leaves basal and smaller leaves on the stem
Dodecatheon .. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [see Samolus in THEOPHRASTIDACEAE]
2 Leaves all or chiefly cauline .............. [see Anagallis, Centunculus, Lysimachia, Trientalis in MYRSINACEAE]

\section*{Dodecatheon Linnaeus 1753 (Shooting star)}

A genus of \(13-15\) species, herbs, of North America and ne. Asia. Mast et al. (2004) show that Dodecatheon is nested within Primula, and is closely related to (and derived from) Primula subgenus Auriculastrum, apparently via a relatively simple alteration of the corolla for buzz-pollination. References: Fassett (1944)=Z; Mast et al. (2004).

1 Wall of the capsule thin and flexible; corolla lobes rose-purple
[D. amethystinum]
1 Wall of the capsule thick and stiff; corolla lobes white to medium pink.
2 Leaves cordate, subcordate, or abruptly narrowed to the petiole
[D. meadia var. frenchii]
2 Leaves long-cuneate at the base, gradually narrowed to the petiole.
3 Flowers 1-14 per plant; calyx lobes (2.5-) 3.5-4.0 (-5.0) mm long on expanding flowers, becoming 4-5 mm long on fruits; anthers 4-7 mm long; fruit 7-10 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . D. meadia var. brachycarpum 3 Flowers 4-125 per plant; calyx lobes (3-) 4-5 (-8) mm long on expanding flowers, becoming (4-) 5.5-7 (-9) mm long on fruits; anthers 6.5-10 mm long; fruit 10-17 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . D. meadia var. meadia

Dodecatheon meadia Linnaeus var. brachycarpum (Small) Fassett, Ozark Eastern Shooting Star. Mt (VA): dolomite woodlands and glades; rare (VA Watch List). Late April-May; late May-June. Chiefly Ozarkian: MO and OK, and AR south to n. AL and TX; rarely disjunct as far east as w . and sw. VA. [= C, F, G; < D. meadia -- RAB, W, infraspecific taxa not distinguished; = D. meadia ssp. brachycarpum (Small) R. Knuth -- K; = D. brachycarpa Small -- S]

Dodecatheon meadia Linnaeus var. meadia, Common Eastern Shooting Star. Mt (GA, NC, SC, VA), Pd (GA, NC, SC, VA), \(C p\) (SC): rich forests, woodlands, and rock outcrops (primarily calcareous or mafic), especially with nutrient-rich seepage; uncommon, rare in NC (NC Rare, VA Watch List). Late March-early June; late May-June. MD and PA west to s. WI, se. MN, IA, and OK, south to n. GA, n. FL (Gadsden County), AL, and TX. [= C, F, G; < D. meadia -- RAB, W, infraspecific taxa not distinguished; = D. meadia ssp. meadia -- K; >D. meadia -- \(\mathrm{S} ;>\mathrm{D}\). hugeri Small \(-\mathrm{S} ;>\mathrm{D}\). meadia var. genuinum -Z ; \(>\mathrm{D}\). meadia var. obesum Fassett - Z]

Dodecatheon amethystinum (Fassett) Fassett, Jeweled Shooting Star. MN and WI south to IL and MO, apparently disjunct eastwards in WV and PA. The eastern distribution of \(D\). amethystinum is alternatively considered by some to represent eastern
populations of \(D\). radicatum Greene, or merely depauperate plants of \(D\). meadia. \([=F, K, Z ;<D\). radicatum Greene var. radicatum C; < D. radicatum - G]

Dodecatheon meadia Linnaeus var. frenchii Vasey, French's Shooting-star. IN, IL, and MO south to AL and AR. [= C, F, G, Z; = D. frenchii (Vasey) Rydberg -- K]

Hottonia Linnaeus 1753 (Water-violet)
A genus of 2 species, aquatic herbs, of North America and Eurasia. References: Anderberg in Kubitzki (2004).
Hottonia inflata Elliott, Featherfoil, Water-violet. Cp (NC, SC, VA), Pd (GA, NC): slow-moving or stagnant waters of swamps, millponds, beaverponds, sag ponds, oxbows, rivers, probably dispersed by waterfowl, primarily in the Coastal Plain, very rarely in the Piedmont; rare (GA Special Concern, NC Watch List). April-May; May-June. ME south to FL, west to TX, inland up the Missisippi Embayment to IL, and at other scattered locations inland (as WV, and especially around the Great Lakes). The species shows large population fluctuations, and may be essentially ephemeral at many locations. Townsend (1995) documents its first SC record. [= RAB, C, F, G, GW, K, S]

\author{
PUNICACEAE \\ (see LYTHRACEAE)
}

\section*{PYROLACEAE}
(see ERICACEAE)

\section*{RANUNCULACEAE de Jussieu 1789 (Buttercup Family)}
(also see HYDRASTIDACEAE)

A family of about 62 genera and 2450 species, herbs, shrubs, and vines, primarily of temperate and boreal regions. References: Whittemore \& Parfitt in FNA (1997); Keener (1977); Tamura in Kubitzki, Rohwer, \& Bittrich (1993).

1 Shrub or vine; leaves compound (or sometimes some to most of them simple in Clematis).
2 Leaves opposite, distributed along the usually branched, clambering stem; sepals 4, white to blue or purplish, 10-50 mm long; wood not yellow; [subfamily Ranunculoideae, tribe Anemoneae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Clematis
2 Leaves alternate, clustered together at the top of the usually unbranched, erect stem; sepals 5, maroon, 2-5 mm long; wood yellow; [subfamily Isopyroideae, tribe Coptideae].
. Xanthorhiza
1 Herb; leaves compound or simple.
3 Leaves simple, sometimes deeply cleft or lobed into rounded or elongate segments.
4 Plants in flower.
5 Flowers bilaterally symmetrical, the upper sepal hooded or spurred; [subfamily Helleboroideae, tribe Delphinieae].
6 Upper sepal hooded or helmet-shaped; petals hidden by the sepals; perianth blue or creamy white; stems weak, clambering, reclining, vining, or ascending in a curve

Aconitum
6 Upper sepal spurred; petals at least partly exserted from the sepals; perianth blue, pink, white, or greenish; stems strong, erect, normally straight . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Delphinium
5 Flowers radially symmetrical, no perianth parts spurred or hooded (except the 5 sepals spurred in Myosurus).
7 Petals present, white or yellow, larger and more conspicuous than the sepals; sepals present, green; [in other words, with a second, green, less conspicuous perianth whorl below the largest and colored perianth whorl; note that Hepatica has a calyx-like involucre of 3 bracts subtending each flower]; [subfamily Ranunculoideae, tribe Ranunculeae].
8 Basal leaves linear to linear-spatulate, mostly 4-8 cm long, 1-3 mm wide; receptacle elongate, 1-6 cm long (superficially resembling a Plantago inflorescence)

Myosurus
8 Basal leaves various, but not as above; receptacle globose to sub-cylindric, mostly less than 1 cm long

Ranunculus
7 Petals absent (or modified into relatively inconspicuous nectaries or staminodia); sepals present and petaloid (white, yellow, yellow-green, cream, or blue).
9 Sepals 3-5 mm long, caducous; stamens white and showy; [subfamily Ranunculoideae, tribe
Ranunculeae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Trautvetteria
9 Sepals 6-40 mm long, not caducous; stamens not notably white and showy.
10 Leaves opposite, distributed along the stem; style plumose; [subfamily Ranunculoideae, tribe
Anemoneae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Clematis
10 Leaves all basal, or with a few alternate or whorled involucrate leaves on the stem; style not plumose.
11 Sepals white, bluish, or blue; basal leaves 3-5 (-7)-lobed; [subfamily Ranunculoideae, tribe Anemoneae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Anemone
11 Sepals yellow, green, or whitish (sometimes marked with purple); basal leaves unlobed, or palmately cleft into 5-11 (-many) segments; [subfamily Helleboroideae, tribe Helleboreae]. 12 Leaves cordate-reniform, unlobed; sepals bright yellow; petals absent; [native, of bogs

\section*{Flora of the Carolinas and Virginia, Working Draft of 10 June 2005 -- RANUNCULACEAE}
and marshes] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Caltha
12 Leaves palmately or pedately lobed or divided; sepals green, greenish, dull yellow, or whitish; petals modified into tubular nectaries; [introduced, rarely persistent or escaped from cultivation].
13 Sepals 5-8, much longer than wide; cauline leaves absent, except for the involucre which immediately subtends the flower . . . . . . . . . . . . . . . . Eranthis
13 Sepals 5 , nearly as wide as long; cauline leaves present . . . . . . . . Helleborus
4 Plants in fruit.
14 Fruit a follicle, each carpel with 2 or more ovules; [subfamily Helleboroideae].
15 Leaves cordate-reniform, toothed, not lobed or divided; [tribe Helleboreae] . . . . . . . . . . . . . . . . . . Caltha
15 Leaves variously palmately or pedately lobed or divided.
16 Carpels 1-3; plants 3-30 dm tall; [native]; [tribe Delphinieae].
17 Stems weak, clambering, reclining, or vining . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Aconitum
17 Stems strong, erect . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Delphinium
16 Carpels 3-6; plants 1-5 dm tall; [introduced, rarely persistent or escaping]; [tribe Helleboreae].
18 Cauline leaves absent, except for the involucre which immediately subtends the fruit . . Eranthis
18 Cauline leaves present
Helleborus
15 Fruit an achene (or dehiscent utricle in Trautvetteria), each carpel with 1 ovule; [subfamily Ranunculoideae]
19 Leaves opposite, distributed along the stem; style plumose; [tribe Anemoneae] ............. Clematis
19 Leaves all basal, or with a few alternate or whorled involucrate leaves on the stem; style not plumose.
20 Basal leaves linear to linear-spatulate, mostly 4-8 cm long, 1-3 mm wide; receptacle elongate, 1-6 cm
long (superficially resembling a Plantago inflorescence); [tribe Ranunculeae] . . . . . . . . . Myosurus
20 Basal leaves various, but not as above, generally long-petiolate, with an expanded, cordate, 3-lobed,
or palmately-lobed blade; receptacle globose to sub-cylindric, mostly less than 1 cm long.
21 Fruit a dehiscent utricle; cauline leaves alternate; [tribe Ranunculeae] . . . . . . . . Trautvetteria
21 Fruit an achene; cauline leaves opposite or whorled (or alternate in Ranunculus).
22 Cauline leaves alternate; sepals present; [tribe Ranunculeae]
Ranunculus
22 Cauline leaves opposite or whorled, or reduced to 3 sepal-like involucral bracts immediately subtending the flower; sepals absent (but in Hepatica mimicked by the bracts); [tribe Anemoneae]

Anemone
3 Leaves compound, the leaflets either linear or more-or-less petiolulate
Actaea, Anemone, Anemonella, Aquilegia, Clematis, Consolida, Coptis, Enemion, Eranthis, Helleborus, Nigella, Ranunculus, Thalictrum

\section*{Aconitum Linnaeus 1753 (Monkshood, Aconite)}

A genus of about 300 species, herbs, of Eurasia, n. Africa, and North America. References: Brink \& Woods in FNA (1997); Hardin (1964b) \(=\) Z; Tamura in Kubitzki, Rohwer, \& Bittrich (1993).

1 Flowers white, creamy white, or yellowish; basal leaves numerous, large, usually 10-20 cm across, on long, stout petioles; roots fascicled; [section Lycoctonum]
A. reclinatum

1 Flowers pale to medium blue (rarely white); basal leaves fewer, smaller, rarely over 10 cm across, on shorter and wirier petioles; root thickened, tuberous.
2 Upper leaves mostly 5-lobed, the lobes narrow, cuneate, serrate or further divided into acuminate teeth or segments; pedicels and inflorescence rachis pubescent . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. uncinatum var. muticum
2 Upper leaves 3-lobed, the lobes broad and only shallowly toothed; inflorescence rachis glabrous, pedicels usually pubescent only near the flower or fruit . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. uncinatum var. uncinatum

Aconitum reclinatum A. Gray, White Monkshood, Trailing Wolfsbane, White Aconite. Mt (NC, VA): rich cove forests, particularly along brookbanks, in seepages, and in periglacial boulderfields with seepage, primarily over mafic rocks (such as amphibolite, metagabbro, or greenstone), rarely over sandstone or granitic rocks; rare (NC Rare, VA Watch List). June-September. A Southern and Central Appalachian endemic: sw. PA through w. VA and e. WV to w. NC and ne. TN. It is more restricted in distribution and habitat than \(A\). uncinatum, but the two species sometimes occur together, even intertwined! [= RAB, C, F, FNA, G, K, S, W; A. vaccarum Rydberg]

Aconitum uncinatum Linnaeus var. muticum Augustin de Candolle, Appalachian Blue Monkshood. Mt (GA, NC, SC, VA), Pd, Cp (NC, VA): seepages, cove forests, other moist forests; uncommon (SC Rare). August-September. W. PA south through e. WV and VA to \(w\). and \(c\). NC, n. GA, e. TN, and w. SC. In our area it occurs primarily in the mountains, with disjunct occurrences in the lower Piedmont and upper Coastal Plain. [= C; = A. uncinatum Linnaeus ssp. muticum (Augustin de Candolle) Hardin = K, Z ; < A. uncinatum -- RAB, FNA, S, W, in part, infraspecific taxa not distinguished; = A. uncinatum var. acutidens Fernald -- F]

Aconitum uncinatum Linnaeus var. uncinatum, Common Blue Monkshood. Mt (GA, NC, SC, VA), Pd, Cp (GA, NC, VA): seepages, swamp forests, moist forests; uncommon (SC Rare). August-September. MD, c. WV, and s. IN south through TN, VA, NC, and w. SC to c. GA. In our area it occurs primarily along the Blue Ridge escarpment and in the upper Piedmont and, in GA, nc. \(N C\) and VA, in the lower and middle Piedmont and upper Coastal Plain. [ \(=C, F ;<A\). uncinatum -- RAB, FNA, S, W, in part, infraspecific taxa not distinguished; = A. uncinatum ssp. uncinatum -- K, Z]

A genus of about 28 species, perennial herbs, of temperate regions of the Northern Hemisphere. Compton, Culham, \& Jury (1998) support the inclusion of Cimicifuga in Actaea, based on analyses of morphology and DNA sequences. References: Ford in FNA (1997); Compton, Culham, \& Jury (1998)=Z; Tamura in Kubitzki, Rohwer, \& Bittrich (1993); Park \& Lee 1996).

References: Ramsey in FNA (1997); Compton, Culham, \& Jury (1998)=Z; Ramsey (1987, 1988); Tamura in Kubitzki, Rohwer, \& Bittrich (1993).

Identification notes: In rich coves, Actaea occurs with and is sometimes mistaken for (especially when in vegetative condition) various other genera, including Astilbe (Saxifragaceae), Aruncus (Rosaceae), Caulophyllum (Berberidaceae), Angelica and Ligusticum (Apiaceae), Aralia (Araliaceae) and others. The curious evolutionary convergence of leaf morphology (to a 2-3-ternately compound form) of a large number of unrelated genera of Appalachian cove forests is interesting. See Appendix 1, Key B \{not yet completed\}.

1 Plant in flower or fruit.
2 Carpels 3-8, on a short stipe elongating to \(5-8 \mathrm{~mm}\) long; flowering July-September; roots with vascular tissue in lunate bundles arranged in a circle; [section Podocarpae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. podocarpa
2 Carpels 1 (-3), sessile; flowering April-October; roots with vascular tissue in a central (3-) 4 (-5)-armed cross or star. 3 Fruit fleshy, indehiscent; flowering April-May; [section Actaea].

4 Fruiting pedicels thick, 1-2 mm in diameter; fruit white (rarely red) . . . . . . . . . . . . . . . . . . . . . . A. pachypoda
4 Fruiting pedicels slender, 0.4-0.7 mm in diameter; fruit red (rarely white) . . . . . . . . . . . . . . . . . . . . [A. rubra]
3 Fruit dry, follicular, dehiscent; flowering May-October.
5 Staminodes present; principal leaves with (15-) 20-70 leaflets; follicles 6-9 mm long; terminal leaflet broadly cuneate, rounded, truncate, or subcordate, with 3 major veins arising from the base; flowering May-August; [section Actaea] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. racemosa
5 Staminodes absent; principal leaves with 3-9 (-17) leaflets; follicles 12-17 mm long; terminal leaflet deeply cordate, with 7-9 major veins arising palmately from the base; flowering August-October; [section Oligocarpae]
1 Plant with leaves only present.
6 Terminal leaflet deeply cordate, mostly more than 12 cm wide, with 7-9 major veins arising palmately from the base; principal leaves with 3-9 (-17) leaflets[ [section Oligocarpae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. rubifolia
6 Terminal leaflet broadly cuneate, rounded, truncate, or subcordate, mostly less than 12 cm wide, with 3 major veins arising from the base; principal leaves with (15-) 20-70 leaflets.
\(7 \quad\) Petiole of basal leaves with a deep, broad groove (ca. 1 mm wide and 1 mm deep), persistent on fully expanded leaves; roots with vascular tissue in lunate bundles arranged in a circle; flowering August-September; [section Podocarpae].
A. podocarpa

7 Petiole of basal leaves terete, not grooved (or with a shallow, narrow groove early, obscure or absent on fully expanded leaves); roots with vascular tissue in a central (3-) \(4(-5)\)-armed cross or star; flowering April-August; [section Actaea]
A. pachypoda, A. racemosa, or [A. rubra]

Actaea pachypoda Elliott, White Baneberry, Dolls'-eyes, White Cohosh. Mt, Pd (GA, NC, SC, VA), Cp (VA): rich cove forests and slopes; common (rare in Piedmont and Coastal Plain). April-May; August-October. Québec and MN south to c. GA, LA, and OK. [= RAB, F, FNA, K, W, Z; = A. alba (Linnaeus) P. Miller -- C, G, S, probably misapplied; > A. pachypoda f. pachypoda -- Z; > A. pachypoda f. rubrocarpa (Killip ex House) Fernald -- Z]

Actaea podocarpa Augustin de Candolle, Mountain Black-cohosh, Late Black-cohosh. Mt (GA, NC, SC, VA): rich cove forests and slopes, at moderate to high elevations; uncommon (SC Rare). July-September. Endemic to the Southern and Central Appalachians: s. PA to W. NC, ne. GA, and e. TN. Most closely related to Actaea laciniata (S. Watson) J. Compton of OR and WA. [= K, Z; = Cimicifuga americana Michaux -- RAB, C, F, FNA, G, S, W]

Actaea racemosa Linnaeus, Common Black-cohosh, Early Black-cohosh. Mt, Pd (GA, NC, SC, VA), Cp (NC, VA): rich cove forests, other mesic and moderatrely to very fertile forests; common (uncommon in SC, rare in Coastal Plain of NC). May-August. Primarily Appalachian: w. MA south to SC and c. GA, but extending e. into the Coastal Plain and west to OH, IN, and MO. Var. dissecta appears to be a sporadically occurring form, apparently always occurring in small numbers associated with typic material; McCoy (2004) reports its collection in NC. [= Cimicifuga racemosa (Linnaeus) Nuttall -- RAB, C, F, FNA, S, W; < C. racemosa var. cordifolia (Pursh) Gray -- F, misapplied in part; < C. racemosa -- G, in part (see also C. rubifolia); > Actaea racemosa Linnaeus var. racemosa -- K, Z; > Actaea racemosa Linnaeus var. dissecta (A. Gray) J. Compton -- K, Z]

Actaea rubifolia (Kearney) Kartesz, Appalachian Black-cohosh. Mt (VA): rich cove forests over calcareous rocks (limestone or dolostone); rare (US Species of Concern, VA Rare). August-October. Sw. VA south to e. TN; disjunct in s. IL, w. KY, and nw. TN. This species is alleged by C (1991) to occur in NC, but this is probably an error, based on confusion with Cimicifuga cordifolia Pursh, now considered a form of Actaea racemosa. For this reason, the name Actaea cordifolia used by Compton, Culham, \& Jury (1998) does not apply to this taxon. Actaea rubifolia is related to Actaea elata (Nuttall) Prantl of nw. North America. [=K; = Cimicifuga rubifolia Kearney -- C, FNA, S, W; C. racemosa var. cordifolia (Pursh) A. Gray -- F, misapplied in part; C. racemosa -G, in part; Actaea cordifolia Augustin de Candolle -- Z, misapplied]

Actaea rubra (Aiton) Willdenow, Red Baneberry. South to c. PA (Rhoads \& Klein 1993) and n. NJ. [= C, F, FNA, G, Z; A. rubra ssp. rubra -- K]

\title{
Flora of the Carolinas and Virginia, Working Draft of 10 June 2005 -- RANUNCULACEAE
}

\section*{Adonis Linnaeus 1753 (Adonis)}

A genus of about 26 species, annual and perennial herbs, of Eurasia. References: Tamura in Kubitzki, Rohwer, \& Bittrich (1993).
* Adonis annua Linnaeus, Autumn Adonis, Bird's-eye, is naturalized in n. AL and sc. TN (Parfitt in FNA 1997). [= C, FNA, G, K]

Anemone Linnaeus 1753 (Anemone)

A genus of about 140-200 species (depending on circumscription), perennial herbs (rarely shrubs), of Eurasia, North America, Central America, South America, and Africa. Hoot, Reznicek, \& Palmer (1994) discuss the phylogeny of Anemone, and also suggest that Hepatica be included within it. References: Dutton, Keener, \& Ford in FNA (1997); Keener, Dix, \& Dutton (1996); Tamura in Kubitzki, Rohwer, \& Bittrich (1993); Steyermark \& Steyermark (1960)=Z; Ziman et al. (2004)=Y.

1 Basal leaves lobed but not fully divided into 3 or more leaflets; [subgenus Anemonidium].
2 Leaves lobed, and also toothed and variously cleft; leaves not variegated; [section Anemonidium] . . . . . . A. canadensis
2 Leaves lobed, the margins of the lobes entire; leaves often prominently variegated; [section Hepatica].
3 Leaves \(3(-7)\) lobed, the lobes acute, the primary sinuses deep, over halfway to the petiole (the middle lobe 70-90\% of the total length of the leaf blade); involucral bracts acute
A. acutiloba

3 Leaves 3 -lobed, the lobes broadly rounded, the primary sinuses less deep, about halfway to the petiole (the middle lobe \(50-70 \%\) of the total length of the leaf blade); involucral bracts obtuse
A. americana

1 Basal leaves compound, fully divided into 3 or more leaflets.
4 Stem branched, 4-11 dm tall, bearing 2 or more flowers; involucral bracts petiolate; [subgenus Anemone; section Anemone; group Multifida].
5 Base of involucral bracts usually truncate to subtruncate, sometimes reniform or cordate, terminal leaflets deep green, margins proximally concave- to straight-sided, distally incised, thinly pubescent; anthers typically less than 0.8-1.2 (-1.5) mm long; heads of achenes more or less ovoid-cylindric, 8-10 (-11) mm in diameter
[A. virginiana var. alba]
5 Base of involucral bracts cordate or reniform, rarely subtruncate, terminal leaflets light green, margins proximally mostly straight- to convex-sided, variously lobed or serrate, variously pubescent; anthers typically more than (0.9-) 1.1-1.5 (-1.7) mm long; heads of achenes ovoid to ovoid-cylindric, (9-) 10-12 (-14) mm in diameter

4 Stem unbranched, 0.5-4 dm tall, bearing 1 flower.
6 Sepals (5-) 8-20, cream-white, violet, blue, pink, or green; involucral leaves sessile; [subgenus Anemone; section Anemone; group Coronaria].
7 Stem densely pubescent above and below the involucre; involucre above the midpoint of the stem at anthesis; plant from a globose, vertically oriented bulb; involucral leaflets linear, (1.5-) 3-6 cm long, 1-4 (-6) mm wide; achene bodies more than 2.7-3.5 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. berlandieri
7 Stem densely pubescent above the involucre, glabrous to very sparsely pubescent beneath the involucre; involucre at or below the midpoint of the stem at anthesis; plant with horizontal rhizomes; involucral leaflets oblanceolate, 1-2.5 cm long; achene bodies less than 1.5-2.5 (-3.0) mm long . . . . . . . . . . . . . . A. caroliniana
6 Sepals \(5(-8)\), white; involucral leaves petiolate, the leaflets ovate, obovate, elliptic, lanceolate, or oblanceolate 2-8 cm long, \(8-30 \mathrm{~mm}\) wide; [subgenus Anemonanthea, section Anemonanthea, series Quinquefoliae].
8 Leaves and stems glabrous; ovaries and achenes with hairs 0.1-0.2 mm long; terminal leaflet broadest at or below the middle (lanceolate or ovate), serrate to below the middle; sepals 15 mm or more long . . A. lancifolia
8 Leaves and stems puberulent to subglabrous; ovaries and achenes with hairs 0.5-1.0 mm long; terminal leaflet broadest at or above the middle (elliptic, oblanceolate, or obovate), serrate only above the middle; sepals less than 15 mm long.
9 Achene bodies 2.5-3.0 mm long; lateral leaflets of radical leaves toothed only (rarely lobed); terminal leaflet usually broadest at the middle; styles \(0.5-1 \mathrm{~mm}\) long; sepals about 8 mm long
. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. quinquefolia var. minima
Achene bodies \(3.0-4.5 \mathrm{~mm}\) long; lateral leaflets of radical leaves lobed or cleft (sometimes only toothed); terminal leaflet usually broadest above the middle; styles 1-2 mm long; sepals 6-15 mm long

\section*{A. quinquefolia var. quinquefolia}

Anemone acutiloba (Augustin de Candolle) G. Lawson, Sharp-lobed Hepatica, Sharp-lobed Liverleaf. Mt (GA, NC, SC, VA), Pd (GA?, NC): moist forests, especially over calcareous or mafic rocks; uncommon (SC Rare). March-April. Widespread in e. North America. See comments under A. americana about the taxonomy of the two taxa of "Hepatica." [= FNA; = Hepatica acutiloba Augustin de Candolle - RAB, C, F, G, W; = Hepatica nobilis P. Miller var. acuta (Pursh) Steyermark -- K, Z; = Hepatica acuta (Pursh) Britton -- S]

Anemone americana (Augustin de Candolle) H. Hara, Round-lobed Hepatica, Round-lobed Liverleaf. Pd, Mt, Cp (GA, NC, SC, VA): moist forests; common (uncommon in Coastal Plain of NC and GA, rare in Coastal Plain of SC). February-April. Widespread in e. North America. The two taxa of "Hepatica" seem entirely distinct in our area; they are described as hybridizing freely or merging indistinguishably in other parts of their ranges. They are also both closely related to the European H. nobilis P . Miller. Steyermark \& Steyermark (1960) chose to treat the three entities as varieties of H. nobilis; I prefer to retain them at the specific level. [= FNA; = Hepatica americana (Augustin de Candolle) Ker-Gawler -- RAB, C, F, G, W; = Hepatica nobilis P. Miller
var. obtusa (Pursh) Steyermark -- K, Z; < Hepatica hepatica (Linnaeus) Karsten -- S]
Anemone berlandieri Pritzel, Eastern Prairie Anemone, Tenpetal Anemone. Pd (GA, NC, SC, VA): thin, circumneutral soils around rock outcrops; rare (GA Special Concern, NC Rare, SC Rare, VA Rare). March-April. A. berlandieri and A. caroliniana have been much confused in floras; see Joseph \& Heimburger (1966) for clarification. A. berlandieri is primarily a species of midwestern prairies, occurring in from KS, OK, and TX east to AR, MS, and AL; disjunct in \(c . G A, c . N C\), and sc. VA. It reaches its northeastern limit (and only VA occurrence) at calcareous mudstone cliffs on the Banister River in Pittsylvania County, VA; it is scattered in the Piedmont of NC on a variety of rock types, including mafic meta-argillite and plagioclase-rich granite. [=FNA, K; <A. caroliniana Walter -- RAB, C, F, G, S, W, in part; A. heterophylla Nuttall ex Torrey \& Gray; A. decapetala Arduino, misapplied (a South American species)]

Anemone canadensis Linnaeus, Canada Anemone. Mt, Pd (VA): moist forests; rare (VA Rare). May-August. Québec west to Alberta, south to MD, w. VA, s. WV, e. TN (Chester, Wofford, \& Kral 1997), KY, MO, and NM. [= C, F, FNA, G, K, W]

Anemone caroliniana Walter, Prairie Anemone, Carolina Anemone. Pd (GA, NC, SC): clayey soils of post oak and blackjack oak woodlands (Iredell soils), wet meadows; rare (GA Special Concern, NC Rare, SC Rare). Ranging primarily in the Midwest, north in the Southeast to disjunct locations in c. and sc. GA, c. SC, c. TN (Chester, Wofford, \& Kral 1997), and sc. NC. [= FNA, K; < A. caroliniana Walter -- RAB, C, F, G, S, W, in part only (also see A. berlandieri)]

Anemone lancifolia Pursh, Lanceleaf Anemone. Pd, Mt, Cp (NC, SC, VA): rich, moist soils on slopes or in bottomlands; common (uncommon in NC and SC Mountains, rare in VA Piedmont, rare in Coastal Plain). March-May. Appalachian: s. PA south to GA (?), in and near the Appalachians. It is a somewhat larger plant than the closely related A. quinquefolia. [= RAB, C, F, FNA, G, K, S, W; = A. quinquefolia var. lancifolia (Pursh) Fosberg]

Anemone quinquefolia Linnaeus var. minima (Augustin de Candolle) Frodin ex Dutton \& Keener, Tiny Anemone. Mt (NC, VA), Pd (VA): acidic forests, especially under Alnus serrulata along small streams; rare (NC Watch List, VA Watch List). MarchMay. A Southern Appalachian endemic: VA and WV south to NC and TN. See Dutton \& Keener (1994). [=FNA, K; = A. minima Augustin de Candolle -- C, F, G, W]

Anemone quinquefolia Linnaeus var. quinquefolia, Wood Anemone. Mt (GA, NC, SC, VA), Pd (GA, NC, VA), Cp (NC, VA): rich, moist forests, grassy balds, often abundant at high elevations; common (rare in upper Piedmont and outer Coastal Plain of NC and VA). March-May. The species is widespread in ne. North America, south to MD, IN, IL, and IA, and south in the mountains to nc. GA. [= FNA; = A. quinquefolia -- \(\mathrm{RAB}, \mathrm{S}, \mathrm{W} ;>\) A. quinquefolia var. quinquefolia \(-\mathrm{C}, \mathrm{F}, \mathrm{K} ;>\mathrm{A}\). quinquefolia var. bifolia Farwell \(\mathrm{C}, \mathrm{G}, \mathrm{K} ;>A\). quinquefolia var. interior Fernald \(-\mathrm{F}, \mathrm{G}]\)

Anemone virginiana Linnaeus var. virginiana, Tall Anemone, Thimbleweed. Mt, Pd, Cp (GA, NC, SC, VA): rich forests and woodlands, especially prevalent on circumneutral soils; common (uncommon in Coastal Plain, especially south of VA). May-July. The species is widespread in e. North America. Two other varieties are more northern; see discussion of var. alba below. [= C, FNA, K; < A. virginiana -- RAB, W, infraspecific taxa not distinguished; A. virginiana -- F, G, S, in a narrow sense; A. riparia Fernald -- S, misapplied]
* Anemone blanda Schott \& Kotschy is reported by Harvill et al. (1992) from Madison County, VA and for Fauquier County, VA by Shetler \& Orli (). It is not known whether this species is established in our area. \{make sure this is not a misidentified specimen of \(A\). berlandieri -- see FNA p. 140\} [= FNA, K] \{not yet keyed\}

Anemone virginiana Linnaeus var. alba (Oakes) A. Wood ranges south to se. NY and NJ (Kartesz 1999) and has been reported for our area. Keener, Dix, \& Dutton (1996) discuss the intergrading varieties of \(A\). virginiana. This variety might be expected in \(n\). VA, especially in river scour situations. [= C, FNA; = A. virginiana var. riparia (Fernald) Boivin -- K; = A. riparia Fernald -- F, G]

\section*{Anemonella Spach (Rue-anemone, Windflower)}

A monotypic genus, a perennial herb, of temperate e. North America. Anemonella is often united with Thalictrum (as section Anemonella); this may prove to be the more appropriate treatment. References: Park \& Festerling in FNA (1997); Tamura in Kubitzki, Rohwer, \& Bittrich (1993).

Anemonella thalictroides (Linnaeus) Spach, Rue-anemone, Windflower. Mt, Pd, Cp (GA, NC, SC, VA): moist forests; common (rare in Coastal Plain). March-May. The species is widespread in e. North America. [= C, F, G; Thalictrum thalictroides (Linnaeus) Eames \& Boivin -- RAB, FNA, K, W; Syndesmon thalictroides (Linnaeus) Hoffmannsegg ex Britton -- S]

\section*{Aquilegia Linnaeus 1753 (Columbine)}

A genus of about 80 species, perennial herbs, of the Northern Hemisphere. References: Whittemore in FNA (1997); Munz (1946) \(=\) Z; Tamura in Kubitzki, Rohwer, \& Bittrich (1993).

Identification notes: When in leaf, easily mistaken for Thalictrum, Anemonella, or Enemion; look for old fruits.
1 Flowers red and yellow . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. canadensis
1 Flowers blue or purple . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. vulgaris

Aquilegia canadensis Linnaeus, Canada Columbine, Eastern Columbine. Mt, Pd, Cp (GA, NC, SC, VA): forests, woodlands, rock outcrops, especially (though by no means entirely) on calcareous or mafic substrates; common (rare in Coastal Plain of GA, NC, and SC, where restricted to coquina limestone outcrops, Indian shell middens, and other calcareous sites). March-May.

Widespread in e. North America, one of our most familiar wildflowers. Disjunct populations in the deep South, on limestone in sw. GA and FL Panhandle, have been described as A. australis or A. canadensis var. australis; they need additional study. [= RAB, C, F, FNA, G, K, S, W; A. canadensis var. coccinea (Small) Munz -- F, Z; A. australis Small - S; A. coccinea Small -- S; A. canadensis var. australis (Small) Munz - Z]
* Aquilegia vulgaris Linnaeus, European Columbine. Pd, Mt (NC), \{GA\}: disturbed areas; rare, introduced from Europe. Many varieties have been named; there seems little utility in trying to apply these names to the cultivated plants rarely persistent in our area. [= RAB, C, FNA, G, K; A. vulgaris varieties - Z]
\[
\text { Caltha Linnaeus } 1753 \text { (Marsh Marigold, Cowslip) }
\]

A genus of about 12 species, perennial herbs, of the Northern and Southern Hemispheres (sometimes further divided). References: Ford in FNA (1997); Tamura in Kubitzki, Rohwer, \& Bittrich (1993).

Caltha palustris Linnaeus var. palustris, Marsh Marigold, Cowslip. Mt (NC, VA), Pd, Cp (VA): bogs, wet meadows, seepage swamps, brookbanks; uncommon, rare south of VA (NC Rare). April-June. Caltha palustris is circumboreal, widespread in \(n\). Eurasia and n. North America, south in e. North America to w. NC, ne. TN, WV, IN, IL, and IA. Caltha palustris is polymorphic; one or more additional varieties (some of them sometimes recognized as separate species) are more northern. Eastern North American material is apparently uniformly \(2 n=32\) (Keener 1977). [=G, GW, K; C. palustris -- RAB, C, F, FNA, S, W, infraspecific taxa not distinguished; C. palustris var. flabellifolia (Pursh) Torrey \& A. Gray]

\section*{Cimicifuga Wernischeck 1763 (Black-cohosh) (see Actaea)}

Clematis Linnaeus 1753 (Clematis, Virgin's-bower)
A genus of about 295 species, shrubs, vines, and suffruticose herbs, of Eurasia, North America, South America, Africa, Madagascar, and Oceania. W.A. Weber (1995) proposes generic status (as Coriflora W.A. Weber) for the leatherflowers, here treated as Clematis, subgenus Viorna. References: Pringle in FNA (1997); Moreno \& Essig in FNA (1997); Essig (1990); Keener (1975); Keener (1967); Pringle (1971)=Z; Tamura in Kubitzki, Rohwer, \& Bittrich (1993).

1 Flowers numerous, in compound cymose-paniculate inflorescences; sepals white; filaments glabrous; [subgenus Clematis].
2 Flowers perfect, with 5-10 carpels; anthers 1.5-3 mm long; leaf margins entire (rarely cleft); leaflets (3-) 5 ( -7 ); [alien, in disturbed areas]
C. terniflora

2 Flowers mostly polygamo-dioecious, the pistillate with 18-60 carpels; anthers \(0.5-1 \mathrm{~mm}\) long; leaf margins coarsely toothed; leaflets 3 (C. virginiana) or 5-7 (C. catesbyana); [native, though sometimes weedy].
\(\begin{array}{ll}3 & \text { Leaves } 3 \text {-foliolate; pistillate flowers with } 40-60 \text { carpels } \ldots \ldots \ldots \ldots \ldots \ldots \ldots . \ldots \\ 3 & \text { Leaves } 5-7 \text {-foliolate; pistillate flowers with } 18-35 \text { carpels . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. catesbyana }\end{array}\)
1 Flowers solitary or in groups of 3's; sepals usually at least partly bluish, purplish or red; filaments pubescent.
4 Leaves (most or all of them) simple, sessile or subsessile; plant an erect herb to 7 dm tall; [subgenus Viorna].
5 Leaves glaucous and glabrous beneath, the uppermost commonly pinnate and tendril-bearing ....... C. addisonii 5 Leaves green and usually pubescent beneath, the uppermost usually simple and entire, neither pinnate nor tendrilbearing (though occasionally lobed).
6 Leaves of flowering material soft-pubescent beneath, the largest \(3-9 \mathrm{~cm}\) wide, with stomates on the lower surface only; leaves of fruiting material usually light green with the secondary and tertiary veins forming prominent reticulations on the upper surface.
\(7 \quad\) Stems and leaves usually densely sericeous-woolly; sepal backs densely sericeous; mature styles white to pale yellow, sharply recurved and flexuous; [of shale barrens and calcareous woodlands of w. VA]

\section*{C. coactilis}

7 Stems and leaves villous; sepal backs moderately sericeous-pilose; mature styles yellowish-white to deep tawny, loosely spreading-recurved; [of various woodlands, in NC, SC, and VA] . . . . . . . . . C. ochroleuca
6 Leaves of flowering material glabrous to sparsely pilose beneath, the largest \(2-5 \mathrm{~cm}\) wide (or \(3.5-11 \mathrm{~cm}\) wide in C. fremontii), with stomates on both surfaces; leaves of fruiting material often dark green, either with the secondary and tertiary veins forming prominent reticulations on the upper surface ( \(C\). fremontii) or the upper with the secondary and tertiary veins not forming prominent reticulations on the upper surface (C. albicoma and C. viticaulis).

8 Sepal tips acuminate; achene bodies cobwebby-tomentose towards the tip; [of prairies of nw. GA] ......
8 Sepals tips obtuse to acute; achene bodies pilose throughout; [of shale barrens of w. VA and WV].
9 Sepal backs villous; pubescence on the summit of the achene and the base of the style spreading or reflexed; mature styles white to pale yellow, sharply recurved and flexuous . . . . . . . . . . C. albicoma
9 Sepal backs finely puberulent; pubescence on the summit of the achene and the base of the style closely appressed-ascending; mature styles tawny to deep reddish-brown, loosely spreading-recurved
. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. viticaulis

4 Leaves (most of them) compound, petiolate; plant a trailing or climbing vine, to many meters long (or erect or ascending in
C. addisonii and C. socialis).

10 Sepals thin in texture, \(3-5 \mathrm{~cm}\) long, soft-villous, neither apically recurved nor with broad, strongly crisped margins; leaves 3-foliolate; [subgenus Atragene] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. occidentalis var. occidentalis
10 Sepals thick in texture, 1-5 cm long, short-sericeous, apically recurved; leaves 1-11-foliolate; [subgenus Viorna]. 11 Lower surface of leaves glaucous and glabrous (rarely with a few scattered hairs).

12 Plant an erect or ascending herb; lower leaves simple, upper leaves simple to 2-6-foliolate; [of dry limestone glades, endemic to VA] C. addisonii

12 Plant a climbing vine; all leaves generally compound, often 6-10-foliolate; [of various habitats, ranging from NC south].
13 Leaf blade thin in texture; secondary and tertiary veins not prominently reticulate .. C. glaucophylla
13 Leaf blade leathery in texture; secondary and tertiary veins prominently reticulate; [in the Ridge and Valley of eastern TN and westwards]
[C. versicolor] 11 Lower surface of leaves not glaucous, pubescent (rarely nearly glabrous). 14 Plants erect, to 2-3 (-5) dm tall, forming clonal patches by underground rhizomes; leaflets linear-lanceolate, averaging ca. \(10 \times\) as long as wide C. socialis

14 Plants viny, sprawling or climbing, the stems usually over 1 m long, not rhixomatous-clonal; leaflets generally broader.
15 Leaves coriaceous, the secondary and tertiary veins forming prominent reticulations on the upper surface.
16 Leaf blade coarsely reticulate-veined, the ultimate closed areoles often more than 2 mm long in the longer dimension, the tertiary and quaternary veins not prominently raised; achene beak sparsely pubescent to silky, with ascending or appressed hairs ..... [C. pitcheri var. pitcheri]
16 Leaf blade finely reticulate-veined, the ultimate closed areoles mostly less than 2 mm long in the longest dimension, the tertiary and quaternary veins often pominently raised; achene beak plumose, with spreading hairs . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. reticulata 15 Leaves membranous, the secondary and tertiary veins forming faint, indistinct reticulations on the upper surface.
17 Sepals 2.5-5 cm long, the tips widely spreading, the upper margins thin, crisped, to 6 mm wide; peduncles usually without bracts . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. crispa
17 Sepals \(1.5-3 \mathrm{~cm}\) long, the tips either abruptly and shortly recurved (C. viorna) or spreading to short-reflexed (C. morefieldii), the upper margins not thin or crisped, to 2.5 mm long; peduncles usually with bracts.
18 Stems with cobwebby pubescence; bracts near the base of the peduncle; sepals densely silky-pubescent on the outer surface, pinkish-green; [limestone habitats of n. AL and se. TN
[C. morefieldii]
18 Stems glabrous to sparsely pilose; bracts well above the base of the peduncle; sepals sparsely pubescent on the outer surface, pale lavender to purple; [widespread in our area]
C. viorna

Clematis addisonii Britton, Addison's Leatherflower. Mt (VA): dry to mesic calcareous barrens, woodlands, and forests, over dolostone (Elbrook Formation); rare (VA Rare). April-June. Endemic to w. VA (Botetourt, Montgomery, Roanoke, and Rockbridge counties). [= C, F, FNA, G, K, W; Viorna addisonii (Britton) Small -- S; Coriflora addisonii (Britton) W.A. Weber]

Clematis albicoma Wherry, White-haired Leatherflower. Mt (VA): shale barrens; uncommon. May-June. Endemic to w. VA (Alleghany, Augusta, Bath, Botetourt, Highland, and Rockbridge counties), and e. WV. [= C, FNA, G, K, W; C. albicoma var. albicoma -- F; Coriflora albicoma (Wherry) W.A. Weber]

Clematis catesbyana Pursh, Coastal Virgin's-bower, Satin-curls. Cp (GA, NC, SC), Mt (NC, VA): dunes and interdune swales with abundant shell hash, calcareous woodlands and thickets; rare (NC Watch List, VA Rare). July-September. Se. VA south to FL and west to LA, and inland especially in calcareous parts of c. TN and n. AR and s. MO, as well as in the Ridge and Valley of VA and disjunct at Linville Caverns, McDowell County, NC, where on dolomite in a geologic window in the Blue Ridge. [= C, FNA, GW, K, S; C. ligusticifolia Nuttall -- RAB, misapplied; C. micrantha Small -- S]

Clematis coactilis (Fernald) Keener, Virginia White-haired Leatherflower. Mt (VA): shale barrens, shaly woodlands, dry calcareous barrens and woodlands; rare (VA Rare). May-June. Endemic to w. VA (Botetourt, Craig, Giles, Montgomery, Pulaski, Roanoke, and Wythe counties). [= C, FNA, K, W; C. albicoma Wherry var. coactilis Fernald -- F]

Clematis crispa Linnaeus, Marsh Clematis, Southern Leatherflower, Blue Jasmine. Cp, Pd (GA, NC, SC, VA), Mt (GA): marshes, swamps, disturbed wet or moist areas; common (rare in VA, rare in Piedmont) (VA Watch List). April-August. Widespread in Southeastern United States, FL to TX, north to se. VA and s. IL. [= RAB, C, F, FNA, G, GW, K, W; Viorna crispa (Linnaeus) Small -- S; Coriflora crispa (Linnaeus) W.A. Weber]

Clematis fremontii S. Watson. Mt (GA): prairies; rare. MO, KS, and NE; disjunct in nw. GA. See Anonymous (2003) for additional information. [= FNA, K; Coriflora fremontii (S. Watson) W.A. Weber]

Clematis glaucophylla Small, White-leaved Leatherflower. Mt, Pd (GA, NC?, SC?, VA), Cp (GA): habitat in our area poorly known, the species not recently seen here, probably in dry woodlands or openings over calcareous rocks, according to RAB in "rich woods"; rare (NC Rare, VA Rare). May-September. Widespread in Southeastern United States, from w. NC (?), e. TN, KY, and OK, south to FL and MS, but apparently rare and poorly known. [= RAB, C, F, FNA, G, GW, K; Viorna glaucophylla (Small) Small -- S; Coriflora glaucophylla (Small) W.A. Weber]

Clematis occidentalis (Hornemann) Augustin de Candolle var. occidentalis, Purple Clematis, Mountain Clematis. Mt (NC, VA): rocky slopes over mafic rocks (greenstone, amphibolite), known positively in NC only from Bluff Mountain, Ashe County; rare
(NC Rare, VA Watch List). May-June. Var. occidentalis is widespread in ne. North America, from New Brunswick west to w. Ontario, south to NJ, DE, OH, nw. IL, and ne. IA, and in the mountains to w. VA and w. NC. Two other varieties occur in the Rocky Mountains. Fernald's var. cacuminis, published under \(C\). verticillaris, described plants from the mountains of VA and NC; it is apparently merely a form based on material in early flower (Pringle 1971). [= FNA, K; C. verticillaris Augustin de Candolle -- RAB, G; C. occidentalis -- C, W; C. verticillaris Augustin de Candolle var. cacuminis Fernald -- F; Atragene americana Sims -- S]

Clematis ochroleuca Aiton, Curlyheads. Pd (GA, NC, SC, VA), Mt (GA, NC, VA), Cp (NC, SC, VA): dry woodlands and woodland borders, generally over mafic or calcareous rocks, such as diabase, gabbro, or calcareous siltstone; uncommon (rare in Mountains and Coastal Plain). April-June. Primarily Piedmont: NY south to ec. GA. [= RAB, C, F, FNA, G, K, W; Viorna ochroleuca (Aiton) Small -- S; Coriflora ochroleuca (Aiton) W.A. Weber]

Clematis reticulata Walter. Cp (GA, SC), Pd (GA), Mt? (GA?): dry, sandy woodlands, such as longleaf pine sandhills and dry hammocks; uncommon. May-August. Se. SC south to FL, west to TX, and north in the interior to TN and AR. [= RAB, FNA, K; Viorna reticulata (Walter) Small -- S; Coriflora reticulata (Walter) W.A. Weber]

Clematis socialis Kral, Alabama Leatherflower. Mt (GA): bottomlands; rare (US Endangered, GA Endangered). Nw. GA (Floyd Co.) and ne. AL (St. Clair and Cherokee counties). Timmerman-Erskine \& Boyd (1999) report on reproductive ecology of this endangered species. [= FNA, K]
* Clematis terniflora Augustin de Candolle, Sweet Autumn Clematis, Yam-leaved Clematis. Mt (NC, VA), Pd, Cp (GA, NC, SC, VA): disturbed areas; uncommon, introduced from e. Asia (Japan, China, Korea). July-September. [= C, FNA, GW, K, W; C. dioscoreifolia Léveillé \& Vaniot -- RAB; C. dioscoreifolia Léveillé \& Vaniot var. robusta Carrière \& Rehder -- F; C. paniculata Thunberg -- S; C. maximowicziana Franchet \& Savatier]

Clematis viorna Linnaeus, Northern Leatherflower, Vase-vine. Mt, Pd, Cp (GA, NC, SC, VA): mesic forests, woodlands, thickets, especially over mafic rocks; common (rare in Coastal Plain south of VA). May-September. Widespread in Southeastern United States, north to PA, IL, and MO. [= RAB, C, F, FNA, G, K, W; Viorna viorna (Linnaeus) Small -- S; Viorna beadlei Small -- S; Viorna flaccida (Small) Small -- S; Coriflora viorna (Linnaeus) W.A. Weber; Coriflora beadlei (Small) W.A. Weber]

Clematis virginiana Linnaeus, Virgin's-bower. Mt, Pd, Cp (GA, NC, SC, VA): moist forests, thickets, and openings; common (rare in Coastal Plain south of VA). July-September. Widespread in e. North America. Vegetatively, this species can be distinguished from C. viorna and C. crispa (the other common and widespread species in our area) by its leaves with three relatively symmetrical leaflets (vs. leaves with 3-many irregular leaflets). [= RAB, C, F, FNA, GW, K, S, W; C. virginiana var. virginiana -- G]

Clematis viticaulis Steele, Millboro Leatherflower. Mt (VA): shale barrens and shaly woodlands; rare (US Species of Concern, VA Rare). May-June. Endemic to w. VA (Augusta, Bath, and Rockbridge counties). [= C, F, FNA, G, K, W; Coriflora viticaulis (Steele) W.A. Weber]

Clematis morefieldii Kral, Morefield's Leatherflower, is known from limestone habitats of nc. AL and se. TN. [= FNA, K] Clematis pitcheri Torrey \& A. Gray var. pitcheri, Bellflower Leatherflower, ranges east to nc. TN (Chester, Wofford, \& Kral 1997) and KY (Kartesz 1999). [= FNA, K; Viorna pitcheri (Torrey \& A. Gray) Britton -- S]

Clematis versicolor Small ex Rydberg, Pale Leatherflower, occurs east to e. TN (Chester, Wofford, \& Kral 1997), KY, and AL (Kartesz 1999), and seems likely to occur in sw. VA. [= FNA, K; Viorna versicolor (Small ex Rydberg) Small -- S] * Clematis viticella Linnaeus, native to Europe, has been reported for TN (Pringle in FNA 1997). \{not keyed\} [= FNA, K; Viticella viticella (Linnaeus) Small]

Other species of Clematis, of Asian or European origin, are cultivated as ornamentals.

Consolida (Augustin de Candolle) S.F. Gray 1821 (Annual Larkspur)
A genus of about 43 species, annual herbs, of Eurasia. References: Warnock in FNA (1997); Tamura in Kubitzki, Rohwer, \& Bittrich (1993).

1 Lower bracts of the inflorescence with 5 or more lobes; inflorescence an elongate or compound raceme; pistil densely pubescent; follicle 12-25 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. ajacis
1 Lower bracts of the inflorescence unlobed or the lowermost with 3 lobes; inflorescence a corymbiform raceme; pistil glabrous; follicle \(8-17 \mathrm{~mm}\) long
C. regalis
* Consolida ajacis (Linnaeus) Schur, Rocket Larkspur. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): roadsides, fields, waste places, disturbed ground; common, introduced from Europe. [= FNA, K; Delphinium ajacis Linnaeus -- RAB, F, G, S; Delphinium ambiguum Linnaeus -- C; Consolida ambigua (Linnaeus) P.W. Ball \& Heywood in Heywood \& P.W. Ball -- W]
* Consolida regalis S.F. Gray, Rocket Larkspur, Forking Larkspur. Cp (NC): disturbed areas; rare, introduced from Europe. Also known from DC and to be expected in VA. [= FNA, K; Delphinium consolida Linnaeus -- C, G, S]
* Consolida pubescens (de Candolle) Soó is naturalized in s. TN (Warnock in FNA 1997). [= FNA, K] \{not yet keyed\}

\section*{Coptis Salisbury 1807 (Goldthread)}

A genus of about 15 species, perennial herbs, of boreal to temperate e. Asia and North America. References: Ford in FNA (1997); Tamura in Kubitzki, Rohwer, \& Bittrich (1993).

Coptis trifolia (Linnaeus) Salisbury var. groenlandica (Oeder) Fassett, Goldthread, Goldenroot. Mt (NC): bogs; rare (NC

Rare). May-June. The species ranges from Greenland west to AK, south to NJ, nw. NC, n. IN, IA, and British Columbia; and in e. Asia. Var. groenlandica is the variety in e. North America, northeast to Greenland, and in southern parts of nw. North America; var. trifolia is Alaskan and e. Asian. Whether the varieties are worth recognition is somewhat questionable. Coptis had been reported for NC by many floras (for instance, C, F, G, and S), but the documentation was unknown; its presence in NC has now been confirmed (McMillan, pers. comm.). The species is distinctive, with neatly trifoliolate leaves, small white flowers on scapes, and yellow roots. [= C; C. groenlandica (Oeder) Fernald - F; C. trifolia ssp. groenlandica (Oeder) Hultén -- G; C. trifolia -- FNA, K, S, infraspecific taxa not distinguished]

Delphinium Linnaeus 1753 (Larkspur)
(also see Consolida)
A genus of about 320 species, herbs, of Eurasia, Africa, and North America. References: Warnock in FNA (1997); Kral (1976)=Z; Warnock 1995; Tamura in Kubitzki, Rohwer, \& Bittrich (1993).

1 Follicles divergent; raceme 0.5-2 (-3) dm long; flowering plants 2-5 (-7) dm tall; flowering March-May; [section Diedropetala, subsection Grumosa].
2 Stems (4.5-) 6-9 (-13) dm tall; flowers (sepals) deep blue; lower stem pubescent . . . . . . . . . . . . . . . ... D. alabamicum
2 Stems 2-6 dm tall; flowers (sepals) deep bluish purple, pink, or white; lower stem glabrous or nearly so . . . . . D. tricorne
1 Follicles erect; raceme more than 3 dm long; flowering plants 5-20 dm tall; flowering May-September.3Seeds wing-margined, the surfaces smooth; stem below the inflorescence glabrous; flowering plants 8-20 dm tall; flowering July-September; [section Diedropetala, subsection Exaltata]
D. exaltatum

3 Seeds with prominent transverse ridges; stem below the inflorescence pubescent; flowering plants 2-10 (-15) dm tall; flowering May-July; [section Diedropetala, subsection Virescens].
4 Basal leaves usually present at anthesis; flowers (sepals) white; stems 2-4 (-7) dm tall; ultimate segments of midcauline leaves \(5-12\) in number, 2-4 mm wide . . . . . . . . . . . . . . . . . . . . . . D. carolinianum ssp. calciphilum
4 Basal leaves absent at anthesis; flowers (sepals) blue to purple (rarely white); stems (3-) 6-10 (-15) dm tall; ultimate segments of midcauline leaves 12-25 in number, \(0.5-1.5 \mathrm{~mm}\) wide D. carolinianum ssp. carolinianum

Delphinium alabamicum Kral, Alabama Larkspur. Mt (GA): calcareous soils; rare. Endemic to c. and n. AL and nw. GA. It is very rare, if not extinct. [= FNA, K]

Delphinium carolinianum Walter ssp. calciphilum M.J. Warnock, Glade Larkspur. Mt (GA): limestone glades; rare (GA Special Concern). East to ne. AL, nw. GA, and c. and e. TN. [= FNA, K; D. virescens Nuttall, in part; D. carolinianum Walter ssp. virescens (Nuttall) R.E. Brooks, in part]

Delphinium carolinianum Walter ssp. carolinianum, Prairie Larkspur, Carolina Larkspur, Blue Larkspur. Pd, Cp (GA, SC): rocky woodlands, granite outcrops, Altamaha Grit outcrops, moist sandy woodlands associated with longleaf pine; rare (GA Watch List, SC Rare). May-July. IL west to MO, south to LA and TX, with disjunct occurrences eastwards in SC, GA, TN, and MS. The flowers are a pale to medium blue. This species has been reported for NC (by C) and "north to Va." (by F and S). I know of no documentation for its past or present occurrence in NC or VA, but its presence in those states is plausible. [=FNA, K; D. carolinianum Walter -- C, F, G, S, Z]

Delphinium exaltatum Aiton, Tall Larkspur. Mt (NC, VA), Pd (NC): dry to moist soils over calcareous (such as dolostone, especially Elbrook Formation) or mafic rocks (such as amphibolite, metagabbro, greenstone, and diabase), usually in the open (as grassy balds) or on forest edges in partial sun; rare (US Species of Concern, NC Endangered, VA Watch List). July-September. Primarily west of the Blue Ridge, ranging from sw. PA and OH southwest to MO and e. TN, and south to the Mountains of VA and the Mountains and Piedmont of NC. The flowers are a pale to medium blue. [= RAB, C, F, FNA, G, K, S, W, Z]

Delphinium tricorne Michaux, Dwarf Larkspur. Mt (GA, NC, \{SC\}, VA), Pd, Cp (NC, VA): rich, moist forests, especially over mafic or calcareous rocks, less commonly (as along the Roanoke River in ne. NC) on very fertile alluvial deposits; uncommon (rare in Piedmont and Coastal Plain) (GA Special Concern). March-May. The flowers are variable in color, usually a deep bluish violet, but ranging through pink to pure white. Sw. PA and MN south to NC, nw. GA, AL, and OK. [= RAB, C, F, FNA, G, K, S, W, Z]

Enemion Rafinesque 1820 (Isopyrum)
A genus of about 6 species, perennial herbs, of temperate North America and e. Asia. The issue of the separation of the genus Enemion from Isopyrum remains controversial; I here follow Keener (1977). References: Ford in FNA (1997); Tamura in Kubitzki, Rohwer, \& Bittrich (1993); Keener (1977).

Identification notes: Enemion is superficially similar to Anemonella thalictroides, but can be distinguished by the following characters: fruit a follicle (vs. fruit an achene), petaloid sepals 5 (vs. 5-10, usually some at least of the flowers on a plant with 6 or more).

Enemion biternatum Rafinesque, Isopyrum, False Rue-anemone. Pd (NC, SC, VA), Cp (NC): rich forests, either on natural levees with very nutrient rich sediments or on slopes with underlying mafic rocks; rare (NC Rare, VA Rare, SC Rare). March-April; May. Fairly widespread in e. North America, primarily west of the Appalachians, from w. NY, s. Ontario and MN south to TN and AR; disjunct in the Piedmont and Coastal Plain of VA, NC, and SC and the Coastal plain of FL. [= FNA, K; Isopyrum biternatum (Rafinesque) Torrey \& Gray -- RAB, C, F, G, S]

Eranthis Salisbury 1808 (Winter-aconite)
A genus of about 8 species, perennial herbs, of Europe and Asia. References: Parfitt in FNA (1997); Tamura in Kubitzki, Rohwer, \& Bittrich (1993).
* Eranthis hyemalis (Linnaeus) Salisbury, Winter-aconite. Cp (VA), Pd (NC): cultivated in gardens, rarely persisting or escaped; rare, native of Eurasia. January-March. [= F, FNA, G, K]
\[
\text { Helleborus Linnaeus } 1753 \text { (Hellebore, Christmas-rose) }
\]

A genus of about 21 species, perennial herbs, of Europe and Asia. References: Ford in FNA (1997); Tamura in Kubitzki, Rohwer, \& Bittrich (1993).
* Helleborus viridis Aiton, Green Hellebore, Christmas-rose. Mt (VA), Pd (NC): cultivated in gardens, rarely escaped or persistent; rare, introduced from Europe. December-May. This plant has fallen somewhat out of horticultural favor. [= C, F, FNA, G, K, S]

\author{
Hepatica \\ (see Anemone)
}

Isopyrum
(see Enemion)

\section*{Myosurus Linnaeus 1753 (Mousetail)}

A genus of about 15 species, annual scapose herbs, nearly cosmopolitan (lacking in e. Asia and tropical regions), with a center of diversity in w. North America. References: Whittemore in FNA (1997); Campbell (1952)=Z; Tamura in Kubitzki, Rohwer, \& Bittrich (1993).

Myosurus minimus Linnaeus, Mousetail. Pd (NC, SC, VA), Cp (NC, VA), \{GA\}: usually in disturbed areas, such as fields in floodplains; uncommon. March-May. The species is circumboreal and also found in various places in the Southern Hemisphere. Widely distributed in North America, Eurasia, and the Southern Hemisphere. A number of subspecies have been described; if these are recognized, our material is the typic ssp. minimus. The pre-Columbian occurrence of Myosurus in our area is uncertain; it may well be an alien. [= RAB, C, F, FNA, G, GW, K, S; M. minimus ssp. minimus -- Z]

\section*{Nigella Linnaeus 1753 (Fennel-flower)}

A genus of about 20 species, annual herbs, of Europe, n. Africa, and Asia. References: Ford in FNA (1997); Tamura in Kubitzki, Rohwer, \& Bittrich (1993).
* Nigella damascena Linnaeus, Love-in-a-mist, Fennel-flower. Mt (VA): cultivated in gardens, rarely persistent or escaping; rare, native of \(s\). Europe. [= C, F, FNA, G, K]

Ranunculus Linnaeus 1753 (Buttercup, Crowfoot, Spearwort)
A genus of about 600 species, perennial and annual herbs, nearly cosmopolitan (most diverse in temperate and boreal regions of the Northern Hemisphere). The seven subgenera are distinctive and have often been recognized at the generic level; three are represented in our area. Distributions given in many works (including Harvill et al. 1992) for the R. hispidus complex are apparently garbled by differences in taxonomic concepts. I am here following Duncan's (1980) taxonomic entities, though recognizing some of his varieties as species. References: Whittemore in FNA (1997); Duncan (1980)=Z; Keener (1976)=Y; Keener \& Hoot (1987)=X; Tamura in Kubitzki, Rohwer, \& Bittrich (1993). Keys adapted, in part, from C, GW, X, Y, and Z.

Identification notes: Mature or relatively mature achenes are necessary for the identification of some species. Shape and pubescence of the receptacle is also a frequently used taxonomic character, best judged by stripping off the achenes.

1 Sepals 3 (-4); petals 7-12; achenes pubescent, beakless; leaves simple, cordate, unlobed; [introduced garden plants]; [subgenus Ficaria]
1 Sepals (3-) 5 (-6); petals typically 5-9 (10 in some "doubled" forms); achenes smooth or variously ornamented with spines, papillae, or tubercles, sometimes also pubescent; leaves various, usually not at once simple, cordate, and unlobed; [native or introduced].
2 Petals dull, white; achenes roughly transverse-ridged; plants aquatic, the leaves finely dissected to merely shallowly lobed; [native, occurring in circumneutral waters]; [subgenus Batrachium] Key B

2 Petals shiny, yellow (sometimes fading or bleaching to whitish); achenes usually not transverse-ridged (though often variously ornamented); plants aquatic or terrestrial, the leaves various; [native or introduced, occurring in various habitats]; [subgenus Ranunculus].
3 Cauline leaves all simple, mostly lanceolate, either entire, denticulate, or serrate, but not lobed or deeply divided; [native, occurring in marshes or other wetlands]; [section Flammula] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Key C 3 Cauline leaves (at least most them) lobed, divided, or compound; [native or introduced, occurring in various habitats].

4 Basal leaves not divided, mostly cordate, reniform, or ovate (and merely toothed), distinctly unlike the deeply divided cauline leaves; achenes turgid, ovoid, 1-2.5 mm long, without pronounced marginal rims; petals 1.5-3 mm long; [native, occurring in mesic to dry forests and woodlands, and also (especially \(R\). abortivus) weedy]; [section Epirotes]

Key D
4 Basal leaves mostly deeply parted or compound, the cauline leaves generally similar but smaller and often less divided; achenes various, 1-5 mm long, with or without pronounced marginal rims; petals 2-15 mm long; [native or introduced, occurring in various habitats].
5 Achenes markedly spiny, papillose, or tuberculate (the protuberances few and small in \(R\). sardous, keyed both here and below); [introduced, usually weedy and in disturbed habitats]; [section Echinella] . . . Key E 5 Achenes smooth (rarely pubescent or papillose); [native or introduced, occurring in various habitats].

6 Achenes turgid, 1-1.5 (-2) mm long, the marginal rims scarcely or not at all evident, the achenes corky-thickened at their bases for dispersal by floating; [of mucky marshes or ditches, or aquatic in pools]; [section Hecatonia]. Key F
6 Achenes moderately turgid or flattened, \(1.5-3.8 \mathrm{~mm}\) long, with a pronounced (at \(10 \times\) or more) marginal rim appearing as a differentiated border or flange, more-or-less flattened, and separated from the central bulge of the achene by a concavity or even a groove, the achenes not corkythickened at their bases; [of mostly terrestrial or in bottomland forests]; [section Ranunculus] . Key G

Key A -- subgenus Ficaria (Lesser Celandine)

\section*{Key B -- subgenus Batrachium (White Water Crowfoots)}

1 Leaves floating, shallowly lobed; receptacles glabrous . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . R. hederaceus
1 Leaves submersed (or stranded by falling water levels), dissected into filiform segments; receptacles hispid.
2 Leaves firm (not collapsing when removed from water); free petioles much shorter than the dilated stipular base; leaves usually much shorter than the internode above; achene beaks 0.7-1.5 mm long . . . . . . . . . . . . . . . . . . . R. Iongirostris
2 Leaves flaccid (collapsing when removed from water); free petioles about as long as the dilated stipular base; leaves usually about as long as the internode above; achene beaks 0.1-0.3 (-0.5) mm long . R. trichophyllus var. trichophyllus

Key C -- subgenus Ranunculus, section Flammula (simple-leaved buttercups) (Spearworts)
1 Petals 1-3 (-5), 1-2 mm long, about as long as the sepals; annual . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . R. pusillus
1 Petals (4-) 5-9, distinctly longer than the sepals; annual or perennial.
2 Cauline leaves 6-14 cm long; sepals 4-7 mm long; achene beak 1.0-1.3 mm long ...................... R. ambigens
2 Cauline leaves 1-6 cm long; sepals 1.5-3 mm long; achene beak 0.1-0.3 mm long ...................... R. laxicaulis

\section*{Key D -- subgenus Ranunculus, section Epirotes}

1 Achene beaks (0.6-) 0.7-1.0 mm long; petals less than \(1 / 2\) as long as the sepals; sepals hirsute ......... R. allegheniensis
1 Achene beaks \(0.1-0.3 \mathrm{~mm}\) long; petals more than \(1 / 2\) as long as the sepals; sepals glabrous to sparsely long-villous.
2 Leaves and stems glabrous or nearly so (or the upper stem puberulent); basal leaves 1-6 (-10) cm wide, reniform to cordate at the base; roots usually all filiform
R. abortivus

2 Leaves and stems villous, at least towards the base; basal leaves 1-2.5 cm wide, truncate to cuneate (rarely cordate) at the base; roots sometimes in part fusiform-thickened
R. micranthus

\section*{Key E -- subgenus Ranunculus, section Echinella}

1 Flowers sessile, opposite the petioles; sepals 3 ; petals \(3 \ldots \ldots\). . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . R. platensis
1 Flowers pedunculate, axillary; sepals usually 5 ; petals usually 5 .
2 Petals 1-2 (-3) mm long; receptacles glabrous . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . R. parviflorus
2 Petals (3-) 4-12 mm long; receptacles pubescent.
3 Achenes bodies \(1.5-3 \mathrm{~mm}\) long, 30-60 per head; achene beak ca. 0.5 mm long; achene with conical protuberances or short spines, to 0.16 mm long; achene beak \(0.1-0.5 \mathrm{~mm}\) long.
4 Achene with a few conical protuberances; petals \(5-12 \mathrm{~mm}\) long; plant sparsely to densely hirsute; achenes 30-
\[
40 \text { per head . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . R. sardous }
\]

4 Achene with numerous short spines; petals (3-) 4-5 mm long; plant with a few, widely scattered, long hairs; achenes 40-60 per head . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . R. trilobus
3 Achenes 3-5 mm long, 4-20 per head; achene beak 1.5-3.0 mm long; achene conspicuously spiny, the longer spines mostly \(0.30-0.85 \mathrm{~mm}\) long.
5 Achenes 4-9 per head, in a single whorl; achene margins spiny, as also the faces; beak of the achene 2.5-3 mm long . . . . . ................................................................................ R. arvensis
5 Achenes 10-20 per head, in several whorls; achene margins smooth, the spines restricted to the faces; beak of the achene \(1.5-2.5 \mathrm{~mm}\) long
R. muricatus

\section*{Key F -- subgenus Ranunculus, section Hecatonia}

1 Petals 6-14 mm long; achene body 1.3-2.5 mm long, the beak 0.7-1.5 mm long; plants with submersed leaves dissected into numerous linear segments; [aquatic]
R. flabellaris

1 Petals 2-4 (-5) mm long; achene body 0.8-1.2 mm long, the beak 0-0.1 mm long; plants without distinctive, dissected submersed leaves; [terrestrial or semi-aquatic]
\(R\). sceleratus var. sceleratus

\section*{Key G -- subgenus Ranunculus, section Ranunculus}

1 Petals 2-6 mm long, about as long as the sepals; achene beak strongly hooked, 0.5-1.2 mm long
R. recurvatus var. recurvatus

1 Petals \(5-15 \mathrm{~mm}\) long, (1.3-) \(1.5 \times\) or more as long as the sepals; achene beak straight, flexuous, slightly curved, or hooked, \(0.2-\) 3.0 mm long.

2 Achene beaks recurved or hooked, the stigmatic surface elongate, along the upper (curved) side of the style (beak) (visible at \(10 \times\) ); [introduced, usually weedy in disturbed habitats].

Stems repent, rooting at the nodes
R. repens

3 Stems erect, not rooting at the nodes.
4 Petals 5-8 mm long; plant a soft-based annual; achene face usually with at least a few conical protuberances (if examined carefully at \(10 \times\) or more) R. sardous [of section Echinella]

4 Petals 8-16 mm long; plant a cormose or hard-based perennial; achene face truly smooth.
5 Sepals spreading; stems not cormose-thickened at the base; larger leaves appearing (3-) 5-parted, all of the segments sessile; plant to 12 dm tall
. R. acris
5 Sepals tightly reflexed; stems cormose-thickened at the base; larger leaves pinnately 3-5-parted, the terminal segment long-stalked; plant to 6 dm tall
R. bulbosus

2 Achene beaks straight or slightly curved, flexuous, the stigmatic surface limited to the tip of the style (beak); [native, normally in more-or-less natural habitats].
6 Larger leaves mostly pinnately 3-7-foliolate, the terminal leaflet larger than the lateral leaflets, the leaflets (especially the terminal) often further cleft or lobed, the blade usually longer than wide in outline, the segments often rather narrow; naked receptacle conical, tapering gradually to the apex (the region of staminal attachment as thick as the region of gynoecial attachment, which tapers through all or nearly all of its length, best seen by stripping off the achenes); rhizome regenerating totally each growing season, producing both fibrous and (at the end of the growing season) tuberous roots (1.3-4.9 mm in diameter); [rare in our area, in calcareous, mafic, or ultramafic sites with prairie affinities]
R. fascicularis

6 Larger leaves mostly palmately 3 -foliolate, the terminal leaflet about the same size as the lateral leaflets, the leaflets sometimes further cleft or lobed, the blade usually as wide as long or wider; naked receptacle clavate or ellipsoid (the region of staminal attachment distinctly narrower than the region of gynoecial attachment, thus forming a waist, from which the gynoecial region expands and then tapers to the apex); rhizome regenerated partially each growing season, producing uniform, fibrous roots (up to 3.0 mm in diameter); leaves usually simple and ovate, or trifoliate with ovate leaflets; [collectively widespread in our area].
7 Achenes wide-margined (wider portions of the margin \(1 / 4\) to \(2 / 3\) as wide as the achene body); plants colonial, sending out stolons (by the time of fruiting) which root at the nodes, forming new plants; sepals reflexed at full

7 Achenes narrow-margined (wider portions of the margin \(1 / 8\) or less as wide as the achene body); plants usually erect or repent by the time of fruiting (if repent sometimes forming adventitious roots at the nodes, but not generally developing new plants); sepals spreading at full anthesis (sometimes reflexed later).
8 Plants repent; aerial shoots 50-80 (-91) cm long at time of fruiting; [generally of swamps and marshes] . . .
8 Plants erect; aerial shoots \(14-45(-60) \mathrm{cm}\) long at time of fruiting; [generally of upland habitats]
R. hispidus

Ranunculus abortivus Linnaeus, Kidneyleaf Buttercup. Mt, Pd, Cp (GA, NC, SC, VA): low fields, disturbed areas, bottomlands, lawns, roadsides; common (uncommon in Coastal Plain south of VA). (February-) March-June. Labrador to AK, south to FL, TX, and CO. A common weed in shady and sunny places. [= RAB, FNA, GW, K, S, W, Y; R. abortivus var. abortivus -- C, F, G; R. abortivus var. indivisus Fernald -- F]
* Ranunculus acris Linnaeus, Tall Buttercup, Bitter Buttercup. Mt, Pd (GA, NC, VA), Cp (NC, SC, VA): pastures, fields, roadsides, disturbed areas; common (uncommon in Piedmont, rare in Coastal Plain), introduced from Europe. May-August. [= RAB, C, F, FNA, G, GW, S, W, Y; R. acris var. acris -- K]

Ranunculus allegheniensis Britton, Allegheny Buttercup, Mountain Crowfoot. Mt (NC, VA, SC?), Pd (VA): cove forests, rich forested slopes; uncommon (rare in Piedmont). April-June. MA west to OH , south to w . NC and ne. TN, an Appalachian endemic. [= RAB, C, F, FNA, G, GW, K, S, W, Y]

Ranunculus ambigens S. Watson, Water-plantain Crowfoot, Water-plantain Spearwort. Cp, Pd (NC, VA), Mt (VA): marshes; rare (NC Rare, VA Watch List). April-June. ME west to MN, south to VA, NC, ne. TN, w. TN, and LA. [= RAB, C, F, FNA, G, GW, K, W, Y; R. obtusiusculus Rafinesque -- S]
* Ranunculus arvensis Linnaeus, Corn Crowfoot, Hungerweed. Pd (GA, NC, SC), Mt (NC): fields, disturbed areas; rare, introduced from Europe. April-June. [= RAB, C, FNA, G, GW, K, X, Y; > R. arvensis var. arvensis - RAB; >R. arvensis var. tuberculatus (Augustin de Candolle) Koch -- RAB]
* Ranunculus bulbosus Linnaeus, Bulbous Buttercup. Cp (NC, SC, VA), Pd, Mt (GA, NC, SC, VA): fields, roadsides, disturbed areas; common (rare in SC), introduced from Europe. April-June. [= RAB, C, FNA, GW, K, S, W, Y; > R. bulbosus var. bulbosus F; > R. bulbosus var. dissectus Barbey -- F; > R. bulbosus var. valdepubens (Jordan) Briquet -- F]

Ranunculus caricetorum Greene, Northern Swamp Buttercup, Marsh Buttercup. Pd (VA): swampy forests and marshes; rare. April-August. New Brunswick west to s. Manitoba, south to NJ, n. VA, s. OH, and s. MO; reports of this species further south are probably in error. This species is octoploid ( \(\mathrm{n}=32\) ); the remainder of the \(R\). hispidus complex is tetraploid. [= \(R\). hispidus Michaux var. caricetorum (Greene) T. Duncan -- C, FNA, K, Z; = R. septentrionalis Poiret -- F, GW, W, Y, misapplied; > \(R\). septentrionalis var. caricetorum (Greene) Fernald -- F, G; > R. septentrionalis var. pterocarpus Linnaeus Benson -- \(G\); \(>R\). septentrionalis var. septentrionalis - G]

Ranunculus carolinianus Augustin de Candolle. Cp, Pd, Mt (GA, NC, SC, VA): swamp forests, wet woodlands, open marshy wetlands; uncommon. April-August. NY west to s. Ontario, WI, and MN, south to n. peninsular FL, LA, and e. TX. This species is tetraploid \((\mathrm{n}=16)\). [= RAB, F, G, GW, W, Y; R. hispidus Michaux var. nitidus (Chapman) T. Duncan -- C, FNA, K, Z; R. palmatus Elliott -- S ; R. septentrionalis -- S ]

Ranunculus fascicularis Muhlenberg ex Bigelow, Thick-root Buttercup, Early Buttercup. Pd (GA, NC, SC, VA), Mt (GA, NC, VA), \(\mathrm{Cp}(\mathrm{GA})\) : wet flats with prairie affinities (with Camassia scilloides), rocky barrens and glades over mafic rocks (such as gabbro or diabase), ultramafic outcrop barrens (over olivine), limestone barrens; rare (NC Watch List, SC Rare). March-June. MA and NY west to s. Ontario, MN, and se. Manitoba, south to c. NC, nc. SC, sw. GA, and e. TX; occurrences which are both south of New England and east of the Appalachians are scattered and disjunct. This species is tetraploid ( \(n=16\) ). [=C, F, FNA, GW, K, S, W, Y, Z; R. fascicularis var. fascicularis -- F, G]

Ranunculus ficaria Linnaeus, Lesser Celandine, Pilewort. Pd (NC, VA), Cp (VA): disturbed rich forests and bottomlands, mesic suburban forests, lawns, naturalized locally from horticultural plantings; rare, introduced from Europe. This species and several close relatives are very possibly better treated as a separate genus. [=C,F,FNA, G, Y; > R. ficaria var. bulbifera MarsdenJones -- K; = Ficaria verna Hudson]

Ranunculus flabellaris Rafinesque, Yellow Water Crowfoot. Cp (NC, VA): pools in floodplains of small stream swamps, other stagnant or slowly moving waters; rare (NC Rare, VA Watch List). March-May. ME west to British Columbia, south to ne. NC, KY, IN, IL, LA, OK, UT, and CA. [= RAB, C, F, FNA, G, GW, K, Y; R. delphiniifolius Torrey ex Eaton -- S]

Ranunculus hederaceus Linnaeus, Ivy-leaved Water Crowfoot. Longstalked Crowfoot. Cp (NC, SC, VA), Mt (VA): coastal brackish marshes, other circumneutral marshes; rare (NC Rare, VA Rare). April-June. Se. PA south to SC on the Coastal Plain; disjunct in Newfoundland; also in Europe. [= RAB, C, F, FNA, G, GW, K, Y]

Ranunculus hispidus Michaux, Hispid Buttercup, Hairy Buttercup. Mt, Pd (GA, NC, SC, VA), Cp (GA, VA): rich moist forests, creekbanks, mesic to dry woodlands and forests; bottomlands; common. March-June. MA and VT west to s. Ontario, n. IL, and se. KS, south to c. NC, s. GA, s. AL, AR, and ne. OK. This species is tetraploid ( \(\mathrm{n}=16\) ). [= RAB, F, G, GW, S, W, Y; R. hispidus var. hispidus -- C, FNA, K, Z; R. hispidus var. falsus Fernald -- F; R. hispidus var. marilandicus (Poiret) L. Benson -- G; R. hispidus var. eurylobus L. Benson -- F, G]

Ranunculus laxicaulis (Torrey \& A. Gray) Darby, Coastal Plain Spearwort. Cp (GA, NC, SC, VA), Pd (GA): marshes; rare (NC Watch List, VA Rare). April-June. DE south to sw. GA, west to TX, inland in the interior to w. TN, s. IN, s. IL, MO, and KS, almost entirely on the southeastern Coastal Plain. R. subcordatus E.O. Beal, allegedly endemic to NC, is conspecific with \(R\). laxicaulis. [= RAB, F, FNA, G, GW, K, W, Y; R. texensis Engelmann -- C; > R. subcordatus E.O. Beal -- GW, Y; R. oblongifolius Elliott -- S, misapplied]

Ranunculus longirostris Godron, White Water Crowfoot. Mt, Pd (VA): submerged in streams; rare (VA Rare). Sw. Québec west to Saskatchewan, ID, and OR, south to DE, VA, KY, nc. TN, AL, AR, TX, NM, and AZ. [= C, F, GW, K, Y; R. aquatilis Linnaeus var. diffusus -- FNA, in part; \(R\). circinatus Sibthorp -- G; Batrachium trichophyllum -- S, misapplied]

Ranunculus micranthus Nuttall, Small-flowered Buttercup, Rock Buttercup. Pd (NC, VA), Mt, Cp (VA), \{GA?\}: rich forests; uncommon (rare south of VA) (NC Rare). April-June. MA west to SD, south to e. VA, c. NC, sc. TN, WV, OH, and OK. [= RAB, C, F, FNA, G, GW, K, S, W, Y; R. micranthus var. delitescens (Greene) Fernald -- F]

Ranunculus muricatus Linnaeus. Pd (GA, SC), Cp (SC): ditches and marshes; rare, introduced from Europe. April-June. [= RAB, FNA, GW, K, S, X, Y]
* Ranunculus parviflorus Linnaeus, Small-flowered Buttercup, Stickseed Crowfoot. Cp, Pd, Mt (GA, NC, SC, VA): disturbed areas; common (rare in Mountains), introduced from Europe. February-July. [= RAB, C, F, FNA, G, GW, K, S, W, X, Y]

Ranunculus platensis Sprengel. Pd (NC), Cp (GA): lawns, ditches; rare, introduced from South America. [=FNA, GW, K, X, Y]

Ranunculus pusillus Poiret, Low Spearwort. Cp, Pd (GA, NC, SC, VA), Mt (GA, NC, VA) : marshes, ditches, other wet habitats; common (uncommon in Mountains). April-June. S. NY south to FL, west to TX, north in the interior to OH, IN, and MO. [= RAB, C, F, FNA, G, GW, S, W, Y; R. pusillus var. pusillus -- K]

Ranunculus recurvatus Poiret var. recurvatus, Hooked Buttercup, Hooked Crowfoot. Mt, Pd, Cp (GA, NC, SC, VA): bottomland forests, cove forests, swamps, mesic slope forests; common. April-June. ME and Québec west to MN, south to sw. GA, MS, and OK. [= FNA, K; R. recurvatus -- RAB, C, F, G, GW, S, W, Y, infraspecific taxa not distinguished; R. recurvatus var. adpressipilis Weatherby -- F]
* Ranunculus repens Linnaeus, Creeping Buttercup, Meg-many-feet. Mt, Pd (NC, VA), Cp (NC, SC, VA): low meadows, disturbed areas; uncommon, introduced from Europe. [= RAB, C, F, FNA, G, GW, K, S, W, Y; R. repens var. degeneratus Schur -C; R. repens var. glabratus Augustin de Candolle -- C, F; R. repens var. pleniflorus Fernald -- F]

Ranunculus sardous Crantz, Sardinian Buttercup, Hairy Buttercup. Cp, Pd (GA, NC, SC, VA), Mt (GA, VA): low fields, disturbed areas; uncommon, introduced from Europe. April-July. [= RAB, C, F, FNA, G, GW, K, X, Y]

Ranunculus sceleratus Linnaeus var. sceleratus, Cursed Buttercup, Celery-leaf Crowfoot. Cp (GA, NC, SC, VA), Pd (NC, \(V A)\), Mt (VA): marshes, ditches, and stream margins; common (uncommon south of VA). June-September. The species is circumboreal, ranging south in North America (partly introduced, at least southwards) to n. FL, LA, TX, and CA. Var. sceleratus is widespread and the only variety in e. North America; var. multifidus occurs in w. North America. The epithet is often misspelled "scleratus." [= C, F, FNA, G, K; < R. sceleratus -- RAB, GW, S, W, Y, infraspecific taxa not distinguished]

Ranunculus trichophyllus Chaix var. trichophyllus, White Water Crowfoot. Cp, Mt, Pd (VA), \{NC?\}: submerged in water of acidic streams; rare (NC Rare, VA Rare). R. trichophyllus is circumboreal, ranging south in North America to NJ, VA, nc. TN, PA, MN, SD, NM, AZ, and CA. Var. trichophyllus ranges south to the southern limit of the species. This taxon was reported as far south as \(N C\) by \(G\) and \(S\); the documentation is unknown and the species was not treated by RAB. The more northern var. calvescens \(W\). Drew, with the receptacle glabrous or with a few scattered hairs (vs. hirsute with tufted hairs), ranges south to PA and MI. [= C, F, K; R. aquatilis Linnaeus var. diffusus Withering -- FNA, in part; \(R\). trichophyllus -- Y, infraspecific taxa not distinguished; \(R\). aquatilis Linnaeus var. capillaceus (Thuill.) Augustin de Candolle -- G; Batrachium flaccidum (Persoon) Ruprecht -- S]
* Ranunculus trilobus Desfontaines. Cp (SC): fields, roadsides, ditches; rare, introduced from sw. Europe. [= FNA, K, X, Y]

Ranunculus harveyi (A. Gray) Britton var. harveyi, east to e. TN and AL. [= FNA, K] \{add synonymy\} Ranunculus macounii d’Urv., occurs in WV (Kartesz 1999). \{investigate\} [= K] \{not yet keyed; add synonymy\} Ranunculus pensylvanicus Linnaeus f., Bristly Buttercup, ranges south to s. PA (Rhoads \& Klein 1993), DE, DC, and MD (Whittemore in FNA 1997). [= FNA, K] \{add synonymy\}

Thalictrum Linnaeus 1753 (Meadow-rue)
(also see Anemonella)
A genus of about 330 species, perennial herbs, of Eurasia, North America, South America, and Africa. References: Park \& Festerling in FNA (1997); Park (1992)=Z; Tamura in Kubitzki, Rohwer, \& Bittrich (1993).

Thalictrum clavatum Augustin de Candolle, Lady-rue, Mountain Meadowrue. Mt (GA, NC, SC, VA), Pd (NC, VA), Cp? (VA?): seepages, moist forests, spray cliffs at waterfalls, brookbanks; common, rare in Piedmont (rare in Coastal Plain, if record is valid). May-July. A Southern Appalachian endemic: VA, WV, e. KY south through w. NC and e. TN to nw. SC and n. GA. [= RAB, C, F, FNA, G, GW, K, S, W]

Thalictrum cooleyi Ahles, Cooley's Meadowrue, Savanna Meadowrue. Cp (GA?, NC): ecotones between calcareous savannas (shallowly underlain by coquina limestone ("marl") and adjacent swamp forests, generally within a few meters of Taxodium ascendens and Liriodendron tulipifera; rare (US Endangered, GA Endangered, NC Endangered). Late June-early July; AugustOctober. The species is endemic to two small areas, centered around Maple Hill (Pender and Onslow counties, NC) and Old Dock (Columbus and Brunswick counties, NC), with a small disjunct population in FL and an ambiguous population in GA. It is associated with a number of other narrow endemic species. The leaflets of basal leaves (winter rosettes) are much broader, resembling the leaflets of other Thalictrum species in length/width ratio. Leaves produced from May on have the very narrow leaves typical of the species. Park (1992) found that Th. cooleyi has the highest chromosome number in the genus, \(2 \mathrm{n}=210\), a ploidy level of 30 x compared to the base chromosome level of 7 in Thalictrum. [= RAB, FNA, GW, K, Z]

Thalictrum coriaceum (Britton) Small, Appalachian Meadowrue, Maid of the Mist. Mt (GA, NC, SC, VA), Pd (VA): rich forests; uncommon, rare in Piedmont (GA Rare). May-July. A Southern and Central Appalachian endemic: MD, VA, and WV south through w. KY and e. TN to w. NC and ne. GA. The roots are bright yellow. A preliminary study concluded that Th. steeleanum B. Boivin is not distinct from Th. coriaceum (Park 1988); further study is needed. Th. steeleanum is alleged to differ in the following ways (and others): plant with long, cordlike rhizomes (vs. stout caudex), terminal leaflets mostly wider than long (vs. mostly longer than wide), achenes curved, \(4-6 \mathrm{~mm}\) long (vs. less curved, \(2.5-4 \mathrm{~mm}\) long). Park found these characters (and others) to be variable and to occur together within populations. It ranges from s. PA south through MD, e. WV, w. VA to nw. NC. [= RAB, FNA, K, S; > Th. coriaceum - C, F, G, W, in a narrower sense; > Th. steeleanum B. Boivin -- C, F, G, W; Th. caulophylloides Small -- S]

Thalictrum debile Buckley, Trailing Meadowrue. Mt (GA): moist to wet forests over limestone; rare (GA Threatened). Nw. GA west to e. MS. [= FNA, GW, K, S]

Thalictrum dioicum Linnaeus, Early Meadowrue. Mt, Pd (GA, NC, SC, VA), Cp (VA): seepages, moist forests; common, rare in Coastal Plain. ME, Québec, and MN south to SC, c. GA, AL, and MO. [= RAB, C, F, FNA, G, GW, K, S, W]

Thalictrum macrostylum Small \& Heller, Small-leaved Meadowrue. Cp, Pd, Mt (GA, NC, SC, VA): moist places, perhaps associated with circumneutral soils, moist to dry ultramafic outcrop barrens (over olivine), tidal freshwater marshes; rare (GA Rare [Th. subrotundum], NC Watch List, VA Rare). May-August. Se. VA south and west through NC, SC, sc. GA, FL, and AL to MS. [= C, F, FNA, G, GW, K, S, Z; > Th. macrostylum - RAB, in a narrower sense; > Th. subrotundum B. Boivin -- RAB]

Thalictrum pubescens Pursh var. hepaticum (Greene) Keener, Appalachian Tall Meadowrue. Mt (GA, NC): seepage areas; rare (NC Watch List). May-July. PA south to \(n\). GA and se. TN, strictly or primarily in the Appalachians. Plants tentatively placed here have been problematic. Keener (1981) reduced Th. hepaticum Greene to a variety of Th. pubescens, and discussed their distinction. Park (1992) contends that these plants are, indeed, glandular puberulent, and should therefore be reduced to synonymy under Th. revolutum, stating "these are not given varietal status [under Th. revolutum] since this morphological variation in anthers is not correlated with a continuous geographic range. As indicated above, I have located specimens from Georgia, North Carolina, Tennessee, and Pennsylvania which fit the description." As mapped by Keener (1981) Th. pubescens var. hepaticum (Greene) Keener appears as an endemic to the Southern Appalachians; if extended to Pennsylvania, the distribution is still very restricted (and in a phytogeographically plausible manner) compared to either Th. revolutum or Th. pubescens. This entity appears to be closer to Th. pubescens in leaflet shape, sepal length, anther length, and stigma length, and to Th. revolutum in leaflet and petiolule vestiture. More study is needed; the taxon is here provisionally accepted in order to draw attention to the problem. [= W; Th. polygamum Muhlenberg ex Sprengel -- RAB, F, G, S, nomen nudum, infraspecific taxa not recognized; Th. pubescens -- C, GW, K, W, infraspecific taxa not recognized; Th. revolutum -- FNA, in part]

Thalictrum pubescens Pursh var. pubescens, Common Tall Meadowrue, Late Meadowrue, King-of-the-meadow. Mt, Pd (NC, VA), Cp (NC, SC, VA), \{GA\}: bogs, marshes, wet forests; common, rare in Piedmont and Coastal Plain south of VA. May-July. Labrador, Newfoundland, and Ontario south to GA, SC and MS. [= W; Th. polygamum Muhlenberg ex Sprengel -- RAB, F, G, S, nomen nudum, infraspecific taxa not recognized; Th. pubescens -- C, GW, K, W, Z, infraspecific taxa not recognized; Th. pubescens -- FNA]

Thalictrum revolutum DC, Skunk Meadowrue. Mt, Pd (NC, SC, VA), Cp (NC, VA), \{GA\}: mesic to dry forests, woodlands, and barrens, over hornblende, greenstone, dolostone, and serpentinized olivine; common, rare in Coastal Plain south of VA. MayJuly. Québec and Ontario south to n. FL, LA, and TX, and scattered southwest to CO, NV, and AZ. The species is normally stipitate-glandular or papillose, but can be glabrous, as accounted for in the key. [= RAB, C, F, FNA, G, GW, K, S, W]

Thalictrum dasycarpum Fischer \& Avé-Lallemant, Purple Meadowrue. Québec and Yukon south to PA, KY, TN, AL, MS, LA, TX, NM, AZ, and WA. It has been reported for scattered localities in VA (Harvill et al. 1992). Park (1992) and FNA do not document the occurrence of Th. dasycarpum in our area; substantiation is needed. [= FNA, K] \{not yet keyed; add synonymy\}

Thalictrum mirabile Small is a delicate relative of Th. clavatum, occurring on wet sandstone cliffs primarily in the Cumberland Plateau (and especially associated with sandstone rockhouses), from KY south through TN to \(n\). AL and nw. GA (and additionally cited in FNA as occurring in w. NC). The inflorescence appears sparser because of the shorter and narrower achenes borne on longer stipes. [= FNA, GW, K, S]

\section*{Trautvetteria Fischer \& C.A. Meyer 1835 (Tassel-rue)}

A monotypic genus, a perennial herb, disjunctly distributed in temperate to boreal e. North America, w. North America, and Japan (or sometimes treated as 2-3 species). Trautvetteria is very closely related to some parts of Ranunculus (Johansson 1998). References: Parfitt in FNA (1997); Tamura in Kubitzki, Rohwer, \& Bittrich (1993); Johansson (1998).

Trautvetteria caroliniensis (Walter) Vail var. caroliniensis, Tassel-rue, False Bugbane. Mt, Pd (GA, NC, SC, VA), Cp (GA, NC, SC): streambanks, seepages, grassy balds, moist forests, swamp forests, very rarely in an calcareous longleaf pine savanna ecotones; common, uncommon in Piedmont, rare in Coastal Plain (SC Rare). Late May-July. The genus is monotypic, the single species distributed disjunctly as follows: sw. PA and KY to GA, AL, and Panhandle FL, primarily in the Southern and Central Appalachians, disjunct on calcareous sites in AR (Sundell et al. 1999), IN, IL, and MO [var. caroliniensis], in w. North America from s. British Columbia south to CA, AZ, and NM [var. borealis (H. Hara) T. Shimizu], and in Japan [var. japonica (Siebold \& Zuccarini) T. Shimizu]. The varieties are poorly differentiated morphologically and may not warrant recognition. The discovery of this species in the edge of a calcareous savanna (Camp Branch Savanna, Brunswick County, NC) in the outer Coastal Plain was surprising; the small population has since been destroyed by intensive silvicultural practices. [=K; T. caroliniensis -- RAB, C, F, FNA, G, GW, S, W, infraspecific taxa not distinguished]

\section*{Xanthorhiza Marshall 1785 (Yellowroot)}

A monotypic genus, a shrub, of temperate e. North America. References: Parfitt in FNA (1997); Tamura in Kubitzki, Rohwer, \& Bittrich (1993).

Identification notes: An unmistakable plant, the stems usually about knee-high and unbranched, the rhizomes with a bright yellow, bitter-tasting alkaloid.

Xanthorhiza simplicissima Marshall, Yellowroot, Brook-feather. Mt, Pd, Cp (GA, NC, SC, VA): streambanks and riverbanks; common (uncommon in Coastal Plain, and essentially absent from VA north of the James River). March-May; May-June. NY and se. PA (where only naturalized, according to Rhoads \& Klein 1993), south to SC, sw. GA, w. FL, and AL. [= RAB, C, F, FNA, G, GW, K, W; = Xanthorrhiza simplicissima -- S, an orthographic variant]

\section*{RESEDACEAE (Mignonette Family)}

A family of about 6 genera and \(75-80\) species, herbs and shrubs, of the northern hemisphere. References: Kubitzki in Kubitzki \& Bayer (2003).

Reseda Linnaeus 1754 (Mignonette)
A genus of about 55-60 species, herbs, of Europe, Mediterranean region, and c. Asia.
1 Upper and middle leaves deeply pinnately lobed.
\begin{tabular}{|c|c|c|}
\hline  & Carpels 4; petals white; seeds tuberculate & a] \\
\hline 2 & Carpels 3; petals yellowish; seeds smooth & [R. Iutea] \\
\hline \multicolumn{3}{|l|}{Upper and middle leaves entire or finely toothed (sometimes with 1-2 lateral lobes).} \\
\hline 3 & Sepals and petals 4; seeds smooth; fruits \(<7 \mathrm{~mm}\) long, crowded, erect to ascending & [R. Iuteola] \\
\hline \multirow[t]{3}{*}{3} & Sepals and petals 6; seeds rugose; fruits \(>7 \mathrm{~mm}\) long, well-spaced, pendent. & \\
\hline & 4 Capsules 7-11 mm long; sepals (in fruit) \(<5 \mathrm{~mm}\) long & R. odorata \\
\hline & 4 Capsules (well-sdeveloped) 11-15 mm long; sepals (in fruit \(>5 \mathrm{~mm}\) long & [R. phyteuma] \\
\hline
\end{tabular}
* Reseda odorata Linnaeus, Garden Mignonette. Cp (SC), Pd (NC): gardens, garden borders, and disturbed areas; rare, doubtfully established, introduced from Mediterranean Europe. Reported for scattered locations in eastern North America (Kartesz 1999). [= K]
* Reseda alba Linnaeus, White Mignonette, is introduced from the Mediterranean region to ne. United States, south to DE and se. PA (Rhoads \& Klein 1993). [= C, F, G, K]
* Reseda lutea Linnaeus, Yellow Mignonette, Wild Mignonette, is introduced from Europe to the ne. United States, south to DE, se. PA, and sc PA (Rhoads \& Klein 1993). [= C, F, G, K]
* Reseda luteola Linnaeus, Weld, Dyer's Rocket, Yellow-weed, formerly cultivated as a die plant, is reported from se. and sc. PA (Rhoads \& Klein 1993). [= C, F, G, K]
* Reseda phyteuma Linnaeus, Corn Mignonette, introduced from Europe, is reported from se. PA (Rhoads \& Klein 1993). [= K]

\section*{RHAMNACEAE (Buckthorn Family)}

A family of about 50-52 genera and 900-925 species, mostly trees, shrubs, and lianas, cosmopolitan in distribution. References: Brizicky (1964a)=Z; Richardson et al. (2000a, 2000b); Medan \& Schirarend in Kubitzki (2004).

1 Plant a vine; [tribe Rhamneae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Berchemia
1 Plant a shrub or small tree.
2 Leaves with 3 prominent veins from near the base.

\title{
Plants not spiny; fruit dry, capsular; [native]; [tribal placement uncertain] \\ Ceanothus \\ Plants armed with stipular spines; fruit pulpy; [alien, cultivated and escaped]; [tribe Paliureae] . . . . . . . . . . Ziziphus \\ 2 Leaves with prominently pinnate venation, the lowermost lateral veins no more prominent than others. \\ 4 Leaves opposite, 2-4 cm long; [of shell middens and shell hammocks in the outer Coastal Plain of NC and SC]; [tribe Rhamneae] \\ Sageretia
}

4 Leaves alternate (or opposite in Frangula and some Rhamnus), 3-15 cm long; [of various habitats in the Piedmont and Mountains (rarely Coastal Plain) of VA, NC, and SC].
5 Inflorescence repeatedly branched dichotomously; peduncles fleshy and reddish in fruit; nectariferous disc pubescent; [tribe Paliureae]
] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Hovenia Inflorescence not repealy branched dichomously; pedunces not fleshy; nectariferous disa glabrous; [tribe
5 Rhamneae]
6 Winter buds naked, pubescent; flowers perfect, sepals, stamens, and petals 5 ; style undivided; leaves with \(8-10\) lateral veins on either side of the midvein

Frangula
6 Winter buds with bud scales; flowers functionally unisexual, sepals and stamens 4 or 5 (the stamens rudimentary in the pistillate flowers), petals 0 or 4 (never 5 ); style divided \(1 / 3\) to \(2 / 3\) its length into 2 , 4 or 5 segments; leaves with (2-) 3-9 lateral veins on either side of the midvein

Rhamnus

\section*{Berchemia Necker 1825 (Supplejack)}

A genus of about 12 species, vines, of tropical to warm temperate Asia, Africa and se. North America. B. scandens is the only New World species. References: Brizicky (1964a)=Z; Medan \& Schirarend in Kubitzki (2004).

Identification notes: The young stems are shining and reddish, the bark on older stems is medium gray and smooth (though often marred by sap wells drilled by Yellow-bellied Sapsuckers). Larger stems can reach 10 cm in diameter. The smooth bark and neatly pinnately-veined leaves are distinctive.

Berchemia scandens (Hill) K. Koch, Supplejack, American Rattan. Cp (GA, NC, SC, VA), Pd (GA, NC), Mt (GA): swamp forests, bottomlands, streambanks, in mesic to even xeric uplands over calcareous rock or sediment; common (rare in Piedmont). April-May; August-October. Se. VA south to s. FL, west to TX, north in the interior to nc. TN, w. TN, s. IL, and s. MO. Berchemia climbs high into the crowns of swamp trees. [= RAB, C, F, G, GW, K, S, Z]

\section*{Ceanothus Linnaeus 1753 (Redroot, New Jersey Tea)}

A genus of ca. 55 species, shrubs, mostly in California. References: Coile (1988)=Y; Brizicky (1964a)=Z; Medan \& Schirarend in Kubitzki (2004).
1 Leaves 0.2-1.0 cm long, obovate
C. microphyllus

1 Leaves 2-10 cm long, elliptic to ovate.
2 Inflorescences terminating leafy terminal shoots; leaves mostly obtuse to acute ........................ C. herbaceus
2 Inflorescences terminating leafless axillary shoots (these sometimes with leafy bracts distinctly smaller than normal leaves); leaves mostly acute to acuminate.
3 Leaves (3-) 4-10 cm long, mostly 2.5-6 cm wide; [of various habitats of the Piedmont, Mountains, and rarely Coastal Plain] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. americanus var. americanus 3 Leaves 2-4 (-6) cm long, mostly 1-2 cm wide; [primarily of sandy habitats of the Coastal Plain and rarely Piedmont] C. americanus var. intermedius

Ceanothus americanus Linnaeus var. americanus, Common New Jersey Tea. Mt, Pd (GA, NC, SC, VA), Cp (NC, VA): woodland borders, dry woodlands, glady openings, dry ridge forests and woodlands (pine or oak) in the Mountains; common. MayJune; June-July. Ranging from ME west to s. Manitoba, south to FL and TX. [= C, F, G, Y, Z; <C. americanus -- RAB, K, S, W; = C. americanus -- \(S\), in the narrow sense]

Ceanothus americanus Linnaeus var. intermedius (Pursh) Torrey \& A. Gray, Southern New Jersey Tea. Cp (GA, NC, SC, VA), Pd (GA, NC, SC): sandhills, dry sandy woodlands and forests, rocky openings around granitic or quartzitic rocks in the Piedmont; common. May-June; June-July. Ranging from NJ (or possibly MA) south to FL, west to LA, mostly on the Coastal Plain, but disjunct inland to sandy soils around outcrops of siliceous rocks. The recognition of infraspecific taxa in the variable \(C\). americanus is uncertain; var. intermedius may either represent ecological forms, or the variation may be too clinal to make taxonomic recognition rewarding. However, material from our area (and beyond) sorts relatively easily, with some intermediates from the Piedmont; varietal status seems provisionally appropriate. [= C, F, G, Y, Z; < C. americanus -- RAB, K, S, W; = C. intermedius Pursh -- S]

Ceanothus herbaceus Rafinesque, Prairie Redroot. Pd (VA?): flood-scoured rocky riverbanks; rare. April-May. This species is primarily midwestern, ranging from MI west to MT, south to nw. IN, AR, TX, and Mexico; disjunct eastward in Québec, NH, VT, NY, MD, WV, DC, and n. VA (? - Arlington County). Rafinesque described C. herbaceus from "near the falls of the Potowmack, between the rocks." The holotype not extant, Coile (1988) chose a neotype, collected by Sheldon in 1881 from "Arlington County, Virginia, Chain Bridge, rocky river bottoms, Potomac River." However, Bartgis, Fleming, \& Wiegand (1997) indicate that C. herbaceus in the Washington, D.C. area can only be ascribed with certainty to DC and MD. [= K, Y, Z; = C. ovatus Desfontaines --

F, S, misapplied; = C. pubescens (Torrey \& A. Gray ex S. Watson) Rydberg ex Small -- S]
Ceanothus microphyllus Michaux. Cp (GA): sandhills; common. E. GA, FL, and s. AL, approaching to within a few kilometers of SC (in Screven and Chatham counties, GA), and should be sought in se. SC (except that its outlandish appearance makes it difficult to overlook!). C. ×serpyllifolius Nuttall (prosp.) is apparently a hybrid of C. americanus var. intermedius and \(C\). microphyllus (Coile 1988); it is known from scattered sites in FL and GA. [= K, S, Y, Z]

Frangula P. Miller 1754 (Buckthorn)

The distinctions between Frangula and Rhamnus are many and meaningful; their separation at the generic level seems warranted based on morphological and molecular analyses (Richardson et al. 2000a; Bolmgren \& Oxelman 2004). References: Brizicky (1964a)=Z; Medan \& Schirarend in Kubitzki (2004).

1 Leaves entire; leaves ca. \(2 \times\) as long as wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . F. alnus
1 Leaves serrulate; leaves ca. \(3 \times\) as long as wide F. caroliniana

Frangula alnus P. Miller, European Alder-Buckthorn. Mt (NC): forested area along Blue Ridge Parkway; rare, introduced from Europe. This speceis is a seriously invasive weed in ne. United States, south to (at least) NJ, s. PA (Rhoads \& Klein 1993), KY, and se. TN (Marion County) (Chester, Wofford, \& Kral 1997, Kral 1981), and w. NC. [=K; = Rhamnus frangula Linnaeus -- C, F, G]

Frangula caroliniana (Walter) A. Gray, Carolina Buckthorn. Mt (GA, NC, SC, VA), Pd (GA, NC, SC), Cp (GA, SC): dry to moist barrens, woodlands, and forests, Coastal Plain limestone bluffs and shell middens, especially over mafic or calcareous rocks; rare (NC Watch List). May-June. Sw. VA west to s. OH and s. MO, south to FL and TX. [= K; = Rhamnus caroliniana Walter -RAB, S, W; > Rhamnus caroliniana Walter var. caroliniana -- C, F, G, Z]

\section*{Hovenia Thunberg 1781 (Raisin-tree)}

A genus of 7 species, trees, of e. Asia. References: Brizicky (1964a)=Z; Medan \& Schirarend in Kubitzki (2004).
* Hovenia dulcis Thunberg, Japanese Raisin-tree. Pd (NC): escaped from cultivation to suburban woodlands; rare, introduced from China. Goldman (1998) presents a discussion of this species' introduction into North America, with a color photograph. [= RAB, K, Z]

Rhamnus Linnaeus 1753 (Buckthorn) (also see Frangula)

The recognition of Frangula as separate from Rhamnus is supported by molecular phylogeny (Bolmgren \& Oxelman 2004).
References: Brizicky (1964a)=Z; Bolmgren \& Oxelman (2004); Medan \& Schirarend in Kubitzki (2004).
1 Leaves mostly opposite or subopposite (or some alternate), mostly with (2-) 3-6 lateral veins on either side of the midrib; plant a large shrub or small tree, to 10 m tall; fruit with 4 stones; [aliens, mostly of moist (but not boggy) soils].
2 Leaves mostly \(1-2 \times\) as long as wide, with (2-) \(3(-4)\) lateral veins on either side of the midrib; style divided half its length into 4 segments . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [Rh. cathartica]
2 Leaves mostly \(2-3 \times\) as long as wide, with 4-6 lateral veins on either side of the midrib; style divided \(2 / 3\) its length into 2 segments

Rh. davurica
1 Leaves alternate, mostly with (4-) 6-9 lateral veins on either side of the midrib; plant a shrub to 2 m tall; fruit with 2-3 stones; [natives].
2 Sepals and stamens 5; petals 0; fruit with 3 stones; [of mafic or calcareous peaty wetlands and seeps] . . . . Rh. alnifolia
2 Sepals and stamens 4; petals 4; fruit with 2 stones; [of dry to moist calcareous woodlands and thickets]. 3 Young leaves and young branches glabrous or with scattered hairs; mature leves glabrous below

Rh. lanceolata var. glabrata
3 Young leaves and young branches pubescent; mature leaves soft pubescent below. Rh. lanceolata var. lanceolata
Rhamnus alnifolia L'Héritier, Alder-leaved Buckthorn, American Alder-Buckthorn. Mt (VA): mafic or calcareous (dolomitic) seeps, usually with Parnassia grandifolia; rare (VA Rare). May-July. Newfoundland west to British Columbia, south to NJ, PA, w. VA, ne. TN (Chester, Wofford, \& Kral 1997), OH, n. IN, n. IL, IA, and CA. [= C, F, G, K, W, Z]
* Rhamnus davurica Pallas, Dahurian Buckthorn. Pd (NC, VA): planted, rarely naturalized in suburban woodlands; rare, introduced from e. Asia. [> Rhamnus davurica ssp. ?? -- K; = Rh. citrifolia (Weston) W. Hess \& Stearn -- C]

Rhamnus lanceolata Pursh var. glabrata Gleason, Western Lance-leaved Buckthorn. Mt (VA): dry habitats over calcareous rocks; rare (VA Rare). April-May. Var. glabrata Gleason ranges from OH west to SD, south to w. VA (Ludwig 1999), KY, c. TN, AR, and KS. [= C, F, G, Z; = Rh. lanceolata ssp. glabrata (Gleason) Kartesz \& Gandhi -- K; < Rh. lanceolata -- S, W]

Rhamnus lanceolata Pursh var. Ianceolata, Eastern Lance-leaved Buckthorn. Mt (VA): dry to moist thickets over calcareous rocks; rare (VA Watch List). April-May. Var. lanceolata ranges from PA south to AL, mostly in the Appalachians. [= C, F, G, Z; = Rh. lanceolata ssp. lanceolata -- K; < Rh. lanceolata -- S, W]
* Rhamnus cathartica Linnaeus, Common Buckthorn. Reported for VA by Harvill et al. (1991), but the report is actually based on specimens of Rh. davurica (Virginia Botanical Associates 2005). \{check sspp.\} [= C, F, G, K, Z]

Sageretia Brongniart 1827 (Small-flowered Buckthorn)
A genus of about 35 species, shrubs and trees, of tropical to warm temperate areas of Africa, Asia, and America. References: Nesom (1993c)=Y; Brizicky (1964a)=Z; Medan \& Schirarend in Kubitzki (2004).

Identification notes: S. minutiflora can appear superficially a bit like Ilex vomitoria, with which it typically grows; it can be distinguished from Ilex vomitoria by its opposite leaves.

Sageretia minutiflora (Michaux) C. Mohr, Small-flowered Buckthorn. Cp (GA, NC, SC): shell middens and shell hammocks; rare (GA Threatened, NC Rare, SC Rare). September; November. Se. NC south to s. FL, west to s. MS. S. minutiflora is apparently most closely related to S. elegans (Kunth) Brongniart, which ranges from s. Mexico south to s. South America. [= RAB, K, S, Y, Z]

\section*{Ziziphus P. Miller 1754 (Jujube)}

A genus of \(85-100\) species, shrubs and trees, of tropical and warm temperate areas. References: Brizicky (1964a)=Z; Medan \& Schirarend in Kubitzki (2004).
* Ziziphus zizyphus (Linnaeus) Karsten, Chinese Jujube, Common Jujube. Pd (GA): \{habitat\}; rare, introduced, native of from Eurasia. Reported from ec. GA (Jones \& Coile 1988). Cultivated at least as far north as NC. [= K; = Zizyphus zizyphus (Linnaeus) Karsten - S, orthographic variant; = Z. jujuba P. Miller - Z]

\section*{RHIZOPHORACEAE (Red Mangrove Family)}

A family of about 15 genera and 120 species, of tropical areas of the Old and New World.

\section*{Rhizophora Linnaeus (Red Mangrove)}

A genus of 8-9 species, trees and shrubs, of tropical shores.
Rhizophora mangle Linnaeus, Red Mangrove. Cp (GA, NC, SC): beaches; rare. The distinctive floating seedlings of Rhizophora occasionally wash up as jetsam on beaches of GA, NC, and SC, particularly following hurricanes. Photographic evidence has been supplied from Bear Island, Onslow County, NC, 11 June 1996 (Dave Owen, pers. comm. and photograph). These propagules may sprout and grow for some time, forming a young sapling with leaves, but do not survive because of frost. Not truly a part of our flora, but repeatedly introduced naturally. [= GW, K, S]

ROSACEAE (Rose Family)
(see also CHRYSOBALANACEAE)

A family of about 85-95 genera and 2000-3000 species, trees, shrubs, and herbs, nearly cosmopolitan, but mainly boreal and temperate. References: Eriksson et al. (2003); Kalkman in Kubitzki (2004).

Tribe Exochordeae: Exochorda.
Tribe Spiraeae: Aruncus, Spiraea.
Tribe Neillieae: Physocarpus, Stephanandra.
Tribe Gillenieae: Gillenia, Sorbaria.
Tribe Kerriae: Kerria, Neviusia, Rhodotypos.
Tribe Ulmarieae: Filipendula.
Tribe Sanguisorbeae: Agrimonia, Sanguisorba.
Tribe Potentilleae: Duchesnea, Fragaria, Potentilla, Sibbaldiopsis.
"Geum group": Geum, Waldsteinia.
Tribe Rubeae: Dalibarda, Rubus.
Tribe Roseae: Rosa.
"Alchemilla group": Alchemilla, Aphanes.
Tribe Pruneae: Prunus.
"Cydonia group": Chaenomeles, Cydonia.
Tribe Maleae: Amelanchier, Aronia, Malus, Photinia, Pyrus, Sorbus,
Tribe Crataegeae: Crataegus, Pyracantha

\section*{Agrimonia Linnaeus (Agrimony)}

A genus of about 10-15 species, herbs, mainly north temperate. References: Robertson (1974)=Z; Kalkman in Kubitzki (2004).

1 Inflorescence axis glandular-pubescent (sometimes also with non-glandular hairs).
2 Larger leaves with 11-15 (-23) primary leaflets (not counting the secondary leaflets); stamens 5-7 . . . . . . . A. parviflora
2 Larger leaves with 3-9 primary leaflets (not counting the secondary leaflets); stamens 10-15.
3 Hypanthium 3-5 mm wide in fruit; nutlet 3-3.3 mm in diameter; inflorescence usually with copious long, spreading, non-glandular hairs A. gryposepala

3 Hypanthium 2-2.5 mm wide in fruit; nutlet 2-2.4 mm in diameter; inflorescence usually with minute glandular hairs only (or sparsely pubescent with long non-glandular hairs]
A. rostellata 1 Inflorescence axis pubescent with non-glandular hairs.

4 Larger leaves with 3-5 (-7) primary leaflets (not counting the secondary leaflets)
4 Larger leaves with 5-13 primary leaflets (not counting the secondary leaflets).
5 Terminal leaflets 1-2.5 (-3) cm long; [of pinelands of the Coastal Plain] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. incisa
5 Terminal leaflets \(2.5-9 \mathrm{~cm}\) long; [of various habitats].
6 Larger leaves with 7-13 lanceolate-elliptic leaflets; outer bristles of the fruit spreading .......... A. bicknellii
6 Larger leaves with 5-7 (-9) obovate-elliptic leaflets; outer bristles of the fruit ascending . . . . . . . A. pubescens
Agrimonia bicknellii (Kearney) Rydberg. Cp (GA, NC, SC, VA), Pd (NC, SC, VA): moist forests and woodlands; uncommon? July-September; August-October. MA west to MI, south to NC, GA, and TN. Closely related to, and perhaps not separable from, \(A\). pubescens. [= K, S, Z; <A. pubescens Wallroth var. pubescens - RAB, in part; < A. pubescens -- C, F, G, in part]

Agrimonia gryposepala Wallroth, Common Agrimony. Mt (GA, NC, SC, VA), Pd (NC, SC, VA): mesic forests, thickets, marshes, bogs, wet meadows, wet forests; common (GA Special Concern). July-August; July-October. ME and Ontario west to MT, south to NJ, w. NC, e. TN, IN, and KS; also in CA and NM. [= RAB, C, F, G, K, S, W, Z]

Agrimonia incisa Torrey \& A. Gray, Pineland Agrimony. Cp (GA, NC?, SC): pinelands, disturbed areas associated with pinelands; rare (US Species of Concern, NC Watch List). July-early September. E. SC south to FL and west to MS (also reported repeatedly from NC, but no specimen has been seen). [= RAB, C, K, S, Z]

Agrimonia microcarpa Wallroth, Low Agrimony. Cp, Pd (GA, NC, SC, VA), Mt (NC, SC, VA): dry to moist forests and woodlands; uncommon. July-September; August-October. NJ south to FL, west to e. TX. [= C, F, G, K, S, W, Z; = A. pubescens Wallroth var. microcarpa (Wallroth) Ahles -- RAB; > A. microcarpa - S; > A. platycarpa Wallroth -- S]

Agrimonia parviflora Aiton, Southern Agrimony. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): marshes, bottomland forests, wet pastures; common. July-September; July-October. CT west to s. MI and SD, south to FL, TX, the West Indies and Mexico. [= RAB, C, F, G, K, S, W, Z]

Agrimonia pubescens Wallroth, Downy Agrimony. Mt (GA, NC, SC, VA), Pd, Cp (GA, NC, VA): dry to moist forests and woodlands; common. July-September; August-October. ME west to MI and SD, south to NC, GA, and OK. [= K, S, W, Z; A. pubescens var. pubescens -- RAB; <A. pubescens -- C, F, G, in part (also see A. bicknellii)]

Agrimonia rostellata Wallroth, Woodland Agrimony. Mt, Pd, Cp (GA, NC, SC, VA): moist to wet forests and woodlands; common. July-August; July-October. CT west to IN and KS, south to SC, GA, LA, and OK. [= RAB, C, F, G, K, S, W, Z]
* Agrimonia eupatoria Linnaeus, Medicinal Agrimony. Mt (NC): fields and disturbed areas; rare, apparently naturalized, introduced from Eurasia. July-September. Introduced at scattered localities in ne. North America. [= C, F, G, K, Z] \{not yet keyed\}

Agrimonia striata Michaux, Roadside Agrimony. Pd (GA): \{habitat unknown\}; rare. South to se. PA (Rhoads \& Klein 1993), MD, DE, WV, KY, Piedmont GA (Jones \& Coile 1988), and AL. It will key to A. bicknellii in the above key, but differs in having the leaves conspicuously glandular and sparsely pubescent beneath (vs. densely velvety pubescent and not conspicuously glandular), the fruiting hypanthium 4-5 mm long (vs. 2.5-3 mm long). [=C, F, G, K] \{not yet keyed\}

\section*{Alchemilla Linnaeus \\ (see Aphanes)}

Amelanchier Medikus 1789 (Serviceberry, Sarvis, Shadbush, Juneberry, "May Cherry", "Currant")

A genus of about 20-40 species, shrubs ad trees, north temperate. References: Robertson (1974)=Z; Kalkman in Kubitzki (2004).

Amelanchier arborea (Michaux f.) Fernald var. alabamensis (Britt.) G.N. Jones, Alabama Serviceberry. (GA, NC, SC, VA).
[= K, Z; A. arborea -- RAB, W, infraspecific taxa not distinguished]
Amelanchier arborea (Michaux f.) Fernald var. arborea, Downy Serviceberry. (GA, NC, SC, VA). [= RAB, K, Z; A. arborea --

C, F, G, W, infraspecific taxa not distinguished]
Amelanchier arborea (Michaux f.) Fernald var. austromontana (Ashe) Ahles, Southern Appalachian Serviceberry. (GA, NC, SC, VA). [= RAB, K, Z; A. arborea -- C, F, G, W, infraspecific taxa not distinguished]

Amelanchier canadensis (Linnaeus) Medikus, Eastern Serviceberry. (GA, NC, SC, VA). [= RAB, C, G, GW, K, W; > A. canadensis var. canadensis - F, Z; > A. canadensis var. subintegra Fernald -- \(F, Z]\)

Amelanchier laevis Wiegand, Smooth Serviceberry. (GA, NC, SC, VA). [= C, G, K, W, Z; = A. arborea var. laevis -- RAB; > A. laevis var. laevis -- F]

Amelanchier nantucketensis Bicknell, Nantucket Serviceberry. Pd (VA): rocky areas; rare. In Potomac River Gorge, VA and MD (Chris Frye, pers. comm.), but may actually be a new species. See Dibble \& Campbell (1995). [= F, K; ? A. canadensis \(\times\) spicata - C]

Amelanchier obovalis (Michaux) Ashe, Coastal Plain Serviceberry. (GA, NC, SC, VA). [= RAB, C, F, G, GW, K, Z]
Amelanchier sanguinea (Pursh) Augustin de Candolle var. sanguinea, Roundleaf Serviceberry, New England Serviceberry. (GA, NC, VA). [=K; A. sanguinea -- RAB, F, W, Z, infraspecific taxa not distinguished; A. sanguinea var. sanguinea - C, G, in part only (also see \(A\). humilis)]

Amelanchier stolonifera Wiegand, Dwarf Serviceberry. (GA, NC, SC, VA). [ \(=\mathrm{F}, \mathrm{K}, \mathrm{W}, \mathrm{Z}\); A. spicata (Lamarck) K. Koch -- C, G, misapplied as to North American material]

Amelanchier bartramiana (Tausch) M.J. Roemer. South to WV and PA. [= C, F, G, K] \{add synonymy\}
Amelanchier humilis Wiegand. South to montane MD, NJ, and PA. [=K; <A. sanguinea var. sanguinea - C, G, in part; > A. humilis var. humilis - F] \{add synonymy\}

\section*{Aphanes Linnaeus (Parsley-piert)}

A genus of about 20 species, herbs, of tropical and temperate Old World. Aphanes has usually been accepted by Europeans as distinct from Alchemilla, but Kalkman (in Kubitzki 2004) retains it (with some doubt) in Alchemilla, as a subgenus and Eriksson et al. (2003) include it in Alchemilla based on molecular evidence. References: Robertson (1974)=Z; Kalkman in Kubitzki (2004); Eriksson et al. (2003).
* Aphanes microcarpa (Boissier \& Reuter) Rothmaler, Parsley-piert. Pd (GA, NC, SC, VA), Cp, Mt (NC, SC, VA): lawns, fields, pastures, roadsides; common (uncommon in Piedmont of VA and Mountains of NC and VA), introduced from Europe. Late AprilMay. This plant is inconspicuous and often overlooked. [=C, K; = Alchemilla microcarpa Boissier \& Reuter -- RAB, F, G, W, Z; > Aphanes australis Rydberg -- S]
* Aphanes arvensis Linnaeus is reported for SC and TN by Kartesz (1999), but the only documentation consists of generalized range maps published in Hultén \& Fries (1986). Rejected as a component of our region's flora without additional documentation. [= C, K; Alchemilla arvensis (Linnaeus) Scopoli - F, G] \{not keyed\}

\section*{Argentina Hill}
(see Potentilla)

\section*{Aronia Medicus 1789 (Chokeberry)}

Aronia has sometimes been treated as a component of Sorbus or Pyrus. More recently, Robertson et al. (1991) have included Aronia in Photinia. Kalkman in Kubitzki (2004) agrees that Aronia and Photinia should be combined, but points out that Aronia is the older name and therefore must be used for the combined genus. References: Hardin (1973)=Y; Robertson (1974)=Z; Robertson et al. 1991=X; Kalkman in Kubitzki (2004).

Identification notes: All our species of Aronia can be distinguished from other shrubs in our flora by the presence of several dark (usually purplish-black) trichomes on the upper surface of the midrib, mostly towards the base of the leaf.

1 Lower surfaces of leaves, twigs, and inflorescence rachis glabrous; fruit black
A. melanocarpa

1 Lower surfaces of leaves, twigs, and inflorescence rachis pubescent; fruit bright red or dark purple.
2 Fruit bright red; leaves densely pubescent beneath
A. arbutifolia

2 Fruit dark purple; leaves sparsely pubescent beneath
A. prunifolia

Aronia arbutifolia (Linnaeus) Persoon, Red Chokeberry. Cp, Mt, Pd (GA, NC, SC, VA): bogs, pocosins, wet savannas, other wet habitats; common. March-May; September-November. Widespread in the Coastal Plain from Newfoundland south to FL and west to TX, extending inland in the south to WV and KY. [=C, G, GW, S, W; = Sorbus arbutifolia (Linnaeus) Heynhold var. arbutifolia -- RAB; = Pyrus arbutifolia (Linnaeus) Linnaeus f. -- F, Z; = Photinia pyrifolia (Lamarck) K. Robertson \& J.B. Phipps -- K, X]

Aronia melanocarpa (Michaux) Elliott, Black Chokeberry. Mt (GA, NC, SC, VA), Pd (NC, VA), Cp (VA): balds, forests, and openings and exposed rock outcrops at high elevations, bogs in the Mountains; uncommon (rare in Piedmont). May-June; AugustSeptember. Widespread in ne. North America, extending south to n. GA, n. AL, and MO. [= C, G, GW, S; = Sorbus melanocarpa
(Michaux) Heynhold -- RAB; = Pyrus melanocarpa (Michaux) Willdenow -- F, Z; < A. melanocarpa -- W, in part only (also see A. prunifolia); = Photinia melanocarpa (Michaux) J.B. Phipps -- K, X]

Aronia prunifolia (Marshall) Rehder, Purple Chokeberry. Pd, Mt (NC, VA), Cp (VA): balds, bogs, seepages, swamp forests; uncommon, rare south of VA (NC Watch List). April-May; September-October. Widespread but local in ne. North America, south to NC, FL?, and OH. While apparently originating as a hybrid between our other two species, A. prunifolia exists in populations independent of the two parent species, apparently reproducing successfully. It seems best to treat a now independent lineage such as this as a separate taxon. [= C, G, GW; = Sorbus arbutifolia var. atropurpurea (Britton) Schneider -- RAB; = Pyrus floribunda Lindley -- F, Z; = Aronia atropurpurea Britton -- S; < A. melanocarpa -- W, in part; = Photinia floribunda (Lindley) J.B. Phipps -- K, X]

\section*{Aruncus Linnaeus 1758 (Goat's-beard)}

A genus of 1-2 species, perennial herbs, of temperate North America and Europe. References: Robertson (1974)=Z; Kalkman in Kubitzki (2004).

Identification notes: Aruncus dioicus can be distinguished from the superficially closely similar Astilbe biternata by the following characteristics: trichomes of foliage not glandular (vs. glandular in Astilbe), stamens 20 (vs. 10), carpels 3-4 (vs. 2), seeds less than \(1.5-2 \mathrm{~mm}\) long (vs. ca. 4 mm long), terminal leaflets usually unlobed (vs. terminal leaflets usually trilobed).

1 Follicles 2.5-3.5 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [A. sylvester]
1 Follicles \(1.5-2 \mathrm{~mm}\) long.
2 Follicles semi-ovoid, strongly convex on the back, about \(1 / 2\) as thick (measured radially) as long; leaves somewhat lustrous, the lower surface glabrous to sparsely pubescent . . . . . . . . . . . . . . . . . . . . . . . . . . . A. dioicus var. dioicus
2 Follicles nearly cylindric, about \(1 / 3\) as thick (measured radially) as long; leaves dull, the lower surface pubescent.......

\section*{A. dioicus var. pubescens}

Aruncus dioicus (Walter) Fernald var. dioicus, Eastern Goat's-beard. Mt (GA, NC, SC, VA), Pd (GA, NC, VA), Cp (VA): moist, nutrient-rich forests and woodland borders; common. May-June; June-September. NY (?) and PA west to IN, south to NC, SC, GA, and AL. [= C, F, K, Z; > A. dioicus -- RAB, W, infraspecific taxa not distinguished; = A. allegheniensis Rydberg -- S]

Aruncus dioicus (Walter) Fernald var. pubescens (Rydberg) Fernald, Midwestern Goat's-beard. Mt (VA): moist, nutrient-rich forests and woodland borders?; rare? May-June; June-September. W. VA, KY, and IL west to IA, south to TN, AR, and OK. The validity of this variety and its attribution to our area (by G, K, and S) need further evaluation. Robertson (1974) states that the "two varieties intergrade completely, and it is questionable whether they should be maintained." [= C, F, K, Z; > A. dioicus -- RAB, W, infraspecific taxa not distinguished; = A. pubescens Rydberg -- S]
* Aruncus sylvester Kosteletzky ex Maximowicz is attributed to our area by Small (1933). This European species is occasionally cultivated in e. North America. [= C, G; = A. dioicus var. vulgaris (Maximowicz) Hara -- K; = A. aruncus (Linnaeus) Karsten]

\section*{Chaenomeles Lindley 1821 (Flowering Quince)}

A genus of \(3-4\) species, shrubs, of montane, temperate e. Asia. References: Kalkman in Kubitzki (2004).
* Chaenomeles speciosa (Sweet) Nakai, Flowering Quince. Pd (NC), Cp (VA): frequently persisting and rarely spreading from horticultural plantings to suburban woodlands; rare, native of China. January-April. The "fruiting" or Common Quince, Cydonia oblonga P. Miller, native of the Caucasus, is widely cultivated in Europe and formerly in e. North America. It has fallen out of favor, and is now rarely cultivated in our area. [= K]

Crataegus Linnaeus 1753 (Hawthorn, Haw, Thornapple)
(contributed by R. Lance)
A genus of 100-500 species, shrubs and small trees, north temperate and Central America, most in e. North America. References: Lance (in prep.)=X; Lance (1995); Phipps (1988)=Z; Phipps (1998)=Y; Phipps, O’Kennon, \& Lance (2003)= V; Kalkman in Kubitzki (2004). The treatment below has been adapted from that of Lance (1995), which is provisional. Substantial changes are likely prior to publication.

Identification notes: all references to leaves and petioles pertain to foliage on short shoots (floreal shoots), unless otherwise specified.

\section*{Key A - hawthorns with leaf bases cordate, truncate, rounded, or very abruptly contracted from a rounded base}

\section*{Key B - hawthorns with acute to cuneate leaf bases; leaves conspicuously glandular on petiole and teeth; and twigs and branchlets geniculate}

1 Leaves mostly widely elliptic or broadly obovate, base acute to short-cuneate.
2 Leaves sharply-toothed and shallowly lobed.
3 Leaves sparsely hairy to glabrous . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. allegheniensis
3 Leaves tomentose ................................................................................... C. dispar
2 Leaves with short, blunt teeth, mostly unlobed.
4 Leaves < 2 cm long, some suborbicular . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. Iepida
4 Leaves > 2 cm long, few suborbicular.
5 Fruit red . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. aprica
5 Fruit yellow . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. flava
1 Leaves mostly obovate or spatulate, base cuneate to attenuate.
6 Leaves and pedicels glabrous; branches slender, strongly weeping ..... C. lacrimata6 Leaves and pedicels variously hairy, at least when young; branches drooping or recurved.7 Leaves obscurely toothed to entire on marginC. Iassa
7 Leaves toothed along most of margin.
8 Leaf base attenuate or long-cuneate; apex 3-lobed or with 3 distinct points.
9 Fruit small, usually \(<8 \mathrm{~mm}\), often with calyx elevated C. anisophylla
9 Fruit usually 10 mm or more, calyx sessile C. senta
8 Leaf base cuneate; apex short-pointed; rarely lobed on floreal shoots.
10 Leaf teeth acute; twigs moderately slender, branchlets rigid C. alabamensisC. geniculata
Key C - Leaves eglandular,
or if glandular then twigs relatively straight, not conspicuously geniculate
1 Leaves spatulate or oblanceolate, < 13 mm wide; petiole winged to base; pyrenes < 4 mm long C. spathulata
1 Leaves not as above, or pyrenes \(>4 \mathrm{~mm}\) long.
2 Leaves with hair tufts in abaxial main vein axils; plants typically of wet or floodplain habitats
3 Inflorescence simple, 1-5-flowered; fruit > 1 cm in diameter, mature in late spring.
4 Leaves mostly obovate, 2-5 cm long C. aestivalis
Inflorescence compound, 5 to 20 -flowered; fruit usually < 1 cm in diameter, mature in autumn.
5 Petiole \(5-12 \mathrm{~mm}\) long; terminal shoot leaves unlobed C. crus-galli (=ammophila)
5 Petiole > 15 mm long; terminal shoot leaves lobed C. viridis
2 Leaves glabrous or with hairs scattered, not in tufts; plants typically of upland habitats.
6 Pyrenes of fruit channeled or pitted on inner side.
7 Leaves thin, dull yellow-green, usually pubescent at least abaxially; pedicels tomentose C. calpodendron
7 Leaves firm, dark green or lustrous, glabrous or slightly hairy abaxially, veins conspicuously impressed and reticulate adaxially; pedicels glabrous or pubescent C. succulenta
6 Pyrenes of fruit plane on inner side.
8 Leaves mostly < 3 cm long; calyx lobes foliaceous, deeply toothed; spines slender ..... C. uniflora
8 Leaves commonly \(>3 \mathrm{~cm}\) long and not with above combination of characters.
9 Thorns short (<2 cm ), or spinose spur shoots present; fruit black; leaves with reticulate veins adaxaially; main lateral veins run to sinuses and lobe tips in lobed leaves C. brachyacantha
9 Thorns usually > 2 cm long; fruit not black; leaves not as above
10 Petioles eglandular.
11 Leaves widely obovate, with rounded lobes and blunt teeth; calyx lobes broadly triangular . ..... C. margaretta
11 Leaves not widely obovate; lobes acute or lacking; calyx lobes elongate.
12 Leaves mostly ovate or broadly elliptic.
13 Petiole and leaf underside glabrous or sparsely hairy C. aemula
13 Petiole and leaf underside pubescent to tomentose C. mollis
12 Leaves mostly obovate or oblong-elliptic.
14 Leaf veins impressed adaxially, prominent abaxially; leaves dull green.
15 Leaves hairy abaxially; branches dark gray; fruit usually < 12 mm ; calyx and stem hairy ..... C. collina
15 Leaves glabrous abaxially after maturity; branches ashy gray; fruit 12-22 mm; calyx fruit stem glabrous C. punctata
14 Leaf veins obscure; leaves lustrous.
16 Leaves, petioles, pedicels hairy . berberifolia
16 Leaves, petioles, pedicels glabrous C. crus-galli
10 Petioles glandular (3 or more glands visible).
17 Leaves distinctly hairy or pubescent abaxially.
18 Leaves lobed 1/3-2/3 to midrib on terminal shoots; fruit calyx elevated
C. intricata var. biltmoreana
18 Leaves shallowly lobed to unlobed on terminal shoots; fruit calyx sessile.
19 Leaves thin; inflorescence simple, 3 to 5 -flowered; stamens usually 30 or more
C. triflora
19 Leaves firm; inflorescence compound, >5-flowered; stamens 20 or fewer. 20 Leaves shallowly lobed on terminal shoots, usually \(>5 \mathrm{~cm}\) wide ... C. harbisonii 20 Leaves unlobed, most \(<5 \mathrm{~cm}\) wide.
21 Leaf veins slightly impressed adaxially; fruit calyx deeply glandular-serrate; petiole conspicuously glandular . . . . . . . . . . . . . . . . . . . . . . . . C. ashei
21 Leaf veins distinctly impressed adaxially; fruit calyx remotely serrate to entire; petiole sparsely glandular ..... C. collina
17 Leaves sparsely hairy to glabrous.

Crataegus aemula Beadle. \{GA\}. GA to MS. [= K, X]
Crataegus aestivalis (Walter) Torrey \& A. Gray, Mayhaw, Eastern Mayhaw. Cp (GA, NC, SC, VA): swamp forests, generally where flooded for much of the year, often flowering and fruiting while standing in water, often associated with Taxodium distichum, Nyssa aquatica, Nyssa biflora, Planera aquatica; uncommon (though locally abundant). March-April; June-July. Se. VA south to n. FL and se. AL. Related species C. rufula Sargent and C. opaca Hooker \& Arnott occur in the deeper south in similar habitats, \(C\). rufula restricted to w. FL, sw. GA, and se. AL, and C. opaca ranging from nw. FL west to e. TX and s. AR. See Phipps (1988) for extensive additional discussion of \(C\). aestivalis and relatives. The fruits of all three species are traditionally gathered for preserves, pies, and jelly. [= RAB, K, X, Z]

Crataegus alabamensis Beadle. \{GA, SC\}. [= X]
Crataegus alleghaniensis Beadle. \{GA\}. [= X]
Crataegus ancisa Beadle. \(\{\mathrm{GA}\}\) [= X]
Crataegus anisophylla Beadle. \{GA\} [= X]
Crataegus aprica Beadle. \{GA, NC, SC, VA\} [= X; C. flava Aiton - K]
Crataegus berberifolia Torrey \& Gray. \{GA, NC, SC\} [=K, X]
Crataegus boyntonii Beadle. \{GA, NC, SC, VA\} [= X; C. intricata Lange - K]
Crataegus brachyacantha Sargent \& Engelmann, Blueberry Hawthorn. Cp (GA): open pinelands; rare (GA Special
Concern). In sw. GA, disjunct from a main range further west. [= K, Y, X]
Crataegus buckleyi Beadle. \{GA, NC, SC, VA\} [= X]
Crataegus calpodendron (Ehrhart) Medikus, Pear Hawthorn. Mt (VA) \{GA, NC, SC\}: [= RAB]
Crataegus chrysocarpa Ashe, Fireberry Hawthorn. Mt (VA?): South to WV (and VA?). [= X; C. margarettiae Ashe var. brownii (Britton) Sargent; C. chrysocarpa var. chrysocarpa - K]

Crataegus coccinea Linnaeus, Scarlet Hawthorn. Mt, Pd (NC, VA): rare. [= RAB]
Crataegus collina Chapman, Chapman's Hill-thorn. Mt (VA) \{GA, NC, SC\}: hillside forests and woodlands, especially over calcareous rocks. Sw. VA west to KS, south to GA, ne. MS and OK. [= X; C. punctata Jacquin, in part -- RAB]

Crataegus crus-galli Linnaeus, Cockspur Hawthorn. Mt, Pd, Cp (GA, NC, SC, VA): pastures, thickets, disturbed woodlands and forests, fence-rows; common. [=K, X; C. crus-galli Linnaeus, in part -- RAB]

Crataegus dispar Beadle, Aiken Hawthorn. \{GA, SC\}. Endemic to GA and SC. [= K, X]
Crataegus geniculata Ashe. \{GA, NC, SC\} [= X]
Crataegus intricata Lange, Entangled Hawthorn. \{GA, NC, SC, VA\} [= X; C. intricata Lange - K, in part]
Crataegus iracunda Beadle, Red Hawthorn. Cp, Pd, Mt (GA, NC, SC, VA): swamps, bottomlands, moist slopes; common. [=
X]
Crataegus lassa Beadle. \{GA, NC, SC\} [= X]
Crataegus lepida Beadle. \{GA\} [= X]
Crataegus macrosperma Ashe. Mt, Pd, Cp (NC, SC, VA) \{GA\}: [C. flabellata (Bosc) K. Koch, in part -- RAB]
Crataegus margaretta Ashe. \{VA\} [C. margarettiae - K, orthographic variant]
Crataegus marshallii Eggleston, Parsley Hawthorn, Parsley Haw. Cp (GA, NC, SC, VA), Pd (GA, NC, SC): swamp forests (especially over calcareous soils), alluvial forests, dry and mesic upland slopes (especially over mafic or calcareous rocks). Aprilearly May; September-October. Se. VA south to c. peninsular FL, west to e. TX, and north in the interior to sc. TN, n. AL, n. MS, w. TN, s. IL, se. MO, nc. AR, and se. OK (Phipps 1998). C. marshallii is distinctive and immediately recognizable among Crataegus, by its deeply lobed leaves, small flowers, and small fruits ( \(4-6 \mathrm{~mm}\) long by about 3 mm wide, with only 1-3 pyrenes). [= RAB, K, Y]

Crataegus mollis Scheele. \{VA\} In c. TN (Chester, Wofford, \& Kral 1997). [= K, X]
Crataegus opima Beadle. \{GA\} [=X]
Crataegus pallens Beadle. \(\{\mathrm{NC}\}\) [= X; C. intricata Lange - K, in part]
Crataegus phaenopyrum (Linnaeus f.) Medikus, Washington Hawthorn. Mt, Pd, Cp (GA, NC, SC, VA): bottomland forests and thickets; uncommon. Late May-June; September-October. Phipps (1998) discusses this species (in which he includes C. youngii). The distribution (as mapped by Phipps 1998) seems unlikely. [= F, K; C. phaenopyrum -- RAB, Y, in part; C. cordata (P. Miller) Aiton, of uncertain application]

Crataegus pruinosa (Wendl.) K. Koch, Frosted Hawthorn. Mt (VA, NC?): \{GA, NC, SC, VA\} [= X]
Crataegus pulcherrima Ashe, Beautiful Haw. \{GA\} (GA Special Concern). [=K, X]
Crataegus punctata Jacquin, Dotted Hawthorn. Mt, Pd (GA, NC, VA): forests, woodlands, thickets, and pastures, most common at moderate to high elevations in the Mountains; common. May-early June; September-October. [C. punctata Jacquin, in part -- RAB]

Crataegus sargentii Beadle. \(\{\mathrm{GA}\}[=\mathrm{K}, \mathrm{X}]\)
Crataegus schuettii Ashe. \{GA?, NC, SC?, VA?\} [= K, X]

Crataegus senta Beadle. \{GA, NC, SC?\} [=X; C. flava - K, in part]
Crataegus spathulata Michaux, Littlehip Hawthorn. Cp (GA, NC, SC, VA), Pd, Mt (GA, NC, SC): bottomland forests, extending upslope to drier sites especially on mafic or calcareous substrates; uncommon. April-May; September-October. E. NC south to Panhandle FL, west to e. TX, north in the inland to w. NC, c. TN, s. MO, and e. OK (Phipps 1998). This species is distinctive for its small spatulate leaves (tending to be trilobed) and thin, flaking bark (multicolored green, cream, brown and brownish gray). [= RAB, Y]

Crataegus succulenta Schrader ex Link. \{VA\} [=X]
Crataegus triflora Chapman, Three-flower Hawthorn. Mt (GA): rocky, limestone slopes; rare (GA Special Concern). [= K]
Crataegus uniflora Muenchhausen, One-flowered Haw. Cp, Pd, Mt (GA, NC, SC, VA): dry sandy or rocky soils, in sandhills, barrens, dry woodlands; common. April-May; August-October. NY west to OH and MO, south to FL and e. TX. [= RAB]

Crataegus viridis Linnaeus, Green Hawthorn. Cp (GA, NC, SC, VA), Pd (GA, NC, VA), Mt (GA, VA): bottomlands forests, slope forests (especially over calcareous rocks). Late March-May; September-October. [= RAB]

Crataegus ashei Beadle. In AL. [= X; C. harbisonii Beadle - K]
Crataegus harbisonii Beadle. TN. [= X]
Crataegus mendosa Beadle, Albertville Hawthorn. AL (to be expected in GA). [=K, X]
Crataegus opaca Hooker \& Arnott. AL. [= K, X]
Crataegus pinetorum Beadle. In AL and TN. [= K, X]
Crataegus rufula Sargent. Cp (GA): flatwoods ponds, river swamps; uncommon. [= Z]

\section*{Cydonia P. Miller 1754 (Quince)}

A monotypic genus, a shrub, probably native of the Caucasus. References: Kalkman in Kubitzki (2004)=Z.
* Cydonia oblonga P. Miller, Edible Quince, is reported for MD (Kartesz 1999). [=K, Z; = Pyrus cydonia Linnaeus]

Dalibarda Linnaeus (Dewdrop, Robin-runaway, Star-violet)
The genus is monotypic, but should perhaps be included in Rubus (Alice \& Campbell 1999). References: Robertson (1974)=Z; Alice \& Campbell (1999).

Dalibarda repens Linnaeus, Dewdrop, Robin-runaway, Star-violet. Mt (NC, VA): bog margins and mountain swamp forests, often along spring seeps, mostly in dense shade beneath Rhododendron maximum; rare (NC Endangered, VA Rare). JuneSeptember. Ranging from Newfoundland west to MI and MN, south to NJ and OH, and disjunct to WV, sw. VA, and w. NC. [= RAB, C, G, GW, K, S, W; = Rubus dalibarda Linnaeus; = Rubus repens (Linnaeus) Kuntze]

\section*{Dasiphora Rafinesque (Shrubby-cinquefoil)}

Molecular phylogenetic studies indicate that this genus is more closely related to Alchemilla, Aphanes, Drymocallis, Fragaria, Sibbaldiopsis, and other genera outside our area than to Potentilla (Eriksson et al. 2003). References: Robertson (1974)=Z; Eriksson et al. (2003); Kalkman in Kubitzki (2004).

Dasiphora fruticosa (Linnaeus) Rydberg ssp. floribunda (Pursh_Kartesz, Shrubby-cinquefoil, Golden-hardhack. This species is widepread in the western and northern parts of North America, south to NJ, PA, OH, IN, and IL. It was reported for western NC (near Ducktown, in Turtletown, Cherokee County, N.C.") by Gattinger (1901), but additional documentation is lacking. [= K; > Potentilla fruticosa Linnaeus - C, G, Z; Potentilla fruticosa var. fruticosa - F; = Pentaphylloides floribunda (Pursh) A. Löve]

\section*{Drymocallis Fourrier ex Rydberg 1908}

A genus of about 30 species, best segregated from Potentilla. Molecular phylogenetic studies indicate that this genus is more closely related to Alchemilla, Aphanes, Dasiphora, Fragaria, Sibbaldiopsis, and other genera outside our area than to Potentilla (Eriksson et al. 2003). References: Eriksson, Donoghue, \& Hibbs (1998); Eriksson et al. (2003); Kalkman in Kubitzki (2004).

Drymocallis arguta (Pursh) Rydberg, Tall Potentilla. Mt (VA): greenstone barrens; rare (VA Rare). Québec west to Mackenzie, south to w. VA, IN, MO, and AZ. Reported for e. TN by Gattinger (1901); the documentation unknown. [= Potentilla arguta Pursh -- F, G; > P. arguta var. arguta -- C; > P. arguta ssp. arguta -- K]

Duchesnea J.E. Smith 1811 (Indian Strawberry) (see Potentilla)

A genus of about 4 species, shrubs, of e. Asia. References: Kalkman in Kubitzki (2004).
* Exochorda racemosa (Lindley) Rehder, Pearlbush. Pd (GA, NC, SC, VA): disturbed areas, woodland borders; rare, introduced from China. First reported for South Carolina by Hill \& Horn (1997). [= C, G, K]

\section*{Filipendula P. Miller 1754 (Queen-of-the-Prairie)}

A genus of about 15 species, herbs, north temperate in e. and nw. North America, Europe, and Asia. References: Schanzer (1994) \(=\) Y; Robertson (1974)=Z.

1 Lateral leaflets lobed and toothed; flowers pink; fruit straight; rootstock with long subterranean runners; [native plant of wetlands, also sometimes cultivated]; [section Albicoma] \(\qquad\)
1 Lateral leaflets merely coarsely toothed; flowers white; fruit twisted; rootstock short, without runners; [introduced species, sometimes escaped, at least north of our area]; [section Filipendula]
[F. ulmaria]
Filipendula rubra (Hill) B.L. Robinson, Queen-of-the-Prairie. Mt (GA, NC, VA), Pd (VA): bogs, wet meadows, over mafic or calcareous rocks; rare (NC Endangered, VA Rare). June-July; July-September. PA west to n. IL and MN, south to WV, w. VA, w. NC, n. GA, KY, and IA. The closest relatives are the other two members of section Albicoma: F. palmata (Pall.) Maximowicz and F. angustifolia (Turczaninow) Maximowicz, both of ne. Asia. [= RAB, C, F, G, GW, K, S, W, Z]
* Filipendula ulmaria (Linnaeus) Maximowicz, Meadowsweet, Queen-of-the-Meadow, is cultivated and sometimes escaped or persistent. It is reported for KY, WV, PA, and NJ (Kartesz 1999). [= Y; > F. ulmaria var. ulmaria - C, F, G; > F. ulmaria ssp. ulmaria -K]

\section*{Fragaria Linnaeus (Strawberry)}

A genus of about 10 species, herbs, of temperate Eurasia, North Americ, and South America. References: Kalkman in Kubitzki (2004).
* Fragaria ×ananassa Thuillier (pro sp.) var. ananassa [chiloensis \(\times\) virginiana], Garden Strawberry, Cultivated Strawberry. (GA, NC, SC, VA). An octoploid hybrid of the two octoploid species, F. chiloensis and F. virginiana. [= K; F. xananassa - RAB, infraspecific taxa not distinguished; \(F\). ananassa - C]

Fragaria vesca Linnaeus var. americana Porter. (NC, VA). [=C; F. vesca -- RAB, infraspecific taxa not distinguished; \(F\). vesca ssp. americana (Porter) Staudt - K]

Fragaria virginiana P . Miller ssp. grayana (Vilm. ex J. Gay) Staudt, Wild Strawberry. (VA). [= K; F. virginiana - RAB, C, infraspecific taxa not distinguished]

Fragaria virginiana \(P\). Miller ssp. virginiana, Wild Strawberry. Mt, Pd, Cp (GA, NC, SC, VA): grasslands, roadsides, pastures; common. [= K; F. virginiana -- RAB, C, infraspecific taxa not distinguished]

Fragaria vesca Linnaeus var. vesca. East and south to PA, WV, and KY. [=C; F. vesca -- RAB, infraspecific taxa not distinguished; \(F\). vesca ssp. vesca \(-K\) ]

\section*{Geum Linnaeus (Avens)}

Many researchers have advocated breaking Geum into varying numbers of segregate genera; even the most conservative divisions place G. radiatum in a genus separate from our other species (such as Parageum; see synonymy) and some would place G. vernum in Stylipus. A preliminary molecular study (Smedmark \& Eriksson 2002) did not fully resolve the issues. Whether generic splitting is advisable (and if so, to what degree) remains uncertain and needs further study. Alternatively, Waldsteinia could be included in Geum. References: Robertson (1974)=Z, Bolle (1933)=Y; Král (1966)=X; Smedmark \& Eriksson (2002); Kalkman in Kubitzki (2004).

1 Style straight or slightly sinuous, neither jointed nor tightly twisted, the tip straight; basal leaves with a cordate or reniform terminal lobe \(7-15 \mathrm{~cm}\) wide and 1 -several lateral lobes generally less than 1 cm long (rarely to 2 cm long); cauline leaves much reduced, flabellate, with clasping base and rounded apex; leaves thick, subcoriaceous, the upper surface dark green and glossy; petals 13-20 mm long, bright yellow; [of crevices and ledges on high elevation cliffs (less commonly grassy balds)]; [subgenus Micracomastylis; genus Parageum]
G. radiatum

1 Style with a tight kink or twist, the straight portion above the kink more-or-less deciduous, leaving a hook; basal leaves variable, trifoliate, pinnatifid, simple or with a large terminal lobe (to 8 cm wide) and much smaller lateral lobes; cauline leaves trifoliate to simple, mostly sessile or petiolate base, with acute or acuminate apex; leaves herbaceous, the upper surface medium green, not notably glossy; petals \(1-10 \mathrm{~mm}\) long, white, cream, pale yellow, bright yellow, or lavender; [of mesic to boggy forests, or less commonly, grassy balds (G. geniculatum)].

2 Calyx lobes 2-4 mm long, lacking bractlets between the lobes; head of achenes elevated above the calyx on a 1-2 mm stipe; flowering April-May; fruiting May-June; [subgenus or genus Stylipus]
G. vernum

2 Calyx lobes 4-10 mm long, with bractlets between the lobes; head of achenes more-or-less sessile; flowering May-August; fruiting late May-September; [subgenus or genus Geum].
3 Portion of the style above the kink 3-7 mm long; calyx campanulate, cup-like in flower and fruit (sometimes becoming slightly and irregularly reflexed late in fruit), the sepals \(5-10 \mathrm{~mm}\) long, green or purple-darkened; petals yellow or often with a substantial suffusion of rose, lavender, or purple; lower portion of style with long, gland-tipped hairs 4 Portion of the style above the kink 4-7 mm long; sepals \(5-10 \mathrm{~mm}\) long, green or purple-darkened; [of nw. NC and adjacent TN]
G. geniculatum

4 Portion of the style above the kink 3-4 mm long; sepals \(9-15 \mathrm{~mm}\) long, purple; [of ne. WV northwards]
[G. rivale]
3 Portion of the style above the kink 1-2 mm long; calyx reflexed soon after anthesis, the sepals \(3-9 \mathrm{~mm}\) long, green; petals white, cream, or yellow; lower portion of style glabrous or with long, eglandular hairs.
5 Larger stipules more than 10 mm wide, coarsely toothed or even lobed; mid-cauline leaves very coarsely toothed, with 1-5 teeth per cm of margin . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . G. virginianum
5 Larger stipules 2-10 (-12) mm wide, entire to toothed; mid-cauline leaves less coarsely toothed, with 3-7 teeth per cm of margin.
6 Plant in flower.
7 Petals bright yellow, 5-9 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . G. aleppicum
7 Petals white or cream (often drying pale yellow), 2-7 (-7.5) mm long.
8 Petals (3-) 4-7 (-7.5) mm long; pedicels puberulent (sometimes also slightly hirsute); [of moist to
8 Petals (2-) 2.5-4 (-5.5) mm long; pedicels densely hirsute with spreading or slightly reflexed hairs, and also puberulent; [of wetlands].
9 Young achenes glabrous . . . . . . . . . . . . . . . . . . . . . . . . . . . G. laciniatum var. laciniatum
9 Young achenes sparsely to densely pubescent with long stiff trichomes
G. Iaciniatum var. trichocarpum

6 Plant in fruit.
9 Pedicel predominantly puberulent, also sometimes with scattered long hairs; cauline leaves mostly 3foliolate or simple; receptacle densely hispid with yellowish, stiff hairs (best seen by removing a several achenes to expose the receptacle surface); [widespread and common in our area, primarily occurring in moist to wet forests]
G. canadense

9 Pedicel moderately to densely hirsute with long, spreading to reflexed hairs \(1-2.5 \mathrm{~mm}\) long, and also puberulent; cauline leaves mostly pinnately compound, the leaflets mostly elongate and often also laciniately divided; receptacle glabrous or sparsely to densely hispid; [rare in our area, occurring in the Mountains of NC and the Mountains, Piedmont, and Coastal Plain of VA, primarily in bogs and boggy meadows].
11 Hairs on the achene extending upwards onto the lower portion of the style; pedicel sparsely hirsute with spreading hairs; receptacle densely hispid . . . . . . . . . . . . . . . . . . . G. aleppicum 11 Hairs on the achene absent or at least not extending upwards onto the lower portion of the style; pedicel densely hirsute with spreading to reflexed hairs; receptacle glabrous to sparsely hispid.
12 Achenes glabrous . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . G. Iaciniatum var. laciniatum 12 Achenes sparsely to densely pubescent with long stiff trichomes
G. laciniatum var. trichocarpum

Geum aleppicum Jacquin, Yellow Avens. Mt (NC, VA), Pd (VA): bogs and boggy meadows; rare (NC Rare, VA Rare). JuneJuly; July-August. Circumboreal, in North America south to NJ, w. NC, ne. TN (Chester, Wofford, \& Kral 1997), IN, IL, IA, and NM. The report for GA (Jones \& Coile 1988) is in error. American plants are sometimes separated from Eurasian ones as var. strictum (Aiton) Fernald. [= RAB, GW, K, W, Y, Z; > G. aleppicum var. strictum (Aiton) Fernald -- C, F, G]

Geum canadense Jacquin. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): moist slope forests, bottomland forests, swamp forests; common. May-July; July-November. Nova Scotia west to ND, south to c. GA and TX. Some authors have recognized a number of varieties in G. canadense (see synonymy); some (at least) of these may warrant recognition. [= RAB, C, G, GW, S, W, Z; \(>G\). canadense var. canadense -- F, K, Y; > G. canadense var. brevipes Fernald --F, Y; > G. canadense var. camporum (Rydberg) Fernald \& Weatherby -- F, Y; > G. canadense var. grimesii Fernald \& Weatherby -- F, Y]

Geum geniculatum Michaux, Bent Avens. Mt (NC): seeps, seepy boulderfield forests, grassy balds, cliff bases, banks of cool streams up to about 5 m wide, at high to moderate elevations on Grandfather Mountain (Avery, Watauga, and Caldwell counties, NC), the Roan Mountain massif (Avery and Mitchell counties, NC and Carter County TN), and Rich Mountain (Watauga County, NC); rare, though locally fairly common (US Species of Concern, NC Threatened). July-August; August-September. G. geniculatum is apparently restricted to the few highest peaks in nw. NC and ne. TN: the Roan Mountain massif (Roan High Knob, Roan High Bluff, Round Bald, Jane Bald, Grassy Ridge, Little Hump Mountain, Big Yellow Mountain, and Big Hump Mountain), Grandfather Mountain, and Rich Mountain. It may be found on a few other peaks, such as Snake Mountain. The distribution of this species is peculiar. While limited to the several highest and coldest mountains in the Southern Appalachians, it extends downslope on Roan Mountain and Grandfather Mountain nearly to their bases, in situations that are apparently repeated on many other Southern Appalachian peaks. Perhaps G. geniculatum was more widespread in the Southern Appalachians in the cooler, moister conditions of the post-Pleistocene, but became restricted to the few coldest peaks during the warmer, drier conditions of the Hypsithermal Interval (7000-2000 B.C.). Following climatic cooling, it was able to disperse downslope from its several refugia, but has not
dispersed successfully to other peaks. G. geniculatum is most closely related to the circumboreal G. rivale, with which it shares such characteristics as purplish, non-reflexed sepals, a relatively long terminal style segment, upper pedicel with long glandular hairs, and basal style segment with long glandular hairs. [= RAB, K, S, W, Y, Z]

Geum laciniatum Murray var. Iaciniatum. (VA): \{info from VAHP\}. This variety ranges south to VA, MD, KY, and TN. It resembles \(G\). laciniatum var. trichocarpum but has the achenes glabrous (vs. sparsely to densely pubescent with long stiff trichomes). [= F, G, K, Z; < G. laciniatum -- C, W, Y, infraspecific taxa not distinguished]

Geum laciniatum Murray var. trichocarpum Fernald, Rough Avens. Mt (NC, SC, VA), Pd, Cp (VA): bogs and boggy meadows, usually calcareous or basic; rare (NC Rare, VA Rare). June-July; July-August. G. laciniatum ranges from Nova Scotia west to MN, south to w. NC, ne. TN, MO, and KS. Var. trichocarpum ranges from Nova Scotia west to MN, south to w. NC, IL, MO, and KS. Var. laciniatum, differing in its glabrous achenes, appraches our area and should be sought; it is generally more northern and more restricted in distribution, ranging from Nova Scotia west to s. Ontario, south to MD, WV, TN, OH, and IN. [=F, G, K, Z; < G. Iaciniatum -- RAB, C, GW, W, Y, infraspecific taxa not distinguished]

Geum radiatum Michaux, Spreading Avens, Cliff Avens. Mt (NC): high elevation rocky summits, in thin soil at tops of cliffs and on ledges (where not trampled), in pockets of soil on nearly vertical portions of cliffs, in open grassy balds, around Rhododendron catawbiense in grassy balds, or in grassy areas at bases of cliffs (where succession by shrubs is prevented by accumulation of seepage ice and by stone fall); rare (US Endangered, NC Endangered). June-August; July-September. Ranging from Ashe County, NC (Phoenix Mountain) south and west to Sevier County, TN (Mount Leconte) and Transylvania County, NC (the Devil's Courthouse), restricted to "pseudo-alpine" rock outcrops and grassy meadows near the summits of the higher peaks of the Southern Blue Ridge, notably Bluff Mountain, Three Top Mountain, Phoenix Mountain, and The Peak (Ashe County, NC), Grandfather Mountain (Watauga and Avery counties, NC), Grassy Ridge (Avery County, NC), Roan High Bluff (Mitchell County, NC), Mount Craig in the Black Mountains (Yancey County, NC), Craggy Pinnacle, Craggy Dome, and Craggy Gardens (Buncombe County), the Devil's Courthouse (Transylvania County, NC), and Mount Leconte (Sevier County, TN). G. radiatum is closely related to three other taxa, these siblings also restricted in range and endemic to mountainous areas, collectively showing a relictual distribution: G. peckii Pursh (of alpine meadows and moist, rocky slopes of Nova Scotia and the higher peaks of NH and ME), G. calthifolium Menzies ex Smith var. calthifolium (of wet snow-melt meadows of w. British Columbia, w. Yukon, s. AK, and the Aleutians), and G. calthifolium var. nipponicum (of wet snow-melt meadows of s. Kamchatka and Japan). It is illegal to collect \(G\). radiatum without federal and state permits, and there is no justification (scientific or otherwise) for additional collections from known sites. This is one of the few plant species that has been seriously depleted by collection by scientists (several hundred herbarium sheets from Roan Mountain alone!), though recreational over-use of its habitats, and possibly also pollution and break-up of adjoining spruce-fir forests, are the more critical threats to its continued existence. [= RAB, K, W, Z; = Sieversia radiata (Michaux) Greene -- S; = Parageum radiatum (Michaux) H. Hara - X; = Acomastylis radiata (Michaux) Bolle -- Y]

Geum vernum (Rafinesque) Torrey \& A. Gray, Spring Avens. Mt, Pd (NC, VA): seepages, swamps, roadsides, disturbed areas; uncommon, probably both native and introduced in our area, the native occurrences now being supplemented by its spread along roads from further west. April-May; May-June. [= RAB, C, F, G, GW, K, W, Y, Z; = Stylypus vernus Rafinesque -- S]

Geum virginianum Linnaeus, Cream Avens. Mt, Pd (NC, SC, VA), Cp (NC, VA): bottomland forests, moist slope forests, swamp forests, and extending upslope to mesic or even dry sites, especially over mafic rocks; common. June-August; JulyNovember. MA and NY west to IN, south to SC and TN. [= RAB, C, F, G, GW, K, S, W, Y, Z; = G. hirsutum Muhlenberg ex Link -S]

Geum rivale Linnaeus, Water Avens, Purple Avens, is a circumboreal plant of calcareous bogs, swamps, seepages, and wet meadows that ranges south to WV (Pocahontas, Preston, Randolph, and Tucker counties). It is most closely related (in our area) to G. geniculatum. [= C, F, G, K, Y]

\section*{Gillenia Moench 1802 (Indian-physic, Bowman's-root)}

A genus of 2 species, herbs, of e. North America. There has been nomenclatural debate about the name Gillenia must be rejected because it is a later homonym of Gillena; the resolution appears to be that Gillenia can be used, and as it is older than the name Porteranthus, should be used (see Robertson 1974; Brummitt 1988; Parkinson 1988). References: Robertson (1974)=Z; Kalkman in Kubitzki (2004).

1 Stipules ovate, \(10-20 \mathrm{~mm}\) long; leaves trifoliate, the leaflets of the lower leaves laciniate-toothed to divided ..... G. stipulata
1 Stipules linear, 6-8 mm long; leaflets of the lower leaves; leaves trifoliate, the leaflets of the lower leaves merely toothed, like the upper leaves
G. trifoliata

Gillenia stipulata (Muhlenberg ex Willdenow) Nuttall, Midwestern Indian-physic. Pd (GA, NC, VA), Mt (GA): dry to mesic woodlands and forests, especially over circumneutral soils derived from diabase (in NC) or greenstone (in VA); rare (NC Rare, VA Rare). May-June; July-October. NY to KS, south to nw. GA and TX, and disjunct east of the Blue Ridge in sc. VA, c. NC, and c. GA. [= RAB, F, G; = Porteranthus stipulatus (Muhlenberg ex Willdenow) Britton - C, K, S, W, Z]

Gillenia trifoliata (Linnaeus) Moench, Mountain Indian-physic. Mt, Pd (GA, NC, SC, VA), Cp (VA): moist forests, roadbanks, forest edges; common. April-June; August-October. Ontario west to MI, south to SC, AL, nc. GA, and MO. [=RAB, F, G; = Porteranthus trifoliatus (Linnaeus) Britton -- C, K, S, W, Z]

\section*{Kerria Augustin de Candolle 1818 (Kerria)}

A monotypic genus, a shrub, of China and Japan. References: Kalkman in Kubitzki (2004).
* Kerria japonica (Linnaeus) Augustin de Candolle, Kerria, Japanese-rose. Pd (NC, SC, VA), Cp (VA): woodland borders, suburban woodlands; rare, introduced from China. April-May. Single and "doubled" forms are cultivated. [= C, F, G, K]

\section*{Malus P . Miller (Apple, Crabapple)}

A genus of 30-50 species, trees and shrubs, north temperate. References: Robertson (1974)=Z; Kalkman in Kubitzki (2004).
Subgenus Chloromeles: angustifolia, coronaria
Subgenus Malus: pumila
Malus angustifolia (Aiton) Michaux var. angustifolia, Wild Crab Apple. Cp, Pd, Mt (GA, NC, SC, VA): . [= K; Malus angustifolia -- RAB, in part; Pyrus angustifolia Aiton -- C, G, Z, infraspecific taxa not distinguished; Pyrus angustifolia var. angustifolia -- F; Malus angustifolia -- S, infraspecific taxa not distinguished]

Malus angustifolia (Aiton) Michaux var. puberula Rehder, Wild Crab Apple. (VA). [= K; Malus angustifolia -- RAB, in part; Pyrus angustifolia Aiton -- C, G, Z, infraspecific taxa not distinguished; Pyrus angustifolia var. spinosa (Rehder) L.H. Bailey -- F; Malus angustifolia -- S, infraspecific taxa not distinguished]

Malus coronaria (Linnaeus) P. Miller, Wild Crab Apple. Mt, Pd, Cp (GA), \{NC, SC, VA \(\}\) : [= RAB, K; Pyrus coronaria Linnaeus -- C, Z; Pyrus coronaria Linnaeus var. coronaria -- F; Pyrus coronaria Linnaeus var. elongata Rehder -- F; Pyrus coronaria Linnaeus var. dasycalyx (Rehder) Fernald -- F; Pyrus coronaria Linnaeus var. lancifolia (Rehder) Fernald -- F; Pyrus lancifolia Bailey -- G; Malus bracteata Bailey -- S; Malus coronaria (Linnaeus) P. Miller -- S; Malus lancifolia Rehder -- S; Malus coronaria (Linnaeus) P. Miller var. dasycalyx Rehder]
* Malus prunifolia (Willdenow) Burkhardt. (SC, VA). [= K; = Pyrus prunifolia Willdenow]
* Malus pumila P. Miller, Common Apple. commonly cultivated throughout, especially in the Mountains and Piedmont, and long persistent. [= RAB, K; = Pyrus malus Linnaeus -- C, F, G, Z; = Malus malus (Linnaeus) Britton -- S; Malus domestica Burkhart]

Malus ioensis (Wood) Britton var. ioensis, Prairie Crabapple. East to KY and MS. [= K] \{not yet keyed; add synonymy\}

\section*{Neviusia A. Gray 1858 (Snow-wreath)}

A genus of 2 species, shrubs, of e. North America and California. References: Kalkman in Kubitzki (2004).
Neviusia alabamensis A. Gray, Alabama Snow-wreath. Mt (GA): limestone woodlands, where there is seasonal moisture; rare (GA Threatened). Sc. TN (Chester, Wofford, \& Kral 1997), nw. GA (Jones \& Coile 1988), and n. AL. [= K, S]

\section*{Photinia Lindley (Photinia, Redtip)}
(also see Aronia)
A genus of about 35 species, trees and shrubs, of Asia and Central America. Perhaps should be combined into Aronia (see discussion under that genus). References: Kalkman in Kubitzki (2004).
* Photinia villosa (Thunberg) Augustin de Candolle, Redtip, Photinia, is cultivated as an ornamental landscaping plant and persists after cultivation. [= K; Aronia]

\section*{Physocarpus (Cambess.) Rafinesque 1838 (Ninebark)}

A genus of 3-5 species, shrubs, of North America and ne. Asia. References: Robertson (1974)=Z; Kalkman in Kubitzki (2004).
\begin{tabular}{ll}
1 & Follicles stellate-pubescent . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Ph. opulifolius var. intermedius \\
1 Follicles glabrous . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Ph. opulifolius var. opulifolius
\end{tabular}

1 Follicles glabrous
Ph. opulifolius var. opulifolius

Physocarpus opulifolius (Linnaeus) Maximowicz var. intermedius (Rydberg) B.L. Robinson, Midwestern Ninebark. Pd (SC, NC?): \{habitat and distribution needing additional investigation\}. W. NY west to MN and CO, south to SC, FL, AL, and AR. It is unclear whether the southern species recognized by Small (1933) are best allied with his taxon. Additional study is needed. [= C, \(F\), G, K, Z; < Ph. opulifolius -- RAB, W, infraspecific taxa not distinguished; > Opulaster alabamensis Rydberg -- S; > Opulaster stellatus Rydberg -- S; Opulaster intermedius Rydberg]

Physocarpus opulifolius (Linnaeus) Maximowicz var. opulifolius, Eastern Ninebark. Mt, Pd (NC, SC), \{GA, VA\}: stream banks, riverside thickets, rock outcrops, cliffs, especillay over mafic or calcareous rocks; common. May-July. Québec west to WI, south to SC, TN, and n. IL. [= C, F, G, K, Z; < Ph. opulifolius -- RAB, W, infraspecific taxa not distinguished; > Opulaster opulifolius (Linnaeus) Kuntze -- S; > Opulaster australis Rydberg -- S]

\section*{Porteranthus}
(see Gillenia)

\section*{Potentilla Linnaeus 1753 (Cinquefoil, Five-fingers, Potentilla) (also see Drymocallis and Sibbaldiopsis)}

References: Robertson (1974)=Z; Eriksson, Donoghue, \& Hibbs (1998); Eriksson et al. (2003); Kalkman in Kubitzki (2004).
1 Flowers solitary, on naked, axillary pedicels; leaves palmately 3-5-foliolate.
2 Leaves 3 -foliolate; fruit strawberry-like, fleshy and red, consisting of an expanded fleshy receptacle bearing superficial achenes . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. indic
2 Leaves primarily 5 -foliolate on a plant (some poorly developed leaves may be 3 -foliolate); fruit a head of achenes, dry.
3 Lowest flower from the axil of the second well-developed leaf . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. simplex
3 Lowest flower from the axil of the first well-developed cauline leaf, or from the axil of a lower and poorly-developed leaf.
4 Middle leaflet of larger leaves \(1.5-4 \mathrm{~cm}\) long; plants silky-pilose, the pubescence appressed or loosely ascending . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. canadensis var. canadensis

\text { ninal cymes; leaves palmately 3-9-foliolate. }
\end{gathered}
\]

1 Flowers in terminal cymes; leaves palmately 3-9-foliolate.
5 Leaves 3-foliolate.
6 Petals and sepals subequal; stamens (15-) 20 ; achenes usually ridged . . . . . . . . . . . . . . . . . . . . . . . . . P. norvegica
6 Petals much shorter than the sepals; stamens 5-10 (-15); achenes smooth . . . . . . . . . . . P. rivalis var. millegrana
5 Leaves 5-9-foliolate.
7 Leaves (5-) 7-9-foliolate; petals 8-18 mm long, pale (sulphur) yellow, creamy-white, or white.
8 Leaves pinnately compound; petals \(12-18 \mathrm{~mm}\) long, creamy-white or white . . . . . . . . . . . . [see Drymocallis] 8 Leaves palmately compound; petals \(8-15 \mathrm{~mm}\) long, pale (sulphur) yellow . . . . . . . . . . . . . . . . . . . . . P. recta
7 Leaves 5 (-7)-foliolate; petals \(3-7 \mathrm{~mm}\) long, medium yellow.
9 Leaves pubescent beneath, the surface not concealed
P. intermedia

9 Leaves densely tomentose beneath, the surface concealed.
10 Pubescence of the stem and veins of the leaf undersurface tomentose only; leaves revolute . P. argentea
10 Pubescence of the stem and veins of the leaf undersurface tomentose and also with long, spreading hairs;
leaves not revolute
\(P\). inclinata
* Potentilla argentea Linnaeus, Silvery Five-fingers, Hoary Five-fingers. Mt, Pd, Cp (NC, VA): disturbed areas; rare, naturalized from Europe. May-July. [= RAB, C, F, G, W; P. argentea var. argentea -- K]

Potentilla canadensis Linnaeus var. canadensis, Running Five-fingers. Mt, Pd, Cp (GA, NC, SC, VA): woodlands, forests, fields, lawns, disturbed areas; common. March-May; April-June. The relative distributions and habitats of the two varieties obscure. [= F, G, K; P. canadensis -- RAB, C, W, infraspecific taxa not distinguished; P. pumila Poiret -- S]

Potentilla canadensis Linnaeus var. villosissima Fernald, Hairy Five-fingers. Pd (NC): woodlands, forests, fields, lawns, disturbed areas; uncommon. March-May; April-June. The relative distributions and habitats of the two varieties obscure. [= F, G, K; \(P\). canadensis -- RAB, C, W, infraspecific taxa not distinguished; P. caroliniana Poiret -- S]

Potentilla inclinata Villars. Cp (NC): disturbed areas; rare, naturalized from Europe. May-June. [= C, K; P. canescens Bess. -- RAB, F, G]
* Potentilla indica (Andrews) T. Wolf, Indian Strawberry. Cp, Pd, Mt (GA, NC, SC, VA): disturbed areas, lawns, gardens; common, naturalized from Asia. February-frost. Duchesnea is apparently not closely related to Fragaria, and is best combined with Potentilla, which does have other species with an accrescent fruit (Eriksson, Donoghue, \& Hibbs 1998). The strawberry-like fruit is not sweet; it can also be distinguished from Fragaria by its whitish interior flesh. The leaves are more coarsely toothed than Fragaria. [Duchesnea indica (Andrews) Focke -- RAB, C, F, G, K, S, W]
* Potentilla intermedia Linnaeus. Mt (NC, VA), Pd, Cp (VA): disturbed areas; rare, naturalized from Europe. May-July. [= RAB, C, F, G, K]

Potentilla norvegica Linnaeus, Strawberry-weed. Mt (GA, NC, VA), Cp (NC, VA), Pd (GA, NC, SC, VA): pastures, fields, disturbed areas, especially where moist; common (uncommon in Piedmont and Coastal Plain). Late May-frost; June-frost. This species is apparently a complex circumboreal species complex, with both native and introduced elements now present in NC. [= RAB, C, G, W; P. norvegica var. norvegica -- F; P. norvegica ssp. monspeliensis (Linnaeus) Ascherson \& Graebner - K; P. monspeliensis Linnaeus -- S]
* Potentilla recta Linnaeus, Sulphur Five-fingers. Mt, Pd, Cp (GA, NC, SC, VA): disturbed areas; common, naturalized from Europe. April-July; May-August. [= RAB, C, F, G, K, W]
* Potentilla rivalis Nuttall, Brook Five-fingers. Mt, Pd, Cp (VA): habitat not known; rare, adventive from further west. [P. rivalis -- C, G, K, infraspecific taxa not recognized; P. millegrana Engelmann ex Lehm. -- F; P. rivalis var. millegrana (Engelmann ex Lehm.) S. Watson]

Potentilla simplex Michaux, Old-field Five-fingers. Cp, Mt, Pd (GA, NC, SC, VA): woodlands, fields, disturbed areas; common. April-June; April-July. Newfoundland and MN south to AL and TX. [= RAB, C, F, G, K, S, W; P. simplex var. argyrisma Fernald -- F; P. simplex var. calvescens Fernald -- F; P. canadensis -- S, in part, misapplied]
* Potentilla anserina Linnaeus, Silverweed, occurs as an introduction south to e. TN (Chester, Wofford, \& Kral 1997), se. PA (Rhoads \& Klein 1993), and NJ (Kartesz 1999). [= C; Argentina anserina (Linnaeus) Rydberg - K] \{not yet keyed; add synonymy\} Potentilla reptans Linnaeus, Creeping Five-fingers, is reported for VA (Cronquist 1991, Kartesz 1999) and occurs as well in se. PA (Rhoads \& Klein 1993). [= C, K] \{not yet keyed; add synonymy\}

\section*{Prunus Linnaeus (Plum, Cherry, Sloe, Peach)}

A genus of about 200 species, trees and shrubs, nearly cosmopolitan. References: Robertson (1974)=Z; Shaw \& Small (2004); Kalkman in Kubitzki (2004).
subgenus Padus: alabamensis, serotina var. serotina, virginiana var. virginiana
section Prunocerasus: allegheniensis var. allegheniensis, americana, angustifolia var. angustifolia, hortulana, injucunda, maritima var. maritima, mexicana, munsoniana, nigra, umbellata
section __: avium, caroliniana, cerasus, glandulosa, insititia, mahaleb, pensylvanica, persica, serrulata, susquehanae
Prunus alabamensis C. Mohr, Alabama Black Cherry. Cp, Pd (GA), \{NC, SC\}: [=K; Prunus serotina Ehrhart var. alabamensis (C. Mohr) Little -- RAB; Padus alabamensis (C. Mohr) Small -- S; Padus cuthbertii Small -- S; Padus australis Beadle -S ; Prunus serotina ssp. hirsuta (Elliott) McVaugh -- Z]

Prunus alleghaniensis Porter var. alleghaniensis, Allegheny Plum, Allegheny Sloe. \{NC, VA\} [= K; Prunus alleghaniensis -C, F, G, W, infraspecific taxa not distinguished]

Prunus americana Marshall, Wild Plum. Cp, Pd, Mt (GA), \{NC, SC, VA\}: [= C, K, W, S, Z; Prunus americana var. americana -- RAB, F, G]

Prunus angustifolia Marshall var. angustifolia, Chickasaw Plum. Cp, Pd, Mt (GA), (NC, SC, VA\}: [= F, K; Prunus angustifolia -- RAB, C, G, S, W, Z, infraspecific taxa not distinguished]
* Prunus avium Linnaeus, Sweet Cherry, Mazzard Cherry, Bing Cherry. (NC, SC, VA\} [= RAB, C, F, G, K, S, W, Z]

Prunus caroliniana (P. Miller) Aiton, Carolina Laurel Cherry. Cp, Pd, Mt (GA), \(\{N C, S C\}:[=R A B, K, Z\); Laurocerasus caroliniana (P. Miller) M. Roemer -- S]
* Prunus cerasus Linnaeus, Sour Cherry, Pie Cherry. (GA, NC, VA). [= RAB, C, F, G, K, S, W, Z]

Prunus hortulana Bailey, Wild-goose Plum. (VA). [= C, F, G, K, S, Z]
Prunus injucunda Small, Hog Plum, Flatwood Plum. (GA, NC, SC). [= S; Prunus umbellata Elliott var. injuncunda (Small) Sargent -- K; Prunus umbellata -- RAB, Z, infraspecific taxa not distinguished]
* Prunus insititia Linnaeus, Damson, Bullace. (VA). [= F, G, Z; Prunus domestica ssp. insititia (Linnaeus) C.K. Schneider -- C; Prunus domestica Linnaeus var. insititia (Linnaeus) Fiori \& Paoletti -- K]
* Prunus mahaleb Linnaeus, Mahaleb Cherry, Perfumed Cherry, St. Lucie Cherry. (NC, VA). [= RAB, C, F, G, K, W, Z]

Prunus maritima Marshall var. maritima, Beach Plum. (VA): [= K; Prunus maritima -- C (in the broad sense); Prunus maritima -- F, G (in the narrow sense)]

Prunus mexicana S. Watson, Big-tree Plum, Mexican Plum. (GA, NC, SC): \{habitat\}; rare (GA Special Concern). [= C, G, K, S, Z; Prunus americana Marshall var. lanata -- F]

Prunus munsoniana W. Wight \& Hedrick, Munson Plum. Pd (GA); \{\} (VA). [= C, F, G, K, S, Z]
Prunus pensylvanica Linnaeus f., Fire Cherry, Pin Cherry. Mt (GA, NC, VA): common (GA Special Concern). [= RAB, C, F, G, W, Z; Prunus pensylvanica var. pensylvanica -- K; Prunus pennsylvanica -- S (an orthographic variant)] * Prunus persica (Linnaeus) Batsch, Peach. Cp, Pd (GA, NC, SC, VA). [= RAB, C, F, G, K, W, Z; Amygdalus persica Linnaeus -- S]

Prunus serotina Ehrhart var. serotina, Black Cherry. Mt, Pd, Cp (GA, NC, SC, VA). [= RAB, K; Prunus serotina -- C, F, G, W, infraspecific taxa not distinguished; Padus virginiana -- S, misapplied; Prunus serotina ssp. serotina -- Z]
* Prunus serrulata Thunberg, Japanese Flowering Cherry. Pd (NC): suburban woodlands; arre, introduced from Japan. [= K]

Prunus susquehanae Hort. ex Willdenow, Appalachian Sand Cherry, Susquehanna Cherry. (NC, VA). sc. TN (Chester, Wofford, \& Kral 1997), as P. pumila? Catling (1997) supports species status. [= F; Prunus pumila Linnaeus var. susquehanae (Hort. ex Willdenow) Jaeger -- RAB, K; Prunus pumila var. cuneata (Rafinesque) L.H. Bailey -- C, G; Prunus cuneata Rafinesque -S; Prunus pumila -- W, Z, infraspecific taxa not distinguished]

Prunus umbellata Elliott, Hog Plum, Flatwood Plum. (GA, NC, SC). Fox, Godfrey, \& Blomquist (1952) report Prunus mitis for s. NC (Cleveland County). [= S; Prunus umbellata Elliott var. umbellata -- K; Prunus umbellata -- RAB, Z, infraspecific taxa not distinguished; Prunus mitis Beadle -- S]

Prunus virginiana Linnaeus var. virginiana, Choke Cherry. Mt (GA, NC, VA): forming clonal thickets in oak and northern hardwood forests; common, rare southwards (GA Special Concern). [=K, Z; Prunus virginiana -- RAB, C, F, G, W, infraspecific taxa not distinguished; Padus nana (Du Roi) Roemer -- S]
* Prunus cerasifera Ehrhart, Cherry-plum. Introduced at scattered locations; reported for TN, PA, NJ (Kartesz 1999). [= K]
* Prunus domestica Linnaeus, Eurpean Plum. Introduced at scattered locations; reported for MD, PA, NJ. [Prunus domestica
var. domestica -- K]
* Prunus glandulosa Thunberg, Flowering Almond, introduced in NC (Kartesz 1999). \{investigate\} [= K]

Prunus nigra Aiton, Canada Plum. Mt, Pd (VA): [= C, F, G, K] \{not yet keyed; add synonymy\}
* Prunus padus Linnaeus, European Bird Cherry, is cultivated and rarely escaped at least as far south as se. PA (Rhoads \&

Klein 1993) and DE (Kartesz 1999). [= C, K]

Prunus pumila Linnaeus var. depressa (Pursh) Gleason, Northern Sand Cherry, ranges south to s. PA (Rhoads \& Klein 1993). [= C, K; Prunus depressa Pursh]

Prunus tomentosa Thunberg. In MD and PA (Kartesz 1999). [= K]

Pyracantha M.J. Roemer 1847 (Firethorn, Pyracantha)
A genus of about 3 species, shrubs, of s. Europe east to e. Asia. References: Robertson (1974)=Z; Kalkman in Kubitzki (2004).
* Pyracantha coccinea M.J. Roemer, Firethorn. Pd, Cp (GA, NC, SC): planted, persistent around old homesites, and rarely escaped to woodlands; rare, introduced from se. Europe and Asia Minor. [= K, Z; Cotoneaster pyracantha (Linnaeus) Spach -- F, S; Crataegus pyracantha]
* Pyracantha koidzumii (Hayata) Rehder. Pd (SC): planted, rarely escaped to woodlands, rare, native of Taiwan. [= K, Z]
* Pyracantha fortuneana (Maximowicz) Li, Chinese Firethorn. AI and FL. [= K]

> Pyrus Linnaeus (Pear)
> (see also Aronia, Malus, and Sorbus)

A genus of 10-20 species, trees and shrubs, of Eurasia and n. Africa. References: Robertson (1974)=Z; Kalkman in Kubitzki (2004).

* Pyrus calleryana Decaisne, Bradford Pear, Callery Pear. Cp, Pd, Mt (GA, NC, SC, VA): planted and persistent; commonly cultivated, becoming an aggressive naturalizer, introduced from China. March-April. Its abundant naturalization in MD suggests that this species has the potential to become a serious pest (see Nesom 2000c, Vincent 2005). [= K]
* Pyrus communis Linnaeus, Common Pear. Mt, Pd, Cp (GA, NC, SC, VA): planted, persistent around oldhouses and in orchards; uncommon, introduced from Europe. April; August-October. [= RAB, C, F, G, K, S, Z]
* Pyrus pyrifolia (Burmann f.) Nakai, Oriental Pear, Japanese Pear, Chinese Pear. Cp, Pd (VA): planted, persistent around old houses and in orchards; uncommon, introduced from Asia. April; August-October. [= F, K, Z]

Rhodotypos Siebold \& Zuccarini 1841 (Jetbead)
A monotypic genus, a shrub, of Japan and China. References: Kalkman in Kubitzki (2004).
Identification notes: Distinguished by its opposite leaves and black, beadlke fruits.
* Rhodotypos scandens (Thunberg) Makino, Jetbead. Pd (NC, SC, VA): suburban woodlands, disturbed areas, roadsides, old house sites; rare, introduced from e. Asia. May-June. [= C, G, F, K; Rh. tetrapetalus (Siebold) Makino]

\section*{Rosa Linnaeus 1753 (Rose)}

A genus of more than 100 species, shrubs or woody vines; mainly of north temperate regions. Many cultivars cannot be readily identified to species. References: Robertson (1974)=Z; Kalkman in Kubitzki (2004).
*? Rosa arkansana Porter var. suffulta (Greene) Cockerell, Prairie Rose. Mt (NC): Reported from North Carolina portion of the Great Smoky Mountains National Park. [= K]
* Rosa bracteata J.C. Wendl., Macartney Rose, Chickasaw Rose. \{GA, NC, SC, VA\} [= RAB, K, Z]
* Rosa canina Linnaeus, Dog Rose. \{NC, VA\} [= RAB, K, Z]

Rosa carolina Linnaeus, Carolina Rose. \{GA, NC, SC, VA\} [= RAB, C, Z; R. carolina var. carolina -- K]
* Rosa cinnamomea Linnaeus, Cinnamon Rose. \{VA\} Reported for VA (Kartesz 1999). \{investigate\} [= K, Z]
* Rosa damascena P. Miller, Damask Rose. \{NC\} [= RAB; R. ×damascena P. Miller (pro sp.) -- K]
* Rosa eglanteria Linnaeus, Eglantine Rose, Sweetbriar Rose. \{GA, (NC, SC, VA\} [= RAB, K, Z; R. rubiginosa Linnaeus]
* Rosa gallica Linnaeus, French Rose. \{NC, SC, VA\} [= RAB, K, Z]
* Rosa laevigata Michaux, Cherokee Rose. native of China. \{GA, NC, SC\} [= RAB, K, Z]
* Rosa micrantha Borrer ex J.E. Smith, Eglantine Rose. \{NC, SC, VA\} [= RAB, C, K, Z]
* Rosa multiflora Thunberg ex Murray, Multiflora Rose. \{GA, NC, SC, VA\} [= RAB, K, Z]

Rosa palustris Marshall, Swamp Rose. \{GA, NC, SC, VA\} [= RAB, K, Z]
* Rosa rubrifolia Vill., Red-leaf Rose. \{SC\} [= K]
* Rosa rugosa Thunberg, Japanese Rose, Rugosa Rose. Cp (VA): cultivated and occasionally escaped; rare, introduced from Asia. [= C, K, Z]

Rosa setigera Michaux, Prairie Rose. \(\{G A, N C, S C, V A\}[=R A B ; R\). setigera var. setigera -- K, Z; R. setigera var. tomentosa Torrey \& A. Gray - K, Z]
* Rosa spinosissima Linnaeus, Scotch Rose. Mt (VA): cultivated and rarely escaped; rare, introduced. [= K; R. pimpinellifolia Linnaeus - C]
* Rosa tomentosa Sm. \{NC\} [= K]

Rosa virginiana P. Miller, Virginia Rose. \{GA, NC, VA\}. c. TN (Chester, Wofford, \& Kral 1997). [= C, Z; R. virginiana var. virginiana -- K]
* Rosa wichuraiana Crépin, Memorial Rose. \{GA, NC, SC, VA\} See Duncan (1985) for documentation for GA. [=C, K, Z; R. wichuriana -- RAB, orthographic variant]
* Rosa xanthina Lindley, Yellow Rose, reported for SC (Kartesz 1999). \{investigate\} [= K]

Rosa acicularis Lindley ssp. sayi (Schwein.) W.H. Lewis, Prickly Rose. South and east to WV (Cronquist 1991, Kartesz 1999).
[= C, K; R. acicularis var. bourgeauiana (Crépin) Crépin - C]
Rosa blanda Aiton var. blanda, Smooth Rose, Meadow Rose, occurs south to s. PA (Rhoads \& Klein 1993), MD, and WV (Kartesz 1999). [= C, K]
* Rosa dumetorum Thuill. Introduced in KY. [= K]
* Rosa moschata J. Herrmann, Musk Rose. Introduced in AL. [= K]

Rosa obtusiuscula Rydberg. Endemic to Tennessee? [= K]

\section*{Rubus Linnaeus (Blackberry, Raspberry, Dewberry, Wineberry, Bramble)}

A genus of about 250 species (if treated conservatively) or 2000-3000 microspecies, shrubs (and a few herbs), almost cosmopolitan in temperate areas. References: Robertson (1974)=Z; Alice \& Campbell (1999); Widrlechner (1998); Kalkman in Kubitzki (2004).

Identification Notes: All of our species of Rubus except \(R\). odoratus have biennial stems. The first year the stems remain sterile and are termed primocanes. The second year, these stems produce lateral branches with flowers and are termed floricanes. Primocane and floricane leaves differ.

1 Leaves palmately lobed; petals deep pink; [subgenus Anoplobatus - flowering raspberries]
R. odoratus

1 Leaves 3-9-foliolate (reduced simple leaves may also be present in the inflorescence); petals white or pale pink (rarely red).
2 Fruit separating from the receptacle, the receptacle remaining on the pedicel; stems either strongly white-glaucous ( \(R\). occidentalis), or densely beset with slender-based prickles and bristles ( \(R\). idaeus), or densely pubescent with 3-5 mm long glandular hairs ( \(R\). phoenicolasius), or if not as above then the leaves pinnately 5 -9-foliolate ( \(R\). illecebrosus); [subgenus Idaeobatus -- raspberries].
3 Floricane leaves pinnately 5-9-foliolate
R. illecebrosus

3 Floricane leaves 1-3-foliolate.
4 Inflorescence paniculiform, many-flowered; berries sticky, purplish-red, lacking a glaucous bloom \(\qquad\)
R. phoenicolasius

4 Inflorescence corymbiform, few-flowered; berries not sticky, black or red (rarely purplish or yellow), with a glaucous bloom.
5 Fruit black (rarely yellow); pedicels with stout curved prickles; stems (at least the primocanes) strongly white-glaucous . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . R. occidentalis
\(5 \quad\) Fruit red (rarely purple or yellow); pedicels with narrow straight bristles and sometimes also glandular hairs; stems green.
6 Inflorescence without glandular hairs or gland-tipped bristles; [alien, cultivated, sometimes escaped or persistent] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . R. idaeus var. idaeus 6 Inflorescence with glandular hairs and gland-tipped bristles; [native in Mountains of NC and VA] .... R. idaeus var. strigosus

2 Fruit retaining the receptacle; stems or leaves not as described above, except if beset with slender-based prickles and bristles then also less than 1 m tall; [subgenus Rubus - blackberries and dewberries].
7 Canes very coarse, scrambling, often 2-3 m long, heavily armed; inflorescence cymose-paniculate; branches and pedicels of the floricanes armed with strong, flattened prickles (or nearly straight in \(R\). bifrons); [alien, generally in disturbed habitats]; [alien blackberries].
8 Leaves compound, the leaflets additionally laciniately divided; leaves green beneath . . . . . . . . . R. laciniatus 8 Leaves compound, the leaflets toothed; leaves grayish-tomentose beneath.

9 Prickles nearly straight; stems glabrescent; petals pale pink to red . . . . . . . . . . . . . . . . . . . . . . R. bifrons
9 Prickles recurved; stems canescent above; petals white to pale pink . . . . . . . . . . . . . . . . . . . R. discolor
7 Canes delicate to coarse, arching or trailing, 0-4 m long, unarmed to strongly armed; inflorescence racemiform; branches and pedicels of the floricanes generally unarmed; [native, though often in disturbed habitats].
10 Primocanes prostrate, creeping, or low-arching, rooting at the tip or also at the nodes; [dewberries].
11 Stems primarily armed with narrow-based prickles or even narrower bristles, with or without stout-based prickles as well.
12 Inflorescence racemiform; bristles of the stem nonglandular (very small glandular hairs may be

Rubus allegheniensis Porter, Allegheny Blackberry. Mt (GA, NC, VA), Pd (NC, VA): forests, woodlands, grassy balds; common. May-June; July. Nova Scotia west to MN, south to w. NC, n. GA, and e. TN. [= RAB, C, W; R. allegheniensis var. allegheniensis -- F, K; R. alumnus Bailey -- F, K; collective species \(R\). allegheniensis -- G; R. allegheniensis var. gravesii Fernald K; R. nigrobaccus Bailey -- S]

Rubus argutus Link, Southern Blackberry. Cp, Pd, Mt (GA, NC, SC, VA): roadsides, thickets, clearcuts, disturbed areas, pastures; common. April-May; late May-July. MA west to MO, south to FL and TX. The most common "highbush" blackberry in most of our area. [= RAB, C, F, GW, K, S; R. betulifolius Small -- RAB, S; R. blakei Bailey -- F; R. fatuus Bailey -- F; R. jugosus Bailey -- F; R. louisianus Berger -- F; R. argutus -- W, in part only (also see \(R\). pensilvanicus); collective species \(R\). argutus -- G] * Rubus bifrons Vest ex Trattinick. Cp, Pd, Mt (NC, SC, VA), \{GA\}: disturbed areas, roadsides, thickets; common, introduced from Europe. May-June; late June-July. [= RAB, C, G, K, W]

Rubus canadensis Linnaeus, Smooth Blackberry, Thornless Blackberry. Mt (GA, NC, SC, VA): forests, woodlands, grassy balds, especially common at high elevations; common. June-July; July-August. Newfoundland west to MN, south (primarily in the Appalachians) to w. NC, e. TN, and n. GA. [= RAB, C, F, K, S, W; collective species \(R\). canadensis -- G]

Rubus cuneifolius Pursh, Sand Blackberry. Cp, Pd (NC, SC, VA), Mt (VA), \{GA\}: woodlands, forests, disturbed areas; common (rare in Mountains). Late April-early June; June-July. CT and NY (Long Island) south to FL and AL, primarily on the Coastal Plain. [= RAB, C, F, GW, K, S, W; R. cuneifolius var. subellipticus Fernald -- F; R. longii Fernald -- F, K; R. sejunctus Bailey -- F; collective species \(R\). cuneifolius -- G]

Rubus discolor Weihe \& Nees, Himalaya-berry. Cp, Pd (NC?, SC?, VA): disturbed areas, thickets; uncommon, introduced from Europe. [= C, K; R. procerus P.J. Mueller -- F; R. linkianus Ser. -- S, misapplied?]

Rubus enslenii Trattinick, Southern Dewberry. \(\{\mathrm{Cp}, \mathrm{Pd}, \mathrm{Mt}(\mathrm{NC}, \mathrm{SC}, \mathrm{VA}),\{\mathrm{GA}\}\) : roadsides, disturbed areas; uncommon? \{phenology\} S. ME west to s. WI, south to GA and LA.\} [= C, F, S; R. flagellaris -- RAB, K, W, in part; R. akermanii Fernald -- F; R. cathartium Fernald -- F; R. celer Bailey -- F, K; R. clarus Bailey -- F, K; R. felix Fernald -- F; R. hypolasius Fernald -- F; R. imperiorum Fernald -- F; R. iniens Bailey -- F, K; R. leviculus Bailey -- F, K; R. longipes Fernald -- F; R. nefrens Bailey -- F, K; R. pernagaeus Fernald -- F, K; R. scambens Bailey -- F, K; R. sewardianus -- F, K; R. subinnoxius Fernald -- F; R. tetricus Bailey -- F; collective species \(R\). enslenii -- G]

Rubus flagellaris Willdenow, Northern Dewberry. Cp, Pd, Mt (NC, SC, VA), \{GA\}: old fields, woodlands, roadsides, disturbed areas; common. April-May; May-July. Québec west to MN, south to GA and AR. [= C, S; R. flagellaris -- RAB, F, K, W, in part (also see R. enslenii); R. baileyanus Britton -- F, K, S?; R. invisus (Bailey) Britton -- F, K, S?; R. jaysmithii -- F, K; R. plexus Fernald -- F \(\mathrm{K} ; R\). roribaccus (Bailey) Rydberg -- \(\mathrm{F}, \mathrm{K} ; R\). temerarius Bailey -- \(\mathrm{F}, \mathrm{K}\); collective species \(R\). flagellaris -- G]

Rubus hispidus Linnaeus, Swamp Dewberry. Cp (NC, SC, VA), Mt, Pd (NC, VA): bogs, moist woodlands and forests, disturbed moist areas; common. May-June; June-July. Nova Scotia and Québec west to WI, south to n. SC and MO. [= RAB, C, F, GW, K, S, W; R. ambigens Fernald -- F; R. hispidus var. obovalis (Michaux) Fernald -- F; R. vigil Bailey -- F; collective species \(R\). hispidus -- G]
* Rubus idaeus Linnaeus var. idaeus, Cultivated Red Raspberry. Mt (NC, VA): disturbed areas; rare (commonly cultivated in the cooler portions of our area, rarely escaped or persistent), introduced from Eurasia. June-August; July-September. [= C, F; R. idaeus ssp. idaeus -- K]

Rubus idaeus Linnaeus var. strigosus (Michaux) Maximowicz, Red Raspberry. Mt (NC, VA): high elevation forests and thickets, adelgid-killed spruce-fir forests; rare. June-August; July-September. The species is circumboreal; var. strigosus ranges from Newfoundland west to AK, south to PA, IN, IA, and AZ; disjunct further south in nw. VA and ne. WV, and in w. NC and e. TN. [= C, F; R. idaeus Linnaeus var. canadensis (Richardson) House -- RAB, F; R. idaeus ssp. strigosus (Michaux) Focke -- K; R. carolinianus Rydberg -- S; R. idaeus ssp. sachalinensis (Levl.) Focke -- W; R. idaeus ssp. melanolasius Focke var. canadensis - Z] * Rubus illecebrosus Focke, Strawberry-raspberry. Mt (NC), \{VA?\}: disturbed areas; rare, introduced from Japan. [= RAB, C, F, G, KK]

Rubus laciniatus Willdenow, Cut-leaved Blackberry, Evergreen Blackberry. Mt, Pd (NC, SC, VA): disturbed areas, thickets; rare, introduced from Europe. May-June; June-July. [= RAB, C, F, K, W]

Rubus occidentalis Linnaeus, Black Raspberry, Blackcap. Mt, Pd, Cp (NC, SC, VA), \{GA\}: roadsides, woodlands, thickets, disturbed areas; common (increasingly rare southwards in our area; much more common in VA than in NC, and rare in \(n\). SC). Late April-early June; June-July. Québec to e. CO, south to n. GA and AR. [= RAB, C, F, G, K, S, W, Z]

Rubus odoratus Linnaeus, Flowering Raspberry. Mt (GA, NC, VA): moist roadsides, thickets, and forests; common. JuneAugust; July-October. Nova Scotia west to MI, south to w. NC, n. GA, and e. TN. [= RAB, C, G, W, Z; Rubus odoratus var. odoratus -- F, K; Rubus odoratus var. columbianus Millspaugh - K; Rubacer odoratum (Linnaeus) Rydberg -- S]

Rubus pensilvanicus Poiret, Pennsylvania Blackberry. Cp, Pd, Mt (NC?, VA), \{SC?\}: roadsides, thickets, woodlands; common. April-May; late May-July. ME west to MN, south to VA (NC?, SC?), IN, and MO. [= C, F, K; R. cupressorum Fernald -- F; R. defectionis Fernald -- F, K; R. dissitiflorus Fernald -- F; R. floricomus Blanchard -- F, K; R. floridus Tratt. -- F, S; R. frondosus Bigelow; R. pauxillus Bailey -- \(\mathrm{F}, \mathrm{K}\); \(R\). recurvans Blanchard -- F , K; collective species \(R\). pensilvanicus -- G; collective species \(R\). ostryifolius Rydberg -- G]
* Rubus phoenicolasius Maximowicz, Wineberry. Mt, Pd (NC, SC, VA), Cp (VA), \{GA \}: roadsides, thickets; common, introduced from e. Asia. May-June; June-July. [= RAB, C, F, G, K, S, W]

Rubus recurvicaulis Blanchard. Mt (NC?, VA): \{moist areas; uncommon? \{phenology\} Nova Scotia west to MN, south to MD, NC?, and IN. [= C, F; R. boyntonii Ashe -- F, K; R. cordifrons Bailey -- F; R. grimesii Bailey -- F, K; collective species \(R\). arundelanus Blanchard -- G]

Rubus setosus Bigelow, Bristly Blackberry. (VA): \{habitat not known\}; rare? \{phenology\} Québec west to WI, south to VA and IL. [= C, F, K; collective species R. setosus -- G; R. elegantulus Blanchard - K]

Rubus trivialis Michaux, Southern Dewberry, Coastal Plain Dewberry. Cp, Pd (GA, NC, SC, VA), Mt (GA, NC, SC): roadsides, old fields, thickets, disturbed areas; common (rare in Mountains). March-April; late April-May. E. MD south to FL, west to TX, north in the interior to MO. [= RAB, C, F, G, GW, K, S, W; R. Iucidus Rydberg -- S]

Rubus orarius Blanch. South to WV. [Rubus pergratus Blanch. -- K]
Rubus pubescens Rafinesque, Dwarf Blackberry, ranges south to WV and s. PA (Rhoads \& Klein 1993). [= C; R. pubescens var. pubescens -- K]

\section*{Sanguisorba Linnaeus 1753 (Burnet)}

A genus of 15 or more species, herbs, of Eurasia, n. Africa, and North America. References: Robertson (1974)=Z; Nordborg (1966, 1967) \(=\) Y; Kalkman in Kubitzki (2004).

1 Leaflets pinnatifid; [subgenus Poteridium]
S. annua

1 Leaflets toothed.
2 Leaflets \(3-10 \mathrm{~cm}\) long; inflorescence 6-30 cm long, spike-like; stamens 4 per flower, the filaments \(8-10 \mathrm{~mm}\) long; sepals white (sometimes fading greenish); [native]; [subgenus Sanguisorba, section Sanguisorba] ............. S. canadensis
2 Leaflets \(0.8-2 \mathrm{~cm}\) long; inflorescence 1-2 cm long, globose; stamens 15-20 per flower, the filaments 3-4 mm long; sepals green to pinkish-purple; [cultivated, occasionally escaped]; [subgenus Poterium, section Poterium] S. minor ssp. muricata
* Sanguisorba annua (Nuttall ex Hooker) Torrey \& A. Gray. Cp (SC): roadsides; rare, introduced from sc. United States. AprilMay. [= RAB, G, K, Z]

Sanguisorba canadensis Linnaeus, Canada Burnet, American Burnet, White Burnet. Mt (GA, NC, SC, VA): fens, seepage over mafic or ultramafic rocks (such as amphibolite, greenstone, serpentinite), spray zones around waterfalls; rare (GA Threatened, NC Rare, VA Rare). Late July-September. Newfoundland and Labrador west to Manitoba, south to NJ, PA, OH, and IN; disjunct southwards in KY, nc. VA, and from sw. VA south to sw. NC, ne. TN, and ne. GA. Reported for South Carolina by Hill \& Horn (1997) and Hill (1999). [= RAB, C, F, G, GW, K, S, W, Z]
* Sanguisorba minor Scopoli ssp. muricata (Spach) Nordborg, Salad Burnet, Garden Burnet. Mt (NC, VA), Pd (VA): cultivated as an herb and salad green, escaped to moist, disturbed areas; rare, introduced from Europe. June-July. [= K, Y, Z; S. minor -RAB, C, F, G, infraspecific taxa not distinguished; Poterium sanguisorba Linnaeus -- S]

Sibbaldiopsis Rydberg 1901 (Mountain-cinquefoil)
A genus of several species, subshrubs, of northern North America and ne. Asia; most closely related to Sibbaldia. Molecular
phylogenetic studies indicate that this genus is more closely related to Alchemilla, Aphanes, Dasiphora, Drymocallis, Fragaria, and other genera outside our area than to Potentilla (Eriksson et al. 2003). References: Eriksson, Donoghue, \& Hibbs (1998); Eriksson et al. (2003); Kalkman in Kubitzki (2004).

Sibbaldiopsis tridentata (Aiton) Rydberg, Mountain-cinquefoil, Three-toothed Cinquefoil, Mountain White Potentilla, Wine-leaf Cinquefoil. Mt (GA, NC, VA): grassy balds, crevices of rock outcrops at high (rarely moderate) elevations, high elevation glades; rare, though sometimes locally abundant (GA Endangered, NC Watch List, VA Rare). June-August; July-September. Greenland and Newfoundland west to Northwest Territories, south to ND, IA, WI, MI, s. Ontario, and Nova Scotia, and in the mountains to w. VA, ne. TN, and ne. GA (at progressively higher elevations southward). Showy in flower, and also in leaf from late summer on, when the leaves tend to turn a rich burgundy red. Though appearing herbaceous, S. tridentata is really an evergreen sub-shrub. [= K, S; Potentilla tridentata Aiton -- RAB, C, F, G, W]

Sorbaria (Ser.) A. Braun 1860
A genus of 4 species, shrubs, of c. and e. Asia. References: Kalkman in Kubitzki (2004)
* Sorbaria sorbifolia (Linnaeus) A. Braun, False Spiraea, an Asian shrub, is cultivated and naturalized at least as far south as s. PA (Rhoads \& Klein 1993) and WV. [= C, F, G, K]

Sorbus Linnaeus (Mountain-ash, Rowan)
(also see Aronia)
A genus of about 250 species, trees and shrubs, of mainly temperate Northern Hemisphere. References: Jones (1939)=Z; Aldasoro et al. (2004).

1 Branches and lower leaf surfaces glabrous (or inconspicuously and sparsely pubescent); winter buds glutinous; [native tree] . .
. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. americana

1 Branches and lower leaf surfaces densely white-villous; winter buds white-villous; [introduced tree] ......... [S. aucuparia]
Sorbus americana Marshall, Mountain-ash, American Rowan. Mt (GA, NC, VA), Pd (NC, SC): high elevation forests, balds, and high elevation rock outcrops, often with Picea, Abies, and/or Betula alleghaniensis; common (rare in Piedmont) (GA Rare). June-July; September-October (persisting well into winter). Newfoundland west to MN, south to PA, w. NC, e. TN, ne. GA, and n. IL. This small-to-medium tree is showy in most seasons; in the summer its creamy-white corymbs are attractive, the leaves turn a bright orange-red in fall, and the red berries persist well into winter. [= RAB, C, G, K, S, W, Z; = Pyrus americana (Marshall) Augustin de Candolle -- F]
* Sorbus aucuparia Linnaeus, Rowan, European Mountain-ash, occurs as a planted tree and escape (sometimes appearing naturalized), south to s. PA (Rhoads \& Klein 1993), MD, DE, WV (Kartesz 1999), and DC (Jones 1939). Also reported for SC by Kartesz (1999), supposedly based on Jones (1939), but Jones (1939) does not mention SC in his account of S. aucuparia. [= C, G, K, Z; = Pyrus aucuparia (Linnaeus) Gaertner -- F]

\section*{Spiraea Linnaeus 1753 (Spiraea, Meadowsweet, Hardhack)}

A genus of about 80 species, shrubs, of north temperate areas (especially Asia). References: Robertson (1974)=Z; Rehder (1940); Uttal (1974); Kalkman in Kubitzki (2004).

1 Inflorescence a simple umbel; flowers white; [section Chamaedryon]; [introduced].
2 Umbels sessile, 3-6-flowered; leaves 2-5 cm long, ovate, finely serrulate . . . . . . . . . . . . . . . . . . . . . . . . . . . S. prunifolia
2 Umbels peduncled, many-flowered; leaves 1.5-3.5 cm long, obovate, coarsely serrate . . . . . . . . . . . . . . S. . x vanhouttei
1 Inflorescence a compound corymb or panicle; flowers white, pink, or red; [native or introduced].
3 Inflorescence a corymb, flat-topped or rounded, broader than long; [section Calospyra].
4 Leaves rounded, obtuse, or acute at the apex; petals white (rarely pink); [native].
5 Follicle 2-3 mm long; leaves 1-2× as long as wide, rounded or obtuse at apex, rounded at base; plants 3-8 (-10) dm tall; [of dry or moist forested slopes, or thin soil on rock outcrops, rarely of streambanks] . . S. corymbosa
5 Follicle 1-2 mm long; leaves \(2-4 \times\) as long as wide, acute at apex, cuneate at base; plants 4-25 dm tall; [of rocky riverbanks] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. virginiana
4 Leaves long-acuminate at the apex; petals pink (rarely white or red); [introduced].
6 Leaves pubescent on the veins beneath; flowers usually pink (rarely white); shrub to 15 dm tall \(\qquad\)

6 Leaves glabrous; flowers usually white (rarely pink); shrub to 8 dm tall . . . . . . . . . . . . . . . . . . . S. xbumalda
3 Inflorescence a panicle, longer than broad; [section Spiraea].
7 Lower leaf surface densely tomentose with white, tawny, or rusty tomentum which obscures the surface.
8 Follicles pubescent; [native, common in boggy wetlands]
s. tomentosa

\footnotetext{
8 Follicles glabrous; [introduced, rare]
S. \(\times\) billiardii

7 Lower leaf surface glabrous or with a few scattered hairs that do not obscure the surface.
9 Leaves lanceolate to oblong-lanceolate, widest at or below the middle; flowers pink; [introduced, rarely escaped or persisting] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. salicifolia
9 Leaves oblanceolate to obovate or oblong, widest above or at the middle; flowers white (rarely slightly pink; [native, of bogs, stream-banks, swampy areas, or moist to dry rocky areas].
10 Leaves \(3-5(-8) \times\) as long as wide, finely and sharply toothed; inflorescence, hypanthium, and sepals pubescent; sepals usually obtuse; twigs yellow-brown to brown S. alba 10 Leaves \(2-3 \times\) as long as wide, coarsely and bluntly toothed; inflorescence, hypanthium, and sepals usually glabrous or nearly so; sepals usually acute; twigs red-brown to purple-brown
S. Iatifolia
}

Spiraea alba Du Roi, Narrowleaf Meadowsweet. Mt (NC, VA), Pd (VA): bogs, boggy streambanks, seepages; uncommon (NC Watch List). June-September; August-October. Ranging from Québec west to Alberta, south to NC, IN, and MO. There is considerable disagreement over whether S. alba and S. latifolia represent two species with some introgression in areas of overlap, two varieties, or a variable or clinal species. \([=F, G, S, W, Z ;=S\). alba var. alba -- RAB, C, GW, K]
* Spiraea \(\times\) billiardii Herincq [S. douglassii \(\times\) salicifolia]. Mt (VA): cultivated, escaped or persisting; rare, introduced from cultivation, one parent from w. North America, one from Eurasia. [= K]
* Spiraea \(\times\) bumalda Burven [S. albiflora \(\times\) japonica]. Pd (VA): cultivated, escaped or persisting; rare, introduced from cultivation, both parents from Asia. [= K]

Spiraea corymbosa Rafinesque, Dwarf Spiraea, Rock Spiraea. Mt, Pd (NC, VA), \{GA?\}: rocky forests and woodlands, granitic domes, dry slopes of Piedmont monadnocks, rocky slopes in partial sun; common, rare in NC (NC Rare). June-August; August-October. A Southern and Central Appalachian endemic: sc. PA and w. MD south through w. VA, e. WV, to nw. NC, and perhaps also to e. TN (?), to n . \(\mathrm{AL}(?)\), apparently fairly common only in w. VA. The species is limited to only a few counties each of NC and WV (Franklin 2004, Strausbaugh \& Core 1978), and is not listed for TN in Chester, Wofford, \& Kral (1997). Although Mohr (1901) listed the species for AL, it is not listed as a part of the state's woody flora by Clark (1971). S. corymbosa is closely related to S. Iucida Douglas ex Greene [= S. betulifolia var. Iucida (Douglas ex Greene) C.L. Hitchcock] of the Rocky Mountains, S. betulifolia [= S. betulifolia var. betulifolia] of ne. Asia (Japan, e. Siberia, ne. China, Sakhalin, and the Kurile Islands, and S. aemiliana Schneider [= S. betulifolia var. aemiliana (Schneider) Koidz.]. The group is often treated as 4 varieties or subspecies of \(S\). betulifolia, but the morphological differences and strongly disjunct distribution seem to warrant treatment as a relictual complex of related species. See Uttal (1974), Greene (1892), and others listed in Robertson (1974) for additional discussion and a range of conclusions. [= F, S; < S. betulifolia -- RAB, infraspecific taxa not distinguished; = S. betulifolia Pallas var. corymbosa (Rafinesque) Maximowicz -- C, G, K, W, Z; = S. betulifolia ssp. corymbosa (Rafinesque) Taylor \& MacBryde]
* Spiraea japonica Linnaeus f. var. fortunei (Planchon) Rehder, Japanese Spiraea. Mt, Pd (NC, SC, VA), \{GA\}: roadsides, woodland borders, old home-sites; uncommon, introduced from Japan and China. June-July; July-August. [= K; < S. japonica -RAB, C, F, G, W, Z, infraspecific taxa not distinguished]

Spiraea latifolia (Aiton) Burkhart, Broadleaf Meadowsweet. Mt (NC, VA), Pd, Cp (VA): bogs, seeps, and rock outcrops (glades) over amphibolite, greenstone, olivine, and granite; uncommon (GA Rare, NC Watch List). June-September; AugustOctober. Newfoundland west to MI, south to w. NC. [=G, S, W, Z; = S. alba var. latifolia (Aiton) Dippel -- RAB, C, GW, K; > S. latifolia var. Iatifolia - F; > S. latifolia var. septentrionalis Fernald -- F]
* Spiraea prunifolia Siebold \& Zuccarini, Bridal-wreath Spiraea. Mt, Pd, Cp (VA), \{NC?\}: cultivated, escaped or persisting; uncommon, introduced from China, Korea, and Taiwan. [= C, G, K]
* Spiraea salicifolia Linnaeus, Willowleaf Spiraea. Mt (NC, VA): cultivated, escaped or persisting; rare, introduced from Eurasia. [= C, K]

Spiraea tomentosa Linnaeus, Hardhack, Steeplebush. Mt (GA, NC, SC, VA), Pd, Cp (NC, SC, VA): bogs, wet meadows; common (rare in Piedmont) (GA Rare). July-September; September-October. Nova Scotia west to MN, south to SC, ne. GA, c. TN, and AR. [= RAB, GW, K, S, W; > S. tomentosa var. rosea (Rafinesque) Fernald -- C, F, G, Z; > S. tomentosa var. tomentosa-C, F, G, Z; S. subcanescens Rydberg]
* Spiraea ×vanhouttei (C. Briot) Carrière [S. cantoniensis \(\times\) trilobata], Bridal-wreath Spiraea. Pd (NC): cultivated, escaped or persisting; rare, introduced from cultivation, the two parents both from Asia. [ \(=\mathrm{K}, \mathrm{Z}\); = C. vanhouttei -- C, G]

Spiraea virginiana Britton, Virginia Spiraea, Appalachian Spiraea. Mt (GA, NC, VA): riverbanks, riverside shrub thickets, where occasionally flood-scoured; rare (US Threatened, GA Threatened, NC Endangered, VA Endangered). June-July; AugustSeptember. A Southern Appalachian endemic: sw. PA, WV, and sw. VA south through w. NC and e. TN to nw. GA. Ogle (1991a, 1991b) presents an excellent discussion of the taxonomy, history, and biology of this interesting species. [=RAB, C, F, G, K, S, W, Z; > S. virginiana var. serrulata Rehder]
* Spiraea cantoniensis Loureiro. Cp (NC): roadsides; rare, introduced from Asia. S. cantoniensis has been collected twice on Fort Bragg, NC, by Phil Crutchfield (specimen at Fort Bragg) (Sorrie, pers. comm.). Also reported fpr other scattered states in e. North America (AL, AR, LA, NY (Kartesz 1999). [= K] \{add synonymy; not yet keyed\}
* Spiraea thunbergii Siebold ex Blume. Cp (NC): roadsides; rare, introduced from Asia. S. thunbergii has been collected from roadside at Fort Bragg, NC, by Phil Crutchfield (specimen at Fort Bragg) (Sorrie, pers. comm.). [= C, K] \{add synonymy; not yet keyed\}

Other species are sometimes cultivated and may sometimes escape.

A genus of about 3 species, shrubs, of e. Asia. References: Kalkman in Kubitzki (2004).
* Stephanandra incisa (Thunberg) Zabel, Lace Shrub. Pd (VA): woodland borders; rare, probably only persistent following cultivation, introduced from Japan and Korea. [= K]

Waldsteinia Willdenow 1799 (Barren Strawberry)
A genus of about 5 species, perennial herbs, of North America, southern Europe, and Korea. Closely related to Geum, and possibly to be merged. References: Douglass (1980); Robertson (1974)=Z; Bolle (1933)=Y; Smedmark \& Eriksson (2002); Kalkman in Kubitzki (2004).

1 Leaves trilobed (the sinuses cleft \(1 / 4\) to \(3 / 4\) the way to the midrib); leaves rather densely pubescent with stiff hairs, these distributed on the veins and on the intervein surfaces . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . W. Iobata
1 Leaves trifoliolate (fully divided); leaves sparsely pubescent with stiff hairs, these distributed mostly or strictly on the veins, the intervein surfaces glabrous to very sparsely pubescent.
2 Calyx lobes 2-7.5 mm long; petals \(5-10 \mathrm{~mm}\) long, \(3-6 \mathrm{~mm}\) wide . . . . . . . . . . . . . . . . . W. fragarioides var. fragarioides
2 Calyx lobes 3-4.5 mm long; petals 2.5-4 mm long, 1-1.5 mm wide . . . . . . . . . . . . . . . . W. fragarioides var. parviflora
Waldsteinia fragarioides (Michaux) Trattinick var. fragarioides, Northern Barren Strawberry. Pd (GA?, NC, VA?): forests, streambanks; rare (NC Watch List). Late March-May; May-June. New Brunswick west to MN, south to NC, GA, TN, IN, and MO. [= \(\mathrm{C}, \mathrm{F} ;<\mathrm{W}\). fragarioides -- RAB, W, Y, infraspecific taxa not distinguished; = W. fragarioides ssp. fragarioides -- K, Z; = W. fragarioides -- G, S (sensu stricto)]

Waldsteinia fragarioides (Michaux) Trattinick var. parviflora (Small) Fernald, Southern Barren Strawberry. Pd, Mt (GA, NC, SC, VA), Cp (NC, SC): forests, streambanks; uncommon (rare in Coastal Plain and Mountains). (January-) March-May; May-June. PA south to GA, AL, and TN. [= C, F; = Waldsteinia fragarioides ssp. doniana (Trattinick) Teppner -- K, Z; < W. fragarioides -- RAB, W, Y, infraspecific taxa not distinguished; = W. parviflora Small -- G; = W. doniana Trattinick -- S]

Waldsteinia lobata (Baldwin) Torrey \& A. Gray, Lobed Barren Strawberry. Mt (GA, NC, SC), Pd (GA, SC): forests, streambanks; rare (GA Threatened, NC Rare, SC Rare). March-May; May-June. Sw. NC south to nw. SC and n. and c. GA. Some populations appear to be morphologically intermediate between W. lobata and W. fragarioides ssp. doniana; further study is needed. [ \(=\mathrm{K}, \mathrm{S}, \mathrm{Y}, \mathrm{Z}\) ]

\section*{RUBIACEAE (Madder Family)}

A family of about 630 genera and 10,200 species, trees, shrubs, vines, and rarely herbs, cosmopolitan, but especially diverse in tropical and subtropical areas. References: Rogers (1987).

1 Trees, shrubs, or woody vines.
2 Woody vine; corolla lilac; [alien] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Paederia
2 Shrub or tree; corolla white, green, or maroon; [native].
3 Inflorescence spherical; petals white; sepals inconspicuous; [widespread in our area] ............. Cephalanthus
3 Inflorescence cymose; petals green or maroon; some sepals petaloid (pink or creamy), 3-8 cm long; [in the Coastal Plain, from s. SC southwards] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Pinckneya

Spermacoce

A genus of 90-200 species, mostly European.
* Asperula arvensis Linnaeus, Woodruff. South to se. PA as an introduction (Rhoads \& Klein 1993). [= C, G, K]

\section*{Borreria}
(see Spermacoce)

\section*{Cephalanthus Linnaeus (Buttonbush)}

A genus of about 6 species, of tropical and temperate America. References: Rogers (1987)=Z; Ridsdale (1976)=Y.
Cephalanthus occidentalis Linnaeus, Buttonbush. Cp, Pd, Mt (GA, NC, SC, VA): streambanks, rivernanks, depressional wetlands, lakes, often in standing water; common. June-July. Widespread in North America, and south into Mexico, Guatemala, and Honduras. [= RAB, K, W, S, Y, Z; C. occidentalis var. occidentalis -- C, F, G; C. occidentalis var. pubescens -- C, F, G; C. occidentalis var. occidentalis -- GW, in a broader sense (including var. pubescens)]

Cruciata P. Miller (Crosswort)
A genus of ca. 10 species, herbs, of Europe and western Asia.
* Cruciata pedemontana (Bellardi) Ehrend, Piedmont Crosswort. Mt (GA, NC, VA), Pd (GA, VA), Cp (VA), \{SC\}: lawns, grassy roadsides; uncommon, introduced from s. Europe. April-June. The Piedmont referred to in the name is the "original" Piedmont of southern Europe. In GA Mountains and Piedmont (T. Govus, pers. comm. 2005). [= K; = Galium pedemontanum (Bellardi) Allioni -RAB, C, F, W]

Diodia Linnaeus

A genus of about 30 species, of tropical and warm temperate America and Africa. Bacigalupo \& Cabral (1999) suggest that Diodella Small should be recognized as distinct from Diodia. References: Bacigalupo \& Cabral (1999)=Z.

Diodia teres Walter. Cp, Pd, Mt (NC), \{GA, SC, VA\}: June-December. [= RAB, C, GW, W; > Diodia teres var. hirsutior Fernald \& Griscom - F, K; > Diodia teres var. hystricina Fernald \& Griscom - F, G, K; > Diodia teres var. oblongifolia Fernald - F, K; > Diodia teres var. teres - F, G, K; = Diodella teres (Walter) Small - Z]

Diodia virginiana Linnaeus. \(C p, P d, M t(N C),\{G A, S C, V A\}\) : June-December. [=RAB, C, G, GW, W; > D. virginiana var. attenuata Fernald - F, K; >D. virginiana var. latifolia Torrey \& A. Gray - K; > D. virginiana var. virginiana - F, K; > Diodia virginiana -S, in a narrow sense; > Diodia tetragona Walter - S; > Diodia hirsuta Pursh - S; > Diodia harperi Small - S]

Galium Linnaeus (Bedstraw, Cleavers, Woodruff)
(also see Cruciata)
A genus of ca. 300 species, herbs, cosmopolitan. References: Puff \((1976,1977)=Z\).

\section*{Key A -- Bedstraws with leaves mostly in whorls of 4 (rarely a few in whorls of 5-6)}

1 Flowers yellow; plant an annual, 0.5-3 dm tall
[Cruciata pedemontana]
1 Flowers white, creamy, greenish-purple, maroon, or purple; plant a perennial, 1-8 dm tall.
2 Flowers solitary, sessile or subsessile in the leaf axils; leaves \(4-10 \mathrm{~mm}\) long G. virgatum

2 Flowers on pedicels, usually in complex inflorescences; leaves \(>10 \mathrm{~mm}\) long.
3 Larger leaves \(6-25 \mathrm{~mm}\) wide, mostly \(1.5-4 \times\) as long as wide; fruits uncinate-hispid (except smooth in G. Iatifolium);
flowers greenish or purplish.
4 Larger leaves 4-8 cm long, 1-2 cm wide, widest below the middle, tapering to a long-acuminate apex, averaging about \(3-4 \times\) as long as wide.
5 Fruits uncinate-hispid; flowers yellowish, turning maroon . . . . . . . . . . . . . . . . . . . . . . . . G. Ianceolatum
5 Fruits smooth; flowers purple . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . G. latifolium

4 Larger leaves 1-5 cm long, 0.6-2.5 cm wide, widest at about the middle, tapering to an obtuse (or broadly acute) apex, averaging about \(2 \times\) as long as wide.
6 Flowers (some of them) sessile or subsessile along the inflorescence branches; leaves \(1.5-5 \mathrm{~cm}\) long, the larger usually more than 2.5 cm long, not punctate.
7 Lower leaf surface glabrous or sparsely short-hispid on the veins; larger leaves 1.5-2.5 (-4.0) cm long and 0.7-1.4 (-1.8) cm wide; [more southern] . . . . . . . . . . . . . . . . . G. circaezans var. circaezans
7 Lower leaf surface appressed-pilose, long-hirsute on the veins; larger leaves \(2-5 \mathrm{~cm}\) long, 1-2.5 cm wide; [more northern] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . G. circaezans var. hypomalacum \(6 \quad\) Flowers all distinctly pedicelled; leaves \(1-2.5 \mathrm{~cm}\) long, glandular-punctate beneath.

8 Stem glabrous . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . G. orizabense ssp. laevicaule 8 Stem pubescent.

9 Stem and leaves pubescent with spreading, straight hairs; [more northern] \(\qquad\)

9 Stem and leaves pubescent with short, upwardly incurved hairs; [more southern]
G. pilosum var. puncticulosum

3 Larger leaves 1-6 mm wide, mostly 4-20× as long as wide; fruits smooth or pubescent (if pubescent, the hairs not hooked), either fleshy or dry; flowers white or creamy.
10 Fruits fleshy, blue-black; leaves firm, more-or-less evergreen, glandular-punctate beneath.
11 Leaves elliptic, \(7-18 \mathrm{~mm}\) long, \(3-6 \mathrm{~mm}\) wide, \(2-3.5 \times\) as long as wide \(\ldots\). . . . . . . . . . . . G. Gispidulum 11 Leaves linear, \(15-25 \mathrm{~mm}\) long, \(2-4 \mathrm{~mm}\) wide, \(5-10 \times\) as long as wide
G. uniflorum

10 Fruits dry, black; leaves herbaceous, deciduous, not glandular-punctate beneath.
12 Stems erect or nearly so; leaves \(15-45 \mathrm{~mm}\) long, 2-6 mm wide
G. boreale

12 Stems sprawling, matted; leaves 6-30 mm long, 0.5-5 (-6) mm wide. 13 Corollas 4 -lobed, the lobes longer than wide.

14 Leaves (8-) 10-20 (-25) mm long, (0.5-) 0.8-2 mm wide, margin usually smooth, with strongly down-rolled margins; corolla (1.8-) 2-2.5 (-3) mm across; pedicels filiform; stems 15-50 (-60) cm long, delicate . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . G. obtusum var. filifolium
14 Leaves (10-) 15-25 (-30) mm long, (2-) 3-5 (-6) mm wide, margin scabrous, not down-rolled; corolla (2-) 2.5-3.5 (-4) mm across; pedicels thicker; stems (15-) 25-60 (-80) cm long, firm . . . .

13 Corollas 3-(4)-lobed, the lobes about as wide as long, or wider than long.
15 Flowers and fruits borne on arcuate pedicels, (5-) 7-15 (-20) mm long and densely retrorsely scabrous . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [G. trifidum var. trifidum]
15 Flowers and fruits borne on straight pedicels, these (2-) 2.5-8 (-12) mm long and smooth.
16 Fruiting pedicels (4-) 5-8 (-12) mm long; pairs of fruits (3-) \(3.5-5 \mathrm{~mm}\) across at maturity; leaves 2-3 (-4) mm wide ............................. G. tinctorium var. floridanum
16 Fruiting pedicels (2-) 2.5-5 (-6) mm long; pairs of fruits \(2-3 \mathrm{~mm}\) across at maturity; leaves (1.5-) 2-2.5 (-2.8) mm wide . . . . . . . . . . . . . . . . . . . . . . . G. tinctorium var. tinctorium

\section*{Key B -- Bedstraws with leaves mostly 6 per node (ranging from 4-8)}

1 Flowers in terminal heads, subtended by an involucre of leaves fused at the base; stem rough-hairy, but not retrorse-scabrid
[Sherardia arvensis]
1 Flowers in axillary or terminal diffuse inflorescences, not subtended by an involucre; stems either smooth, retrorse-scabrid, or pubescent.
2 Fruits and ovaries uncinate-hispid; leaves \(15-50 \mathrm{~mm}\) long, \(7-10 \mathrm{~mm}\) wide
G. triflorum

2 Fruits and ovaries glabrous or papillose; leaves \(5-25 \mathrm{~mm}\) long, 1-6 mm wide.
Largest leaves less than 10 mm long; fruits \(0.7-1 \mathrm{~mm}\) across; annual
G. divaricatum

3 Largest leaves more than 10 mm long; fruits \(1-2.5 \mathrm{~mm}\) across; perennial.
4 Corolla 1.5-2.5 mm across, 3-lobed; [collectively widespread in our area].
5 Fruiting pedicels (4-) 5-8 (-12) mm long; pairs of fruits (3-) 3.5-5 mm across at maturity; leaves 2-3 (-4) mm wide G. tinctorium var. floridanum

5 Fruiting pedicels (2-) 2.5-5 (-6) mm long; pairs of fruits (2-) 2.5-3 mm across at maturity; leaves (1.5-) 2-2.5 (-2.8) mm wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . G. tinctorium var. tinctorium
4 Corolla 2.5-4.5 mm across, 4-lobed; [mostly of the Mountains in our area, extending into the Piedmont or even Coastal Plain in n. VA and northwards].
6 Leaf margins retrorsely ciliate-scabrid; leaves \(3-5 \times\) as long as wide; [plants of bogs and moist thickets] . .
6 . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . G. asprellum
6 Leaf margins antrorsely ciliate-scabrid; leaves \(4-8 \times\) as long as wide; [plants of dry forests and woodlands].
7 Leaves sharply acute or cuspidate; corolla 2.5-3 mm across . . . . . . . . . . . . . . . . . . G. concinnum
7 Leaves rounded, obtuse, or barely acute; corolla ca. 4 mm across . . . . . . . . . . . . . . . [G. palustre]

Key C -- Bedstraws with leaves mostly 8 or more per node (ranging from 5-12)

1 Leaves 8-12 per whorl (many whorls with more than 8 leaves); flowers bright yellow, in a large showy terminal compound inflorescence; fruits glabrous; perennial.
2 Flowers golden-yellow, fragrant; inflorescence dense, usually not interrupted . . . . . . . . . . . . . . . . . . . . . . . . . G. verum
2 Flowers lemon-yellow, odorless; inflorescence interrupted . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [G. wirtgenii]
1 Leaves (5-) \(8(-10)\) per whorl (few if any whorls with more than 8 leaves); flowers white or greenish, in a terminal compound inflorescence or in small axillary inflorescences; fruits glabrous, papillose, or uncinate-hispid; annual or perennial. 3 Stems retrorsely scabrous; annual.

4 Fruits and ovaries uncinate-hispid; flowers and fruits mainly in clusters of 2-5 ....................... G. aparine

3 Stems glabrous or pubescent, but not scabrous; perennial.
5 Fruits and ovaries uncinate-hispid; nodes bearded, the stem otherwise glabrous . . . . . . . . . . . . . G. odoratum
5 Fruits and ovaries glabrous; nodes not bearded, the stem either glabrous or pubescent towards the base of the plant. 6 Corolla 3-5 mm across, the pedicels usually shorter than the width of the corolla; inflorescence branches ascending, mostly at less than 45 degrees . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . G. mollugo var. erectum 6 Corolla 2-3 mm across, the pedicels usually longer than the width of the corolla; inflorescence branches spreading, mostly at more than 45 degrees . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . G. mollugo var. mollugo

Galium aparine Linnaeus, Cleavers. Mt, Pd, Cp (GA, NC, SC, VA): meadows, thickets, disturbed areas, forests; common. April-May. Circumpolar, south in North America to FL and TX. Apparently represented in North America (including our area) by both native and introduced genotypes. [= RAB, C, F, G, GW, K, S, W; G. aparine var. echinospermum (Wallroth) Farwell -- C]

Galium asprellum Michaux, Rough Bedstraw. Mt (NC, VA), Pd, Cp (VA): bogs, streambanks, wet meadows; uncommon. July-September. Newfoundland west to MN, south to n. VA, w. NC, ne. TN, sc. TN (Chester, Wofford, \& Kral 1997), and MO. [= RAB, C, F, G, GW, K, S, W]

Galium boreale Linnaeus, Northern Bedstraw. Mt (VA): woodlands and fields; uncommon (VA Watch List). May-August. Circumboreal, south in North America to DE, sw. VA, KY, MO, and CA. [= C, K, W; G. boreale var. intermedium Augustin de Candolle -- F, G]

Galium circaezans Michaux var. circaezans, Southern Forest Bedstraw. Mt, Pd, Cp (GA, NC, SC, VA): moist forests; common. April-June. NY, KY, and MI, south to FL and TX. The varieties need additional study. [= C, F, G, K; G. circaezans -RAB, S, W, infraspecific taxa not distinguished]

Galium circaezans Michaux var. hypomalacum Fernald, Northern Forest Bedstraw. Mt (NC, VA), Pd (VA), \{GA?, SC?\}: moist forests; common? April-June. Québec west to MN and NE, south to VA, w. NC, KY, MO, and TX (?). The varieties need additional study. [= C, F, G, K; G. circaezans -- RAB, S, W, infraspecific taxa not distinguished]

Galium concinnum Torrey \& A. Gray, Shining Bedstraw. Mt, Pd (VA): dry woodlands; uncommon. June-August. NJ west to MN and NE, south to sw. VA, e. TN, nc. TN, and AR. [=C, F, G, K, W]
* Galium divaricatum Purret ex Lamarck. Pd (NC, VA), Cp, Mt (VA): pastures, disturbed areas; uncommon, introduced from Europe. June-July. [=K; G. parisiense Linnaeus - RAB, C, F, G, S, W]

Galium hispidulum Michaux. Cp (GA, NC, SC, VA), Mt (NC): maritime forests, sandhills, dry sandy forests; common, rare in Mountains, rare in VA (VA Watch List). June-August; August-September. S. NJ south to FL, west to LA, primarily on the Coastal Plain. [= RAB, C, F, G, K, W; G. bermudense Linnaeus -- S, misapplied]

Galium lanceolatum Torrey, Wild-licorice. Mt (NC, SC, VA), Pd (VA), Cp (VA): moist hardwood forests; uncommon (rare in Coastal Plain and Piedmont). June-July. Québec west to MN, south to w. NC and e. TN. [= RAB, C, F, G, K, S, W]

Galium latifolium Michaux, Wideleaf Bedstraw. Mt (GA, NC, SC, VA), Pd (NC, VA): moist hardwood forests; common (uncommon in Piedmont). May-July. C. PA and KY south to n. GA and n. AL, a Southern and Central Appalachian endemic. The closely related G. arkansanum A. Gray is the Ozarkian sibling of the Appalachian G. latifolium. Var. hispidum, named from VA, needs additional study. [= RAB, C, F, G, K, S, W; G. latifolium var. hispidum Small -- F, G]
* Galium mollugo Linnaeus var. erectum (Hudson) Domin. Mt?, Pd?, Cp? (NC?, VA?): moist roadsides, disturbed areas; ??, introduced from Europe. May-June. The varieties need additional study. [= C, G; G. mollugo -- RAB, K, W, infraspecific taxa not distinguished; G. erectum Hudson -- F; G. album P. Miller]
* Galium mollugo Linnaeus var. mollugo. Mt (NC, VA), Pd?, Cp? (VA?), \{GA\}: moist roadsides, disturbed areas; uncommon, introduced from Europe. May-June. The varieties need additional study. [= C, G; < G. mollugo -- RAB, K, W; G. mollugo -- F, in the narrow sense]

Galium obtusum Bigelow var. filifolium (Wiegand) Fernald, Carolina Bedstraw. Cp (GA, NC, SC, VA), Pd (GA?, NC, SC, VA), Mt (VA): marshes, swamps, creekbanks, alluvial forests; common. April-May. S. NJ south to c. GA, primarily on the Coastal Plain. [= RAB, C, F, W; G. obtusum -- GW, infraspecific taxa not distinguished; G. obtusum ssp. filifolium (Wiegand) Puff -- K, Z; G. filifolium (Wiegand) Small -- S]

Galium obtusum Bigelow var. obtusum, Bluntleaf Bedstraw. Cp, Pd, Mt (GA, NC, SC, VA): marshes, swamps; common. April-May. Nova Scotia west to SD, south to FL and TX. "Ssp. australe Puff", cited in Kartesz (1999) and allegedly endemic to GA, was never published and is not considered a useful entity by its putative author (Puff, pers. comm. 2004). [= RAB, C, F, G, W; G. obtusum -- GW, infraspecific taxa not distinguished; G. obtusum var. ramosum Gleason -- G; G. obtusum ssp. obtusum -- K, Z; G. tinctorium -- S, misapplied]
* Galium odoratum (Linnaeus) Scopoli, Sweet Woodruff, Waldmeister. Mt, Pd (NC, VA): commonly cultivated, rarely escaped or persistent, introduced from Europe. May. Used fresh as a flavoring for May-wine. [= C, K; Asperula odorata Linnaeus -- F, G]

Galium orizabense Hemsley ssp. laevicaule (Weatherby \& Blake) Dempster. Cp (GA, NC, SC, VA?): forests; uncommon? (VA Watch List) May-August. Ranging from se. VA south to FL, west to se. TX. [= K; G. pilosum -- RAB, S, in part; G. pilosum Aiton var. laevicaule Weatherby \& Blake -- F]

Galium pilosum Aiton var. pilosum. Mt, Pd, Cp (NC, SC?, VA), \{GA\}: forests, woodland borders, clearings; common. May-

August. S. NH west to MI, south to NC, TN, MO, and TX. The varieties need additional study. [= C, F, G, K; G. pilosum -- RAB, S, W, infraspecific taxa not distinguished (and also including G. orizabense ssp. Iaevicaule)]

Galium pilosum Aiton var. puncticulosum (Michaux) Torrey \& A. Gray. Cp (GA, NC, SC, VA), Pd?: forests, woodland borders, clearings; common. May-August. S. NJ south to FL, west to MS. The varieties need additional study. [=C, F, G, K; G. pilosum -- RAB, S, W, infraspecific taxa not distinguished (and also including G. orizabense ssp. laevicaule)]

Galium tinctorium (Linnaeus) Scopoli var. floridanum Wiegand, Florida Three-lobed Bedstraw. Cp (GA, NC, SC, VA), Mt (NC, SC, VA), Pd (NC, SC): swamps, marshes, and ditches; common (VA Watch List). April-June. Ranging from MA south to FL, west to e. TX, mostly on the Coastal Plain, but extending inland to w. VA, w. NC, se. KY, s. IL, and se. MO. See Puff (1976) for additional information. [=F; G. tinctorium -- RAB, C, K, W, infraspecific taxa not distinguished; G. obtusum var. floridanum (Wiegand) Fernald -- G; G. claytonii Michaux -- S, and infraspecific taxa not distinguished); G. tinctorium ssp. floridanum (Wiegand) Puff -- Z]

Galium tinctorium (Linnaeus) Scopoli var. tinctorium, Southern Three-lobed Bedstraw. Mt (GA, NC, SC, VA), Pd, Cp? (NC, SC, VA): swamps, marshes, and ditches; common. April-June. Ranging from Newfoundland west to MN and NE, south to SC, \(n\). GA, KY, and ne. MO. See Puff (1976) for additional information. [= F, G, GW; G. tinctorium -- RAB, C, K, W, infraspecific taxa not distinguished; G. claytonii Michaux -- S, and infraspecific taxa not distinguished); G. tinctorium ssp. tinctorium -- Z]
* Galium tricornutum Dandy, Small Bedstraw. Pd (GA, SC): disturbed areas; rare, introduced. This species has been reported from Cherokee and Greenwood counties, SC, nearby GA, and se. PA (Rhoads \& Klein 1993). [= K; G. tricorne Stokes -- F, in part]

Galium triflorum Michaux, Sweet-scented Bedstraw. Mt, Pd, Cp (GA, NC, SC, VA): woodlands, roadsides, disturbed areas; common. July-August. Circumboreal, south in North America to FL and Mexico. [= RAB, C, F, G, K, S, W; G. triflorum var. asprelliforme Fernald -- C, F, G]

Galium uniflorum Michaux. \(\mathrm{Cp}, \mathrm{Pd}(\mathrm{GA}, \mathrm{NC}, \mathrm{SC}, \mathrm{VA})\) : moist slope forests and alluvial forests; uncommon. April-September. Ranging from se. VA south to FL, west to TX. [= RAB, C, F, G, K, S]
* Galium verum Linnaeus, Yellow Bedstraw, Our Lady's Bedstraw. Mt (NC, VA), Pd (VA): meadows, pastures, roadsides; uncommon (rare in NC), introduced from Europe. June-July. [= C, F, G, K; G. verum -- RAB, W, in part (also including G. wirtgenii)] * Galium virgatum Nuttall, Ozark Bedstraw. Cp (SC): waif around wool-combing mill; rare, probably not established, introduced from sc. United States. Native from TN and AL west to KS, OK, and TX. [= C, F, G, K; G. virgatum var. leiocarpum Torrey \& A. Gray - S; G. virgatum var. virgatum - S]

Galium palustre Linnaeus, Marsh Bedstraw, Ditch Bedstraw, ranges south to NJ, s. PA (Rhoads \& Klein 1993), MD, and WV (Kartesz 1999). [= C, F, G, K]

Galium trifidum Linnaeus var. trifidum, Northern Three-lobed Bedstraw. Moist places, bogs, and swamps, circumboreal, south in North America to MD, DE, PA, and NJ. [= C, F, G; G. trifidum ssp. trifidum - K, Z]
* Galium wirtgenii F.W. Schultz, Yellow Bedstraw. Not definitely known from our area, but likely to be present. [= C, F, G, K; G. verum -- RAB, W, in part]

Hedyotis Linnaeus (Bluet) \\ (see Houstonia, Oldenlandia, Stenaria)
}

Houstonia Linnaeus (Bluet)
(also see Stenaria)
The generic limits of Houstonia, Hedyotis, Oldenlandia, and Stenaria remain unclear. I do not agree with Terrell's (1991) sinking of the varieties of \(H\). Iongifolia and reduction of \(H\). tenuifolia to a variety of \(H\). longifolia. References: Terrell (1959)=Z; Terrell (1991) \(=\) Y; Terrell (1996) \(=\mathrm{X}\); Rogers (1987) \(=\) Q; Ward (2004c) \(=\mathrm{V}\); Church (2003); Turner (1995b) \(=\mathrm{U}\); Terrell (2001)=V. Key adapted in part from the references.

Identification notes: in the key below, all leaf measurements and length/width ratios are based on median cauline leaves.
1 Flowers solitary on terminal (rarely axillary) pedicels (2-) 6-50 (-70) mm long; corolla salverform; leaves 2-15 mm long; [subgenus Houstonia].
2 Stems prostrate and creeping; [section Houstonia].
3 Corolla white (rarely pale lavender); capsule (2.3-) 3.0-6.3 mm across; leaves \(2-13 \mathrm{~mm}\) wise; pedicels usually single, 2-25 mm long; flowers chasmogamous and cleistogamous (these borne underground); [of the outer Coastal Plain] .

3 Corolla blue (rarely white); capsule \(2.5-5.0 \mathrm{~mm}\) across; leaves \(0.5-7 \mathrm{~mm}\) wide; pedicels single or paired, to 60 mm long; flowers all chasmogamous and aerial; [of the Mountains] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . H. serpyllifolia
2 Stems erect or spreading.
4 Stems 1-4 (-7) cm tall; leaves mostly oblanceolate, 0.3-3.0 mm wide; corolla 5-12 mm long, white to pale pink; seeds with a hilar ridge in an elliptical depression; [section Mullera] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [H. rosea]
4 Stems 1-26 cm tall; leaves elliptic, ovate or spatulate, 0.3-9.0 mm wide (at least some on a plant generally \(>3 \mathrm{~mm}\) wide); corolla 2-21 mm long, purple, pale blue, pink, or white; seeds subglobosa with a ventral cavity; [section Houstonia].
5 Plants perennial, with a well-developed, persistent basal rosette; corolla 5.8-16 (-21) mm long, the tube (2-) 4-
11 (-12) mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . H. caerulea

Plants annual, with at most a few short-lived basal leaves; corolla 2-10 (-12) mm long, the tube 0.8-5.5 mm long.
6 Calyx lobes \(1 / 5\) as long as to slightly longer than the corolla tube; corollas purple or violet (rarely white), \(3.5-10(-12.5) \mathrm{mm}\) long, the tube \(2.0-5.5 \mathrm{~mm}\) long H. micrantha

6 Calyx lobes slightly shorter than to slightly longer than the corolla tube; corollas white, 2.0-5.5 mm long, the tube \(0.8-2.5 \mathrm{~mm}\) long
H. pusilla

1 Flowers several to many, in terminal cymes; corolla funnelform; leaves (8-) 10-60 mm long; [subgenus Chamisme, section Amphiotis].
7 Capsule obovoid-cylindric, longer than wide, the free calyx lobes distinctly shorter than the capsule; stipules of mid-cauline leaves ciliate or fringed, and also often bristle-tipped; leaves 1-3 mm wide; [plants of calcareous glades and barrens]
H. nigricans var. nigricans

7 Capsule as long as wide or wider, depressed globose, the free calyx lobes about as long as the capsule; stipules of midcauline leaves not cilate, fringed, or bristle-tipped; leaves 0.5-34 mm wide; [plants of various habitats, including calcareous glades and barrens]
8 Basal leaves persistent in a rosette until and past flowering; leaves distinctly ciliate . . . . . . . . . . . . . H. canadensis
8 Basal leaves absent at the onset of flowering; leaves smooth-margined or ciliate.
9 Leaves ovate or lanceolate, \(1-6 \times\) as long as wide, \(4-34 \mathrm{~mm}\) wide, widest toward the base or at the middle; calyx lobes \(1-7 \mathrm{~mm}\) long.
10 Calyx lobes 4-7 mm long; leaves mostly lanceolate (varying from narrowly lanceolate to broadly ovate), 1.7-3.3 cm long, 0.4-1.0 cm wide, \(3.3-6 \times\) as long as wide . . . . . . . . . . . . . . . H. purpurea var. calycosa

10 Calyx lobes \(1-4 \mathrm{~mm}\) long; leaves mostly ovate (varying from broadly ovate to ovate-lanceolate), 0.8-6.3 cm long, 0.6-3.4 cm wide, 1-3.2× as long as wide.
11 Corollas light purple to white, (4-) 5-8 (-10) mm long; leaves (10-) 25-50 (-60) mm long, (6-) 12-30 (34) mm wide; stems sparsely to densely pubescent; median internodes \(2-9 \mathrm{~cm}\) long; leaves with pubescence ciliate on the leaf margin, on the midrib, and scattered on the surface; [of various habitats, widely distributed]
H. purpurea var. purpurea

11 Corollas deep purple, 8-12 mm long; leaves 8-20 (-30) mm long, 3-8 (-13) mm wide; stems glabrous (or slightly short-pubescent on the lower nodes only); median internodes \(0.5-4 \mathrm{~cm}\) long; leaves entirely glabrous or with pubescence ciliate on the leaf margin, on the midrib, but lacking from the leaf surface; [of high elevation rocky summits and adjacent grassy balds in w. NC and e. TN] .
H. montana

9 Leaves linear to narrowly elliptic, \(4-20 \times\) as long as wide, \(0.5-6 \mathrm{~mm}\) wide, widest at the middle or near the apex or nearly equally wide for most of their lengths; calyx lobes \(0.5-3 \mathrm{~mm}\) long.
12 Leaves 1.3-4.7 cm long, 0.5-4.0 mm wide (mostly less than 2.5 mm wide), \(7-20 \times\) as long as wide; inflorescence very diffuse and open, to 20 cm long, the branches ascending, spreading, or deflexed, slender and often ultimately filiform, with 1-4 remote nodes bearing reduced leaves, the pedicels to 14 mm long; internodes mostly 4-9; mature capsules mostly 1.5-2.5 mm long and wide; stem densely cinereouspuberulent, especially at the nodes
H. tenuifolia

12 Leaves 1.6-4.0 cm long, 1.5-6.0 mm wide (mostly more than 2.5 mm wide), \(4-11 \times\) as long as wide; inflorescence rather open to rather compact, less than 12 cm long, the branches ascending or spreading, slender, pedicels to 8 mm long; internodes mostly \(7-11\); mature capsules mostly 1.8-3.0 mm long and wide; stem densely cinereous-puberulent, glabrate, or glabrous.
13 Stems glabrous or glabrate (sometimes puberulent on the nodes only); internodes 7-10, the median internodes (1.1-) 2.0-4.5 (-6.0) cm long; [of moist soil mats on moderate to high elevation granitic domes in sw. NC, nw. SC, and ne. GA] . . . . . . . . . . . . . . . . . . . . . . . . . . H. Iongifolia var. glabra 13 Stems densely cinereous-puberulent; internodes (6-) 7-11 (-13), the median internodes (1.0-) 1.5-3.5 (-4.4) cm long; [of dry sandy, shaley, gravelly, or rocky soil, widely distributed] H. Iongifolia var. compacta

Houstonia caerulea Linnaeus, Quaker Ladies, Innocence, Common Bluet. Mt, Pd, Cp (GA, NC, SC, VA): forests, woodlands, openings, lawns, a wide variety of disturbed sites; common. April-May; May-June. This species is widespread in e. North America. The flowers of this species and \(H\). serpyllifolia are very similar; \(H\). caerulea is a somewhat duller blue. \([=R A B, G, K, S, W, X, Y\); Houstonia caerulea var. caerulea -- F; Hedyotis caerulea (Linnaeus) Hooker -- C, GW; Hedyotis caerulea - Q, in part only]

Houstonia canadensis Willdenow ex Roemer \& J.A. Schultes, Canada Bluet. Mt (GA, VA): dry limestone barrens, locally abundant in shallow soils over limestone; rare (VA Rare). April-June. Ranging from ME and s. Ontario west to MN, south to sw. VA, se. and c. TN, nw. GA, and AR. Terrell (1959) determined that Houstonia setiscaphia (allegedly a narrow endemic of sw. VA) fell within the range of variation of southern populations of \(H\). canadensis. Further study is perhaps warranted. \([=F, G, K, W, X, Y, Z\); Hedyotis canadensis (Willdenow ex Roemer \& J.A. Schultes) Fosberg -- C, Q; Houstonia setiscaphia L.G. Carr -- F; Houstonia canadensis var. setiscaphia (L.G. Carr) C.F. Reed]

Houstonia longifolia Gaertner var. compacta Terrell, Eastern Longleaf Bluet. Mt (GA, NC, VA), Pd, Cp (GA, NC, SC, VA): dry rock outcrops and adjacent open woodlands, dry sandy woodlands, dry roadbanks, glades and barrens; uncommon. Early JuneAugust; September-October. Var. compacta is centered in the central Appalachians of VA, WV, e. KY, and se. OH, with extensions north to VT, west into n. IL, and south in the Piedmont and adjacent Coastal Plain to SC and GA. The typic variety is more northern, apparently reaching its southern limit in IN, not reaching our area. [= Z; Houstonia longifolia -- RAB, C, F, G, S, W, infraspecific taxa not distinguished; Hedyotis longifolia (Gaertner) Hooker -- \(C, Q\), infraspecific taxa not distinguished; Houstonia longifolia var.
longifolia -- Y , in part; Houstonia longifolia, "Appalachian Group" -- X; Houstonia longifolia - K, in part (and also including \(H\). tenuifolia)]

Houstonia longifolia Gaertner var. glabra Terrell, Granite Dome Bluet. Mt (GA, NC, SC): seasonally and periodically moist soils of shallow soil mats and crevices of granitic domes; rare (NC Watch List). June-August; September-October. Var. glabra is endemic to the granitic dome district centered around Highlands, NC, occurring in sw. NC, nw. SC, and ne. GA. Terrell (1959) says "the lower internodes [are often] so smooth they appear to have been polished," and gives an altitudinal range of \(850-1750 \mathrm{~m}\). Although the morphological differences between var. glabra and var. compacta are not great, the combination of distinctive morphology correlated with a distinctive habitat and a disjunct range seem to warrant recognition at the varietal level. [= Z; Houstonia longifolia -- RAB, S, W, infraspecific taxa not distinguished; Hedyotis longifolia (Gaertner) Hooker -- C, Q, infraspecific taxa not distinguished; Houstonia longifolia var. longifolia -- Y, in part; Houstonia longifolia, "Glabra Group" -- X; Houstonia longifolia - K, in part (and also including \(H\). tenuifolia)]

Houstonia micrantha (Shinners) Terrell. Cp, Pd (GA): granitic flatrocks, February-April. E. and c. GA west to sw. TN, nw. AR, south to s. MS, s. LA, and e. TX. [= K, X; Hedyotis australis W.H. Lewis \& D.M. Moore - Q; Houstonia pusilla - S, misapplied]

Houstonia montana Small, Roan Mountain Bluet. Mt (NC): in crevices of rock outcrops at the summits of high elevation peaks of the Southern Blue Ridge, also in thin, frost-heaved, gravelly soils of grassy balds near summit outcrops, from \(1250-1950 \mathrm{~m}\) in elevation; rare (US Endangered, NC Endangered). June-July; July-August. This species is endemic to the high Blue Ridge of nw. NC and ne. TN, most notably occurring on Roan Mountain, Grandfather Mountain, Bluff Mountain, and Three Top Mountain. It was first noted by Asa Gray in 1841, who described it as "a remarkable dwarfish form." There has been debate over whether it is not indeed merely a weather-induced form, but it sometimes occurs in close proximity to H. purpurea, with no sign of intergradation. In addition to the characters given above in the key, H. montana also differs from H. purpurea in having larger calyx lobes, corolla, capsules, and seeds. See Terrell (1959), Yelton (1974), and Terrell (1978) for further discussion. [= S, W; Houstonia purpurea -RAB, in part; Houstonia purpurea Linnaeus var. montana (Small) Terrell -- K, X, Y, Z; Hedyotis purpurea - Q, in part; Hedyotis purpurea (Linnaeus) Torrey \& A. Gray var. montana (Small) Fosberg]

Houstonia nigricans (Lamarck) Fernald var. nigricans, Diamond-flower. Mt (SC?, VA), Cp (GA): limestone barrens dominated by Andropogon gerardii; rare (VA Rare). This species has been variously placed in Houstonia, Hedyotis, and Stenaria. Based primarily on seed characters and chromosome numbers, Terrell (2001) has concluded that this taxon is not congeneric with the Sri Lankan type of the genus Hedyotis, and is also not a Houstonia, so has published the new genus Stenaria for Hedyotis nigricans and its close relatives. Church (2003) considers Stenaria congeneric with Houstonia, based on molecular phylogeny. The resolution of generic limits in this group is still unresolved. As interpreted by Terrell (1991, 2001) and Turner (1995b), Houstonia nigricans is a polymorphic species, with Houstonia nigricans var. nigricans as a widespread matrix variety, and other, much more local varieties warranting recognition. Var. nigricans ranges from sw. VA (Ludwig 1999), s. MI, IA, NE, and e. CO, south to s. FL, TX, e. NM, and along the Sierra Madre Oriental to Hidalgo, Mexico. Turner (1995b) reports Houstonia nigricans var. nigricans (as Hedyotis nigricans var. nigricans) from Pickens County, SC; the documentation is not known to me, and suitable habitats in Pickens County are unlikely. [Stenaria nigricans (Lamarck) Terrell var. nigricans -- V; Hedyotis nigricans (Lamarck) Fosberg var. nigricans -K, U, Y; Hedyotis nigricans -- C, Q, infraspecific taxa not distinguished; Houstonia nigricans (Lamarck) Fernald -- F, G; Houstonia angustifolia Michaux -- S; Houstonia filifolia (Chapman) Small -- S]

Houstonia procumbens (Walter ex J.F. Gmelin) Standley, Creeping Bluet. Cp (GA, SC): beach dunes, moist to wet sandy pinelands; common. October-April. Ranging from se. SC south to s. FL, west to se. LA. Gaddy \& Rayner (1980) note that this plant is fairly common on South Carolina barrier islands, but flowers in the winter and is easily overlooked in other seasons (when botanists are more likely to be afield). See Wilbur (1968) and Ward (2004c) for differing opinions about the merits of the taxonomic recognition of the glabrous and pubescent plants. [=RAB, K, S, X, Y; Hedyotis procumbens (Walter ex J.F. Gmelin) Fosberg - Q; Houstonia rotundifolia Michaux; Houstonia procumbens var. procumbens - V; Houstonia procumbens var. hirsuta (W.H. Lewis) D. B. Ward - V]

Houstonia purpurea Linnaeus var. calycosa Shuttleworth ex A. Gray, Midwestern Summer Bluet. Mt (GA, NC): dry woodlands, banks, rock outcrops, shallow soils around mafic and calcareous rock outcrops; rare (NC Watch List). May-July; JulyAugust. The distribution and ecology of var. calycosa in our area are poorly known; it apparently occupies drier and typically more circumneutral sites than var. purpurea. Var. calycosa ranges from s. ME and w. NY west to s. OH, and sw. MO, south to w. NC, n. GA, AL, MS, AR, and e. OK. [= G, K, X, Y, Z; Houstonia purpurea -- RAB, in part, infraspecific taxa not distinguished; Hedyotis purpurea (Linnaeus) Torrey \& A. Gray -- C, Q, in part, infraspecific taxa not distinguished; Houstonia lanceolata (Poiret) Britton -- F, S; Houstonia purpurea -- W, in part, infraspecific taxa not distinguished; Hedyotis purpurea (Linnaeus) Torrey \& A. Gray var. calycosa (Shuttleworth ex A. Gray) Fosberg]

Houstonia purpurea Linnaeus var. purpurea, Summer Bluet. Mt, Pd, Cp (GA, NC, SC, VA): moist and dry woodlands and forests, roadbanks, thinner soils around rock outcrops, a variety of disturbed sites; common, rare in Coastal Plain. May-July; JulyAugust. Var. purpurea ranges from MD and s. PA west to s. OH, s. IL, and sw. MO south to SC, sw. GA, MS, s. LA, e. TX, and e. OK. Plants growing in high elevation and exposed sites are sometimes dwarfed, and in that respect only, superficially resemble \(H\). montana. [= G, K, X, Y, Z; Houstonia purpurea -- RAB, in part, infraspecific taxa not distinguished (and also including Houstonia montana); Houstonia purpurea -- F, S; Houstonia purpurea -- W, in part, infraspecific taxa not distinguished; Hedyotis purpurea (Linnaeus) Torrey \& A. Gray -- C, Q, in part, infraspecific taxa not distinguished; Hedyotis purpurea (Linnaeus) Torrey \& A. Gray var. purpurea]

Houstonia pusilla Schoepf, Tiny Bluet. Pd, Cp (GA, NC, SC, VA), Mt (GA, NC): woodlands, lawns, and other disturbed sites; common. March-April. H. pusilla ranges from MD south to FL, west to TX, and inland from IL west to NE, south to TN and TX. [= RAB, G, K, S, W, X, Y; Houstonia patens Elliott -- F; Hedyotis crassifolia Rafinesque -- C, GW; Hedyotis caerulea (Linnaeus) Hooker - Q, in part; Houstonia minima L.C. Beck - S]

Houstonia serpyllifolia Michaux, Appalachian Bluet, Thyme-leaf Bluet. Mt (GA, NC, SC, VA): streambanks, grassy balds, moist forests, seepy rock outcrops, spray cliffs, and moist disturbed areas; common (VA Watch List). (March-) May-June. A Southern and Central Appalachian endemic, ranging from PA south to nw. SC and ne. GA. The flowers are very similar to, but
usually a brighter blue than, the more widespread H. caerulea. [= RAB, F, G, K, S, W, X, Y; Hedyotis michauxii Fosberg -- C, GW, Q]

Houstonia tenuifolia Nuttall, Diffuse-branched Bluet. Pd, Mt (GA, NC, SC, VA), Cp (NC, SC, VA): usually in dry woodlands, often rocky (especially mafic rocks) or sandy; uncommon (rare in Coastal Plain). May-July; July-October. This species is centered in the Southern Appalachians and the Ozarks, extending into provinces adjacent to both areas of concentration, ranging overall from PA west to MO and OK, south to SC, GA, and TX. [= RAB, F, G, S, W, Z; Hedyotis nuttalliana Fosberg -- C; Hedyotis longifolia (Gaertner) Hooker - C, Q, in part; Houstonia longifolia var. tenuifolia (Nuttall) Wood; Houstonia longifolia, "Tenuifolia Group" -- X; Houstonia longifolia - K, in part]

Houstonia rosea (Rafinesque) Terrell. AL west to TX. [= K; Hedyotis rosea Rafinesque]

\section*{Mitchella Linnaeus (Partridge-berry)}

The only other species in the genus is e. Asian.
Mitchella repens Linnaeus, Partidge-berry. Mt, Pd, Cp (GA, NC, SC, VA): deciduous and coniferous forests, stream-banks, heath balds, maritime forests, on rotten logs; common. May-June; June-July. Nova Scotia west to MN, south to peninsular FL and TX. Plants in maritime forests are more robust than others and often have an ascending habit, the stems sometimes 20-30 cm tall. \([=R A B, C, F, G, G W, K, S, W]\)

Mitracarpus Zuccarini (Girdle-pod)
A genus of about 30 species, of tropical America.
* Mitracarpus hirtus (Linnaeus) Augustin de Candolle, Girdle-pod. Cp (GA): disturbed areas; rare, introduced from tropical America. In sw. GA (Jones \& Coile 1988) and FL. [= K; M. villosus (Sw.) Chamisso \& Schlechtendahl ex Augustin de Candolle]

Oldenlandia Linnaeus (OIdenlandia)
References: Terrell (1991)=Z; Rogers (1987)=Y; GW.
1 Flowers (1) 2-5 in pedunculate axillary umbels, the filiform peduncle 5-10 mm long, the filiform pedicels 3-5 mm long ......

1 Flowers 1-10 in sessile or subsessile clusters.
2 Stem glabrous or nearly so; leaves mostly linear or linear-oblanceolate, 1-3 mm wide, generally 5-10× as long as wide; flowers solitary or (rarely) in 2-3-flowered clusters; plant a perennial . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . O. boscii
2 Stem pilose or villous; leaves mostly ovate or broadly lanceolate, 4-10 mm wide, generally \(2-3 \times\) as long as wide; flowers in compact clusters of 3-10, rarely solitary; plant an annual . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 0 . uniflora

Oldenlandia boscii (Augustin de Candolle) Chapman, Bosc's Bluet. Cp (GA, NC, SC, VA), Mt (GA): clay-based Carolina bays, rivershore and millpond drawdown shores, sagponds, other seasonally saturated habitats; rare (GA Special Concern, NC Rare, VA Rare). August-September. A Southeastern Coastal Plain endemic, ranging from se. VA south to FL and west to TX. Similar in vegetative condition to Polypremum procumbens. [= RAB, G, K, S, Z; = Hedyotis boscii Augustin de Candolle -- C, F, GW, Y]
* Oldenlandia corymbosa Linnaeus, Diamond-flower. Cp (GA, NC, SC), Pd (NC): moist lawns, gardens; rare, introduced from South America. July-October. Reported for NC by Nesom (2000e). [= RAB, K, S, Z; = Hedyotis corymbosa (Linnaeus) Lamarck -GW, Y]

Oldenlandia uniflora Linnaeus, Oldenlandia. \(\mathrm{Cp}, \mathrm{Pd}(\mathrm{GA}, \mathrm{NC}, \mathrm{SC}, \mathrm{VA})\) : pondshores, muddy drawdown shores, moist to wet ecotones of Coastal Plain streamheads, other moist to wet places; uncommon (rare in Piedmont). August-October. Mostly a species of the Southeastern Coastal Plain, ranging from Long Island, NY south to FL and west to TX, north in the interior to MO. [= RAB, G, K, S, Z; = Hedyotis uniflora (Linnaeus) Lamarck -- C, F, GW, Y]

\section*{Paederia Linnaeus (Skunk-vine)}

A genus of ca. 30 species, woody vines, of the Tropics. References: Diamond (1999).
* Paederia foetida Linnaeus, Skunk-vine. Cp (SC), Pd (NC): disturbed areas, rarely spreading from plantings; rare, introduced from se. Asia. Diamond (1999) reports its naturalization in Randolph Co., NC. [= RAB, K, S]

A genus of 2 species, herbs, of tropicala nd warm temperate America and Africa. References: Terrell (1991)=Z; Rogers (1987)=Y.
* Pentodon pentandrus (K. Schumach. \& Thonn.) Vatke. Cp (GA, SC): pond edges, wet meadows, moist ground; rare, apparently introduced from Africa (GA Special Concern). July-September. In North America, ranging from e. SC south to FL, west to se. TX. [= GW, K, Y, Z; P. halei (Torrey \& A. Gray) A. Gray -- S; Oldenlandia halei (Torrey \& A. Gray) Chapman]

Pinckneya Michaux (Pinckneya, Fever-tree)
Pinckneya is a monotypic genus, showy when in flower because of the development of 1 of the 5 calyx lobes of some of the flowers of the inflorescence into a large (to 7 cm by 5 cm ), petaloid (pink or cream) appendage. References: Godfrey (1988); Rogers (1987) \(=Z\).

Pinckneya bracteata (Bartram) Rafinesque, Pinckneya, Fever-tree. Cp (GA, SC): margins of acidic, peaty (blackwater) swamps; rare (SC Rare). May-June (-July); September. Se. SC south to n. (panhandle) FL. [= GW, K, Z; = P. pubens Michaux -RAB, S]

\section*{Richardia Linnaeus (Richardia)}

References: Lewis \& Oliver (1974)=Z; Krings (2002). Key based on Krings (2002).
1 Stems hirsute, generally densely and evenly so from tip to base; adaxial leaf surface evenly strigose; mericarps conspicuously and densely hispidulous to strigose, the adaxial face broad, with a pronounced median keel; perennial from a woody rhizome (or annual)
\(R\). brasiliense
1 Stems hirsute or villous near the tips, but progressively more sparsely so to glabrate towards the base; adaxial leaf surface glabrous to strigillose near the margins only, the median portion of the leaf blade glabrous; mericarps papillose to tuberculate, the adaxial surface closed to a narrow groove; annual R. scabra
* Richardia brasiliensis Gomes. Cp, Pd (GA, NC, SC, VA): roadsides, fields, vacant lots, urban areas, disturbed areas; common, introduced from South America. May-November. [=RAB, C, F, K, S, Z]
* Richardia scabra Linnaeus. Cp, Pd (GA, NC, SC, VA): roadsides, fields, vacant lots, urban areas, disturbed areas; common, introduced from South America. June -December. Lewis \& Oliver (1974) consider this species to be native from our area south through Central America into northern South America, based on the semi-contiguous distribution, but occurrences in our region seem to be in altered habitats. [= RAB, C, F, G, K, S, Z]

\section*{Sherardia Linnaeus (Field-madder)}

A monotypic genus, an herb, native of Europe and w. Asia.
Identification notes: Habitally similar to Galium, but differing in its involucrate inflorescence and the more tubular, pink to purple flowers.
* Sherardia arvensis Linnaeus, Field-madder. Pd (GA, NC, SC, VA), Cp, Mt (NC, SC, VA): lawns, disturbed areas; uncommon, introduced from Europe. February-August. [= RAB, C, F, G, K, S, W]

Spermacoce Linnaeus

Spermacoce glabra Michaux, Smooth Buttonweed. Mt (VA), Cp (GA, SC*, VA*): rocky riversides in the mountains, disturbed areas in the Coastal Plain; rare (GA Rare). Perhaps only introduced in at least some parts of our area; see Wieboldt et al. (1998) for discussion. [= RAB, C, F, G, GW, K, S]

Spermacoce assurgens Ruiz \& Pavón, in sw. GA (Jones \& Coile 1988). [= K; Borreria laevis, misapplied; Borreria brachysepala, misapplied] \{add synonymy; not yet keyed\}

Spermacoce tenuior Linnaeus, reported from sw. GA. \{ID needs checking\} [= K] \{add synonymy; not yet keyed\}

A family of about 156 genera and 1800 species, trees, shrubs, vines, and rarely herbs, cosmopolitan.

\section*{Citrus Linnaeus}

A genus of about 17 species, trees, of s. and se. Asia. The circumscription is uncertain, but Freitas de Araújo, Paganucci de Queiroz, \& Machado (2003) favor a broad circumscription (followed here), including Poncirus, based on DNA analyses. References: Mabberley (1997b)=Z; Freitas de Araújo, Paganucci de Queiroz, \& Machado (2003)=Y.

Identification notes: Citrus has simple to trifoliolate, evergreen, coriaceous, acuminate, and glossy green leaves, and the familiar spherical fruits.

1 Leaves unifoliolate; fruit glabrous, \(>8 \mathrm{~cm}\) in diameter . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. \(\times\). \({ }^{\text {aurantium }}\) 1 Leaves trifoliolate; fruit densely pubescent, \(<6 \mathrm{~cm}\) in diameter . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. trifoliata
* Citrus ×aurantium Linnaeus (pro sp.), Sour Orange. Cp (GA): cultivated horticulturally, sometimes persistent; rare. Reported from several counties in s. and e. GA (Jones \& Coile 1988). [= Z; C. aurantium -- K (as species)]
* Citrus trifoliata Linnaeus, Trifoliate Orange. Pd (GA, NC, SC, VA), Cp (GA, SC, VA): woodlands, thickets, and streambanks, especially in suburban areas; rare, introduced from China. March-April; September-October. Planted in our area as an ornamental, also used in warmer climates as a grafting stock for citrus, C. trifoliata is a small tree or shrub that seems to be made up almost entirely of thorns. The fruits closely resemble an orange, but are small (ca. 4 cm in diameter), densely pubescent, and sour. Citrus trifoliata is often considered a separate genus, Poncirus, but differs very little from Citrus morphologically and has been shown to be phylogenetically nested within Citrus. [= Y; Poncirus trifoliata (Linnaeus) Rafinesque - RAB, F, G, K, S]
* Citrus \(\times\) limon (Linnaeus) Burmann f., Lemon, C. \(\times\) paradisi Macfadyen in Hooker (pro sp.), Grapefruit, and C. sinensis (Linnaeus) Osbeck, Orange, have been grown on the Outer Banks of North Carolina in Buxton, Dare County, NC (Brown 1959). They are apparently not naturalized, being killed outright or severely damaged by occasional colder winters. \{not keyed\}

Poncirus Rafinesque (Trifoliate Orange)
(see Citrus)

Ptelea Linnaeus (Hop-tree, Wafer-ash, Stinking Ash)
A genus of about 11 species, of North America (south into Mexico). References: Bailey (1962)=Z.
1 Twigs densely pubescent; leaflets densely soft-pubescent beneath . . . . . . . . . . . . . . . . . . . . . . . . P. trifoliata var. mollis 1 Twigs glabrous or glabrescent; leaflets usually glabrous or glabrate . . . . . . . . . . . . . . . . . . . . . . . . . . P. trifoliata var. trifoliata

Ptelea trifoliata Linnaeus var. mollis Torrey \& A. Gray, Hairy Hop-tree. Cp (GA, NC, SC), Pd (GA, NC, SC), Mt (GA, NC, SC, VA): rocky bluffs, especially calcareous or mafic, open woodlands, calcareous Coastal Plain river bluffs, granitic domes; uncommon. The relative distribution and habitats of the two varieties in our area need further study. April-June; June-August. MD, w. NC, n. GA, n. AL, and c. TX south to e. GA, panhandle FL, and s. TX. Our varieties are both placed by Bailey (1962) as quadrinomials in the eastern ssp. trifoliata. [= F; < P. trifoliata -- RAB; = P. trifoliata ssp. trifoliata var. mollis Torrey \& A. Gray -- C, K, Z; \(<\) P. trifoliata var. trifoliata -- G; ><P. trifoliata -- S, in part]

Ptelea trifoliata Linnaeus var. trifoliata, Smooth Hop-tree. Mt (GA, NC, VA), Pd (GA, SC, VA), Cp (GA, VA): rocky bluffs, especially calcareous or mafic, open woodlands, calcareous Coastal Plain river bluffs, granitic domes; uncommon. April-June; June-August. NJ, w. NY, MI, s. WI, and NE south to c. peninsular FL, c. AL, c. MS, e. TX. The relative distribution and habitats of the two varieties in our area need further study. Bailey discusses some odd forms, corresponding in part to Small's species, which she does not recognize taxonomically; further study is warranted. [=F; < P. trifoliata -- RAB; = P. trifoliata ssp. trifoliata var. trifoliata \(--\mathrm{C}, \mathrm{K}, \mathrm{Z} ;<P\). trifoliata var. trifoliata \(--\mathrm{G} ;>P\). trifoliata -S , in part; \(>P\). serrata \(\mathrm{Small}-\mathrm{S} ;>P\). microcarpa \(\mathrm{Small}-\mathrm{S}\); \(>P\). baldwinii Torrey \& A. Gray -- S]

A genus of about 7 species, of the Old World.
* Ruta graveolens Linnaeus, Rue. Pd (NC), Mt (VA): cultivated in gardens as a medicinal herb, persistent and rarely escaping, sometimes locally abundant in pastures over limestone; rare, introduced from Eurasia. May-August; June-September. This plant causes dermatitis in some people, apparently by removing the skin's sun-resistance. Ruta has a disagreeable smell, and has toxic properties. [= RAB, C, F, G, K, S]

\section*{Zanthoxylum Linnaeus (Prickly-ash, Toothache Tree)}

A genus of about 250 species, of America, Africa, Asia, and Australia. References: Porter (1976)=Z.
1 Leaves thin in texture, pubescent; flowers in small axillary clusters . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Z. americanum
1 Leaves coriaceous in texture, glabrous and waxy; flowers in large terminal compound cymes . . . . . . . . . . Z. clava-herculis
Zanthoxylum americanum P. Miller, Prickly-ash, Toothache Tree, Northern Prickly-ash. Mt (VA), Pd (GA, VA), Cp (GA, SC): woodlands and forests over calcareous or mafic rocks, often forming extensive colonies near outcrops; rare (NC Watch List, VA Watch List). March-April; July-August. S. Québec west to e. ND, south to e. SC, c. GA, Panhandle FL, e. TN, c. TN, and OK. Sometimes planted. There is only a single known site in SC. [= RAB, C, K, W, S, Z; = Xanthoxylum americanum -- F, an orthographic variant]

Zanthoxylum clava-herculis Linnaeus, Toothache Tree, Hercules'-club, Sea-ash, Southern Prickly-ash, Pepper-bark, Tickletongue. Cp (GA, NC, SC, VA): maritime forests, dunes, shell middens, shell hammocks, maritime scrub, inland (in GA) in hammock forests; uncommon (VA Watch List). April-May; July-September. A Southeastern Coastal Plain endemic: se. VA south to FL and west to TX, AR, and OK. The compound leaves are armed with stout prickles along the rachis. The twigs are also spiny. On the larger branches and trunks, the spines become elevated on conical, pyramidal, or cylindrical corky bases up to 5 cm long and 4 cm in diameter, giving the trunk a very peculiar appearance. Many of the common names come from the numbing effect on the mouth of chewing the leaf or twig, the flavor, smell, and effect being very similar to Ctenium aromaticum, Toothache Grass. In our area it is restricted to the outer Coastal Plain, nearly entirely on the barrier islands. Although normally a small tree, it can reach considerable size, up to about 60 cm DBH. In the 5 km immediately north of Buxton, Dare County, NC one can see several hundred individuals growing on open, Uniola-dominated dunes. Because of salt-pruning, the trees often have 5 times as wide a spread as they are tall. Some trees have a basal diameter of \(30-40 \mathrm{~cm}\), a short trunk less than a meter tall, a total height of \(2-3 \mathrm{~m}\), and a spread of 10 m . [= RAB, C, G, K, S, Z; = Xanthoxylum clava-herculis -- F, an orthographic variant]

SALICACEAE (Willow Family)
A family of 2 genera and about 435 species, trees, shrubs, and subshrubs, nearly cosmopolitan.
1 Leaf blades \(0.8-2(-3) \times\) as long as wide; stamens \(5-80\); buds covered by several, overlapping scales; flowering catkins arching

1 Leaf blades (2-) 3-30× as long as wide; stamens 1-9; buds covered by a single scale; flowering catkins usually erect or ascending Salix

\section*{Populus Linnaeus (Poplar, Aspen, Cottonwood)}

A genus of about 35 species, trees, largely north temperate. References: Eckenwalder (1977)=Z; Eckenwalder (1984) \(=\mathrm{Y}\); Eckenwalder (1996); Hamzeh \& Dayanandan (2004).

1 Winter buds viscid (sticky and shiny as if recently varnished); stamens (15-) 20-80.
2 Petiole terete or dorsally flattened (in the plane of the leaf blade), and often also channeled above; leaf blades dark green above, glaucous white beneath; leaf margin not translucent, finely serrate with teeth \(<1 \mathrm{~mm}\) deep; [section Tacamahaca]. 3 Petioles \(7-10 \mathrm{~cm}\) long; leaves ovate, broader below the midpoint; leaf base rounded to subcordate; twigs terete or slightly angled in cross-section . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. balsamifera 3 Petioles < 2 cm long; leaves obovate, broader past the midpoint; leaf base cuneate to rounded; twigs strongly angles in cross-section
P. simonii

2 Petiole laterally flattened ( 90 degrees to the plane of the leaf blade), especially near the junction with the blade; leaf blades light green above, often paler beneath but not distinctly whitened; leaf margin translucent, finely to coarsely serrate with teeth \(>1 \mathrm{~mm}\) deep.
4 First-year branches reddish-brown; leaves noticeably paler beneath; flattened portion of petiole < \(2 \times\) as deep as wide; early leaves with > 20 teeth per side, the largest < 2.5 mm deep; [probable intersectional hybrid of section Aegeiros and section Tacamahaca] P. \(\times j a c k i i\)

4 First-year branches yellow- to orange- brown; leaves nearly the same color above and below; flattened portion of petiole \(>2 \times\) as deep as wide; early leaves usually with \(<20\) teeth per side, the largest \(<2.5 \mathrm{~mm}\) deep; [section
```

        Aegeiros].
        5 Stigmas 3-4; stamens (30-) 40-80; [native tree, common] . . . . . . . . . . . . . . . . . . P. deltoides ssp. deltoides
        5 Stigmas 2-3; stamens (15-) 20-30; [alien trees, rare out of cultivation].
        6 Floral disk 2-4 mm wide; stigmas 2-3; ovules and seeds 6-14 (-20) per placenta . . . . . . . P. xcanadensis
        6 Floral disk 1-2 mm wide; stigmas 2; ovules and seeds 4-8 per placenta
        P. nigra
    1 Winter buds not viscid; stamens 5-20
7 Stamens 12-20; scales of the catkins deeply fimbriate; petioles terete; [section Leucoides] . . . . . . . . . . . P. heterophylla
Stamens 5-12; scales of the catkins dentate or with only 3-7 linear-trianglar lobes; petioles strongly flattened laterally (90
degrees to the plane of the leaf blade), especially near the junction with the blade; [section Populus].

\section*{OLD KEY}

1 Mature leaves densely white-tomentose beneath; leaves weakly 3-9 lobed or coarsely and irregularly toothed; [section Populus] \(P\). alba
1 Mature leaves glabrous or glabrescent (densely pubescent beneath when young in \(P\). heterophylla and \(P\). grandidentata); leaves regularly and finely or coarsely toothed, but not lobed.
2 Petioles terete, nearly terete, flattened only adjacent to the blade, or slightly flattened throughout.
3 Leaves obtuse or rounded at the tip, cordate at the base; buds not viscid; [native trees mostly of swamps of the Coastal Plain]; [section Leucoides] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. heterophylla
3 Leaves acuminate or acute at the apex, truncate, subcordate, or cordate at the base; buds viscid (sticky and shiny as if recently varnished); [introduced trees mostly of riverbanks of the Mountains]; [section Tacamahaca] . . . P. xjackii
2 Petioles distinctly flattened laterally.
4 Leaves with a well-developed translucent or whitened border broader than the adjacent main veinlets (use 10x magnification); leaves rather triangular or deltoid in shape, the base often subcordate or truncate; leaf teeth incurved and callous-tipped (at \(10 \times\) ); bark rough; stamens 15 or more; ament scales glabrous, ciliate-margined with numerous segments; [section Aegeiros].
5 Leaf blades (6-) 7-12 (-20 cm wide; sinuses between the largest teeth of leaf blade (1.5-) 2-5 mm deep; [native large trees]
P. deltoides var. deltoides

5 Leaf blades usually less than 8 cm wide; sinuses between the largest teeth of leaf blade 1-2 mm deep; [introduced small trees, generally obviously alien].
P. nigra

4 Leaves lacking a well-developed translucent or whitened border broader than the adjacent main veinlets (use \(10 \times\) magnification); leaves mostly rounded or orbicular, the base often rounded or broadly cuneate; stamens less than 12; ament scales pilose, also fringed with only 3-7 (-10) linear to lanceolate segments; [section Populus].
6 Leaf margins coarsely crenate- or undulate-toothed, with fewer than \(12(-15)\) teeth per side, the sinuses of the larger teeth \(1.5-6 \mathrm{~mm}\) deep; leaves puberulent beneath when young (glabrate in age); buds gray-pubescent

6 Leaf margins finely crenulate-serrulate, with 15-35 (-70) teeth per side, the sinuses 0.5-1.0 mm deep; leaves glabrous; buds glossy brown
P. tremuloides
* Populus alba Linnaeus, Silver Poplar, White Poplar. Mt, Pd, Cp (GA, NC, SC, VA): disturbed areas, suburban woodlands; common, native of Europe. March-April. [= RAB, C, F, G, K, S, W]
* Populus \(\times\) canadensis Moench (pro sp.) [P. deltoides \(\times\) nigra], Hybrid Black Poplar. Pd (GA) \(\{N C, V A\}\) : disturbed areas; rare. Reported for a county in C. GA (Jones \& Coile 1988) and for NC and VA (Kartesz 1999). [= C, K]

Populus deltoides Bartram ex Marshall var. deltoides, Eastern Cottonwood. Pd, Cp (NC, SC, VA), Mt (VA), \{GA\}: riverbanks, bottomland forests (not found along blackwater streams); common. March-April. Var. deltoides ranges from Québec west to MN, south to FL and TX. Var. occidentalis Rydberg [ssp. monilifera (Aiton) Eckenwalder] is more western, primarily of the Great Plains. [= C, GW; <P. deltoides -- RAB, G, W; >P. deltoides var. deltoides \(-F\), in a narrower sense; >P. deltoides var. missouriensis (A. Henry) A. Henry -- F ; = P. deltoides ssp. deltoides -- K, Z; P. balsamifera Linnaeus -- S, misapplied]

Populus grandidentata Michaux, Bigtooth Aspen. Mt (NC, VA), Pd, Cp (VA): dry, rocky, upland forests; common, rare south of VA (NC Watch List). April-May. Nova Scotia west to MN, south to w. NC, sc. TN, and n. MO. [= RAB, C, F, G, K, S, W]

Populus heterophylla Linnaeus, Swamp Cottonwood. Cp (GA, NC, SC, VA), Pd (NC, VA): blackwater and brownwater swamp forests; common (rare in Piedmont). March-April. CT west to MI, south to n . FL and LA, scattered and irregular in distribution, absent from the Appalachians. [= RAB, C, G, GW, K, S]
* Populus \(\times\) jackii Sargent [probably P. balsamifera \(\times\) deltoides], Balm-of-Gilead. Mt (NC, VA): bottomlands, riverbanks, streambanks; rare or locally abundant, spread from cultivation. April. This cultivar is of uncertain origin, considered by some to be a hybrid \(P\). balsamifera \(\times\) deltoides, by others to be an atypical pistillate clone of \(P\). balsamifera Linnaeus. The cultivar 'gileadensis' is distinguished from the typical form by the petioles densely and stiffly pubescent (vs. petioles glabrous). P. xjackii is locally abundant along the New River in Watauga, Ashe, and Alleghany counties, NC and downstream into VA. [= C, K, Y; P. candicans Aiton --

RAB, G, S, misapplied; > \(P\). \(\times\) gileadensis Rouleau -- F, W]
* Populus nigra Linnaeus, Black Poplar, Lombardy Poplar. Pd (GA, VA), Cp (GA): disturbed suburban areas; rare, introduced from s. Europe. Cultivated in many forms, including the columnar "Lombardy Poplar;" short-lived and only weakly spreading to disturbed areas in the vicinity of plantings. [= F, G, K; > P. italica (Du Roi) Moench -- S]
* Populus simonii Carrière, Chinese Poplar, Simon's Poplar. Mt (NC): riverbanks; rare, native of China. Naturalized in the Mountains of NC.

Populus tremuloides Michaux, Quaking Aspen. Mt (NC, VA), Pd (VA): heath balds, rocky woodlands, exposed rock oucrops, and clearings; rare (VA Rare). April-May. Labrador west to AK, south to NJ, VA, w. NC, WV, MO, and (in the Rockies) to TX and Mexico. [= C, G, K, S, W; P. tremuloides var. tremuloides -- F]

Populus balsamifera Linnaeus, Balsam Poplar, Hackmatack, ranges south to s. PA (Rhoads \& Klein 1993) and to VA (according to Kartesz 1999). Also reported for n. GA (Jones \& Coile 1988) and provisionally for SC (Kartesz 1999). I have been unable to locate herbarium specimens documenting its occurrence in our primary area \{further investigate\}. [=C, G; P. balsamifera ssp. balsamifera -- K; >P. balsamifera var. balsamifera - F; > P. balsamifera var. magnifica Victorin - F; P. balsamifera var. subcordata Hylander; P. balsamifera var. michauxii (Dode) Henry]
* Populus \(\times\) canescens (Aiton) Sm. (pro sp.) [P. alba \(\times\) tremula], Gray Poplar. Mt, Pd (GA): Occurs at scattered locations in TN, n. GA (Jones \& Coile 1988), se. PA (Rhoads \& Klein 1993), and NC, SC, and VA (Kartesz 1999). [= C, K; = P. canescens (Aiton) Sm. - F, G] \{not yet keyed\}

Populus \(\times\) smithii Boivin [P. grandidentata \(\times\) tremuloides]. South to MD and WV. [ \(=\mathrm{C}, \mathrm{K}\) ]

\section*{Salix Linnaeus (Willow)}

A genus of about 400 species, trees, shrubs, and subshrubs, mostly north temperate and boreal. References: Argus (1986)=Z; Dorn (1995) \(=\) Y; Argus (1997). Key adapted from Z.

13 Leaf margin coarsely and irregularly serrate; leaves glabrous beneath; leaf blade 4-7 (-10)× as long as wide; petioles (7-) 10-20 mm long, glabrous; [section Salix] . . . . . . . . . . . . . . . . . . . . . . S. fragilis
13 Leaf margin minutely and uniformly serrulate; leaves long-sericeous or glabrate beneath; leaf blade 5\(13 \times\) as long as wide; petioles \(3-12 \mathrm{~mm}\) long, tomentose or sericeous.
14 Leaves glabrate beneath; branches normally pendulous; leaves very narrowly lanceolate, with length/width ratio of 6.5-13; petioles \(7-12 \mathrm{~mm}\) long; petioles \(7-12 \mathrm{~mm}\) long, tomentose; flowering branchlets ca. 0.3 cm long; [section Subalbae]..
S. babylonica

14 Leaves long-sericeous beneath; branches ascending (rarely pendulous); leaves narrowly lanceolate, with length/width ratio of 5-6.5; petioles 3-6 mm long; petioles 3-6 mm long, sericeous; flowering branchlets 1-1.5 cm long; [section Salix] . . . . . . . . . . . . . . . . . . . . S. alba
10 Leaf margin entire or crenate (to slightly and irregularly serrate); [subgenus Vetrix, section Cinerella].
15 Leaves glabrate (sparsely pubescent when young), not revolute
S. discolor

15 Leaves permanently pubescent, at least on the lower surface (densely villous or tomentose when young), revolute.
16 Leaf margin entire and undulate; pistillate aments \(1-3.5 \mathrm{~cm}\) long; pistils borne on stipes mostly less than 2 mm long; staminate aments \(0.5-2 \mathrm{~cm}\) long; shrubs, less than 2 m tall.
17 Leaves stipulate; leaf blades (5-) avg. \(7(-13) \mathrm{cm}\) long, (12-) avg. 17 ( -35 ) mm wide; staminate aments 1-2 cm long; pistillate aments 2-3.5 cm long... . . . . . . . . . . . . . . . . . . . . . . . . S. humilis
17 Leaves exstipulate; leaf blades (2.5-) avg. 4 ( -5 ) cm long, (5-) avg. 7 ( -10 ) mm wide; staminate aments \(0.5-1.1 \mathrm{~cm}\) long; pistillate aments \(1-2 \mathrm{~cm}\) long . . . . . . . . . . . . . . . . . . S. occidentalis
16 Leaf margin crenate or irregularly serrate (rarely nearly entire); pistillate aments \(3-8 \mathrm{~cm}\) long; pistils borne on stipes mostly more than 2 mm long; staminate aments \(2-5 \mathrm{~cm}\) long; shrubs to small trees, mostly \(3-15 \mathrm{~m}\) tall.
18 Trees or tall shrubs, to 15 m tall; decorticated wood of 1-4 year old branches smooth or with a few ridges usually less than 5 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. caprea
18 Shrubs, 3-7 (12) m tall; decorticated wood of 1-4 year old branches with numerous ridges, many of them longer than 2 cm .
19 Leaves tomentose beneath with a mixture of white and rusty hairs . . . . . . S. atrocinerea
19 Leaves tomentose beneath with white or gray hairs . . . . . . . . . . . . . . . . . . . . S. cinerea
* Salix alba Linnaeus, European White Willow. Mt (GA, NC, VA), Pd (GA, NC, VA), Cp (VA): disturbed areas; rare, native of Eurasia. March-April. [= RAB, C, F, G, S, W, Z; S. alba var. ?? -- K]
* Salix atrocinerea Brotero, Common Sallow, Olive-leaf Willow. Mt (NC): disturbed areas; rare, native of western Europe. April. [=K; = S. cinerea Linnaeus ssp. oleifolia (Smith) Macreight -- Z; < S. cinerea -- RAB, C, F, G]
* Salix babylonica Linnaeus, Weeping Willow. Mt, Pd, Cp (GA, NC, SC, VA): disturbed areas; common, native of Asia. MarchApril. [= RAB, C, F, G, K, S, W, Z; S. \(\times\) pendulina Wenderoth (fragilis \(\times\) ? sepulcralis) \(-\mathrm{K} ;\) S. \(\times\) sepulcralis Simonkai (alba \(\times\) ?pendulina) - K]
* Salix caprea Linnaeus, Goat Willow, Great Sallow. Mt (NC, VA), Pd (VA): disturbed areas; rare, native of Eurasia. April. [= C, F, G, K, Z]

Salix caroliniana Michaux, Carolina Willow, Coastal Plain Willow. Cp, Pd, Mt (GA, NC, SC, VA): riverbanks, sandbars, other wet sites; common (uncomomon to rare in Piedmont and Mountains). March-April. Widespread in the Southeast, S. caroliniana has a somewhat peculiar range, with three main centers of distribution, the Coastal Plain from VA south to FL, the Interior Low Plateau of TN, KY, and n. AL, and the Ozark-Ouachita Highlands of AR and MO. [= RAB, C, F, G, GW, K, Z; S. longipes Andersson -- S] * Salix cinerea Linnaeus, Gray Willow. Mt (NC, SC, VA), Pd (GA, NC, SC, VA), Cp (NC): disturbed areas; rare, native of Eurasia. April. [=K; =S. cinerea ssp. cinerea \(-Z ;<S\). cinerea -- RAB, C, F, G (circumscription uncertain but apparently including S. atrocinerea)]

Salix discolor Muhlenberg, Pussy Willow. Mt (VA), Pd (NC): calcareous wetlands, disturbed areas; rare, apparently native in VA, introduced only in NC (VA Rare). April. Newfoundland and Alberta south to DE, w. VA, KY, MO, SD, and MT. [= C, K, S, Z; S. discolor var. discolor -- F, G]

Salix eriocephala Michaux var. eriocephala, Heart-leaved Willow. Mt, Pd, Cp (GA, VA): seepage areas, ditches, alluvial areas; common. April-May. Newfoundland and Québec west to Yukon and British Columbia, south to e., c., and w. VA, n. KY, w. TN, n. AR, ne. KS, and CA; disjunct in AL and adjacent w. GA, s. GA, and panhandle FL. Var. eriocephala is the more eastern of six varieties, and ranges from Newfoundland west to ND, south to w. FL and s. KS (Dorn 1995). [<S. eriocephala -- C, K, W, Z; S. rigida Muhlenberg var. rigida -- F, G; S. rigida var. angustata (Pursh) Fernald -- F; S. cordata Muhlenberg -- S, misapplied; S. eriocephala ssp. eriocephala var. eriocephala -- Y]

Salix exigua Nuttall var. sericans (Nees) Nesom, Sandbar Willow. Mt, Pd, Cp (VA): sandbars, riverbanks, creekbanks; rare (VA Rare). March-mid May and June-August. S. exigua occurs throughout North America except most of the Southeast, south to DE, w. VA, e. TN, MS, LA, TX, and Mexico; var. sericans is the more eastern variety of the complex (Nesom 2002). [<Salix exigua \(-\mathrm{K}, \mathrm{W}, \mathrm{Z}\); S. exigua ssp. interior (Rowlee) Cronquist var. angustissima (Andersson) Reveal \& Broome -- C; S. interior Rowlee var. interior -- F, G; S. interior Rowlee -- GW, K, S]

Salix floridana Chapman, Florida Willow. Cp (GA): sphagnous seepages; rare (GA Endangered). March-April. C. GA south to c. peninsular and Panhandle FL. [= GW, K, S, Z]
* Salix fragilis Linnaeus, Crack Willow, Brittle Willow. Pd (VA): low areas; rare, native to Asia Minor, introduced to Europe and thence to here. [=C, F, G, K, S, Z]

Salix humilis Marshall, Upland Willow, Prairie Willow. Mt, Pd (GA, NC, VA), Cp (GA, NC, SC, VA): upland areas, often in open or semi-open sites, in barrens, fens, and grassy balds over mafic rocks (such as amphibolite) up to at least 1800 m elevation,
also in powerline rights-of-way, woodland borders, and other miscellaneous habitats; uncommon. March-May. This species is widespread in e. North America. [= C, G, S; < S. humilis -- RAB, GW (see also S. occidentalis); = S. humilis var. humilis -- K, W, Z; \(>S\). humilis var. humilis - F; >S. humilis var. hyporhysa Fernald -- F]
* Salix lucida Muhlenberg, Shining Willow. Mt (VA): low areas; rare (VA Watch List). May. Doubtfully indigenous to the one known population in Roanoke County, VA. [= C, W, Z; S. lucida var. lucida -- F, G; S. lucida ssp. lucida -- K]

Salix nigra Marshall, Black Willow. Pd, Mt, Cp (GA, NC, SC, VA): riverbanks, sandbars, other moist areas; common. MarchApril. S. nigra occurs nearly throughout e. North America. [= RAB, F, G, GW, K, S, W, Z; S. nigra var. nigra -- C]

Salix occidentalis Walter, Dwarf Upland Willow, Sage Willow. Mt, Pd (GA, NC, VA), Cp (GA, NC, SC, VA): upland areas, often over mafic (amphibolite) or ultramafic (olivine) rocks; uncommon. March-May. This species is less widespread than the related S. humilis, with a distribution centered in the central Appalachians. [= C; < S. humilis -- RAB, GW; = S. humilis var. microphylla (Andersson) Fernald -- F, W, Z; = S. tristis Aiton -- G, S; = S. humilis var. tristis (Aiton) Griggs -- K]
* Salix pentandra Linnaeus, Bay Willow. Pd, Mt (NC, VA): disturbed areas; rare (perhaps not established), introduced from Eurasia. April. [= C, F, G, K, Z]
* Salix purpurea Linnaeus, Basket Willow, Purple Willow, Purple Osier. Mt (NC, VA), Pd (GA, VA): disturbed areas; rare, native of Europe. April. [= RAB, C, F, G, K, S, Z]

Salix sericea Marshall, Silky Willow. Mt (GA, NC, SC, VA), Pd, Cp (NC, SC, VA): bogs, peaty swamps, banks of small streams; uncommon. March-April. S. sericea is a northeastern species, ranging south to w. NC, ne. GA, e. TN, sc. TN, AL, and AR. [ = RAB, C, F, G, GW, K, S, W, Z]

Salix amygdaloides Andersson, Peachleaf Willow. East to w. KY. [= K, Z] \{add to synonymy\}
Salix bebbiana Sargent, Long-beaked Willow, Gray Willow, is widespread and rather common in PA (Rhoads \& Klein 1993)
and also occurs in MD (Argus 1986). [= K, Z] \{subgenus Salix, section Fulvae\}
Salix cordata Michaux, south to MD, PA (Kartesz 1999). \{investigate\} [= K] \{not yet keyed\}
* Salix elaeagnos Scopoli is reported for SC (Kartesz 1999). [= K] \{subgenus Vetrix, section Canae\} \{not keyed\}
* Salix matsudana Koidzumi, Corkscrew Willow, is reported for VA (Fairfax and Fauquier counties). [= K] \{not keyed\}

\section*{SAMOLACEAE (Water-pimpernel Family)}

A monogeneric family of 10-15 species, herbs and subshrubs, cosmopolitan. Samolus was previously generally treated as an aberrant component of Primulaceae. The traditional families Primulaceae, Myrsinaceae, and Theophrastaceae have been repartitioned by Källersjö, Bergqvist, \& Anderberg (2000) in order to create monophyletic groups, with Samolus placed in Theophrastaceae. However, Samolus remains aberrant in Theophrastaceae and is basal; it is probably best placed in its own family, Samolaceae (Ståhl in Kubitzki 2004). References: Källersjö, Bergqvist, and Anderberg (2000); Ståhl in Kubitzki (2004).

\section*{Samolus Linnaeus (Water-pimpernel)}

A genus of about 10-15 species, herbs and subshrubs, nearly cosmopolitan. References: Ståhl in Kubitzki (2004).
Samolus parviflorus Rafinesque, Water-pimpernel, Brookweed. Cp, Pd (GA, NC, SC, VA), Mt (GA, VA): stream banks, brackish marshes, pools in floodplains, interdune ponds; common. April-October. New Brunswick west to British Columbia, south to Central America; also in c. and s. South America. Sometimes treated as a subspecies of the European S. valerandi; the appropriate taxonomic and nomenclatural treatment is uncertain. [= RAB, F, GW, W; S. floribundus Humboldt, Bonpland, \& Kunth -- C, G, S; S. valerandi Linnaeus ssp. parviflorus (Rafinesque) Hultén -- K]

\section*{SANTALACEAE (Sandalwood Family)}

A family of about 34 genera and 540 species, trees, shrubs, and herbs, primarily of tropical and warm temperate regions of the Old World and New World. All members of the family are hemiparasitic, attaching to the roots of other plants. Viscaceae are closely related and should perhaps be included (Angiosperm Phylogeny Group 2003). References: Nickrent \& Malécot (2001).

1 Leaves alternate; monoecious herb or shrub.
2 Herb, to \(2(-3) \mathrm{dm}\) tall; leaves \(1-4 \mathrm{~cm}\) long; inflorescence a terminal panicle of cymes; [tribe Comandreae] ... Comandra
2 Shrub, more than 4 dm tall; leaves 5-15 cm long; inflorescence a terminal raceme; [tribe Pyrularieae] ........ Pyrularia
1 Leaves opposite; dioecious shrub.
3 Staminate flowers in terminal umbel-like dichasia; pistillate flowers solitary, terminal; clumped shrub to 4 m tall; [tribe Thesiae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Buckleya
3 Staminate flowers in axillary umbels; pistillate flowers solitary, axillary; rhizomatous shrub to 1 m tall; [tribe Santaleae]...
Nestronia

\section*{Buckleya Torrey (Piratebush)}

A genus of 4 species, shrubs, of temperate e. North America and e. Asia -- the 3 other species are B. lanceolata (Siebold \&

Zuccarini) Miquel of Japan, and B. henryi Diels and B. graebneriana Diels of China. References: Carvell \& Eshbaugh 1982=Z; Massey et al. (1983).

Buckleya distichophylla (Nuttall) Torrey, Piratebush. Mt (NC, VA): dry or rocky bluffs and slopes; rare (US Species of Concern, NC Endangered, VA Endangered). April-May; June-October. A Southern Appalachian endemic: sw. VA south through ne. TN to sw. NC, in the western edge of the Blue Ridge and to the west in the Ridge and Valley. It is apparently parasitic on a variety of hosts -- not limited to Tsuga, as has sometimes been reported. The branches are often mistaken for a compound leaf. [= RAB, C, F, G, K, S, W, Z]

Comandra Nuttall (Bastard-toadflax)
A genus of 2 species (the only other species European).
Comandra umbellata (Linnaeus) Nuttall var. umbellata, Eastern Bastard-toadflax. Pd, Mt (GA, NC, SC, VA), Cp (NC, SC, VA): dry forests and woodlands, woodland borders; common. April-early June; July. Ssp. umbellata ranges from ME to MI, south to n . GA and AL; other subspecies are western. [ \(=\mathrm{C} ;<\mathrm{C}\). umbellata -- RAB, W, infraspecific taxa not distinguished; = \(C\). umbellata ssp. umbellata -- K; C. umbellata -- F, G, S; C. richardsiana -- F, G]

Nestronia Rafinesque (Nestronia)
A monotypic genus, a shrub, endemic to se. United States. References: Libby \& Bloom (1998).
Nestronia umbellula Rafinesque, Nestronia, Conjurer's-nut, Leechbrush. Pd (GA, NC, SC, VA), Cp (GA, NC, SC): relatively mesic sites in sandhills in the upper Coastal Plain, mesic to dry Piedmont oak forests; rare (GA Threatened, NC Watch List, SC Rare, VA Endangered). April-May; July. Sc. VA south and west to sc. GA, se. AL, nc. AL, and sc. TN; disjunct in sc. KY. See Libby \& Bloom (1998) for an interesting discussion and county distribution map. In its clonal, usually knee-high growth, Nestronia has something of the aspect of an opposite-leaved lowbush blueberry. It sometimes forms colonies (presumably clones) several hectares in size. [= RAB, C, F, G, K, S, W]

\section*{Pyrularia Michaux (Buffalo-nut)}

A genus of 4 species, shrubs, of e. North America and e. Asia (the other 3 species are of e. Asia).
Pyrularia pubera Michaux, Buffalo-nut, Oil-nut. Mt, Pd (GA, NC, SC, VA): moist forests; common. April-May; July-October. A Southern and Central Appalachian endemic, Pyrularia ranges from sw. PA (Rhoads \& Klein 1993), e. WV, and w. VA south and west to e. KY, w. NC, e. TN, and \(n\). and wc. GA. The oil in the fruits is very poisonous. [= RAB, C, F, G, K, S, W]

\section*{SAPINDACEAE (Soapberry Family)}

A family of about 133 genera and 1465 species, trees, shrubs, vines, and herbs, primarily of tropical (rarely temperate) regions of the Old World and New World. Evidence increasingly suggests that the inclusion of the Hippocastanaceae and Aceraceae in the Sapindaceae is warranted.

\(\qquad\)

1 Leaves simple, generally shallowly to deeply 3-5 (-7) lobed.
3 Leaves finely to coarsely toothed, the toothing often regular, the teeth \(8-50\) per principal lobe; sinuses between the principal leaf lobes generally sharp, forming a definite angle (or if rounded, then the sinus much deeper than broad). 4 Leaves deeply lobed, the two sinuses on either side of the central lobe deep and narrow, approaching the midrib, the terminal lobe thus narrower at its base than at its middle; leaves silvery white beneath; flowers without petals; [subgenus Eriocarpa, section Eriocarpa] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. saccharinum 4 Leaves shallowly lobed, the two sinuses on either side of the central lobe broadly wedge-shaped, not approaching the midrib, the terminal lobe thus broadest at its base and progressively (though often irregularly) narrowing towards the tip; leaves green, pale-green, greenish-white, or strongly glaucous-whitened beneath; flowers with petals; [subgenus Acer].
5 Winter buds stalked, with 2-4 valvate scales; inflorescence an elongate raceme or panicle; petals green to bright yellow, 2-10 mm long; fruits maturing in midsummer to autumn; leaves green beneath; shrub, small tree, or medium tree (to 35 cm DBH).
6 Bark with narrow white stripes on a green background (best seen on stems 3-10 cm in diameter); leaf blades 12-20 ( -30 ) cm long and wide, finely serrate ( \(5-10\) teeth per cm ), pubescent beneath with yellow to orange hairs \(0.1-0.3 \mathrm{~mm}\) long (as seen at \(10 \times\) ); inflorescence a drooping raceme; [subgenus Acer, section Macrantha]
A. pensylvanicum

6 Bark brownish, never conspicuously striped; leaf blades \(8-12(-14) \mathrm{cm}\) long and wide, coarsely serrate (2-3 teeth per cm ), pubescent beneath with whitish hairs \(0.3-1.0 \mathrm{~mm}\) long (as seen at \(10 \times\) ); inflorescence an erect panicle; [subgenus Acer, section Spicata] A. spicatum

5 Winter buds sessile, with 6-10 imbricate scales; inflorescence a sessile or subsessile cluster or fascicle; petals red (rarely yellowish), \(1-3 \mathrm{~mm}\) long; fruits maturing in spring; leaves slightly to strongly glaucous-whitened beneath; medium to large tree (to 100 cm DBH); [subgenus Eriocarpa, section Rubra].
\(7 \quad\) Mature leaves densely felty-pubescent beneath; mature samaras \(2.7-5 \mathrm{~cm}\) long .
A. drummondii

7 Mature leaves glabrous (or nearly so) beneath; mature samaras \(1.5-3 \mathrm{~cm}\) long.
8 Leaves (3-) \(5(-9)\)-lobed, the central lobe \(4-8 \mathrm{~cm}\) long, the 2 upper lateral lobes 2-5 cm long; leaf base generally cordate (rarely rounded); leaves \(7-18 \mathrm{~cm}\) wide; [widespread, in nearly all habitats, except peaty wetlands of the Coastal Plain]
A. rubrum var. rubrum

8 Leaves (1-) \(3(-5)\)-lobed (sometimes unlobed or 5-lobed), the central lobe 1-5 cm long, the lateral lobes 0.5-2 (-3) cm long; leaf base broadly cuneate to rounded or subcordate; leaves 3-10 cm wide; [primarily of wetlands, especially in the Coastal Plain]
A. rubrum var. trilobum

3 Leaves not toothed, or often with a few rounded, coarse, and irregular teeth on the principal lobes, these teeth 0-5 per principal lobe; sinuses between the principal leaf lobes generally broadly rounded, the sinus broader than deep.
9 Petioles and young twigs exuding milky sap when broken; inflorescence peduncled, the flowers on ascending, moderately stout pedicels; [subgenus Acer, section Platanoidea] . . . . . . . . . . . . . . . . . . . . . . . . . A. platanoides 9 Petioles and young twigs exuding clear sap when broken; inflorescence sessile, the flowers on drooping, filiform pedicels; [subgenus Saccharodendron].
10 Leaves pale, grayish, silvery-gray, or strongly heavily glaucous beneath, glabrous, pubescent on the veins, or pubescent across the surface; leaf sinuses on either side of the terminal lobe deep, the two sides of each sinus forming an angle of less than 70 degrees (the terminal lobe typically with parallel margins, or even narrower towards the base than towards the tip); leaves usually planar, but sometimes with drooping lobe tips, especially in A. barbatum, and especially in sun-exposed individuals.
11 Leaves small, (3.5-) avg. \(8(-11) \mathrm{cm}\) broad; leaf undersurface usually pubescent; fruits \(20-25 \mathrm{~mm}\) long; medium to large trees; bark gray, smooth and beech-like, becoming irregularly furrowed or plated in large individuals; [primarily of the Coastal Plain and Piedmont, extending into the Mountains in GA].
A. floridanum

11 Leaves large, (8-) avg. 15 (-20) cm broad; leaf undersurface glabrous or pubescent only on the veins; fruits 25-30 mm long; large trees; bark grayish-brown, with loose-edged plates; [primarily of the Mountains and upper Piedmont]
A. saccharum

10 Leaves green beneath, moderately to densely pubescent across the surface; leaf sinuses on either side of the terminal lobe shallow, the two sides of each sinus forming an angle of more than 90 degrees (the terminal lobe typically broadly triangular); leaves sometimes planar, more usually with drooping lobe tips.
12 Leaves small, (3-) avg. 6 (-11) cm broad; small trees, often multi-trunked and crooked; bark whitish (in part because of dense growth of crustose lichens), becoming cracked and blackened on larger stems; [primarily of the Piedmont, extending into the lower Mountains in w. SC and n. GA] . . . . . A. leucoderme
12 Leaves large, (8-) avg. \(15(-20) \mathrm{cm}\) broad; large trees, single-trunked; bark dark brown or blackish, becoming furrowed in large individuals; [primarily of the Mountains and westwards] . . . . . . . . A. nigrum

Acer drummondii Hooker \& Arnott ex Nuttall, Swamp Red Maple, Drummond Red Maple. Cp (GA, NC, SC, VA): swamps and floodplains; uncommon. January-March; April-June. A. drummondii is mostly southern, ranging north to NJ (?), IN, and MO. It reaches its greatest abundance in the basin of the Mississippi River. Because this taxon is more distinctive than the other taxa in the \(A\). rubrum complex, it is often (as here) given specific status. [<A. rubrum -- RAB, C, GW; = A. rubrum Linnaeus var. drummondii (Hooker \& Arnott ex Nuttall) Sargent -- F, G, K; = Rufacer drummondii (Hooker \& Arnott ex Nuttall) Small -- S; = A. rubrum ssp. drummondii (Nuttall) Murray -- Z]

Acer floridanum (Chapman) Pax, Southern Sugar Maple, Florida Maple. Pd, Cp (GA, NC, SC, VA), Mt (GA): bottomland forests, mesic slopes, especially common over mafic or calcareous rocks, but not at all limited to such situations; common, rare in

Mountains. April-May; June-October. S. VA, w. TN, se. MO, and e. OK south to FL and TX. It is widely planted in southern cities and towns as a street tree. Ward (2004b) discusses the reasons for accepting A. floridanum as the correct name for this species. [= A. saccharum ssp. floridanum (Chapman) Desmarais -- RAB, Z; = Acer barbatum Michaux -- \(\mathrm{C}, \mathrm{K}\); > A. barbatum var. barbatum -F , G; > A. barbatum var. longii (Fernald) Fernald -- F, G; = Saccharodendron floridanum (Chapman) Nieuwland -- S]

Acer leucoderme Small, Chalk Maple. Pd, Mt (GA, NC, SC), Cp (GA): rocky slopes and bluffs, particularly over mafic or calcareous rock; uncommon (rare in Mountains and Coastal Plain). March-April; May-September. A species of se. North America, primarily of the Piedmont from NC to AL, less commonly in the Ridge and Valley of se. TN (Chester, Wofford, \& Kral 1997), low Blue Ridge of w. NC and adjacent TN and GA, Coastal Plain of GA, AL, MS, LA, and se. TX, and in sw. AR and se. OK. The leaves, at least those on lower and inner branches, tend to dry a tawny color and remain on the tree until spring, reminiscent of beech. [= K, W; = A. saccharum ssp.leucoderme (Small) Desmarais -- RAB, Z; = Saccharodendron leucoderme (Small) Nieuwland -- S]

Acer negundo Linnaeus var. negundo, Eastern Box Elder, Ash-leaved Maple. Pd, Cp, Mt (GA, NC, SC, VA): riverbanks, swamps, bottomlands; common (uncommon in Coastal Plain and Mountains). March-April; May-October. The species, broadly treated, ranges nearly across North America, including well into the arid west along rivers. Var. negundo is the typical eastern variety, occurring throughout e. North America. A. negundo often grows on the banks of rivers, leaning out over the water at a 45 degree angle. The leaves can resemble poison ivy (Toxicodendron radicans), which has alternate leaves. The coarse toothing (approaching lobing) distinguishes it from any of our ashes (Fraxinus). [= F, G, K, Z; < A. negundo -- RAB, GW, W; < A. negundo var. negundo - C (also see var. violaceum); < Negundo negundo (Linnaeus) Karsten -- S; < Negundo aceroides (Linnaeus) Moench]

Acer negundo Linnaeus var. texanum Pax, Texas Box Elder. Mt (NC): riverbanks and bottomlands: rare. April; JuneOctober. The status of this variety in our area is poorly known at present. Var. texanum is primarily southcentral in distribution (Texan and Ozarkian), but apparently scattered as far east as w. NC and s. OH. [= C, F, G, K, Z; < A. negundo -- RAB, GW, W; < Negundo negundo (Linnaeus) Karsten -- S; < Negundo aceroides (Linnaeus) Moench]

Acer nigrum Michaux f., Black Maple. Mt (GA, NC, VA): riverbanks, streambanks, cove forests, river slope forests; uncommon in VA, rare in GA and NC (NC Watch List). May-June; June-September. Fairly widespread in nc. North America, A. nigrum ranges primarily west of the Appalachians. [=C, F, G, K, W; = A. saccharum Marshall ssp. nigrum (Michaux f.) Desmarais -RAB, Z; = Saccharodendron nigrum (Michaux f.) Small -- S; A. saccharum Marshall var. viride (Scmidt) E. Murray]

Acer pensylvanicum Linnaeus, Striped Maple. Mt (GA, NC, SC, VA), Pd (VA): dry to mesic forests; common, rare in Piedmont (SC Rare). May; June-September. Primarily a broad Appalachian species, but extending into the Great Lakes region, south to PA and OH, and, in the mountains, to w. NC, e. TN, ne. GA, and nw. SC. The prominently striped bark of this common, mid-elevation understory tree is unmistakable. [= RAB, C, F, G, K, S, W, Z]
* Acer platanoides Linnaeus, Norway Maple. Mt, Pd, Cp (VA): escaped from horticultural cultivation to hedgerows, suburban areas, disturbed forests; uncommon, introduced from Europe. March-April. In much of the ne. United States, A. platanoides has become a noxious weed tree. A commonly planted cultivar has purple foliage. [= C, F, G, K, W, Z]

Acer rubrum Linnaeus var. rubrum, Eastern Red Maple. Mt, Pd, Cp (GA, NC, SC, VA): upland deciduous forests, up to at least 1500 m elevation, moist bottomlands and slopes; common. January-March; April-July. This variety is the most widespread and common in NC; indeed it is one of the most ubiquitous and common trees in the state. It is probably more abundant than formerly, because of its weedy abilities. Overall, it ranges throughout e. North America. Whether the varieties of \(A\). rubrum are worthy of recognition is a matter of disagreement; I choose here to try to distinguish them. [=F,K, Z; < A. rubrum -- RAB, C, GW, W; < A. rubrum var. rubrum -- G (also see var. trilobum); = Rufacer rubrum (Linnaeus) Small -- S]

Acer rubrum Linnaeus var. trilobum Torrey \& A. Gray ex K. Koch, Carolina Red Maple. Cp (GA, NC, SC, VA): wetlands, especially peaty, acid sites; common. January-March; April-June. Primarily a Southeastern Coastal Plain variety, the range of var. trilobum is unclear, possibly extending well inland and northward (see F). This variety has greatly increased in abundance in the Coastal Plain of our area because of fire suppression and mechanical disturbance of peaty wetlands. Former large pocosin tracts, such as the Dismal Swamp, are now largely dominated by this tree. [=F, K, Z; < A. rubrum -- RAB, C, GW; < A. rubrum var. rubrum -- G; = Rufacer carolinianum (Walter) Small -- S]

Acer saccharinum Linnaeus, Silver Maple, Soft Maple. Mt, Pd, Cp (GA, NC, SC, VA): bottomlands, riverbanks, and disturbed areas; uncommon (locally common). February-April; April-July. Widespread in ne. North America, south to AL and MS west of the Appalachians, east of the Appalachians and south of VA, rare and mostly introduced. This is an abundant tree along major rivers in the Piedmont of VA. In our area (particularly from c. NC south), the species is more common as a street tree or an escape from cultivation than as a native tree. On the Coastal Plain of NC and SC, A. saccharinum is largely confined to the banks and levees of large brownwater rivers, such as the Roanoke and Congaree. The silvery undersides of the leaves are obvious in windy conditions. [= RAB , C, F, G, GW, K, W, Z; = Argentacer saccharinum (Linnaeus) Small -- S]

Acer saccharum Marshall, Sugar Maple, Hard Maple, Sugar Tree. Mt (GA, NC, VA), Pd (*GA, *NC, *SC, VA): cove forests, rich forests, especially over mafic rocks; common (rare in Piedmont, where perhaps only introduced south of VA). April-June; June-September. Two varieties are sometimes recognized. Var. saccharum is widespread in ne. and nc. North America. Var. schneckii Rehder, with petioles and lower leaf surfaces densely pubescent, is alleged to occur in s. PA (Rhoads \& Klein 1993), IN, IL, and MO; it is probably only a form. A. saccharum is the primary source of maple sugar and maple syrup; formerly, commercial sugaring was done in w. NC and w. VA. Large individuals of this species are the favorite substrate of a number of lichens, including Lobaria pulmonaria. The brown, platy bark is often similar to that of Aesculus flava. For its bright orange fall color, A. saccharum is one of our most prized ornamental trees. In NC, it is most common northwards and on mafic rocks, thus reaching perhaps its best development in the amphibolite peaks of Ashe, Watauga, Avery, and Mitchell counties; it is more general in VA. [= C; > A. saccharum var. saccharum -- F, G, K, Z; = A. saccharum ssp. saccharum -- RAB, W; = Saccharodendron barbatum (Michaux) Nieuwland -- S]

Acer spicatum Lamarck, Mountain Maple. Mt (GA, NC, VA): high elevation forests (northern hardwoods or spruce-fir), generally above 1500 m in NC, above 1000 m in VA, especially common in periglacial boulderfields; uncommon (GA Special Concern). May-July; August-October. Widespread in ne. North America, south to PA and OH, and in the mountains to w. NC, e. TN, ne. GA, and ne. AL. The foliage is quite similar to that of \(A\). rubrum var. rubrum, with which it can occur; in addition to the key
characters, A spicatum can be distinguished from A. rubrum by its leaves which have a strongly rugose texture, the secondary and tertiary veins impressed on the upper surface, distinctly raised on the lower (vs. not rugose, the secondary and tertiary veins only slightly impressed on the upper surface, and slightly raised on the lower). A. spicatum is also sometimes confused with \(A\). pensylvanicum, but these two species are readily distinguished by their leaves (see key). [= RAB, C, F, G, K, S, W, Z]
* Acer campestre Linnaeus, Hedge Maple, introduced from a native range in Europe and w. Asia, is reported to be "occasionally spreading from cultivation to moist, rocky, disturbed woods" in sc. and se. PA (Rhoads \& Klein 1993). Infraspecific taxa are recognized in its native area. [subgenus Acer, section Platanoidea] [= C, F, G, K, Z] \{not yet keyed\}
* Acer ginnala Maximowicz, Amur Maple, introduced from a native range in e. Asia, is reported as "cultivated and escaped" in s. PA (Rhoads \& Klein 1993). Infraspecific taxa are recognized in its native area. [subgenus Acer, section Ginnala] [= F, K, Z] \{not yet keyed\}

Acer negundo Linnaeus var. violaceum (Kirchner) Jaeger. East to KY and OH. [= F, G; < A. negundo var. negundo-C] \{not keyed; investigate Medley\}
* Acer palmatum Thunberg, Japanese Maple, introduced from a native range in e. Asia, is frequently planted in its numerous cultivars. Infraspecific taxa are recognized in its native area. It is reported as escaped in the DC area (Shetler \& Orli 2000). [subgenus Acer, section Palmata] [= K, Z] \{not yet keyed\}
* Acer pseudoplatanus Linnaeus, Sycamore Maple, introduced from a native range in Europe, is planted in our area as a street and yard tree, especially in the mountains. It may be naturalized in our area; northwards it is a noxious weed tree. \(A\).
pseudoplatanus has large, serrate, 5-lobed leaves, the inflorescence a pendulous panicle. [subgenus Acer, section Acer] [= C, G, \(\mathrm{K}, \mathrm{Z}\); = Acer pseudo-platanus - F, orthographic variant] \{not yet keyed\}

The hybrid Acer \(\times\) freemanii E . Murray [A. rubrum \(\times\) saccharinum] has been collected at scattered locations in our area.

\section*{Aesculus Linnaeus (Buckeye)}

A genus of about 13 species, trees and shrubs, of temperate North America, e. Asia, and se. Europe. References: Hardin (1957) \(=Z\).

1 Petals white, unmarked with red; stamens long-exserted; inflorescence 2-5 dm long; [section Macrothyrsus] . . Ae. parviflora
1 Petals yellow, red, or white (then marked with red); stamens not long-exserted; inflorescence 1-2.5 dm long.
2 Petals usually 5 , white with a reddish mark near the cordate base of the petal-blade; buds glutinous (sticky); fruit spiny; leaflets 7 (-9) per leaf; [alien, uncommonly planted, rarely naturalized]; [section Aesculus] . . . . . . . Ae. hippocastanum
2 Petals 4, yellow or red, none of them with a cordate petal-blade; buds not glutinous; fruit smooth (with prickles in \(A e\). glabra var. glabra); leaflets \(5(-7)\) per leaf; [native]; [section Pavia].
3 Stamens about \(2 \times\) as long as the petals, well-exserted beyond the corolla; petals only slightly unequal in size; fruit spiny with short prickles (rarely essentially smooth) . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Ae. glabra var. glabra 3 Stamens about \(1 \times\) as long as the petals, included or barely exserted beyond the corolla; petals markedly unequal in size; fruit smooth.
4 Petal margins stipitate-glandular; petals scarlet; fruits \(3-6 \mathrm{~cm}\) in diameter . . . . . . . . . . Ae. pavia var. pavia 4 Petal margins villous, not glandular; petals yellow; fruits \(2-8 \mathrm{~cm}\) in diameter.

5 Calyx and pedicels stipitate-glandular; large tree; petiolules 2-3 (-4) mm long; fruits 5-8 cm in diameter ... Ae. flava
5 Calyx and pedicels puberulent; shrub to small tree; petiolules 3-12 mm long; fruits 2-4 cm in diameter ... Ae. sylvatica

Aesculus flava Solander, Yellow Buckeye. Mt, Pd (GA, NC, SC, VA): moist forests, up to nearly 2000m, especially prominent in seepy cove forests, in the Piedmont only in "montane" habitats; common (rare in Piedmont). Late April-mid June; AugustSeptember. A broad Southern Appalachian endemic: sw. PA, s. OH, s. IN, and s. IL south through KY, WV, sw. VA, and TN to n. AL, n. GA, nw. SC, and w. NC. A. flava is one of the largest, most massive, and commonest trees in Southern Appalachian coves, recognizable in winter by the bark of large plate-like slabs, thick twigs, and massive form. Meyer \& Hardin (1987) discuss the nomenclatural issues relating to the names "A. flava" and "A. octandra." \([=C, K, W ;=A\). octandra Marshall -- RAB, F, G, Z; < A. octandra -- S (see also A. sylvatica)]

Aesculus glabra Willdenow var. glabra, Ohio Buckeye. Mt (GA): mesic forests over limestone; rare (GA Special Concern). Largely midwestern, but ranges east to sw. PA, e. TN, and nw. GA (Jones \& Coile 1988); it is also sometimes introduced eastwards of that distribution. It occurs in TN counties adjacent to both VA and NC. [= C, F, G, K, Z; < Ae. glabra -- S]
* Aesculus hippocastanum Linnaeus, Horsechestnut. Mt (NC), Pd (NC, SC): urban and suburban areas, perhaps not definitely naturalized, but fairly often planted as a street tree and escaping as seedlings in the vicinity of plantings; rare, native of se. Europe. [= C, F, G, K, Z]

Aesculus parviflora Walter, Bottlebrush Buckeye. Cp (GA), Pd (SC): mesic forests on bluffs and in ravines (the SC occurrence is on Fall Line river bluffs, with shaley, subcalcareous soils); rare (GA Special Concern, SC Rare). Sc. SC southwest to AL. See Wyatt (1985) for a discussion of this interesting, relictual occurrence. Occasionally planted outside its native range. [=K, S, Z]

Aesculus pavia Linnaeus var. pavia, Red Buckeye. Cp, Pd (GA, NC, SC), Mt (GA): swamp forests, usually stagnant, usually blackwater (not receiving significant alluvium), and especially over marl (coquina limestone); uncommon (rare in Piedmont). Aprilearly May; July-August. Var. pavia ranges from se. NC south to n. FL and west to e. TX, extending north in the Missisippi

Embayment to se. MO and s. IL, and in scattered occurrences off the Coastal Plain, as in sc. TN. Var. flavescens (Sargent) Correll occurs in the Edwards Plateau of c. TX. Fernald reports this species from VA and WV, but there is likely taxonomic or nomenclatural confusion. [=K, Z; <A. pavia -- RAB, C, G, S, W; ><A. pavia - F; ><A. discolor Pursh -- F]

Aesculus sylvatica Bartram, Painted Buckeye. Pd (GA, NC, SC, VA), Cp (GA, NC, VA), Mt (GA, NC, SC): in the Piedmont in mesic, nutrient-rich forests, on bottomlands, lower slopes, and in ravines, in the Coastal Plain primarily on floodplains of brownwater (alluvium-carrying) rivers (most notably the Roanoke River in NC), in the Mountains only at low elevations; common. April-mid May; July-August. Primarily a Southeastern Piedmont endemic, occurring primarily in the Piedmont from sc. VA south through c. NC, c. SC, and nc. GA to nc. AL, with an extension north into e. TN. [= RAB, C, F, K, W, Z; = A. neglecta Lindley -- G, misapplied; < A. octandra -- S (also see A. flava); > Ae. georgiana Sargent]

The following hybrids are known from our area: Aesculus \(\times\) neglecta Lindley [flava \(\times\) sylvatica] and Aesculus \(\times\) mutabilis (Spach) Scheele [pavia \(\times\) sylvatica]. They can be recognized by their intermediate morphology.

\section*{Cardiospermum Linnaeus (Balloon Vine)}

A genus of about 14 species, vines, of tropical regions (especially America).
* Cardiospermum halicacabum Linnaeus, Balloon Vine, Heartseed. Mt (GA), Pd (SC): disturbed areas; rare, introduced from tropical America. August-September. [=RAB, F, G, K, S; = C. halicababum -- C, orthographic error]

\section*{Koelreuteria Laxmann (Golden Rain Tree)}

A genus of 3 species, trees, of temperate China and Taiwan. References: Meyer (1976)=Z. Key based on Meyer (1976).

1 Leaves pinnate (rarely bipinnate in part), the leaflets coarsely crenate to lobulate; capsule valves ovate, ca. \(2 \times\) as long as wide; capsules greenish to tawny when young, aging to dark brown
K. paniculata

1 Leaves bipinnate, the leaflets entire to shallowly serrate; capsule valves orbicular, 0.9-1.4× as long as wide; capsules rosepurple when young, aging to tawny-brown.
2 Leaflets weakly oblique, acute to short-acuminate, entire to uniformly serrate; petals 4 (-5) . . . . . . . . . . . [K. bipinnata]
2 Leaflets strongly oblique, long acuminate to caudate, entire to irregularly crenate-serrate; petals (4-) 5 . . . . . [K. henryi]
* Koelreuteria paniculata Laxmann, Golden Rain Tree. Pd (NC, VA): disturbed areas, roadsides; rare, introduced from \(n\). China (frequently cultivated as an ornamental tree, rarely escaped). June; September. [= RAB, C, F, G, K]
* Koelreuteria bipinnata Franchet, Bougainvillea Golden Rain Tree. Becoming popular horticulturally, and producing abundant seedlings near the planted specimens; potentially invasive. Native of s. China. [= Z]
* Koelreuteria henryi Dümmer, Flamegold. This taxon appears to be distinct morphologically and geographically from \(K\). elegans, and warrants recognition at the species level. Becoming popular horticulturally, and producing abundant seedlings near the planted specimens; potentially invasive. Native of Taiwan. [Koelreuteria elegans (Seem.) A.C. Smith ssp. formosana (Hayata) F.G. Meyer -- K, Z]

\section*{Sapindus Linnaeus (Soapberry)}

A genus of about 13 species, trees, of tropical and warm temperate regions of the Old and New World.
Sapindus marginatus Willdenow, Florida Soapberry. Cp (GA, SC?): coastal marsh hammocks, shell middens; rare (GA Special Concern). May-June. Se. SC (?) and e. GA south to c. peninsular FL. Small (1933) reports this species from SC, but there is doubt whether this species was actually ever documented to occur in SC; there are no recent records. Although sometimes combined (as by K) with the tropical Sapindus saponaria, I follow most recent Florida authors (Wunderlin 1982, Clewell 1985, Tomlinson 1986, Godfrey 1988, Nelson 1994, Nelson 1996) in maintaining it as distinct. [= RAB, S; < S. saponaria Linnaeus var. saponaria -- K; ? Sapindus saponaria var. drummondii (Hooker \& Arnott) L. Benson, misapplied?]

\section*{SAPOTACEAE (Sapodilla Family)}

A family of about 53-54 genera and 1100-1250 species, trees and shrubs, primarily tropical (rarely temperate), of Old World and New World. References: Pennington in Kubitzki (2004); Govaerts, Frodoin, \& Pennington (2001).

Sideroxylon Linnaeus 1754 (Bumelia, Buckthorn, Bully)
As defined broadly by Pennington (1991), Sideroxylon includes about 75 species, widely distributed in the New World and Old World Tropics (our species are the northern tip of a "tropical iceberg"). He found that no consistent set of characters could be used to
separate Bumelia from other New World genera (such as Mastichodendron and Dipholis), and that the New World segregate genera were also not separable from several Old World genera. The Linnaean Sideroxylon has nomenclatural priority. Four of the five taxa in or approaching our area were originally named in Sideroxylon. References: Pennington (1991)=Z; Godfrey (1988)=Y; Govaerts, Frodin \& Pennington (2001)=X. Key adapted from Y.

1 Leaves pubescent beneath with appressed to tomentose hairs, ranging in color (depending partly on age) from silvery through coppery to dark brown; first-year twigs persistently pubescent, the hairs silvery, tan, gray, tan or brown.
2 Mature leaves pubescent beneath, the hairs woolly-tomentose, neither matted nor shiny; leaves 1-10 cm long, 0.8-4 cm wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. lanuginosum ssp. lanuginosum
2 Mature leaves densely pubescent beneath, the hairs sericeous, matted and shiny; leaves 2-5 (-7) cm long, 0.5-2 (-3) cm wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . \(S\). tenax
1 Leaves glabrous, glabrate, or sparsely pubescent beneath with appressed blond hairs or cottony white hairs; first-year twigs pubescent when young, soon becoming glabrous or nearly so, the hairs white to yellow.
3 Upper surfaces of the mature leaf blades faintly and coarsely reticulate-veined (at \(20 \times\) or greater magnification), the veins of the reticulum not at all raised, usually somewhat impressed, and, although pale, not bony-cartilaginous .... S. thornei
3 Upper surfaces of the mature leaf blades notably finely reticulate-veined (at \(20 \times\) or greater magnification), the veins of the reticulum usually raised above the enclosed islets, and bony-cartilaginous in contrast to the green islets.
4 Larger leaf blades 8-12 (-14) cm long; large shrub or small tree, the stem usually solitary; berries 10-15 mm long, 1012 mm in diameter; [of NC, SC, and VA and southwards] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. Iycioides
4 Larger leaf blades 2-5 (-7) cm long; small to large shrub, usually multi-stemmed; berries 5-8 mm long, ca. 5 mm in diameter; [of SC and southwards] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. reclinatum ssp. reclinatum

Sideroxylon lanuginosum Michaux ssp. Ianuginosum, Gum Bumelia, Gum Bully. Cp, Pd (GA): mesic to floodplain forests; common. E. GA south to nc. FL, west to LA. Other subspecies are more western. Reported for SC by Kartesz (1999).
\{investigate\} [= X; > S. lanuginosum ssp. lanuginosum - K, in a narrower sense; > S. lanuginosum ssp. albicans (Sargent) Kartesz \& Gandhi - K; < Bumelia lanuginosa (Michaux) Persoon -- S; = B. lanuginosa ssp. lanuginosa -- Y; < S. lanuginosum -- Z]

Sideroxylon lycioides Linnaeus, Buckthorn Bumelia, Buckthorn Bully. Cp (GA, NC, SC, VA), Pd (GA, NC), Mt (GA): maritime forests, maritime scrub, river bluffs, swamp margins, usually in circumneutral soil (over shell hash, coquina limestone, marl, or limestone), in the Piedmont and Mountains in rich, mesic forests over mafic or calcareous rocks; uncommon (NC Watch List, VA Watch List). June-July; September-October. Se. VA south to panhandle FL, west to se. TX, north in the interior to s. IL and se. MO, mostly on the Coastal Plain, but extending (in our area in NC and SC) to the upper Piedmont and north in the interior (primarily on limestone) to KY and TN. This species is extremely variable in leaf shape; though described in most works as up to 10-12 cm long and up to 4 cm wide, the leaves can be to 15 cm long and 8 cm wide. The leaf apex can be acuminate, acute, rounded, or notched. [= K, X, Z; = Bumelia lycioides (Linnaeus) Persoon -- RAB, C, G, GW, S, Y; > B. lycioides var. lycioides - F; > B. lycioides var. virginiana Fernald -- F; > B. smallii R.B. Clark - F]

Sideroxylon reclinatum Michaux ssp. reclinatum, Smooth Bumelia, Florida Bully. Cp (GA, SC): floodplain forests and river margins; rare. Ssp. reclinatum ranges from s. SC and se. GA south to c. peninsular FL. Ssp. austrofloridense (Whetstone) Kartesz \& Gandhi [= K; Bumelia reclinata (Michaux) Ventenat var. austrofloridensis Whetstone] occurs in peninsular FL. [=K, X; > Bumelia reclinata -- \(\mathrm{S} ;>B\). microcarpa Small - \(\mathrm{S} ;=\) B. reclinata (Michaux) Ventenat var. reclinata -- Y ; < S. reclinatum -- Z]

Sideroxylon tenax Linnaeus, Tough Buckthorn, Tough Bumelia, Tough Bully. Cp (GA, NC, SC): maritime scrub, maritime forests, also inland; rare (NC Rare). May-June; September-October. Se. NC south to c. peninsular FL. [=K, X, Z; = Bumelia tenax (Linnaeus) Willdenow -- RAB, Y; > B. tenax - S; > B. lacuum Small - S]

Sideroxylon thornei (Cronquist) Pennington, Thorne's Bumelia, Swamp Bumelia. Cp (GA): bottomlands and limesink depressions, particularly over calcareous substrates; rare (GA Endangered). May-June; August-early October. Ne. GA south to FL and west to AL . The validity of this species has been supported by Anderson (1996). [ \(\mathrm{K}, \mathrm{K}, \mathrm{X}, \mathrm{Z}\); = Bumelia thornei Cronquist -Y\(]\)

Sideroxylon alachuense L.C. Anderson, Alachua Bully, Silver Buckthorn. Cp (GA): sandy hammocks, shell middens; rare (GA Special Concern). [= K; = Bumelia anomala (Sargent) R.B. Clark - Y; = S. alachense - X, misspelled; = B. lanuginosa (Michaux) Persoon var. anomala Sargent] \{not yet keyed\}

Sideroxylon lanuginosum Michaux ssp. oblongifolium (Nuttall) T.D. Pennington. AL and KY west to KS, OK, and TX. [= K, X; = Bumelia lanuginosa (Michaux) Persoon var. oblongifolia (Nuttall) R.B. Clark - C, F, G; < S. lanuginosum -- Z] \{not yet keyed\}

Sideroxylon rufohirtum Herring \& Judd. Hammocks. N. FL. [= S. reclinatum ssp. rufotomentosum (Small) Kartesz \& Gandhi -\(\mathrm{K}, \mathrm{X}\); = Bumelia rufotomentosa Small -- S, Y; = B. reclinata (Michaux) Ventenat var. rufotomentosa (Small) Cronquist] \{not keyed\}

Sideroxylon sp. 1, Ohoopee Bumelia. Cp (GA): longleaf pine sandhills; rare (GA Special Concern). \{not yet keyed\}

\section*{SARRACENIACEAE (Pitcherplant Family)}

A family of 3 genera and about 17 species, perennial insectivorous herbs, of e. North America (Sarracenia), w. North America (Darlingtonia), and ne. South America (Heliamphora). References: Kubitzki in Kubitzki (2004).

\section*{Sarracenia Linnaeus (Pitcherplant)}

A genus of about 11 species, perennial insectivorous herbs, of e. North America. References: McDaniel (1971); Wood (1960)=Z; Schnell \& Determann (1997)=Y; GW; Schnell (2002b)=X; Bell (1949)=Q; Schnell (1979, 1981, 1993, 1998, 2002); Bell (1952); Bell \&

1 Leaves (pitchers) mostly decumbent; lateral wing of the pitcher very prominent; [section Sarracenia].
2 Leaves (pitchers) prominently marked with white on the hood; hood of the pitcher globose; orifice formed by the fusion of the hood margins S. psittacina

2 Leaves (pitchers) not marked with white on the hood; hood of the pitcher expanded and erect; orifice not involving the hood margins.
3 Petals pale pink; lip of pitcher 2.6-7.5 mm thick at thickest point; scape 16.3-35.1 cm high; style arm 2.6-4.1 cm long; [of the Gulf Coastal Plain, from sw. GA westwards]
S. rosea

3 Petals red to deep maroon; lip of pitcher 0.7-3.1 mm thick at thickest point; scape 22-79 cm high; style arm 1.7-2.9 (3.8 ) cm long; [of e. GA northwards]

4 Leaves (pitchers) more than \(3 \times\) as long as broad; pitchers glabrous on the outer surface; petals dark maroon (occasionally red); rhizomes generally vertical, and with relatively many pitchers per crown (often 6-10); [of e. VA northwards]
S. purpurea var. purpurea

4 Leaves (pitchers) less than \(3 \times\) as long as broad; pitchers bristly-pubescent on the outer surface; petals bright red; rhizomes generally horizontal, and with relatively few pitchers per crown (often 4-5); [of the Coastal Plain of se. VA southwards, and in the Mountains and Piedmont of NC and SC].
5 Hood lobes closely incurved, touching each other or nearly so, obscuring the hood opening; hairs lining the hood averaging 0.8-1.0 mm long; [of the Mountains of sw. NC, nw. SC, and ne. GA]
S. purpurea var. montana

5 Hood lobes not closely incurved and touching; hairs lining the inner surface of the hood (1.0-) 1.5-3.0 mm long; [of the Atlantic Coastal Plain of VA, NC, and SC south to e. GA]
S. purpurea var. venosa

1 Leaves (pitchers) erect; lateral wing of the pitcher generally not prominent; [section Erectae].
6 Leaves (pitchers) with white (or whitish and translucent) patches toward the summit of the pitcher and behind the orifice and/or on the hood.
7 Areas of whitish, translucent tissue toward the summit of the pitcher and on the lower portion of the hood, behind the orifice, the areas of translucent white tissue not enclosed within a conspicuous network of reddish venation; hood arching horizontally over the orifice; petals pale lemon yellow . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. minor
7 Areas of white tissue all around the summit of the pitcher and throughout the hood, the areas of bright white tissue surrounded by a conspicuous network of reddish venation; hood erect or ascending; petals maroon. S. leucophylla
6 Leaves (pitchers) without white or translucent patches toward the summit of the pitcher.
8 Hood typically \(4-10 \mathrm{~cm}\) wide, the margins conspicuously reflexed (outrolled); petals yellow.
\(9 \quad\) Phyllodia (nonpitcher leaves) rare, only a few per plant (if present at all), 12-30 cm long, straight to slightly curved; scapes shorter than the pitchers; narrowed base of the hood very strongly and loosely rolled back, the edges often nearly touching in the back; blade of the hood broadly reniform to orbicular-reniform, broadly cordate basally; [of the Coastal Plain and rarely Piedmont, from se. VA southwards to \(n\). FL and west to se. MS]
................................................................................................ S. flava
\(9 \quad\) Phyllodia (nonpitcher leaves) many per plant and forming a rosette, \(5-18 \mathrm{~cm}\) long, strongly curved, usually 45-90 degrees; scapes taller than the pitchers; narrowed base of the hood with revolute margins, but not conspicuously rolled back, the edges never close to touching in the back; blade of hood ovate, not at all or just barely cordate basally; [of the Mountains (in our area) from sw. NC and e. TN south and west to n. GA and c. AL]
8 Hood typically 1-3 cm wide, the margins not conspicuously reflexed (outrolled); petals maroon.
10 Leaves (pitchers) averaging (25-) avg. 40-50 (-75) cm tall; scapes about the same height as the leaves (pitchers); hood ascending, leaving the orifice exposed, 1.5-6.5 cm long, 2.0-5.4 cm wide; [of the Mountains of NC and SC]
S. jonesii

10 Leaves (pitchers) (7-) avg. 15-30 cm tall (-55) cm tall; scapes 1.5-2× the height of the leaves (pitchers); hood horizontal, held closely over the orifice, 0.7-4.5 cm long, 0.7-3.9 cm wide; [of the Coastal Plain of NC, SC, and GA] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. rubra

Sarracenia flava Linnaeus, Yellow Pitcherplant, Trumpets. Cp, Pd (GA, NC, SC, VA): savannas, seepage bogs, pocosins; common, rare in Piedmont and rare in VA (VA Rare). March-April; May-June. Se. VA south to n. FL and west to s. AL and se. MS. In the centers of peat domes and large peat-filled Carolina bays, S. flava is sometimes very abundant, occasionally the dominant plant over areas exceeding several square kilometers. [=RAB, C, F, G, GW, K, Q, W, Z; < S. flava -- S (see also S. oreophila); > S. flava var. flava \(-X ;>S\). flava var. atropurpurea (Bull) Bell - X; > S. flava var. maxima Bull ex Masters - X; > S. flava var. ornata Bull ex Masters - X; > S. flava var. cuprea Schnell - X; > S. flava var. rugelii (Shuttleworth ex de Candolle) Masters - X; >S. flava var. rubricorpora Schnell - X]

Sarracenia jonesii Wherry, Mountain Sweet Pitcherplant. Mt (NC, SC): bogs; rare (US Endangered, NC Endangered, SC Rare). May; July. Endemic to a small area in sw. NC and nw. SC. There has been a great deal of disagreement over the taxonomic treatment of this taxon, a montane sibling of S. rubra. See Wherry (1929), Bell (1949), McDaniel (1971), Wherry (1972), Case and Case (1976), Schnell (1977), Massey et al. (1983), and McDaniel (1986) for further discussion. [= W; < S. rubra -- RAB, GW, Q, Z; = S. rubra ssp. jonesii (Wherry) Wherry -- K, X]

Sarracenia leucophylla Rafinesque, Whitetop Pitcherplant, Crimson Pitcherplant. Cp (GA, *NC): wet pine savannas; rare (GA Endangered). Sw. GA, w. FL, s. AL, and se. MS, a Gulf Coastal Plain endemic; introduced in eastern NC. The NC population (on Croatan National Forest, Carteret Co.) was apparently introduced in the 1980s; it is not known whether this species will spread in NC, but it is persisting and has been independently "discovered" several times. [= GW, K, X, Z; = S. drummondii Croom -- Q , S ]

Sarracenia minor Walter, Hooded Pitcherplant. Cp (GA, NC, SC): wet savannas; uncommon, rare in NC (NC Watch List) April-May; June-July. Se. NC south through SC and GA to c. peninsular and e. panhandle FL. Schnell (2002a) recognizes var. okeefenokeensis Schnell as endemic to the Okeefenokee Swamp area of GA. [= RAB, GW, K, Q, S, X, Z]

Sarracenia oreophila (Kearney) Wherry, Green Pitcherplant. Mt (GA, NC): seepage bogs; rare (US Endangered, GA Endangered, NC Endangered). April-May; June-July. A montane-piedmontane sibling of S. flava, known from sw. NC, se. TN (where presumed extirpated from the state), n. GA, and c. and ne. AL (Govus 1987, Wherry 1933, Schnell 1980b, Dennis 1980, Catalani 2004). [= GW, K, Q, W, X, Z; < S. flava -- S]

Sarracenia psittacina Michaux, Parrot Pitcherplant. Cp (GA): savannas; uncommon (GA Threatened). This distinctive species is distributed primarily in the East Gulf Coastal Plain, but ranges east to the Atlantic Coastal Plain of e. GA (Bullock County), in close proximity to the SC border. [= GW, K, Q, S, X]

Sarracenia purpurea Linnaeus var. montana Schnell \& Determann, Southern Appalachian Purple Pitcherplant. Mt (GA, NC, SC), Pd (NC, SC): mountain bogs, seepage bogs; rare (GA Endangered). May; July. Var. montana is restricted to a few dozen populations in sw. NC (south of Asheville), nw. SC, and ne. GA (Rabun County). These montane populations (in sw. NC, nw. SC, and ne. GA) show some consistent differences and appear to warrant taxonomic distinction (Schnell \& Determann 1997); further study is warranted. For those tolerant of quadrinomial taxonomy, plants in our area can be called S. purpurea ssp. venosa (Rafinesque) Fernald var. montana Schnell \& Determann. Allozyme studies by Godt and Hamrick (1999) show striking genetic differences between var. montana, var. purpurea, var. venosa and the Gulf Coast var. burkii, supporting their taxonomic recognition. In fact, the genetic differentiation is greater than that between taxa in the S. rubra complex. [<S. purpurea -- RAB, GW, Q, S, W; < S. purpurea var. purpurea -- Reveal (1993); = S. purpurea ssp. venosa (Rafinesque) Fernald var. montana Schnell \& Determann -K, Y; S. venosa Rafinesque]

Sarracenia purpurea Linnaeus var. purpurea, Northern Purple Pitcherplant. Cp (VA): bogs; rare (VA Rare). April-May; JuneJuly. The species as a whole is widespread in e. North America, the only Sarracenia to extend north of se. VA. Var. purpurea is northeastern, extending south to ne. VA, MD, DE, and NJ. A nomenclatural battle about the application of the typic variety has been resolved, with var. purpurea applying to the northern variety (Reveal 1993, Cheek 1994, Kartesz \& Gandhi 1995, Cheek 2001). [= C, F, G, Z; < S. purpurea -- RAB, GW, Q, S, W; = S. purpurea ssp. gibbosa (Rafinesque) Wherry - K; = S. purpurea var. terraenovae de la Pylaie -- Reveal (1993); S. purpurea ssp. purpurea - X]

Sarracenia purpurea Linnaeus var. venosa (Rafinesque) Fernald, Southern Purple Pitcherplant. Cp (NC, SC, VA), Pd? (NC?): wet savannas, sandhill seepage bogs; common (VA Rare). April-May; June-July. Var. venosa is restricted to the Atlantic Coastal Plain of the southeastern United States, ranging from se. VA south to se. SC; perhaps disjunct in e. LA. See MacRoberts \& MacRoberts (2004) for a detailed discussion about old LA collections of S. purpurea or S. rosea. For those tolerant of quadrinomial taxonomy, plants in our area may be considered S. purpurea ssp. venosa (Rafinesque) Fernald var. venosa. It is notable, though, that the findings of Godt and Hamrick (1999) and Ellison et al. (2004) do not support the greater relationship of the southern taxa to one another and their divergence from the northern taxon, and thus do not support the quadrinomial taxonomy. \([=C, F, G, Z ;<S\). purpurea -- RAB, GW, Q, S, W; = S. purpurea Linnaeus ssp. purpurea var. purpurea --K; = S. purpurea var. purpurea -- Reveal (1993); = S. purpurea ssp. venosa (Rafinesque) Fernald var. venosa -- X, Y; = S. venosa Rafinesque]

Sarracenia rosea Naczi, F.W. Case, \& R.B. Case, Rose Pitcherplant. Cp (GA): wet pine savannas and seepage bogs; rare (GA Endangered). Sw. GA west to s. MS and (?) e. LA. Schnell (1993) distinguished the distinctive East Gulf Coastal Plain population (with short peduncles, white stigmas, and pale pink petals) as S. purpurea ssp. venosa var. burkii Schnell; Naczi et al. (1999) elevated this to species rank, as S. rosea. See Naczi et al. (1999) and Schnell (1993) for more detailed information and color photographs. Naczi et al.'s (1999) treatment of this taxon at specific rank is supported by the greater genetic distance found by Godt and Hamrick (1999) and morphologic and genetic analyses (Ellison et al. 2004). See MacRoberts \& MacRoberts (2004) for a detailed discussion about old LA collections of S. purpurea or S. rosea. [< S. purpurea -- GW, Q, S; S. purpurea Linnaeus ssp. purpurea var. burkii Schnell -- K; S. purpurea var. purpurea -- Reveal (1993); S. purpurea ssp. venosa (Rafinesque) Fernald var. burkii Schnell -- X, Y]

Sarracenia rubra Walter, Sweet Pitcherplant, Redflower Pitcherplant. Cp (GA, NC, SC): sandhill seepage bogs, pocosins, wet savannas; uncommon (GA Endangered, SC Rare). April-May; June-July. The S. rubra complex consists of five geographically isolated entities, variously treated as species, subspecies, or geographic races (see S. jonesii for some of the pertinent references). The S. rubra complex is here treated as five separate species, of which S. rubra (sensu stricto) is the northeasternmost element, primarily limited to the Atlantic Coastal Plain, extending from se. and sc. NC south through SC and GA to n. FL. Three of the entities ("alabamensis", "gulfensis", and "wherryi") are limited to the Gulf Coastal Plain. S. jonesii, of montane sw. NC and nw. SC, is the other. [< S. rubra -- RAB, GW, Q, S, Z (also see S. jonesii); S. rubra ssp. rubra -- K, X]

Sarracenia alabamensis F.W. and R.B. Case, Alabama Pitcherplant. Endemic to AL. [= S. rubra Walter ssp. alabamensis (F.W. \& R.B. Case) Schnell - K, X; < S. rubra -- GW, S, Z; = S. alabamensis F.W. \& R.B. Case ssp. alabamensis] \{not yet keyed\}

Sarracenia alata Wood, Pale Pitcherplant. S. AL west to e. TX. [= K, X; = S. sledgei Macfarlane - Q] \{not yet keyed; add synonymy\}

Sarracenia sp. 1, Wherry's Pitcherplant. April-May. AL, MS, FL. [= S. rubra Walter ssp. wherryi (F.W. \& R.B. Case) Schnell K, X; = S. alabamensis F.W. \& R.B. Case ssp. wherryi F.W. \& R.B. Case; < S. rubra -- GW, S, Z] [not yet keyed; add synonymy]

Sarracenia sp. 2, Gulf Pitcherplant. April-May. Schnell (2002b) considers the populations of the "rubra complex" in Taylor County, GA (the western Coastal Plain of GA, near the AL line) to be best assigned to "gulfensis." [= S. rubra Walter ssp. gulfensis Schnell - K, X; < S. rubra -- GW, S, Z]

Hybrids between the various species of pitcher-plants are relatively frequent; see Bell (1952) and Bell \& Case (1956) for further discussion. They are usually rather easy to determine, since they show intermediacy in characters, and usually are found in close proximity to both parents. S. xcatesbaei is by far the most frequent of the hybrids. The following hybrids are known to occur in our area:
```

Sarracenia flava $\times$ leucophylla [S. ×moorei Masters]. Known from GA. [= K, X]
Sarracenia flava $\times$ minor [S. $\times$ harperi Bell]. Known from GA and SC (Charleston and Hampton counties). [= K, X]
Sarracenia flava $\times$ purpurea [S. $\times$ catesbaei Elliott ]. Known from NC (Brunswick, Carteret, Harnett, Iredell, Montgomery, and
Pender counties), SC (Chesterfield County), and VA (Greensville County). [= K, X]
Sarracenia flava x rubra [S. xpopei hort. ex Masters]. Known from NC (Moore County). [= K, X]
Sarracenia minor $\times$ psittacina [S. xformosa Veitch ex Masters]. Known from GA. [= K, X]
Sarracenia minor $\times$ purpurea [S. $\times$ swaniana (W. Robinson) Bell]. Known from NC (Brunswick and Bladen counties). [= K, X]
Sarracenia minor $\times$ rubra [S. $\times$ rehderi Bell]. Known from NC (Brunswick County). [= K, X]
Sarracenia psittacina $\times$ rubra [S. $\times$ gilpinii Bell \& Case]. [= K]
Sarracenia purpurea $\times$ rubra [S. $\times$ chelsonii Veitch ex Masters]. Known from NC (Scotland County). [= K, X]
Sarracenia jonesii $\times$ purpurea. Known from NC (Henderson County).

```

\section*{SAURURACEAE E. Meyer 1827 (Lizard's-tail Family)}

A family of 4 genera and 6 species, perennial herbs, of temperate e. and se. Asia (Saururus, Gymnotheca, Houttuynia), w. North America (Anemopsis), and e. North America (Saururus). One other member of the family occurs in North America: Anemopsis californica Hooker \& Arnott, primarily of the sw. United States. References: Buddell \& Thieret in FNA (1997); Wood (1971); ChengYih \& Kubitzki in Kubitzki, Rohwer, \& Bittrich (1993); Meng et al. (2003)

Saururus Linnaeus 1753 (Lizard's-tail, Water-dragon)

A genus of 2 species, perennial herbs, our species in temperate e. North America, the other in e. Asia. References: Cheng-Yih \& Kubitzki in Kubitzki, Rohwer, \& Bittrich (1993).

Saururus cernuus Linnaeus, Lizard's-tail, Water-dragon. Cp, Pd, Mt (GA, NC, SC, VA): swamps, ditches, overwash pools in stream floodplains, usually where in water seasonally or periodically; common (rare in Mountains). May-July; August-September. CT, s. Québec, s. Ontario, and MI south to s. FL and e. TX. In swamps of the Coastal Plain, Saururus often is dominant in large patches. The elongate inflorescence, drooping at the tip, is distinctive, attractive, and the (rather fanciful) inspiration for the genus name, the specific epithet, and the common names. Thien et al. (1994) studied the reproductive biology of Saururus cernuus, and found that pollination was both by wind and by insects. [= RAB, C, F, FNA, G, GW, K, S, W]

\section*{SAXIFRAGACEAE (Saxifrage Family) \\ (see also GROSSULARIACEAE, HYDRANGEACEAE \\ ITEACEAE, PARNASSIACEAE, and PENTHORACEAE)}

If narrowly circumscribed (as here), a family of about 30 genera and 650 species, herbs, nearly cosmopolitan, but especially diverse in warm temperate and cold temperate regions of North America and Eurasia. The circumscription of a much narrower Saxifragacaeae is clearly warranted, based on a wide variety of data, and recently strongly corroborated by molecular data (Morgan \& Soltis 1993). References: Spongberg (1972); Morgan \& Soltis (1993).

\footnotetext{
1 Leaves compound
Astilbe
1 Leaves simple (sometimes cleft or lobed).
2 Stem creeping, the leaves all cauline, opposite; leaves short-petioled or sessile, less than 2 cm long .. Chrysosplenium
2 Stem erect, the leaves mostly or entirely basal, alternate (stem leaves opposite in Mitella); leaves long-petioled, more than 4 cm long (except short-petioled or sessile and sometimes less than 4 cm long in Saxifraga).
3 Basal leaves short-petioled or sessile, the petioles \(0-1 \times\) as long as the blade; basal leaves cuneate or rounded at the base; leaf venation predominately pinnate Saxifraga
3 Basal leaves long-petioled, the petioles (1-) \(2-5 \times\) as long as the blade; basal leaves cordate at the base; leaf venation predominantly palmate.
4 Stem leaves opposite; petals fimbriate; inflorescence a raceme; flowers on pedicels 1.5-3 mm long ... Mitella
4 Stem leaves absent or alternate; petals not fimbriate; inflorescence a panicle or raceme; flowers mostly on pedicels more than 3 mm long.

6 Seeds papillose, echinate, smooth, or slightly ridged, \(0.4-0.7 \mathrm{~mm}\) long; leaves cleft more than halfway to base (in Boykinia) or less than halfway (in Heuchera); hypanthium fused to the lower half or more of the pistils; stems with (in Boykinia) or without (in Heuchera) several petiolate leaves.
\(7 \quad\) Stems normally with several petiolate leaves much like the basal leaves (though typically somewhat smaller); ovary with 2 locules; leaves cleft more than halfway to base . . . Boykinia
7 Stems with only very reduced sessile bracts unlike the basal leaves; ovary with 1 locule; leaves
}

\section*{Astilbe Buchenau-Hamilton ex D. Don (False Goat's-beard)}

A genus of 14 species, perennial herbs, of e. Asia and e. North America.

Identification notes: Superficially, Astilbe is quite similar to Aruncus (Rosaceae). Astilbe may be distinguished by the following characteristics: pubescence of the stem and lower leaf surface glandular, plants monoecious, carpels 2 per flower, stamens 10 per flower (vs. Aruncus: pubescence nonglandular, plants dioecious, carpels 3-4 per flower, stamens 15-20 per flower).

1 Leaves serrate, the teeth sharp; fruit conic-lanceolate, tapering gradually, 4-5 mm long ..................... A. biternata
1 Leaves crenate, the teeth rounded (but with a prominent mucronate tip); fruit ovoid, abruptly contracted to the tip, 3 mm long

Astilbe biternata (Ventenat) Britton, Appalachian False Goat's-beard. Mt (GA, NC, SC, VA): cove forests, seepage slopes; common. May-June; July-August. VA, sw. WV, and KY south to n. GA. [= C, F, G, K, S, W; < A. biternata -- RAB (see also A. crenatiloba)]

Astilbe crenatiloba (Britton) Small, Roan Mountain False Goat's-beard. Mt (NC): mountain forests; rare (believed extinct) (US Species of Concern, NC Rare). July?; September. This species has apparently not seen since the original collections by N.L Britton on the NC and TN flanks of Roan Mountain; the habitat, flowering and fruiting dates, and other characteristics of this species are therefore poorly known. The morphologic characters are striking. [= K, S, W; < A. biternata -- RAB]

\section*{Boykinia Nuttall (Boykinia)}

A genus of 9-12 species, herbs, of e. Asia, e. North America, and w. North America, a classic relictual distribution. The other species are distributed primarily in the Pacific Northwest or Rocky Mountains, with several endemics in Japan and an endemic in the unglaciated portions of Alaska and e. Siberia.

Identification notes: Sometimes mistaken in vegetative condition for Trautvetteria, which is a coarser plant, often occupying similar habitats.

Boykinia aconitifolia Nuttall, Brook-saxifrage, Aconite-saxifrage, Eastern Boykinia. Mt (GA, NC, SC, VA): streambanks, riverbanks, in crevices in spray cliffs around waterfalls, seepages; uncommon (SC Rare). June-July. A Southern Appalachian endemic: sw. VA and s. WV, south through w. NC, e. TN, and nw. SC, to n. GA and ne. AL. [= RAB, C, F, G, GW, K, W; = Therophon aconitifolium (Nuttall) Millspaugh -- S]

\section*{Chrysosplenium Linnaeus (Golden-saxifrage)}

A genus of about 60 species, herbs, of Europe, ne. Asia, n. North America, n. Africa, and temperate South America.
Chrysosplenium americanum Schweinitz ex Hooker, Golden-saxifrage, Water-mat, Water-carpet. Mt (GA, NC, SC, VA), Pd, Cp (VA): in shallow seepage in shade; uncommon (GA Special Concern). March-June. Québec west to Saskatchewan, south to e VA, w. NC, n. GA, e. TN, and IN. [= RAB, C, F, G, GW, K, S, W]

\section*{Heuchera Linnaeus (Alumroot)}

A genus of about 55 (or fewer) species, perennial herbs, of North America. Soltis (1985) found that speciation in Heuchera "apparently occurs with little divergence at genes coding for isozymes." Vegetatively, Heuchera resembles Tiarella and Mitella. References: Wells (1984)=Z; Rosendahl, Butters, \& Lakela (1936)=Y; Wells (1979). The keys adapted from Wells (1984).

1 Calyx glandular-villous, white or pink, often with green-tipped lobes, 1.3-3.3 mm long, 1.1-2.9 mm in diameter; free hypanthium \(0.1-0.4 \mathrm{~mm}\) long; petals linear or oblanceolate, \(2-3 \times\) as long as the calyx lobes, glabrous; plants flowering (June-) July-October. 2 Leaves with widely to narrowly triangular lobes and triangular teeth; petals linear, often coiled; seeds echinate; internodes of flora branches 0.3-2.9 mm long.
3 Leaves deeply and sharply lobed, the terminal lobe wider than long; bracts of the inflorescence oblong to spatulate, at least the lower ones toothed; [of the Interior Low Plateau] . . . . . . . . . . . . . . . . . . . . [H. villosa var. macrorhiza] 3 Leaves deeply and sharply lobed, the terminal lobe longer than wide; bracts of the inflorescence linear, rarely toothed; [primarily of Ridge and Valley, Blue Ridge, and upper Piedmont] . . . . . . . . . . . . . . H. villosa var. villosa
2 Leaves with rounded lobes and rounded teeth; petals oblanceolate, reflexed; seeds smooth; internodes of floral branches 2.5-11.2 mm long.

4 Petioles and peduncles more-or-less villous, the hairs \(0.7-2.5 \mathrm{~mm}\) long; leaf blades slightly to fairly densely villous above and below, at least on the veins; [of ec. TN, KY, s. WV, sw. VA, w. NC, n. GA, n. AL, s. MO, s. IL, and s. IN] .

4 Petioles and peduncles densely glandular-puberulent, the hairs \(<0.6 \mathrm{~mm}\) long; leaf blades densely puberulent above and below; [of c. KY westwards]
[H. puberula]
1 Calyx glandular-puberulent, greenish, 2.9-13.2 mm long, 2.4-7.5 mm in diameter; free hypanthium 0.6-7.0 mm long; petals rhombic-spatulate, slightly shorter to slightly longer than the calyx lobes, glandular-puberulent on the abaxial (lower) surface; plants flowering April-June.
5 Free hypanthium less than 2 mm long; calyx weakly zygomorphic; calyx urceolate, subglobose, or campanulate.
6 At the onset of anthesis stamens exserted \(0.2-1.5 \mathrm{~mm}\) beyond the calyx and styles included or exserted up to 1.1 mm beyond the calyx; calyx subglobose
H. caroliniana

6 At the onset of anthesis the stamens exserted 3 mm or more beyond the calyx and styles exserted 2.6 mm or more beyond the calyx; calyx urceolate or campanulate.
\(7 \quad\) Free hypanthium less than 1.5 mm long; petals greenish, white, creamy, or pink, the margins entire or bearing short teeth . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . H. americana 7 Free hypanthium 1.5-1.9 mm long; petals purple, the margins fimbriate . . . . . . . . . . . . . . . . . . . . H. hispida
5 Free hypanthium more than 2 mm long; calyx weakly to strongly zygomorphic; calyx subglobose, campanulate, or tubular.
8 Stigmas included within the calyx (the calyx lobes extending 1.3-5.3 mm beyond the stigma tips); calyx tubular; calyx lobes and petals inflexed, closing the mouth of the flower
H. longiflora

8 Stigmas barely included within the calyx (the calyx lobes extending up to 0.6 mm beyond the stigma tips) to moderately exserted beyond it; calyx subglobose or campanulate; calyx lobes and petals erect or spreading, not closing the mouth of the flower.
9 Calyx 2.8-4.5 mm long, subglobose; [of the Piedmont of sc. VA southwards to SC] . . . ......... H. caroliniana
9 Calyx 5.5-13.2 mm long, narrowly campanulate; [primarily of the Mountains and upper Piedmont of VA and nc. NC].
10 Flowers large, with white, exserted petals; [of high elevations (usually over 1000 m ) on strongly acidic substrates, such as quartzitic sandstones, in w. VA and adjacent e. WV]
H. alba

10 Flowers smaller, with greenish or purplish-green petals; [of lower elevations on circumneutral or subacidic substrates]
H. pubescens

Heuchera alba Rydberg. Mt (VA): quartzitic outcrops at high elevations; rare. Further study of \(H\). alba Rydberg is needed; its recognition as distinct from H. pubescens is probably warranted (Bartgis, pers. comm.). It apparently differs from \(H\). pubescens in its large flowers with white, exserted petals (vs. greenish or purplish-green petals), and occurs at higher elevations (usually over 1000 m ) on acidic substrates, such as quartzitic sandstones (vs. at lower elevations on circumneutral or subacidic substrates). [= K; < H. pubescens -- C, F, S, W, Z; < H. pubescens var. brachyandra Rosendahl, Butters, \& Lakela -- F, G, Y]

Heuchera americana Linnaeus, American Alumroot. Mt, Pd (GA, NC, SC, VA), Cp (GA, NC, VA): rocky forests, rock outcrops, particularly where soils are subacidic to circumneutral; common (uncommon in Coastal Plain). April-June. CT and NY west to s. Ontario, n. IN, s. IL, and sc. MO south to c. GA, c. AL, n. MS, and n. LA, and the most widespread in our area, \(H\). americana is the only Heuchera in the Coastal Plain, though \(H\). caroliniana reaches the lower Piedmont. Within the range of \(H\). caroliniana, \(H\). americana is absent. [=C; >H. americana var. americana -- F, G, K, Z; < H. americana -- RAB, W; >H. americana var. heteradenia Fernald -- F; > H. americana var. interior Rosendahl, Butters, \& Lakela - F, Y; >H. americana var. subtruncata Fernald -- F; > H. americana var. brevipetala Rosendahl, Butters, \& Lakela -- G, Y; > H. calycosa Small - S; > H. curtisii -- S; > H. lancipetala Rydberg - S; >H. americana var. typica \(-\mathrm{Y} ;>H\). americana var. calycosa (Small) Rosendahl, Butters, \& Lakela - Y]

Heuchera caroliniana (Rosendahl, Butters, \& Lakela) E. Wells, Carolina Alumroot. Pd (NC, SC, VA): rocky forests, rock outcrops, particularly where soils are subacidic to circumneutral, replacing \(H\). americana in much of the upper Piedmont; uncommon (NC Watch List). April-June. Endemic to the Piedmont of sc. VA, NC, and nc. SC; first found in VA (Henry County) by T.F. Wieboldt in 2002 (Belden et al. 2004). [=K, Z; = H. americana Linnaeus var. caroliniana Rosendahl, Butters, \& Lakela - Y; < H. americana RAB, \(S\), in part]

Heuchera hispida Pursh, Purple Alumroot. Mt (VA), Pd (NC, VA): calcareous rocky forests, rock outcrops, particularly where soils are subacidic to circumneutral; rare (NC Watch List, VA Watch List). April-June. S. PA south through MD, WV, and VA to nw. NC. This species is intermediate between \(H\). americana and \(H\). pubescens; it is almost certainly of hybrid origin. The treatment of this hybrid derivative of \(H\). americana and \(H\). pubescens as \(H\). americana var. hispida (a variety of one parent) seems undesirable. Since it partly replaces its parents within its range, occurs in populations away from one or both parent, and is not strictly intermediate, it seems best to accord it species status. [=F, G, S, Y; < H. americana -- RAB, W; = H. xhispida Pursh -- C; = H. americana var. hispida (Pursh) E. Wells -- K, Z]

Heuchera longiflora Rydberg, Long-flowered Alumroot. Mt (NC, VA): rich shaded forests and woodlands over calcareous rocks such as limestone, dolostone, or calcite-cemented shales, siltstones, or sandstones, in circumneutral soils; rare (NC Watch List). May-June. This species is nearly limited to sedimentary rocks, occurring in e. and c. KY, s. OH, sw. WV, sw. VA, ne. TN, w. NC, and c. AL (?). In NC, it occurs primarily in the sedimentary window around Hot Springs, and is possibly limited to Madison, Buncombe, and Haywood counties. Wells (1984) calls it "most distinctive", "characterized by a unique combination of floral characters: long, tubular calyx, deeply included styles, inflexed calyx lobes and petals that close the mouth of the flower obliquely, and horizontal orientation of the flowers." \([=C, F, G, K, S, W, Z ;>H\). longiflora Rydberg var. aceroides (Rydberg) Rosendahl, Butters, \& Lakela - Y; > H. aceroides Rydberg -- S; > H. scabra Rydberg -- S; > H. longiflora var. typica - Y]

Heuchera parviflora Bartling, Cave Alumroot. Mt (GA, NC, SC, VA), Pd (NC): shaded cliff bases, usually under overhangs, on grotto floors, behind waterfalls where humidity is high but not in the spray zone, nearly always in deeply shaded situations where little or no direct sunlight falls; rare (NC Watch List, SC Rare, VA Watch List). July-September. An uncommon species throughout its range (ec. TN, KY, s. WV, sw. VA, w. NC, n. GA, n. AL, s. MO, s. IL, and s. IN), H. parviflora is probably most common in the gorge and waterfall country of sw. NC and in the Cumberland Plateau of TN and KY. In deeply shaded sites, it is often the only
vascular plant present. The closely related species \(H\). puberula Mackenzie \& Bush [H. parviflora var. puberula (Mackenzie \& Bush) E. Wells] occurs in s. MO and nc. AR, with scattered disjunct sites as far east as c. KY, c. TN, and s. IN. [= RAB, S, W; = H. parviflora var. parviflora -- C, K, Z; > H. parviflora var. parviflora - F, G; >H. parviflora var. rugelii (Shuttleworth) Rosendahl, Butters, \& Lakela -- F, G, Y; > H. parviflora var. typica - Y]

Heuchera pubescens Pursh, Marbled Alumroot. Mt (SC?, VA), Pd (NC, VA): rocky forests, rock outcrops, particularly where soils are subacidic or circumneutral; uncommon (NC Watch List). May-June. Primarily a species of the Ridge and Valley Province of PA, MD, WV, and VA, H. pubescens ranges south to only a few locations in the upper Piedmont of NC. See discussion under \(H\). alba. The report in RAB of the occurrence of \(H\). pubescens in Madison County is apparently erroneous; Wells (1984) shows \(H\). pubescens reaching its southern limit just south of the VA border, and not occurring at all in KY, TN, or the mountains of NC. She found the bract characters used in the key in RAB to be unreliable. Reported by Hill \& Horn (1997) for South Carolina \{report needs verification\}. [=K; < H. pubescens -- C, S, W, Z, in part (also see H. alba); H. pubescens -- RAB, apparently misapplied; >H. pubescens var. brachyandra Rosendahl, Butters, \& Lakela, in part -- F, G, Y; H. pubescens var. pubescens - F; H. pubescens var. typica - Y]

Heuchera villosa Michaux var. villosa, Crag-jangle, Rock Alumroot. Mt, Pd (GA, NC, SC, VA): in crevices of rock outcrops, or in thin soil over boulders, a characteristic component of the flora of high elevation cliffs and summits (to at least 1920 m ), not particular about the rock type, occurring on a wide range of rock types in our area, including felsic gneisses and schists, mafic gneisses, granites, quartzites, and others, probably the most acidophilic of our species of Heuchera; common (rare in upper Piedmont). Late June-October. W. VA and s. WV south through w. NC and e. TN to nw. SC, n. GA, ne. AL (primarily a Southern Blue Ridge endemic). In the Ozarks of AR it is replaced by the related H. arkansana Rydberg [H. villosa var. arkansana (Rydberg) E.B. Smith] with shorter and narrower inflorescence, shorter pedicels, and larger flowers. [= F, G; < H. villosa -- RAB, W; < H. villosa var. villosa - C, K, Z, in a broader sense; = H. villosa-S, in a narrow sense; = H. villosa var. typica - Y; > H. villosa var. intermedia Rosendahl, Butters, \& Lakela -- \(\mathrm{F}, \mathrm{Y}\), in part]

Heuchera puberula Mackenzie \& Bush, east to c. KY (Medley 1993) and c. TN (?). [=F, G, Y; = H. parviflora Bartling var. puberula (Mackenzie \& Bush) E. Wells - K, Z]
* Heuchera sanguinea Engelmann var. sanguinea, Coral Bells. Cultivated as an ornamental "wildflower;" native of w. North America. [= K; < H. sanguinea-G; = H. sanguinea var. typica - Y] \{not keyed\}

Heuchera villosa Michaux var. macrorhiza (Small) Rosendahl, Butters, \& Lakela, Giant Alumroot. S. WV, s. OH, and s. IN south through c. KY and c. TN to \(n\). AL and ne. MS. This taxon has usually been disregarded in recent years, but is recognized by Chester et al. (1997). In its purest form, this plant seems to be very distinct from typical \(H\). villosa, and actually may be more closely related to \(H\). arkansana. The existence of intermediates and intergrades with \(H\). villosa var. villosa muddies the taxonomic waters, however, and the overall best treatment seems to be at the varietal level. Some intermediates occur in the primary area, as in w . VA. [= G; > H. villosa var. macrohriza - F, Y, in a narrower sense; = H. macrorhiza Small - S; < H. villosa var. intermedia Rosendahl, Butters, \& Lakela -- F, Y]

\section*{Mitella Linnaeus (Miterwort)}

A genus of about 20 species, herbs, of cold temperate e. North America, w. North America, and e. Asia.
Mitella diphylla Linnaeus, Two-leaved Miterwort. Mt (GA, NC, SC, VA), Pd, Cp (VA): moist rich forests, especially in the Mountains, and especially rocky; common (uncommon in Piedmont, rare in Coastal Plain) (SC Rare). April-June. Québec west to MN, south to e. VA, w. NC, nw. SC, ne. GA, nw. GA, and MO. The fringed petals will reward a close look. [= RAB, C, F, G, GW, K, S, W]

\section*{Saxifraga Linnaeus (Saxifrage)}

As currently circumscribed, a large and heterogeneous genus of about 440 species, mostly perennial herbs, of north temperate areas. As shown by molecular data, Saxifraga as currently defined is polyphyletic, and all of our species will likely be recognized in the near future as Micranthes (Soltis 1995, Soltis et al. 1996, Mort \& Soltis 1999). Soltis et al. (1996) demonstrate that Micranthes is closely allied with Heuchera, Mitella, and Tiarella, less closely related to Astilbe, Boykinia, Sullivantia, and Chrysosplenium, and least closely related to the bulk of Saxifraga. Four of our six species are Southern or Southern Appalachian/Central Appalachian endemics.

1 Larger leaf blades oblanceolate, 4-10× as long as wide.
2 Leaf margin entire to crenate; petals greenish-white, lacking yellowish spots . . . . . . . . . . . . . . . . . . . S. pensylvanica
2 Leaf margin coarsely serrate; petals white, either 3 or 5 of them with yellowish spots.
3 Leaves mostly with 4-8 teeth per side; pubescence of the leaves and scapes mostly gland-tipped; corolla bilaterally symmetrical, the 3 upper petals distinctly clawed (the petal blade with a cordate or truncate base) and with 2 yellow spots, the 2 lower petals smaller, cuneate, and not spotted; filaments filiform; [mostly of rock outcrops and seepages, often exposed, but sometimes shaded] \(\qquad\) S. michauxii

3 Leaves with mostly 12-40 teeth per side; pubescence of the leaves and scapes mostly nonglandular; corolla radially symmetrical; filaments strongly clavate; [mostly of shaded seepages and brook-banks] . . . . . . S. micranthidifolia
1 Larger leaf blades ovate or obovate, 1-3 (-4)× as long as wide.
4 Leaf margins entire or with obscure teeth mostly less than 1 mm long; leaves to \(5(-9) \mathrm{cm}\) long and 2.5 cm wide; filaments

1-1.5 mm long; ovary partly inferior, the hypanthium partly adnate to the ovary; petals spatulate and cuneate, but not clawed; [widespread in our area].
5 Inflorescence remaining compact with age; inflorescence axis sparsely short-hairy, the hairs not glandular (or with a very few glandular hairs interspersed; pedicels glabrous or nearly so; petals 2-3.5 mm long; [of granite outcrops in GA, otherwise in sc. US] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. texan
5 Inflorescence branching with age, some branches often lower than the midpoint of the plant's height; inflorescence axis glandular-hairy; pedicels glandular-hairy; petals \(3.5-6 \mathrm{~mm}\) long; [widespread in our area] . . . . . S. virginiensis
4 Leaf margins with coarse teeth mostly \(2-10 \mathrm{~mm}\) long; leaves to 15 cm long and 8 cm wide; filaments \(2.5-3.5 \mathrm{~mm}\) long; ovary superior, the hypanthium free from the ovary; petals (either 3 or 5 of them) moderately to strongly clawed; [of the Mountains and upper Piedmont].
5 Leaves not petiolate, cuneate to the base, gradually increasing in width from the base to the widest point; corolla bilaterally symmetrical, the 3 upper petals distinctly clawed and with yellow spots, the 2 lower smaller, cuneate, and not spotted . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. michauxii
5 Leaves petiolate, the blade rather abruptly contracted to the petiole; corolla radially symmetrical, all the petals alike. 6 Sepals erect, later spreading; filaments filiform (use 10×); body of fruit (excluding the beak) 2.5-5 mm long; petals not spotted, or each with 2 obscure yellow spots . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. careyana 6 Sepals spreading, later reflexed; filaments slightly clavate (use \(10 \times\) ); body of fruit (excluding the beak) \(4-5 \mathrm{~mm}\) long; petals each with 2 yellow spots . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. caroliniana

Saxifraga careyana A. Gray, Carey Saxifrage. Mt (GA, NC, VA): moist rock outcrops and cliffs, often under overhangs, often in moist soil at the base of a vertical or overhanging rock outcrop; rare (GA Special Concern, NC Watch List, SC Rare, VA Rare). May-June. A Southern Appalachian endemic: sw. VA south to e. TN, w. NC, and nw. SC. There remains a great deal of doubt regarding the taxonomic relationship between S. careyana and S. caroliniana. Many of the characters appear to be poorly correlated, and most specimens have been annotated at one time or another, by one investigator or another, as both species. The synonymization of Micranthes tennesseensis Small under S. careyana seems questionable, since the capsule size (seemingly one of the more stable characters in this complex) suggests \(S\). caroliniana. I here retain the two taxa more to draw continued attention to them than out of conviction that the two are entirely satisfactory taxa (at least as currently defined). [= RAB, C, F, G, GW, K, W; = Micranthes careyana (A. Gray) Small -- S; ? Micranthes tennesseensis Small -- S]

Saxifraga caroliniana A. Gray, Carolina Saxifrage. Mt (NC, VA): moist rock outcrops and cliffs, often under overhangs, often in moist soil at the base of a vertical or overhanging rock outcrop; rare (US Species of Concern, NC Rare, VA Rare). May-June. A Southern Appalachian endemic: WV south to w. NC and ne. TN. See S. careyana for discussion of the two taxa. [= RAB, C, F, G, K, W; = Micranthes caroliniana (A. Gray) Small -- S; ? Micranthes tennesseensis Small -- S]

Saxifraga michauxii Britton, Cliff Saxifrage. Mt (GA, NC, SC, VA), Pd (NC, VA): in crevices in exposed rock outcrops at high elevations, other rock outcrops (moist to rather dry), periglacial boulderfields, rocky seeps; common (rare in VA Piedmont). JuneAugust. A Southern Appalachian endemic: nw. VA, WV, and KY south to e. TN, w. NC, sw. SC, and ne. GA. The orange anthers are an attractive contrast to the white petals (the three upper with two yellow spots each). [= RAB, C, F, G, GW, K, W; = Hydatica petiolaris (Rafinesque) Small -- S ; = Micranthes sp. 1]

Saxifraga micranthidifolia (Haworth) Steudel, Branch-lettuce. Mt (GA, NC, SC, VA), Pd (NC, VA): wet soils of seepages, in the beds of high elevation brooks, brookbanks; rocky seepages; common (rare in VA Piedmont). May-June. A Southern and Central Appalachian endemic: e. PA and WV, south to e. TN, w. NC, nw. SC, and ne. GA. This plant is gathered in considerable quantities as a spring green in the mountains of our area, and can sometimes even been seen for sale in grocery stores. The common name refers to the plant's habitat; "branches" are mountain streams. [= RAB, C, F, G, GW, K, W; = Micranthes micranthidifolia (Haworth) Small -- S]

Saxifraga pensylvanica Linnaeus, Swamp Saxifrage. Mt, Pd (NC, VA), Cp (VA): mountain bogs, mucky seeps; uncommon, rare in NC (NC Rare). April-June. ME west to MN, south to e. VA, c. and w. NC, and MO. [= RAB, C, F, K, W; > S. pensylvanica ssp. pensylvanica -- G; = Micranthes pensylvanica (Linnaeus) Haworth]

Saxifraga texana Buckley, Texas Saxifrage. Pd (GA): granite outcrops; rare (GA Special Concern). Found in 1980 by Jim Allison on a small granite outcrop in McDuffie County, GA. It is uncertain whether its occurrence in GA represents a natural disjunction or a freak introduction (J. Allison, pers. comm.). [=F, G, K; = Micranthes texana (Buckley) Small - S]

Saxifraga virginiensis Michaux, Early Saxifrage. Mt, Pd, Cp (GA, NC, SC, VA): rock outcrops, moist alluvial and slope forests, streambanks, riverbanks; common (rare in Coastal Plain). March-May. New Brunswick west to Manitoba, south to c. GA, LA, and AR. [= RAB, C, F, G, GW, W; > S. virginiensis var. virginiensis -- K; = Micranthes virginiensis (Michaux) Small -- S]

\section*{Sullivantia Torrey \& A. Gray ex A. Gray (Sullivantia)}

A genus of 4 species, perennial herbs, of c. North America. References: Soltis (1980)=Z.
Sullivantia sullivantii (Torrey \& A. Gray) Britton, Sullivantia. Mt (VA): moist limestone cliffs; rare (VA Rare). June-August. S. sullivantii has a very scattered, relictual distribution, known from w. VA, e. KY, s. OH, IL, sw. WI, ne. IA, se. MN, and MO. [= C, F, G, K, Z]

\section*{Tiarella Linnaeus (Foamflower)}

A genus of about 5 species, perennial herbs, of temperate North America and e. Asia. References: Lakela (1937)=Y; Spongberg
```

(1972)=Z; Wherry (1940, 1949)=X; Fernald (1943)=V .

```

1 Plant with stolons; capsules 8-12 mm long, subacuminate; lower fruiting pedicels 7-13 mm long; [of the Mountains] . . . . . . . .
․ . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . T. cordifolia

1 Plant without stolons; capsules 6-10 mm long, round-tipped; lower fruiting pedicels 6-10 mm long; [of the Mountains, Piedmont, and (less commonly) Coastal Plain]
T. wherryi

Tiarella cordifolia Linnaeus. Mt (GA, NC, SC, VA): moist forests, cove forests, rock outcrops; common. April-June. Nova Scotia west to Ontario and WI, south to w. NC, nw. SC, n. GA, and MO. [=F, V, Z; = T. cordifolia var. cordifolia - RAB, C, G, K; <T. cordifolia - S, W, in part (also see T. wherryi); T. macrophylla Small - S (type a combination of Heuchera and Tiarella); T. cordifolia var. typica - Y]

Tiarella wherryi Lakela. Pd, Mt, Cp (GA, NC, SC, VA), Cp (VA): moist forests, cove forests, rock outcrops; common. AprilJune. VA and KY south to sw. GA, AL, and MS. Whether or not to recognize several taxa within what is here treated as \(T\). wherryi, and at what level, has been controversial; see Lakela (1937), Wherry (1940, 1949), Fernald (1943), and Spongberg (1972) for discussion. [= F, V, Z; = T. cordifolia Linnaeus var. collina Wherry - RAB, C, G, K; < T. cordifolia - S, W, in part; > T. cordifolia var. collina - X, in a narrower sense; > T. wherryi-X, Y, in a narrower sense; > T. cordifolia var. austrina - K, X, Y]

\section*{SCHISANDRACEAE BI. 1830 (Star-vine Family)}

A family of 2 genera and about 40-50 species, woody vines, of e. Asia and e. North America (only our single species). References: Saunders (2001); Keng in Kubitzki, Rohwer, \& Bittrich (1993).

\section*{Schisandra Michaux 1803 (Star-vine)}

A genus of about 25 species, woody vines, of e. Asia (about 24 species) and e. North America (1 species). References: Vincent in FNA (1997); Godfrey (1988)=Z; Saunders (2001)=Y; Keng in Kubitzki, Rohwer, \& Bittrich (1993).

Schisandra glabra (Brickell) Rehder, Star-vine, Climbing-magnolia, Magnolia-vine. Cp (GA, NC, SC), Pd (GA, NC), Mt (GA): rich slopes adjacent to bottomland forests, or mesic "islands" surrounded by bottomlands; rare (GA Threatened, NC Threatened). May-June; July-August. Ne. NC (Martin County), sc. NC (Gaston County), n. GA, w. TN, sc. KY, and e. AR south south to the FL panhandle and LA; Mexico (Sierra Madre Oriental, Hidalgo). [= RAB, K, Y, Z; Schizandra coccinea Michaux -- S (orthographic variant); S. coccinea Michaux -- W]

\section*{SCROPHULARIACEAE (Snapdragon Family) \\ (also see OROBANCHACEAE, PAULOWNIACEAE, PHRYMACEAE, and PLANTAGINACEAE)}

There is increasing evidence that the Scrophulariaceae as traditionally constituted includes two main and quite distinct groups (Olmstead \& Reeves 1995; Young, Steiner, \& dePamphilis 1999; Albach, Meudt, \& Oxelman 2005). Based on molecular analysis, Young, Steiner, \& dePamphilis (1999) suggest that Scrophulariaceae, Antirrhinanthaceae, and Orobanchaceae be restructured to include the current members of Orobanchaceae, Scrophulariaceae, and Callitrichaceae. Beardsley \& Olmstead (2002) suggest that Mimulus and Mazus be included with Phryma in a redefined Phrymaceae. References: Pennell (1935)=P; Olmstead \& Reeves (1995); Young, Steiner, \& dePamphilis (1999); Olmstead et al. (2001); Beardsley \& Olmstead (2002).

Disposition of the traditional Scrophulariaceae (including Antirrhinanthaceae), Orobanchaceae, Plantaginaceae, Callitrichaceae, Buddlejaceae, Phrymaceae:

Scrophulariaceae s.s.: Buddleja, Scrophularia, Verbascum.

Orobanchaceae: Agalinis, Aureolaria, Buchnera, Castilleja, Conopholis, Dasistoma, Epifagus, Macranthera, Melampyrum, Orobanche, Pedicularis, Schwalbea, Seymeria, Striga.

Plantaginaceae (Veronicaceae): Amphianthus, Antirrhinum, Bacopa, Callitriche, Chaenorrhinum, Chelone, Collinsia, Cymbalaria, Digitalis, Gratiola, Kickxia, Leucospora, Limnophila, Limosella, Linaria, Mecardonia, Misopates, Nuttallanthus, Penstemon, Plantago, Scoparia, Veronica, Veronicastrum.

Phrymaceae: Lindernia, Mazus, Micranthemum, Mimulus, Phryma.

\section*{Buddleja Linnaeus 1753 (Butterfly-bush)}

A genus of about 90 species, trees and shrubs, of subtropical and tropical America, Asia, and Africa. The two species listed (and others) are grown for ornament and for their attractiveness as nectaring sites for butterflies. References: Rogers (1986)=Z; Oxelman, Kornhall, \& Norman in Kadereit (2004).

1 Leaves serrate or crenate; corolla, calyx, pedicels, and inflorescence rachis pubescent (not granular-farinose) ..... B. davidii 1 Leaves entire or remotely dentate; corolla, calyx, pedicels, and inflorescence rachis granular-farinose . . . . . . . . B. lindleyana
* Buddleja davidii Franchet, Summer-lilac, Orange-eye Butterfly-bush. Mt (GA, NC, VA), Pd (SC): planted, rarely escaped to disturbed places, such as thickets or streambanks (Wise Co., VA); rare, native of China. June-October. [= RAB, C, F, G, K, Z]
* Buddleja lindleyana Fortune ex Lindley. Pd (GA, NC, SC), Mt, Cp (NC, SC): rarely escaped to disturbed areas; rare, native of China. June-October. [= RAB, K, Z; = Adenoplea lindleyana (Fortune ex Lindley) Small -- S]

EXCLUDED: B. alternifolia Maximowicz is reported as introduced in NC by Kartesz (1999), but the alleged documentation is not present. B. officinalis Maximowicz is reported as introduced in GA by Kartesz (1999), but the alleged documentation is not available.

\section*{Scrophularia Linnaeus (Figwort)}

A genus of about 200 species, of temperate and tropical regions of the Old and New Worlds. Though our 2 species are only subtly distinct morphologically, they are clearly distinct. References: Pennell (1935)=P; Fischer in Kadereit (2004).

1 Sterile filament (hidden under the upper corolla lip) yellowish-green, often wider than long; leaf serrations coarse, often more than 3 mm long; flowering May-early July; capsule 6-10 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. Ianceolata
1 Sterile filament dark purple or brownish, often longer than wide; leaf serrations fairly fine, less than 3 mm long; flowering mid July-October; capsule 4-7 mm long

Scrophularia lanceolata Pursh, American Figwort. Mt, Pd, Cp (VA): woodlands and forests; common (rare in Piedmont and Coastal Plain). May-early July. Québec and Nova Scotia west to British Columbia, south to VA, MO, NM, and n. CA. [= C, F, G, K, P, W]

Scrophularia marilandica Linnaeus, Eastern Figwort. Mt, Pd, Cp (GA, NC, SC, VA): moist to dry, nutrient-rich woodlands and forests, especially over mafic or calcareous rocks; common (rare in Piedmont and Coastal Plain south of VA). July-October. Québec west to MN, south to SC, ne. GA, sw. GA, and LA. [= RAB, C, F, G, K, P, S, W]

\section*{Verbascum Linnaeus (Mullein)}

A genus of about 360 species, herbs (annual, biennial, and perennial) and shrubs, of Eurasia and ne. Africa. References: Pennell (1935)=P; Fischer in Kadereit (2004).

1 Leaves green and glabrous on both sides, or sparsely pubescent with glandular hairs; hairs of the calyx and upper stem simple and glandular.
2 Flowers 1 per node throughout the inflorescence; pedicels longer than the calyx; glandular hairs usually restricted to the upper part of the plant
V. blattaria

2 Flowers usually > 1 per node in the lower parts of the inflorecence; pedicels shorter than the calyx; glandular hairs extending down the stem to the base . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . V. virgatum
1 Leaves densely tomentose at least on the lower surface, and often the upper as well; hairs of the calyx and upper stem branched, not glandular (except in V. sinuatum).
3 Inflorescence generally simple (sometimes with 1 -several small branches), dense and spike-like (at least initially); leaves moderately to densely tomentose above; upper 3 filaments bearing white hairs.
4 Leaves sessile to auriculate-clasping, slightly or not at all decurrent on the stem; stigma patulate, decurrent on the style; corolla white or yellow . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . V. phlomoides 4 Leaves sessile, decurrent down the stem to the next leaf; stigma capitate; corolla yellow . . . . . . . . . . . V. thapsus
3 Inflorescence freely branched, paniculate; leaves green and nearly glabrous above; all 5 filaments bearing either white or violet hairs.
5 Basal leaves not lobed; inflorescence lacking glandular hairs; filaments bearing white hairs .......... V. Iychnitis
5 Basal leaves lobed; inflorecence with glandular hairs; filaments bearing violet hairs . . . . . . . . . . . . [V. sinuatum]
* Verbascum blattaria Linnaeus, Moth Mullein. Cp, Pd, Mt (GA, NC, SC, VA): fields, roadsides, disturbed areas; common, native of Eurasia. May-June; June-July. [= RAB, C, F, G, K, P, S, W]
* Verbascum lychnitis Linnaeus, White Mullein. Cp, Pd (VA): disturbed areas, fields; rare, native of Eurasia. [= RAB, C, F, G, K, P, S]

Verbascum phlomoides Linnaeus, Clasping Mullein, Orange Mullein. Mt, Pd, Cp (NC, VA): disturbed areas, roadsides; rare, native of Europe. May-June; July. [= RAB, C, F, G, K, P, W]
* Verbascum thapsus Linnaeus, Woolly Mullein, Common Mullein, Flannel-plant, Velvet-plant. Mt, Pd, Cp (GA, NC, SC, VA): fields, roadsides, disturbed areas; common, native of Europe. June-September; July-October. [= RAB, C, F, G, K, P, S, W]
* Verbascum virgatum Stokes, Twiggy Mullein. Cp (NC, SC): sandhills, sandy disturbed areas, roadsides; rare, native of Europe. April-May; June. [= RAB, C, F, G, K, P, S]
* Verbascum sinuatum Linnaeus, Wavyleaf Mullein, is introduced at scattered locations in MD, PA, NJ, and NY, on ballast and in
disturbed areas. July-August. [= G, K]

\section*{SIMAROUBACEAE (Quassia Family)}

A family of about 13 genera and 111 species, trees and shrubs of primarily tropical areas of the New World and Old World. The Leitneriaceae has been traditionally considered to be monotypic family, endemic to se. North America; a variety of recent studies have suggested its inclusion in the Simaroubaceae (Angiosperm Phylogeny Group 1998, 2003; Bogle in FNA (1997). References: Angiosperm Phylogeny Group (1998, 2003).

1 Leaves compound; [species alien, aggressively naturalizing in upland sites] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Ailanthus
1 Leaves simple; [species native, in wetland sites] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Leitneria

\section*{Ailanthus Desfais (Tree-of-Heaven)}

A genus of 5 species, trees, native to Asia and Australia. References: Hu (1979).
* Ailanthus altissima (P. Miller) Swingle, Tree-of-Heaven, Copal Tree, Stink-tree. Pd, Mt, Cp (GA, NC, SC, VA): roadsides, forests, disturbed areas, including cities, especially in moist, fertile soils; common, native of e. Asia. Late May-early June; JulyOctober. In our area, this tree is now an aggressive and noxious weed, colonizing even undisturbed forests and outcompeting the native vegetation. As serious a weed as it is here, it is (at the time of this writing, at least), much worse to the north, now the dominant tree in fencerows, woodlots, and forests in the urbanized, suburbanized, and even rural Northeast. It can be recognized vegetatively by its large pinnately compound leaves, very stout twigs (over 1 cm thick), and the characteristic and unpleasant odor of the crushed foliage. [= RAB, C, F, G, K, S, W]

\section*{Leitneria Chapman (Corkwood)}

A monotypic genus, endemic to se. North America. References: Bogle in FNA (1997); Channell \& Wood (1962).
Leitneria floridana Chapman, Corkwood. Cp (GA): swamps and cabbage palm / sawgrass marshes; rare (GA Special Concern). February-March. This species occurs in scattered sites from the Coastal Plain of sw. GA west to e. TX, and north in the Mississippi Embayment to AR and MO. [= FNA, GW, K, S]

\section*{SOLANACEAE (Nightshade Family)}

A family of about 94 genera and nearly 3000 species, shrubs, trees, vines, and herbs, nearly cosmopolitan but especillay diverse in South America. References: Hunziker (2001).

Subfamily Cestroideae, Tribe Cestreae: Cestrum
Subfamily Cestroideae, Tribe Nicotianeae: Calibrachoa, Nicotiana, Nierembergia, Petunia
Subfamily Solanoideae, Tribe Solaneae: Capsicum, Physalis, Salpichroa, Solanum
Subfamily Solanoideae, tribe Datureae: Datura
Subfamily Solanoideae, tribe Lycieae: Lycium
Subfamily Solanoideae, tribe Nicandreae: Nicandra

\section*{Bouchetia Dunal}

Bouchetia erecta Augustin de Candolle. MS and TX. [= K] \{add synonymy\}

\section*{Calibrachoa Llave \& Lexarza (Seaside Petunia)}

A genus of \(\}\). references: Hunziker (2001)=Z.
* Calibrachoa parviflora (Antoine Laurent de Jussieu) D'Arcy, Wild Petunia, Seaside Petunia. Cp (NC, VA): upper edges of salt marshes, waste areas, garbage dumps; rare, naturalized from tropical America. Tatnall (1946) documents its occurrence in Virginia: "upper edge of salt marsh, Wachapreague," Accomack Co. (Fernald \& Long 4169, 26 July 1934). [= K; = Petunia parviflora Antoine Laurent de Jussieu -- RAB, C, F, G, S, Z]

Capsicum Linnaeus (Red Pepper, Chile)

A genus of about 10 species, herbs and shrubs, of tropical America. References: D'Arcy \& Eshbaugh (1974)=Z; Heiser \& Pickersgill (1975). Key based on Z.

1 Flowers usually only one per node after the first flowering node, rarely more; corolla pure white (raerely bluish or violet) . . . . .
C. annuum

1 Flowers 2 or more per node above the first flowering node; corolla greenish-white . . . . . . . . . . . . . . . . . . . . . C. frutescens
* Capsicum annuum Linnaeus, Red Pepper, Chile. Pd, Cp (GA?, NC, SC, VA): naturalized or persistent from gardens; commonly cultivated, rare as a naturalized species. June-frost. A very influential food crop introduced from the New World to the Old World, now important in various (especially tropical or subtropical) cuisines, including Hunan, Szechuan, Indian, various African, Mexican, and others. [= RAB, S, Z; = C. annuum var. annuum -- K]
* Capsicum frutescens Linnaeus, Tabasco Pepper. Cp (GA): persistent from gardens; rarely cultivated, rare as a waif. Reported in e. GA (Duncan 1985; Jones \& Coile 1988). [=C. annuum Linnaeus var. frutescens (Linnaeus) Kuntze; = Capsicum annuum Linnaeus var. glabriusculum (Dunal) Heiser \& Pickersgill -- K]

\section*{Cestrum Linnaeus (Night-flowering Jessamine)}

A genus of 150-200 shrubs (rarely trees or vines), of Tropical America. References: Hunziker (2001)=Z.
* Cestrum nocturnum Linnaeus, Night-flowering Jessamine. Cp (GA): cultivated, weakly (if at all) established; rare, introduced from West Indies. See Small (1933). [=K, Z; C. parqui-S, misapplied]

\section*{Datura Linnaeus (Jimsonweed)}
\{needs thorough rework, based on herbarium material and clarification of nomenclature\}
A genus of about 10 species, of \(s\). North America (probably originally native to sw. United States and Mexico). Several species of Datura are known to have been in our area at the time of first settlement by Europeans. They may have been weeds in Indian fields, or grown for their hallucinogenic properties. The common name "Jimsonweed" is a corruption of "Jamestown Weed." References:

1 Calyx 3-5 cm long, the tube strongly angled, the angles even narrowly winged; corolla 7-10 cm long; capsule erect, dehiscent by 4 valves . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . D. stramonium
1 Calyx 5-15 cm long, the tube terete or slightly angled; corolla 12-20 cm long; capsule inclined or nodding, irregularly dehiscent. 2 Corolla with 10 teeth, lavender; spines of capsule few, very stout-based . . . . . . . . . . . . . . . . . . . . . . . . . . . . . D. metel
2 Corolla with 5 or 10 teeth, white or pale lavender; spines of capsule many, hispid (the base only slightly thickened).
3 Corolla with 10 teeth; leaves soft-pubescent . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . D. inoxia
3 Corolla with 5 teeth; leaves glaucescent . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . D. wrightii
* Datura inoxia J.S. Miller. Cp, Pd (NC, SC, VA?): disturbed areas, rare, introduced from Mexico; September-October. This species may not be distinct from \(D\). wrightii. [It is currently not known which records in our area apply to which taxon] [=K; \(D\). innoxia -- F, S, orthographic variant; D. meteloides -- G, misapplied]
* Datura metel Linnaeus (NC): location and habitat in our area not known; rare, presumably introduced, allegedly native of tropical Africa and Asia. July-August. [= RAB, C, K, S]
* Datura stramonium Linnaeus, Jimsonweed. Cp, Pd, Mt (GA, NC, SC, VA): fields, pastures, disturbed areas, especially common in severely over-grazed pastures; common, presumably introduced from further south and west. July-September; AugustOctober. The plant is dangerously poisonous. [= RAB, C, F, K, S, W; D. stramonium var. tatula (Linnaeus) Torrey -- F; D. tatula Linnaeus]
* Datura wrightii Regel, Indian-apple. Pd (NC, SC, VA?), Cp (VA): disturbed areas; rare, introduced from Mexico. JulySeptember; September-October. [= K; D. meteloides Dunal -- RAB, S, misapplied; D. metel -- G, misapplied]
* Datura quercifolia Kunth is reported for sw. GA by Jones \& Coile (1988). [= K] \{not yet keyed\}

Lycium Linnaeus (Matrimony-vine)
A genus of about 100 species, shrubs, of warm temperate and tropical areas of the Old World and New Word (especially America).
1 Leaves succulent, oblanceolate, 1-5 mm wide; [native, in maritime situations] . . . . . . . . . . . . . . . . . . . . . . L. carolinianum
1 Leaves herbaceous, elliptic, ovate, or broadly oblanceolate, \(8-30 \mathrm{~mm}\) wide; [introduced, persistent or naturalized, usually around old home sites].
2 Corolla lobes shorter than the corolla tube; leaves gray-green, 2-5 cm long
L. barbarum

2 Corolla lobes longer than the corolla tube; leaves bright green, 3-8 cm long
L. chinense
* Lycium barbarum Linnaeus, Common Matrimony-vine. Cp (NC, SC, VA), Pd, Mt (GA, NC, VA): old home sites, disturbed
areas, along railroad tracks; introduced from s. Europe. May-November; August-December. [=K; L. halimifolium P. Miller -- RAB, F, G, S, W; L. barbarum -- C (also including L. chinense)]

Lycium carolinianum Walter, Christmas-berry, Carolina Matrimony-vine. Cp (GA, SC): shell middens, shell mounds, shelly sand dunes, brackish marshes, maritime sand spits; rare (GA Special Concern). September-October. Se. SC and e. GA south to FL, west to e. TX; also in the West Indies. Apparently not recently seen in SC; its occurrence in that state is based on Walter's flora. [= RAB, GW, S; L. carolinianum var. carolinianum -- K]

Lycium chinense \(P\). Miller, Chinese Matrimony-vine. Mt (NC, VA), Pd, Cp (VA): old home sites; rare, introduced from China. May-November; August-December. [= RAB, F, G, K; L. barbarum -- C, in part]

Lycopersicon P. Miller (Tomato) (see Solanum)

Nicandra Adanson (Apple-of-Peru)
A monotypic genus, an annual herb native of Peru.
* Nicandra physalodes (Linnaeus) Gaertner, Apple-of-Peru. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): disturbed places, such as cultivated fields; uncommon, native of Peru. July-September; August-October. [= RAB, C, F, G, K, W; = Physalodes physalodes (Linnaeus) Britton -- S]

\section*{Nicotiana Linnaeus (Tobacco)}

A genus of about 67 species, of America, Australia, and s. Pacific areas. Fernald (1950) describes the genus as "rank, acridnarcotic American herbs." References: Knapp, Chase, \& Clarkson (2004).

1 Corolla 5-8 cm long, pink; larger leaves 4-8 dm long; plant 1-2.5 m tall; [section Nicotiana] ...................... N. tabacum
1 Corolla 1.5-2 cm long, greenish yellow; larger leaves 1-2 dm long; plant 0.4-1 m tall; [section Rusticae] . . . . . . . . . . N. rustica
* Nicotiana rustica Linnaeus, Indian Tobacco, Wild Tobacco. Cp, Pd, Mt (GA?, NC, SC, VA): formerly commonly cultivated by native Americans in all parts of our area, persistent following cultivation, now apparently extinct in our area; rare, originally native of Peru. This was the tobacco cultivated by American Indians at the time of contact by Europeans, and was the first tobacco taken to Europe and cultivated there. [= RAB, C, F, K, S]
* Nicotiana tabacum Linnaeus, Cultivated Tobacco. Pd, Cp, Mt (GA, NC, SC, VA): persistent after cultivation; commonly cultivated, rarely naturalized, native of tropical America. June-frost; September-October. This is the tobacco currently cultivated in our area for the manufacture of cigarettes, cigars, and other smoking and chewing tobacco products. Two different strains are cultivated. Burley tobacco, with acute to acuminate leaves, grown mostly in the Mountains and upper Piedmont, is air-cured in open barns, and used mostly for cigar and pipe tobacco. Flue-cured tobacco, with obtuse or broadly acute leaves, is grown mostly in the Coastal Plain and lower Piedmont, cured in closed, cubical barns with forced heat, and used mostly for cigarettes. [= RAB, C, F, K, S]
* Nicotiana alata Link \& Otto, Jasmine Tobacco. Cp (GA): cultivated in gardens; rarely persistent. See Jones \& Coile (1988). \{not keyed\} [=K]
* Nicotiana glauca Graham, Tree Tobacco. Cp (GA): cultivated in gardens, rarely persistent or spreading; rare, introduced from South America. Apparently present at Fort Pulaski National Monument, Chatham County, GA (Jones \& Coile 1988; W. Duncan pers.comm. 2004). [= K] \{not yet keyed\}
* Nicotiana longiflora Cavanilles, Long-flower Tobacco. Also cultivated and may be found as a waif or persistent. \{not keyed\} [= K]

\section*{Nierembergia Ruiz \& Pavón (Cupflower)}

A genus of about 23 species, of Mexico, Central America, and South America.
* Nierembergia frutescens Durieu, Tall Cupflower, is reported from sw. GA (Jones \& Coile 1988). [= K]

> Petunia Antoine Laurent de Jussieu (Petunia)
> (also see Calibrachoa)

A genus of \(\}\).
* Petunia \(\times\) hybrida Vilmorin [ \(P\). axillaris \(\times\) integrifolia], Petunia. Cp, Pd (GA, NC, SC, VA): disturbed areas; common in cultivation, uncommonly spread from cultivation, native of Argentina. May-November. Individual plants may closely resemble either
parent, but this taxon in our area is best considered as a variable hybrid taxon. [=C; \(P\). xatkinsiana D. Don ex Loudon -- RAB, K; \(P\). axillaris (Lamarck) Britton, Sterns, \& Poggenburg -- C, F, G, K, S; P. violacea Antoine Laurent de Jussieu -- F, S, misapplied; P. integrifolia (Hooker) Schinz. \& Thellung -- C, G, K]

\section*{Physalis Linnaeus (Ground-cherry)} (contributed by Milo Pyne)

A genus of about 80 species, nearly cosmopolitan, but especially diverse in America. Many of the species of Physalis in our area occur primarily in disturbed habitats. The pre-Columbian ranges of these species are unclear; they may have been introduced to e. North America by native Americans. Of the species treated here, only Ph. philadelphica is definitely introduced.

1 Plants obviously covered with dense, stellate hairs, especially the young growth, flowering calyces, and pedicels . . Ph. walteri
1 Plants glabrous to variously pubescent, the pubescence not stellate.
2 Leaves glabrous or essentially so.
3 Perennials from rhizomes, frequently with remnant of last year's stem attached to crown; corolla with 5 dark maculations in the throat.
4 Hairs on the pedicels and young stems retrorse or retrorse-spreading; fruiting calyx 5 -angled, indented at base
4 Hairs on the pedicels and young stems antrorse; fruiting calyx subterete, with 10 ribs, not indented at base .
Ph. Iongifolia var. subglabrata
3 Annuals from taproots; corolla with or without 5 dark maculations in the throat.
5 Upper part of the stem with long, spreading hairs; corolla with 5 dark maculations in the throat.
6 Leaf margins strongly dentate with 7-10 (or more) teeth per side; fruiting pedicels 12 mm or more long; mature fruiting calyx 2.5-4 cm (or more) long, the lobes long-acuminate to attenuate; corolla pubescent internally

Ph. cordata
6 Leaf margins entire, or dentate with 1-8 teeth per side; fruiting pedicels less than 10 mm long; mature fruiting calyx 2.5 cm or less long, the lobes triangular-acuminate; corolla glabrous internally.
7 Leaves mostly toothed nearly to the base with 5-8 teeth per side; leaf blade thick in texture, not translucent; fruiting calyces \(2-3.5 \mathrm{~cm}\) long, \(1.2-3 \mathrm{~cm}\) wide, the lobes triangular to narrowly lanceolate, the apex narrowly acute to acuminate, (3.5-) 4.5-6.5 mm long . . . . Ph. pubescens var. pubescens 7 Leaves entire or with few teeth, usually 1-4 teeth per side; leaf blade thin in texture, flaccid and translucent; fruiting calyces \(1.2-2.5 \mathrm{~cm}\) long, 1-1.5 cm wide, the lobes ovate to deltoid, the apex acute, \(3-3.5 \mathrm{~mm}\) long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Ph. pubescens var. integ Upper part of the stem glabrous or glabrate (when young, sometimes with minute, deflexed hairs in lines); corolla with or without 5 dark maculations in the throat.
8 Corolla 4-10 mm long entirely yellow, without 5 dark maculations in the throat; anthers 1-2.3 mm long; berry \(8-11 \mathrm{~mm}\) in diameter

Ph. angulata var. angulata
8 Corolla 7-15 mm long, yellow and with 5 dark maculations in the throat; anthers 2.5-4 mm long; berry to 40 mm in diameter

Ph. philadelphica
2 Leaves variously pubescent, the hairs copious and villous to sparse and appressed.
9 Flowering calyces 6 mm or less long; annuals from taproots.
10 Stems, young growth, and major veins of the leaves covered with villous pubescence intermixed with sessile glands; leaves gray-green, prominently and coarsely dentate to the base, with well-defined reticulate venation, especially visible on the lower surface, frequently drying orange or with orange spots; anthers yellow, perhaps with a bluish tinge; body of mature calyx about as long as broad, abruptly acuminate at apex; berry tawny orange when mature
10 Stems, young growth, and major veins of leaves with fine, non-villous pubescence; leaves green, obscurely dentate, often in the upper half only, or entire, without well-defined reticulate venation, drying green or brownish; anthers blue or violet; body of mature calyx longer than broad, long-acuminate at the apex; berry green when mature.
11 Leaves mostly toothed nearly to the base with \(5-8\) teeth per side; leaf blade thick in texture, not translucent; fruiting calyces \(2-3.5 \mathrm{~cm}\) long, \(1.2-3 \mathrm{~cm}\) wide, the lobes triangular to narrowly lanceolate, the apex narrowly acute to acuminate, (3.5-) \(4.5-6.5 \mathrm{~mm}\) long . . . . . . . . . . Ph. pubescens var. pubescens
11 Leaves entire or with few teeth, usually 1-4 teeth per side; leaf blade thin in texture, flaccid and translucent; fruiting calyces \(1.2-2.5 \mathrm{~cm}\) long, 1-1.5 cm wide, the lobes ovate to deltoid, the apex acute, 3-3.5 mm long

Ph. pubescens var. integrifolia
9 Flowering calyces 6 mm or more long; perennials from rhizomes.
12 Pubescence viscid, generally composed of glandular trichomes mixed with fine, short hairs and long, multicellular hairs; leaf blades broadly ovate to suborbicular, the base rounded, truncate, or cordate (occasionally widely cuneate) Ph. heterophylla
12 Pubescence seldom if at all glandular-viscid, composed of trichomes of varying lengths, from dense, spreading, and long-villous to sparse, strigose, and appressed; leaf blades narrowly ovate to broadly lanceolate, the base cuneate (rarely truncate).
13 Pedicels and flowering calyces pubescent with minute, appressed, antrorse hairs; hairs on the calyx primarily confined to 10 narrow longitudinal strips consisting of simple, appressed hairs 0.5 mm or less appressed retrorse hairs); hairs on the calyx scattered more or less evenly over the surface, not confined to 10 longitudinal strips.
14 Pedicels with both divergent and antrorse hairs; principle leaf blades \(5-8 \mathrm{~cm}\) long; filaments 0.5 as wide as the anthers; spots at the base of the corolla inconspicuous or absent; berry more than 14 mm in diameter when mature

Ph. lanceolata
14 Pedicels with short, appressed, retrorse hairs, or with short retrorse and longer divergent hairs intermixed; principle leaf blades \(3-6 \mathrm{~cm}\) long; filaments as wide or wider than the anthers; spots at base of the corolla prominent; berry less than 12 mm in diameter when mature

Ph. virginiana var. virginiana
Physalis angulata Linnaeus var. angulata, Smooth Ground-cherry. Cp, Pd (GA, NC, SC, VA), Mt (GA): disturbed areas, open woodlands, agricultural fields; common (VA Watch List). August-October. Var. angulata is widely distributed in Tropical America, north to se. VA and MO, and scattered as an adventive further north. Var. pendula (Rydberg) Waterfall is (in North America) more western, east to nw. TN and, allegedly, to SC. It can be distinguished from var. angulata by the following characters: principle cauline leaf blades generally more than \(2.75 \times\) as long as wide (vs. less than \(2.5 \times\) as long as wide), flowering pedicels \(1.5-\) 2.5 cm long, elongating to \(3.0-4.0 \mathrm{~cm}\) long in fruit (vs. flowering and fruiting pedicels \(0.5-1.0 \mathrm{~cm}\) long), pedicels and calyx covered at anthesis with fine, even, antrorse hairs, especially at the base of the calyx (vs. pedicels and calyx essentially glabrous at anthesis except for hairs on the margins of the calyx lobes). [Ph. angulata -- RAB, K, S, infraspecific taxa not distinguished; Ph. angulata -\(\mathrm{F}, \mathrm{G}]\)

Physalis cordata P. Miller, Toothleaf Ground-cherry. Cp (NC), \{GA, SC \}: disturbed areas; rare. July-October. This species is scattered in the Southeastern United States, and is more widespread in Mexico, Central America, and West Indies. [= K; Ph. pubescens var. glabra (Michaux) Waterfall -- RAB; Ph. barbadensis var. glabra (Michaux) Fernald -- F]

Physalis grisea (Waterfall) M. Martínez, Gray Ground-cherry, Strawberry-tomato, Dwarf Cape-gooseberry. Mt, Pd (GA, NC, VA), Cp? (GA?), \{SC\}: wooded slopes, disturbed areas; uncommon. July-September; August-October. The species is mainly distributed in ne. United States, south (mainly) to NC, TN, and MO, and scattered further south. The fruits are edible, sweet, and tasty. Martínez (1993) discusses the nomenclature of this species, showing that the \(P\). pruinosa Linnaeus is properly applied to a Mexican and Central American species. [=K; Ph. pubescens var. grisea Waterfall -- RAB, C; P. pruinosa Linnaeus -- F, G, S, W, misapplied]

Physalis heterophylla Nees, Clammy Ground-cherry. Pd, Mt, Cp (GA, NC, SC, VA): disturbed areas, dry rocky woodlands; common (uncommon in Mountains, rare in Coastal Plain). May-July; July-September. Widespread in e. and c. United States and adjacent Canada. [= RAB, C, F, G, S, W; Ph. heterophylla var. ambigua (A. Gray) Rydberg -- F, G; Ph. heterophylla var. clavipes Fernald -- F; Ph. heterophylla var. nyctaginea (Dunal) Rydberg -- F; P. heterophylla var. heterophylla -- K; Ph. ambigua (A. Gray) Britton -- S; Ph. nyctaginea Dunal -- S]

Physalis lanceolata Michaux, Sandhills Ground-cherry. Cp (GA, NC, SC): sandhills; rare (NC Rare). June-July; JulySeptember. Endemic to sandhill habitats of (primarily) sc. and (rarely) se. NC (northern limit in Lee, Wayne, and New Hanover counties), south through SC to just over the Savannah River in Richmond County, GA. Many earlier floras included midwestern material in the concept of this species; it is, however, limited to the Carolinas and Georgia. [= RAB; Ph. lanceolata -- \(\mathrm{F}, \mathrm{G}, \mathrm{S}\), in part only, the concept also including Ph. hispida (Waterfall) Cronquist]

Physalis longifolia Nuttall var. subglabrata (Mackenzie \& Bush) Cronquist, Longleaf Ground-cherry. Mt, Pd (NC, VA), \{GA, SC\}: open woodlands, gardens and disturbed areas; uncommon. June-August; August-October. The species is widespread in e. and c. United States; var. subglabrata is more eastern, var. longifolia more western. [= C, G, K, W; Ph. virginiana P. Miller var. subglabrata (Mackenzie \& Bush) Waterfall -- RAB; Ph. subglabrata Mackenzie \& Bush -- F, S]
* Physalis philadelphica Lamarck, Tomatillo. Pd (NC): naturalized after cultivation; rare, native of Mexico and Central America. June-August; July-October. See Kartesz \& Gandhi (1994) for a discussion of this group. It is the large-flowered plant (and therefore Ph. philadelphica in the narrow sense) that is weakly naturalized after cultivation in c. NC. [= C; Ph. ixocarpa auct. non Brotero ex Hornemann -- F, G, in part; > Ph. philadelphica var. immaculata Waterfall - K]

Physalis pubescens Linnaeus var. integrifolia (Dunal) Waterfall, Thinleaf Downy Ground-cherry. The distribution, abundance, and habitats of the two varieties are poorly known. July-September; August-October. Widespread in the American tropics, north to PA and IA. [= C, K; Ph. pubescens var. pubescens -- RAB, in part only; Ph. pubescens -- F, G, S, W, in part only; Ph. turbinata Medikus -- G, S (at least as applied by G, S); Ph. pruinosa Linnaeus, misapplied]

Physalis pubescens Linnaeus var. pubescens, Thickleaf Downy Ground-cherry. The distribution, abundance, and habitats of the two varieties are poorly known. July-September; August-October. Widespread in the American tropics, north to VA. [= C, K; Ph. pubescens var. pubescens -- RAB, in part only; Ph. barbadensis Jacquin var. barbadensis -- F; Ph. pubescens -- G, S, W, in part only; Ph. barbadensis Jacquin -- G, S]

Physalis virginiana P. Miller var. virginiana, Virginia Ground-cherry. Pd, Mt, Cp (GA, NC, SC, VA): woodlands and disturbed areas; common. April-May; June-July. This complex species is widespread in e. and c. North America. Var. virginiana is the most eastern of a number of varieties, some of the others being var. campaniforma Waterfall, var. polyphylla (Greene) Waterfall, and var. texana (Rydberg) Waterfall. The validity and true affinities of some of these varieties is, at present, uncertain; var. texana may be actually affiliated with Ph. longifolia. [= RAB, K; Ph. virginiana -- C, F, G, S, W, infraspecific taxa not distinguished; Ph. intermedia Rydberg -- S; Ph. monticola C. Mohr -- S]

Physalis walteri Nuttall, Dune Ground-cherry. Cp (GA, NC, SC, VA): dunes of sea-beaches, openings in maritime forests; uncommon (VA Rare List). May-September. This species ranges from se. VA south to s. FL and west to s. MS. See Sullivan (1985) for further information on this species and its relatives. It is largely replaced on the Gulf Coast by the related Ph. angustifolia,
with which it locally intergrades in peninsular FL. Ph. viscosa Linnaeus is South American. [= C, K; Ph. viscosa Linnaeus ssp. maritima (M.A. Curtis) Waterfall -- RAB; Ph. maritima M.A. Curtis -- F; Ph. viscosa -- G, S]
* Physalis acutifolia (Miers emend Sandwith) Sandwith, native to AZ and vicinity, was collected once in NC (in 1936), from a nursery in Mecklenburg County, NC. It is probably not established. It is most similar to Ph. angulata, but differs in its white to cream-colored corollas, with yellow basal spots, and the presence of 5 hairy pads, alternating with the stamens near the base of the corolla limb. [=K]
* Physalis alkekengi Linnaeus, Chinese-lantern Plant, native of Japan, Korea, and n . China, is commonly cultivated as an ornamental and occasionally naturalized in e. North America, as at scattered locations in TN (Chester, Wofford, \& Kral 1997). It is perennial, readily recognized by its mature calyces red-orange and up to 5 cm long. [= K]

Physalis arenicola Kearney, Sandhill Ground-cherry, reported from nc. GA by Jones \& Coile (1988) and for "cypress-heads and scrub thickets" by GANHP (GA Special Concern). [= K; Ph. arenicola var. ciliosa (Rydberg) Waterfall] \{add to key; add synonymy\}
* Physalis cinerascens (Dunal) A.S. Hitchcock var. cinerascens, native to OK, TX, and Mexico, occurs locally in the Southeastern United States in weedy situations; it has been found once in our area, in a disturbed habitat in SC. It is probably not established. It resembles Ph. walteri in having stellate pubescence, but differs in having leaves ovate to suborbicular, with margins sinuate, dentate, or entire (vs. leaves obovate, with margins entire), anthers at least \(1.5 \times\) as long as the filaments (vs. anthers equal to or shorter than the filaments), and fruiting pedicels mostly at least \(1.5 \times\) as long as the calyces (vs. fruiting pedicels equal to or shorter than the fruiting calyces). [= K] \{add to key and full treatment\}

Physalis longifolia Nuttall var. Iongifolia occurs east to PA, WV, KY, TN, and GA (Kartesz 1999). [= K]
Physalis missouriensis Mackenzie \& Bush, reported from nc. GA in Jones \& Coile (1988); record not repeated in Kartesz 1999). [= K; Ph. pubescens Linnaeus var. missouriensis (Mackenzie \& Bush) Waterfall] \{investigate; not yet keyed; add synonymy\} * Physalis peruviana Linnaeus, Cape Gooseberry or Po'ha, is also cultivated. Native to South America, it is now cultivated for its edible fruit in various tropical and temperate areas, and is known to rarely persist in e. North America. [= K]

Physalis viscosa Linnaeus. AL, MS. [= K]

\section*{Salpichroa Miers}

A genus of about 17 species, herbs and shrubs, native of South America. References: Hunziker (2001)=Z.
* Salpichroa origanifolia (Lamarck) Baillon. Cp (GA, NC, SC, VA), Pd (GA, NC, SC): gardens, roadsides, disturbed areas; rare, introduced from \(n\). South America. May-November. [= RAB, K, Z; Perizoma rhomboidea (Gillies \& Hooker) Small -- S; Salpichroa rhomboidea (Gillies \& Hooker) Miers]

Solanum Linnaeus (Nightshade, Tomato, Potato, Horse-nettle)
A genus of about 1700 species, trees, shrubs, vines, and herbs, of tropical and temperate regions of the Old and New World. References: Schilling (1981)=Z; Bohs \& Olmstead 1997; Olmstead \& Palmer 1997.
* Solanum capsicoides Allioni. Cp (SC), Pd (NC): disturbed areas; rare, introduced. [= K; S. aculeatissimum -- RAB, misapplied]

Solanum carolinense Linnaeus var. carolinense, Horse-nettle, Ball-nettle. Cp, Pd, Mt (GA, NC, SC, VA): [= K; S. carolinense - RAB, C, F, infraspecific taxa not distinguished]
* Solanum dimidiatum Rafinesque. \(C p(S C),\{G A\}\) : disturbed areas; rare, introduced from w. North America. April-June. [=C, K; S. torreyi A. Gray -- RAB, F]

Solanum dulcamara Linnaeus, Bittersweet, Nightshade. Mt (NC, VA), Pd, Cp (VA), \{GA\}: introduced from Europe. [= RAB, C; S. dulcamara var. dulcamara -- F, K]
* Solanum elaeagnifolium Cavanilles, Silverleaf Nightshade, White Horse-nettle. Cp (NC, SC), Pd (NC): disturbed areas; rare, introduced from sc. North America. June-September. [=C,F, K; S. eleagnifolium -- RAB, orthographic error]
* Solanum lycopersicum Linnaeus, Tomato. Cp, Pd, Mt (GA, NC, SC, VA): persistent and weakly naturalized around gardens, especially where compost or sewage sludge is spread; commonly cultivated, rare as a naturalized species. June-frost. The species is native to the Andes Mountains of nw. South America. S. lycopersicum is one of the most important and influential of edible species introduced from the New World to the Old World. There appears to be little reason to separate Lycopersicon from Solanum. [Lycopersicon esculentum -- RAB, C, G, infraspecific taxa not recognized; Solanum lycopersicum Linnaeus var. cerasiforme (Dunal) Spooner, J. Anderson, \& R.K. Jansen - K; Solanum lycopersicum var. lycopersicum - K; Lycopersicon lycopersicon (Linnaeus) Karsten -- S; Lycopersicon esculentum var. cerasiforme (Dunal) Alefani; Solanum lycopersicum Linnaeus]
* Solanum nigrum Linnaeus ssp. nigrum, European Black Nightshade. Cp (SC): disturbed areas; rare, introduced from Eurasia. May-November. [= Z; S. nigrum -- RAB, F, infraspecific taxa not distinguished; S. nigrum -- C, in part; S. nigrum ssp. nigrum - K ]
* Solanum physalifolium Rusby, Hairy Nightshade. Cp, Pd (NC, VA): introduced from South America. [= K; S. sarrachoides

Sendtner -- RAB, C, Z, apparently misapplied; S. sarachoides -- F, orthographic error and apparently misapplied]
* Solanum pseudocapsicum Linnaeus, Jerusalem-cherry. Pd (NC), Mt (GA), \{GA, SC\}: rarely cultivated, perhaps not established, introduced from Mediterranean Europe. [= K; S. pseudo-capsicum -- F, orthographic variant]

Solanum pseudogracile Heiser, Dune Nightshade. Cp (GA, NC, SC): ocean dunes, usually with Uniola paniculata;
uncommon. May-October. E. NC south to FL, west to LA. [= K, Z; S. gracile -- RAB, misapplied]
Solanum ptychanthum Dunal, American Black Nightshade. Mt, Pd, Cp (GA, NC, SC, VA): disturbed areas; common. JuneDecember. [=K, Z; S. americanum P. Miller -- RAB, F, misapplied; S. nigrum -- C, in part]
* Solanum rostratum Dunal, Buffalo-bur, Kansas-thistle. Cp (NC, SC, VA), Mt, Pd, (NC, VA), \{GA\}: introduced from w. North America. [= RAB, C, F, K; S. cornutum Lamarck, misapplied]
* Solanum sisymbriifolium Lamarck, Sticky Nightshade. Cp (NC, SC), \{GA, VA\}: disturbed areas; uncommon, introduced from South America. July-September; September-October. [= RAB, C, F, K]
* Solanum tuberosum Linnaeus, Potato, Irish Potato, White Potato. Cp, Pd, Mt (NC, SC, VA): commonly cultivated, rarely escaped or spontaneous from thrown-out tubers, introduced from Andean South America. June-August. [= RAB, C, K]
* Solanum viarum Dunal, Tropical Soda Apple. Cp (GA, NC, SC): pastures; rare, introduced from South America (s. Brazil, Paraguay, and \(n\). Argentina). This species has only recently appeared in our area, but has been publicized as a severe, extremely aggressive, and rapidly spreading weed further south (Wunderlin et al. 1993, Mullahey et al. 1993, Mullahey 1996). [= K]

Solanum americanum P. Miller, north to e. GA. [= K; S. nodiflorum Jacquin]
* Solanum capsicastrum Link ex Schauer. Reported for NC and SC (Kartesz 1999). \{investigate; probably a false attribution\} [=K]

Solanum carolinense Linnaeus var. floridanum (Shuttleworth ex Dunal) Chapman, occurs in sandy pinelands in GA and FL (Kartesz 1999). [= K; S. floridanum Shuttleworth ex Dunal - S]

Solanum carolinense Linnaeus var. hirsutum (Nuttall) A. Gray, occurs in GA and AL (Kartesz 1999). [= K]
* Solanum citrullifolium A. Braun var. citrullifolium. Introduced in scattered states, including DE and FL (Kartesz 1999). [= K]
* Solanum melongena Linnaeus, Eggplant, is planted in gardens but does not persist. [= K]

Solanum nigrescens Mart. \& Gal. occurs in NC, SC, GA, etc. (Kartesz 1999). \{investigate\} [= K]
Solanum pumilum Dunal is known from dolomitic Ketona glades in Bibb County, c. AL (Allison \& Stevens 2001) and historically in GA (GAHP).
* Solanum triflorum Nuttall. Introduced in c. TN. [= K]

SPHENOCLEACEAE (Chickenspike Family)
A family of one genus and 2 species, annual herbs, of tropical regions, native of the Old World. References: Rosatti (1986)=Z.
Sphenoclea Gaertner (Chickenspike)
A genus of 2 species, annual herbs, native of the Old World.
* Sphenoclea zeylanica Gaertner, Chickenspike. Cp (SC), Pd (GA, NC): rice plantations, reservoirs, other disturbed wetlands; rare, native of Old World tropics. August-October. [=K, S, Z; = S. zeylandica - RAB, GW, orthographic error (presumably from a mistaken notion that the epithet refers to New Zealand rather than Ceylon)]

\section*{STAPHYLEACEAE (Bladdernut Family)}

A family of 5 genera and about 27 species, trees and shrubs, of temperate Northern Hemisphere, especially e. Asia. References: Spongberg (1971)=Z.

Staphylea Linnaeus (Bladdernut)
A genus of 11 species, trees and shrubs, of temperate Eurasia and e. North America.
Staphylea trifolia Linnaeus, Bladdernut. Pd, Mt, Cp (GA, NC, SC, VA): nutrient-rich bottomland forests, extending upslope over calcareous or mafic rocks; common. April; September-October. Québec west to MN, south to sw. GA, Panhandle FL, n. AL, n. MS, and OK. The opposite, trifoliolate leaves with serrulate margins are distinctive. [= RAB, C, F, G, GW, K, S, W, Z]

\section*{STERCULIACEAE (Chocolate Family) (see MALVACEAE)}

\section*{STYRACACEAE (Storax Family)}

A family of about 11 genera and 160 species, trees and shrubs, of warm temperate and tropical regions of America, Mediterranean, se. Asia, Malesia. References: Fritsch in Kubitzki (2004).

1 Corolla lobes 4; fruit elongate, winged, 2.5-5 cm long; petioles \(15-25 \mathrm{~mm}\) long .................................. . Halesia
1 Corolla lobes 5; fruit globose, not winged, 0.5-0.9 cm in diameter; petioles 2-10 mm long . . . . . . . . . . . . . . . . . . . . . . . Styrax

\section*{Halesia Ellis ex Linnaeus (Silverbell, Snowdrop Tree)}

A genus of about 5 species, trees and shrubs, of e. North America and e. Asia. The genus was named to honor Stephen Hales; it therefore seems more appropriate to pronounce the genus with three syllables (the accent on the first) than the commonly heard four, which thoroughly distorts the honoree's name. The number of taxa in our area and their appropriate taxonomic level are in dispute; recent analyses vary from from 2-4, with specific or varietal status. References: Fritsch \& Lucas (2000)=X; Reveal \& Seldin (1976) \(=\mathrm{Y}\); Sargent (1921); Godfrey (1988)=Z.

1 Petals united only basally, the lobes longer than the tube; fruits broadly 2 -winged; leaves broadly obovate to suborbicular, \(1-2 \times\) as long as wide.
2 Corolla 10-15 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . H. diptera var. diptera
2 Corolla 20-30 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . H. diptera var. magniflora
1 Petals united for most of their length, the tube longer than the lobes; fruits narrowly or broadly 4-winged; leaves elliptic-oblong, ca. \(2 \times\) as long as wide.
3 Corolla 7-10 (-12) mm long, the style strongly exserted ( \(1 / 3\) to \(1 / 2\) the length of the corolla tube beyond its mouth), the anthers at the mouth of the corolla tube or slightly exserted; fruit obovate in outline, broadest towards the tip, strongly narrowed to the base, narrowly winged . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . H. carolina
3 Corolla (12-) 15-30 mm long, the style included or slightly exserted, the anthers within the mouth of the corolla tube; fruit ellipsoid to slightly obovate in outline, broadest near the middle, broadly winged.
4 Corolla (18-) 20-30 mm long, the style included, the anthers well inside the mouth of the corolla tube; large tree, to 40 m tall. H. tetraptera var. monticola

4 Corolla (12-) 15-20 mm long, the style slightly exserted, the anthers just within the mouth of the corolla tube; shrub to small tree, rarely exceeding 10 m in height . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . H. tetraptera var. tetraptera

Halesia carolina Linnaeus, Little Silverbell. Pd (GA, SC): sandy alluvial forests; rare (SC Rare List). March-April; SeptemberOctober. S. SC south to panhandle FL, west to s. MS. [= K, Y, Z; = H. parviflora Michaux -- RAB, GW, S; < H. carolina - X]

Halesia diptera Ellis var. diptera, Common Two-wing Silverbell. Cp (GA, SC): bottomland forests, forested edges of brackish marshes; rare (SC Rare List). April-May; August-September. Var. diptera ranges from s. SC south to panhandle FL, west to \(n\). AL, sw. AR, and e. TX. [= Y, Z; < H. diptera -- RAB, GW, K, S]

Halesia diptera Ellis var. magniflora Godfrey. \(\mathrm{Cp}(\mathrm{GA})\) : dry to moist hammocks; rare. Endemic to sw. GA and panhandle FL. [= Y, Z; < H. diptera - GW, K, S]

Halesia tetraptera Ellis var. monticola (Rehder) Reveal \& Seldin, Mountain Silverbell. Mt (NC, VA?): cove forests, moist ridges, mostly above 1000 m in elevation; common (VA Watch List). April-May; August-September. Apparently limited to the higher mountains of the Southern Appalachians of NC, TN, and VA (?), but the range obscure, perhaps limited to the area south of Linville Gorge, notably the Great Smoky Mountains. [=K, Y; < H. carolina -- RAB, F, G, W; < H. tetraptera -- C; H. monticola (Rehder) Sargent -- S; H. carolina - X]

Halesia tetraptera Ellis var. tetraptera, Common Silverbell. Mt (GA, NC, SC, VA), Pd, Cp (GA, NC, SC): moist slopes, coves, creek-banks, bottomlands; common (uncommon in lower Piedmont and Coastal Plain). March-May; August-September. W. VA, WV , s OH and s IL, south to FL and e. TX (and cultivated elsewhere). [= K, Y; < H. carolina -- RAB, F, G, W; < H. tetraptera -- C; = H. carolina Linnaeus -- S; < H. carolina - X]

\section*{Styrax Linnaeus (Snowbell, Storax)}

A genus of about 120-130 species, trees and shrubs, of s. Europe, Malesia, se. Asia, se. North America, and tropical America. References: Gonsoulin (1974)=Z. The differences of opinion about the correct grammatical gender (covering all 3 possibilities!) are ignored in the synonymy, all endings standardized to the masculine "-us."

1 Leaves generally broadly obovate, sometimes broadly ovate, \(5-14 \mathrm{~cm}\) long, \(4-10 \mathrm{~cm}\) wide, the apices acute to short-acuminate, densely and finely pubescent beneath, giving the underside of the leaf a pale color; inflorescence usually of 5-20 flowers S. grandifolius

1 Leaves narrowly elliptic to ovate or obovate, usually 2-8 cm long, \(1-4 \mathrm{~cm}\) wide, the apices short- to long-acuminate, glabrous or sparsely pubescent beneath (to densely pubescent and then giving the underside of the leaf a rusty color in var. pulverulentus); inflorescence usually of 1-7 flowers.
2 Leaves oblong-elliptic, glabrous or sparsely pubescent on the undersurfaces and petioles, the margins usually distantly toothed toward the apices); pedicels \(10-14 \mathrm{~mm}\) long; calyces essentially glabrous; new growth glabrous to sparsely pubescent
S. americanus var. americanus

2 Leaves elliptic to ovate to oblanceolate or obovate, sparsely to densely scurfy-hairy on the undersurfaces and petioles, margins entire to serrate; pedicels \(4-6 \mathrm{~mm}\) long; calyces and pedicels densely scurfy-hairy; new growth densely matted pubescent.
S. americanus var. pulverulentus

Styrax americanus Lamarck var. americanus, American Snowbell, American Storax. Cp (GA, NC, SC, VA), Pd (GA, NC, SC), Mt (GA, VA): swamp forests, pocosin edges, other moist to wet habitats; uncommon (rare in Piedmont, rare in VA) (VA Watch List). April-June; July-September. Var. americanus ranges from ne. WV, OH, s. IN, s. IL, s. MO, south to s. FL and e. TX. See
discussion below on var. pulverulentus and the presence in our area of transitional plants. [=C,F,Z; S. americanus -- RAB, G, GW, K, W; = Styrax americanus -- S]

Styrax americanus Lamarck var. pulverulentus (Michaux) Perkins ex Rehder, Downy American Snowbell. Cp (GA, SC): wet pine flatwoods; rare. April-May; July-September. "Good" var. pulverulentus ranges from SC south to s. FL and west to e. TX and se. MO; some plants in NC and SC are transitional between the two varieties and will not be easily assigned. [=F, Z; < S. americanus -- RAB, G, GW, K, W; = S. pulverulentus Michaux -- S]

Styrax grandifolius Aiton, Bigleaf Snowbell, Bigleaf Storax. Pd, Cp, Mt (GA, NC, SC, VA): upland forests, bluffs; uncommon (rare in Mountains) (VA Watch List). April-May; August-September. Se. VA south to s. FL, west to e. TX, north to se. MO. [= RAB, C, F, K, S, Z, W]

\section*{SYMPLOCACEAE (Sweetleaf Family)}

A family of 1 genus and about 250-300 species, trees and shrubs, of tropical and warm temperate America and Asia. References: Nooteboom in Kubitzki (2004).

\section*{Symplocos Jacquin (Sweetleaf)}

A genus of about 300 species, trees and shrubs, of tropical and warm temperate America and Asia. Wang et al. (2004) found that the affinities of S. tinctoria are with South American species of subgenus Epigenia, rather than with east Asian species of subgenus Hopea, section Palaeosymplocos. References: Wang et al. (2004); Nooteboom in Kubitzki (2004).

Identification notes: The foliage of S. tinctoria has a sweet taste, and an odor and taste similar to green apples. Sometimes the leaves are glossy and appear subcoriaceous, somewhat resembling Kalmia latifolia.

1 Leaf margins sharply and finely glandular-dentate; inflorescence a terminal panicle; drupes blue (white); [alien, rarely cultivated and escaped]; [subgenus Hopea, section Palura] [S. paniculata]
1 Leaf margins entire to coarselt serrate-crenate; inflorescence an axillary fascicle; drupes green; [native, common in parts of our area]; [subgenus Epigenia].
S. tinctoria

Symplocos tinctoria (Linnaeus) L'Heritier de Brutelle, Sweetleaf, Horsesugar. Cp (GA, NC, SC, VA), Mt, Pd (GA, NC, SC): moist bottomland forests, pocosin edges, mesic forests, ridgetop forests; common (rare in Piedmont). March-May; AugustSeptember. DE south to n . FL and west to e. TX and se. OK. The range in our area is discontinuous and interesting, the species rather abundant in the Coastal Plain throughout our area, and in the Mountains of NC and SC (absent from the VA mountains!), but present in the Piedmont only near its borders with the other provinces and in scattered sites in the central Piedmont. The leaves have a subcoriaceous and rather evergreen appearance, but are (in our area) only semi-evergreen. As the name implies, the leaves are somewhat sweet, but the sweetness seems variable from plant to plant, season to season, and taster to taster. Whether sweet or not, the taste is distinctive and is helpful (once learned) in distinguishing this rather nondescript shrub or small tree. Where protected from fire, S. tinctoria can reach considerable size, up to 20 cm in diameter and 10 m tall, with longitudinally striped bark. [= RAB , C, GW, K, S, W; > S. tinctoria var. tinctoria - F, G; > S. tinctoria var. pygmaea Fernald -- F, G (probably based on fire sprouts)]
* Symplocos paniculata (Thunberg) Miq., Sapphire-berry, Asiatic Sweetleaf, native of e. Asia, has been reported as spreading from plantings in the District of Columbia (Whittemore 2003).

\section*{TAMARICACEAE (Tamarisk Family)}

A family of about 4 genera and 78 species, shrubs and trees, of Eurasia and Africa (especially from the Mediterranean to c. Asia). References: Crins (1989b); Gaskin in Kubitzki \& Bayer (2003); Gaskin et al. (2004).

\section*{Tamarix Linnaeus (Tamarisk, Salt-cedar)}

A genus of about 54 species, trees and shrubs, native of Eurasia and Africa. References: Baum (1978)=Z; Crins (1989b) \(=\mathrm{Y}\).
* Tamarix africana Poiret, African Tamarisk. (SC). [= K, Y]
* Tamarix canariensis Willdenow, Canary Island Tamarisk. (GA, NC, SC). [= K, Y]
* Tamarix gallica Linnaeus, French Tamarisk. \{GA, NC\} Reported as introduced in NC and SC by RAB and Kartesz (1999)
(perhaps in error), and for GA (Kartesz 1999). [= F, G, K, S, Y]
* Tamarix parviflora Augustin de Candolle, Small-flower Tamarisk. (NC, VA). [= C, G, K, Y]
* Tamarix ramosissima Ledeb., Salt-cedar. (GA, NC, SC, VA). [= K, Y]
* Tamarix tetragyna C. Ehrenb., Four-stamen Tamarisk. Cp (GA): \{habitat unknown\}; rare, introduced from the Middle East.

Established on Cumberland Island, Camden County, GA (Crins 1989b). [= K, Y]

\footnotetext{
* Tamarix aralensis Bunge, Russian Tamarisk. Reported for NC (Kartesz 1999), but the specimen is of a plant in cultivation as an ornamental. [= K, Y]
* Tamarix chinensis Loureiro, Five-stamen Tamarisk. Reported for NC (Kartesz 1999), but the specimen is of a plant in cultivation as an ornamental. [= C, K, Y; = T. pentandra Pallas - G, an illegitimate name]
}

\section*{TETRACHONDRACEAE}

A family of 2 genera, Polypremum and Tetrachondra (Oxelman et al. 1999), and 3 species, perennial herbs, of s. North America south to South America, and New Zealand. References: Oxelman et al. (1999); Wagstaff in Kadereit (2004).

\section*{Polypremum Linnaeus (Polypremum)}

The genus is monotypic; its assignment to family controversial, problematic, and unresolved. A recent molecular analysis strongly suggests that its closest relationship is with Tetrachondra (Oxelman et al. 1999). References: Rogers (1986)=Z; Wagstaff in Kadereit (2004).

Polypremum procumbens Linnaeus, Polypremum. Cp, Pd, Mt (GA, NC, SC, VA): fields, disturbed areas; common, rare in Mountains. Late May-September; August-October. Se. NY, NJ, and MO south to FL and TX, and south into tropical America. [= RAB, C, F, G, GW, K, S, W, Z]

\section*{THEACEAE (Tea Family)}

With a more circumscribed definition (excluding Ternstroemiaceae), a family of about 8 genera and 195-460 species, trees and shrubs, of primarily tropical and subtropical regions of the Old and New Worlds. References: Prince \& Parks (2001); Stevens, Dressler, \& Weitzman in Kubitzki (2004).

1 Leaves deciduous, medium green above, herbaceous in texture.
2 Leaves broader towards the tip, 2-2.5× as long as wide; [tribe Gordonieae]
Franklinia
2 Leaves broadest near or below the middle, 1-1.8× as long as wide); [tribe Stewartieae] ........................ Stewartia
1 Leaves evergreen, dark green above, coriaceous in texture.
3 Leaves ovate to elliptic (broadest at or below the middle), 1-3x as long as wide, slightly to strongly acuminate, 5-10 (-15) cm long; [introduced shrub, planted in upland soils]; [tribe Theeae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Camellia
3 Leaves oblanceolate to narrowly elliptic (broadest at or above the middle), 2.5-4× as long as wide, acute to obtuse (rarely slightly acuminate), 8-30 cm long; [small to large tree, native in acidic Coastal Plain wetlands]; [tribe Gordonieae]

Gordonia

Camellia Linnaeus 1753 (Camellia, Tea)
A genus of about 100-300 species, shrubs and trees, of se. Asia. References: Stevens, Dressler, \& Weitzman in Kubitzki (2004).
1 Sepals deciduous; flowers sessile; leaves mostly ovate, acuminate, more than 4 cm wide .................... C. japonica
1 Sepals persistent; flowers on pedicels; leaves mostly elliptic, only slightly acuminate, less than 4 cm wide ...... C. sinensis
* Camellia japonica Linnaeus, Camellia. Cp (GA, NC, SC): frequently cultivated, sometimes persistent around old home sites (especially in the Coastal Plain of NC and SC); rare, native of China and Japan. [= K]
* Camellia sinensis (Linnaeus) Kuntze, Tea. Cp (SC): cultivated in plantations and as a horticultural novelty, rarely escaped; rare, native to China. [= K; = Thea sinensis Linnaeus]

Camellia sasanqua Thunberg, Sasanqua Camellia, is reported as introduced in NC, SC, GA, and FL (Kartesz 1999). [= K] \{not yet keyed\}

\section*{Franklinia Bartram ex Marshall 1785 (Franklinia)}

A monotypic genus, apparently endemic to e. GA (now presumably extinct in the wild). In the North American flora, Franklinia is most closely related to Gordonia, from which it differs in its deciduous leaves (vs. evergreen) and globose fruits (vs. pointed).

Franklinia is actually most closely related to the Asian genus Schima (Prince \& Parks 2001). References: Bozeman \& Rogers (1986); Stevens, Dressler, \& Weitzman in Kubitzki (2004).

Franklinia alatamaha Bartram ex Marshall, Franklinia. Cp (GA): habitat speculative, probably dry sandy ridges, near the mouth of the Altamaha River; rare (believed to be extinct in the wild) (GA Special Concern). It was native to the Coastal Plain of GA, where it was found by William Bartram near the mouth of the Altamaha River. It has not been seen in the wild since 1790 and is now believed to be extinct in the wild. It is sometimes cultivated in our area. Bozeman \& Rogers (1986) discuss the history of this tree. [= K, S; = Gordonia alatamaha (Bartram ex Marshall) Sargent]

\section*{Gordonia Ellis 1771 (Loblolly Bay, Gordonia)}

A monotypic genus, a tree, of se. North America. The other \(20-70\) species, trees and shrubs, of se. Asia, previously assigned to Gordonia are actually in a different tribe and should be reassigned to Polyspora (Yang et al. 2004). References: Yang et al. (2004); Stevens, Dressler, \& Weitzman in Kubitzki (2004).

Identification notes: Gordonia is one of the "bay trees" so typical of acid Coastal Plain wetlands of our area -- the other two being Sweet Bay (Magnolia virginiana of the Magnoliaceae) and Swamp Red Bay (Persea palustris of the Lauraceae). Gordonia can be distinguished from the other two species by its smooth leaves, serrate towards the tip, odorless when crushed (vs. pubescent leaves, entire-margined, aromatic when crushed). Gordonia is also distinctive in its narrow, conical crown, resembling Liriodendron or Chamaecyparis, and its medium-gray, deeply furrowed bark. Most individuals of Gordonia have at least a few orange-red leaves visible, at any season.

Gordonia lasianthus (Linnaeus) Ellis, Loblolly Bay, Gordonia. Cp (GA, NC, SC): pocosins, acidic, organic-rich swamp forests, wet pine savannas, bay forests; common. July-September; September-October. Ne. NC south to s. peninsular FL, west to s. MS (Sorrie \& Leonard 1999), a Southeastern Coastal Plain endemic. Peat-filled Carolina bays and large peat dome pocosins typically have Gordonia as an important tree, surpassed in abundance and importance only by Pinus serotina. On deep peats, Gordonia individuals are stunted and rarely reach sizes larger than pocosin shrubs. [= RAB, GW, K, S]

Stewartia Linnaeus 1753 (Stewartia, Wild Camellia)
A genus of about 10 species, trees and shrubs, of temperate e. Asia and e. North America. Both our species of Stewartia are very attractive shrubs. The other species of the genus are Asian. Li et al. (2002) demonstrate that our 2 species form a clade together, separate from and basal to the Asian species; Prince (2002) shows a different tree topology. References: Spongberg (1974)= \(\mathrm{Z} ; \mathrm{Li}\) et al. (2002); Prince (2002); Stevens, Dressler, \& Weitzman in Kubitzki (2004).

Identification notes: The leaves are borne in horizontal planes, reminiscent of Cornus florida and Cornus alternifolia. The leaves of both species are obscurely serrate or crenate, and also conspicuously and copiously ciliate-margined.

1 Style 1, with a 5-lobed stigma; seeds \(5-7 \mathrm{~mm}\) long, shiny, plump, angled; fruits lobed, the lobes rounded; leaves mostly 4-10 cm long; petioles narrowly winged, not enclosing and concealing the terminal and lateral buds; calyx subtended by 2 persistent bracts, each \(2-4 \mathrm{~mm}\) long; leaf blades mostly \(5.5-11 \mathrm{~cm}\) long s. malacodendron

1 Styles 5, separate; seeds \(8-10 \mathrm{~mm}\) long, dull, flat, thin (to slightly winged); fruits lobed, the lobes angled; leaves mostly \(6-15 \mathrm{~cm}\) long; petioles widely winged, enclosing and concealing the terminal and lateral buds; calyx subtended by 1 persistent bract, 1114 mm long; leaf blades mostly 7-15 cm long
S. ovata

Stewartia malacodendron Linnaeus, Silky Camellia, Virginia Stewartia. Cp (GA, NC, SC, VA), Pd (GA, NC, SC), Mt (NC): mesic forests, especially on beech-dominated bluffs or "islands" in Coastal Plain swamps; uncommon, rare in Piedmont and Mountains (GA Rare, VA Rare List). May-June; September-October. Primarily Coastal Plain, se. VA south to FL, west to se. TX, but extending inland to the Piedmont of Ga, NC, and SC and the Mountains of NC. [= RAB, K, W, Z; = Stewartia malachodendron -C, F, G (orthographic variant); = Stuartia malachodendron -- S (orthographic variant)]

Stewartia ovata (Cavanilles) Weatherby, Mountain Camellia, Mountain Stewartia. Mt (GA, NC, SC, VA), Pd (GA, NC, VA), Cp (VA): mesic forests, especially acidic bluffs, often in openings in rhododendron thickets ("hells"), in the Coastal Plain of VA restricted to ravines; rare (SC Rare List, NC Watch List, VA Rare List). Late June-July; August-September. Primarily Appalachian: e. KY, sc. VA, e. VA south to c. NC, w. SC, e. and c. TN to \(n\). GA and \(n\). AL, avoiding, however, the higher mountains, and extending into the Coastal Plain in e. VA. The species is most abundant in the Cumberland Plateau of KY and TN. [= RAB, C, F, G, K, W, Z; = Malachodendron pentagynum (L'Héritier) Small -- S]

\section*{THYMELAEACEAE (Mezereum Family)}

A family of about 45-53 genera and 500-800 species, mostly trees and shrubs, of cosmopolitan distribution, but especially diverse in Africa (Van der Bank, Fay, \& Chase 2002). References: Van der Bank, Fay, \& Chase (2002); Herber in Kubitzki \& Bayer (2003).

\title{
Flora of the Carolinas, Virginia, and Georgia, Working Draft of June 10, 2005 -- TROPAEOLACEAE
}

\section*{Dirca Linnaeus 1753 (Leatherwood, Leatherbark)}

A genus of 3 species, shrubs, of North America (including Mexico). Our species is most closely related to D. mexicana Nesom \& Mayfield, of the Sierra Madre Oriental, Tamaulipas, Mexico; the other species is D. occidentalis A. Gray of California (Schrader \& Graves 2004). Dirca is in subfamily Thymelaeoideae (Van der Bank, Fay, \& Chase 2002). References: Nevling (1962)=Z.

Dirca palustris Linnaeus, Leatherwood, Leatherbark, Wicopee, Rope-bark. Pd (GA, NC, SC, VA), Mt (GA, NC, VA), Cp (GA, VA): very rich forests, on slopes or bottomlands, limited to calcareous or mafic rocks such as limestone, calcareous siltstone, calcareous shale, gabbro, or amphibolite, in marl ravine bottoms in the Coastal Plain of VA; uncommon, rare south of VA and in VA Coastal Plain (NC Watch List, SC Rare List). March-April; June-July. Widespread in e. North America, from Nova Scotia and s. Québec, south to FL, AL, and OK. The curiously flexible twigs and swollen nodes are distinctive. The tan-brown bark is extraordinarily tough and was used by the native Americans for cordage; the common names refer to this property. [= RAB, C, F, G, K, S, W, Z]

Edgeworthia Meisner 1841 (Paperbush)
A genus of 3 species, shrubs, of e. Asia.
* Edgeworthia papyrifera Siebold \& Zuccarini, Paperbush, is reported for Rabun County, GA by Jones \& Coile (1988). [= K]

\section*{TILIACEAE (Basswood Family) (see MALVACEAE)}

TROPAEOLACEAE (Nasturtium Family)
A family of 1-3 genera and about 90 species, herbs, of Central and South America. References: Sparre \& Andersson (1991)=Z; Bayer \& Appel in Kubitzki \& Bayer (2003).

\section*{Tropaeolum Linnaeus 1753 (Nasturtium)}

A genus of about 85-90 species, herbs, of tropical Central America and South America (s. Mexico to Peru). References: Sparre \& Andersson (1991)=Z.
* Tropaeolum majus Linnaeus, Nasturtium, is cultivated and rarely persistent or present around refuse areas, as in se. PA (Rhoads \& Klein 1993). T. majus is considered by Sparre \& Andersson (1991) to be a taxon of hybrid origin, not known from wild populations. It is probably not truly established in our area. [=K, Z]

TURNERACEAE (Turnera Family)
A family of about 10 genera and 100 species, shrubs, herbs, and trees, of tropical and subtropical Africa and America.
Piriqueta Aublet
A genus of about 21 species, of tropical and subtropical America and Africa. References: Arbo (1990, 1995 )=Z.
Piriqueta caroliniana (Walter) Urban. Cp (GA, SC): longleaf pine sandhills, sandy soils of roadsides, woodland edges, and disturbed areas; uncommon. May-September. SC south to n. FL; Cuba and Hispaniola; and in Central and n. South America. Arbo (1990; 1995) treats \(P\). caroliniana as a subspecies of \(P\). cistoides, but the morphoogical distinctions seem strong and the two taxa have widely overlapping distributions in the Neotropics. [= RAB; = P. cistoides (Linnaeus) Grisebach ssp. caroliniana (Walter) M.M. Arbo -- K, Z; >P. caroliniana -- \(S\), in the narrow sense; >P. viridis Small - S; P. caroliniana (Walter) Urban var. glabra (Augustin de Candolle) Urban]

Piriqueta cistoides (Linnaeus) Grisebach is reported for GA (Kartesz 1999) with untraceable documentation. \{not keyed; rejected pending better documentation\} [=P. cistoides ssp. cistoides \(-\mathrm{K}, \mathrm{Z}]\)

\section*{ULMACEAE Mirbel 1815 (Elm Family)}
[also see CANNABACEAE]
As here circumscribed (excluding the Celtidaceae), a family of \(6-7\) genera and about 35 species, of temperate, subtropical, and boreal Northern Hemisphere, rarely extending into the Southern Hemisphere). Zavada \& Kim (1996) discuss compelling reasons to
recognize the Celtis from the Ulmaceae. The distinctiveness of the Celtidaceae from the Cannabaceae and Moraceae is more questionable. References: Sherman-Broyles, Barker, \& Schulz in FNA (1997); Zavada \& Kim (1996); Todzia in Kubitzki, Rohwer, \& Bittrich (1993).

1 Leaves strongly 3-veined from the base, the venation otherwise pinnate; fruit a drupe with thin flesh
[Celtis -- see CANNABACEAE]
1 Leaf venation pinnate throughout, the venation strictly pinnate; fruit dry, a samara (flat and winged) or nutlike (with numerous fleshy protuberances).
2 Fruit nutlike (with numerous fleshy protuberances); primary lateral veins mostly forking before reaching the margin; [small trees of swamp forests of the Coastal Plain from se. NC and SC southwards]

Planera
2 Fruit a samara (flat and winged); primary lateral veins mostly parallel and unforked to the leaf margin; [small to large trees, widespread in our area]

Ulmus

\section*{Planera J.F. Gmelin 1791 (Planer-tree, Water-elm)}

A monotypic genus, a tree, of temperate se. North America. References: Barker in FNA (1997); Todzia in Kubitzki, Rohwer, \& Bittrich (1993).

Planera aquatica (Walter) J.F. Gmelin, Planer-tree, Water-elm. Cp (GA, NC, SC): river swamps where flooded (often to depths of 1-2 m) in the winter; common (uncommon in NC and limited to the Waccamaw River and the Lumber River). Se. NC south to n . FL, west to e. TX, and north in the Mississippi Embayment to w. TN, w. KY, s. IL, and se. MO. [= RAB, C, F, FNA, G, GW, K, S]

Ulmus Linnaeus 1753 (Elm)
A genus of about 25-30 species, trees (rarely shrubs), of temperate and boreal regions of the Northern Hemisphere (most diverse in c. and n. Asia). References: Sherman-Broyles in FNA (1997); Wiegrefe, Sytsma, \& Guries (1994); Kurz \& Godfrey (1962)=Z; Todzia in Kubitzki, Rohwer, \& Bittrich (1993). Key adapted in part from FNA.

1 Leaf blades mostly less than 7 cm long, the base symmetrical to somewhat oblique.
2 Samaras ciliate-margined; twigs often cork-winged; upper surfaces of leaves glabrous to scabrous; [native trees, sometimes weedy].
3 Leaf apex acute; flowers appearing in the late winter to late spring; calyx lobes 5; upper surfaces of leaves glabrous to somewhat scabrous; [widespread in our area; [subgenus Oreoptelea, section Chaetoptelea] ............ U. alata
3 Leaf apex obtuse; flowers appearing in the late summer to fall; calyx lobes 6-9; upper surfaces of leaves harshly scabrous; [of w. TN, w. MS westwards, and in FL]; [subgenus Oreoptelea, section Trichoptelea] . . . [U. crassifolia]
2 Samaras with glabrous margins; twigs never cork-winged; upper surfaces of leaves glabrous; [introduced trees, planted
and sometimes naturalized or persistent]; [subgenus Ulmus, section Microptelea].
4 Flowers appearing in the late summer to fall; leaf base generally oblique; leaves 1.5-2.5 cm wide, 5 or more of the lateral veins forked per side
U. parvifolia

4 Flowers appearing in the late winter to late spring; leaf base generally symmetrical; leaves 2-3.5 cm wide, 3 or fewer of the lateral veins forked per side
U. pumila

1 Leaf blades mostly more than 7 cm long, the base moderately to strongly oblique (rarely nearly symmetrical).
5 Leaf uppersurface slightly to very strongly scabrous; leaf undersurface tomentose or villous, with tufts of hairs in the vein axils; flowers and fruits sessile or subsessile (on pedicels \(0-2 \mathrm{~mm}\) long), not pendulous, in dense fascicles; [subgenus Ulmus, section Ulmus].
6 Leaves with ciliate margins; samara pubescent on the body with reddish hairs; bud scales red, the margins redtomentose; [native tree]
U. rubra

6 Leaves without ciliate margins; samara glabrous except along the margin of the notched apex or on the central vein of the wing; bud scales brown, margins pale-cilate; [introduced tree, planted and sometimes naturalized or persistent] \(7 \quad\) Leaf base strongly oblique, the lower side overlapping the petiole; branchlets not corky; samara glabrous except on the central vein of the wing
[U. glabra]
7 Leaf base oblique but not overlapping the petiole; branchlets with corky wings; samara glabrous except along the margin of the notched apex . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . U. procera
5 Leaf uppersurface glabrous (or slightly to moderately scabrous on stump sprouts or seedlings); leaf undersurface glabrous to tomentose, with or without tufts of hairs in the vein axils; flowers and fruits pedicellate (on pedicels \(5-20 \mathrm{~mm}\) long), pendulous, in fascicles or racemes.
8 Leaf undersurfaces glabrous or slightly pubescent, but always with tufts of hairs in the vein axils; branches never with corky wings; inflorescence a fascicle; [trees widespread in our area]; [subgenus Oreoptelea, section Blepharocarpus].
9 Leaf bases strongly oblique; larger leaves \(10-15 \mathrm{~cm}\) long; primary leaf teeth acuminate, often curved inward; [tree widespread in our area]
U. americana var. americana

9 Leaf bases moderately oblique (rarely nearly symmetrical); larger leaves 7-10 cm long; primary leaf teeth acute,

\section*{not curved; [tree restricted to moist calcareous sites in the Coastal Plain of se. NC southwards]}

\section*{U. americana var. floridana}

8 Leaf undersurfaces moderately white or yellowish soft-pubescent, lacking prominant tufts of hairs in the vein axils (differing from the general pubescence of the surface); branches often developing corky wings; inflorescence a raceme or racemose cyme; [trees of calcareous areas immediately west of our area]; [subgenus Oreoptelea, section Trichoptelea].
10 Leaves 7-8 (-14) cm long, lanceolate to ovate, the undersurface with yellowish-gold pubescence; buds and young twigs glabrous; calyx lobes \(5-6\); seeds thickened . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . U. serotina
10 Leaves 9-11 (-16) cm long, obovate, the undersurface with whitish pubescence; buds and young twigs pubescent; calyx lobes 7-8; seeds inflated [U. thomasii]

Ulmus alata Michaux, Winged Elm. Cp, Pd, Mt (GA, NC, SC, VA): rock outcrops, dry and mesic forests and woodlands, bottomlands, old fields, disturbed areas, common (rare in the Mountains). February-March; March-April. N. VA west to MO, south to \(c\). peninsular FL and c. TX. [= RAB, C, F, FNA, G, GW, K, S, W, Z]

Ulmus americana Linnaeus var. americana, American Elm, White Elm. Cp, Pd, Mt (GA, NC, SC, VA): swamps, bottomland forests, moist slopes, especially on relatively or strongly nutrient-rich substrates; common (rare in Mountains of NC and SC). February-March; March-April. Nova Scotia, New Brunswick and Québec west to se. Saskatchewan, south to n. FL and c. TX. An ascomycetous fungus, Ceratocystis ulmi, is the cause of the Dutch Elm disease. In our area, the effects of the disease appear to have been mild or nonexistent, especially in natural areas. [= Z; < U. americana -- RAB, C, F, FNA, G, GW, K, W; = U. americana -S]

Ulmus americana Linnaeus var. floridana, Florida Elm. Cp (GA, NC, SC): shell middens, other calcareous forests; uncommon. January-March; February-April. Se. NC south to c. peninsular FL, west to panhandle FL. \([=Z\); < U. americana -- RAB, C, F, FNA, G, GW, K, S, W; = U. floridana Chapman -- S]
* Ulmus parvifolia Jacquin, Chinese Elm, Lacebark Elm. Cp, Mt (VA), Pd (NC, VA): disturbed areas; rare, introduced from China and Japan. August-October; September-November. [= FNA, K]
* Ulmus procera Salisbury, English Elm, English Cork Elm. Cp (NC, VA), Pd, Mt (VA): disturbed areas; rare, introduced from Europe. [= C, FNA, K; U. minor P. Miller, misapplied]

Ulmus pumila Linnaeus, Siberian Elm, Dwarf Elm. Cp (NC, VA), Pd, Mt (VA): disturbed areas; rare, introduced from Asia. [= C, F, FNA, K]

Ulmus rubra Muhlenberg, Slippery Elm, Red Elm. Mt, Pd, Cp (GA, NC, SC, VA): moist to fairly dry calcareous forests, rich bottomlands, rich cove forests in the low Mountains; common (rare in Coastal Plain of GA, NC, and SC). February-March; MarchApril. ME, Québec, and Ontario west to MN and ND, south to panhandle FL and c. TX. [= RAB, C, FNA, G, K, W, Z; = U. fulva Michaux -- S]

Ulmus serotina Sargent, September Elm. Mt (GA): mesic limestone forests; rare (GA Rare). KY, s. IL, and e. OK south to e. TN, nw. GA, AL, and MS. It was collected on the French Broad River by Rugel in 1842, and has been attributed to NC by Mohr. [= C, FNA, F, G, K, S]

Ulmus crassifolia Nuttall, Cedar Elm. Bottomlands, mesic forests. W. TN, s. MO, and OK south to MS, LA, and TX; disjunct in e. Panhandle FL. [= FNA, K, S, Z]
* Ulmus glabra Hudson, Wych Elm, Scotch Elm. Introduced from Europe in ne. United States; reported from VA and DC (Sherman-Broyles in FNA 1997), but may only be cultivated. [= FNA, C, F, K]

Ulmus thomasii Sargent, Cork Elm, Rock Elm. Rocky or rich slopes, especially over limestone. Québec to MN and NE, south to \(\mathrm{NJ}, \mathrm{MD}, \mathrm{PA}, \mathrm{WV}, \mathrm{KY}, \mathrm{TN}, \mathrm{AR}\), and KS. [= C, FNA, K; = U. thomasi -- F, G, orthographic variant]

URTICACEAE A.L. de Jussieu 1789 (Nettle Family)

A family of about 45 genera and 1000 species, herbs, shrubs, vines, and trees, of cosmopolitan distribution in tropical, subtropical, and temperate regions. References: Boufford in FNA (1997); Friis in Kubitzki, Rohwer, \& Bittrich (1993); Miller (1971a).

1 Leaves alternate.
2 Flowers in axillary spikes; woody herb to 4 m tall; [tribe Boehmerieae] . . . . . . . . . . . . . . . . . . . . . . . . . . Boehmeria nivea
2 Flowers in terminal panicles, axillary panicles, or axillary fascicles; herb to 1.5 m tall.
3 Leaves 4-13 cm wide, with stinging trichomes; [tribe Urticeae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Laportea
3 Leaves 0.8-2 cm wide, lacking stinging trichomes; [tribe Parietarieae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . Parietaria
1 Leaves opposite.
4 Plant with stinging trichomes, these having a distinct bulbous or cylindrical base, and a stiff, translucent apex; [tribe Urticeae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Urtica
4 Plant without stinging trichomes (or these minute and not apparent), the non-stinging hairs (if present) soft and flexible, lacking a bulbous or cylindrical base.
5 Flowers in axillary spikes; foliage dull, yellow-green; [tribe Boehmerieae] . . . . . . . . . . . . . . . Boehmeria cylindrica
5 Flowers in axillary panicles or fascicles; foliage shiny, bright green; [tribe Lecantheae] . . . . . . . . . . . . . . . . . . . Pilea

Boehmeria Jacquin 1760 (False-nettle)

A genus of about 80 species, trees, shrubs, and perennial herbs, of warm temperate, subtropical, and tropical regions of the Old World and New World. References: Friis in Kubitzki, Rohwer, \& Bittrich (1993).

1 Leaves opposite; monoecious herb to 1.5 m tall; [subgenus Duretia] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . B. cylindrica
1 Leaves alternate; dioecious herb to 4 m tall; [subgenus Tilocnide] B. nivea

Boehmeria cylindrica (Linnaeus) Swartz, False-nettle. Cp, Pd, Mt (GA, NC, SC, VA): swamp forests, bottomlands, bogs, marshes, other wetlands; common. July-August; September-October. Québec and MN south to FL and NM. [= RAB, C, FNA, G, GW, K, W; > B. cylindrica var. cylindrica - F; > B. cylindrica var. drummondiana (Weddell) Weddell -- F; > B. cylindrica - S; > B. drummondiana Weddell -- S]
* Boehmeria nivea (Linnaeus) Gaudichaud-Beaupré, Ramie. Cp (SC): waste ground; rare, introduced from Asia. This plant is cultivated for the fiber of its stems, which is extracted and used for fabric in a manner reminiscent of linen (from Linum usitatissimum). [= RAB, FNA, K; = Ramium niveum (Linnaeus) Small -- S]

\section*{Laportea Gaudichaud-Beaupré 1830 (Wood-nettle)}

A genus of about 21 species, shrubs, perennial herbs, and annual herbs, of tropical and warm temperate e. Asia and temperate e. North America. References: Friis in Kubitzki, Rohwer, \& Bittrich (1993).

Laportea canadensis (Linnaeus) Weddell, Wood-nettle. Mt, Pd, Cp (GA, NC, SC, VA): moist, nutrient-rich forests, especially abundant in cove forests in the Mountains and bottomlands in the Piedmont; common (rare in Coastal Plain). Late June-August; late July-October. Nova Scotia and se. Manitoba south to panhandle FL and OK. By mid-summer, Laportea often becomes the aspect dominant in rich, moist cove forests of the mountains (especially those with extensive seepage), visually replacing the diverse spring flora. The stinging hairs can penetrate pants made of light-weight or loosely woven fabrics. [= RAB, C, F, FNA, G, GW, K, W; Urticastrum divaricatum (Linnaeus) Kuntze -- S]

\section*{Parietaria Linnaeus 1753 (Pellitory)}

A genus of about 20 species, annual and perennial herbs, of nearly cosmpolitan distribution. References: Hinton (1968)=Z; Friis in Kubitzki, Rohwer, \& Bittrich (1993).

1 Leaves softly pubescent; [alien weed]; [subgenus Parietaria] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. judaica
1 Leaves glabrescent; [native, sometimes weedy in calcareous or coastal areas]; [subgenus Freirea].
2 Main lateral veins diverging from the midvein above the usually narrowly cuneate leaf base; larger leaves \(2-5 \times\) as long as wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. pensylvanica var. pensylvanica
2 Main lateral veins diverging from the midvein at the usually truncate, rounded, or broadly cuneate leaf base; larger leaves \(1-2 \times\) as long as wide.
3 Achene without a flanged stipe, the minute apiculate tip located asymmetrically, the achene usually \(1.2(-1.4) \mathrm{mm}\) long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. praetermissa 3 Achene with a flanged stipe, the minute apiculate tip located symmetrically at the pole of the achene, the achene 0.8-1.0 mm long P. floridana
*? Parietaria floridana Nuttall, Florida Pellitory. Cp (GA, NC, SC): coastal shores, sometimes weedy in calcareous situations; rare, perhaps only introduced in our area (NC Watch List). March-frost; April-frost. DE south to FL and west to TX, on the outer Coastal Plain. This species has smaller leaves than P. praetermissa. [= FNA, GW, K, Z; P. nummularia Small -- C, F, S]
* Parietaria judaica Linnaeus, Pellitory-of-the-wall. Cp (VA): disturbed urban areas; rare, introduced from Europe. [= FNA, K; P. diffusa Mertens \& Koch]

Parietaria pensylvanica Muhlenberg ex Willdenow var. pensylvanica, Pennsylvania Pellitory, Rock Pellitory. Mt (GA, NC, VA), Pd, Cp (NC, VA): in circumneutral soils, such as in thin soils at the bases of calcareous or subcalcareous cliffs or on calcareous shale barrens; uncommon, rare in VA Coastal Plain and NC (GA Special Concern, NC Watch List). April-October; MayOctober. ME west to British Columbia, south to e. NC, w. NC, AL, TX, NV, and Mexico (though scattered and irregular in much of that area). Var. pensylvanica is eastern and northern; var. obtusa (Rydberg ex Small) Shinners is southwestern. [<P. pensylvanica -- C, FNA, G, GW, K, RAB, S, W, infraspecific taxa not recognized; = P. pensylvanica -- F (sensu stricto)]

Parietaria praetermissa Hinton, Coastal Pellitory. Cp (GA, NC, SC): shell middens, coastal hammocks; rare (NC Watch List). March-frost; April-frost. E. NC south to FL and west to LA. [= FNA, GW, K, Z; P. floridana Nuttall -- RAB, C, F, S, misapplied]

\section*{Pilea Lindley 1821 (Clearweed)}

A genus of about 250 species, annual and perennial herbs, nearly cosmpolitan in tropical and warm temperate regions of the Old World and the New World. References: Friis in Kubitzki, Rohwer, \& Bittrich (1993).
 Achene \(1.5-2 \times\) as long as broad, smooth, green or light brown, with slightly raised dark to black lines and mottlings . . . . .
\(\ldots \ldots \ldots \ldots \ldots\)

Pilea fontana (Lunell) Rydberg, Blackfruit Clearweed, Lesser Clearweed. Cp, Mt (NC, SC, VA), Pd (NC, SC): swamp forests, freshwater marshes, calcareous wetlands; common (SC Rare List). August-September; September-November. E. Canada west to MN and ND, south to FL, IN, and NE. Only reliably distinguishable from \(P\). pumila using fruits, \(P\). fontana is, however, somewhat less shiny and transparent-translucent. [= RAB, C, F, FNA, G, GW, K, W; < Adicea pumila (Linnaeus) Rafinesque -- S]
* Pilea microphylla (Linnaeus) Liebmann, Rockweed, Artillery Weed. Cp (GA, SC): old rock and brick walls, urban areas; rare. January-December. Although listed by RAB for the Carolinas as "a weed in and around greenhouses, not established as part of our flora," this species is well-established and weedy in Charleston, SC and Savannah, GA. It is presumably adventive from further south. [= RAB, FNA, K, S]

Pilea pumila (Linnaeus) A. Gray, Greenfruit Clearweed, Coolwort, Richweed. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): swamp forests, bottomlands, freshwater marshes; common. August-September; September-November. Québec west to MN, south to FL, LA, and OK. [= RAB, C, FNA, G, GW, W; >P. pumila var. pumila -- F, K; >P. pumila var. deamii (Lunell) Fernald \(-\mathrm{F}, \mathrm{K}\); < Adicea pumila (Linnaeus) Rafinesque -- \(S\) (including in concept \(P\). fontana)]

\section*{Urtica Linnaeus 1753 (Stinging Nettle)}

A genus of about 80 species, annual and perennial herbs, nearly cosmpolitan, but primarily in temperate regions of the Northern Hemisphere. References: Woodland (1982)=Z; Woodland, Bassett, Crompton, \& Forget (1982); Friis in Kubitzki, Rohwer, \& Bittrich (1993).

1 Tap-rooted annual; stipules 1-3 mm long, spreading or deflexed; inflorescences usually shorter than the subtending leaf petiole, each panicle consisting of a mixture of pistillate and staminate flowers.
2 Flower clusters subglobose; mature achenes ovate, 1-1.5 mm long, less than 1 mm wide; leaf teeth generally blunt, the sides of the tooth convex
U. chamaedryoides

2 Flower clusters elongate; mature achenes triangular, 1.5-2.5 mm long, 1-1.5 mm wide; leaf teeth generally sharp, the sides of the tooth straight . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . U. U
1 Rhizomatous perennial; stipules \(5-15 \mathrm{~mm}\) long, erect; inflorescences usually surpassing the subtending leaf petiole, each panicle of either pistillate or staminate flowers.
3 Plants dioecious (male and female flowers always on separate plants); stems usually weak, sprawling, branching; stems strongly hispid with stinging hairs; leaf blades strongly hispid with stinging hairs on both surfaces; leaf teeth commonly 5-6 mm long
U. dioica

3 Plants mostly monoecious (with male and female flowers in separate inflorescences on the same plant), rarely an entire plant male or female; stems upright, erect, less branched; stems glabrous to puberulent or strigose, lacking (or nearly so) stinging hairs; leaf blades glabrous or glabrescent above (lacking stinging hairs), glabrous to puberulent below (with some stinging hairs); leaf teeth commonly 2-3.5 mm long.
U. gracilis

Urtica chamaedryoides Pursh, Dwarf Stinging Nettle. Cp (GA, NC, SC), Pd (NC, SC): rich moist soil, usually on floodplains; rare (NC Rare). November-May; May-July. WV, KY, se. MO and OK south to FL, TX, and Mexico; very rare east of the Blue Ridge. Notable locations in our area include Stevens Creek (Richmond County, SC), and various sites on very rich levees of the Roanoke River (NC). Gaddy \& Rayner (1980) report the common winter flowering of this species in our area. [= RAB, C, F, FNA, G, K, S, Z]
* Urtica dioica Linnaeus, European Stinging Nettle, Great Nettle. Mt, Cp (GA, NC, VA), Pd (NC, VA): disturbed areas, primarily in calcareous soils; uncommon, introduced from Europe. May-July; July-September. See U. gracilis for discussion of the two taxa. [=F, S; < U. dioica -- RAB, W (also see U. gracilis); = U. dioica var. dioica -- C, G; = U. dioica ssp. dioica -- FNA, K, Z]

Urtica gracilis Aiton, American Stinging Nettle. Mt (NC?, VA), Pd (VA): bottomland forests and edges, particularly over limestone; rare (NC Watch List). May-July; July-September. Labrador and Nova Scotia west to AK, south to sw. VA, w. NC (?), s. \(\mathrm{OH}, \mathrm{s} . \mathrm{IL}, \mathrm{s} . \mathrm{MO}, \mathrm{n} . \mathrm{TX}, \mathrm{s}\). NM, and se. AZ. The native stinging nettle of e. and c. North America is best treated as specifically distinct from U. dioica of Europe. Woodland (1982) and Woodland, Bassett, Crompton, \& Forget (1982) showed that U. gracilis differs from \(U\). dioica in a variety of morphologic characters (see key), chromosome number ( \(2 \mathrm{n}=26\) for \(U\). gracilis, \(2 \mathrm{n}=52\) for \(U\). dioica), breeding system (monoecy vs. dioecy), and distribution (North American vs. Eurasian); furthermore, the two taxa could not be crossed. Woodland (1982) chose subspecific status, apparently to emphasize the close relationship of the two (and a third taxa in \(\mathbf{w}\). North America). The combination of morphological distinctiveness, allopatry, major differences in species biology, and incompatability seem adequate to warrant separation as species, however. Until herbaria can be checked, it is uncertain whether \(U\). gracilis occurs in NC. F (as U. procera), G (as U. dioica var. procera and S include NC in the range; Woodland (1982), however, showed the range as extending only south to VA. \([=S ;<U\). dioica -- RAB, W; = U. dioica Linnaeus var. procera (Muhlenberg ex Willdenow) Weddell -- C, G; > U. gracilis Aiton - F; > U. procera Muhlenberg -- F; = U. dioica Linnaeus ssp. gracilis (Aiton) Selander -- FNA, K, Z]
* Urtica urens Linnaeus, Burning Nettle, Dog-nettle, Small Nettle. Cp (SC), Mt (VA), \{GA\}: disturbed areas; rare, introduced from Eurasia. April-May; May-July. [= RAB, C, F, FNA, G, K, S, Z]

\section*{VALERIANACEAE (Valerian Family)}

A family of about 10 genera and 300-350 species, herbs (rarely shrubs), nearly cosmopolitan in distribution. References: Bell (2004); Ferguson (1965).

Valeriana Linnaeus (Valerian)

A genus of about 200 species, herbs and shrubs, of temperate North America and Eurasia, s. Africa, and Andean South America.
```

1 Corolla tube $3-4 \mathrm{~mm}$ long
[V. officinalis]

```

1 Corolla tube 12-16 mm long
V. pauciflora

Valeriana pauciflora Michaux, Pink Valerian, Long-tube Valerian. Pd (VA): very nutrient-rich alluvium in floodplain forests; rare. May; June. MD, se. PA, and sw. PA, west to s. IL, south to n. VA, sc. TN, KY, and MO. [= C, F, G, K, W]
* Valeriana officinalis Linnaeus, Garden-heliotrope, is a European species sometimes cultivated in our area; it may escape or persist. [= C, K]

\section*{Valerianella P. Miller (Corn-salad)}

A genus of about 50 species, herbs, of temperate North America, Eurasia, and \(n\). Africa. Valerianella species exhibit an interesting set of fruit polymorphisms; the fruit forms in a single species are often strikingly different, and these forms were traditionally regarded as separate taxa. Ware (1983) demonstrated that they were under simple genetic control, and that different fruit forms were found in the same population. Thus, some taxa previously considered distinct are best considered mere fruit types. The fruit consists of three locules, one of which is fertile and dorsal to or more-or-less flanked by the two sterile locules. The sterile locules may be elongate, forming (between them) a groove, or they may be expanded laterally well beyond the width of the fertile locule into flattened or bulbous wings. In V. locusta, there is additionally a corky mass on the side of the fertile locule opposite the two sterile locules. References: Ware (1983)=Z.

1 Fruit greatly thickened by a corky mass on the back of the fertile locule; corolla pale blue (or white) .............. V. Iocusta 1 Fruit lacking a corky mass on the back of the fertile locule; corolla white.

2 Corolla 1.5-2 mm long, the corolla lobes \(0.4-0.8 \mathrm{~mm}\) long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . V. radiata 2 Corolla 3-5 mm long, the corolla lobes 1-2 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . V. umbilicata
* Valerianella locusta (Linnaeus) Lat., European Corn-salad. Pd (GA, NC, SC, VA), Cp (NC, VA), Mt (GA, NC, VA): roadsides, moist forests, bottomlands, disturbed areas; common, introduced from Europe. April-May. [= RAB, K, S, Z; V. olitoria (Linnaeus) Pollich -- F, G]

Valerianella radiata (Linnaeus) Dufresne. Cp, Pd, Mt (GA, NC, SC, VA): moist forests, bottomlands, disturbed areas; common. April-May. VA, s. IL, and KS, south to FL and TX. [= RAB, F, K, S, Z; V. radiata var. fernaldii Dyal -- F; V. radiata var. radiata -- G]

Valerianella umbilicata (Sullivant) Wood. Pd, Mt (NC, VA), Cp (VA), \{SC?\}: moist forests, bottomlands, disturbed areas; rare. S. NY west to IL, south to NC and sc. TN (Chester, Wofford, \& Kral 1997). Ware (1983) raises the question of whether V. woodsiana is a distinct taxon; further study is needed. [= RAB, F, G, K, S, Z; V. patellaria (Sullivant ex A. Gray) Wood -- F, S; V. intermedia Dyal -- F; V. radiata var. intermedia (Dyal) Gleason -- G; V. woodsiana (Torrey \& A. Gray) Walpers -- K, S, Z]

Valerianella chenopodiifolia (Pursh) Augustin de Candolle ranges south to s. PA, MD, and WV (Kartesz 1999) and might be expected in the northern part of our area. [= K; V. chenopodifolia -- C, orthographic variant] \{not yet keyed; add synonymy\}
* Valerianella dentata (Linnaeus) Pollich is reported as naturalized in central TN by Kral (1981) and Chester et al. (1997), in nc. GA (Jones \& Coile 1988), and in AL (Kartesz 1999). [= K] \{not yet keyed; add synonymy\}

VERBENACEAE (Verbena Family)
(also see LAMIACEAE and PHRYMACEAE)
As recently reworked, a family of about 34-41 genera and 950-1200 species, trees, shrubs, vines, and herbs, widespread in tropical, subtropical, and warm temperate regions of the Old World and New World. References: Atkins in Kadereit (2004).
tribe Verbeneae: Glandularia, Stylodon, Verbena.
tribe Lantaneae: Aloysia, Lantana, Phyla.

\section*{Aloysia Palau 1784 (Bee-brush)}

A genus of about 30 species, shrubs, of tropical and subtropical America. References: Atkins in Kadereit (2004).
* Aloysia triphylla (L'Héritier) Britton, Lemon Bee-brush, is allegedly introduced in Iredell County, in the Piedmont of NC (Moldenke 1980); the documentation is unknown. [= K]

\section*{Glandularia J.F. Gmelin 1796 (Vervain)}

A genus of about 100 species, herbs, of \(s\). North America, Central America, and South America. References: Umber (1979)=Z; Atkins in Kadereit (2004).

1 Leaves finely dissected, the divisions 1 mm or less wide, the margins strongly revolute
G. pulchella

1 Leaves coarsely dissected or lobed, the divisions more than 1 mm wide, the margins slightly or not at all revolute.
2 Calyx lobes \(3-4 \mathrm{~mm}\) or more long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . G. canadensis

Glandularia canadensis (Linnaeus) Nuttall, Rose Vervain, Rose Verbena, Creeping Vervain. Cp (GA, NC, SC, VA), Pd (GA, NC, SC): roadsides, sandhills, other dry (especially sandy) soils; uncommon. March-May. PA, IL, and CO, south to FL and TX, and introduced elsewhere. [= K, S, Z; = Verbena canadensis Linnaeus -- RAB, C, F, G]
* Glandularia \(\times\) hybrida (Grönland \& Rümpler) Nesom \& Pruski, Garden Vervain. Cp (SC): cultivated in gardens; uncommonly cultivated, rarely escaped or persistent. March-July. Nesom \& Pruski (1992) have provided the transfer to Glandularia of this common garden plant. [= Verbena \(\times\) hybrida Grönland \& Rümpler -- RAB, G, K; = Verbena hybrida -- C]
* Glandularia pulchella (Sweet) Troncoso, Moss Vervain, South American Vervain. Cp (GA, NC, SC), Pd (GA, SC): pastures, roadsides, other disturbed areas; common, introduced from South America. March-November. [=K, Z; Verbena tenuisecta Briquet -- RAB, C; G. tenuisecta (Briquet) Small -- S]

Glandularia bipinnatifida (Nuttall) Nuttall var. bipinnatifida, Dakota Vervain. Mt (GA): dry prairies on clay soils; rare (GA Special Concern). East to KY, TN, nw. GA, AL, and MD (Kartesz 1999). [= K; = Verbena bipinnatifida Nuttall - C] \{not yet keyed; add synonymy\}

\section*{Lantana Linnaeus 1753 (Lantana)}

A genus of about 150 species, shrubs and subshrubs, of tropical and subtropical America and Africa. References: Sanders (1987) \(=\) Z; Atkins in Kadereit (2004).
* Lantana camara Linnaeus, Common Lantana, Hedgeflower. Cp (GA, NC, SC). [= RAB, K, S, Z]
*? Lantana depressa Small var. floridana (Moldenke) R. Sanders, Florida Lantana. Cp (SC): edges of brackish marshes, dunes; rare, apparently introduced from FL. Native from ne. FL south to se. FL. [=K, Z; < L. ovatifolia Britton -- RAB, S, misapplied; <L. depressa Small - S]
* Lantana montevidensis (Sprengel) Briquet, Trailing Shrub-verbena. Cp (GA): disturbed areas; rare, introduced. Scattered locations in s. and e. GA (Jones \& Coile 1988). [= K]
* Lantana urticoides Hayek, West Indian Lantana. Cp (NC?, SC): [=K; <L. horrida Kunth -- RAB, misapplied]
\[
\text { Phyla Loureiro } 1790 \text { (Frogfruit, "Fogfruit") }
\]

A genus of about 11-15 species, herbs, of tropical, subtropical, and warm temperate regions of the Old and New Worlds. References: Atkins in Kadereit (2004).

1 Leaves 2-6 cm long, lanceolate, widest at or below the middle, acute at the tip; leaf teeth (5-) 7-11 per leaf side
Ph lanceolata
1 Leaves 1-4 cm long, obovate, widest above the middle, obtuse to rounded at the tip; leaf teeth (3-) 5 (-7) per leaf side
\(\qquad\)

Phyla lanceolata (Michaux) Greene, Marsh Frogfruit, Northern Frogfruit. Cp (GA, NC, SC, VA), Pd, Mt (VA): brackish marshes, other marshes, ditches; common (GA Special Concern). June-November. Ontario west to SD, south to ne. FL, AL, MS, LA, CA, and n. Mexico; primarily in the outer Coastal Plain in the Carolinas, but extending inland in VA. [= C, G, GW, K, S, W; = Lippia lanceolata Michaux -- RAB; > L. lanceolata var. lanceolata - F; > Lippia lanceolata var. recognita Fernald \& Griscom -- F]

Phyla nodiflora (Linnaeus) Greene, Creeping Frogfruit, Capeweed, Turkey-tangle, Matgrass. Cp (GA, NC, SC, VA): sandy soils of roadsides, lawns, ditches, disturbed areas; common (VA Rare List). May-November. Pantropical, in North America from se. VA south to s. FL and west to CA, north in the interior to AR, se. MO, and southwards into the tropics. This species is very weedy, and is a familiar component of road margins and lawns in the southeastern Coastal Plain. [= C, G, GW, K, S; = Lippia nodiflora
(Linnaeus) Michaux -- RAB, F]

Stylodon Rafinesque 1825 (Carolina-vervain)
A monotypic genus, an herb, of se. North America. References: Atkins in Kadereit (2004).

Stylodon carneus (Medikus) Moldenke, Carolina-vervain. Cp (GA, NC, SC, VA?): sandy woodlands, sandhills; uncommon. April-July. E. NC (se. VA?) south to c. peninsular FL, west to e. TX. [= K; = Verbena carnea Medikus -- RAB, F; = Stylodon carolinensis (Walter) Small -- S]

\section*{Verbena Linnaeus 1753 (Verbena, Vervain)}
(also see Glandularia and Stylodon)
A genus of about 200-250 species, herbs, of tropical, subtropical, and warm temperate regions of the New World and (rarely) Old World. References: Barber (1982)=Z; Atkins in Kadereit (2004).
* Verbena bonariensis Linnaeus. Cp (GA, NC, SC, VA), Pd (GA, NC, SC): introduced from South America. [= RAB, C, G, GW, S; > V. bonariensis var. bonariensis -K; > V. bonariensis var. conglomerata Briq. -- K]

Verbena bracteata Lagasca \& Rodriguez, Prostrate Vervain. Cp (GA, NC, VA), Pd (GA, NC), Mt (NC): [= RAB, C, F, G, K, Z; =? V. bracteosa Michaux -- S]
* Verbena brasiliensis Vellozo, Brazilian Vervain. Cp, Pd (GA, NC, SC, VA), Mt (GA, NC): introduced from South America. [= RAB, C, F, G, GW, K, S]

Verbena xengelmannii Moldenke [Verbena hastata \(\times\) urticifolia]. Mt (NC), Cp (GA), \{VA\}: [= RAB, C, K]
Verbena halei Small. Cp (GA, NC, SC): ? introduced from farther west. [= RAB, K, S; = V. officinalis ssp. halei (Small) Barber -- Z]

Verbena hastata Linnaeus, Common Vervain, Blue Vervain, Simpler's-joy. Cp, Pd, Mt (NC, VA), \{GA, SC\}: [= RAB, C, F, G, GW, S, W, Z; > V. hastata var. hastata -- K; > V. hastata var. scabra Moldenke -- K]
* Verbena officinalis Linnaeus, European Vervain, Juno's Tears, Herb-of-the-cross. Cp (GA, NC, SC, VA), Mt (NC, VA), Pd (VA): [=RAB, C, F, G, S; > V. officinalis var. officinalis - K; >V. officinalis var. prostrata Gren. \& Godr. -- K; = V. officinalis ssp. officinalis -- Z]
* Verbena rigida Sprengel. Cp (GA, NC, SC, VA), Pd (GA): introduced from South America. [= K, S]

Verbena riparia Rafinesque ex Small \& Heller, Riverbank Vervain. Mt (NC, VA), Pd (NC): [= RAB, C, F, G, K, S, W]
Verbena scabra Vahl, Rough Vervain, Harsh Vervain. Cp (GA, NC, SC, VA), Pd (GA, VA?), Mt? (VA?): [= RAB, C, F, G, GW, K, S]

Verbena simplex Lehmann, Narrowleaf Vervain. Pd (GA, NC, SC, VA), Mt (GA, VA), Cp (VA): [=RAB, C, F, G, K, W, Z; ? V. angustifolia Michaux -- S]

Verbena stricta Ventenat, Hoary Vervain. Cp (NC), Pd (GA): [= RAB, C, F, G, K, S, W, Z]
Verbena urticifolia Linnaeus var. leiocarpa Perry \& Fernald, Velvetleaf Vervain. \{Cp, Pd, Mt (NC, SC, VA): \} [= C, F, G, K; < V. urticifolia -- RAB, GW, W, Z; < V. urticaefolia -- S, orthographic variant]

Verbena urticifolia Linnaeus var. urticifolia, White Vervain. \{GA, NC, SC, VA\}[=C,F,G,K; <V. urticifolia -- RAB, GW, W, Z; < V. urticaefolia -- S, orthographic variant]

Verbena canescens Kunth. AL. [= K]
Verbena carolina Linnaeus. AL and MS. [= K]
Verbena litoralis Kunth. Cp (GA): scattered sites in e. and s. GA (Jones \& Coile 1988). [=K; = V. littoralis - S, orthographic variant] \{add synonymy\}

Verbena xutha Lehmann, Gulf Vervain. AL west to TX. [= K, S]

\section*{VIOLACEAE (Violet Family)}

A family of about 20 genera and 900 species, herbs, shrubs, and vines, cosmopolitan in distribution. References: McKinney \& Russell (2002)=X.

1 Plants caulescent, 4-10 dm tall, the leaves narrowly cuneate to a petiole 0-20 mm long, also long acuminate; petals green; fruit \(15-20 \mathrm{~mm}\) long

Hybanthus
1 Plants acaulescent or caulescent, 0-5 dm tall, if caulescent, the leaves not at the same time cuneate, short-petiolate, and acuminate; petals white, yellow, violet, or blue, the lowermost spurred; fruit less than 13 mm long

Hybanthus Jacquin (Green-violet)
A genus of about 70-150 species, shrubs and herbs, of tropical and warm temperate regions of the Old and New Worlds.

References: McKinney \& Russell (2002)=X; Wofford et al. (2004).
1 Leaves 9-17 cm long, entire (or with a few obscure teeth); capsule 15-20 mm long; seeds ca. 4 mm long; [native, of nutrientrich forests] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . H. concolor
1 Leaves \(0.6-3 \mathrm{~cm}\) long, finely crenate; capsule \(3-4 \mathrm{~mm}\) long; seeds ca. 1.5 mm long; [alien, of weedy areas] ... H. parviflorus
Hybanthus concolor (T.F. Forster) Sprengel, Green-violet. Pd, Mt (GA, NC, SC, VA), Cp (GA, VA): very nutrient-rich and mesic forests; uncommon. Cleistogamous flowers: April-early May; late May-June. Chasmogamous flowers: Late May-June; August-October. VT and s. Ontario west to MI and KS, south to SC, GA, and AR. [= RAB, C, F, G, K, W, X; = Cubelium concolor (T.F. Forster) Rafinesque -- S]
* Hybanthus parviflorus (Mutis ex Linnaeus f.) Baill. Cp (GA): disturbed area; rare, introduced from South America. April. First collected in North America in New Jersey in the \(19^{\text {th }}\) century; and again in 1998 by Tom Govus at Fort Pulaski National Monument (Chatham County, GA). It is unclear whether this is a recent introduction or an old weed introduced via ship's ballast (Wofford et al. 2004).

Viola Linnaeus (Violet, Johnny-jump-up, Pansy)
(contributed by B.A. Sorrie and A.S. Weakley)
A genus of about 525-600 species, herbs (rarely subshrubs), of temperate regions of the Old and New Worlds. References: Ballard (1992)=Z; Gil-ad (1998)=Y; McKinney \& Russell (2002)=X; Haines (2001)=V; McKinney (1992); Ballard \& Wujek (1994); Russell (1955); Ballard, Sytsma, \& Kowal (1999). Key adapted, in part, from Ballard (1992) and Ballard \& Wujek (1994).

1 Plant caulescent (producing aerial stems bearing leaves and flowers).
2 Corolla yellow, or white with a yellow center (sometimes drying lavender); stipules entire or erose .............. Key A
2 Corolla wholly cream-colored, or cream with a yellow center, or blue-violet, or multicolored (blue or violet with orange or yellow)

Key B
1 Plant acaulescent (with leaf petioles and flower stalks arising separately from the base of the plant).
3 Corolla yellow; leaves borne more-or-less flat on the ground . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Key C
3 Corolla white, blue-violet, or blue-and-white variegated.
4 Plant producing stolons; corolla white (or blue in V. appalachiensis, V. walteri, and V. odorata) ............. Key D
4 Plant not producing stolons; corolla blue-violet . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Key E

\section*{Key A -- Caulescent Violets with yellow or white flowers}

1 Corolla white with a yellow center (sometimes drying lavender); stipules long-triangular, attenuate

\section*{Key B -- Caulescent Violets with blue, cream, or multicolored flowers}

1 Stipules foliaceous, deeply lobed; leaves cuneate at base; [of weedy habitats].
2 Corolla pale blue with a cream center; petals \(2 \times\) as long as the sepals . . . . . . . . . . . . . . . . . . . . . . . . . . . . V. bicolor
2 Corolla either cream with a yellow center or multicolored; petals less than \(2 \times\) as long as the sepals.
3 Corolla cream with a yellow center; petals shorter than the sepals or longer by up to \(2 \mathrm{~mm} \ldots\). ..... V. arvensis
3 Corolla multicolored (cream to orange with a yellow center, the upper petals at least partly dark blue); petals longer than the sepals by 2 mm or more. .
V. tricolor

1 Stipules herbaceous, fringed along the margin; leaves truncate or cordate at the base; [section Viola].
4 Above-ground stems absent (surficial stolons present; style terminating in a slender hook ca. 1 mm long; capsules
hirtellous; [introduced, cultivated, rarely persistent or spreading] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . V. odorata
4 Above-ground stems present, ascending or prostrate (and stolon-loke rhizomes present in \(V\). appalachiensis and \(V\). walteri); style straight or terminating in a bent or recurved hook \(0-0.5 \mathrm{~mm}\) long; capsules glabrous; [native].
5 Stems immediately becoming prostrate at time of flowering; stems persistent through winter, rooting at the nodes, and generating the following year's plants at their tips (plants thus mat-forming).
6 Leaf blades with scattered hairs near the margin only; petioles, peduncles and stems glabrous; stipules

\section*{shallowly lacerate, with marginal processes less than \(1 / 4\) as long as the stipule}

6 Leaf blades moderately to densely puberulent over the entire surface; petioles, peduncles and stems moderately to densely puberulent; stipules deeply laciniate with marginal processes more than \(1 / 2\) as long as the stipule . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . V. walteri
5 Stems ascending to erect at time of flowering and fruiting; stems deciduous at end of growing season, not rooting at nodes (plants thus solitary).
\(7 \quad\) Lateral sepals glabrous within; corolla lavender, with a purple-black eyespot surrounding the throat; spur 7-20 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . V. rostrata
7 Lateral sepals bearded within; corolla uniformly creamy-white or blue (rarely white), lacking a contrasting eyespot around the throat; spur 3-6 mm long.
8 Sepal margins eciliate; flowers lavender to violet (rarely white in albino forms); spur mostly more than 5 mm long
8 Sepal margins distinctly ciliate; flowers creamy-white; spur mostly less than 5 mm long
V. Iabradorica
\[
\text { than } 5 \mathrm{~mm} \text { long . . . . . . V. striata }
\]

\section*{Key C -- Acaulescent Violets with yellow flowers}

One species in our area
V. rotundifolia

\section*{Key D -- Acaulescent Violets with stolons and white or blue flowers}

1 Flowers generally blue (white or blue-and-white variegated in V. odorata, which has the style terminating in a conic hook).
2 Above-ground stems absent (surficial stolons present); style terminating in a slender hook ca. 1 mm long; capsules hirtellous; [introduced, cultivated, rarely persistent or spreading]
V. odorata

2 Above-ground stems generally present, ascending or prostrate (and stolon-like rhizomes present); style straight or terminating in a bent or recurved hook 0-0.5 mm long; capsules glabrous; [native].
3 Leaf blades with scattered hairs near the margin only; petioles, peduncles and stems glabrous; stipules shallowly lacerate with marginal processes less than \(1 / 4\) as long as the stipule . . . . . . . . . . . . . . . . . . . V. appalachiensis
3 Leaf blades moderately to densely puberulent over the entire surface; petioles, peduncles and stems moderately to densely puberulent; stipules deeply laciniate with marginal processes more than \(1 / 2\) as long as the stipule V. walteri 1 Flowers white (and the style broad at the tip, in most species resembling a scoop). 4 Leaf blades more than \(1.5 \times\) as long as broad.

5 Leaf blades lance-ovate, broadly cuneate to subcordate at the base . . . . . . . . . . . . . . . . . . . . . . . V. primulifolia
5 Leaf blades linear to lanceolate, narrowly cuneate at the base.
6 Leaf blades lanceolate, less than \(8 \times\) as long as wide; plant glabrous
V. Ianceolata var. Ianceolata

6 Leaf blades linear or narrowly lanceolate, more than \(10 \times\) as long as wide; plant glabrous to pubescent
V. Ianceolata var. vittata

4 Leaf blades less than \(1.5 \times\) as long as broad.
7 Leaf blades completely glabrous (petioles may be villous); [of wet, acidic seepage or streamsides]
7 Leaf blades pubescent, at least on the upper surface of the basal lobes.
8 Lateral petals glabrous within; petioles and peduncles usually reddish-tinged; leaf apex acute; basal lobes of the leaf often overlapping; pubescence of the upper leaf surface often restricted to the basal lobes; [of mesic, often nutrient-rich forests]
V. blanda

8 Lateral petals bearded within; petioles and reduncles green; leaf apex obtuse to rounded; basal lobes of the leaf not overlapping; pubescence of the upper leaf surface usually widespread; [of mesic to wet situations]
V. incognita

\section*{Key E -- Acaulescent Violets without stolons, with blue-violet flowers}

1 Leaf blades deeply divided throughout, or lobed basally, or deeply toothed basally (the earliest 1-2 leaves may be simply cordate); [some species keyed both here and below].
2 Leaf blades deeply divided throughout into linear or lanceolate segments (or with several narrow lateral segments and a broadly lanceolate central segment), the leaf blade (in outline) about as broad as long.
3 Lateral petals glabrous within; stamens orange, conspicuously exserted; [of dry habitats] . . . . . . . . . . . . V. pedata
3 Lateral sepals bearded; stamens not orange and conspicuously exserted; [of moist to wet habitats, or dryish, basic sites].
4 Petioles and leaf blades (the lower leaf surface at least) moderately to densely pubescent; [of mesic to fairly dry, woodlands, over circumneutral to basic soils] V. palmata var. subsinuata

4 Petioles and leaves glabrous or glabrate with marginal ciliate hairs; [of moist to wet habitats].
5 Leaf segments 9-11, with a narrow central lobe \(1-2 \times\) as wide as the lateral lobes; peduncle equal to or shorter than the leaves; sepal auricles much longer than wide; [of ecotones at upper edges of alluvial or levee forests]
V. brittoniana var. brittoniana

5 Leaf segments 5-7, with a broadly lanceolate central lobe3-5× as wide as the lateral lobes; peduncle normally much longer than the leaves; sepal auricles wider than long or equal; [of mesic pine savannas and pocosin ecotones]
2 Leaf blades lobed or deeply toothed only towards the base.
6 Leaf blade outline oblong-lanceolate to ovate-triangular, much longer than wide.
\(7 \quad\) Petioles distinctly shorter than the leaf blades; leaf blades densely pubescent, the apex blunt, the basal teeth undeveloped or with a few coarse teeth on mature leaves; [of dry sandy clearings and banks] . . . V. fimbriatula
\(7 \quad\) Petioles equal to or longer than the leaf blades; leaf blades glabrate, the apex acute, the basal teeth welldeveloped, very coarse to lobe-like; [of mesic sandy soil of fields, meadows, and pine savannas] . V. sagittata
6 Leaf blade outline ovate to subrotund, about as wide as long.
8 Plant moderately to densely pubescent, at least on petioles and undersurfaces of leaves; mature leaves trilobed; [of mesic to dryish woodlands, in circumneutral or basic soils] . . . . . . . . . . V. palmata var. palmata
8 Plant glabrous or glabrate (hairs on leaf margins or on upper surface of the lobes); mature leaves either trilobed or 5-7-lobed; [of moist to wet habitats].
9 Mature leaves trilobed, with \(1(-2)\) reniform or obovate lobes on each side; spurred petal glabrous; [of streamsides, floodplains, levee forests]
9 Mature leaves deeply lobed with 2 3 lanceol pine savannas and pocosin ecotones]
V. septemloba

1 Leaf blades merely serrate along the margin, ovate to subrotund in outline, cordate to truncate at the base.
10 Leaf blades mostly longer than broad, narrowly ovate to long-triangular, tapering to an acute or even short-acuminate apex.
11 Foliage moderately to densely pubescent; leaves distinctly longer than wide; [of dry to mesic clearings and banks]..
V. fimbriatula

11 Foliage glabrous or glabrate; [plants of various habitats].
12 Lateral petals bearded with clavate hairs; spurred petal glabrous within; [of swamps and sphagnous

12 Lateral petals with hairs of essentially uniform width; spurred petal bearded within; [of various habitats]. 13 Basal teeth no larger than the others; leaf bases cordate; [of mesic forests, streamsides, and seeps]
V. affinis

13 Basal teeth longer than the others; leaf bases truncate to subcordate (ignore earliest 1-2 leaves).
14 Leaf outline broadly triangular, not much longer than wide; teeth on lower half of leaf numerous, pectinate . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . V. brittoniana var. pectinata
14 Leaf outline narrowly triangular-ovate, much longer than wide; basal teeth few, very coarse
V. sagittata

10 Leaf blades about as wide as long or wider, ovate to suborbicular, the apex obtuse to acute.
15 Lateral petals bearded with clavate hairs; foliage glabrous or glabrate.
16 Petals light blue or light violet-blue, with a dark eye and dark veins; sepals \(8-12 \mathrm{~mm}\) long; all plants in population with unlobed leaves; [primarily of the Mountains]
V. cucullata

16 Petals violet-blue, with a white eye and dark veins; sepals 6-7 (-8) mm long; at least some plants in population with trilobed leaves; [primarily of the Coastal Plain] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . V. esculenta 15 Lateral petals bearded with hairs of uniform width; foliage distinctly pubescent, glabrate, or glabrous.

17 Leaf blades glabrous or glabrate, or with hairs confined to just the basal lobes; petioles glabrous or glabrate. 18 Leaf blades with obvious area of hairs confined to upper surface of the basal lobes; spurred petal bearded; all plants in population with unlobed leaves
V. affinis

18 Leaf blades glabrous or glabrate, not as above; spurred petal glabrous or glabrate; all plants in population with unlobed leaves, or some leaves trilobed.
19 Blades green beneath; spurred petal glabrous; at least some plants in population with trilobed leaves
V. esculenta

19 Blades red-dotted or red-tinged beneath; spurred petal glabrous or glabrate; all plants in population with unlobed leaves
. V. sororia
17 Leaf blades moderately to densely pubescent on one or both surfaces, or on the petioles. 20 Leaf blades equally pubescent on both surfaces, or glabrate on both surfaces.

21 Leaf blades large, the apex acute, held high above the ground on long, ascending petioles, deciduous; peduncles shorter than to equalling the petioles . . . . . . . . . . . . . . . . . . . . . . . . V. sororia
21 Leaf blades small, blunt or rounded, essentially flat on the ground, evergreen or tardily deciduous; peduncles much longer than the petioles
V. villosa 20 Leaf blades much more pubescent on one surface than the other.

22 Leaf blades densely pubescent above, sparsely so below and on the petiole; leaf apex blunt to rounded; leaf blade often purple-tinged below . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . V. hirsutula
22 Leaf blades much more pubescent beneath and on petiole, glabrate above; leaf apex acute; leaf blade green beneath . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . V. septentrionalis

Klein 1993). [=K, Y; = V. sororia Willdenow var. missouriensis (Greene) L.E. McKinney - X] Viola nephrophylla Greene, Northern Bog Violet, south to PA and WV (Kartesz 1999). [= K, V] \{not yet keyed\}

\section*{VISCACEAE (Mistletoe Family)}

A family of about 7 genera and 385 species, epiphytic hemiparasites, of cosmopolitan distribution. The recognition of the Viscaceae as distinct from Loranthaceae appears well warranted (see Z); however, the Viscaceae should likely be combined into the Santalaceae (Angiosperm Phylogeny Group 2003). References: Kuijt (1982)=Z.

\section*{Phoradendron Nuttall (Mistletoe)}

A genus of about 235 species, epiphytic hemiparasites, of tropical and rarely temperate America. References: Kuijt (2003)=Y; Kuijt (1982) \(=\) Z.

Phoradendron serotinum (Rafinesque) M.C. Johnston ssp. serotinum, American Mistletoe, Christmas Mistletoe. Cp, Pd, Mt (GA, NC, SC, VA): parasitic on various species of trees, especially abundant in swamp forests (perhaps because they are less frequently cut and have older, more mature hardwoods); common (uncommon in Piedmont and Mountains). October-November (March); November-January (-May). Kuijt (2003) interprets this as a species with four subspecies; ssp. serotinum is the eastern component, ranging from NJ west to s . \(\mathrm{OH}, \mathrm{s}\). IN, and s . MO, south to s . FL and s . TX. The other three subspecies are distributed in sw. United States and \(n\). Mexico. Phoradendron is, of course, the mistletoe familiar (at least traditionally) in e. United States as a Christmas decoration. Z comments that "the superficial likeness of Phoradendron serotinum to the European Viscum album has made the transfer of the latter's folklore to North America easy;" Viscum album was a sacred plant of Celtic and druidical preChristian European societies. The white berries of Ph. leucarpum are extremely poisonous. Their sticky flesh promotes the dispersal of the seeds by birds from tree to tree. The nomenclatural argument about which Rafinesquian epithet to adopt is arcane; the basionym "leucarpum" has nomenclatural precedence by 3 years, but the combination in Phoradendron can be considered a later homonym of Phoradendron leucocarpum Patschovsky. I here follow Kuijt (2003) in his decision to reject "leucarpum." [= Y; = Phoradendron leucarpum (Rafinesque) Reveal \& M.C. Johnston -- K; Ph. serotinum (Rafinesque) M.C. Johnston -- RAB, C, W, Z, infraspecific taxa not distinguished; Ph. flavescens (Pursh) Nuttall -- F, G, S]

VITACEAE (Grape Family)
A family of about 14 genera and 850 species, vines (rarely small trees or herbs), of tropical, subtropical, and temperate regions of the Old and New Worlds.

1 Branches and leaves distinctly fleshy, the leaves more than 1 mm thick when fresh; leaves 3-foliolate
Cissus
1 Branches and leaves herbaceous.
2 Leaves compound with (3-) 5-numerous leaflets.
Leaves bipinnate to tripinnate Ampelopsis arborea
3 Leaves palmately 3-5 (-7)-foliolate.4 Leaflets pinnately lobed; tendrils twining, lacking adhesive tips; berries yellow to orange when ripeAmpelopsis aconitifolia
4 Leaflets toothed or entire; tendrils not twining, usually terminating in adhesive tips; berries dark blue when ripeParthenocissus
2 Leaves simple, sometimes shallowly or deeply 3-5 (-7)-lobed.
5 Tendrils not twining, terminating in adhesive disks Parthenocissus
5 Tendrils twining, lacking adhesive disks.
6 Petals separate at their tips, falling individually; pith continuous through the node Ampelopsis
6 Petals connate at their tips, falling together; pith interrupted by a diaphragm at each node (except continuous inV. rotundifolia)Vitis
Ampelopsis Michaux (Peppervine)

A genus of about 25 species, vines, of temperate and subtropical America and Asia.
1 Leaves compound, either palmately 5 -foliolate (the leaflets additionally pinnately lobed) or bipinnate to tripinnate.
2 Leaves palmately 5 -foliolate, the leaflets additionally pinnately lobed; [introduced species, rarely escaped] A. aconitifolia
2 Leaves bipinnate to tripinnate into numerous leaflets to 6 cm long and 3 cm wide; [common native species of mesic to wet habitats]
A. arborea

1 Leaves simple, grape-like, to 12 cm long and 9 cm wide.
3 Leaves \(3(-5)\) lobed; young twigs pubescent A. brevipedunculata

3 Leaves not lobed; young twigs glabrous . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. cordata
* Ampelopsis aconitifolia Bunge. Pd (NC): planted as an ornamental, rarely escaping to suburban woodlands; rare, introduced from n. China. [= K]

Ampelopsis arborea (Linnaeus) Koehne, Peppervine. Cp, Pd (GA, NC, SC, VA), Mt (NC): swamp forests, marshes, wet thickets, moist to wet maritime forests; common (rare in Piedmont and Mountains). June-October. Se. VA (and MD?) south to s. FL, west to TX and n. Mexico, north in the interior to s. IL. [= RAB, C, F, G, GW, K, S, W]
* Ampelopsis brevipedunculata (Maximowicz) Trautvetter, Porcelain-berry. Pd, Cp (NC, VA), Mt (VA): thickets and disturbed areas; rare, introduced from ne. Asia. June-July; September. [= RAB, C, F, K; < A. heterophylla (Thunberg) Siebold \& Zuccarini -S ; = A. heterophylla (Thunberg) Siebold \& Zuccarini var. brevipedunculata (Maximowicz) C.L. Li]
*? Ampelopsis cordata Michaux, Raccoon-grape, False-grape. Mt, Cp, Pd (GA, VA): moist forests, bottomlands, and thickets, particularly where disturbed; rare (perhaps introduced only in all or part of our area). May-July. E. VA south to panhandle FL, west to TX, north in the interior to s. OH, s. IN, s. IL, MO, and NE; also introduced at scattered sites inland. [= RAB, C, F, G, GW, K, S, W]

Cissus Linnaeus
A genus of about 200 species, of tropical and warm temperate areas.
Cissus trifoliata (Linnaeus) Linnaeus, Marine-ivy. Cp (GA, *SC): dredge spoil; rare, probably introduced from further south. Se. SC (Jasper County) south through GA, FL, and west along the Gulf Coast to TX, AR, and Mexico. [= K, S; < C. incisa (Nuttall) Des Moulins -- GW, S]

\section*{Parthenocissus Planchon (Virginia-creeper, Woodbine)}

A genus of about 10 species, vines, of temperate Asia and North America.
1 Leaves 3-lobed to 3-foliolate; [introduced ornamental, rarely escaped] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. tricuspidata
1 Leaves (3-) 5 (-7)-foliolate (only a few leaves on a plant 3-foliolate); [native].
2 Inflorescence with a well-developed (zigzag) central axis, the dichotomous branches very unequal, the inflorescence therefore paniculiform; tendrils usually with numerous adhesive disks (though young shoots may not have the disks yet formed); leaves usually dull above; leaflets sessile or with petiolules to 10 mm long; [widespread in our area] P. quinquefolia

2 Inflorescence without a well-developed central axis, the dichotomous branches relatively equal, the inflorescence therefore corymbiform, as wide or wider than long; tendrils usually lacking adhesive disks (though sometimes swollen at the tip); leaves usually glossy above; leaflets with petiolules \(5-20(-30) \mathrm{mm}\) long; [in our area only in e. VA] . .. . P. vitacea

Parthenocissus quinquefolia (Linnaeus) Planchon, Virginia-creeper. Cp, Pd, Mt (GA, NC, SC, VA): swamp forests, bottomlands, maritime forests and thickets, rock outcrops, mesic forests; common. May-July; July-August. ME west to IA, and NE,
south to FL and TX. [= RAB, C, F, G, K, W; >P. quinquefolia - S; >P. hirsuta (Pursh) Graebner -- S]
* Parthenocissus tricuspidata (Siebold \& Zuccarini) Planchon, Boston-ivy. Pd (NC): frequently grown for ornament, rarely persisting or escaped; rare, introduced from Japan and China. [= C, F, G, K]

Parthenocissus vitacea (Knerr) A. Hitchcock. Cp (VA): rich alluvial forests, roadsides and dumps; rare. Québec west to Manitoba, WY, and CA, south to e. VA, OH, MO, TX, and AZ. [= C, G, K; = P. inserta (Kerner) Fritsch -- F, probably misapplied]

\section*{Vitis Linnaeus (Grape)}

A genus of about 65 species, vines, of temperate regions of Eurasia and North America. Rossetti et al. (2002) conducted a molecular phylogenetic study of Vitaceae and suggest that recognition of Muscadinia as a genus may well be warranted. References: Moore (1989)=Z. Key adapted with little modification from Moore (1989).

1 Tendrils simple; bark adherent (on all but the largest stems), with prominent lenticels; pith continuous through nodes; leaves relatively small and coarsely toothed, never deeply lobed; [subgenus Muscadinia].
2 Mature fruits < 12 mm in diameter; infructescences with > 12 berries; leaf blades often < 5 cm long; [of s . GA southwards]
V. rotundifolia var. munsoniana

2 Mature fruits > 12 mm in diameter; infructescences usually with < 12 berries; leaf blades usually > 5 cm long; [widespread in our area] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . V. rotundifolia var. rotundifolia
1 Tendrils bifid to trifid; bark shedding, the lenticels inconspicuous; pith interrupted by diaphragms at nodes; leaves relatively large and finely toothed, often deeply lobed; [subgenus Vitis].
3 Mature leaves glaucous beneath (the glaucescence sometimes rather obscured by pubescence); nodes often glaucous; [series Aestivales].
4 Mature 3-4 seeded berries more than 9 mm in diameter; mature leaves slightly to strongly arachnoid-pubescent beneath; nodes usually not glaucous; nodal diaphragms usually more than 2 mm in diameter V. aestivalis var. aestivalis

4 Mature 3-4 seeded berries less than 9 mm in diameter; mature leaves glabrous to glabrate beneath; nodes usually glaucous; nodal diaphragms usually less than 2 mm in diameter . . . . . . . . . . . . . . . . . . V. aestivalis var. bicolor
3 Mature leaves not glaucous beneath; nodes not glaucous.
5 Tendrils or inflorescences present at 3 or more consecutive nodes; leaves densely pubescent beneath; [series Labruscae] ...................................................................................... V. labrusca
5 Tendrils or inflorescences present at only 2 consecutive nodes; leaves glabrous or moderately pubescent beneath. 6 Leaves reniform, glabrous beneath at maturity; tendrils absent, present only opposite the uppermost nodes, or sometimes extending down the stem; [section Ripariae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . V. rupestris 6 Leaves cordate to cordate-ovate, glabrous to pubescent beneath at maturity; tendrils present opposite most nodes.
7 Nodal diaphragms less than 1 mm wide, usually less than 0.5 mm wide; growing shoot tips enveloped by enlarging, unfolded leaves; [section Ripariae]
V. riparia

7 Nodal diaphragms more than 1 mm wide; growing shoot tips not enveloped by enlarging, unfolded leaves.
8 Branchlets of the season more or less terete, glabrous or arachnoid-pubescent; mature 3-4 seeded berries usually greater than 8 mm in diameter; nodes usually not banded with red pigmentation; [series Cordifoliae].
9 Nodal diaphragms \(>2.5 \mathrm{~mm}\) wide; leaf apices usually long-acuminate; branchlets of the season with a purplish cast . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . V. palmata
9 Nodal diaphragms \(<2.5 \mathrm{~mm}\) wide; leaf apices acute to short-acuminate; branchlets of the season gray, green, or brown (sometimes purple only on one side) . . . . . . . . . . . . . . . . . . V. vulpina
8 Branchlets of the season angled, arachnoid-pubescent and/or hirtellous-pubescent (or nearly glabrous); mature 3-4 seeded berries less than 8 mm in diameter; nodes frequently banded with red pigmentation; [series Cinerescentes].
10 Branchlets of the season sparsely to densely hirtellous pubescent, often with arachnoid pubescence as well; leaf undersurfaces usually more-or-less uniformly hirtellous on the veins; [west of our area, approaching it in w. KY, w. TN, sc. AL, and FL Panhandle]
[V. cinerea var. cinerea]
10 Branchlets of the season lacking evident hirtellous trichomes (if present, obscured by the arachnoid pubescence; leaf undersurfaces lacking hirtellous pubescence, or only very sparsely so; [collectively widespread in our area].
11 Branchlets glabrate to only slightly arachnoid-pubescent; nodes usually banded with red pigmentation; leaves glabrous to very slightly arachnoid-pubescent beneath; [mostly of the Piedmont and Mountains] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . V. cinerea var. baileyana 11 Branchlets slightly to densely arachnoid-pubescent; nodes usually not banded with red pigmentation; leaves slightly to densely arachnoid-pubescent beneath; [mostly of the Coastal Plain]
V. cinerea var. floridana

Vitis aestivalis Michaux var. aestivalis, Summer Grape. Cp, Pd, Mt (GA, NC, SC, VA): forests and woodlands, mostly upland; common. May-June; September-October. MA west to MO and IA, south to FL and e. TX. [= RAB, C, F, G, K, Z; = V.
aestivalis -- S; < V. aestivalis -- GW, W]
Vitis aestivalis Michaux var. bicolor Deam, Silverleaf Grape. Mt (GA, NC, SC, VA): forests and woodlands, mostly upland; common. May-June; September-October. Ontario and MN south to n . GA and n . AL. \([=Z ;=V\). aestivalis var. argentifolia (Munson) Fernald -- RAB, C, F, G, K; = V. bicolor Le Conte -- S; < V. aestivalis -- GW, W]

Vitis cinerea (Engelmann in A. Gray) Engelmann ex Millardet var. baileyana (Munson) Comeaux, Possum Grape. Mt, Pd, Cp (GA, NC, SC, VA): forests and woodlands, mostly bottomlands; common (rare in Coastal Plain). Late May-June; SeptemberOctober. S. PA, s. OH, and se. IN south to c. SC, c. GA, and AL. [= K, Z; = V. baileyana -- RAB, C, F, G, S; < V. vulpina -- GW; < V. cinerea -- W]

Vitis cinerea (Engelmann in A. Gray) Engelmann ex Millardet var. floridana Munson, Florida Grape. Cp (GA, NC, SC, VA), Pd? (NC?, SC?, VA?): floodplain and other moist forests; common (rare in Piedmont). Late May-June; August-October. Se. VA south to FL, west to s. MS. [= RAB, C, F, G, K, Z; V. simpsonii Munson -- S; < V. cinerea -- GW, W]

Vitis labrusca Linnaeus, Fox Grape. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): forests and woodlands, wet, moist, and dry; common (uncommon in Mountains). May-June; September-October. ME west to s. MI, south to n. GA, n. AL, and n. MS. [= RAB, C, GW, K, S, W, Z; > V. labrusca var. labrusca - F, G; > V. labrusca var. subedentata Fernald -- F, G]

Vitis palmata Vahl, Red Grape, Cat Grape, Catbird Grape. Cp (GA): floodplain forests, riverbanks; rare (GA Special Concern). Mid June-late June; late July-October. IN, c. TN (Chester, Wofford, \& Kral 1997), sc. GA (Jones \& Coile 1988), and FL Panhandle west to MO and TX. [= C, F, G, GW, K, S, Z]

Vitis riparia Michaux, Riverbank Grape. Mt, Pd, Cp (NC?, VA): forests and woodlands, mostly moist to wet; uncommon. April-June; August-September. New Brunswick west to se. Saskatchewan, south to VA, NC, c. and w. TN, n. MS, LA, and e. TX, and in the Pacific Northwest. [= RAB, C, G, GW, K, Z, W; V. riparia var. riparia -- F]

Vitis rotundifolia Michaux var. munsoniana (Simpson ex Munson) M.O. Moore, Munson Grape. Cp (GA): floodplain forests, banks of blackwater rivers; rare. Late April-May; late July-September. Sc. GA, s. AL, and FL. [= K, Z; = Muscadinia munsoniana (Simpson ex Munson) Small -- S; = Vitis munsoniana Simpson ex Munson]

Vitis rotundifolia Michaux var. rotundifolia, Muscadine, Scuppernong. Cp, Pd, Mt (GA, NC, SC, VA): forests, swamps, dunes; common (uncommon in Mountains). May-June; August-October. DE west to KY and MO, south to FL and TX. Cultivars of this species are popular in the Southeastern United States for eating grapes and for a distinctive wine. \([=\mathrm{K}, \mathrm{Z}\); = V. rotundifolia -RAB, C, F, GW, W; = Muscadinia rotundifolia (Michaux) Small -- S]

Vitis rupestris Scheele. Mt, Pd (VA): along streams and in riverbank scour areas, especially in calcareous areas; uncommon (VA Rare List). April-May; August-September. MD, WV, sw. PA west to MO, south to VA, c. TN, and n. AR. [= C, F, K, W, S, Z]

Vitis vulpina Linnaeus, Frost Grape, Winter Grape, Chicken Grape. Pd, Mt, Cp (GA, NC, SC, VA): forests and woodlands, primarily upland, but also in bottomlands; common. May; July-September. Se. NY west to MO and e. KS, south to FL and nc. TX. [= RAB, C, F, G, K, S, Z, W; < V. vulpina -- GW; V. cordifolia Michaux -- S]

Vitis cinerea (Engelmann in A. Gray) Engelmann ex Millardet var. cinerea, Graybark Grape, Pigeon Grape, may occur in our area, but is primarily more western, ranging from VA (?), w. KY, wc. TN, IN, and WI, south to sc. AL, Panhandle FL, and TX. [= RAB, C, F, G, K, Z; = V. cinerea -- S (sensu stricto); < V. cinerea -- GW, W]
* Vitis \(\times\) labruscana Bailey [aestivalis \(\times\) labrusca] is the commonly cultivated Concord Grape (and related cultivars). It is sometimes persistent after cultivation. [= K; = V. labruscana Bailey - F] \{not keyed\}
* Vitis vinifera Linnaeus, the European Wine Grape, has been increasingly cultivated in our area, especially in VA, now one of the leading wine-producing states in the United States. The climate of our area is too humid to be ideal for this species, and special measures are needed to reliably produce good crops of "vinifera" grapes. [= K] \{not yet keyed\}

\section*{ZYGOPHYLLACEAE (Creosote-bush Family)}

A family of about 27 genera and 285 species, trees, shrubs, and (rarely) herbs, of tropical and subtropical regions of the Old and New Worlds.

1 Fruit with tubercles, at maturity separating into 10 mericarps . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Kallstroemia
1 Fruit with spines, at maturity separating into 5 mericarps . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Tribulus

\section*{Kallstroemia Scopoli}

A genus of about 17 species, of tropical and subtropical America. References: Porter 1969)=Z
*? Kallstroemia maxima (Linnaeus) Hooker \& Arnott, Greater Caltrop. Cp (GA, SC): disturbed areas, dunes; rare, native status uncertain. SC south to FL; West Indies; Mexico (Sinaloa and Tamaulipas) south throuigh Central America to northern South America (Venezuela, Colombia). Early collections from Charleston (Stephen Elliott) and Savannah suggest the likelihood of introduction via ballast. [= RAB, K, S, Z]

\section*{Tribulus Linnaeus}

A genus of about 25 species, of tropical and subtropical regions.

\footnotetext{
1 Petals 8-22 mm long; peduncle \(>2 \mathrm{~cm}\) long; perennial . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . T. cistoides
1 Petals 3-5 mm long; peduncle \(<1 \mathrm{~cm}\) long; annual . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . T. terrestris
* Tribulus cistoides Linnaeus, Jamaican Fever-plant. Cp (GA): disturbed areas; rare, native of Africa. Introduced in GA, FL, LA, and TX (Kartesz 1999). [= K, S]

Tribulus terrestris Linnaeus, Puncture-weed, Caltrop, Devil's-thorn. Cp (GA, NC, SC): dunes, sandy roadsides, ballast; rare introduced from Mediterranean Europe. June-December. [= RAB, C, F, G, K, S]
}

\title{
MONOCOTS
}

\section*{ACORACEAE Martinov 1820 (Calamus Family)}

The family consists only of Acorus. References: Thompson in FNA (2000); Bogner \& Mayo in Kubitzki (1998b).

\section*{Acorus Linnaeus 1753 (Calamus, Sweetflag)}

A genus of 2-4 species, widespread in north temperate and subtropical regions. Although traditionally treated as part of the Araceae, a wide variety of morphological, anatomical, and embryological evidence supports the segregation of the Acoraceae (Grayum 1987), a segregation additionally supported by molecular studies (Duvall et al. 1993, Chase et al. 1993). The spathe in Acorus is not morphologically equivalent to the spathe of the Araceae. References: Thompson in FNA (2000); Grayum 1987.

1 Midvein of the leaves not well-developed, about equally as prominent as the lateral veins; mature fruits produced
. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. A. A. americanus

1 Midvein of the leaves well-developed, distinctly more prominent than the lateral veins; mature fruits not produced A. calamus

Acorus americanus (Rafinesque) Rafinesque, American Calamus, Sweetflag. Cp (GA?, VA), Mt (GA): marshes, wet meadows, other wet areas, limey seeps; rare (GA Special Concern). May-June. Widespread in ne. North America. This species is apparently a fertile diploid. Because this species has not generally been recognized in floras, its distribution is poorly known; additional distributional records should be expected and sought. [= FNA, K; < A. calamus Linnaeus -- RAB, C, F, G, GW, in part; < A. americanus -- W, in part]
* Acorus calamus Linnaeus, European Calamus, Sweetflag. Cp, Pd, Mt (NC, SC, VA): marshes, wet meadows, other wet areas; uncommon, introduced from Eurasia, now widespread in e. North America. May-June. The aromatic rhizome and leaves have been used medicinally and candied as a confection. Populations of \(A\). calamus introduced in our area are apparently sterile triploids from Europe, though diploid and tetraploid populations of \(A\). calamus are known from Asia. [= FNA, K; < A. calamus Linnaeus -- RAB, C, F, G, GW, in part only (also see A. americanus); < A. americanus -- W, in part]

\section*{AGAVACEAE Endlicher 1841 (Agave Family)}

A family of about 11 genera and 315 species, herbs and rosette shrubs, of temperate and tropical America. The placement of Camassia, Schoenolirion, and Hastingsia, sometimes grouped as Hyacinthaceae subfamily Chlorogaloideae, is uncertain; they are probably better placed in the Agavaceae, a position supported by molecular, serological, and biogeographic evidence. References: Verhoek \& Hess in FNA (2002a); Bogler \& Simpson (1995, 1996); Verhoek in Kubitzki (1998a).

\[
\text { Camassia Lindley } 1832 \text { (Wild Hyacinth, Quamash Lily, Camas Lily) }
\]

A genus of 6 species, of North America. The family placement of Camassia is uncertain; there is some increasing evidence that the affinities of Camassia are with the Agavaceae, rather than the Hyacinthaceae (Fay \& Chase 1996, Bogler \& Simpson 1996, Speta in

Kubitzki 1998a). References: Ranker \& Hogan in FNA (2002a); Speta in Kubitzki (1998a).
Camassia scilloides (Rafinesque) Cory, Wild Hyacinth, Quamash Lily, Eastern Camas Lily. Mt (GA, VA), Cp (NC), Pd (SC): moist forests, over circumneutral soils, in VA on limestone, in NC on slopes and natural levees along the Roanoke River, in SC over gabbro; rare (NC Threatened, SC Rare, VA Rare). April-May. W. PA and s. Ontario west to s. WI and e. KS, south to nw. GA (Jones \& Coile 1988) and TX, nearly entirely west of the Blue Ridge, with only a few disjunct occurrences in the Piedmont and Coastal Plain. [= RAB, C, F, FNA, G, K, W; Quamasia hyacintha (Rafinesque) Britton -- S]

\section*{Manfreda Salisbury 1866 (False-aloe)}

A genus of about 26 species, primarily in sw. United States, Mexico, and Central America. References: Verhoek in FNA (2002a); Speta in Kubitzki (1998a).

Manfreda virginica (Linnaeus) Salisbury ex Rose, Rattlesnake-master, Eastern False-aloe. Pd (GA, NC, SC), Cp (GA, NC, SC), Mt (GA, NC, SC, VA): granite flatrocks, diabase glades, xeric woodlands over mafic or calcareous rocks, sandhill woodlands; uncommon (VA Rare). Late May-mid July; August-October. E. SC, c. NC, sw. VA, WV, s. OH, s. IN, s. IL, and MO south to n. FL and TX. [= FNA, K, W; = Agave virginica Linnaeus -- RAB, C, F; > M. tigrina (Engelmann) Small -- S; > M. virginica - S, in a narrower sense; = Polianthes virginica (Linnaeus) Shinners]

\section*{Nolina \\ (see RUSCACEAE)}

\section*{Schoenolirion Torrey ex Durand (Sunnybell)}

A genus of 3 species, herbs, of \(s\). North America. References: Sherman in FNA (2002a).
1 Inflorescence with 1-6 branches; leaves without fleshy bases, withering to a persistent fibrous crown ....... Sch. albiflorum
1 Inflorescence rarely branched; leaves with fleshy bases, not fibrous.
2 Perianth white . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [Sch. wrightii]

2 Perianth golden-yellow . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Sch. croceum
Schoenolirion albiflorum (Rafinesque) R.R. Gates, White Sunnybell. Cp (GA): wet pinelands, cypress depressions, and Hypericum depressions; rare (GA Special Concern). E. GA south to FL and west to AL. [= FNA, K; = Sch. elliottii Feay ex A. Gray -GW; = Oxytria albiflora (Rafinesque) Pollard -- S]

Schoenolirion croceum (Michaux) Wood, Yellow Sunnybell. Pd (GA, SC), Cp (GA, NC?), Mt (GA): seepages on granite flatrocks, wet seepages in sandhills (allegedly); rare (NC Watch List, SC Rare). April-May; May-June. SC (and allegedly NC) south to n . FL, west to se. TX; and in c. TN on limestone glades (Chester et al. 1993). The occurrence in NC in "wet pinelands" in Richmond County referred to in RAB has not been relocated or further documented. [= RAB, FNA, GW, K; = Oxytria crocea (Michaux) Rafinesque -- S]

Schenolirion wrightii Sherman, Texas Sunnybell, occurs east to AL. [= FNA, K; = Oxytria texana (Scheele) Pollard - S]

Yucca Linnaeus 1753 (Yucca, Adam's-needle)
A genus of about 40 species, of sw. North America, n. Mexico, se. United States, and the West Indies. References: Hess \& Robbins in FNA (2002a); Speta in Kubitzki (1998a); Ward (2004c)=Z.

1 Leaf margins fraying into filamentous threads; plant acaulescent (or essentially so); fruit erect.
2 Inflorescence branches glabrous; tepals 5-7 cm long; leaves 2-6 cm wide, stiff, the apex acute-acuminate to obtuse, often concave upwards at the apex \(\qquad\) \(Y\). filamentosa
2 Inflorescence branches scurfy-pubescent; tepals 3-5 cm long; leaves 1.5-4 cm wide, pliable, the apex attenuateacuminate, not notably concave . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Y. flaccida
1 Leaf margins not fraying, minutely notched-serrulate or entire, and hyaline; plant with a trunk; fruit pendulous (erect in \(Y\). recurvifolia).
3 Leaf margins minutely notched-serrulate, particularly towards the base; seeds 2.5 mm thick, marginless ..... Y. aloifolia
3 Leaf margins entire, smooth, hyaline-brown or hyaline-tellow; seeds ca. 1 mm thick, margined.
4 Leaf blades rigid, straight; fruits pendent, \(5.5-8 \mathrm{~cm}\) long; [of NC south to FL] Y. gloriosa 4 Leaf blades recurved, flexible; fruits generally erect, 2.5-4.5 cm long; [of GA westwards] . . . . . . . . . Y. recurvifolia

Yucca aloifolia Linnaeus, Spanish Dagger. Cp (GA, NC, SC): dunes; uncommon. June-early July; October-December. E. NC (Carteret County) south to FL and west to LA. [= RAB, FNA, K, S]

Yucca filamentosa Linnaeus, Curlyleaf Yucca, Spoonleaf Yucca. Cp, Pd (GA, NC, SC, VA), Mt (NC, SC, VA): woodlands, forests, dunes, roadsides, disturbed areas; common. Late April-early June; September-October. MD or s. NJ south to GA, west to MS; escaped from cultivation over a broader area of e. United States. [= FNA, F, S, W, Z; = Y. filamentosa var. filamentosa -- RAB; < Y. filamentosa -- C, G, K, in part (also see Y. flaccida); = Y. concava Haworth -- S]

Yucca flaccida Haworth, Weakleaf Yucca. Cp, Pd, Mt (GA, NC, SC, VA*): woodlands, roadsides, disturbed areas; rare (NC Watch List). Late April-early June; September-October. C. NC and TN south to FL and AL. Whether or not this taxon is valid (and if so, as a variety or as a species) has been unclear; further research is needed. The occurrence of this species in VA is apparently the result of cultivation and persistence. [= FNA, S, W; = Y. filamentosa var. smalliana (Fernald) Ahles -- RAB; < Y. filamentosa -- C, G, K, in part; = Y. smalliana Fernald -- F; > Y. flaccida var. flaccida - Z; > Y. flaccida var. smalliana (Fernald) D.B. Ward - Z]

Yucca gloriosa Linnaeus, Mound-lily Yucca, Spanish Bayonet. Cp (GA, NC, SC): dunes, shell middens; uncommon, rare in NC (NC Rare). (April), October; November-December. E. NC (Dare County) south to ne. FL, west to LA (Kartesz 1999). [= RAB, K, S; = Y. gloriosa var. gloriosa - FNA]

Yucca recurvifolia Salisbury, Curve-leaf Yucca. Cp (GA): dunes, dry sandy soils; rare. GA west to LA (?). [= S; = Y. gloriosa Linnaeus var. recurvifolia (Salisbury) Engelmann - FNA]

\section*{ALISMATACEAE Ventenat 1799 (Water-plantain Family)}

A family of about 12 genera and 80 species, herbs, subcosmopolitan in distribution. References: Haynes \& Hellquist in FNA (2000); Rogers (1983); Haynes, Les, \& Holm-Nielsen in Kubitzki (1998b).

1 Pistils in a single whorl, borne on a flat receptacle; stamens 6; inflorescence compound, many of the primary nodes bearing whorled branches which in turn bear whorled branches or whorled flowers . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Alisma
1 Pistils spiraled in several to many whorls, borne on a globose receptacle; stamens 6-many; inflorescence racemose (or in some species of both Echinodorus and Sagittaria somewhat compound, with the lowermost node or two bearing branches which in turn bear whorled flowers).
2 Achenes turgid, with ribs or ridges; flower whorls subtended by 3 bracts and additional bracteoles . . . . . . . Echinodorus
2 Achenes flattened, with winged margins and often also with irregular corky ornamentations on the faces; flower whorls subtended by 3 bracts, with no additional bracteoles . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Sagittaria

\section*{Alisma Linnaeus 1753 (Water-plantain)}

A genus of about 9 species, herbs, subcosmopolitan in distribution. References: Haynes \$ Hellquist in FNA (2000); Haynes, Les, \& Holm-Nielsen in Kubitzki (1998b).

1 Leaf blades 2.7-5x as long as wide (or even narrower on submerged leaves), tapering at the base; petals pink, 2.3-3.7 mm long; achene with a dorsal ridge flanked by two dorsal grooves
A. gramineum

1 Leaf blades 1.3-2.5 (2.7)× as long as wide, rounded to subcordate at the base; petals white, either 1.8-2.5 mm or \(3.8-4.5 \mathrm{~mm}\) long; achene with a single dorsal groove.

Alisma gramineum Lejeune, Grassleaf Water-plantain. Cp (VA): in seasonally flooded areas in impoundments; rare (VA Watch List). June-August. This species is circumboreal, ranging in North America south to e. VA, NY, WI, MO, NM, and CA. The occurrence of this species in our area may be the result of dispersal by waterfowl; first reported for our area by Wieboldt et al. (1998). [= C, F, FNA, K; < A. plantago-aquatica Linnaeus var. americanum J.A. Schultes -- G]

Alisma subcordatum Rafinesque, Southern Water-plantain. Mt, Pd (GA, NC, SC, VA), Cp (NC, VA): marshes, ponds, stream edges; uncommon. April-November. MA west to ND, south to FL and TX. [= RAB, C, F, FNA, G, GW, K, S, W; = A. plantagoaquatica Linnaeus ssp. subcordatum (Rafinesque) Hultén; A. plantago-aquatica var. parviflorum (Pursh) Torrey]

Alisma triviale Pursh, Northern Water-plantain, ranges south to s. PA and KY (and according to Fernald to MD and WV). [= C, F, FNA, K; < A. plantago-aquatica Linnaeus var. americanum J.A. Schultes -- G]

Echinodorus L.C. Richard ex Engelmann 1848 (Burhead)

A genus of about 27 species, herbs, primarily of the American tropics and subtropics. References: Haynes \& Hellquist in FNA (2000); Haynes, Les, \& Holm-Nielsen in Kubitzki (1998b).

1 Leaf blades 1-3 cm long, 0.2-2 cm wide; achenes \(10-20\) per head; stamens 6 or 9 ; petals 1-3 mm long; scapes 5-10 cm tall, erect; [subgenus Helanthium] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . E. tenellu
1 Leaf blades \(5-20 \mathrm{~cm}\) long, 3-15 cm wide; achenes 40 or more per head; stamens ca. 21 ; petals 6-12 mm long, scapes 20-120 cm tall, erect or arching/reclining; [subgenus Echinodorus].
2 Scapes arching and rooting down at maturity; veins of the sepals papillose-roughened . . E. cordifolius ssp. cordifolius

2 Scapes rigidly erect at maturity; veins of the sepals smooth.
\begin{tabular}{ll}
3 & Stamens \(9-15\); plants to 70 cm tall . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . E. berteroi \\
3 & Stamens 21; plants to 200 cm tall . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [E. floridanus]
\end{tabular}

Echinodorus berteroi (Sprengel) Fassett, Tall Burhead. Cp (GA): \{habitats\}; rare. OH, IL, and ND south to w. FL, sw. GA, and TX. [= FNA, K; > E. berteroi var. lanceolatus (Engelmann ex S. Watson \& Coulter) Fassett -- C; = E. cordifolius -- S, misapplied; ? E. rostratus (Nuttall) Engelmann -- GW] \{synonymy\}

Echinodorus cordifolius (Linnaeus) Grisebach ssp. cordifolius, Creeping Burhead. Cp (GA, NC, SC, VA): swamps, ditches, wet thickets, especially on base-rich substrates, such as over calcareous or mafic rocks; common. June-November. MD south to FL, west to TX, south into tropical America, and north in the interior (primarily in the Mississippi Embayment) to s. IL. [= FNA; < E. cordifolius -- RAB, F, G, GW, K; = E. cordifolius var. cordifolius -- C; = E. radicans (Nuttall) Engelmann -- S]

Echinodorus tenellus (Martius) Buchenau, Mud-babies, Dwarf Burhead. Cp (GA, NC, SC, VA), Mt (GA, VA): on drawdown zones of Coastal Plain ponds, pineland ponds, blackwater riverbanks, or ponds in the Mountains with Coastal Plain affinities (Augusta County, VA); rare (GA Special Concern, NC Rare, VA Rare). MA west to MN, south to c. peninsular FL and e. TX, but widely scattered and disjunct in that range. See Belden et al. (2004) for a discussion of the species in Virginia. [= FNA, G, K; > E. parvulus Engelmann -- G, GW; > E. tenellus (Martius) Buchenau var. parvulus (Engelmann) Fassett -- C; > Helanthium parvulum (Engelmann) Britton -- S]

Echinodorus floridanus R.R. Haynes \& J.R. Burkhalter, Florida Burhead, is a recently named endemic, known only from Escambia County, FL. [= FNA, K]

\section*{Sagittaria Linnaeus 1753 (Arrowhead)}

A genus of about 25 species, herbs, primarily of the Americas. References: Haynes \& Hellquist in FNA (2000); Bogin (1955)=Z; Wooten (1973)=Y; Beal, Wooten, \& Kaul (1982)=X; Preston \& Adams (1961); Haynes, Les, \& Holm-Nielsen in Kubitzki (1998b).

Identification notes: Portions of this key (and treatment) are provisional. The taxonomy and best characters to use in the linearleaved species is particularly problematic.

1 Leaf blades sagittate or cordate (at least some of the leaves on a plant with sagittate or cordate basal lobes; some species are keyed both here and below).
2 Leaf blades stellate-pubescent; [subgenus Sagittaria] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. Iatifolia var. pubescens 2 Leaf blades glabrous.

3 Sepals appressed in fruit; lower flowers perfect, the stamens either functional or not; stamen filaments roughened with minute scales (except glabrous in S. spatulata); [subgenus Lophotocarpus].
4 Leaves primarily phyllodial, lanceolate or spatulate (sagittate leaves rare in the population and few on a given plant); flowers in 1-2 (-3) whorls; stamen filaments glabrous (use \(10 \times\) ); [native, of tidal marshes] . . S. spatulata 4 Leaves primarily sagittate (phyllodial leaves rare in the population and few on a given plant); flowers in 3-12 whorls; stamen filaments roughened with minute scales (use 10×); [either introduced aliens, sometimes in tidal marshes, or native, found in inland alkaline sites].
5 Petals white, immaculate; stamens of pistillate flowers functional; [of inland sites, native or introduced at a given locality] S. calycina

5 Petals white, with a purple spot at the base; stamens of pistillate flowers generally nonfunctional; [exotic, introduced around coastal ports]
S. montevidensis

3 Sepals reflexed or at least widely spreading in fruit; lower flowers pistillate; stamens glabrous (except roughened with minute scales in S. rigida); [subgenus Sagittaria].
6 Leaves cordate basally, floating; stalks of the pistillate flowers stout, reflexed in fruit; stamens mostly fewer than 15 . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. filiformis
6 Leaves sagittate basally, emersed; stalks of the pitillate not notably stout, ascending in fruit; stamens 15 or more.
7 Beak of the achene lateral (at a right angle to the long axis of the achene); bracts of the inflorescence 2-14 mm long, boat-shaped, obtuse or broadly acute.
8 Lowermost (pistillate) flowers on long pedicels (at least 20 mm ), the pedicels of the lowermost flowers longer than those in whorls above; inflorescence normally not bent; stamen filaments glabrous

\section*{S. Iatifolia var. latifolia}

8 Lowermost (pistillate) flowers sessile or on short pedicels (to 5 mm or rarely 10 mm long), the pedicels of the lowermost flowers notably shorter than those in whorls above; inflorescence normally bent at the lowest whorl of flowers; stamen filaments minutely roughened with minute scales S. rigida
7 Beak of the achene terminal (extending along the long axis of the achene; bracts of the inflorescence 5-40 mm long, either blunt or acuminate, not boat-shaped.
9 Bracts of the inflorescence thick and herbaceous, \(5-25 \mathrm{~mm}\) long, rounded at the tip; flowers in 2-4 whorls; achenes with facial resin-ducts; [of acidic, blackwater habitats of the Coastal Plain] . . . . . . . .

9 Bracts of the inflorescence papery and tan, 7-40 mm long, acuminate at the tip; flowers in 5-12

\section*{Flora of the Carolinas, Virginia, and Georgia, Working Draft of June 10, 2005 -- ALISMATACEAE}
whorls; achenes without resin-ducts; [primarily of other habitats, commectively widespread].
10 Petiole sharply 5-wing-angled in cross-section; inflorescence unbranched; fruiting heads 1.0-1.5 cm in diameter, globular S. australis

10 Petiole corrugated but not wing-angled in cross-section; inflorescence often branched at the base; fruiting heads (1.2-) 1.7-2.2 cm in diameter, often globular-depressed . . . S. brevirostra 1 Leaf blades linear or lanceolate, or modified as linear, bladeless phyllodia, these often of spongy texture.

11 Stalks of the pistillate flowers stout, reflexed in fruit; stamen filaments glabrous (except roughened with minute scales in \(S\). platyphylla and S. calycina).
12 Sepals appressed in fruit; lower flowers perfect, the stamens either functional or not; [subgenus Lophotocarpus].
13 Leaves generally primarily sagittate (phyllodial leaves generally rare in the population); flowers in 3-12 whorls; stamen filaments roughened with minute scales (use \(10 \times\) ); [of inland alkaline sites] . . . . . . . . . . . S. calycina
13 Leaves primarily phyllodial, lanceolate or spatulate (sagittate leaves rare in the population and few on a given plant); flowers in 1-2 (-3) whorls; stamen filaments glabrous (use 10×); [of tidal marshes] . . . . . . . S. spatulata
12 Sepals reflexed or at least widely spreading in fruit; lower flowers pistillate; [subgenus Sagittaria].
14 Plant generally with erect, emersed leaves with well-developed blades with firm texture, the blades lanceolate, elliptic, or ovate, 2-8 cm wide; stamen filaments roughened with minute scales . . . . . . . . . . . S. platyphylla
14 Plant with all leaves phyllodial, if expanded at the summit, the expanded blade of weak texture, floating. 15 Leaves very variable from population to population, in swiftly flowing black water typically about 100 cm long and 2-3 mm wide, in more stagnant water (or when emersed by dropping water levels, typically with lax petioles and floating blades, the blades lanceolate, or elliptic, the base cuneate, rounded, or cordate; [of nontidal waters]
S. filiformis

15 Leaves 2-30 cm long, 3-8 mm wide (sometimes with dilated tip to 20 mm wide); [of tidal, fresh to brackish waters]
S. subulata

11 Stalks of the pistillate flowers not notably stout, ascending or spreading in fruit; stamen filaments roughened with minute scales (except glabrous in S. engelmanniana).
16 Stamen filaments linear, less thick than the anther, changing little in diameter from near base to near summit.
17 Bracts of the inflorescence firm in texture, smooth; stamen filaments glabrous; [of inland acidic wetlands]
17 Bracts of the inflorescence either papillose or longitudinally striate-ribbed; stamen filaments roughened with minute scales; [of estuarine areas and associated nontidal wetlands].
18 Bracts and sepals striate-ribbed; stamen filaments \(2-5 \mathrm{~mm}\) long; [rare, from e. SC southwards] .........
S. Iancifolia var. lancifolia

18 Bracts and sepals papillose; stamen filaments 1.5-3.5 mm long; [common, throughout our coastal area].
S. Iancifolia var. media

16 Stamen filaments either distinctly dilated towards the base (often broadly conic) or thickened throughout, the filament (at least basally) as thick or thicker than the anther.
19 Lowermost (pistillate) flowers sessile or on short pedicels (to 5 mm or rarely 10 mm long); inflorescence normally bent at the lowest whorl of flowers . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. rigida
19 Lowermost (pistillate) flowers on longer pedicels; inflorescence normally not bent.
20 Leaves all phyllodia, the phyllodia terete or nearly so; [of DE and NJ northwards] . . . . . . . . . . [S. teres]
20 Leaves with blades and petioles, or if all phyllodia, the phyllodia flattened or triangular in cross-section; [collectively widespread].
21 Plants with corms and/or stolons, lacking coarse rhizomes.
22 Blades of emersed leaves lanceolate, narrowly spatulate; [of Mountain and upper Piedmont bogs, swamp forests, and adjacent ditches] . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. fasciculat
22 Blades of emersed leaves linear (less than 3 mm wide); [of Coastal Plain depression wetlands]
21 Plants with coarse rhizomes, lacking corms and stolons.
23 Abaxial wing of fruit scalloped or toothed; [plants of \(n\). AL]
S. isoetiformis

23 Abaxial wing of fruit entire; [plants collectively widespread]. 24 Larger phyllodes \(0.8-2.5 \mathrm{~cm}\) wide, the apices blunt (rarely acute); longer pistillate pedicels 2-5 (-6.5) cm long; median resin duct of mature achene linear, about as wide as the posterior duct (or ducts absent)
S. weatherbiana 24 Larger phyllodes to 1 cm wide (except sometimes wider in S. graminea var. chapmanii), the apices avute; longer pistillate pedicels \(1-4 \mathrm{~cm}\) long; median resin duct of mature achene club-shaped and \(2 \times\) the diameter of the posterior duct.
25 Inflorescence branched at the base (in at least some plants of a population); bracts of the inflorescence only slightly connate, the free tips narrowly triangular, 6-15 mm long 25 Inflorescence unbranched at the base; bracts of the inflorescence slightly to almost fully connate . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. graminea

Sagittaria australis (J.G. Smith) Small. Cp (NC, SC, VA), Pd, Mt (GA, NC, SC, VA): marshes, swamps, margins of ponds and lakes; common. June-October. NY west to s . IN and se. MO, south to SC and MS. [= C, F, FNA, K, W, X; >S. australis - S; = S. longirostra -- RAB, S, misapplied; = S. engelmanniana J.G. Smith ssp. longirostra -- G, GW, Z, misapplied]

Sagittaria brevirostra Mackenzie \& Bush, Midwestern Arrowhead. Mt (VA): \{habitat\}; rare. June-October. OH west to ND, south to w. VA, e. TN, AL, and TX. [= C, F, FNA, K, W, X; S. engelmanniana J.G. Smith ssp. brevirostra (Mackenzie \& Bush) Bogin -- G, Z]

Sagittaria calycina Engelmann. Pd* (NC*, SC*), Mt (VA): ponds; rare (VA Rare). May-September. N. OH and MI west to SD and CO, south to sw. VA, c. TN, LA, TX, and Mexico; disjunct in CA. Presumably only introduced in North Carolina and South Carolina. First reported for South Carolina by Hill \& Horn (1997). [= RAB, C, W; = Lophotocarpus calycinus (Engelmann) J.G. Smith -- F; = S. montevidensis Chamisso \& Schlechtendahl ssp. calycina (Engelmann) Bogin -- FNA, G, GW, Z; > S. calycina var. calycina -- K]

Sagittaria chapmanii (J.G. Smith) C. Mohr, Chapman's Arrowhead. Cp (GA, NC, SC): limesink (doline) ponds with drawdown hydrology, mucky ditches; rare (NC Rare). May-September. Se. NC south to s. FL, west to s. AL. First reported for SC by Nelson \& Kely (1997). Analyses of allozyme variation in the S. graminea complex revealed great differentiation between S. graminea, S. chapmanii, and S. platyphylla; S. graminea and S. platyphylla appeared to be more closely related to one another than either was to S. chapmanii (Hauber \& Legé 1999). Therefore, it seems best to treat these three taxa at equal rank and at the species level. [= S; = S. graminea Michaux ssp. chapmanii (J.G. Smith) R.R. Haynes \& C.B. Hellquist - FNA; = S. graminea Michaux var. chapmanii J.G. Smith - GW, K, Y, Z]

Sagittaria engelmanniana J.G. Smith. Cp (GA, NC, SC, VA), Pd (GA?, NC, VA): blackwater streambanks, sphagnum bogs, pocosins, beaver ponds; rare (NC Watch List, VA Rare). June-October. MA and NY south to n. FL and s. MS, primarily on the Coastal Plain. [= RAB, C, F, FNA, K, W, X; = S. engelmanniana ssp. engelmanniana -- G, GW, Z]

Sagittaria fasciculata E.O. Beal, Bunched Arrowhead. Mt (GA, NC, SC), Pd (SC): bogs, ditches adjacent to drained bogs, wooded seepage areas; rare (US Endangered, NC Endangered). May-July. Endemic to a several-county area in sw. NC and nw. SC, where most of its former habitat has been drained. The type material of S. macrocarpa J.G. Smith is ambiguous. [= RAB, FNA, GW, K, W, Y; = S. macrocarpa J.G. Smith -- S; = S. graminea Michaux var. macrocarpa (J.G. Smith) Bogin -- Z]

Sagittaria filiform is J.G. Smith. Cp (GA, NC, SC, VA?): swiftly flowing water of blackwater rivers and streams, blackwater lake shores; rare (NC Rare). May-September. As conceived here, probably ranging from MA south to FL and s. AL. The forms growing in swiftly flowing black water are remarkable and unlikely to be recognized as a Sagittaria unless in flower, with linear leaves over 100 cm long and only 1-3 mm wide, with \(5-7\) parallel ribbed veins, resembling \(S\). kurziana Glück of spring-fed streams of FL. The proper taxonomic treatment and associated nomenclature to apply to these plants remains unclear (see synonymy). [= FNA, K; \(=\) S. subulata (Linnaeus) Buchenau var. gracillima (S. Watson) J.G. Smith -- RAB, F, G, Z; = S. stagnorum Small -- GW; <S. subulata -- C, in part; > S. filiformis - S; > S. lorata (Chapman) Small -- S; > S. stagnorum - S]

Sagittaria graminea Michaux. Cp (GA, NC, SC, VA), Pd (VA), Mt (GA, VA): marshes, ponds, tidal areas; uncommon (rare in the Piedmont and Mountains). May-November. Newfoundland and Labrador west to MN and SD, south to s. FL and c. TX; West Indies. [= S. graminea Michaux var. graminea - RAB, C, G, GW, K, Y; > S. graminea - F; > S. eatonii J.G. Smith -- F; = S. graminea ssp. graminea - FNA; > S. graminea - S; > S. cycloptera (J. G. Smith) C. Mohr -- S; < S. graminea -- W; < S. graminea var. graminea -- \(Z\) (also see \(S\). isoetiformis)]

Sagittaria isoetiformis J.G. Smith. Cp (GA, NC, SC): clay-based Carolina bays, other seasonally flooded depressions; rare (NC Rare). June-September. Se. NC south to c. peninsular FL, west to s. MS (Sorrie \& Leonard 1999). See Godfrey \& Adams (1964) for additional discussion of this species. [= FNA, GW, K, S, Y; < S. teres -- RAB, S, misapplied; < S. graminea Michaux var. graminea -- Z, in part]

Sagittaria lancifolia Linnaeus var. lancifolia. Cp (GA, SC): marshes, swamps; rare. May-June. E. SC south to s. FL, west to FL Panhandle; West Indies; n. South America. [= C; = S. lancifolia -- RAB; = S. lancifolia ssp. lancifolia -- FNA, GW, K, Z; > S. angustifolia Lindley -- S ; \(>\) S. lancifolia - S , in a narrow sense]

Sagittaria lancifolia Linnaeus var. media Micheli. Cp (GA, NC, SC, VA): freshwater to brackish tidal marshes, ditches; common. June-October. S. DE south to n . FL, west to TX; scattered in Central America. If recognized as a species, this taxon is \(S\). falcata. [= C; = S. falcata Pursh -- RAB, F, G, S; = S. lancifolia ssp. media (Micheli) Bogin -- FNA, GW, K, Z]

Sagittaria latifolia Willdenow var. latifolia. July-October. Cp, Pd, Mt (GA, NC, SC, VA): marshes, swamps, farm ponds, ditches, bogs; common. June-September. Nova Scotia west to British Columbia, south to tropical America (rare in the Appalachian region). In addition to the pubescence difference, var. latifolia and var. pubescens can be separated by the presence (var. latifolia) or absence (var. pubescens) of resin-ducts on the achene-faces. [= C, G, GW, W, Z; > S. latifolia var. latifolia - RAB, F, in a narrower sense; > S. latifolia var. obtusa (Engelmann) Wiegand -- RAB, F; > S. planipes Fernald -- F; < S. latifolia - FNA, K; > S. latifolia -- S, in the narrow sense; > S. ornithorhyncha Small -- S]

Sagittaria latifolia Willdenow var. pubescens (Muhlenberg ex Nuttall) J.G. Smith. Mt, Pd, Cp (GA, NC, SC, VA): bogs, marshes; common. July-October. C. PA, OH, and TN, south to \(n\). FL and e. TX, primarily in the Appalachians. [= RAB, C, F, G, GW, W, Z; < S. latifolia - FNA, K; = S. pubescens Muhlenberg ex Nuttall -- S]
* Sagittaria montevidensis Chamisso \& SchlechtendahI. Cp (GA, NC, SC): disturbed areas, marshes; rare, introduced from South America. July. Most of the collections from the southeastern United States are old collections around major seaports, suggesting that this plant was introduced on the ballast of sailing ships. [= RAB,K, S; = S. montevidensis ssp. montevidensis -FNA, GW, Z]

Sagittaria platyphylla (Engelmann) J.G. Smith. Cp (GA, SC, VA), Pd (NC): marshes, ditches, farm ponds; rare (GA Special Concern, NC Watch List, VA Watch List), perhaps introduced from the s. Midwest. June. The distribution of this species is primarily in the Mississippi drainage; occurrences east of the Appalachians may be introduced, either by humans or by waterfowl. First reported for VA by Wieboldt et al. (1998). Known from numerous counties in sc. GA (Jones \& Coile 1988). [=F, FNA, K, Y; = S. graminea Michaux var. platyphylla Engelmann -- RAB, G, Z; > S. platyphylla - S; > S. mohrii J.G. Smith -- S]

Sagittaria rigida Pursh, Sessile-fruited Arrowhead. Mt (VA): mountain ponds, wet meadows; rare (VA Rare). July-October. ME and MN, south to w. VA, nc. TN, MO, and NE. [=C, F, FNA, G, K, S, W, Y, Z]

Sagittaria secundifolia Kral, Little River Water-plantain. Mt (GA): crevices in sandstone bedrock in streambeds; rare (US

Threatened, GA Threatened). Nw. GA and nc. AL. See Kral (1982) and Threlkeld \& Soehren (2003) for additional information. [= FNA, K]

Sagittaria spatulata (J.G. Smith) Buchenau. Cp (NC, VA): tidal marshes; uncommon (NC Watch List, VA Rare). MaySeptember. New Brunswick south to e. NC along the coast. [= C, G; > Lophotocarpus spongiosus (Engelmann) J.G. Smith -- F; > S. calycina var. spongiosa Engelmann -- K; > S. montevidensis Chamisso \& Schlechtendahl ssp. spongiosa (Engelmann) Bogin -FNA, Z]

Sagittaria subulata (Linnaeus) Buchenau. Cp (GA, NC, SC, VA): tidal marshes and mud flats; uncommon. May-September. MA and NY south to FL and AL. [= FNA, GW, K, S; = S. subulata var. subulata -- RAB, G, Z; < S. subulata -- C, in part (also see S. stagnorum); > S. subulata var. subulata - F; > S. subulata var. natans (Michaux) J.G. Smith -- F]

Sagittaria weatherbiana Fernald. Cp (GA, NC, SC, VA): fresh to brackish marshes, streambanks, pineland pools; uncommon. April-June. Se. VA south to n. FL. Isozyme studies by Hauber \& Legé (1999) provide evidence that this taxon should be given species status; its genetic identity with var. graminea is low, and comparable to the difference between \(S\). graminea (in the narrow sense) and S. platyphylla. [= F; = S. graminea Michaux var. weatherbiana (Fernald) Bogin -- RAB, C, G, GW, K, Y, Z; = S. graminea Michaux ssp. weatherbiana (Fernald) R.R. Haynes \& C.B. Hellquist - FNA]

Sagittaria sp. 1. Cp (NC, SC): beaverponds, old millponds; rare. Currently under research by Bruce A. Sorrie and Adrienne Edwards. \{not yet keyed\}

Sagittaria teres S. Watson ranges from MA south to DE and NJ. [= C, F, FNA, G, K; = S. graminea Michaux var. teres (S. Watson) Bogin] \{not yet keyed\}

ALLIACEAE J. Agardh 1858 (Onion Family)

\section*{References: Fay \& Chase (1996); Rahn in Kubitzki (1998a).}

1 Inflorescence a solitary flower; flowers blue, lavender, or white; fresh plant with an onion odor; [subfamily Gillesioideae] .....
1 Inflorescence an umbel; flowers white, greenish white, cream, pink, or magenta-purple; fresh plant with or without an onion odor.
2 Tepals 2-9 mm long; ovary 3-celled, each with 1-2 ovules; fresh plant with an onion odor; [subfamily Allioideae] .. Allium
2 Tepals 10-15 mm long; ovary 3-celled, each with 6-10 ovules; fresh plant usually without an onion odor; [subfamily Gillesioideae]

Nothoscordum

\author{
Allium Linnaeus 1753 (Onion, Garlic, Leek, Ramps, Chives) \\ (also see Nothoscordum)
}

A genus of 500-700 species, herbs, of Eurasia, n. Africa, and North America (especially diverse in c. Asia). References: Mathew (1996) \(=\) Z; Rahn in Kubitzki (1998a); McNeal \& Jacobsen in FNA (2002a).

1 Leaves appearing before the flowers and withering before anthesis; leaves lanceolate to elliptic (the margins not parallel for most of the length), mostly more than 2 cm wide; [subgenus Rhizirideum].
2 Leaves (1.5-) 2-4 (-4.5) cm wide, without a distinct petiolar base, the basal portion white; flowers (6-) 10-18 (-25) per umbel (fruits often fewer by abortion); spathe bracts 1-2 cm long; fruiting pedicels (8-) 10-15 (-18) mm long. A. burdickii
2 Leaves (3-) 5-8 (-9) cm wide, with a distinct petiolar base, the petioles usually red or pink; flowers (15-) 30-55 (-63) per umbel (fruits often fewer by abortion); spathe bracts \(2-3 \mathrm{~cm}\) long; fruiting pedicels (10-) 15-25 (-30) mm long
A. tricoccum

1 Leaves present at flowering; leaves linear (the margins parallel for most of the length), mostly less than 2 cm wide.
3 Leaves cylindric (round or channeled-indented in cross section), hollow.
4 Stem stout, usually 1 cm or more in diameter; peduncles with a distinct swollen portion .................. A. cepa
4 Stem slender, less than 5 mm in diameter; peduncles without a distinct swollen portion; [subgenus Allium]
A. vineale

3 Leaves variously flattened or keeled (flat or V-shaped in cross section), not hollow.
5 Stem leafy for half its length; leaves \(1.5-4.5 \mathrm{~cm}\) wide; [subgenus Allium].
6 Inflorescence of flowers only
A. ampeloprasum

6 Inflorescence of flowers and bulblets . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. sativum
5 Stem scapose, leafy only at its base; leaves less than 1.4 cm wide; [subgenus Amerallium].
7 Inflorescence erect, the peduncle not bent.
\(8 \quad\) Ovary or capsule crested with projections about 1 mm long; perianth segments acuminate.
9 Spathe bracts usually 5-nerved; ovary crests contorted, ascending; tepals reflexed; leaves 3-10 mm wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. cuthbertii
9 Spathe bracts 1-nerved; ovary crests plane, flattened, spreading; tepals spreading; leaves 1-2 mm wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . .
10 Inflorescence partly or entirely of bulblets
A. canadense var. canadense

10 Inflorescence entirely of normal flowers . . . . . . . . . . . . . . . . . . . . . . A. canadense var. mobilense
7 Inflorescence nodding, the peduncle bent 30-150 degrees in its uppermost several cm (at least in bud -- in \(A\). stellatum becoming erect in flower or fruit).
11 Flowers stellate, the tepals spreading; scape nodding in bud, becoming erect in flower or fruit; bulb ovoid [A. stellatum]
11 Flowers urceolate, campanulate, to nearly rotate, the tepals strongly to slightly incurved; scape nodding in bud, flower, and fruit; bulb elongate.
12 Perianth urceolate, deep magenta-purple; sepals obtuse; [plants of moderate to high elevations in the Mountains] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. allegheniense
12 Perianth campanulate to nearly rotate, pink, pale pink, or nearly white; sepals acute (obtuse in \(A\). oxyphilum); [of moderate to low elevations in the Mountains, Piedmont, and Coastal Plain].
13 Plants flowering late August-early October; petals 6-9 mm long, pale pink to nearly white; leaves moderately to strongly keeled in cross section (the angle between the two lower flat faces generally 90-135 degrees), 4-12 mm wide; [of calcareous wet savannas of the outer Coastal Plain] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. Apecies 13 Plants flowering June-early August; petals \(5-6.5 \mathrm{~mm}\) long, pink to pale pink (white to greenish white in A. oxyphilum); leaves rounded to moderately keeled in cross section (if keeled, the angle between the two lower flat faces generally 120-165 degrees), 2-8 mm wide; [of the Piedmont and Mountains].
14 Pedicels relatively stout, 1.6-3 cm long; petals pink or pale pink (sometimes nearly white); plants flowering June to early August; [widespread in our area, on moderately to strongly calcareous substrates].
A. cernuum

14 Pedicels relatively slender, 2-4 cm long; petals greenish white to white; plants flowering August; [of barrens developed over strongly acid shales in e. WV]
[A. oxyphilum]
Allium allegheniense Small, Allegheny Onion. Mt (NC, VA): in thin soils around outcrops, generally of mafic rocks (such as amphibolite or hornblende gneiss) or calcareous rocks, primarily at moderate to fairly high elevations (1000-1600m); uncommon (VA Watch List). July-early September; August-October. Although not recognized by most recent authors, A. allegheniense seems distinctive enough in morphology, distribution, and range to warrant taxonomic recognition. Known from w. NC, w. VA, and e. WV, possibly more widespread. [= K, S; < A. cernuum -- RAB, C, F, FNA, G, W, in part]
* Allium ampeloprasum Linnaeus, Wild Leek. Cp, Pd, Mt (NC, SC, VA), \{GA\}: roadsides and other disturbed areas; rare, introduced from Eurasia. Late May-early July; July-August. [= RAB, C, F, FNA, G, W, Z; > A. ampeloprasum var. ampeloprasum -K; > A. ampeloprasum var. atroviolaceum (Boiss.) Regel - K]

Allium burdickii (Hanes) A.G. Jones, Narrow-leaf Ramps, White Ramps. Mt (VA): northern hardwood forests, primarily at higher elevations than A. tricoccum, perhaps also in cove forests and rich mountain slopes; rare (VA Watch List). June; August. Only recently determined to be a separate taxon, A. burdickii is apparently rare in the Southern Appalachians. It blooms about a month earlier than A. tricoccum. See Jones (1979) for more details and discussion. Largely sympatric with \(A\). tricoccum, it is somewhat more northern and midwestern, ranging from ME west to ND and south to NJ, and in the Mountains to (?) w. VA. All material ascribed to A. burdickii in w. NC and e. TN appears to be A. tricoccum. [=K, W; = A. tricoccum var. burdickii Hanes -- C, FNA; < A. tricoccum - F, G]

Allium canadense Linnaeus var. canadense, Wild Onion. Pd, Cp, Mt (NC, SC, VA), \{GA\}: bottomland forests, pastures, roadsides; common. Mid April-May; late May-June. Though native, often appearing weedy. New Brunswick west to ND, south to FL and TX. [= RAB, C, FNA, K; = A. canadense -- F, G, S, W]

Allium canadense Linnaeus var. mobilense (Regel) Ownbey. Cp, Pd (SC), \{GA, NC\}: dry woodlands; rare. Mid April-May; Late May-June. S. SC south to FL, west to TX. This taxon is perhaps better treated as a distinct species. [= RAB, FNA, K; > A. microscordion Small -- S; = A. mutabile Michaux -- F; > A. arenicola Small -- S; A. canadense ssp. mobilense (Regel) Traub \& Ownbey]
* Allium cepa Linnaeus, Garden Onion. Cp, Pd, Mt (NC, SC): persisting from gardens, or appearing around compost or trash piles; rare as an escape (commonly grown), native to Eurasia. May-June; July. [= RAB, C, FNA, G; > A. cepa var. cepa -- K]

Allium cernuum Roth, Nodding Onion. Pd, Mt (NC, SC, VA), \(\{G A\}\) : generally in open woodlands or around outcrops of shale, mafic, or calcareous rocks, in the mountains at low elevations; uncommon (SC Rare). June-early August; August-October. NY, MI, \(M N\), and British Columbia, south to GA and AZ. See discussion of \(A\). oxyphilum at end of genus. \([=S\); <A. cernuum -- RAB, C, F, FNA, G, W, in part (also see A. allegheniense and/or A. oxyphilum); > A. cernuum var. cernuum -- K]

Allium cuthbertii Small, Cuthbert's Onion. Pd (GA, NC, SC), Cp (GA, SC): in thin soils around rock outcrops, receiving nutrient-rich seepage and occurring with many strict calciphiles; rare (NC Rare). May-June; June-July. The bright emerald green ovary of the fresh flowers is striking and distinctive. Two morphological forms occur in our area, probably warranting taxonomic recognition. Typical \(A\). cuthbertii occurs on xeric Coastal Plain sands from c. SC south through GA and AL to FL; the perianth is white and the plants 1.5-3.5 dm tall. In NC, a peculiar form of \(A\). cuthbertii is apparently limited to a series of unusual granitic domes in the Brushy Mountains of Alexander and Wilkes counties; these plants are more robust (4-8 dm tall), and the perianth is always pink. [= RAB, FNA, K, S, W]
* Allium sativum Linnaeus, Garlic. \(\mathrm{Cp}, \mathrm{Pd}(\mathrm{SC})\) : gardens, trash heaps, fields; commonly cultivated, rarely occurring as a waif or persistent in gardens. [=C, F, FNA, G, K, Z]

Allium species 1, Savanna Onion. Cp (NC): wet savannas over coquina limestone (marl); rare (NC Rare). Late August-early October; late September-November. This remarkable Coastal Plain relative of \(A\). cernuum was first discovered in 1981 by Steve Leonard in Pender County; it has since been found in similar sites in Onslow and Brunswick counties, always associated with other
endemic species of primarily montane genera, such as Thalictrum cooleyi and Parnassia caroliniana. It appears to warrant taxonomic status.

Allium speculae Ownbey \& Aase, Flatrock Onion. Pd (GA): seepy edges of vegetation mats on Lithonia granitic gneiss (and on sandstone in ne. AL); rare (GA Threatened). May-June; mid June-mid July. Endemic to wc. GA and ne. AL. See Patrick, Allison \& Krakow (1995) for additional information. [= FNA, K]

Allium tricoccum Aiton, Ramps, Red Ramps, Wild Leek, Rampscallions. Mt (GA, NC, VA): cove forests and mesic slope forests; common. June-July: August-September. See A. burdickii for a discussion of the two species of ramps. Nova Scotia and ND south to n . GA, n. AL, and MO. [= RAB, K, W; < A. tricoccum -- F, G, in part (see also A. burdickii); = A. tricocum var. tricoccum -- C, FNA; = Validallium tricoccum (Aiton) Small -- S]
* Allium vineale Linnaeus, Field Garlic. Pd, Cp, Mt (GA, NC, SC, VA): lawns, pastures, other disturbed places; common, introduced from Eurasia. Late May-June; June-August. This is the common weed, often known as "onion grass". [= RAB, C, F, FNA, G, S, W; > A. vineale ssp. vineale -- K; > A. vineale var. vineale - Z; > A. vineale var. capsuliferum Koch - Z; > A. vineale var. compactum (Thuill.) Coss. - Z]

Allium oxyphilum Wherry occurs on shale barrens in WV (Greenbrier, Mercer, Monroe, and Summers counties). Although there has been much discussion of its taxonomic status, it is apparently distinct from \(A\). cernuum. It should be expected in VA, although the outcrops of suitable shales are quite limited (Bartgis, pers. comm.; Wieboldt, pers. comm.). [= K; < A. cernuum -- C, F, FNA, G, W, in part]

Allium stellatum Nuttall ex Ker-Gawler occurs east to c. TN. [= C, F, FNA, G, K]
Other members of the genus are widely cultivated for food, spice, or ornament; some may escape or persist. Some of the more familiar are A. porrum Linnaeus (Leek), A. oleraceum Linnaeus (Field Garlic), and A. schoenoprasum Linnaeus (Chives), introduced from Eurasia.

\section*{Nothoscordum Kunth 1843 (Grace Garlic, False Garlic)}

A genus of about 25 species, herbs, of the Americas (primarily South America). References: Rahn in Kubitzki (1998a)=Z; Jacobsen \& McNeal in FNA (2002a).

1 Leaves 1-4 mm wide; flowers 17 or fewer per umbel; flowers fragrant . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . N. bivalve
1 Leaves \(4-12 \mathrm{~mm}\) wide; flowers 15 or more per umbel; flowers not fragrant
N. gracile

Nothoscordum bivalve (Linnaeus) Britton, Grace Garlic, False Garlic. Cp, Pd (GA, NC, SC, VA), Mt (GA): around granite flatrocks, in glades and barrens of various kinds, in open woodlands, and also weedy in fields and along roadsides; common (VA Rare). Mid March-mid May, and again in September-October; May-June, and again in October-November. Se. VA west to s. OH and KS, south to FL, TX, and South America. An onion-like plant, but generally lacking the odor of onion. [=C, F, G, K, S, W, Z; = Allium bivalve (Linnaeus) Kuntze -- RAB]
* Nothoscordum gracile (Aiton) Stearn. Cp (GA, SC): disturbed areas; rare, introduced from South America. [= FNA, K; = Nothoscordum borbonicum Kunth -- Z, misapplied?; = Allium inodorum Aiton -- RAB; = N. fragrans (Ventenat) Kunth -- S]

Tristagma Poepp. (Star-of-Bethlehem)
A genus of 3 species, herbs, of South America. References: Rahn in Kubitzki (1998a).
* Tristagma uniflorum (Graham) Traub, Star-of-Bethlehem. Cp (GA, NC, SC, VA), Pd (NC, SC, VA): commonly cultivated, escaping to lawns, suburban woodlands, bottomlands, disturbed places; rare, introduced from South America. March-April. Reported for South Carolina by Hill \& Horn (1997). [= K; = Ipheion uniflorum (Graham) Rafinesque -- RAB]

\footnotetext{
* Alstroemeria pulchella Linnaeus f., Peruvian-lily, is naturalized in GA and other states along the Gulf Coast (Holmes in FNA 2002). [= FNA]
}

\section*{AMARYLLIDACEAE J. St. Hilaire 1805 (Amaryllis Family) \\ (also see AGAVACEAE and HYPOXIDACEAE)}

A family of about 59 genera and 850 species, nearly cosmopolitan (especially diverse in the tropics). References: Dahlgren, Clifford, \& Yeo (1985); Müller-Doblies \& Müller-Doblies (1996); Meerow \& Snijman in Kubitzki (1998a).

1 Corona present (a fused tubular or flattened petaloid structure in the center of the flower, above the tepals)
2 Filaments used with the corona; corona very membranous in texture, distinctly thinner than the tepals; flowers white; [native, of riverine or tidal shores and marshes]; [tribe Hymenocallideae, subtribe Hymenocallidinae] . . . . Hymenocallis
2 Filaments not fused with the corona; corona membranous in texture, but similar to the tepals (in texture, though sometimes of a different color); flowers usually at least partly yellow or orange (sometimes purely white); [alien, naturalized in primarily upland and disturbed habitats]; [tribe Narcisseae, subtribe Narcissinae] . . . . . . . . . . . . Narcissus
1 Corona absent.
3 Flowers red; stamens about \(2 \times\) as long as the tepals; [tribe Lycoridae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Lycoris
3 Flowers white, yellow, or white-pink; stamens shorter than or about as long as the tepals.
4 Flowers yellow; [tribe Narcisseae, subtribe Narcissinae] Sternbergia
4 Flowers white or white-pink.
5 Tepals 3-10 cm long, white or sometimes white-pink.
6 Tepals spreading, separate, the perianth rotate; inflorescence a several-flowered umbel terminating the stem; [tribe Amaryllideae, subtribe Crininae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Crinum
6 Tepals ascending, overlapping, the perianth tubular; inflorescence of a single flower; [tribe Hippeastreae, subtribe Zephyranthinae]

Zephyranthes
5 Tepals 0.4-2.5 cm long, white, with small green or yellow spots; [tribe Narcisseae, subtribe Galanthinae].

7 Inner 3 tepals and outer 3 tepals of similar size and shape . . . . . . . . . . . . . . . . . . . . . . . . . . . Leucojum

Crinum Linnaeus 1753 (Swamp Lily, String Lily)
A genus of about 65 species, pantropical, extending locally into warm temperate regions. References: Holmes in FNA (2002a); Meerow \& Snijman in Kubitzki (1998a).

Identification notes: Crinum can be distinguished vegetatively from Hymenocallis by its spiral (vs. distichous) leaf arrangement and leaf margins finely toothed (vs. entire).

1 Flowers sessile; umbels 2-7-floweredl sepals and petals shorter than the tube .......................... . C. americanum
1 Flowers pedicellate; umbels 8-13-flowered; sepals and petals longer than the tube . . . . . . . . . . . . . . . . . . C. bulbispermum
Crinum americanum Linnaeus, Swamp Lily, String Lily. Cp (GA, NC, SC): swamp forests; rare (NC Rare). June-October. Se. NC south to s. FL and west to TX. [= GW, K, S; C. americanum var. americanum - FNA]
* Crinum bulbispermum (Burman f.) Milne-Redhead \& Schweickerdt. Cp (GA?, NC, SC): commonly cultivated, occasional in waste areas; rare, introduced. June-July. [= FNA, K; C. longifolium (Linnaeus) Thunberg -- S]

\section*{Galanthus Linnaeus 1753 (Snowdrop)}

A genus of about 17 species, of Europe and w. Asia. See Bishop, Davis, \& Grimshaw (2001) for detailed information on the genus, especially on cultivars. References: Stace (1997)=Z; Straley \& Utech in FNA (2002a); Bishop, Davis, \& Grimshaw (2001); Meerow \& Snijman in Kubitzki (1998a).

1 Leaves inrolled as they unfold, at least one leaf \(>1 \mathrm{~cm}\) wide at flowering; inner tepals with green blotch at base and apex; [series Latifolii] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [G. elwesii]
1 Leaves flat as they unfold, all leaves \(<1 \mathrm{~cm}\) wide at flowering; inner tepals with green blotch at apex only; [series \(G a l a n t h u s\) ].

\section*{G. nivalis}
* Galanthus nivalis Linnaeus, Snowdrop. Pd (NC, VA): persistent after cultivation; rare, introduced from a native range in southern and central Europe. February-March. [= F, FNA, K, Z]
* Galanthus elwesii Hooker f., Giant Snowdrop, Greater Snowdrop, is reported as cultivated and rarely naturalized in PA (Rhoads \& Klein 1993). It is native of the eastern Meditteranean. [= FNA, Z; = G. elewesii - K, orthographic error]

\section*{Hymenocallis Salisbury 1812 (Spider-lily)}

A genus of about 50 species, from s. North America and the West Indies south to ne. South America. The appropriate systematics and nomenclature of Hymenocallis in se. United States are still unstable and uncertain. Recent publications by Smith and coworkers (e.g. Smith \& Garland 1996, 2003; Smith \& Flory 1990; Smith \& Flory in FNA (2002a) have greatly improved our understanding of southeastern United States Hymenocallis. References: Smith \& Garland (2003)=Z; Meerow \& Snijman in Kubitzki (1998a); Smith \& Flory in FNA (2002a). Key adapted from on Smith \& Flory in FNA (2002a).

Identification notes: Hymenocallis can be distinguished vegetatively from Crinum by its distichous (vs. spiral) leaf arrangement and leaf margins entire (vs. finely toothed).

1 Staminal cup \(>4.5 \mathrm{~cm}\) long; [of rocky river shoals of the Piedmont]
H. coronaria

1 Staminal cup \(<4.5 \mathrm{~cm}\) long; [of the Coastal Plain, Piedmont floodplains, and the GA Ridge and Valley].
2 Leaves oblanceolate, distinctly wider towards the tip.
3 Leaves coriaceous, not glaucous; scape bracts 3-4 (-6) cm long, the tip acute; bulbs rhizomatous; [of wet habitats] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . H. choctawensis
3 Leaves not coriaceous, distinctly glaucous; scape bracts 4-7 cm long, the tip long-acuminate; bulbs rhizomatous; [of moist but not mucky habitats] .
H. occidentalis var. occidentalis

2 Leaves liguliform, not wider towards the tip, the margins parallel throughout.
4 Staminal cups rotate at full anthesis; leaves chiefly arching low, often appearing prostrate; [of s. GA south into FL] .
4 Staminal cups funnelform at full anthesis but gradually spreading in time; leaves suberect to erect; [of se. NC south to FL].
5 Perianth segments (6-) 7-11.5 cm long; leaves 3-7 dm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . H. crassifolia
5 Perianth segments \(5.0-6.5 \mathrm{~cm}\) long; leaves \(1.5-2.5 \mathrm{dm}\) long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . H. pygmaea
Hymenocallis choctawensis Traub, Florida Panhandle Spiderlily, Choctaw Spiderlily. Cp (GA): floodplains; rare (GA Watch List). GA (floodplain of the Ochlockonee River) and FL west to LA. [= FNA, K, Z; < Hymenocallis sp. -- GW]

Hymenocallis coronaria (LeConte) Kunth, Shoals Spiderlily, Cahaba Lily. Pd (GA, SC): rocky river shoals, usually with Justicia americana and Podostemum ceratophyllum; rare (GA Endangered). Mid May-July; July-September. SC south and west to AL. Notable stands of this spectacular plant occur on the Saluda River (SC), Savannah River below I-20 (GA-SC border), and on the Cahaba River (Bibb County, AL). [= FNA, Z; ? H. caroliniana (Linnaeus) Herbert -- K, misapplied; ? H. occidentalis (Le Conte) Kunth -- RAB, S, misapplied; < Hymenocallis sp. -- GW]

Hymenocallis crassifolia Herbert. Cp (GA, NC, SC): tidal marshes, margins of tidal guts, banks of blackwater rivers; common. May-June; June-July. Se. NC south to n. FL. [= RAB, FNA, S, Z; < Hymenocallis sp. -- GW; ? H. floridana (Rafinesque) Morton - K, misapplied]

Hymenocallis duvalensis Traub, Dixie Spiderlily, Duval Spiderlily. Cp (GA): blackwater floodplain (Suwanee River); rare (GA Watch List). S. GA (floodplain of the Suwanee River) south to n. FL. [= FNA, K, Z; < Hymenocallis sp. -- GW]

Hymenocallis occidentalis (LeConte) Kunth var. occidentalis, Hammock Spiderlily, Woodland Spiderlily. Cp (GA, SC), Pd (GA, NC), Mt (GA, NC?): mesic soils of slopes and floodplain forests, gabbro glades and other calcareous upland flats; uncommon. NC west to AR and LA. Var. eulae (Shinn ers) G.L. Smith \& Flory is endemic in the West Gulf Coastal Plain. [= FNA, Z; < Hymenocallis sp. -- GW; < H. occidentalis - S; H. caroliniana (Linnaeus) Herbert - K, misapplied]

Hymenocallis pygmaea Traub, Pygmy Spiderlily, Waccamaw Spiderlily. Cp (NC, SC): banks of blackwater rivers; rare. MayJune; June-July. Se. NC south to ne. SC, perhaps endemic to the Waccamaw River drainage. Needing further study, but strikingly different in appearance from H. crassifolia. [= FNA, Z; < Hymenocallis sp. -- GW; ? H. palmeri S. Watson - K, misapplied]

\section*{Leucojum Linnaeus 1753 (Snowflake)}

A genus of about 10 species, of Europe, n. Africa, and w. Asia. References: Straley \& Utech in FNA (2002a); Meerow \& Snijman in Kubitzki (1998a).
* Leucojum aestivum Linnaeus, Snowflake. Cp (NC, SC, VA), Pd (VA): persistent after cultivation; rare, introduced from Europe. March-April. Reported naturalized in NC by Leonard (1971b). [= RAB, C, F, FNA, G; > L. aestivum ssp. aestivum -- K]

\section*{Lycoris Herbert 1819 (Magic Lily)}

A genus of about 20 species, primarily e. Asian. References: Meerow \& Snijman in Kubitzki (1998a).
* Lycoris radiata (L'Héritier) Herbert, Magic Lily, Surprise Lily, Hurricane Lily. Pd, Cp (NC, SC): frequently cultivated, sometimes persistent for long periods of time, especially in lawns around older homes; rare, introduced from e. Asia. SeptemberOctober. Leaves and flowers are not present at the same time. [= RAB, K]

\section*{Narcissus Linnaeus 1753 (Daffodil, Jonquil, Narcissus, Buttercup)}

A genus of about 40-60 species, of Europe, n. Africa, and w. Asia. References: Stace (1997)=Z; Jefferson-Brown (1991)=Y; Straley \& Utech in FNA (2002a); Hanks (2002); Jefferson-Brown (1969); Meerow \& Snijman in Kubitzki (1998a).

Identification notes: The familiar flower consists of 6 tepals spreading in more or less a plane, and a fused, tubular, corona. The hypanthial tube is below the perianth lobes.

1 Perianth lobes 10-15 mm long; corona 3-5 mm long; leaves and stems cylindrical, hollow; umbel (or spathe, or stem) with 3-10 flowers . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . N. jonquilla
1 Perianth lobes 20-50 mm long; corona 5-50 mm long; leaves and stems flattened, solid; umbel (or spathe, or stem) with 1-4 flowers.
2 Hypanthial tube (below the tepals) parallel-sided (though sometimes suddenly expanded at its apex); corona less than 10 mm long, usually wider than high; corona less than \(0.5 \times\) as long as the perianth lobes; corona rarely undulate; umbel (or spathe, or stem) with 1-10 flowers.
3 Corona of a single color, all white or yellow; umbel (or spathe, or stem) with (1-) 2 (-3) flowers . . . N. xmedioluteus 3 Corona rim red, contrasting with the white or yellow corona; umbel (or spathe, or stem) with 1 flower ... N. poeticus
2 Hypanthial tube (below the tepals) distinctly widening towards its apex; corona usually more than 10 mm long, usually as long as wide or longer than wide; corona more than \(0.5 \times\) as long as the perianth lobes; corona margin undulate; umbel (or spathe, or stem) with 1 flower.
4 Tepals linear to lanceolate, less than 5 mm wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . N. bulbocodium
4 Tepals ovate, triangular-ovate, or suborbicular, more than 10 mm wide.
5 Corona 10-25 mm long, distinctly shorter than the perianth lobes . . . . . . . . . . . . . . . . . . . N. xincomparabilis
5 Corona \(30-50 \mathrm{~mm}\) long, about as long as the perianth lobes . . . . . . . . . . . . . . . . . . N. pseudonarcissus
* Narcissus bulbocodium Linnaeus, Hoop-petticoat Daffodil. Cp (NC): grassy roadsides, established; rare (introduced from Eurasia). March. [= Y, Z]
* Narcissus ×incomparabilis P. Miller (prosp.) [poeticus \(\times\) pseudonarcissus], Nonesuch Daffodil. Cp, Pd (GA, NC, SC, VA): cultivated as an ornamental, persistent and naturalized in lawns, roadsides, woodland borders, and disturbed areas; common, introduced from Europe. March-April. [= C, K, Z; = N. incomparabilis -- RAB, F, G]
* Narcissus jonquilla Linnaeus, Jonquil. Cp (GA, NC, SC): cultivated as an ornamental, persistent and naturalized in lawns, roadsides, woodland borders, and disturbed areas; uncommon, introduced from Europe. March-April. [= RAB, C, F, FNA, G, K, Z]
* Narcissus \(\times \boldsymbol{m}\) edioluteus P. Miller (prosp.) [poeticus \(\times\) tazetta], Primrose-peerless. Cp, Pd, Mt (NC, SC, VA): cultivated as an ornamental, persistent and naturalized in lawns, roadsides, woodland borders, and disturbed areas; common, introduced from Europe. March-May. [= K, Z; = N. tazetta \(\times\) poeticus -- RAB]
* Narcissus poeticus Linnaeus, Poet's Narcissus, Pheasant's-eye Daffodil. Cp, Pd, Mt (GA, NC, SC, VA): cultivated as an ornamental, persistent and naturalized in lawns, roadsides, woodland borders, and disturbed areas; common, introduced from Europe. March-May. [= RAB, C, F, FNA, G, K, Z]
* Narcissus pseudonarcissus Linnaeus, Daffodil, Buttercup. Cp, Pd, Mt (GA, NC, SC, VA): cultivated as an ornamental, persistent and naturalized in lawns, roadsides, woodland borders, and disturbed areas; common, introduced from Europe.
February-April. [= RAB, C, FNA, K, Z; = N. pseudo-narcissus -- F, G, orthographic variant]
Other taxa are under cultivation and may be expected as persistent or escaped in our area. Manuals of cultivated plants and the extensive horticultural literature on Narcissus (such as the references listed above) should be consulted by those interested in more information on members of this genus.

Sternbergia Waldst. \& Kit. 1805 (Winter Daffodil)

A genus of about 8 species, of Meditteranean Europe, n. Africa, and w. Asia. References: Meerow \& Snijman in Kubitzki (1998a).
* Sternbergia lutea (Linnaeus) Ker-Gawler ex Sprengel, Winter Daffodil. Cp (VA): cultivated as an ornamental, persistent and naturalized in lawns, roadsides, woodland borders, and disturbed areas; rare, introduced from Europe. This species has yellow, Crocus-like flowers, in the autumn. [= K]
\[
\text { Zephyranthes Herbert } 1821 \text { (Atamasco-lily, Zephyr-lily, Rain-lily) }
\]

A genus of about 50 species, from s. North America and the West Indies south to s. South America. References: Flagg, Smith, \& Flory in FNA (2002a); Meerow \& Snijman in Kubitzki (1998a).

1 Flowers (from base of ovary to apex of perianth) 3-5 cm long; stamens 1.5-2.5 cm long; stigma 1, 3-lobed; [introduced species, escaped from cultivation] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Z. candida
1 Flowers \(6-10 \mathrm{~cm}\) long; stamens \(4.5-8 \mathrm{~cm}\) long; stigmas 3 ; [native species, sometimes also cultivated].
2 Style and stigma as long as or shorter than the anthers; perianth segments erect-ascending at full anthesis, mostly 3-6 cm

2 Style and stigmas extending beyond the anthers; perianth segments spreading at full anthesis, mostly 5-8 cm long.
3 Mature leaves concave, \(3-8 \mathrm{~mm}\) wide; perianth tube usually \(<2.3 \mathrm{~cm}\) long; filaments \(>1.5 \times\) as long as the perianth tube . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Z. atamascan
3 Mature leaves grooved, 1-4 mm wide; perianth tube usually \(>2.3 \mathrm{~cm}\) long; filaments \(<1.5 \times\) as long as the perianth tube
Z. treatiae

Zephyranthes atamasca (Linnaeus) Herbert, Common Atamasco-lily. Cp, Pd (GA, NC, SC, VA), Mt (NC, SC): bottomland forests and adjacent road shoulders, wet meadows; common (rare in VA Piedmont, rare in Mountains). Late March-April; May-June. Se. and sc. VA south to n. FL, west to s. MS. [= FNA; = Z. atamasco -- RAB, C, F, G, GW, orthographic variant; = Zephyranthes atamasca var. atamasca -- K; = Atamosco atamasco (Linnaeus) Greene -- S, orthographic variant]
* Zephyranthes candida (Lindley) Herbert. Cp (GA, NC, SC): cultivated, persistent or spreading from cultivation; rare, introduced from South America. Late September-October. [= RAB, FNA, K; = Atamosco candida (Lindley) Small -- S]

Zephyranthes simpsonii Chapman, Florida Atamasco-lily. Cp (GA, NC, SC): dry to dry-mesic sandy soils (usually with admixture of shell hash) of coastal fringe sandhills or mainland maritime forests, usually associated with Quercus hemispherica, on barrier islands or within about 10 km of the ocean (NC, SC), pine flatwoods (GA); rare (GA Special Concern, NC Rare). April-May; May-June. Se. NC (Brunswick and Columbus counties) and ne. SC (Horry and Georgetown counties); s. GA, c. and s. peninsular FL. The disjunct populations in NC and SC may differ from Z. simpsonii (sensu stricto) of s. GA and c. and s. peninsular FL, and needs additional study. [= RAB, FNA, GW, K; = Atamosco simpsonii (Chapman) Greene -- S]

Zephyranthes treatiae S. Watson. Cp (GA): wet savannas; uncommon. January-April. S. GA (Jones \& Coile 1998) south into FL. [= FNA, GW; = Z. atamasca (Linnaeus) Herbert var. treatiae (S. Watson) Meerow -- K; = Atamasco treatiae (S. Watson) Greene -- S]

ARACEAE de Jussieu 1789 (Arum Family)
(also see ACORACEAE)
A family of about 100-110 genera and about 4000 species, herbs and reduced aquatic herbs, cosmopolitan, but mostly tropical and subtropical. The Lemnaceae is phylogenetically embedded in the Araceae, and is here included in it as subfamily Lemnoideae (Angiosperm Phylogeny Group 1998, 2003; Keating 2004). References: Thompson in FNA (2000); Mayo, Bogner, \& Boyce in Kubitzki (1998b); Keating (2004); Serviss, McDaniel, \& Bryson (2000); Landolt in FNA (2000); Landolt (1980); Landolt (1986); Landolt in Kubitzki (1998b); Les \& Crawford (1999).

1 Plant a floating aquatic (or stranded), the individual leaves \(<2 \mathrm{~cm}\) long; [subfamily Lemnoideae].
2 Fronds rootless; fronds without nerves; reproductive pouch 1, terminal.
3 Fronds thick, globoid, less than 2 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Wolffia
2 Fronds with roots; fronds with 1 or more nerves; reproductive pouches 2, lateral.
4 Roots 1 per frond; fronds with 1-5 (-7) nerves . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Lemna
4 Roots (1-) 2-21 per frond; fronds with (3-) 5-21 nerves.
5 Roots (1-) 2-7 (-12) per frond; fronds with (3-) 5-7 nerves; fronds \(1.5-3 \times\) as long as wide; all of the roots perforating the scalelike leaflet Landoltia
5 Roots 7-21 per frond; fronds with 7-16 (-21) nerves; fronds 1-1.5× as long as wide; only some of the roots perforating the scalelike leaflet (borne on the underside) . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Spirodela
1 Plant terrestrial, rooted in wetlands, or a floating aquatic (if a floating aquatic - Pistia - the individual leaves \(>2 \mathrm{~cm}\) long).
2 Plant a floating aquatic, with gray-green, velvety, cabbage-like leaves; [subfamily Aroideae, tribe Pistieae] . . . . . . Pistia
2 Plant rooted (even when growing in water), the leaves various, but not as above.
3 Leaves compound; [subfamily Aroideae, tribe Arisaemateae].
4 Bulblets lacking on the petiole; spadix free from the spathe; [native, common in our area] ......... Arisaema
4 Bulblets present at base and summit of the petiole; spadix fused to the spadix; [alien, rare] . . . . . . . [Pinellia]
3 Leaves simple.
5 Leaves peltate and cordate-hastate; [subfamily Aroideae, tribe Colocasieae] .................... Colocasia 5 Leaves not peltate, either cuneate, rounded, or hastate.

6 Spathe absent or obscure; leaf blade \(2.5-4 \times\) as long as wide, cuneate at the base, lanceolate or narrowly elliptic; leaf venation parallel; [subfamily Orontioideae, tribe Orontieae] . . . . . . . . . . . . . . . . . . . Orontium
6 Spathe present, surrounding the spadix, at least at its base; leaf blade1-2.5× as long as wide, either hastate at the base (Peltandra), or rounded (Symplocarpus), or cordate (Calla), broadly ovate in outline. 7 Spathe white; leaves cordate; plants from elongate rhizomes; [subfamily Calloideae] . . . . . . [Calla] 7 Spathe green or white; leaves hastate or rounded at base; plants from fibrous roots, a short thick rhizome, or a corm.
8 Leaves ovate, rounded at base; spathe purple, or purple flecked with white; [subfamily
Orontioideae, tribe Symplocarpeae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Symplocarpus
8 Leaves hastate at base (somewhat arrowhead-shaped); spathe green or white; [subfamily Aroideae].
9 Plant with fibrous roots; larger leaf blades less than 5 dm long; longer petioles less than 7 dm long; [subfamily Aroideae, tribe Peltandreae]

Peltandra

9 Plant with corm or rhizome; larger leaf blades more than 5 dm long; longer petioles 10-20 dm long; [subfamily Aroideae, tribe Caladieae]
[Xanthosoma]

\section*{Arisaema Martius 1831 (Jack-in-the-pulpit, Indian-turnip)}

A genus of about 150-170 species, of Asia, e. North America, e. Africa, and Arabia. Some of the taxa here recognized as subspecies of \(A\). triphyllum might better be considered as species with relatively subtle morphological distinctions. They are broadly sympatric, and sometimes occur together in mixed populations with little sign of introgression or hybridization. Ssp. triphyllum is tetraploid and does not produce fertile seed when crossed with the other (diploid) subspecies (Treiber 1980). References: Thompson in FNA (2000); Huttleston (1981)=Z; Treiber (1980)=Y; Huttleston (1949)=X; Gusman \& Gusman (2002)=Q; Renner, Zhang, \& Murata (2004); Mayo, Bogner, \& Boyce in Kubitzki (1998b). Key based on the references.

1 Leaf with (5-) 7-15 leaflets, arranged pedately on a semicircular axis; spadix 9-20 cm long, attenuate, long-exserted from the spathe; [section Tortuosa] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. Aracontium
1 Leaf with 3-5 leaflets, arranged palmately; spadix 3.5-8 cm long, clavate or cylindrical and blunt, included in the spathe; [section Pedatisecta].
2 Leaves glaucous beneath at maturity; spathe flange 2-9 mm broad; spathe hood green, or green with purple stripes; sterile spadix (appendix) clavate or cylindrical.
3 Lateral leaflets (of primary leaf if more than one) 2-parted or 2-lobed (rarely unlobed); sterile spadix 1-3 mm in diameter, cylindrical, curved outward; spathe hood green . . . . . . . . . . . . . . . . . . . . . . A. triphyllum ssp. quinatum
3 Lateral leaflets (of primary leaf if more than one) undivided (rarely lobed); sterile spadix 4-10 mm in diameter, clavate, straight; spathe hood green, or green striped with purple . . . . . . . . . . . . . . . A. triphyllum ssp. triphyllum
2 Leaves green beneath at maturity (very rarely glaucous); spathe flange \(1-3 \mathrm{~mm}\) broad; spathe hood green with white stripes, green with purple stripes, solid green, or solid purple; sterile spadix (appendix) cylindrical.
4 Spathe tube not fluted (rarely weakly fluted); spathe hood solid green or solid purple . . A. triphyllum ssp. pusillum 4 Spathe tube strongly fluted; spathe hood green with white or purple stripes . . . . . . A. triphyllum ssp. stewardsonii

Arisaema dracontium (Linnaeus) Schott, Green Dragon. Pd, Mt, Cp (GA, NC, SC, VA): bottomlands and floodplains; uncommon (rare in Mountains and Coastal Plain). May; July. S. Québec, MI, and WI, south to FL and e. TX. [= RAB, C, F, FNA, G, GW, K, Q, W; = Muricauda dracontium (Linnaeus) Small -- S]

Arisaema triphyllum (Linnaeus) Schott ssp. pusillum (Peck) Huttleston, Small Jack-in-the-pulpit. Cp, Pd, Mt (GA, NC, SC, VA): swamps and moist forests; common. March-May. CT, NY, and IN, south to FL and LA. Widespread in e. North America. This taxon is diploid \((2 n=28)\). [ \(=K, X, Z ;<A\). triphyllum -- RAB, F, FNA, GW, W, in part, some or all of the subspecies not recognized; = A. triphyllum var. pusillum Peck -- \(\mathrm{C}, \mathrm{G}\); > A. pusillum (Peck) Nash -- \(\mathrm{S} ;>\) A. acuminatum \(\mathrm{Small}-\mathrm{-}\); < A. triphyllum ssp. pusillum - Q, Y, in part (also see ssp. quinatum)]

Arisaem a triphyllum (Linnaeus) Schott ssp. quinatum (Buckley) Huttleston, Southern Jack-in-the-pulpit. Mt, Pd (GA, NC, SC), Cp (GA): mesic forests; uncommon. March-April. Sc. NC, sw. NC, se. TN south to n. FL and e. TX. This taxon is of uncertain validity; Treiber lumps it with ssp. pusillum, while Huttleston recognizes it as a full species (Huttleston 1949) or as a ssp. (Huttleston (1981). This taxon is diploid \((2 n=28)\). \([=K, Z ;<A\). triphyllum -- RAB, FNA, W, in part, some or all of the subspecies not recognized; = A. quinatum (Buckley) Schott -- GW, S, X; <A. triphyllum ssp. pusillum - Q, Y, in part; A. polymorphum Buckley]

Arisaema triphyllum (Linnaeus) Schott ssp. stewardsonii (Britton) Huttleston, Bog Jack-in-the-pulpit. Mt (NC, VA): bogs and peaty swamps; rare (NC Rare). April-May. Nova Scotia west to MN, south to w. NC, e. TN, and n. IN (Treiber 1980). This subspecies is the most northern, and also has the most distinctive habitat, being restricted to distinctly wet, peaty sites. This taxon is diploid \((2 n=28)\). \([=K, Q, X, Y, Z ;<A\). triphyllum -- RAB, FNA, GW, W, in part, some or all of the subspecies not recognized; \(=A\). triphyllum var. stewardsonii (Britton) G.T. Stevens -- C, G; = A. stewardsonii Britton -- F]

Arisaema triphyllum (Linnaeus) Schott ssp. triphyllum, Common Jack-in-the-pulpit. Cp, Pd, Mt (GA, NC, SC, VA): mesic forests; common. March-April. New Brunswick west to se. Manitoba, south to FL, LA, and e. TX (Treiber 1980). This taxon is tetraploid \((2 n=56)\). [ \(=K, Q, X, Y, Z ;<A\). triphyllum sensu lato -- RAB, F, FNA, GW, W, in part, some or all of the subspecies not recognized; = A. triphyllum var. triphyllum -- \(\mathrm{C} ;>\) A. triphyllum var. triphyllum - F ; > A. atrorubens (Aiton) Blume -- F ; = A. triphyllum sensu stricto -- S]

\section*{Arum Linnaeus 1753 (Arum)}

A genus of about 26 species, of temperate Eurasia. References: Thompson in FNA (2000); Mayo, Bogner, \& Boyce in Kubitzki (1998b).
* Arum italicum Linnaeus has been collected in NC, apparently persisting from horticultural planting. It has a large (more than 10 cm long) white spathe. It probably cannot be considered a naturalized component of our flora. [= FNA] \{not yet keyed\}

A monotypic genus, of circumboreal distribution. References: Thompson in FNA (2000); Mayo, Bogner, \& Boyce in Kubitzki (1998b).

Calla palustris Linnaeus, Wild Calla, Water-arum, is a circumpolar species of seepage swamps, ranging south in North America to sw. PA, w. MD, n. IL, c. MN, and British Columbia. [= C, F, FNA, G, K]

\section*{Colocasia Schott 1832 (Elephant's-ear, Taro, Dasheen)}

A genus of about 8 species, of tropical Asia. References: Thompson in FNA (2000); Mayo, Bogner, \& Boyce in Kubitzki (1998b); Serviss, McDaniel, \& Bryson (2000)=Z.
* Colocasia esculenta (Linnaeus) Schott, Elephant's-ear, Taro, Dasheen. Cp (GA, NC, SC): naturalized in ditches or shores; rare, native of the Tropics. Frequently planted for its "tropical" appearance, becoming naturalized, for instance at Lake Waccamaw, Columbus County, NC, where it grows scattered along much of the shoreline, spread by fragments of rhizome. In our area, it is generally infertile. In the Tropics, Colocasia is a food crop cultivated for its rhizomes and shoots. The rhizomes are the source of "poi," a starchy staple of the Hawaiian Islands. See Serviss, McDaniel, \& Bryson (2000) for a discussion of various varieties cultivated in the southeastern United States, their identification, and their weediness. [= FNA, GW, K; > C. antiquorum Schott -- S; > C. esculenta var. antiquorum (Schott) Hubb. \& Rehder - Z; > C. esculenta var. esculenta - Z]

\section*{Landoltia D.H. Les \& D.J. Crawford}

A monotypic genus, now cosmopolitan. References: Landolt in FNA (2000); Landolt (1980)=Z; Landolt (1986)=Y; Landolt in Kubitzki (1998b); Les \& Crawford (1999)=X.
* Landoltia punctata (G.F.W. Meyer) D.H. Les \& D.J. Crawford. Cp (GA, NC, SC, VA), Pd (GA, NC, SC): still to slowly moving waters of ponds, lakes, beaver ponds, and swamps; uncommon, introduced from the Southern Hemisphere. Widespread worldwide. An introduced aquarium plant. Les \& Crawford (1999) make a good case for recognition of this species in the monotypic genus Landoltia, very possibly more closely related to Lemna than to Spirodela. [= FNA, X; = Spirodela punctata (G.F.W. Meyer) C.H. Thompson - C, GW, K, Y, Z; Spirodela oligorrhiza (Kurz) Hegelmann -- RAB, F, G; = Lemna punctata G.F.W. Meyer]

Lemna Linnaeus 1753 (Duckweed)
A genus of 13 species, cosmopolitan. References: Landolt (1980)=Z; Landolt (1986)=Y; Landolt in Kubitzki (1998b); Landolt in FNA (2000). Key adapted from Landolt (1980, 1986).

1 Margin of fronds denticulate in the distal portion; fronds narrowed basally to an elongated, persistent, green stalk, the fronds therefore cohering in long, often branched chains of 3-50 fronds; fronds submerged (except when flowering or fruiting); [section Hydrophylla]
L. trisulca

1 Margin of fronds entire; fronds rounded basally, with a very small white stipe soon decaying, the fronds therefore cohering in simple clusters of 2-5; fronds normally floating.
2 Fronds with (0-) 1 nerve; anthocyanin absent in fronds (fronds green); [section Uninerves]
3 Fronds \(1-2 \times\) as long as wide; nerve indistinct to fairly prominent, reaching at most \(2 / 3\) of the distance from node to apex (nerve about as long as or shorter than the aerenchymatous portion of the frond); fruit 0.6-1.0 mm long L. minuta

3 Fronds \(1.3-3 \times\) as long as wide; nerve mostly prominent, reaching at least \(3 / 4\) of the distance from node to apex (nerve longer than the aerenchymatous portion of the frond); fruit 1.0-1.35 mm long . . . . . . . . . . . . . . L. valdiviana
2 Fronds with 3-5 (-7) nerves; anthocyanin absent or present in fronds (fronds green or red).
4 Root sheath winged at the base; root tip sharply pointed; roots not longer than 3 cm long; anthocyanin absent in fronds; [section Alatae].
5 Seeds with 8-26 prominent ribs, brownish, falling from the fruit when ripe; fronds with only 1 papilla above the node, which is smaller than the papule at the apex; wing of the root sheath \(1-2.5 \times\) as long as wide \(\qquad\)
L. aequinoctialis

5 Seeds with 35-70 obscure ribs, whitish, remaining in the fruit when ripe; fronds very often with 2-3 papilla above the node, which are larger than the papule at the apex; wing of the root sheath \(2-3 \times\) as long as wide L. perpusilla

4 Root sheath not winged at the base; root tip mostly rounded; roots often longer than 3 cm long; anthocyanin present or absent in fronds; [section Lemna].
6Plants forming small, olive-brown rootless turions, 0.8-1.6 mm in diameter, which sink to the bottom L. turionifera 6Plants without distinct turions.
7 Fronds, if reddish, only very slightly so below, and more darkly so above; plants flat (less than 1 mm thick) L. minor
7 Papule at the apex very prominent, those towards the node much smaller; fronds, if reddish, much more intensely red below than above; plants flat or occasionally gibbous (up to 2.5 mm thick) L. obscura

6 Papules along the median line not very prominent, those at the apex and near the node only slightly larger than those between; fronds, if reddish, only very slightly so below, and more darkly so above; plants flat (less than 1 mm thick) L. minor
6 Papule at the apex very prominent, those towards the node much smaller; fronds, if reddish, much more intensely red below

\section*{L. obscura}

Lemna aequinoctialis Welwitsch. Cp (GA, NC, SC, VA): still to slowly moving waters of ponds, lakes, beaver ponds, and swamps; common, rare in VA. Widespread worldwide, except in n. North America and n. Eurasia. [= FNA, K, Y, Z]

Lemna minor Linnaeus. Cp (GA, NC, VA), Pd (NC): still to slowly moving waters of ponds, lakes, beaver ponds, and swamps; common. Widespread in the Northern Hemisphere; scattered in the Southern Hemisphere, where perhaps in part introduced. [= FNA, K, Y, Z; L. minor -- RAB?, C, F, G, W, in part only (also see L. obscura)]

Lemna minuta Kunth. Cp, Mt (GA): quiet waters; rare. Widespread in North America, Central America, and South America; more local in Europe and Japan. [= C, FNA, K; L. valdiviana Philippivar. abbreviata Hegelmann -- F; L. minuscula Herter -- Y, Z]

Lemna obscura (Austin) Daubs. Cp (GA, NC, SC, VA): still to slowly moving waters of ponds, lakes, beaver ponds, and swamps; common. NY west to MN and NE, south to FL, TX, Mexico, and the Bahamas. [=FNA, K, Y, Z; L. minor -- RAB?, C, F, in part]

Lemna perpusilla Torrey. Cp (NC), Pd (NC, VA): still to slowly moving waters of ponds, lakes, beaver ponds, and swamps; uncommon, rare in NC. Québec west to MN, south to NC, TN, and TX. [= RAB, C, F, FNA, G, K, W, Y, Z]

Lemna trisulca Linnaeus. Cp (VA): still to slowly moving waters of ponds, lakes, beaver ponds, and swamps; rare. Widespread in the Northern Hemisphere; scattered in the Southern Hemisphere. [= C, F, FNA, G, K, W, Y, Z]

Lemna valdiviana Philippi. Cp (GA, NC, SC, VA), Mt (GA): still to slowly moving waters of ponds, lakes, beaver ponds, and swamps; common. Widespread in North America, Central America, and South America. [= RAB, C, FNA, G, K, W, Y, Z; L valdiviana var. valdiviana -- F]

Lemna turionifera Landolt, south and east to c. PA (Rhoads \& Klein 1993), WV, and n. AL (FNA). [= FNA, K] \{not yet keyed\}

\section*{Orontium Linnaeus 1753 (Golden Club)}

A monotypic genus, an aquatic herb, of e. North America. References: Thompson in FNA (2000); Mayo, Bogner, \& Boyce in Kubitzki (1998b).

Orontium aquaticum Linnaeus, Golden Club, Bog Torches, Never-wet. Cp, Mt, Pd (GA, NC, SC, VA): generally in peaty and stagnant water, such as beaver ponds, blackwater streams, swamps, pools in low pocosins, streambeds in the Piedmont, bogs and swamps in the mountains; common (rare in Piedmont and Mountains). March-April. MA and c. NY south to FL and west to LA, north in the inland to \(W\). NC, KY, and WV, primarily but by no means strictly Coastal Plain. Fresh leaves are unwettable, silveryglistening when forced under water. [= RAB, C, F, FNA, G, GW, K, S, W]

\section*{Peltandra Rafinesque 1819 (Arrow-arum)}

A genus of 2 species, endemic to e. North America. References: Thompson in FNA (2000); Blackwell \& Blackwell (1974)=Z; Mayo, Bogner, \& Boyce in Kubitzki (1998b).

Identification notes: Peltandra is often confused in vegetative condition with Pontederia and Sagittaria, superficially similar emergent aquatics with hastate or sagittate leaves. Peltandra leaves have pinnate venation, a prominent midvein, a prominent vein running parallel to the leaf margin, and the hastate lobes with rounded to acute apices. Pontederia leaves have parallel venation, lack a prominent midvein and a prominent vein parallel to the leaf margin, and have hastate lobes with broadly rounded apices. The leaves of sagittate species of Sagittaria have parallel venation, a prominent midrib, a vein at 90 degrees to the midrib at the junction of the main blade and each of the hastate lobes that forks, with at least one fork directed apically and at least one fork directed into the basal lobe, lack a prominent vein parallel to the margin, and have hastate-sagittate lobes with acuminate apices.

1 Spathe green at base, bright white above (the white portion not merely a margin), flared open and therefore only loosely surrounding the spadix, succulent below, the white portion thin and herbaceous, the margins generally nearly entire and plane; fruits red; distal portion of leaf blade lacking broad, coarse veins similar to the midvein (all the veins alike and fine)
P. sagittifolia

1 Spathe green (rarely with a narrow cream-colored or whitish margin up to 1.7 cm wide), tightly surrounding the spadix, thick and succulent throughout, the margins crisped; fruits green to dark purplish-green; distal portion of leaf blade often with several broad, coarse veins similar to the midvein, the remainder of the veins fine (sometimes the distal portion of the leaf with fine veins only)
\(P\). virginica

Peltandra sagittifolia (Michaux) Morong, Spoonflower, White Arrow-arum. Cp (GA, NC, SC): pocosins of the outer Coastal Plain, sphagnous swamps; rare (GA Special Concern, NC Rare, SC Rare). July-August. A Southeastern Coastal Plain endemic: e. NC south to c. peninsular FL and west to se. LA. The reduction of \(P\). sagittifolia to a subspecies of \(P\). virginica (Blackwell \& Blackwell 1974) was based on confusion of true \(P\). sagittifolia with forms of \(P\). virginica. The two species are distinct. [= FNA, GW, K ; = P. sagittaefolia (Michaux) Morong -- RAB (an orthographic variant); P. glauca (Elliott) Feay -- S ; P. virginica ssp. luteospadix (Fernald) Blackwell \& Blackwell -- Z, misapplied; P. Iuteospadix Fernald, misapplied]

Peltandra virginica (Linnaeus) Schott, Green Arrow-arum, Tuckahoe. Cp, Pd, Mt (GA, NC, SC, VA): marshes, bogs, beaver ponds, pocosins, other stagnant, aquatic situations; common (rare in Mountains). May-June. ME, s. Québec, and n. MI south to s. FL and e. TX. [= RAB, C, FNA, G, GW, K, S, W; >P. virginica -F , in a narrow sense; > P. Iuteospadix Fernald -- F; > \(P\). virginica
ssp. virginica -- Z; >P. virginica ssp. Iuteospadix (Fernald) Blackwell \& Blackwell -- Z]

Pinellia Tenore 1839 (Pinellia)
A genus of about 6 species, herbs, of temperate e. Asia. References: Thompson in FNA (2000); Mayo, Bogner, \& Boyce in Kubitzki (1998b).
* Pinellia ternata (Thunberg) Makino ex Breitenbach, Pinellia, is introduced from Japan and rarely naturalized, at least north of our area, as in DC, se. PA, NJ, and s. NY. It is likely naturalized in our area, at least in n. VA. [= C, F, FNA, G, K]

\section*{Pistia Linnaeus 1753 (Water Lettuce)}

A genus of probably a single species, widespread in the tropics of both hemispheres. References: Thompson in FNA (2000); Mayo, Bogner, \& Boyce in Kubitzki (1998b).
* Pistia stratiotes Linnaeus, Water Lettuce. Cp (GA?, SC), Pd (NC): stagnant or slow-moving waters of rivers, sometimes cultivated in ponds, where it persists for a while (presumably eventually eliminated by cold winters); rare, introduced from farther south. This floating aquatic, pantropically distributed, appeared in the Waccamaw River of SC (downstream from NC) in 1990 and 1991, apparently successfully overwintering (Nelson 1993). Further south it is a noxious water-weed. Its occurrence as a naturalized component of GA's flora is undocumented; it is at least present as a cultivated plant in water gardens and presumable escapes. The orginal distribution is unclear. [=FNA, GW, K, S]

Spirodela Schleiden 1839
(also see Landoltia)

A genus of 2 species (with Landoltia removed), cosmopolitan. References: Landolt in FNA (2000); Landolt (1980)=Z; Landolt (1986) \(=\) Y; Landolt in Kubitzki (1998b); Les \& Crawford (1999)=X.

1 Roots 7-21 per frond; fronds with 7-16 (-21) nerves; fronds 1-1.5× as long as wide; only some of the roots perforating the scalelike leaflet (borne on the underside) . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. polyrrhiza
1 Roots (1-) 2-7 (-12) per frond; fronds with (3-) 5-7 nerves; fronds \(1.5-3 \times\) as long as wide; all of the roots perforating the scalelike leaflet . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [Landoltia punctata]

Spirodela polyrrhiza (Linnaeus) Schleiden, Greater Duckweed, Minnow-fole. Cp (GA, NC, SC, VA), Pd (GA, VA), Mt (VA): still to slowly moving waters of ponds, lakes, beaver ponds, and swamps; common. Widespread worldwide. [= RAB, FNA, K, X, Y, Z; = S. polyrhiza -- C, F, G, GW, S, W, orthographic variant]

\section*{Symplocarpus R.A. Salisbury ex Nuttall 1818 (Skunk Cabbage)}

A genus of 3 species, of north temperate e. North America and ne. Asia. References: Thompson in FNA (2000); Mayo, Bogner, \& Boyce in Kubitzki (1998b).

Symplocarpus foetidus (Linnaeus) Salisbury ex W.P.C. Barton, Skunk Cabbage. Mt, Pd, Cp (NC, VA): seepage-fed bogs and nonalluvial swamps; common in VA across the state, uncommon in NC (rare in Piedmont and Coastal Plain of NC). JanuaryMarch; July-September. Nova Scotia and s. Québec west to MN, south to n. NC, ne. TN, s. OH, and IL. [= RAB, C, F, FNA, G, GW, K, W; = Spathyema foetida (Linnaeus) Rafinesque -- S; = Dracontium foetidum Linnaeus]
\[
\text { Wolffia Horkel ex Schleiden } 1844 \text { (Watermeal, Mud-mary) }
\]

A genus of 11 species, cosmopolitan. References: Landolt in FNA (2000); Landolt (1980)=Z; Landolt (1986)=Y; Landolt in Kubitzki (1998b).

1 Fronds globoid to ovoid, 1-1.5× as deep as wide; thallus not brownish punctate above .................... W. columbiana 1 Fronds nutshell-like, 0.5-1.0× as deep as wide; thallus punctate above with brownish pigment cells (most visible on dead fronds).
2 Frond \(1.3-2 \times\) as long as wide, the upper side slightly convex, with an upward point apically W. borealis

2 Frond 1-1.5× as long as wide, the upper side with a prominent papilla centrally . . . . . . . . . . . . . . . . . . . W. brasiliensis
Wolffia borealis (Engelmann ex Hegelmann) Landolt ex Landolt \& Wildi. Cp (NC, VA), Pd (VA), Mt (VA): still to slowly moving waters of ponds, lakes, beaver ponds, and swamps; uncommon, rare in Piedmont and Mountains. Québec west to British Columbia, south to ne. NC, TN, MO, and CA. [= FNA, K, Y, Z; W. punctata Grisebach -- C, F, G, GW, misapplied; Bruneria punctata
(Grisebach) Nieuwland -- S, in part, misapplied]
Wolffia brasiliensis Weddell. Cp (VA), Pd (VA), Mt (VA): still to slowly moving waters of ponds, lakes, beaver ponds, and swamps; uncommon, rare in Piedmont and Mountains. Widespread in e. North America, Central America, and South America. [= FNA, K, W, Y, Z; W. papulifera C. Thompson -- RAB, C, F, G, GW; Bruneria punctata (Grisebach) Nieuwland -- S, in part]

Wolffia columbiana Karsten. Cp (NC, VA) \{also GA and SC according to FNA\}: still to slowly moving waters of ponds, lakes, beaver ponds, and swamps; uncommon. Widespread in North America, Central America, and South America. [= RAB, C, F, FNA, G, GW, K, Y, Z; = Bruneria columbiana (Karsten) Nieuwland -- S]

Wolffiella Hegelmann 1895

A genus of 10 species, cosmopolitan. References: Landolt in FNA (2000); Landolt (1980)=Z; Landolt (1986)=Y; Landolt in Kubitzki (1998b).

Wolffiella gladiata (Hegelmann) Hegelmann, Mud-midgets. Cp (GA, NC, SC, VA): ponds, ditches, beaver-ponds millponds; common. April-June. MA and n. IL (s. WI?) south to FL and TX. [= FNA, GW, K, Y, Z; Wolffiella floridana (Donnell-Smith) C. Thompson -- RAB, C, F, G, GW, S]

Xanthosoma Schott 1832
A genus of about 60 species, herbs, of tropical Central and South America. References: Mayo, Bogner, \& Boyce in Kubitzki (1998b); Serviss, McDaniel, \& Bryson (2000)=Z.
* Xanthosoma sagittifolium (Linnaeus) Schott, Elephant-ear, is cultivated in the Southeast, more frequently to the south, but sometimes in our area. It can be seen in ditches adjacent to ornamental plantings; it is uncertain whether it can be considered naturalized in our area. It is superficially similar to Colocasia, differing in its non-peltate leaves. [= K, Z; = Xanthosma sagittifolium -GW, orthographic error]

ARECACEAE Schultz 1832 or PALMAE de Jussieu 1789 (Palm Family)
A family of about 190 genera and 2000 species, trees and shrubs, of tropical and subtropical regions of both hemispheres. Coldhardy palms in other genera are sometimes planted in NC and SC, particularly near the coast. References: Zona in FNA (2000); Dransfield \& Uhl in Kubitzki (1998b).

1 Leaves pinnate (with a well-developed central axis, the leaf blade much longer than wide); [introduced species]; [subfamily Arecoideae, tribe Cocoeae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [Butia]
1 Leaves palmate or costapalmate (lacking a central axis or with a shortcentral axis, the leaf blade about as long as wide; [native species]; [subfamily Coryphoideae, tribe Corypheae].
2 Petioles armed with sharp recurved teeth; [subtribe Livistoninae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Serenoa 2 Petioles smooth, unarmed (leaf sheaths with long needle-like spines in Rhapidophyllum).

3 Petioles and lower leaf surfaces green and glabrous; leaf sheaths without spines; [subtribe Sabalinae] ...... Sabal
3 Petioles and lower leaf surfaces more or less silvery pubescent; leaf sheaths bearing long (10-50 cm ) needle-like spines; [subtribe Thrinacinae]

Rhapidophyllum

A genus of about 8 species, trees, native of subtropical regions of South America. References: Dransfield \& Uhl in Kubitzki (1998b).
* Butia capitata (Mart.) Beccari, Brazilian Butia, South American Jelly Palm, is widely planted in the outer Coastal Plain of se. NC, e. SC, and e. GA. It persists and can appear naturalized in apparently semi-natural situations.

\section*{Cocos Linnaeus (Coconut Palm)}

A monotypic genus, the single species now pantropical. References: Zona in FNA (2000).
Cocos nucifera Linnaeus, Coconut Palm, rarely reaches our shores as propagules (coconuts), but is apparently not established. Photographic evidence has been supplied from Bear Island, Onslow County, NC, 11 June 1996 (Dave Owen, pers. comm. and photograph). [= FNA, K, S]

A monotypic genus, a shrub of se. North America (Henderson, Galeano, \& Bernal 1995). The closest relative to Rhapidophyllum is apparently Trachycarpus of the Himalayan region of se. Asia (Zona in FNA 2000). References: Zona in FNA (2000); Clancy \& Sullivan (1990); Dransfield \& Uhl in Kubitzki (1998b); Zona (1997)=Z.

Rhapidophyllum hystrix (Pursh) H. Wendl. \& Drude ex Drude, Needle Palm. Cp (GA, SC): moist to wet soils of small blackwater stream swamps, especially where underlain with coquina limestone ("marl"), hydric hammocks and rich, wetland-upland transitions; rare (SC Rare). Se. SC (Beaufort and Jasper counties) south to c. peninsular FL, and west to s. MS. becoming somewhat popular as a hardy palm that can be grown in the Southeast, north of its natural range. [= FNA, GW, K, S, Z]

\section*{Sabal Adanson 1763 (Palmetto)}

Sabal has 16 species, primarily distributed around the Caribbean Sea. The other species of se. United States are S. etonia Swingle ex Nash, of scrub habitats in peninsular FL, S. miamiensis Zona, endemic of s. FL pine rocklands, and S. mexicana Martius, of the s. TX coast (Henderson, Galeano, \& Bernal 1995). References: Zona in FNA (2000); Zona (1997)=Z; Dransfield \& Uhl in Kubitzki (1998b).

1 Shrub, with subterranean, rhizomatous "trunk" (very rarely emerging as much as 1 meter from the ground); blade with midrib not decurved, typically appearing 1-2 cm long and oblique on the upper surface, 4-7 (-12) cm long on the lower surface; leaf with the deepest partition generally the terminal one, thus parting the leaf into 2 halves; segments with margins lacking filamentose fibrils S. minor

1 Tree, with erect trunk (though young plants appear as trunkless shrubs, similar in habit to S. minor); blade with midrib 5-50 cm long, decurved; leaf lacking a deep terminal partition dividing the leaf into 2 halves; margins of leaf segments with filamentose fibrils
S. palmetto

Sabal minor (Jacquin) Persoon, Dwarf Palmetto. Cp (GA, NC, SC), Pd (GA): swamps, maritime forests, low moist woods, especially in calcareous soils developed from shell limestone (marl); common. May-July; September-November. Ne. NC south to c. peninsular FL, west to e. TX, c. TX and s. AR; disjunct in Nuevo León (Goldman 1999). This palm reaches its northern limit in Dare County, NC. No other New World palm has a native range extending so far north. [= RAB, FNA, GW, K, S, Z]

Sabal palmetto (Walter) Loddiges ex J.A. \& J.H. Schultes, Cabbage Palmetto. Cp (GA, NC, SC): maritime forests, marsh edges, and other near-coastal communities; common, rare in NC (NC Rare). July; October-November. This palm is the state tree of South Carolina and is common and conspicuous (both as a native tree and in plantings) along the South Carolina coast; it currently reaches its northern limit as a native species in Brunswick County, NC, where it is a conspicuous part of the forest on Smith Island complex (Bald Head Island, Middle Island, Bluff Island). It is planted elsewhere (and further north) on the coast. Periodic disturbance by hurricanes helps maintain populations of Sabal palmetto, which survives winds and flooding that topple or kill Quercus virginiana. Curtis (1883) reports that "Cape Hatteras is, or was, the northern limit of this Palm... It is to be deeply regretted, however, that a reckless indifference to the future, which has been charged as a characteristic of Americans, is likely to efface, at no very distant time, every vestige of this interesting ornament of our coast. The inner portion of the young plant is very tender and palatable, somewhat resembling the Artichoke and Cabbage in taste (hence its name of Cabbage Tree), and is often taken for pickling, and the stock is ruined by the process. Thus for a pound or two of pickles, no better either than many other kinds, the growth of half a century is destroyed in a moment, and posterity left to the wretched inheritance of vain mourning for the loss of the greatest beauty of our maritime forest." [= RAB, FNA, GW, K, S, Z]

Serenoa Hooker f. 1828 (Saw Palmetto)
Serenoa is monotypic shrub (Henderson, Galeano, \& Bernal 1995). Serenoa is most closely related to Acoelorraphe, of the West Indies, including s. FL (Zona in FNA 2000). References: Zona in FNA (2000); Zona (1997)=Z; Dransfield \& Uhl in Kubitzki (1998b).

Serenoa repens (Bartram) Small, Saw Palmetto. Cp (GA, SC): pine flatwoods and maritime forests; common (rare though locally dominant in SC). May-July; October-November. Se. SC (in maritime forests in Charleston and Colleton counties, and in spodosolic flatwoods in Beaufort and Jasper counties) south to s. FL and west to e. LA. Serenoa forms extensive clonal patches, connected by underground rhizomes, and is a dominant plant in many parts of FL and other Gulf Coast states, for instance in pine flatwoods or coastal scrub. [= RAB, FNA, GW, K, S]

\section*{ASPARAGACEAE (Asparagus Family)}

A family of a single genus and 170-300 species, widespread in Europe, Africa, Asia, and Australia (introduced elsewhere). References: Dahlgren, Clifford, \& Yeo (1985); Kubitzki \& Rudall in Kubitzki (1998a).

\section*{Asparagus Linnaeus (Asparagus)}

A genus of 170-300 species, widespread in Europe, Africa, Asia, and Australia (introduced elsewhere). The "Asparagus Fern"
grown as a house plant is another species of Asparagus, A. setaceus (Kunth) Jessop, native to S. Africa. References: Kubitzki \& Rudall in Kubitzki (1998a); Straley \& Utech in FNA (2002a).
* Asparagus officinalis Linnaeus, Asparagus, Sparrowgrass, Garden Asparagus. Mt, Pd, Cp (GA, NC, SC, VA): commonly cultivated, commonly escaped to fencerows, roadsides, disturbed areas; common, native of Eurasia. April-May (or later); JulyOctober. [= RAB, C, F, FNA, G, K, S, W]

\section*{BROMELIACEAE de Jussieu 1789 (Bromeliad or Pineapple Family)}

A family of about 56 genera and 2600 species, herbs, shrubs, and trees, of the New World tropics and subtropics (very rarely warm temperate). References: Luther \& Brown in FNA (2000); Smith \& Till in Kubitzki (1998b).

\section*{Tillandsia Linnaeus 1753 (Spanish-moss)}

A genus of about 540 species, herbs, of s. North America south to s. South America. References: Luther \& Brown in FNA (2000); Smith \& Till in Kubitzki (1998b). Key based in part on FNA.

1 Leaves distichous; inflorescence 1-2 (-3) flowered.
2 Plants in dense, more or less spherical clusters; inflorescence scapose, exserted from the cluster; corolla violet . . . . . . .

2 Plants in elongate, pendulous festoons; inflorescence sessile; corolla yellowish green ................ T. usneoides 1 Leaves spiral in a rosette; inflorescence more than 3-flowered.

3 Leaves narrowly linear, 1-5 mm wide.
4 Leaves densely and coarsely lepidote, appearing gray; floral bracts rose; corolla violet . . . . . . . . . . . . . . T. bartramii
4 Leaves finely lepidote, appearing green or reddish; floral bracts green or reddish; corolla lavender ..... T. setacea
3 Leaves broader, \(10-35 \mathrm{~mm}\) wide.
5 Scape 10-35 cm long; floral bracts imbricate, covering all of the rachis, or nearly all . T. fasciculata var. densispica
5 Scape 20-50 cm long; floral bracts widely spaced, leaving much of the rachis exposed at anthesis ... [T. utriculata]
Tillandsia bartramii Elliott, Bartram's Air-plant. Cp (GA): on tree branches in bayswamps, tidal swamp forests, and mesic hardwood bluffs; rare (GA Rare). E. GA south through Florida; disjunct in Tamaulipas. In five counties in e. GA, as far north as Liberty County (Jones \& Coile 1988), and reported for SC as extirpated (Kartesz 1999). [= FNA, K; ? T. myriophylla Small -- S]

Tillandsia fasciculata Sw. var. densispica Mez, Quill-leaf Airplant. Cp (GA): branches of trees, especially evergreen oaks; rare (GA Rare). Se. GA south through FL, and in the West Indies, Mexico, and Central America. [= FNA, K; < T. fasciculata - S]

Tillandsia recurvata (Linnaeus) Linnaeus, Ball-moss, Bunch-moss. Cp (GA): on tree branches in maritime forests; rare (GA Threatened). Se. GA (Duncan 1985) south to s. FL; LA to AZ and south through Mexico, Central America, and South America; West Indies. Outside of our area, this species also occurs on rock cliffs and is frequent on powerlines. [= FNA, K; = Diaphoranthema recurvata (Linnaeus) Beer -- S]

Tillandsia setacea Sw., Wild-pine, Pine-needle Airplant. Cp (GA): in tree branches, especially on hardwoods, in mesic bluff forests; rare (GA Rare). Se. GA south to s. FL; West Indies; Mexico and Central America. [= FNA, K; T. tenuifolia Linnaeus -- S, misapplied]

Tillandsia usneoides (Linnaeus) Linnaeus, Spanish-moss. Cp (GA, NC, SC, VA), Pd (GA, NC, SC): branches of trees, especially in swamps, but elsewhere where air humidity is high enough, often even in dry forests (near Wilmington, NC Tillandsia is abundant on Quercus laevis in an extensive dry sandhill area which receives frequent fog from the Cape Fear, Brunswick, and Northeast Cape Fear rivers); common, very rare in lower Piedmont (VA Rare). April-June. S. MD (historically), se. VA south to s. FL, west to TX and Mexico, extending south to South America. T. usneoides is the only member of a very large genus to occur north of s. GA. The epithet 'usneoides' refers to its resemblance to the common lichen Usnea. [= RAB, C, F, FNA, G, K; = Dendropogon usneoides (Linnaeus) Rafinesque -- S]

Tillandsia utriculata Linnaeus, Giant Wild-pine, is reported for GA by Kartesz (1999), but not by Luther \& Brown in FNA (2000). [ \(=\) FNA, K, S]

\section*{BURMANNIACEAE (Burmannia Family)}

A family of about 13-15 genera and 130 species, pantropical and warm-temperate. References: Wood (1983a)=Z; Lewis in FNA (2002a); Maas-van de Kamer in Kubitzki (1998a).

1 Floral tube terete; ovary 1 -locular . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Apteria
1 Floral tube 3-angled or 3-winged; ovary 3-locular . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Burmannia

Apteria Nuttall (Nodding Nixie)

A monotypic genus, the single species distributed from s. North America south to c. South America. References: Lewis in FNA (2002a); Maas-van de Kamer in Kubitzki (1998a).

Apteria aphylla (Nuttall) Barnhart ex Small, Nodding Nixie. Cp (GA): acid swamps; rare. E. GA (Glynn County) west to e. TX, south to c. South America, and in the West Indies. [= FNA, GW, K, S]

\section*{Burmannia Linnaeus (Burmannia)}

A genus of about 63 species, autotrophic or mycotrophic herbs, pantropical (to warm temperate). References: Lewis in FNA (2002a); Maas-van de Kamer in Kubitzki (1998a).

Identification notes: Both species of Burmannia are very small and easy to overlook; they occasionally occur together.
1 Floral tube 3-winged, violet; flowers in a spicate cyme (solitary in depauperate individuals) . . . . . . . . . . . . . . . . . . . B. biflora
1 Floral tube obtusely 3 -angled, greenish to creamy white; flowers in a capitate cluster (solitary in depauperate individuals)
B. capitata

Burmannia biflora Linnaeus, Violet Burmannia. Cp (GA, NC, SC, VA): savannas, bogs, shores of Coastal Plain depression ponds; uncommon (SC Rare, VA Rare). August-November. Se. VA south to FL, west to e. TX. [= RAB, C, F, FNA, G, GW, K, S]

Burmannia capitata (J.F. Gmelin) von Martius, White Burmannia. Cp (GA, NC, SC), Pd (GA): savannas, bogs, shores of Coastal Plain depression ponds; uncommon. July-November. E. NC south to FL, west to TX and se. OK; West Indies, Central America, and South America. [= RAB, FNA, GW, K, S]

\section*{CALOCHORTACEAE}
(see LILIACEAE)

CANNACEAE de Jussieu 1789 (Canna Family)
A family of a single genus, herbs, of tropical and warm temperate America. References: Kress \& Prince in FNA (2000); Kubitzki in Kubitzki (1998b).

\section*{Canna Linnaeus 1753 (Canna)}

A genus of about 10-25 species, of tropical and warm temperate America. References: Kress \& Prince in FNA (2000); Kubitzki in Kubitzki (1998b).

Identification notes: The petals are generally sepaloid (sometimes brightly colored); the showy, colored portions of the flower are the staminodes.
```

1 Flowers not tubular at the base (or with a short tube to 2 cm long); petals erect; [alien, cultivated and persistent]

```

```

1 Flowers tubular at the base; petals reflexed; [native or cultivated].
2 Flowers yellow; capsule 5-6 cm long, ellipsoid (longer than broad); leaves glaucous; [native] . . . . . . . . . . . . . C. flaccida
2 Flowers red, orange, or mixed red-and-yellow; capsule 1.5-3 cm long, globose or subglobose (about as long as broad);
leaves green; [alien, cultivated and persistent]
C. indica
Canna flaccida Salisbury, Golden Canna, Yellow Canna. Cp (GA, SC): wet pine savannas, marshes, ditches; uncommon. May-early July; July-August. E. SC south to FL, west to TX, and south into Central America. [= RAB, FNA, K, S]

* Canna $\times$ generalis L.H. Bailey (pro sp.) [= C. glauca $\times$ indica], Common Garden Canna. Cp, Pd (GA, NC, SC): cultivated and persisting; rare. June-September; August-October. [= RAB, FNA, K]
* Canna indica Linnaeus, Indian-shot, Platanillo. Cp, Pd (GA, NC, SC): cultivated and persisting; rare. June-September;
August-October. [= FNA, GW, K, S]

```

COLCHICACEAE Augustin de Candolle 1805 (Meadow Saffron Family)
As here circumscribed, a family of 19 genera and about 225 species, nearly cosmopolitan. The circumscription is uncertain and likely to change. References: Dahlgren, Clifford, \& Yeo (1985); Nordenstam in Kubitzki (1998a).
```

1 Plant acaulescent, from a tunicated bulb . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Colchicum
1 Plant with leafy stem, from a rhizome . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . .................... Uvularia

```

A genus of about 90 species, of \(s\). Europe, n. Africa, and w. and c. Asia. References: Nordenstam in Kubitzki (1998a).
* Colchicum autumnale Linnaeus, Meadow Saffron, Autumn-crocus. Pd (NC): planted as an ornamental, at least longpersistent; rare, introduced from s. Europe. September-October. [= C, F, G, K]

\section*{Uvularia Linnaeus 1753 (Bellwort, Merrybells)}

A genus of about 5 species, of temperate eastern North America. References: Wilbur (1963)=Z; Uttal (1991)=Y; Utech \& Kawano in FNA (2002a); Nordenstam in Kubitzki (1998a).

1 Leaves perfoliate, the margins scarious but smooth; [section Uvularia].
2 Tepals glabrous within; leaves puberulent beneath (or rarely glabrate); leaves below the fork (0-) 1 ( -2 ) ... U. grandiflora
2 Tepals conspicuously granular-papillose within; leaves glabrous and often glaucous beneath; leaves below the fork 2-4
Leaves sessile, the margins scarious and minutely papillose-denticulate; [section Oakesiella].
3 Undivided portion of the style \(0.5-1 \times\) as long as the style branches; upper stem and lower leaf surfaces puberulent to glabrous, light green; rhizome very short, with clustered, thickened roots.
4 Leaves cuneate at base, thin in texture, faintly reticulate on the undersurface, glabrous (rarely puberulent becoming glabrate); stems usually glabrous; [of the Coastal Plain and Piedmont] . . . . . . . . . . . . . . . . U. puberula var. nitida 4 Leaves broadly rounded to somewhat clasping at base, firm in texture, obviously reticulate on the undersurface, puberulent (sometimes becoming glabrate); stems usually minutely puberulent in lines; [of the Mountains and Piedmont] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . U. puberula var. puberula
3 Undivided portion of the style \(3-5 \times\) as long as the style branches; upper stem and lower leaf surfaces glabrous, usually also glaucous; rhizome elongate, with scattered, fibrous roots.
5 Pedicel bearing a sessile, leaf-like bract 5-17 mm below the flower; capsule sessile at base, conspicuously beaked at 5 Pedicel bractless; capsule on a stalk 2-4 (-6) mm long, not beaked ........................... U. sessilifolia

Uvularia floridana Chapman, Florida Bellwort. Cp (GA, SC): alluvial forests, moist ravines; uncommon. Mid March-early April. C. SC south to ne. and panhandle FL, west to c. MS, apparently rare and local throughout its range. [= RAB, FNA, GW, K, Z; = Oakesiella floridana (Chapman) Small -- S]

Uvularia grandiflora J.E. Smith, Large-flowered Bellwort. Mt (GA, NC, VA), Pd (NC, VA): cove forests and other moist, rich, forested sites; common. Mid April-mid May; July-August. S. Québec west to ND, south to w. NC, w. SC, n. GA, c. AL, MS, c. AR, and e. OK. [= RAB, C, F, FNA, G, K, S, W, Z]

Uvularia perfoliata Linnaeus, Perfoliate Bellwort. Mt, Pd, Cp (GA, NC, SC, VA): moist to fairly dry hardwood forests; common. April-early May; June-August. S. NH, s. Ontario, and c. OH, south to panhandle FL and LA. [= RAB, C, F, FNA, G, K, S, W, Z]

Uvularia puberula Michaux var. nitida (Britton) Fernald, Coastal Bellwort. Cp (GA, NC, SC, VA): dry to moist upland, acidic forests; uncommon. Late March-late April; August-October. Var. nitida ranges from Long Island NY south to GA in the Coastal Plain and Sandhills. Var. nitida is reported to intergrade with var. puberula in c. NC; elsewhere, the 2 varieties appear to be geographically allopatric and more-or-less morphologically distinguishable. While Wilbur (1963) chose not to recognize varieties, Uttal (1991) recently supported varietal recognition. [=C, Y; <U. pudica (Walter) Fernald -- RAB, nomen dubium; = U. pudica var. nitida (Britton) Fernald -- F, G; < U. puberula -- FNA, K, W, Z, infraspecific taxa not distinguished; < Oakesiella puberula (Michaux) Small -- S, infraspecific taxa not distinguished]

Uvularia puberula Michaux var. puberula, Appalachian Bellwort. Mt, Pd (GA, NC, SC, VA): dry to moist upland, acidic forests, up to at least 1500 m ; common. Early April-Early May; August-October. Var. puberula ranges from s. PA to GA in the Mountains and (more rarely) Piedmont. [= C, Y; < U. pudica (Walter) Fernald -- RAB, nomen dubium; = U. pudica var. pudica -- F , G; < U. puberula -- FNA, K, W, Z, infraspecific taxa not distinguished; < Oakesiella puberula (Michaux) Small -- S, infraspecific taxa not distinguished]

Uvularia sessilifolia Linnaeus, Straw-lily, Wild-oats. Pd, Mt (GA, NC, SC, VA), Cp (NC, SC, VA): moist hardwood forests, on slopes and mainly in bottomlands; common. Late March-early May; August-October. Nova Scotia west to ND, south to panhandle FL and n. LA. [= RAB, C, F, FNA, K, W, Z; = Oakesiella sessilifolia (Linnaeus) S. Watson -- S]

\section*{COMMELINACEAE R. Brown 1810 (Spiderwort Family)}

A family of about 41 genera and 650 species, herbs, of tropical and warm temperate regions of both hemispheres. References: Faden in FNA (2000); Faden in Kubitzki (1998b); Tucker (1989).

1 Spathes paired, terminating the stem, resembling foliage leaves in size, shape, texture, and coloration; [tribe Tradescantieae] Tradescantia
1 Spathes single, either terminal or axillary, differing from the foliage leaves (in Commelina folded, heart-shaped when spread, and usually pale-green, in Cuthbertia and Murdannia scale-like, scarious, and inconspicuous, sometimes hidden by foliage
leaves in Murdannia).
2 Spathe folded, heart-shaped when unfolded, usually pale-green, closely subtending and surrounding the flower pedicels; petals unequal, the 2 upper petals larger and usually more deeply colored than the lower petal (which is sometimes absent); [tribe Commelineae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Commelina
2 Spathe scale-like, scarious, and inconspicuous, not closely subtending and surrounding the flower pedicels; petals equal, in size and coloration.
3 Leaves linear, more than \(20 \times\) as long as wide; fertile stamens 6; petals bright pink; [of xeric, sandy or rocky habitats]; [tribe Tradescantieae]

Cuthbertia
3 Leaves lanceolate, less than \(20 \times\) as long as wide; fertile stamens 3 , alternating with 3 staminodia; petals pink to purplish or bluish; [of moist to aquatic habitats]; [tribe Commelineae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . Murdannia

\section*{Callisia Loefling \\ (also see Cuthbertia)}

References: Faden in FNA (2000); Tucker (1989)=Z.

Callisia cordifolia (Swartz) E.S. Anderson \& Woodson. Mt (GA): disturbed area?; rare, presumably introduced from the native range in FL, Mexico, the West Indies, and n. South America. Reported for nw. GA (Faden in FNA 2000). [= FNA, K; ? Tradescantella floridana (S. Watson) Small - S; = Tradescantia cordifolia Swartz] \{genus not yet keyed\}

\section*{Commelina Linnaeus 1753 (Dayflower)}

A genus of about 170 species, herbs, cosmopolitan. References: Faden in FNA (2000); Tucker (1989)=Z; Faden (1993)=Y; Brashier (1966) \(=\mathrm{X}\); Faden in Kubitzki (1998b). The key is adapted in part from X, Y, and \(Z\).

1 Spathes with margins free to the base; [introduced species, usually in weedy habitats].
2 Spathes generally whitish or pale green towards the peduncle, with contrasting dark green veins; middle petal white or paler than the others; capsules with 2 locules (the third aborting); seeds rugose foveate-reticulate.
3 Larger petals light blue; sterile anthers entirely yellow . . . . . . . . . . . . . . . . . . . . . . . . C. communis var. communis
3 Larger petals intense violet blue; sterile anthers with brownish-purple spot . . . . . . . . . . C. communis var. Iudens
2 Spathes lacking contrasting veins; middle petal about the same color as the others; capsules with 3 locules; seeds reticulate or smooth to faintly alveolate.
\(4 \quad\) Spathes not at all to slightly falcate (the lower margin straight or very nearly so); upper cyme usually vestigial (rarely well-developed and 1-flowered); seeds smooth to faintly alveolate; peduncles of the spathes with hairs to 0.5 mm long
C. caroliniana

4 Spathes usually distinctly falcate (the lower margin curved); upper cyme in larger spathes usually well-developed and
1 -several-flowered; seeds deeply reticulate; peduncles of the spathes with hairs to 0.1 mm long
C. diffusa

1 Spathes with margins fused basally; [native species, usually in natural habitats, or introduced and weedy].
5 Flowers peach-colored
[C. gambiae]
5 Flowers white and/or bluish.
6 Leaf sheaths ciliate with coarse reddish-brown hairs, the sheath not auriculate; middle petal blue, lilac, or lavender; [mostly of moist soils].
7 Annual from fibrous roots, the stem decumbent; leaf blades broadly elliptic-ovate, 2-9 cm long; leaf margin and upper surface pubescent; [alien, weedy] C. benghalensis

7 Perennial from horizontal rhizomes, often forming clonal patches of erect stems; leaf blades lance-oblong, 6-20 cm long; leaf margin and upper surface scabrous; [native, mostly of moist floodplain forests] . . . . . C. virginica
6 Leaf sheaths ciliate with white hairs, the sheath prolonged upwards into auricles; middle petal white; plant perennial from thickened, fibrous roots, not forming clonal patches; [mostly of dry, sandy or rocky soil].
8 Larger leaves 4-10 (-13) cm long, 0.4-1.4 cm wide; spathes 1-2 (-2.5) cm long; [primarily of the Coastal Plain, especially on sandhills and dunes] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. erecta var. angustifolia
8 Larger leaves (6-) 10-15 cm long, (1.1-) 1.5-3.5 cm wide; spathes (2.0) 2.5-3.6 cm long; [primarily of the Piedmont and Mountains]
C. erecta var. erecta
* Commelina benghalensis Linnaeus, Tropical Spiderwort, Bengal Dayflower. Cp (GA, NC): fields; common, introduced from tropical Asia and becoming a serious weed. This annual, pantropical weed is well established in FL and s. GA (Faden 1993). Spot infestations have been reported in NC as well (Wayne County). "This annual species can be recognized by: its funnelform spathes that are often clustered; relatively broad leaves that frequently have red hairs at the summit of the sheath; and cleistogamous flowers that are borne at the base of the plant and are usually subterranean (in addition to normal, aerial, chasmogamous flowers)" (Faden 1993). [= FNA, K, Y]

Commelina caroliniana Walter, Indian Dayflower. Cp (GA, NC, SC): moist disturbed areas; rare, apparently introduced from India and Bangladesh. June-October. Faden \((1989,1993)\) discusses in detail the taxonomy and history of this species. It was apparently introduced to our area early, probably as a weed in rice. [= RAB, C, FNA, G, K, S, Y; < C. diffusa -- GW, X, Z, in part; > C. hasskarlii C. B. Clarke (the earliest name applied to the species in India)]
* Commelina communis Linnaeus var. communis, Common Dayflower. Cp, Pd, Mt (GA, NC, SC, VA): gardens, bottomlands,
disturbed ground; common, introduced from the Old World. May-October. [=F, G, K, Z; < C. communis -- RAB, C, FNA, GW, S, W, \(\mathrm{X}, \mathrm{Y}\), infraspecific taxa not distinguished]
* Commelina communis Linnaeus var. Iudens (Miquel) C.B. Clarke, Bright-blue Dayflower. \{NC, VA\} The distribution of this taxon in our area is poorly known. May-October? Not recognized by many recent authors (see synonymy). [= F, G, K, Z; < C. communis -- RAB, C, FNA, GW, S, W, X, Y, infraspecific taxa not distinguished]
* Commelina diffusa Burmann f., Creeping Dayflower. Cp, Pd, Mt (GA, NC, SC, VA): roadsides, fields, disturbed ground; uncommon, introduced from the Old World. June-October. [= RAB, C, F, G, W; < C. diffusa -- GW, X, Z, in part only (also see C. caroliniana); C. Iongicaulis Jacquin -- S; C. diffusa var. diffusa -- FNA, K, Y]

Commelina erecta Linnaeus var. angustifolia (Michaux) Fernald, Sand Dayflower. Cp (GA, NC, SC), Pd (GA, VA), Mt (VA): dunes and dry sand flats on barrier islands, sandhills, other dry sandy sites, shale barrens, other dry rocky sites; common. JuneOctober. E. NC south to s. FL, west to TX, and north and west in the interior to IA, nw. NE, CO, and NM. Contrary to the specific epithet, C. erecta var. angustifolia is a trailing plant, the stems sometimes as long as 1.3 m . The taxonomy and distribution of the two varieties here recognized need further study. [ \(=C, F, F N A, G, K, X ;<C\). erecta -- RAB, W, Y, Z, infraspecific taxa not distinguished; > C. angustifolia Michaux -- S; > C. crispa Wooton -- S]

Commelina erecta Linnaeus var. erecta, Erect Dayflower. Cp, Pd, Mt (GA, NC, SC, VA): dry openings and woodlands, especially in thin soil around rock outcrops; common (uncommon in Mountains). June-October. PA west to MO and e. KS, south to FL and TX. [= C, F, FNA, G, K, X; < C. erecta -- RAB, W, Y, Z, infraspecific taxa not distinguished; = C. erecta -- S (in the narrow sense)]

Commelina virginica Linnaeus, Virginia Dayflower. Cp, Pd, Mt (GA, NC, SC, VA): bottomlands, swamp forests, other moist to wet forests and forest edges; common (rare in the upper Piedmont and Mountains). July-October. Our most robust species of Commelina. NJ west to KS and OK, south to FL and TX. [= RAB, C, F, FNA, G, GW, K, S, W, X, Y, Z]
* Commelina gambiae C.B. Clarke, a w. African species first collected in North America in 1976 (Manatee County, FL), is immediately distinguishable from our species by its peach-colored flowers and fused spathes. Faden (1993) reports that it "appears to be spreading rapidly," but whether it can spread northwards from peninsular FL is questionable. [= FNA; = Commelina nigritana Bentham var. gambiae (C. B. Clarke) Brenan -- K, Y]

\section*{Cuthbertia Small 1903 (Roseling)}

A genus of 3 species, herbs, of se. North America. There seems ample reason for recognizing Cuthbertia as distinct from Tradescantia, based on the single spathes (vs. paired), glabrous filaments (vs. hairy), differently shaped anther connectives, etc. Hunt \((1983,1986)\) has treated Cuthbertia as a section of Callisia Loefling, a decision followed with little additional comment or discussion by Tucker (1989). While this course may be warranted, the authors advocating it have presented little evidence to support it. Hunt (1986), in discussing a number of small tropical genera which he also reduces to sections of Callisia, states "this leaves two alternatives: to recognize numerous (perhaps 10) genera of 1-2 species, or to experiment with an amplification and sectionalization of Callisia, which I find the lesser of the two evils." He mentions that "the succulent habit ... is a principal unifying feature of the enlarged genus as a whole, reflecting the concentration of its species in tropical seasonal habitats, often on rocks." Cuthbertia is endemic to se. North America (a separate and more northerly distribution than the remainder of a broad Callisia), is only slightly succulent, occurs primarily in sandy habitats, and has a different base chromosome number ( \(x=6\) ) than some components of a broad Callisia. Until and unless a more compelling case is presented for the inclusion of Cuthbertia in Callisia, I prefer a more conservative and traditional maintenance of Cuthbertia, which is also more in line with the philosophy on the circumscription of genera. References: Faden in FNA (2000); Tucker (1989)=Z; Giles (1942); Giles (1943); Lakela (1972); Faden in Kubitzki (1998b).

1 Leaves erect or ascending, the leaf blades \(1-5 \mathrm{~mm}\) wide (narrower than the sheaths) ...................... C. graminea
1 Leaves loosely spreading, the leaf blades \(4-15 \mathrm{~mm}\) wide (as wide as or wider than the sheaths) .............. C. rosea
Cuthbertia graminea Small. Cp (GA, NC, SC, VA): sandhills; common (VA Rare). May-July. Cuthbertia graminea includes 3 morphologically distinguishable cytological races, occupying different (but partially overlapping) ranges (Giles 1942, Giles 1943, Tucker 1989). The predominant race is tetraploid, occupying the outer Coastal Plain of VA, NC, and SC, middle Coastal Plain of NC and SC, fall-line sandhills of SC, and south into FL. The diploid race is endemic to the fall-line sandhills of sc. NC and nc. SC, a distribution similar to those of Pyxidanthera barbulata var. brevifolia, Liatris cokeri, and Lycopus cokeri. Rare hexaploids have been found at scattered sites in SC and FL. The tetraploid race averages about \(25 \%\) larger than the diploid in most vegetative and floral characters, and is reported to exhibit a greater ecological amplitude (Giles 1942, 1943). [=S; = Tradescantia rosea Ventenat var. graminea (Small) E.S. Anderson \& Woodson -- RAB, C, F, G; = Callisia graminea (Small) G. Tucker -- FNA, K, Z]

Cuthbertia rosea (Ventenat) Small. Cp (GA, SC), Pd (GA, NC, SC): sandhills, other dry woodlands; common (NC Watch List). May-July. [= S; = Tradescantia rosea Ventenat var. rosea -- RAB; = Callisia rosea (Ventenat) D.R. Hunt -- FNA, K, Z]

\section*{Murdannia Royle 1839 (Murdannia)}

A genus of about 50 species, herbs, of tropical and warm temperate regions. References: Faden in FNA (2000); Tucker (1989)=Z; Faden in Kubitzki (1998b).

1 Flowers solitary or in 2-4-flowered racemes borne in the upper leaf axils; capsules 8-10 mm long; seeds ca. 3 mm long;

> pedicels much longer than the capsule . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . M. keisak

1 Flowers in stalked cymose racemes borne terminally or the uppermost leaf axil; capsules 4-5 mm long; seeds 1.0-1.5 mm long; pedicels about as long as the capsule . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . M. nudiflora
* Murdannia keisak (Hasskarl) Handel-Mazzetti. Cp, Pd, Mt (GA, NC, SC, VA): stream banks, canals, ditches, marshes, swamp forests, wet disturbed places; common (primarily in the Coastal Plain, uncommon in the Piedmont, rare in the Mountains), introduced from Asia, now widespread in the se. United States. September-October. [= C, FNA, G, GW, K, W, Z; = Aneilema keisak Hasskarl -- RAB, F]
* Murdannia nudiflora (Linnaeus) Brenan. Cp (GA, NC, SC), Pd? (GA?): moist sands, ditches, wet disturbed places; rare, introduced from Asia, now widespread in the tropics and subtropics of both hemispheres. May-October. This species apparently arrived in the se. United States earlier than M. keisak ( S , for instance, treats this species and not M. keisak), but is distinctly less common. [= FNA, GW, K, Z; = Aneilema nudiflorum (Linnaeus) Sweet -- RAB, S]

\section*{Tradescantia Linnaeus 1753 (Spiderwort) \\ (see also Callisia and Cuthbertia)}

A genus of about 70 species, herbs, of the New World. References: Faden in FNA (2000); Anderson \& Woodson (1935)=Y; Tucker (1989) \(=\) Z; Faden in Kubitzki (1998b).

1 Leaves \(2.5-5 \mathrm{~cm}\) long, 1-2 cm wide; plant decumbent, rooting at nodes . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . T. fluminensis Leaves \(4-45 \mathrm{~cm}\) long, \(0.4-6.5 \mathrm{~cm}\) wide; plant erect to ascending, not rooting at nodes.

1 Leaf blades of the upper stem constricted at their bases to a narrower subpetiolar sheath, the opened sheath narrower than the leaf blade; leaf blades \(6-25 \mathrm{~cm}\) long, \(1.0-5.0 \mathrm{~cm}\) wide, mostly less than \(10 \times\) as long as wide; stomates much more abundant on the lower leaf surface than on the upper, giving the lower surface a much paler color . . . . . . . . . . . . . . . . . . . . T. subaspera
1 Leaf blades of the upper stem not constricted to a subpetiolar sheath, the opened sheath about as wide or wider than the leaf blade; leaf blades \(11-45 \mathrm{~cm}\) long, \(0.4-2.0(-4.5) \mathrm{cm}\) wide, mostly more than \(10 \times\) as long as wide; stomates slightly more abundant on the lower leaf surface than on the upper, or about equally distributed on the two surfaces, the lower surface slightly to not al all paler than the upper.
2 Sepals, pedicels, and ovary glabrous or pubescent with eglandular hairs only (use 10× magnification); leaves glabrous or pilose at the junction of the blade and the sheath.
3 Pedicels glabrous; sepals glabrous or the tip with a tuft of eglandular hairs; leaves glaucous; sepals glaucous (or rarely also suffused with purple), not inflated-turgid
T. ohiensis

3 Pedicels pubescent; sepals eglandular-villous; leaves green; sepals green, inflated-turgid ........... T. virginiana
2 Sepals, pedicels, and ovary pubescent with glandular hairs or a mixture of glandular and eglandular hairs; leaves slightly to densely puberulent or pubescent.
4 Leaves dull green, densely pilose (rarely glabrate); sepals, pedicels, and ovary pubescent with a mixture of glandular and eglandular hairs; pedicels \(2.0-3.5 \mathrm{~cm}\) long T. hirsuticaulis

4 Leaves glaucous to subglaucous, puberulent; sepals, pedicels, and ovary puberulent with glandular hairs only; pedicels 1.2-2.5 cm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . T. roseolens
* Tradescantia fluminensis Vellozo, Wandering Jew. Cp (GA): disturbed areas; rare, introduced and naturalized from GA south and west. [= FNA, K, Z]

Tradescantia hirsuticaulis Small, Hairy Spiderwort. Mt (NC, SC), Pd (GA, SC), Cp (GA): dry rocky woodlands, and rock outcrops (especially granitic flatrocks and domes); rare (NC Watch List). April-June. W. NC and w. SC southwest to \(n\). GA and \(n\). \(A L\); disjunct in AR and e. OK (its core range). There is some question about the validity of this species. [= RAB, FNA, K, W, Y, Z]

Tradescantia ohiensis Rafinesque, Smooth Spiderwort. Mt, Pd, Cp (GA, NC, SC, VA): woodlands and forests, alluvial bottoms, disturbed areas; common. April-July. MA west to MN, south to FL and TX, some of that range the result of naturalization from cultivation. [= RAB, C, F, FNA, G, K, W, Z; ? T. reflexa Rafinesque -- S; ? T. canaliculata Rafinesque -- Y]

Tradescantia roseolens Small, Sandhill Spiderwort. Cp, Pd (GA, SC): dry sandy woodlands; rare (GA Rare). May-June. SC south through GA to s. peninsular FL. [= RAB, FNA, K, Y, Z; = T. longifolia Small -- S]

Tradescantia subaspera Ker-Gawler, Wide-leaved Spiderwort. Mt (GA, NC, SC, VA), Pd (GA, NC, SC), Cp (GA): dry to mesic woodlands and forests; common (VA Watch List). June-July. Nc. NC, w. VA, WV, OH, IN, IL, and MO, south to NC, SC, sw. GA, Panhandle FL, and AL. Two questionable varieties are sometimes recognized. Var. subaspera may be distinguished by the stem conspicuously zigzag above, except on depauperate or juvenile plants (vs. the stems straight or only slightly zigzag), uppermost lateral cymes sessile or short-pedunculate (vs. pedunculate throughout), uppermost internodes very reduced, crowding the upper leaves (vs. internodes less reduced), leaves much broader than the sheath (vs. only slightly broader), and its generally greater size than var. montana. T. subaspera var. montana ranges from sw. VA and c. WV south to nw. SC, n. GA, and se. TN, with disjunct occurrences in c. AL and panhandle FL. Var. subaspera ranges from WV west to n. IL, south to se. TN, ne. AR, and s. MO, with disjunct occurrences in NC. [= RAB, FNA, W; > Tradescantia subaspera Ker-Gawler var. montana (Shuttleworth ex Britton) E.S. Anderson \& Woodson -- C, F, G, K, Y, Z; > T. subaspera var. subaspera - C, F, G, K, Y, Z; ? T. pilosa J.G.C. Lemaire -- S]

Tradescantia virginiana Linnaeus, Virginia Spiderwort. Pd (GA, NC, SC, VA), Mt (GA, VA), Cp (VA): nutrient-rich forests and woodlands; common (rare south of VA) (NC Rare, SC Rare). April-July. ME west to MI and WI, south to n. GA, MO, and AR. [= RAB, C, F, FNA, G, K, S, W, Y, Z; ? T. brevicaulis Rafinesque -- S]

Tradescantia ernestiana E.S. Anderson \& Woodson. Mt (GA): \{habitat\}; rare. Primarily Ozarkian (AR, MO, OK, disjunct east to nw. GA and ne. AL, and west to n. TX (Faden in FNA 2000). [= FNA, Y, Z] \{not yet keyed\}

Tradescantia hirsutiflora Bush. Cp (GA, SC?): In s. and e. GA, west to TX. Reported for SC (Richland Co.) (P. McMillan 2003). [= FNA, K, Y, Z; T. hirsuticaulis -- S, misapplied] \{not yet keyed\}

Tradescantia paludosa E.S. Anderson \& Woodson. Coastal Plain of AL and FL west to TX and AR. [= FNA, K, Y, Z; T. ohiensis Rafinesque var. paludosa (E.S. Anderson \& Woodson) D.T. MacRoberts]

\section*{CONVALLARIACEAE \\ [see RUSCACEAE]}

\section*{CYMODOCEACEAE N. Taylor 1909 (Manatee-grass Family)}

A family of about 5 genera and 16 species, estuarine aquatics, of tropical and subtropical (rarely temperate) waters. References: Kuo \& McComb in Kubitzki (1998b); Haynes in FNA (2000); Green \& Short (2003).

1 Leaves flat above the sheath; leaf tips 3-toothed; female plants with flowers with 1 pistil . . . . . . . . . . . . . . . . . . . . . Halodule 1 Leaves terete or subterete above the sheath; leaf tips acicular; female plants with flowers with 1-2 pistils ..... [Syringodium]

\section*{Halodule Endlicher 1841 (Shoal-grass)}

A genus of about 6 species, of tropical and subtropical regions of both hemispheres. References: Haynes in FNA (2000); McRoy \& Helfferich (1977); Kuo \& McComb in Kubitzki (1998b); Green \& Short (2003)=Z.

Halodule wrightii Ascherson, Shoal-grass. Cp (NC, SC?): submerged in estuarine waters up to about 2 m deep, especially in Core and Pamlico sounds (North Carolina); common. E. NC (reported with unknown documentation from SC, not known from GA); FL west to TX, and south along shores of the Gulf of México and Caribbean; also on the Pacific coast of Panama and Nicaragua. Haynes in FNA (2000) concludes that \(H\). beaudettei is not taxonomically distinct from H. wrightii (the older name). Seagrasses (an informal group including Halodule wrightii, Zostera marina, and Ruppia maritima in our area) are very important components of estuarine ecosystems, providing a large proportion of the primary productivity in such systems and providing shelter and nursery grounds for fish, shrimp, and other invertebrates. An estimated 80,000 hectares of seagrass beds are found in Pamlico and Core sounds, NC, most of that area having Halodule as the co-dominant or dominant species (Ferguson, Rivera, \& Wood 1989). There is concern about the destruction of seagrass beds by pollution, dredging of waterways, and mechanical disturbance by fishing boats (Koch \& Orth 2003; Green \& Short 2003). [= FNA, S, Z; > H. beaudettei (den Hartog) den Hartog -- RAB, GW, K]

\section*{Syringodium F.T. Kützing in R.F. Hohenacker 1860 (Manatee-grass)}

A genus of 2 species, seagrasses, of the Caribbean and Indo-West Pacific. References: Haynes in FNA (2000); Kuo \& McComb in Kubitzki (1998b); Green \& Short (2003)=Z.

Syringodium filiforme F.T. Kützing in R.F. Hohenacker, Manatee-grass, occurs in FL, westwards along the Gulf Coast, and in the West Indies; it is occasionally cast ashore in Georgia and the Carolinas following hurricanes, but there is no evidence that it grows in our area. It is the only other member of the family in e. North America. [= FNA, Z; = Cymodocea filiformis (F.T. Kützing in R.F. Hohenacker) Correll -- GW, K; = Cymodocea manatorum Ascherson -- S]

\section*{CYPERACEAE (Sedge Family)}

A family of about 100 genera and 5000 species, mostly herbs, cosmopolitan. References: Ball, Reznicek, \& Murray in FNA (2002b); Tucker (1987); Goetghebeur in Kubitzki (1998b).

\footnotetext{
1 Achene enclosed in a perigynium (a sac-like structure); [subfamily Caricoideae, tribe Cariceae].
2 Leaf blades 0.5-25 (-52) mm wide, with a midrib, herbaceous, the apex acute; leaf margin various (smooth or scabrous, but not as described below) . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Carex
2 Leaf blades 20-60 mm wide, without a midrib (with 40-100 parallel nerves all of equal prominence), leathery, the apex obtuse; leaf margin scarious, minutely crisped-ruffled (feeling scaberulous to the touch) . . . . . . . . . . . . . . Cymophyllus
1 Achene not enclosed in a perigynium.
3 Scales distichously imbricate; spikelets aggregated into spikes or heads; [subfamily Cyperoideae].
4 Inflorescence axillary; leaves predominantly cauline, conspicuously 3-ranked; perianth bristles subtending the
}

4 Inflorescence terminal, more-or-less scapose (though immediately subtended by leafy bracts); leaves predominantly basal, not 3-ranked; perianth bristles absent; [tribe Cypereae].
5 Inflorescences branched; spikelets 1-many-flowered; rachilla elongate; scales broadly rounded \(\qquad\) Cyperus 5 Inflorescences unbranched (the spikelets sessile); spikelets 1-2-flowered; rachilla not or only slightly elongate; scales conspicuously keeled

Kyllinga
3 Scales spirally imbricate; spikelets not usually aggregated.
\(6 \quad\) Achene (when ripe) bony and white; style base persistent on the summit of the achene, forming a differently-textured or differently-colored tubercle; spikelets all imperfect, the pistillate ones 1-flowered, the staminate ones severalflowered; [subfamily Sclerioideae, tribe Sclerieae]

Scleria
6 Achene mostly brown, black, or tan; style base persistent as a differentiated tubercle (Bulbostylis, Eleocharis, Rhynchospora) or not (Cladium, Eriophorum, Fuirena, Hemicarpha, Isolepis, Lipocarpha, Schoenoplectus, Scirpus, Trichophorum); spikelets mostly or all perfect; [subfamily Cyperoideae].
\(7 \quad\) Style base persistent as a differentiated tubercle (this small and inconspicuous in Bulbostylis and some spp. of Rhynchospora).
8 Leaves consisting of bladeless sheaths; spikelet 1 per stem, terminal (very rarely proliferating and with more than 1 spikelet); [tribe Eleocharideae] Eleocharis
8 Leaves with well-developed blades; spikelets few to many per stem, usually subtended by foliaceous bracts.
9 Perianth bristles absent; spikelets several-many-flowered; leaves capillary; [tribe Abildgaardieae] . . .
9 Perianth bristles present (rarely absent in species without capillary leaves); spikelets 1-2-flowered (several-many-flowered in some species without capillary leaves); leaves capillary to broad; [tribe Schoeneae]

Rhynchospora
\(7 \quad\) Style base not persistent as a differentiated tubercle.
10 Achene not subtended by bristles or scales (in addition to the scales of the spikelets).
11 Involucral bracts 1-3, the lowest erect, appearing like a continuation of the culm, the inflorescence therefore appearing lateral.
12 Achenes \(0.5-0.7 \mathrm{~mm}\) long, \(1.8-3 \times\) as long as wide, minutely papillose in longitudinal lines; [tribe Cypereae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Lipocarpha
12 Achenes 1.2-1.5 mm long, \(1-1.4 \times\) as long as wide, minutely pitted or transversely rugose. 13 Achenes minutely pitted in longitudinal lines; [tribe Cypereae] . . . . . . . . . . . . . . Isolepis 13 Achenes transversely rugose; [tribe Fuireneae] . . . . . . . . . . . . Schoenoplectus erectus 11 Involucral bracts 2-several, spreading, the inflorescence therefore appearing terminal.

13 Plants diminutive, to 5 dm tall; leaves \(3-15 \mathrm{~cm}\) long, to 1 mm wide; [tribe Abildgaardieae] . . . . . Bulbostylis
13 Plants moderate to very robust, \(7-30 \mathrm{dm}\) tall; leaves \(30-150 \mathrm{~cm}\) long, \(1.5-15 \mathrm{~mm}\) wide. 14 Flowers 1-2 per spikelet; [tribe Schoeneae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Cladium 14 Flowers several-many per spikelet.

15 Style fimbriate; leaves 0.5-5 mm wide; [tribe Abildgaardieae] . . . . . . . . . Fimbristylis 15 Style smooth; leaves (2-) 5-18 mm wide; [tribe Scirpeae] . . . . . Scirpus georgianus
10 Achene subtended by either bristles, 3 stalked paddle-like scales, or 1-2 broad-based scales (in addition to the scales of the spikelets).
16 Achene subtended by stalked paddle-like scales or broad-based scales.
17 Achene subtended by a perianth of 3 stalked paddle-like scales; plants 2-7 dm tall; [tribe Fuireneae]

Fuirena
17 Achene lacking a perianth, but subtended by 1-2 broad-based scales; plants \(0.5-3 \mathrm{dm}\) tall; [tribe Cypereae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Lipocarpha
16 Achene subtended by bristles.
18 Bristles 10 -many, more than \(5 \times\) as long as the achene, white to tawny, straight; [tribe Scirpeae] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Eriophorum
18 Bristles 1-6, usually less than \(4 \times\) as long as the achene, brown, straight or conspicuously twisted (twisted if more than \(3 \times\) as long as the achene).
19 Involucral bracts lacking, or consisting only of the slightly modified basal scales of the solitary and terminal spikelet; [of hillsides, upland forests, or cliffs; never (in our area) in marshes, bogs, or streambeds]; [tribe Scirpeae] \(\qquad\) Trichophorum 19 Involucral bracts present, consisting either of a single, erect bract appearing as a continuation of the culm (the inflorescence thus appearing lateral) or of 2 or more spreading, foliaceous bracts (the inflorescence thus appearing terminal); [of marshes, bogs, streambeds, ditches, or (rarely) terrestrial or on rock outcrops].
20 Main involucral bract 1 (rarely 2 ), erect, appearing as a continuation of the culm (the inflorescence thus appearing lateral, though in some species the longer inflorescence branches may overtop the bract); [tribe Fuireneae] . . . . . . . . . . . . . Schoenoplectus 20 Main involucral bracts 2-8, spreading and foliaceous (the inflorescence thus appearing terminal).
21 Spikelets \(10-40 \mathrm{~mm}\) long, 6-12 mm in diameter, 3-50 per culm; [tribe Fuireneae]

\section*{Bolboschoenus Palla (Bulrush)}

A genus of about 10-16 species, herbs, cosmopolitan. The distinction of this genus from Schoenoplectus is uncertain and controversial; it is generally accepted in the Old World, and generally not in the New World. References: Smith in FNA (2002b); Goetghebeur in Kubitzki (1998b).

1 Ventral summit of leaf sheaths truncate or concave, the nerves destined for the leaf margins diverging gradually

1 Ventral summit of leaf sheaths convex, the nerves destined for the leaf margins diverging abruptly, making a nearly right-angle bend.
2 Bristles mostly equalling to surpassing the distinctly trigonous achene . . . . . . . . . . . . . . . . . . . . . . . . . . . . . B. fluviatilis
2 Bristles shorter than to equalling the lenticular or plano-convex achene.
3 Inflorescence relatively open, with (10-) 15-50 spikelets; bristles persistent . . . . . . . . . . . . . . . . . . B. novae-angliae
3 Inflorescence relatively congested, mostly with 5-20 spikelets; bristles more or less caducous . . . . . . . B. robustus
Bolboschoenus fluviatilis (Torrey) J. Soják, River Bulrush. Mt, Pd, Cp (VA): tidal and river marshes; rare (VA Rare). Juneearly July; July-August. New Brunswick west to Saskatchewan, British Columbia (Vancouver Island) and WA, south to VA, OH, IN, KS, AZ, and CA; disjunct in s. AL. [= FNA; = Scirpus fluviatilis (Torrey) A. Gray -- C, F, G; = Schoenoplectus fluviatilis (Torrey) M.T. Strong -- K, Z]

Bolboschoenus maritimus (Linnaeus) Palla ssp. paludosus (A. Nelson) T. Koyama, Alkali Bulrush, Salt-marsh Bulrush. Cp (VA): marshes; rare (VA Watch List). Interruptedly circumboreal, south in North America to VA, NY, MN, MO, OK, TX, and Mexico. [= FNA; Scirpus maritimus var. maritimus -- C; Scirpus maritimus var. fernaldii (Bicknell) Beetle -- F, in part (also see Bolboschoenus novae-angliae); Scirpus maritimus var. fernaldii (Bicknell) Beetle -- G; Scirpus maritimus Linnaeus; Schoenoplectus maritimus (Linnaeus) Lye - K]

Bolboschoenus novae-angliae (Britton) S.G. Smith, Salt-marsh Bulrush. Cp (NC, VA): fresh to brackish tidal marshes, ditches; rare (VA Watch List). Late June-July; July-September. ME to GA. Perhaps a hybrid of Schoenoplectus fluviatilis and Schoenoplectus robustus, but "apparently forming a persistent set of populations" (Cronquist 1991). Possibly better treated as a hybrid, Schoenoplectus \(\times\) novae-angliae; its distinctiveness and ecological behavior suggest that it should be treated as a species. See Schuyler (1975) for additional discussion. [= FNA; Scirpus cylindricus (Torrey) Britton -- C, K, Beal (1977), illegitimate name; Scirpus maritimus var. fernaldii (Bicknell) Beetle -- F, in part; = Scirpus robustus Pursh var. novae-angliae (Britton) Beetle -- G; = Schoenoplectus novae-angliae (Britton) M.T. Strong -- K, Z]

Bolboschoenus robustus (Pursh) J. Soják, Salt-marsh Bulrush. Cp (GA, NC, SC, VA), Mt (VA): brackish marshes; common (rare in Mountains). Late May-June (-September); late June-September. Along the coasts, from Nova Scotia to FL, west to TX, and into tropical America; also in CA. [= FNA, Z; Scirpus robustus Pursh -- RAB, C, F, GW, S, W; Scirpus robustus var. robustus -- G; Schoenoplectus robustus (Pursh) M.T. Strong -- K, Z]

\section*{Bulbostylis Kunth (Hairsedge)}

A genus of about 100 species, herbs, of tropical and warm temperate areas, concentrated especially in tropical Africa and tropical South America. References: Kral (1971)=Z; Kral in FNA (2002b); Goetghebeur in Kubitzki (1998b).

1 Spikelets sessile, the inflorescence therefore a capitate cluster (sometimes a few spikelets pedicellate, but the pedicels not generally longer than the spikelets, the inflorescence still appearing glomerate).
2 Inflorescence bracts widened abruptly at its base, the widened portion prominently fimbriate-pectinate; perennial, culms \(10-50 \mathrm{~cm}\) tall; achene \(1-1.3 \mathrm{~mm}\) long, white or yellowish, the apex retuse (the three lobes projecting beyond and surrounding the tubercle)
B. warei

2 Inflorescence bracts not widened abruptly at its base, the membranous margins smooth or ciliate; annual, culms 5-35 cm tall; achene \(0.5-1.2 \mathrm{~mm}\) long, pale brown or gray, the apex rounded or truncate (the three lobes not exceeding the tubercle).
3 Inflorescence bracts numerous and conspicuous, several much exceeding the cluster of spikelets; achenes 0.8-1.2 mm long, transversely rugose; spikelet scales usually greenish or pale brown, dull, puberulent . . . . B. stenophylla
3 Inflorescence bracts few and inconspicuous, none or sometimes one exceeding the cluster of spikelets (and then only slightly); achenes \(0.5-0.6 \mathrm{~mm}\) long, finely reticulate; spikelet scales usually reddish-brown, lustrous, smooth or nearly so .
B. barbata

1 Spikelets mostly on slender pedicels, the inflorescence therefore open and umbel-like.
4 Achenes finely transversely rugose, tan or brown (when ripe); spikelet scales 1.5-2.0 mm long, with truncate apices . B. capillaris

4 Achenes very finely papillose and waxy, gray or dark greenish-brown (when ripe); spikelet scales 0.7-1.8 mm long, with obtuse to rounded apices.
5 Annual, to 1-2 (-3) dm tall; inflorescence a simple (rarely compound) umbel of few (3-9) lance-ovoid spikelets; longest
involucral bract seldom exceeding the inflorescence; leaf margins usually hispidulous spikelets; longest involucral bract commonly exceeding the inflorescence; leaf margins usually distinctly tuberculatescabrid
B. coarctata
* Bulbostylis barbata (Rottbøll) C.B. Clarke, Old World Hairsedge. Cp (GA, NC, SC), Pd (GA, NC, SC, VA): sandy fields; common, introduced from the Old World tropics (rare and perhaps not established in VA). July-October. [= RAB, FNA, GW, K, W, Z; = Stenophyllus barbatus (Rottbøll) Britton -- S]

Bulbostylis capillaris (Linnaeus) Kunth ex C.B. Clarke, Common Hairsedge. Mt, Pd, Cp (GA, NC, SC, VA): thin soils on rock outcrops, especially granite domes and granite flatrocks (but also on mafic rocks, such as diabase), sandy soils, fields; common. July-October. ME to MN, south to FL and TX, and west to AZ and CA, also in Mexico, Central America, the West Indies, and s. Asia. This species frequently has a mixture of long and very short culms, the short culms only a few cm long and thus nearly hidden amongst the leaves. [= RAB, C, F, FNA, G, GW, W, Z; > B. capillaris var. crebra Fernald -- F; > B. capillaris var. isopoda Fernald -F ; = B. capillaris ssp. capillaris -- K; = Stenophyllus capillaris (Linnaeus) Britton -- S]

Bulbostylis ciliatifolia (Elliott) Fernald, Savanna Hairsedge. Cp (GA, NC, SC, VA): moist to wet sands of savannas, roadsides, disturbed areas; common (VA Watch List). July-October. Se. VA south to s. FL and west to s. AL. Kral (1971) describes this plant as occurring in generally wetter habitats and being much weedier than \(B\). coarctata. The sympatry of this taxon and \(B\). coarctata suggests that they are best recognized as species. [=F, G; = Bulbostylis ciliatifolia (Elliott) Fernald var. ciliatifolia - C, FNA, GW, K, Z; < B. ciliatifolia -- RAB, in part (also including B. coarctata); = Stenophyllus ciliatifolius (Elliott) C. Mohr -- S]

Bulbostylis coarctata (Elliott) Fernald, Elliott's Hairsedge. Cp (GA, NC, SC, VA): sandhills, usually associated with longleaf pine and wiregrass; uncommon (VA Watch List). July-October. Se. VA south to s. FL and west to e. TX, north in the interior to sw. TN. [= F, G; = Bulbostylis ciliatifolia (Elliott) Fernald var. coarctata (Elliott) Kral - C, FNA, GW, K, W, Z; < B. ciliatifolia -- RAB, in part; = Stenophyllus coarctatus (Elliott) Britton -- S]

Bulbostylis stenophylla (Elliott) C.B. Clarke. Cp (GA, NC, SC): sandhills, dry savannas, and disturbed sandy areas; uncommon. July-October. Se. NC south to s. FL, west to w. FL, and in Cuba. [= RAB, FNA, GW, K, Z; = Stenophyllus stenophyllus (Elliott) Britton -- S]

Bulbostylis warei (Torrey) C.B. Clarke, Ware's Hairsedge. Cp (GA, NC, SC): sandhills; rare (NC Rare). July-October. Se. NC south to s. FL and west to s. AL. [= RAB, FNA, GW, K, Z; = Stenophyllus warei (Torrey) Britton -- S]

Carex Linnaeus (Sedge)
(contributed by Thomas F. Wieboldt, Bruce A. Sorrie, and Alan S. Weakley, portions only complete at this time)
A genus of about 2000 (or more) species, herbs, cosmopolitan, especially temperate and boreal. References: Mackenzie (19311935)=M; Ball \& Reznicek in FNA (2002b); Goetghebeur in Kubitzki (1998b); Frye \& Lea (2001).
[Note: because of the size of the genus Carex in our flora, it will be completed in sections. Temporarily, the compound key will be structured so that sections can be accessed via keys such as Cronquist (1991); use Cronquist's key to groups and key to sections, then jump to completed sections in this treatment.]

\section*{Key to Sections (in very small part, and in fragments)}

1 Perigynia tapering gradually into a beak 0.4-0.6 mm long; culms trigonous, the angles rounded to sharp, glabrous to antrorsely scaberulous; leaves glabrous to scaberulous (or pilose basally); [of acid, sandy soils of the Coastal Plain]

Key 29a (section Hallerianae)
1 Perigynia abruptly contracted into a beak 1.0-1.3 mm long; culms trigonous, the angles flattened into wings, sparsely pilose; leaves pilose throughout; [of nutrient-rich, though often rather dry, forests of the Mountains] . . . Key 29b (section Hirtifoliae)

1 Perigynia with numerous impressed nerves, giving the perigynia a longitudinally corrugated appearance.
2 Perigynia tapering toward the base, obtusely trigonous in cross-section, usually pubescent proximally, the apex constricted to a distinct beak (nearly beakless in C. planispicata), the perigynia closely enveloping the achene at maturity

Key 34a (Section Oligocarpae)
2 Perigynia convex-rounded basally, more-or-less terete in cross-section, glabrous, the apex tapered but not constricted, beakless or the beak obscure, the perigynia loosely enveloping the achene at maturity . . . . Key 34b (Section Griseae)
1 Perigynia with few to many raised nerves.
3 Perigynia convex-rounded basally, more-or-less terete in cross-section, loosely enveloping the achene at maturity .
Key 33 (Section Granulares)
3 Perigynia tapered basally, sharply to bluntly trigonous in cross-section, closely enveloping the achene at maturity. 4 Plant long-rhizomatous; culms slender and firm; leaves \(1-4 \mathrm{~mm}\) wide ( -7 mm in C. biltmoreana)

\section*{Key 31 (Section Paniceae)}

4 Plant without obvious long rhizomes; culms broad, often wing-angled, and easily compressed; leaves 2-52 mm wide. 5 Perigynia acutely triangular in cross-section; perigynia with numerous (usually 40 or more) nerves (impressed in living perigynia and raised in dried perigynia) . . . . . . . . . . . . . . . . . . . . . . . . . . Key 32b (section Careyanae) 5 Perigynia obtusely triangular in cross-section; perigynia with fewer nerves . . . . Key 32a (section Laxiflorae)

\footnotetext{
1 Base of plant dark reddish-brown; leaves involute; perigynium beak 0.5-0.8 mm long; sheaths with red spots on the ventral surface; [alien, of coastal salt marshes] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Key 39a (section Spirostachyae)
1 Base of plant dull brownish to white; leaves flat to folded; perigynium beak 1.4-2.3 mm long; sheaths white on the ventral surface; [native species of inland calcareous savannas or seeps] . . . . . . . . . . . . . . . . . . . . . Key 39b (section Ceratocystis)
}

\section*{Key 3 -- section Leucoglochin (Orthocerates)}

A section of 5-6 species, of arctic, boreal, and alpine North America, Eurasia, and South America. References: Cochrane in FNA (2002b).
\(\qquad\)

Key 6 -- section Firmiculmes

A section of 3 species, of western North America. References: Crins in FNA (2002b).
\(\qquad\)

\section*{Key 7 -- section Leptocephalae (Polytrichoidae)}

A monotypic section, of North America and the West Indies. References: Cochrane in FNA (2002b).

\section*{Key 8 -- section Pictae}

A section of 2 species, of e. North America. References: Ball in FNA (2002b).
1 Plants monoecious, with 3-8 spikes per stem; leaf blades \(4-8 \mathrm{~mm}\) wide, glaucous on the upper surface; [of the East Gulf Coastal Plain, east to sw. GA and panhandle FL]
C. baltzellii

1 Plants dioecious, witha single unisexual spike per stem; leaf blades 2-4.5 mm wide, green on the upper surface; [of areas west of area, east to c . TN and nc. GA] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [C. picta]

\section*{Key 10 -- section Macrocephalae}

A section of 2 species, of maritime e. Asia and nw. North America. References: Mastrogiuseppe in FNA (2002b).
\(\qquad\)

\section*{Key 11 -- section Divisae}

A section of 14 species, subcosmopolitan. References: Reznicek \& Catling in FNA (2002b).
1 Beak of the perigynium \(1 / 5\) to \(1 / 3\) as long as the body; spikes 2-7; [alien, naturalized primarily in brackish to salty coastal habitats]
C. divisa

1 Beak of the perigynium \(1 / 3\) to \(1 / 2\) as long as the body; spikes \(5-15\); [alien, naturalized primarily inland along highways treated with salt]
C. praegracilis

\section*{Key 12 - section Holarrhenae (Intermediae)}

A section of 2 species, of temperate Northern Hemisphere. References: Reznicek \& Catling in FNA (2002b).

One species approaching our area
[C. sartwellii]

Key 13 -- section Ammoglochin (Arenariae)

A section of 14 species, of temperate Northern Hemishere. References: Reznicek in FNA (2002b).
One species in our area
C. arenaria
\{C. siccata\}

\section*{Key 15 -- section Phaestoglochin (Bracteosae)}

A section of ca. 27 species, mainly of temperate North America. References: Ball in FNA (2002b); Webber \& Ball (1984). Key adapted from C, M, and Webber \& Ball (1984).

1 Sheaths loose, membranaceous, and fragile on the ventral side, septate-nodulose and usually mottled or striped with green and white on the dorsal side.
2 Ripe perigynia yellowish-brown; scales with a slender tip surpassing the base of the beak of the subtended perigynium; [plants rare in our area, probably only adventive from further west].
3 Perigynia 4-5 mm long, \(2 \times\) as long as wide; perigynia nerveless or very obscurely nerved on the dorsal face . . . . . .
C. gravida var. gravida

3 Perigynia 3-4.5 mm long, 1.3-1.5x as long as wide; perigynia strongly few-nerved on the dorsal face
C. gravida var. Iunelliana

2 Ripe perigynia green; scales barely if at all reaching the base of the beak of the subtended perigynium; [plants common in our area].
4 Inflorescence narrowly ovoid in outline, 2-4 cm long, all the spikes congested together and overlapping; leaves mostly \(3-6 \mathrm{~mm}\) wide; anthers 1.1-2.4 mm long; stigmas relatively slender, protruding 1.5 mm or more from the perigynium
C. aggregata

4 Inflorescence elongate in outline, 4-10 cm long, the lower spikes separated from one another (the internodes typically 1-3 cm ); leaves mostly 5-10 mm wide; anthers \(0.7-1.1(-1.3) \mathrm{mm}\) long; stigmas relatively stout, protruding slightly from the perigynium
C. sparganioides

1 Sheaths tight on the ventral side, neither septate-nodulose nor mottled with green and white on the dorsal side.
5 Perigynia corky-thickened in the lower \(1 / 3\) to \(1 / 2\) (and not more than 4.0 mm long); perigynia spreading or reflexed at maturity; perigynia (2-) 3-12 (-20) per spike; leaves \(0.5-3 \mathrm{~mm}\) wide.
6 Beak of perigynium smooth; pistillate scales acuminate, early deciduous.
7 Average perigynium width \(\geq 1.3 \mathrm{~mm}\); average spongy portion of the perigynium \(\geq 1.1 \mathrm{~mm}\) long; perigynium base distinctly nerved, bulging on the ventral surface, making the perigynium biconvex in cross-section; perigynium 2 \(2.5 \times\) as long as wide; perigynium gradually narrowed to a short beak; leaves \(1-3 \mathrm{~mm}\) wide .... C. retroflexa
7 Average perigynium width < 1.3 mm ; average spongy portion of the perigynium < 1.1 mm long; perigynium base nerveless, flattened on the ventral surface, making the perigynium planoconvex in cross-section; perigynium ca. \(3 \times\) as long as wide; perigynium narrowed to a conspicuous beak; leaves \(0.75-1.5 \mathrm{~mm}\) wide . . . . . C. texensis 6 Beak of perigynium serrulate; pistillate scales obtuse, persistent.

8 Plants with creeping rhizomes, the culms arising scattered along the rhizome; perigynia \(4-5 \times\) as long as wide C. socialis

8 Plants densely cespitose, the culms arising from the center of clump; perigynia 2-3× as long as wide.
\(9 \quad\) Widest leaves \(0.9-1.7 \mathrm{~mm}\) wide; base of fertile culm 0.7-1.4 mm wide.
10 Base of perigynium cuneate to rounded; distance from base of perigynium to base of achene 0.1-0.5 mm ; [primarily of the Mountains in our area].
C. appalachica

10 Base of perigynium rounded to truncate; distance from base of perigynium to base of achene 0.5-0.9 mm ; [widespread in our area]
C. radiata

9 Widest leaves \(1.7-3.0 \mathrm{~mm}\) wide; base of fertile culm \(1.4-2.2 \mathrm{~mm}\) wide.
11 Stigmas \(0.03-0.06 \mathrm{~mm}\) thick, straight to slightly twisted; widest leaves less than 2.0 mm wide; perigynia 3-7 (-8) per spike
C. radiata

11 Stigmas 0.07-0.10 mm thick, mostly coiled; widest leaves more than 1.7 mm wide; perigynia (6-) 7-14 (-20) per spike . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. rosea
5 Perigynia not conspicuously corky-thickened at base (except corky-thickened in the rare alien, C. spicata, which has perigynia 4.0-5.5 mm long); perigynia ascending to spreading at maturity; perigynia (3-) 8-40 per spike; leaves 1-5 mm wide.
12 Inflorescence ovoid in outline, the spikes densely aggregated, nearly indistinguishable except by the projecting setaceous bracts which subtend each spike.
13 Perigynia 1.3-1.7× as long as wide, widest near the broadly rounded, truncate, or even subcordate base
C. leavenworthii

13 Perigynia \(1.6-2.5 \times\) as long as wide, widest just below the middle, the base broadly cuneate to rounded. 14 Pistillate scales (excluding the awns) shorter than the perigynium body; culms not greatly exceeding the leaves.
C. cephalophora

14 Pistillate scales (excluding the awns) as long as or exceeding the perigynium body; culms much exceeding the leaves.
C. mesochorea

12 Inflorescence spicate-racemose, the individual spikes readily distinguishable (often separated by an exposed internode of the axis).

15 Pistillate scales brown or reddish-purple; [alien, sparsely naturalized in our area].
16 Roots and basal sheaths brown to black; perigynia not corky-thickened at base; ligule blunt, wider than long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. divulsa 16 Roots and basal sheaths purplish-tinted; perigynia corky-thickened at base; ligule acute, longer than wide
C. spicata

15 Pistillate scales green, hyaline, or pale tan; [native in our area (except C. austrina), common and widespread in our area].
17 Perigynia ascending, nerveless on the ventral surface; scales acuminate to awned; lowest inflorescence bract elongate, the free portion \(10-50 \mathrm{~mm}\) long
C. austrina

17 Perigynia spreading, either nerved or nerveless on the vegral surface; scales acuminate; lowest inflorescence bract short, delicate, the free portion \(5-20 \mathrm{~mm}\) long.
18 Perigynia 3.0-3.5 mm long, nerveless on the upper (ventral) face ... C. muehlenbergii var. enervis
18 Perigynia \(3.5-4.0 \mathrm{~mm}\) long, nerved on both faces
C. muehlenbergii var. muehlenbergii

\section*{[C. muricata]}

\section*{Key 16 -- section Multiflorae}

A section of 7 species, of North America (including Mexico). References: Standley in FNA (2002b).
1 Beak of the perigynium about equaling the body; leaves usually exceeding the culm; lowermost pistillate bract often more than 5 cm long
C. vulpinoidea

1 Beak of the perigynium much shorter than the body; leaves usually shorter than the culm; lowermost pistillate bract often less than 2 cm long.
2 Body of the perigynium broadly suborbicular, 2.2-3.0 mm wide, broadly rounded to truncate at the base; perigynium redpunctate
C. triangularis

2 Body of the perigynium broadly ovate, \(1.0-2.4 \mathrm{~mm}\) wide, broadly cuneate to rounded at the base; perigynium not red punctate.
3 Perigynia 2.5-3.5 mm long, \(1.6-2.4 \mathrm{~mm}\) wide, strongly nerved, yellowish-brown at maturity; [usually in acidic habitats, widespread in our area] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. annectens var. annectens
3 Perigynia 2.2-2.7 mm long, \(1.5-1.8 \mathrm{~mm}\) wide, nerveless or obscurely nerved, golden yellow at maturity; [usually in calcareous habitats, apparently restricted in our area to VA] . . . . . . . . . . . . . . . . . C. annectens var. xanthocarpa

\section*{[C. fissa var. aristata]}

\section*{Key 17 -- section Vulpinae}

A section of ca. 15 species, of North America, temperate Eurasia, Africa, and Australia. References: Jones \& Reznicek (1995); Standley in FNA (2002b). Key 2 adapted from Jones \& Reznicek (1995).

\section*{Key 1}

1 Leaf sheath fronts yellow, thickened, and not fragile at the top; leaf blades papillose adaxially (at \(25 \times\) magnification)
C. laevivaginata

1 Leaf sheath fronts green or whitish, thin, and fragile at the top; leaf blades not papillose adaxially.

\section*{2 Leaf sheath fronts smooth.}

3 Larger perigynia \(6-8 \mathrm{~mm}\) long; leaves to 12 mm wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. crus-corvi
3 Larger perigynia \(3-5 \mathrm{~mm}\) long; leaves to 7 mm wide.
4 Perigynia smoothly rounded at base, not distended; perigynium veins 3-5 abaxially, 0 adaxially
[C. alopecoidea]
4 Perigynia cordate at base, distended; perigynium veins 10-12 abaxially, 7 adaxially . . . . . . C. oklahomensis
2 Leaf sheath fronts rugose.
5 Perigynia broadly rounded at base, not distended; perigynium veins 3-5 abaxially, 0 adaxially ....... C. conjuncta
5 Perigynia cordate or truncate at base, distended; perigynium veins 15 abaxially, 7 adaxially.
6 Perigynia (5-) avg. 5.4 (-6) mm long, the beak more than 3 mm long; larger leaves mostly 8-17 mm wide;
perigynium scales cuspidate to short-awned; [mostly of the Coastal Plain and lower Piedmont]
C. stipata

6 Perigynia (4-) avg. 4.7 (-5) mm long, the beak less than 2.5 mm long; larger leaves mostly \(4-10 \mathrm{~mm}\) wide; perigynium scales acuminate to cuspidate; [widespread in our area] . . . . . . . . . . . . . C. stipata var. stipata

\section*{Key 2}

1 Beak of the perigynium shorter than the body.
2 Perigynia somewhat abruptly contracted into a beak ca. \(0.5 \times\) as long as the perigynium body; ventral surface of the
perigynium with several incomplete veins basally; culms sharply triangular and narrowly winged, somewhat spongy and easily crushed; dorsal leaf sheaths green; ventral leaf sheaths with scattered red dots, and transversely rugose; [normally of shaded locations]
C. conjuncta

2 Perigynia tapering into a beak, much shorter than the perigynium body; ventral surface of the perigynium with several inconspicuous complete veins; culms inconspicuously triangular to roundish, not winged, neither spongy nor easily crushed; dorsal leaf sheaths dark blue-green with conspicuous white dots; ventral leaf sheaths without scattered red dots, not transversely rugose; [nomally of sunny locations]
C. oklahomensis

1 Beak of the perigynium as long as, or longer than, the body.
3 Ventral leaf sheath margins with orange-red dots; achene ovate-lanceolate; perigynium wall adhering to achene
C. crus-corvi

3 Ventral leaf sheath margins without orange-red dots; achene broadly ovate to ovate-orbicular; perigynium wall not adhering to the achene (or only slightly so).
4 Ventral leaf sheaths not transversely rugose, more or less concave at the apex and not prolonged upward past the base of the blade, thickened, not friable . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. Iaevivaginata
4 Ventral leaf sheaths transversely rugose, more or less convex at the apex and prolonged upward past the base of the blade, friable.
5 Perigynia (5-) avg. 5.4 (-6) mm long, the beak more than 3 mm long; larger leaves mostly 8-17 mm wide; perigynium scales cuspidate to short-awned; [mostly of the Coastal Plain and lower Piedmont]
C. stipata var. maxima

5 Perigynia (4-) avg. \(4.7(-5) \mathrm{mm}\) long, the beak less than 2.5 mm long; larger leaves mostly \(4-10 \mathrm{~mm}\) wide;
perigynium scales acuminate to cuspidate; [widespread in our area] . . . . . . . . . . . . . . C. stipata var. stipata

\section*{Key 18 -- section Heleoglochin (Paniculatae)}

A section of 11-12 species, of temperate North America, Eurasia, n. Africa, and Australsia. References: Cochrane in FNA (2002b).
1 Perigynia obovoid, 1.3-1.5× as long as wide; sheaths concave at the mouth; leaves 3-8 mm wide; [of swamps of the Coastal Plain and lower Piedmont]
C. decomposita

1 Perigynia ovoid, ca. \(2 \times\) as long as wide; sheaths prolonged beyond the blade; leaves 2-3 mm wide; [of calcareous wetlands of the Mountains]
C. prairea
\{C. diandra\}

\section*{Key 19 -- section Glareosae (Heleonastes)}

A section of 20-25 species, circumboreal, but extending in montane areas to South America, New Zealand, and Australia. References: Toivonen in FNA (2002b).
1 Spikes (1-) 2 (-3); perigynia 1-5 per spike, 2.5-4 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. trisperma var. trisperma

1 Spikes 4-9; perigynia 5-30 per spike; 1.7-2.5 mm long.
2 Perigynia (10-) 15-30 per spike; perigynium without ventral nerves (or the nerves very obscure); spike at maturity somewhat bristly appearing in silhouette because of the perigynium beaks ..... C. brunnescens var. sphaerostachya
2 Perigynia 5-10 (-15) per spike; perigynium ventrally nerved; spike at maturity nearly smooth in silhouette (the perigynium beaks strongly appressed)
3 Culms \(15-60 \mathrm{~cm}\) tall; inflorescence 3-5 (-7) cm long, all but the lowest spikes approximate, the lowest spikes 0.5-2.5 cm apart . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. canescens var. canescens
3 Culms 30-90 cm tall; inflorescences 6-12 (-15) cm long, the lower and middle spikes well-spaced, the lowest spikes 2-5 cm apart . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. canescens var. disjuncta

\section*{Key 20 -- section Stellulatae}

A section of ca. 15 species, semicosmopolitan (except Africa). References: Reznicek \& Ball (1980); Reznicek in FNA (2002b). Key based on Reznicek \& Ball (1980).

1 Spikes usually solitary; leaves involute; anthers 2.0-3.6 mm long; [rare disjuncts in Coastal Plain bogs] ............ . C. exilis
1 Spikes 2-8; leaves flat or folded; anthers 0.6-2.2 (-2.4) mm long.
2 Perigynium beak smooth-margined (use at least \(10 \times\) magnification).
2 Perigynium beak serrulate on margin (use at least \(10 \times\) magnification).
3 Widest leaves 2.8-5.0 mm wide.
4 Lower perigynia of spikes mostly \(1.1-1.6 \times\) as long as wide; perigynia mostly \(2.1-3.0 \mathrm{~mm}\) wide C. atlantica ssp. atlantica

4 Lower perigynia of spikes (1.5-) 1.7-3× as long as wide; perigynia mostly 1.2-2.0 mm wide . . . . . . . . C. ruthii
3 Widest leaves \(0.8-2.7 \mathrm{~mm}\) wide.
5 Terminal spikes entirely staminate; anthers (1.0-) 1.2-2.2 (-2.4) mm long . . . . . . . . . . . . . . . . . . . . . . . C. sterilis

5 Terminal spikes partly or entirely pistillate; anthers 0.6-2.2 (-2.4) m long.
6 Terminal spikes without a distinct narrowed base of staminate scales, the staminate portion less than 1 mm long
C. sterilis

6 Terminal spikes with a distinct narrowed base of staminate scales \(1.0-16.5 \mathrm{~mm}\) long.
7 Lower perigynia 2.0-3.0 mm wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. atlantica
7 Lower perigynia 0.9-2.0 mm wide.
8 Lower perigynia mostly 2.8-4.8 mm long; lower perigynia (1.7-) 1.8-3.6× as long as wide; perigynia beaks \(0.95-2.0 \mathrm{~mm}\) long, mostly \(0.45-0.85 \times\) as long as the perigynium body
C. echinata ssp. echinata

8 Lower perigynia mostly 1.9-3.0 mm long; lower perigynia 1.0-2.0 (-2.2)× as long as wide; perigynia beaks \(0.4-0.95 \mathrm{~mm}\) long, mostly \(0.2-0.5 \times\) as long as the perigynium body.
9 Perigynia mostly nerveless over the achene on the adaxial surface; beak of perigynia conspicuously setulose-serrulate; perigynia often more-or-less convexly tapered from widest point to the beak, thus forming a weak shoulder; [of calcareous sites, in our area restricted to the Mountains of VA] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. interior
9 Perigynia mostly 1-10-nerved over the achene on the adaxial surface; beak of perigynia more sparsely serrulate, with definite spaces between the often single teeth; perigynia more-or-less cuneate or concavely tapered from widest point to the beak, not forming a shoulder; [of a variety of situations, not generally calcareous].
10 Widest leaves \(1.6-2.7 \mathrm{~mm}\) wide; infructescence mostly \(18-45 \mathrm{~mm}\) long; [widespread in our area] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. atlantica
10 Widest leaves \(0.6-1.6 \mathrm{~mm}\) wide; infructescence mostly \(8-20 \mathrm{~mm}\) long; [primarily of the Coastal Plain in our area, widely scattered elsewhere]
C. howei

Key 21 -- section Deweyanae
A section of 8 species, of North America and e. Asia. References: Naczi (1990); Naczi in FNA (2002b).
Perigynia 1.3-1.6 mm wide, \(3-4 \times\) as long as wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [C. deweyana var. deweyana]
1 Perigynia 0.8-1.2 mm wide, \(4-5 \times\) as long as wide.
2 Widest leaf (1.3-) 1.5-2.9 (-3.1) mm wide; culms (0.5-) 0.6-1.0 (-1.1) mm thick at mid-height; plant densely to loosely cespitose, the rhizome internodes \(0.2-20 \mathrm{~mm}\) long; [of swamp forests and other wetlands, widespread in our area] . . . .

2 Widest \(28-4 \mathrm{~mm}\) wide culms \(10-1.6 \mathrm{~mm}\) thick at mid-height plants densely cespitose bromoides ssp. bromoides 1.0 (-8.5) mm long; [of seeps and bogs in the Blue Ridge and Blue Ridge Escarpment region]
C. bromoides ssp. montana

\section*{Key 22 -- section Ovales}

A section of ca. 85 species, largely North American, but also occurring in Central and South America and Eurasia. References: Mastrogiuseppe, Rothrock, Dibble, \& Reznicek in FNA (2002b); Rothrock, Reznicek, \& Ganion (1997).

\section*{Key 24 -- section Mitratae (Praecoces)}

A section of ca. 20 species, of Europe, e. Asia, and Australia. References: Standley in FNA (2002b).
One species in our area
C. caryophyllea

\section*{Key 25 -- section Phyllostachyae}

A section of ca. 10 species, of North America. References: Crins, Naczi, Reznicek, \& Ford in FNA (2002b); Naczi, Reznicek, \& Ford (1998); Ford et al. (1998); Naczi \& Ford (2001); Ford \& Naczi (2001). Key adapted in part from Naczi, Reznicek, \& Ford (1998), Catling, Reznicek, \& Crins (1993), and Naczi \& Ford (2001).

1 Lowest pistillate scales 2.4-4.5 mm wide, much wider than the the perigynia, appressed against and essentially concealing them; staminate flowers 2-4 per spike; [northern species, south to PA] [C. backii]
1 Lowest pistillate scales \(1.2-2.5(-3) \mathrm{mm}\) wide, not more than \(1.5 \times\) as wide as the perigynia, spreading and not concealing them; staminate flowers \(5-25\) per spike.
2 Achenes subglobose, \(1-1.5 \times\) as long as wide; staminate scales more or less truncate.
3 Tallest culm 3.2-9.1 cm high, 15-32\% of plant height; terminal spike with 4-8 perigynia; wider leaves with hyaline margins 0.05-0.2 mm wide; hyaline margins of distal pistillate scales \(0.05-0.3 \mathrm{~mm}\) wide; perigynium beak \(30-38 \%\) (\(43 \%\) ) of perigynium length; [of calcareous glades in w. VA and north and west of our area] ....... C. juniperorum
3 Tallest culm 9.0-41 cm high, 39-86\% of plant height; terminal spike with 1-4 perigynia; wider leaves with green margins; hyaline margins of distal pistillate scales \(0.3-0.7 \mathrm{~mm}\) wide; perigynium beak \(34-53 \%\) of perigynium length; [of rich forests or rocky calcareous glades and woodlands].
4 Longest (per plant) staminate portion of terminal spike (4.9-) 5.8-13.5 mm long; proximalmost staminate scale in terminal spike 1.1-1.8 (-2.1) mm long, 13-26 (-35)\% of length of staminate portion of terminal spike; perigynium beaks (1.9-) 2.3-3.9 mm long, 39-53\% of perigynium length; shoot bases lacking red-purple; [of rich mesic forests widespread in our area, especially VA] \(\qquad\) C. jamesii

4 Longest (per plant) staminate portion of terminal spike 3.4-5.6 (-6.2) mm long; proximalmost staminate scale in terminal spike (1.9-) 2.1-3.3 mm long, (35-) 44-77\% of length of staminate portion of terminal spike; perigynium beaks 1.4-2.3 (-2.5) mm long, 34-44\% of perigynium length; shoot bases tinged with reddish-purple; [of c. TN and c. KY and westwards]
[C. timida]
2 Achenes ellipsoid, 1.5-2.0× as long as wide; staminate scales obtuse to acute.
5 Tallest culm 0.18-0.38x as tall as plant; perigynia (7.0-) \(7.5-10.8 \mathrm{~mm}\) long; perigynium beaks (3.6-) 4.1-6.4 mm long; culms erect; peduncles usually erect to spreading
C. superata

5 Tallest culm 0.41-0.87× as tall as plant; perigynia 4.5-8.0 mm long; perigynium beaks 1.7-4.3 mm long; culms erect to spreading; peduncles usually widely spreading to nodding.
6 Longest staminate portion of terminal spikes 12.7-25.6 mm long; perigynia 5.8-8.0 mm long; perigynium beaks 2.5-4.3 mm long; achenes (2.4-) 2.6-3.4 mm long
C. basiantha

6 Longest staminate portion of terminal spikes 4.9-5.7 (-6.5) mm long; perigynia 4.5-5.7 (-6.5) mm long; perigynium beaks \(1.7-2.6(-2.8) \mathrm{mm}\) long; achenes \(1.8-2.6 \mathrm{~mm}\) long
C. willdenowii

\section*{Key 26 -- section Acrocystis (Montanae)}

A section of ca. 35 species, subcosmopolitan in temperate and boreal regions. References: Crins \& Rettig in FNA (2002b); Rettig (1988); Cusick (1992); Rettig \& Crins (1996). Key based in part on Rettig (1988), C, and M.

NOTE TO USERS: This key does not accomodate two to four new species in our area; they are under study, and will likely be added in the near future. Most will key towards C. deflexa.

1 Spikes borne above the middle of the culm, but also with some of the pistillate spikes borne on short or elongate peduncles from the base of the culm.
2 Terminal staminate spike \(2-5 \mathrm{~mm}\) long, closely associated with one or more pistillate spikes, the lowest of these subtended by a foliaceous bract mostly surpassing the staminate spike
2 Terminal staminate spike \(5-15 \mathrm{~mm}\) long, alone or associated with a pistillate spike, the subtending bract not surpassing the staminate spike.
3 Perigynia subcoriaceous, 3.5-4.5 mm long, the body glabrous or very sparsely short-pubescent; leaf blades thick, stiff, deep green, spreading at maturity, 2-4.5 mm wide; plants loosely cespitose with short-ascending stolons; achenes brownish at maturity, shining, pitted C. tonsa

3 Perigynia membranaceous, 2.5-4.25 mm long, the body short-pubescent; leaf blades thinnish, not stiff, light green, erect or ascending at maturity, \(1.5-3 \mathrm{~mm}\) wide; plants densely cespitose; achenes, brownish-black or black, at
maturity, either minutely pitted or obscurely and irregularly pitted.
4 Perigynia (3.0-) 3.2-4.2 mm long, \(1.2-1.5 \mathrm{~mm}\) wide, the beak 1.2-1.6 (-2.0) mm long, from about a half to nearly as long as the body; achenes oblong-obovoid, the outer covering dull grayish-black, appearing minutely roughened, the achenes at maturity black, very obscurely and irregularly pitted ........... C. rugosperma
4 Perigynia 2.2-2.9 (-3.2) mm long, 1-1.3 mm wide, the beak \(0.4-0.9 \mathrm{~mm}\) long, less than half the length of the body; achenes orbicular-obovoid, the outer covering pitted, the achenes at complete maturity brownish-black, very closely and minutely pitted
C. umbellata

1 Spikes all borne close together above the middle of the culm, the terminal one staminate, the lateral ones pistillate (rarely a few spikes borne near the base).
5 Body of the perigynium (excluding the beak and the contracted base) subglobose or spherical, about as wide as long. 6 Plants cespitose; leaves \(1.8-4.7 \mathrm{~mm}\) wide.

7 Perigynium tooth (0.1-) 0.2-0.5 mm long; pistillate scales \(3.4-4.8 \mathrm{~mm}\) long, (1.4-) \(1.6-1.8 \mathrm{~mm}\) wide, conspicuously exceeding the perigynia; plants densely cespitose, the culms erect, arching at the tips; [of nw. SC, sw. NC, and adjacent GA] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. communis var. amplisquama
7 Perigynium tooth 0.1-0.2 (-0.3) mm long; pistillate scales 2.5-4.1 mm long, (1.2-) 1.4-1.6 (-2.0) mm wide, about as long as the perigynia; plants loosely cespitose, the culms prostrate; [widely distributed]
C. communis var. communis

6 Plants with long rhizomes, forming clonal patches; leaves \(1.0-3.0 \mathrm{~mm}\) wide.
8 Beak of perigynium (0.2-) 0.6-1.0 (-1.2) mm long; perigynium body 2.2-3.4 mm long, 1.0-1.8 mm wide; culm smooth; [widely distributed in our area] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. pensylvanica
8 Beak of perigynium (1.0-) 1.2-1.6 (-2.6) mm long; perigynium body 3.1-4.6 mm long, 1.0-1.3 (-1.5) mm wide; culm scabrous, at least near the summit; [(in our area) of the Mountains of sw. VA, w. NC, and nw. SC].
9 Beak of the perigynium averaging 1.5 mm long, the orifice oblique; leaves mostly 1.1-1.3 mm wide; perigynium pubescent only on the summit, at the base of the beak; male spikes less than 15 mm long; culms scabrous throughout; leaves more-or-less smooth on the lower surface
C. Iucorum var. austrolucorum

9 Beak of the perigynium averaging 1.3 mm long, the beak split more-or-less equally; leaves mostly 1.5-2.8 mm wide; perigynium pubescent over the body; male spikes more than 15 mm long; culms scabrous only near the summit; leaves scabrous on the lower surface
[C. Iucorum var. Iucorum]
5 Body of the perigynium (excluding the beak and the contracted base) ellipsoid to obovoid, distinctly longer than wide or thick, often also wider than thick, and slightly trigonous.
10 Plants with long rhizomes, forming clonal patches; [collectively of the Coastal Plain and, less commonly, Piedmont).
11 Achene body (1.4-) 1.5-1.7 (-2.0) mm long, biconvex, trigonous, or both; fertile culms 7-17 cm tall, usually much shorter than the leaves; basal sheaths usually very fibrillose; pistillate scales (2.7-) 3.0-3.7 (-4.2) mm long

11 Achene body (1.1-) 1.2-1.3 (-1.4) mm long, trigonous; fertile culms 20-43 cm tall, equalling or exceeding the leaves; basal sheaths usually not fibrillose; pistillate scales (2.3-) 2.6-3.0 (-3.4) mm long . . . C. physorhyncha 10 Plants cespitose; [collectively widespread in our area].

12 Achene body (1.3-) 1.4-1.6 (-1.7) mm long; fertile culms mostly 10-20 cm tall; pistillate scales (2.9-) 3.1-3.4 mm long
C. nigromarginata

12 Achene body (0.9-) 1.2-1.3 (-1.5) mm long; fertile culms mostly 17-35 cm tall; pistillate scales (2.0-) 2.5-3.1 (3.2) mm long.

13 Scales of the median portion of the staminate spike with a weak to moderately prominent midrib usually not extending to the tip, and minute teeth rarely present on the midrib (visible at \(15 \times\) or greater); perigynium teeth mostly \(0.2-0.3 \mathrm{~mm}\) long; staminate spike \(8.4-11.1 \mathrm{~mm}\) long; culms erect to ascending, equalling or exceeding the leaves, the inflorescence typically conspicuous; pistillate scales with green midrib, hyaline margins, and usually reddish-tinged; [mostly of loamy or clayey soils of the Piedmont and Mountains] .
C. albicans

13 Scales of the median portion of the staminate spike either with a strong, prominent midrib extending to the tip (or even aristate), and with minute teeth usually present on the midrib (visible at \(15 \times\) or greater); perigynium teeth mostly \(0.15-0.25 \mathrm{~mm}\) long; staminate spike \(5.0-8.5 \mathrm{~mm}\) long; culms lax or weakly ascending, often shorter than, curving under, and more-or-less hidden by the leaves; pistillate scales with green midrib, hyaline margins, and only rarely reddish-tinged; [mostly of acid, sandy soils of the Coastal Plain]
C. emmonsii

\section*{Key 28 -- section Clandestinae (Digitatae)}

A section of ca. 20 species, circumboreal. References: Crins in FNA (2002b).
1 Pistillate scales short-awned
C. pedunculata
1 Pistillate scales acute [C. richardsonii]

A section of 5 or more species, s. North America to Central America, s. Europe, sw. Asia, and n. Africa. References: Ball in FNA (2002b); Jones \& Jones (1993). Key adapted from Jones \& Jones (1993).
1 Perigynia densely white-villous apically, glabrous basally; achene body \(2.0-2.7 \mathrm{~mm}\) long, long-stipitate ........ C. dasycarpa
1 Perigynia puberulent throughout; achene body \(3.0-3.3 \mathrm{~mm}\) long, sessile . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. tenax

Key 29b - section Hirtifoliae
A monotypic section, of e. North America. References: Ball in FNA (2002b); Jones \& Jones (1993).

\section*{Key 30 -- section Albae}

A section of 4 species, north temperate. References: Ball in FNA (2002b).
One species in our area
C. eburnea

\section*{Key 31 -- section Paniceae}

A section of 14 species, of temperate parts of North America and Eurasia, and montane Central America and South America. References: Rothrock \& Reznicek in FNA (2002b).

1 Perigynia with a distinct beak, 1.0-2.2 mm long.
2 Basal leaves with well-developed blades; basal sheaths brown; perigynia glabrous; [of moist, usually calcareous habitats of the Coastal Plain]
C. chapmanii

2 Basal leaves reduced to bladeless sheaths; basal sheaths strongly purple; [of dry, acidic habitats of the Mountains]
1 Perigynia beakless, or with an indistinct beak less than 0.5 mm long.
3 Basal sheaths with well-developed blades; basal sheaths brown to strongly purple.
4 Pistillate spike \(5-7 \mathrm{~mm}\) in diameter, with ca. 6 vertical rows of perigynia; perigynia 3.3-4.2 mm long, 2.0-2.5 mm wide; leaves \(3-7 \mathrm{~mm}\) wide, blue green
C. meadii

4 Pistillate spike \(3-4 \mathrm{~mm}\) in diameter, with ca. 2-3 vertical rows of perigynia; perigynia \(2.5-3.5 \mathrm{~mm}\) long, \(1.5-2.0 \mathrm{~mm}\) wide; leaves 2-4.5 mm wide, pale green
C. tetanica

3 Basal sheaths bladeless, or with blades to 3 cm long; basal sheaths strongly purple.
5 Culms to 10 dm tall, (2-) 3-5 mm in diameter near base; larger leaves ca. 5 mm wide; plants forming large clumps; [plants of shallow soils on sloping rock outcrops]
C. biltmoreana

5 Culms to 5 dm tall, ca. 1-2 mm in diameter near the base; larger leaves ca. 2-4 mm wide; plants forming small, spaced clumps, interconnected by long-creeping rhizomes; [plants of mountain slopes in more-or-less deep soils]
C. woodii

\section*{Key 32a -- section Laxiflorae}

A section of ca. 16 species, of North america and Central America. References: Bryson \& Naczi in FNA (2002b); Naczi, Kral, \& Bryson (2001). Key based in part on Naczi, Kral, \& Bryson (2001).

1 Perigynium with 1 distinct and 5-6 much less distinct nerves per face, narrowly cuneate basally; perigynium beak short and usually abruptly bent; foliage dark green; bracts surpassing the staminate spike . . . . . . . . . . . . . . . . . . . . . . . C. Ieptonervia
1 Perigynium with 6-many distinct nerves per face (the central one slightly more distinct); perigynium beak various; foliage various; bracts various.
2 Perigynium with a short, bent beak, usually abruptly bent to one side.
3 Spikes loosely flowered, most perigynia not overlapping.
4 Bracts very broad, \(8-20 \mathrm{~mm}\) wide; basal leaves very wide, up to 40 mm wide; plant glaucescent; basal sheaths purple or brown
C. albursina

4 Bracts narrow, 2.5-6 mm wide; basal leaves narrow, 3-8 mm wide; plant green; basal sheaths purple, often weathering to brown
C. ormostachya

3 Spikes densely flowered, the perigynia overlapping.
5 Basal sheaths brown; uppermost bract overtopping the staminate spike; staminate spike sessile or short-stalked
C. blanda

5 Basal sheaths purple when fresh, weathering to brown; uppermost bract rarely overtopping the staminate spike; staminate spike usually long-stalked
C. gracilescens

2 Perigynium tapering to a straight or slightly curved beak (or a long, curved beak in C. radfordii) (note: some beaks may curve in pressing).
6 Perigynium beaks long (to 1.5 mm long) and excurved; basal sheaths green, white, and brownish striped; [endemic to the escarpment gorge area near the SC-NC-GA tricorner] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. radfordii
6 Perigynium beaks straight or slightly curved; basal sheaths either purple, wine-red, or brownish, not prominently green-and-white striped; [collectively widespread in our area].
7 Basal sheaths purple or wine-red (may weather to brown in C. gracilescens).
8 Spikes densely flowered, the perigynia overlapping . . . . . . . . . . . . . . . . . . . . . . . . . . . C. gracilescens 8 Spikes loosely flowered, the spikelets not overlapping.

9 Mature leaf blades of sterile shoots 4-5 (-6) mm wide, green; culms green, chalky red at base (best seen in fresh material); pistillate spikes (3-) 5-7 (-8) flowered; staminate spike on a peduncle 0-1 cm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. manhartii
9 Mature leaf blades of sterile shoots (6-) 7-10 mm wide, glaucous; culms glaucous, bright red at base (best seen in fresh material); pistillate spikes (4-) 7-11 (-15) flowered; staminate spike on a peduncle 2-3 (-6) cm long \(\qquad\) C. purpurifera

7 Basal sheaths brown, not purple or wine-red.
10 Mature perigynia obovoid.
11 Spikes overlapping, densely flowered; staminate spike more-or-less obscured; plant green
c.........

11 Spikes scattered, loosely flowered; staminate spike prominently exserted; plant usually glaucescent
......................
12 Spikes overlapping, the staminate more-or-less obscured and overtopped by the uppermost bract .
C. crebriflora

12 Spikes scattered, the staminate prominent and exceeding the uppermost bract.
13 Spikes densely flowered; perigynium beaks curved; lowest spike exserted on a long, arching, peduncle ................................................................. C. styloflex
13 Spikes loosely flowered; perigynium beaks straight; lowest spike on a short, erect or ascending, peduncle
C. striatula
\{add C. kraliana, C. chapmanii\}

\section*{Key 32b -- section Careyanae}

A section of 8 species, of tempearte e. North America. References: Bryson \& Naczi in FNA (2002b).
1 Basal sheaths purplish, sometimes mixed with brown.
2 Widest leaf blade 3-6 mm wide; peduncles of lateral spikes usually drooping . . . . . . . . . . . . . . . C. austrocaroliniana
2 Widest leaf blade \(10-25 \mathrm{~mm}\) wide; peduncles of lateral spikes usually erect or spreading.
3 Bracts of middle and basal portions of culms with blades 2.1-9.2 cm long; perigynia 5.0-6.6 mm long; longest (per plant) lateral spike with 4-9 perigynia . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. careyan
3 Bracts of middle and basal portions of culms bladeless, or with blades 0.1-1.9 cm long; perigynia 3.7-4.9 mm long; longest (per plant) lateral spike with 9-13 perigynia . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. plantaginea 1 Basal sheaths brownish, lacking any purple coloration.

4 Widest leaf blade 11-25 mm wide; leaf blades of vegetative shoots \(3.8-9.0 \times\) as wide as bract leaves; bract blades from middle and basal portions of the culms 2.0-6.2 cm long; foliage glaucous . . . . . . . . . . . . . . . . . . . . . . . C. platyphylla
4 Widest leaf blade \(2-14 \mathrm{~mm}\) wide; leaf blades of vegetative shoots \(1.0-3.5 \times\) as wide as bract leaves; bract blades from middle and basal portions of the culms 4.5-24 cm long; foliage green or glaucous.
5 Basalmost scale of each lateral spike sterile (lacking a perigynium) or subtending a staminate flower.
6 Foliage usually bright green; longest (per plant) terminal spike 0.6-2.0 (-2.3) cm long; widest leaf blade 5.3-8.3 mm wide C. laxiculmis var. copulata

6 Foliage usually glaucous; longest (per plant) terminal spike (1.0-) 1.2-2.5 cm long; widest leaf blade 6.4-11.8 mm wide C. laxiculmis var. laxiculmis

5 Basalmost scale of each lateral spike subtending a perigynium.
7 Terminal spikes 0.6-1.4 (-1.6) mm wide; staminate scales obtuse, those from the the middle region of the staminate spike 2.6-3.6 (-3.8) mm long; vegetative shoots much taller than the culms, the tallest vegetative shoot (1.4-) 1.7-3.7 (-4.9) \(\times\) as tall as the tallest culm.
8 Perigynia spirally imbricate; longer lateral spikes with (6-) 8-13 perigynia; peduncles of proximal spikes usually erect, the longest (per plant) peduncle (7.0-) 15-42 (-49) mm long; bract blade of distalmost lateral spike 5.6-17 (-26) \(\times\) as long as wide; loosely or densely cespitose; [primarily of the Coastal Plain in our area, though extending rarely into the Piedmont and Mountains]
8 Perigynia distichously imbricate; longer lateral spikes with 4-8 (-9) perigynia; peduncles of proximal spikes usually drooping or nodding, the longest (per plant) peduncle (28-) 44-84 (-91) mm long; bract blade of distalmost lateral spike (12-) \(17-51 \times\) as long as wide; densely cespitose; [primarily of the Mountains and Piedmont]
C. cumberlandensis

7 Terminal spikes (1.0-) 1.2-2.7 mm wide; staminate scales acute, those from the the middle region of the staminate spike \(3.6-5.5 \mathrm{~mm}\) long; vegetative shoots shorter than or slightly taller than the culms, the tallest vegetative shoot 0.5-1.3 (-1.8) \(\times\) as tall as the tallest culm.
9 Terminal spike usually surpassing the bract blade of the distalmost lateral spike; longest (per plant) peduncle of terminal spike (6.3-) 8.1-15.9 cm long; widest leaf blade 2.0-2.9 (-3.5) mm wide; each perigynium face \(7-10\)-nerved . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. digitalis var. macropoda
9 Terminal spike usually surpassed by the bract blade of the distalmost lateral spike; longest (per plant) peduncle of terminal spike 0.9-7.2 (-11.4) cm long; widest leaf blade 2.7-4.5 (-5.3) mm wide; each perigynium face (8-) 11-15-nerved.
10 Perigynia 2.5-3.3 mm long, the apex barely excurved . . . . . . . . . . . . . . . . C. digitalis var. digitalis 10 Perigynia 3.2-4.2 mm long, the apex noticeably excurved . . . . . . . . . . . C. digitalis var. floridana

Key 33 -- section Granulares
A section of ca. 6 species, of tempearte North America south through Mexico to Central America. References: Cochrane \& Naczi in FNA (2002b).
1 Staminate peduncle elongate, overtopping the uppermost pistillate spike
C. crawei
1 Staminate peduncle none, or shorter than the uppermost pistillate spike
C. granularis
\{add C. gholsonii, C. microdonta\}

\section*{Key 34a -- section Oligocarpae}

\section*{References: Naczi (1989).}

1 Leaf-sheaths hispidulous; perigynia broadest well above the middle; basal sheaths brownish.
2 Leaves glaucescent, usually papillate abaxially; pistillate scale margins entire; perigynia 3.7-5.1 mm long, 1.5-1.8 mm wide; [of the Cumberland Plateau of n. AL] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [C. brysonii]
2 Leaves deep green, abaxially smooth or sparsely scabrous on midrib; pistillate scale margins denticulate; perigynia 4.56.2 mm long, 1.9-2.3 mm wide; [of ne. United States, south in our area to w. NC and w. VA] ......... C. hitchcockiana

1 Leaf-sheaths glabrous; perigynia broadest near the middle; basal sheaths purple, greenish-white, or light tan.
3 Basal sheaths greenish-white or light tan; old leaf bases persistent as brownish fibrils; perigynium beak obscure, essentially absent C. impressinervia

3 Basal sheaths purple; old leaf bases not persistent as fibrils; perigynium beak absent to well-developed, 0-1.0 mm long.
4 Perigynia 1.6-2.6× as long as wide; widest leaf 1.8-4.0 mm wide; achene beak 0.05-0.3 (-0.5) mm long; longest pistillate spikes with 4-8 (-10) perigynia
. C. oligocarpa
4 Perigynia (2.4-) 2.5-3.3x as long as wide; widest leaf (3.0-) 3.5-6.5 mm wide; achene beak (0.3-) 0.4-0.7 mm long; longest pistillate spikes with (5-) 7-14 perigynia . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. planispicata
\{add C. acidicola, C. thornei\}

\section*{Key 34 -- section Griseae (Oligocarpae)}

A section of ca. 21 species, of North America (including Mexico). References: Naczi \& Bryson in FNA (2002b); Naczi, Bryson, \& Cochrane (2002); Naczi (1989, 1993, 1997). Key based on Naczi (1997), in part.

1 Perigynia tapering toward the base, obtusely trigonous in cross-section, usually pubescent proximally, the apex constricted to a distinct beak (nearly beakless in C. planispicata), the perigynia closely enveloping the achene at maturity.
2 Leaf-sheaths hispidulous; perigynia broadest well above the middle; basal sheaths brownish.
3 Leaves glaucescent, usually papillate abaxially; pistillate scale margins entire; perigynia 3.7-5.1 mm long, 1.5-1.8 mm wide; [of the Cumberland Plateau of n . AL] .
[C. brysonii]
3 Leaves deep green, abaxially smooth or sparsely scabrous on midrib; pistillate scale margins denticulate; perigynia 4.5-6.2 mm long, 1.9-2.3 mm wide; [of ne. United States, south in our area to w. NC and w. VA] . . C. hitchcockiana

2 Leaf-sheaths glabrous; perigynia broadest near the middle; basal sheaths purple, greenish-white, or light tan.
4 Basal sheaths greenish-white or light tan; old leaf bases persistent as brownish fibrils; perigynium beak obscure, essentially absent. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. impressinervia
4 Basal sheaths purple; old leaf bases not persistent as fibrils; perigynium beak absent to well-developed, 0-1.0 mm long.
5 Perigynia 1.6-2.6× as long as wide; widest leaf 1.8-4.0 mm wide; achene beak 0.05-0.3 (-0.5) mm long; longest pistillate spikes with 4-8 (-10) perigynia
5 Perigynia (2.4-) 2.5-3.3x as long as wide; widest leaf (3.0-) 3.5-6.5 mm wide; achene beak (0.3-) 0.4-0.7 mm long; longest pistillate spikes with (5-) \(7-14\) perigynia . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. planispicata
1 Perigynia convex-rounded basally, more-or-less terete in cross-section, glabrous, the apex tapered but not constricted,
beakless or the beak obscure, the perigynia loosely enveloping the achene at maturity.
6 Widest leaf (5.1-) 6.2-11.1 (-13.5) mm wide; foliage glaucous; pistillate scales awnless or short-awned, the awns 0-0.9 (1.9) mm long.

7 Perigynia (4.0-) 4.2-5.5 (-6.0) mm long, (2.0-) 2.1-2.7× as long as the achene bodies, spreading to ascending; achene stipes (0.2-) 0.3-0.5 (-0.6) mm long; pistillate spikes (5.0-) 5.9-8.0 (-9.6) mm wide; achene beaks vertical to slightly bent, usually bent \(0-30^{\circ}\) from the vertical
C. flaccosperma
\(7 \quad\) Perigynia 3.2-4.5 (-4.7) mm long, 1.6-2.0× as long as the achene bodies, usually ascending; achene stipes 0.05-0.3 (-0.5) mm long; pistillate spikes (3.3-) 4.2-6.1 (-7.3) mm wide; achene beaks slightly bent to recurved, usually bent \(30-90^{\circ}\) from the vertical.
8 Perigynia 3.2-4.0 (-4.1) mm long, (1.5-) 1.8-2.3 (-2.5)× as long as wide; longest pistillate spike with (14-) 19-45 (-65) flowers, densely flowered, with the ratio [mm of spike length/number of flowers] \(=(0.56-)\) 0.67-1.1 (1.3); longest peduncle of staminate spike 0.5-15 (-31) mm long
C. glaucodea 8 Perigynia (3.7-) 3.9-4.5 (-4.7) mm long, (1.9-) 2.1-2.6 (-2.8)× as long as wide; longest pistillate spike with 11-25 \((-28)\) flowers, rather loosely flowered, with the ratio [mm of spike length/number of flowers] = (0.97-) 1.0-1.3 (1.6); longest peduncle of staminate spike (1.5-) 7.5-37 (-62) mm long . . . . . . . . . . . . . . . . . . . . . . . C. pigr

6 Widest leaf 2.0-6.8 (-9.1) mm wide; foliage green; pistillate scales relatively long-awned, the awns (0.2-) 1.1-8.3 (-13.7) mm long.
9 Axis of inflorescence and pistillate spike peduncles scabrous; perigynia 2.5-4 mm long . . . . . . . . . . . C. conoidea
9 Axis of inflorescence and pistillate spike peduncles smooth; perigynia 3-6 mm long.
10 Plants densely to loosely cespitose; culm purple-red coloration extending (3.5-) 4.0-7.3 cm up from the base; widest leaves 2.4-4.0 (-5.3) mm wide; achene stipe 0.6-0.8 (-0.9) mm long . . . . . . . . . . . . . . . . . . . C. godfreyi
10 Plants densely cespitose; culm purple-red coloration extending 0-3.6 (-3.9) cm up from the base; widest leaves 3.3-6.8 (-9.1) mm wide; achene stipe ( \(0.2-\) ) 0.3-0.6 mm long.

11 Perigynia 1.5-1.9 (-2.2) mm wide, (2.2-) 2.5-3.1× as long as wide . . . . . . . . . . . . . . . . . . . . . C. amphibola 11 Perigynia (1.7-) 1.8-2.6 mm wide, 1.8-2.4 (-2.6) \(\times\) as long as wide. 12 Widest leaves 3.3-5.6 (-8.0) mm wide; achene stipe (0.3-) 0.4-0.6 mm long . . . . . . . . C. corrugata 12 Widest leaves (4.8-) 5.0-6.8 (-9.1) mm wide; achene stipe (0.2-) 0.3-0.4 (0.5) mm long . . . C. grisea
\{add C. ouachitana\}

\section*{Key 35 -- section Hymenochlaenae ("Gracillimae")}

A section of 50-60 species, semicosmopolitan. References: Waterway in FNA (2002b).
1 Lowest pistillate bract auriculate but not sheathing; terminal spike normally staminate (rarely with a few perigynia terminally); leaf blades \(1-2 \mathrm{~mm}\) wide; basal sheaths purplish or red; [of cliffs and rock outcrops at moderate to high elevations in the Mountains]
C. misera

1 Lowest pistillate bract sheathing (the sheath short in C. prasina); terminal spike normally gynecandrous, rarely merely staminate (often merely staminate in C. prasina); leaf blades \(1.5-7 \mathrm{~mm}\) wide; basal sheaths purplish or red (brownish or greenish in C. prasina); [of various habitats, only rarely as above].
2 Perigynia strongly trigonous, the lateral ribs at the angles, broadest below the middle; basal sheaths brownish or greenish; leaf sheaths glabrous on the hyaline ventral portion
C. prasina

2 Perigynia terete to obscurely trigonous, the lateral ribs not at the angles, broadest near the middle; basal sheaths purplish or red; leaf sheaths pubescent on the hyaline ventral portion (glabrous in C. gracillima).
3 Perigynia densely white-hirsute; achenes brown with dark red spots . . . . . . . . . . . . . . . . . . . . . . . . C. roanensis 3 Perigynia glabrous; achenes without dark red spots.

4 Leaf sheaths glabrous on the hyaline ventral portion; larger leaves 3-9 mm wide ............. C. gracillima
4 Leaf sheaths pubescent on the hyaline ventral portion; larger leaves \(1.5-6 \mathrm{~mm}\) wide.
5 Perigynia 2.5-3.0 mm long, 0.9-1.2 mm wide; perigynium beaks absent or very short, the orifice entire; leaf blades1.5-2.5 mm wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. aestivalis
5 Perigynia 3.0-4.6 mm long, \(1.4-2.0 \mathrm{~mm}\) wide; perigynium beaks very short to short, the orifice bidentate; leaf blades 2-6 mm wide.
6 Perigynia 3.0-4.0 mm long, \(1.5-1.75 \mathrm{~mm}\) wide; leaves \(2-4 \mathrm{~mm}\) wide . . . . . . . . . . C. aestivaliform is
6 Perigynia 3.5-6 mm long, 1.75-2.0 mm wide; leaves \(3-8 \mathrm{~mm}\) wide.
7 Upper pistillate scales awned; perigynia 4.5-6 mm long; leaves \(4-8 \mathrm{~mm}\) wide
C. davisii

7 Upper pistillate scales acuminate; perigynia \(3.5-4.6 \mathrm{~mm}\) long; leaves \(3-5 \mathrm{~mm}\) wide C. oxylepis

\section*{Key 36 -- section Hymenochlaenae ("Sylvaticae")}

1 Achene sessile in the base of the perigynium; perigynia 3.2-6 mm long; sterile shoots with leaves \(5-10 \mathrm{~mm}\) wide; [either alien and rarely naturalized in our area, or native and rare].
2 Perigynia 3.2-4.8 mm long, abruptly narrowed to a short stipe; [native, of northern hardwoods forests in the Mountains of NC and VA]
C. arctata

2 Perigynia 5-6 mm long, sessile; [alien, rarely naturalized in our area] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. sylvatica

1 Achene on a stipe \(0.5-1.5 \mathrm{~mm}\) long; perigynia (4.5-) 5.6-8.0 (-10) mm long; sterile shoots with leaves 2-8 mm wide; [native, collectively common and widespread in our area].
3 Internodes between the perigynia mostly \(1.0-1.5 \mathrm{~mm}\); sheaths of the pistillate bracts puberulent at the mouth.

3 Internodes between the perigynia mostly 2.0-4.0 (-6.0) mm ; sheaths of the pistillate bracts glabrous at the mouth.
5 Perigynia puberulent, (5-) avg. \(7(-9) \mathrm{mm}\) long; pistillate scales usually with the midrib excurrent as a short awn C. allegheniensis

5 Perigynia glabrous, (4.5-) avg. 5.6-7 (-10) mm long; pistillate scales usually with the midrib terminating below the apex, not excurrent.
\(6 \quad\) Perigynia (6-) \(7.0(-10) \mathrm{mm}\) long, broadest below the middle, tapering with straight or slightly convex sides to a conspicuous beak with a hyaline tip; [of swamps, bogs, and other moist to wet habitats, nearly throughout our area]
C. debilis

6 Perigynia (4.5-) \(5.6(-7) \mathrm{mm}\) long, broadest near the middle, tapering with concave sides to a short beak lacking a hyaline tip; [of dry to moist upland forests and openings in the Mountains] . . . . . . . . . . . . . . . . C. flexuosa
\{C. castanea\}

\section*{Key 38 -- section Hymenochlaenae ("Longirostres")}

1 Perigynia several-nerved, the beak much shorter than the body; basal sheath not conspicuously fibrous .... C. cherokeensis
1 Perigynia 2-ribbed (otherwise nearly nerveless), the beak about as long as the body; basal sheath conspicuously fibrous
[C. sprengelii]

\section*{Key 39a -- section Spirostachyae (Extensae)}

A section of ca. 15 species, of Eurasia. References: Crins \& Reznicek in FNA (2002b).

Key 39b - section Ceratocystis
A section of 7 species, in temperate North America, Eurasia, and Australia. References: Crins in FNA (2002b).
1 Pistillate scales coppery brown; terminal (staminate) spike 6-24 mm long; pistillate spikes 2-5 per culm; culms 1-8 dm tall; [of calcareous seepages in the Mountains of VA and northwards]
C. flava

1 Pistillate scales yellowish green; terminal (staminate) spike (9-) 17-39 mm long; pistillate spikes 1-2 (-3) per culm; culms \(5-12.5\) dm tall; [of calcareous savannas of the Coastal Plain of NC]
C. Iutea

\section*{Key 40 -- section Porocystis (Virescentes)}

A section of 10 species, of temperate North America, Central America, and South America. References: Ball in FNA (2002b).
1 Terminal spike staminate (rarely gynecandrous, with fewer than \(25 \%\) of the flowers pistillate)............... . C. pallescens
1 Terminal spike gynecandrous (and with more than \(30 \%\) of the flowers pistillate).
2 Perigynia densely pubescent; larger lateral spikes 2-4 mm wide; ligules longer than wide.

2 Perigynia glabrous, minutely papillose, or with few scattered hairs; larger lateral spikes (3.5-) 4-8 mm wide; ligules as wide as long.
4 Perigynia pubescent, minutely papillose, 2.5-4.0 mm long; pistillate scales attenuate, at least some with awns 0.5-2.0 mm long
C. bushii

4 Perigynia glabrous or sparsely pilose, non-papillose, \(2.0-3.5 \mathrm{~mm}\) long; pistillate scales awnless, or awn to 0.5 ( -1.0 ) mm long.
5 Mature perigynia terete, subterete, or subtriangular in cross-section, spreading at greater than 45 degrees from the rachis . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. caroliniana
5 Mature perigynia triangular in cross-section, appressed-ascending at less than 45 degrees from the rachis.
6 Leaf blades glabrous or nearly so, especially on the lower surface; sheaths glabrous to sparsely pubescent, sometimes densely pubescent at the summit; [primarily of the Coastal Plain and Piedmont] .. C. complanata

6 Leaf blades soft-pubescent; sheaths soft-pubescent; [primarily of the Mountains and Piedmont]

\section*{Key 41 -- section "Hirtae"}

\section*{Key 43 -- section Shortianae}

A monotypic section, of e. North America. References: Cochrane in FNA (2002b).
\(\qquad\)

Key 45 -- section Limosae ("Scitae")
A section of 6 species, in cool temperate parts of North America, Eurasia, and South America. References: Ball in FNA (2002b).
One species in our area
C. barrattii

\section*{Key 44 -- section Glaucescentes (Pendulinae)}

A section of 3 species, of se. North America. References: Standley in FNA (2002b).
1 Awn of the pistillate scale tapering gradually into the scale; perigynium 2-ribbed, and also distinctly and evenly nerved between the ribs; [of swamps and marshes]
C. joorii

1 Awn of the pistillate scale emerging from a retuse notch in the apex of the scale; perigynium 2-ribbed, obscurely nerved between the ribs; [generally of acid seepages, pocosins, and blackwater situations, often associated with Pinus serotina].
2 Lowest pistillate spike drooping, on a peduncle 1-4 cm long; perigynia reddish-glaucous, lacking nerves; achenes slightly longer than wide
C. glaucescens

2 Lowest pistillate spike erect, sessile or with a peduncle up to 1 cm long; perigynia white-glaucous, rather distinctly 6-8 nerved; achenes as wide as long
C. verrucosa

\section*{Key 47 -- section Racemosae (Atratae)}

A section of ca. 60 species, of North America nd Eurasia. References: Murray in FNA (2002b).
\(\qquad\)

\section*{Key 48/49 -- section Phacocystis (Cryptocarpae and Acutae)}

A section of 70-90 species, cosmopolitan. References: Standley, Cayouette, \& Bruederle in FNA (2002b); Standley (1983);
Bruederle \& Fairbrothers (1986); Bruederle, Fairbrothers, \& Hanks (1989). Key based in part on C.
1 Lowest spike erect or ascending.
2 Lower sheaths scabrous, reddish-brown, the sheath fronts (ventral faces) with prominent veins forming a persistent network; lower sheaths usually bladeless . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. stricta
2 Lower sheaths glabrous, the sheath fronts (ventral faces) not forming a persistent network; lower sheaths usually with leaf blades.
3 Perigynia evidently nerved on both faces
C. emoryi 3 Perigynia not nerved, or very faintly nerved.

4 Longest bracts overtopping the spikes; perigynia flattened, elliptic to obovate; pistillate scales acute to obtuse, generally shorter than the perigynia . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. aquatilis var. substricta
4 Longest bracts shorter than the spikes; perigynia inflated, obovate; pistillate scales acuminate, longer than the perigynia
[C. haydenii]
1 Lowest spike pendent.
5 Pistillate scales awnless, the sides black or deep purple-brown . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. torta
5 Pistillate scales awned, the sides medium brown.
6 Sheath backs glabrous [prickles \(0-1(-5)\) per \(\mathrm{mm}^{2}\) of sheath surface 5 cm from base]; perigynia somewhat inflated, obovoid, rounded above to an abrupt beak; lowest bract of the infructescence 1.7-6.2 dm long.
7 Perigynia strongly obovoid, \(3-4.5 \mathrm{~mm}\) long, \(2-3 \mathrm{~mm}\) wide; achene symmetrical . . . . C. crinita var. brevicrinis 7 Perigynia ellipsoid to slightly obovoid, 2-3 (-3.5) mm long, 1-2 mm wide; achene usually shortened on one side, therefore asymmetrical
C. crinita var. crinita

6 Sheath backs scabrous [prickles (1-) 5-54 per mm \({ }^{2}\) of sheath surface 5 cm from base]; perigynia flattened, elliptic to ovoid, tapering from near or below the middle to a minute beak; lowest bract of the infructescence 0.7-3.5 dm long. 8 Perigynia smooth to slightly papillate towards the apex, the papillae mostly less than \(10 \mu \mathrm{~m}\) long; lower pistillate scales usually acute or acuminate, tapering into the awn; sheaths strongly scabrous; [mainly distributed in our area in the Mountains]
C. gynandra

8 Perigynia densely granular-papillate throughout, the papillae mostly more than \(13 \mu \mathrm{~m}\) long; lower pistillate scales usually truncate or retuse, abruptly awned; sheaths finely scabrous; [mainly distributed in our area in the Coastal Plain and Piedmont]
C. mitchelliana

\section*{Key 50 -- section Collinsiae}

A monotypic section, of e. North America. References: Standley in FNA (2002b).
One species in our range
C. collinsii

\section*{Key 51 -- section Rostrales (Folliculatae)}

1 Pistillate scales usually awned (rarely merely cuspidate); pistillate scales (including the awn, if present) \(0.5-1.2 \times\) as long as the perigynia; larger leaves mostly 6-16 mm wide; pistillate spikes normally not staminate at apex (rarely with a few staminate flowers); [primarily of the Mountains and Piedmont] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. folliculata
1 Pistillate scales acute or long-acuminate (rarely short-awned); pistillate scales (including the awn, if present) \(0.3-0.6 \times\) as long as the perigynia; larger leaves mostly \(4-10 \mathrm{~mm}\) wide; pistillate spikes normally staminate at apex; [primarily of the Coastal Plain]
C. Ionchocarpa
\{C. turgescens, C. michauxiana\}
[Key 52 -- section Pseudocypereae] -- see Key 55

\section*{Key 53 -- section Paludosae and section Carex (in part)}

\section*{References: Reznicek \& Catling in FNA (2002b); Reznicek (1993).}

1 Culm leaves 1.5-3.3 mm wide; culms 8-30 cm tall (and often appearing even shorter because of being partly buried in sand); perigynium walls corky; [introduced, in coastal sands].
C. pumila (of section Paludosae)

1 Culm leaves 4-15 mm wide; culms 30-150 cm tall; perigynium walls not corky-expanded; [native, in swamps, marshes, wet meadows].
2 Perigynia pubescent . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. trichocarpa (of section Carex)
2 Perigynia glabrous
3 Teeth of the perigynium beak 1.5-3 mm long; [of the Mountains of VA] . . . . . . . . C. atherodes (of section Carex)
3 Teeth of the perigynium beak \(0.4-1.0 \mathrm{~mm}\) long; [mainly of the Coastal Plain]
4 Stems phyllopodic, central, surrounded by old leaf bases; lower sheaths green or slightly pink; ligules about as long as wide; [of the Coastal Plain of NC, SC, and VA] . . . . . . . . . . . C. hyalinolepis (of section Paludosae)
4 Stems aphyllopodic, lateral, not surrounded by old leaf bases; lower sheaths strongly purple; ligules much longer than wide; [of the Coastal Plain and Mountains of VA] . . . . . . . . . C. lacustris (of section Paludosae)

\section*{Key 54 -- section Squarrosae}

A section of 4 species, of e. and c. North America and temperate South America. References: Ford in FNA (2002b). Key based on FNA.

1 Terminal spike usually entirely staminate; pistillate scales with an awn equaling or surpassing the perigynium; achenes 1.2-2.1 mm long.
2 Pistillate scales 0.4-0.9 (-1.1) mm wide, the body wide and translucent; staminate scales 0.9-1.6 mm wide, tightly imbricate in the spike; plants colonial, long-rhizomatous . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. aureolensis
2 Pistillate scales 0.1-0.4 mm wide, the body narrow and indistinct; staminate scales 0.3-0.8 mm wide, irreegularly imbricate with spreading tips; plant cespitose, short-rhizomatous . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. frankii
1 Terminal spike gynecandrous, mainly pistillate; pistillate scales awnless, or with a short awn not surpassing the perigynium; achenes \(2.0-3.0 \mathrm{~mm}\) long.
3 Achene 1.9-2.5× as long as wide; style persistent, strongly kinked at the base; spikes 1-2 (-3) per stem ... C. squarrosa
3 Achene 1.2-1.9x as long as wide; style deciduous, straight or slightly curved; spikes (1-) 2-4 (-6) per stem ... C. typhina

Key 55 -- section Vesicariae [including 52-Pseudocypereae]
A section of ca. 45 species, semicosmopolitan. References: Reznicek \& Ford in FNA (2002b). Key adapted from Reznicek \& Ford in FNA (2002b).

1 Pistillate scales with a prominent, scabrous awn (the body of the scale often ciliate as well).
2 Plants extensively colonial from elongate, creeping rhizomes; staminate scales acute to acuminate, essentialy smoothmargined except at the very tip; perigynia \(7-11\)-nerved . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. schweinitzin
2 Plants densely to loosely cespitose, the rhizomes connecting individual culms in a clump no more than ca. 10 cm long; staminate scales (at least some of them) witha distinct, scabrous awn; perigynia 6-25-nerved.
3 Perigynia 6-12-nerved, the nerves separate nearly to the beak apex; perigynium bodies broadly ellipsoid to more or less globose, (1.8-) 2.0-4.2 mm wide; achenes rough-papillate.
4 Spikes 9-14 (-15) mm thick; widest leaves 2.4-4.0 (-5) mm wide; spikes usually 2.5-3.5× as long as wide; perigynia 4.8-6.6 (-7.6) mm long, the beaks usually \(0.7-1.3 \times\) as long as the body . . . . . . . . . . . . . . . C. baileyi
4 Spikes (12-) 15-22 mm thick; widest leaves (4.0-) 4.5-13 mm wide; spikes usually less than \(2.5 \times\) as long as wide if less than 15 mm thick; perigynia (6-) \(6.5(-10.8) \mathrm{mm}\) long, the beaks \(0.6-0.9 \times\) as long as the body ..... C. Iurida

3 Perigynia 12-25-nerved, the nerves (except for 2 prominent laterals) confluent at or below the middle of the beak; perigynium bodies ellipsoid to lance-ovoid, 1.1-2.2 mm wide; achenes smooth.
5 Mature perigynia reflexed; perigynia obscurely trigonous; pistillate spikes 4-7 cm long, 12-18 mm in diameter; teeth of the perigynium beak \(1.2-2.3 \mathrm{~mm}\) long, divergent C. comosa

5 Mature perigynia spreading or ascending; perigynia round in cross-section; pistillate spikes 1.5-4 (-5) cm long, \(10-15 \mathrm{~mm}\) in diameter; teeth of the perigynium beak \(0.3-0.9 \mathrm{~mm}\) long, straight

6 Leaves flat, U-, V-, or W-shaped in cross-section, the widest 1.5-12 (-15) mm wide; stems round to trigonous, often scabrous-angled; [collectively widespread].
7 Achenes asymmetrical, deeply indented or invaginated on one face; widest perigynia (4.0-) 4.5-7 mm wide; beaks 2.4-4.8 mm long, smooth
[C. tuckermanii]

7 Achenes symmetrical; widest perigynia (2-) 2.5-3.5 (-4.5) mm wide; beaks 1-4.2 (-4.8) mm long, scabrous or smooth. 8 Perigynium beaks finely scabrous (at least near the tip and on the teeth), 2.4-4.2 (-4.8) mm long; widest leaves 1.8-4.3 (-5) November \(5,2004 \mathrm{~mm}\) wide
C. bullata

8 Perigynium beaks smooth, 1-4.5 mm long; widest leaves \(1.5-15 \mathrm{~mm}\) wide.
9 Pistillate spikes globose or short ovoid, ca. 3-20-flowered; [plants of the Coastal Plain from e. NC southwards]
9 Pistillate spikes cylindric, ca. 20-150-flowered; [plants collectively of the Mountains, from nw. NC northwards].
10 Bract of lowest pistillate spike (excepting isolated spikes from long-sheathing bracts on the lower part of the stem) (2.5-) 3-9× as long as the inflorescence; staminate spike often 1 , slightly (if at all) elevated above the summit of the crowded pistillate spikes; perigynia reflexed . . . . . . . [C. retrorsa]
10 Bract of lowest pistillate spike (excepting isolated spikes from long-sheathing bracts on the lower part of the stem) \(0.5-2.5 \times\) as long as the inflorescence; staminate spikes 2-4 ( -5 ), well elevated above the summit of the crowded pistillate spikes; perigynia spreading or ascending.
11 Plant colonial from long-creeping rhizomes; widest leaves (4.5-) 5-12 (-15) mm wide; ligules about as long as wide; basal sheaths usually spongy-thickened and only slightly or not red-
tinged . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. utriculata
11 Plant cespitose; widest leaves \(1.8-6.5 \mathrm{~mm}\) wide; ligules longer than wide; basal sheath not spongy-thickened and often tinged with reddish-purple . . . . . . . . . C. vesicaria var. vesicaria

\section*{Key 56 -- section Lupulinae}

A section of 6 species, of e. North America. References: Reznicek \& Ball (1974); Reznicek in FNA (2002b); Uttal (1971). Key adapted in part from Reznicek \& Ball (1974) and Reznicek in FNA (2002b).

1 Sheath of uppermost leaf absent or <1.5 (-2.5) cm long; beak of perigynia 1.5-4.2 mm long; achenes with elliptic or obovate sides.
2 Perigynia rhombic-ovoid, cuneate to the base, 8-35 per spike, radiating in all directions and therefore forming a globular spike .
C. grayi

2 Perigynia lanceoloid to ovoid, convex to the base, 1-12 (-20) per spike, ascending to spreading (the lowest sometimes slightly reflexed) and therefore forming an ovoid to obovoid spike.
3 Perigynia 3-5 mm wide at the widest point; achenes broadest above the middle, with a pronounced shoulder rounding abruptly to the tip; style of mature achene with a half to full coil in its lower portion; [of high elevations in our area, generally in spruce-fir or northern hardwoods forests]
C. intumescens var. fernaldii

3 Perigynia \(5-8 \mathrm{~mm}\) wide at the widest point; achenes broadest at the middle, smoothly rounded to the tip; style of mature achene straight or arcuate; [widespread in our area] . . . . . . . . . . . . . C. intumescens var. intumescens
1 Sheath of uppermost leaf usually \(>1.7 \mathrm{~cm}\) long; beak of perigynia 4.5-10 mm long; achenes with rhombic or nearly triangular sides.
4 Achenes distinctly wider than long, widest above the middle; perigynia stiffly spreading at right angles to the rachis . . . .

\section*{C. gigantea}

4 Achenes as wide as long or longer, widest near the middle; perigynia ascending.
5 Angles of the achenes pointed, often even knobbed, with nipple-like points; achenes (2.2-) 2.4-3.4 mm wide, often nearly as wide as long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. Iupuliformis
5 Angles of the achenes smoothly curved, not pointed or knobbed; achenes 1.7-2.6 (-2.8) mm wide, distinctly longer than wide.
6 Staminate peduncle (3-) 6-18 cm long, usually exceeding the uppermost spike by 2-12 cm; plants loosely colonial by long slender rhizomes ........................................................... C. Iouisianica
6 Staminate peduncle \(0.5-6(-7) \mathrm{cm}\) long, shorter than to exceeding the uppermost pistillate spike by \(<2 \mathrm{~cm}\); plants solitary or loosely cespitose in small clumps connected by stout, short rhizomes . . . . . . . . . C. Iupulina

\section*{Key 57 - section Rhynchocystis}

A section of 5 species, of Europe, w. Asia, and Europe. References: Reznicek in FNA (2002b).
One species in our area
C. pendula
[some species accounts still skeletal at this time]
Carex abscondita Mackenzie. Cp (GA, NC, SC, VA), Pd, Mt (GA, NC, SC): rich bottomlands and other forests; common. April-June. MA south to n. FL, west to LA, north in the interior to w. VA, s. IN, and s. AR. See C. magnifolia for discussion of the two taxa. Naczi (1999b) reports a chromosome number of \(n=24\). [= C, F, G, M, S, W; C. abscondita -- RAB, FNA, K, in part only (also see C. magnifolia); C. abscondita var. rostellata Fernald -- F]

Carex aestivaliformis Mackenzie. Mt (GA, VA): wet meadows (VA), upland submesic forests (GA); rare (GA Special

Concern). Considered by some to be a hybrid, but with little known documentation or evidence for or against its alleged hybrid status; further study is needed. [= C, G, M; C. ×aestivaliformis -- F, FNA, K]

Carex aestivalis M.A. Curtis ex A. Gray, Summer Sedge. Mt (GA), \{NC, SC, VA\}. [= RAB, C, F, FNA, G, K, M, S, W]
Carex aggregata Mackenzie. (NC, VA). Other useful characters include: culms relatively smooth; pistillate scales sharppointed, the tip reaching to about the base of the perynium; and perigynia nerveless. [=F,FNA, K, M; C. sparganioides Muhlenberg ex Willdenow var. aggregata (Mackenzie) Gleason -- C, G]

Carex alata Torrey. Cp (GA, VA), Pd (VA), \{NC, SC\}: May-June. [= RAB, C, F, FNA, G, GW, K, W]
Carex albicans Willdenow ex Sprengel. Mt, Pd, Cp (NC, SC, VA), \{GA\}: dry woodlands and forests; common. April-May. ME west to IL, and OK, south to DE, NC, SC, n. GA (Jones \& Coile 1988), TN, and MO. [C. artitecta Mackenzie -- RAB, F, M, W; C. albicans var. albicans -- C, FNA, K; C. artitecta var. subtilirostris F.J. Hermann -- F; C. nigro-marginata Schweinitz var. muhlenbergii (A. Gray) Gleason -- G; C. varia Muhlenberg ex Willdenow -- S, in part]

Carex albolutescens Schweinitz. Cp, Pd, Mt (GA, VA), \{NC, SC\}: [= C, F, FNA, K; C. albolutescens -- G, GW, in part only (also see C. longii); C. straminea misapplied]

Carex albursina Sheldon, White Bear Sedge. Mt (GA, NC, SC, VA), Pd (VA): nutrient-rich cove forests, over mafic or calcareous rocks; rare (GA Special Concern, NC Watch List). April-June. VT and s. Québec west to MN, south to SC (P. McMillan pers. comm. 2003, specimen at CLEMS), nw. GA, and AR. Naczi (1999b) reports a chromosome number of \(n=22\). \([=R A B, C, F\), FNA, K, M, S, W; C. laxiflora var. latifolia Boott -- G]

Carex allegheniensis Mackenzie. Mt (GA, NC, SC, VA), Pd, Cp (NC, SC, VA): swamps, bogs, other moist to wet habitats, boggy pools in floodplains; uncommon. May-June. PA south to n. GA, mostly in the Appalachian Mountains. [= M, S; C. debilis Michaux var. pubera A. Gray -- RAB, C, F, G, K; C. debilis var. rudgei L.H. Bailey - FNA, in part; C. debilis var. intercursa Fernald -F, K; C. debilis -- GW, W, in part]

Carex amphibola Steudel. \{GA, NC, SC, VA\}. \{distribution and abundance needing additional herbarium investigation\} MayJune. [= RAB, FNA, G, M, S; C. amphibola var. amphibola -- F, K; C. amphibola var. rigida (Bailey) Fernald -- F, K; C. amphibola -GW, in part only]

Carex annectens (Bicknell) Bicknell var. annectens. [= F, G; C. annectens -- RAB, FNA, K, M, S, W, infraspecific taxa not distinguished; C. vulpinoidea var. ambigua -- C , in part; C. vulpinoidea -- GW, in part]

Carex annectens (Bicknell) Bicknell var. xanthocarpa (Kükenthal) Wiegand. See Cusick (1996). [= F, G; C. annectens -RAB, FNA, K, M, S, W, infraspecific taxa not distinguished; C. vulpinoidea var. ambigua -- C, in part; C. vulpinoidea -- GW, in part; C. brachyglossa Mackenzie -- M]

Carex appalachica J. Webber \& P.W. Ball, Appalachian Sedge. Mt (GA, NC, SC, VA): dry to mesic forests, rock outcrops; uncommon (GA Special Concern). First reported for South Carolina by Hill \& Horn (1997). [= C, FNA, K; C. rosea -- RAB, G, W, in part; C. radiata -- F, M, S, misapplied]

Carex aquatilis Wahlenberg, Aquatic Sedge. Mt (VA): mountaintop pond, with Dulichium arundinaceum, Vaccinium macrocarpon, Juncus canadensis, and Utricularia sp.; rare (VA Rare). Newfoundland west to ND, south to NJ, s. PA, OH, IN, IA, and NE; disjunct in w. VA (Augusta County). First reported for VA by Wieboldt et al. (1998). [= G; Carex aquatilis Wahlenberg var. substricta Kükenthal -- C, FNA; C. aquatilis var. altior (Rydberg) Fernald -- F; C. aquatilis -- G, infraspecific taxa not distinguished; C. aquatilis var. aquatilis -- K; C. substricta (Kükenthal) Mackenzie -- M]

Carex arctata W. Boott, Black Sedge, Drooping Woodland Sedge. Mt (NC, VA): northern hardwood and spruce forests, bog edges; rare (VA Rare). Newfoundland west to MN, south to PA, w. VA, nw. NC, and OH. First reported for our area (in Highland County, VA) by Fleming \& Ludwig (1996). [= C, F, FNA, G, K, M]
* Carex arenaria Linnaeus, Sand Sedge. Cp (NC, VA): moist to dry sandy hammocks; rare, probably introduced from Europe. May-June. Fernald (1950) considers this plant native in se. VA, and populations of it in Carolina Beach State Park, New Hanover County, NC, certainly appear native. In North America, known from MD south to se. NC; also on ballast in OR (Mackenzie 19311935). [= RAB, C, F, FNA, G, K, M]

Carex argyrantha Tuckerman, Silvery-flowered Sedge, Hay Sedge. Mt (NC, VA), Pd? (VA?): wet meadows or dry soils; common (NC Rare). in e. TN (Unicoi County). June-August. [= RAB, C, F, G, K, W; C. aenea, misapplied]

Carex atherodes Sprengel, Awned Sedge. Mt (VA): marl fens; rare (VA Rare). Circumboreal, south in North America to NY, n. VA, WV, MO, CO, UT, and OR. [= C, F, FNA, G, K, M]

Carex atlantica Bailey. Cp, Pd, Mt (GA, NC, SC, VA): bogs and seepages; uncommon. May-June. Nova Scotia west to MI and nw. IN, south to n . FL and e. TX. Reznicek \& Ball (1980) found the distinction of C. incomperta from C. atlantica to be untenable. Intermediates between C. atlantica and C. howei (often treated as C. atlantica ssp. capillacea) occur in portions of their ranges, especially in the southern Coastal Plain. In most other areas they are sharply distinct, and sometimes grow together (as in the mountains of our area and further north) with no evidence of intergradation or hybridization. I prefer to treat them at the species level. [= GW; > C. atlantica - RAB, F, G, M, S, W, in a narrower sense; = C. atlantica var. atlantica -- C; > C. incomperta Bicknell -RAB, F, G, M, S, W; = C. atlantica ssp. atlantica -- FNA, K]

Carex aureolensis Steudel. \{separate from frankii\} \{Pd, Mt, Cp (NC, SC, VA): bottomland forests; common. May-July.\} VA, KY, IL, and NE south to FL, TX, and NM. [= FNA; < C. frankii -- RAB, C, F, G, GW, K, M, S, W, in part]
* Carex austrina Mackenzie. Pd (NC), Cp (VA): roadsides, apparently introduced with hay used for erosion control; rare, introduced from sc. United States. May. First reported for our area by Bryson et al. (1996). [= F, FNA, K, M; C. muhlenbergii var. australis Olney -- C, G; C. muhlenbergii -- S, in part; C. muhlenbergii var. austrina Small]

Carex austrocaroliniana Bailey, South Carolina Sedge. Mt (GA, NC, SC): nutrient-rich, moist coves in the sw. mountains of NC and adjacent SC, often with some seepage; uncommon (SC Rare). April-May. Endemic to the southern end of the Southern Appalachians, in Blue Ridge of sw. NC, ne. SC, n. GA, and e. TN, extending west to the Cumberland Plateau of TN. Naczi (1999b) reports a chromosome number of \(n=28-30\). [= FNA, K, W; C. austro-caroliniana -- RAB, M, S, an orthographic variant]

Carex baileyi Britton, Bailey's Sedge. Mt (NC, VA): bogs; uncommon (NC Watch List). June-July. NH south to KY, NC, and TN, primarily Appalachian. [= RAB, C, F, FNA, G, K, M, S; C. lurida Wahlenberg var. gracilis (Boott) Bailey]

Carex baltzellii Chapman, Baltzell's Sedge. Cp (GA): steepheads, beech-magnolia slopes, and mesic to dry-mesic hammocks; rare (GA Endangered). Sw. GA west to Panhandle FL. [= FNA, K, M, S]

Carex barrattii Schweinitz \& Torrey, Barratt's Sedge. Cp (NC, VA), Mt (GA, NC, SC, VA): peaty bogs and marshes; rare (NC Endangered, VA Rare). April-May. CT south to NC (at least formerly), on the Coastal Plain, and disjunct inland in places with many Coastal Plain affinities, as in w. VA (Augusta County), sw. NC (Henderson County, where now extirpated), nw. SC, sc. TN (Coffee County), n. GA, and n. AL. This species flowers and fruits rarely. Reported for South Carolina by Hill \& Horn (1997) and Horn (1999). [= C, F, FNA, G, K, S, W]

Carex basiantha Steudel, Southern Willdenow's Sedge. Cp (NC, SC): mesic forests, bottomlands, and lower slopes, over calcareous or mafic rocks; rare. Se. NC south to \(n\). FL, west to e. TX, and north to nw. GA, c. TN, and c. AR. [= FNA, K; C. willdenowii Schkuhr ex Willdenow -- RAB, in part; C. willdenovii -- S, in part (see also C. superata and C. willdenowii) and orthographic variant; C. willdenowii var. pauciflora Olney ex L.H. Bailey in J.M. Coulter; C. willdenowii Schkuhr ex Willdenow var. megarrhyncha Hermann, misapplied]

Carex bicknellii Britton. Pd (SC): prairie-like openings and barrens over gabbro; rare. ME west to Saskatchewan, south to DE, OH, MO, OK, and NM; disjunct in nc. SC. First reported for South Carolina by Hill \& Horn (1997). [= FNA; = C. bicknellii var. bicknellii - K; < C. bicknellii -- C, F, G, M, in part (also see C. opaca)]

Carex biltmoreana Mackenzie, Biltmore Sedge. Mt (GA, NC, SC): in thin soils on medium to high elevation granitic domes and other sloping rock outcrops, often dominant in thin-soil herbaceous mats, but also occurring in adjacent woodlands under open to nearly closed canopy of Quercus spp., Fraxinus americana, Carya glabra, and Juniperus virginiana var. virginiana; rare (GA Threatened, NC Rare, SC Rare). May-June. Endemic to sw. NC, nw. SC, and ne. GA (Rabun and Towns counties). This distinctive endemic sedge may be recognized by its robust size (culms to a meter tall, to 5 mm in diameter at the base), habit (large clumps on sloping rock outcrops), and restricted habitat (in periodic seepage on exfoliation domes). Once considered very rare, \(C\). biltmoreana proves to be limited to a narrow range and distinctive habitat, but regularly present and even locally dominant on the \(50-\) 100 granitic domes within 100 km of Brevard, NC. It often occurs with other endemic species, such as Houstonia longifolia var. glabra, Krigia montana, Pycnanthemum montanum, and Packera millefolia. An excellent illustration appears in Massey et al. (1983). [= RAB, FNA, K, M, S, W]

Carex blanda Dewey. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): cove forests, bottomlands, and other mesic, nutrient-rich forests; common. April-June. ME and s. Québec west to ND, south to c. GA (Jones \& Coile 1988), panhandle FL, and TX. Naczi (1999b) reports chromosome numbers of \(n=15-18\). [= RAB, C, F, FNA, K, M, S, W; = C. laxiflora var. blanda (Dewey) Boott -- G]

Carex brevior (Dewey) Mackenzie ex Lunell. Mt, Pd? (VA): dry forests and margins; uncommon. May-June. c. TN. [= F, FNA, G, K, W; < C. festucacea -- RAB, GW, in part; < C. brevior -- C, in part only (see also C. molesta and C. molestiformis); < C. festucacea Schkuhr ex Willdenow var. brevior (Dewey) Fernald]

Carex bromoides Willdenow ssp. bromoides, Common Brome Sedge. Cp (GA, NC, SC, VA), Mt, Pd (NC, SC, VA): swamp forests, bogs, seeps, other wetlands; uncommon. May-July. Ssp. bromoides ranges from New Brunswick west to e. MN, south to \(n\). FL and e. TX, and disjunct in Mexico. Naczi (1999b) reports a chromosome number of \(n=32-34\). [= FNA, K; < C. bromoides -RAB, C, F, G, GW, M, S, W, in part, infraspecific taxa not distinguished]

Carex bromoides Willdenow ssp. montana Naczi, Blue Ridge Brome Sedge. Mt (NC, SC, VA): mountain bogs in the Blue Ridge, seepages in the Blue Ridge Escarpment; rare (NC Watch List). June-July. Ssp. montana is known only from sw. VA, w. NC, and nw. SC. This newly named taxon needs further study in order to better understand its habitats and distribution. Naczi (1999b) provided additional evidence for its recognition, in the form of different chromosome numbers ( \(\mathrm{n}=30-31\) for ssp. montana and \(\mathrm{n}=32\) 34 for ssp. bromoides). [= FNA, K; < C. bromoides -- RAB, C, F, G, GW, M, S, W, in part, infraspecific taxa not distinguished]

Carex brunnescens (Persoon) Poiret var. sphaerostachya (Tuckerman) Kükenthal, Brown Sedge. Mt (GA, NC, SC, VA): grassy balds, bogs, moist forests at moderate to high elevations; common (GA Special Concern, VA Watch List). June-July. The species is circumboreal, in North America ranging south to NJ, OH, MI, and MN, south to w. NC, nw. SC, e. TN, and n. GA. Var. sphaerostachya is apparently the only infraspecific taxon (of four) to reach our area. See Gaddy (1981) for the report of this species in SC. [= F; <C.brunnescens -- C, G, RAB, M, S, W, infraspecific taxa not distinguished; = C. brunnescens ssp. sphaerostachya (Tuckerman) Kalela -- FNA, K]

Carex bullata Schkuhr ex Willdenow. Cp (GA, NC, SC, VA), Mt (GA, NC, VA), Pd (NC): bogs; uncommon. May-June. Nova Scotia south to GA, primarily on the Coastal Plain, but with scattered occurrences inland (as in AR and the Eastern Highland Rim of sc. TN). [= RAB, C, F, FNA, G, GW, K, M, S; > C. bullata var. bullata - G; > C. bullata var. greenii (Böckler) Fernald -- G]

Carex bushii Mackenzie. Pd (GA, NC, VA), Mt (NC, VA): meadows; uncommon (VA Watch List). May-June. MA and s. NY west to MO and KS, south to NC, GA (Jones \& Coile 1988), MS, and TX; disjunct in MI. [= RAB, C, F, FNA, G, K, M, S, W; C. caroliniana Schweinitz var. cuspidata (Dewey) Shinners]

Carex buxbaumii Wahlenberg, Brown Bog Sedge, Buxbaum's Sedge. Mt (GA, NC, SC, VA), Cp (VA), Pd (VA): bogs, fens, and seepages (especially over calcareous or mafic rocks); rare (GA Special Concern, NC Rare, VA Rare). June-July. Circumboreal, in North America ranging from Newfoundland west to s. and w. AK, south to se. VA, w. NC, nw. SC, n. GA (Jones \& Coile 1988), c. TN, KY, n. AR, CO, UT, and CA. Reported for South Carolina by Hill \& Horn (1997) and Hill (1999). [= RAB, C, F, FNA, G, K, M, S, W]

Carex calcifugens Naczi. Cp (GA, NC, SC): rich bluff forests, less typically evergreen maritime forests; rare. Se. NC south to FL. See Naczi, Bryson, \& Cochrane (2002). [= FNA]

Carex canescens Linnaeus var. canescens, Silvery Sedge. Mt (VA): \{habitat\}; rare. Var. canescens.... [= F, G; C. canescens -- C, M, infraspecific taxa not distinguished; C. canescens ssp. canescens -- FNA, K]

Carex canescens Linnaeus var. disjuncta Fernald, Silvery Sedge. Cp (NC, SC, VA), Mt (VA): bogs, swamps, often in disturbed areas; rare (NC Rare, VA Watch List). June. Var. disjuncta ranges from Newfoundland west to MN, south to VA, NC, SC, OH , and IN. [= RAB, F, G; C. canescens -- C, M, infraspecific taxa not distinguished; C. canescens ssp. disjuncta (Fernald) Toivonen -- FNA, K]

Carex careyana Torrey ex Dewey, Carey's Sedge. Mt (GA, NC, VA), Pd (VA): nutrient-rich moist forests, mostly over
calcareous rocks; rare (GA Special Concern, NC Rare, VA Watch List). May-June. NY west to MI and IA, south to sw. NC, AL and MO. Naczi (1999b) reports a chromosome number of \(n=34\). [= C, F, FNA, G, K, M, W]

Carex caroliniana Schweinitz, Carolina Sedge. Cp, Pd, Mt (GA, NC, SC, VA): forests; common. May-June. NJ, PA, MO, and OK south to SC, e. GA, and TX; apparently disjunct in Panhandle FL and adjacent sw. GA. [= RAB, C, F, FNA, G, GW, K, M, S, W]
* \{Carex caryophyllea Latourette, Spring Sedge. Cp? (VA?): disturbed areas; rare, introduced from Eurasia. This species may not actually be known to occur in our area; it has been reported as naturalized south to DC and is likely to be in VA. [= C, F, FNA, G, K, M]\}

Carex cephalophora Muhlenberg ex Willdenow. Cp, Pd, Mt (GA), \{NC, SC, VA\} [=F,FNA, K, M, S; C. cephalophora -- RAB, W, in part only (also see C. mesochorea); C. cephalophora var. cephalophora -- C, G]

Carex chapmanii Steudel, Chapman's Sedge. Cp (GA, NC, SC, VA?): edges of calcareous pine savannas, calcareous slopes and bottomlands; rare (US Species of Concern, NC Rare, SC Rare). April-May. Se. NC south to FL, on the Coastal Plain; allegedly disjunct in nc. TN (Chester et al. 1993). The affinities of this species are questionable; it is usually placed in section Paniceae, but may actually belong to Laxiflorae. [= RAB, FNA, K, S; C. chapmannii -- M, orthographic variant; C. styloflexa Buckley var. fusiformis (Chapman ex Dewey) Wiegand]

Carex cherokeensis Schweinitz, Cherokee Sedge. Cp (GA, NC, SC), Pd (GA, SC), Mt (GA, NC, SC, VA*?): moist, rich, calcareous forests; rare (NC Rare). May-June. Se. NC, nw. SC, sw. NC, nc. TN, se. MO, and OK, south to Panhandle FL and west to e. TX and se. OK; disjunct in the Mountains of VA, where perhaps introduced (Belden et al. 2004). This species is much more common in the sc. United States. [= RAB, FNA, G, K, M, W]

Carex collinsii Nuttall, Collins's Sedge. Cp (GA, NC, SC, VA), Mt (NC): Chamaecyparis bogs and pocosins in the Coastal Plain, bogs in the southwest mountains of NC (where associated with other Coastal Plain disjuncts); uncommon (GA Special Concern, NC Watch List, SC Rare, VA Watch List). June-July. RI to wc. GA on the Coastal Plain, disjunct in the mountains of nw. NJ, PA, sw. NC, and possibly TN (Chester et al. 1993). C. collinsii is a very distinctive species; the slender perigynia teeth are reflexed 180 degrees (thus appressed back against the perigynium). [= RAB, C, F, FNA, G, K, M, S, W; C. collinsiae -- GW, orthographic error]

Carex communis Bailey var. amplisquama (F.J. Hermann) J. Rettig. Mt (GA, NC, SC): dry, open woodlands; rare (NC Rare, SC Rare). July-August. Endemic to n. GA, nw. SC, and sw. NC (Rabun, Towns, White, Union, Lumpkin, Fannin, Murray, and Gilmer counties, GA, Oconee and Greenville counties, SC, and Polk County, NC) (Rettig 1988, Hill \& Horn 1997, Gaddy, pers. comm.). Following Rettig's (1988) determination that C. amplisquama is better treated as a variety of Communis, the combination was made by Rettig \& Crins (1996). The two taxa differ in achene micromorphology, flavonoid chemistry, and minor morphological characters (Rettig 1988). [= FNA, K; = C. amplisquama F.J. Hermann -- W]

Carex communis Bailey var. communis. Mt (GA, NC, SC, VA), Pd (GA): dry woodlands and forests; common. May-June. Prince Edward Island west to MN, south to n. SC, c. GA (Jones \& Coile 1988), and AR. [= FNA, K; = C. communis -- RAB, C, F, G, \(M, S, W\), in the narrow sense]

Carex comosa Boott, Bottlebrush Sedge, Bristly Sedge. Cp (GA, NC, SC, VA), Pd (NC, VA), Mt (GA, VA): swamps, marshes; common. April-June. Québec west to MN, south to FL and LA; also in w. North America. [= RAB, C, F, FNA, G, GW, K, M, S, W]

Carex complanata Torrey \& Hooker. Cp, Pd (GA, NC, SC, VA), Mt (GA): forests; common. May-June. NJ and s. PA south to FL, west to TX and MO; apparently disjunct in AZ. [= F, FNA, K, M, S; = C. complanata var. complanata -- C, G; < C. complanata -RAB, GW, W, in part only (also see C. hirsutella)]

Carex conjuncta Boott, Soft Fox Sedge. Cp, Pd, Mt (VA): mesic forests; rare (VA Rare). May-July. NY, NJ, MN, and SD, south to VA, sc. TN, and AR. [= C, F, FNA, G, K, M, W]

Carex conoidea Schkuhr ex Willdenow, Field Sedge. Mt (NC, VA): seepage and fen over mafic rocks (amphibolite); rare (NC Threatened, VA Rare). May-June. Newfoundland west to MN, south to nw. NC (Ashe Co.) and MO. [= RAB, C, F, FNA, G, K, M, S]

Carex corrugata Fernald. Cp (NC, SC, VA), \{GA\}: wet calcareous forests (NC Rare). \{distribution and abundance needing additional herbarium investigation\} May-June. Se. VA and KY south to TN and AL. See Hill (1992). [= F, FNA, K; < C. grisea -RAB, G, M, S, in part; < C. amphibola -- GW, in part; C. amphibola Steudel var. turgida Fernald]

Carex crawei Dewey, Crawe's Sedge. Mt (VA): dry calcareous barrens; rare (VA Rare). Québec west to British Columbia, south to NJ, w. VA, c. TN, AL, and AR. First reported for VA by Ludwig (1999). Naczi (1999b) reports a chromosome number of \(n=\) 30. [= C, F, FNA, G, K, M, S]

Carex crebriflora Wiegand. Mt, Pd, Cp (GA, NC, SC, VA): bottomland and other nutrient-rich forests: uncommon. AprilJune. VA south to FL, west to TX. [= RAB, C, F, FNA, G, K, M, S, W]

Carex crinita Lamarck var. brevicrinis Fernald. Cp, Pd (NC, SC, VA), \{GA\}: swamps, wet forests; common (VA Watch List). May-June. MA south to FL, west to TX, north in the interior to KY and MO. [= C, F, FNA, K; < C. crinita Lamarck var. crinita -- RAB, G, GW, in part; < C. crinita -- M, S, infraspecific taxa not distinguished; < C. crinita -- W, in part only (also see C. gynandra and C. mitchelliana), and infraspecific taxa not distinguished]

Carex crinita Lamarck var. crinita. Pd, Cp (NC, SC, VA), Mt (NC), \{GA\}: swamps, wet forests, bogs; common (rare in Mountains) May-June. Newfoundland west to MN and Alberta, south to GA, TN, and AR. [= C, F, FNA, K; < C. crinita Lamarck var. crinita -- RAB, G, GW, in a broader sense; < C. crinita -- M, S, infraspecific taxa not distinguished; < C. crinita -- W, in part only (also see C. gynandra and C. mitchelliana), and infraspecific taxa not distinguished]

Carex cristatella Britton, Crested Sedge. Mt (NC, VA), Pd (VA): grassy balds, bogs, wet meadows; rare (NC Rare, VA Rare). May-June. See Fox, Godfrey, \& Blomquist (1952) for the first report from NC. [= RAB, C, F, FNA, G, K, W]

Carex crus-corvi Shuttleworth ex Kunze, Crowfoot Sedge, Ravenfoot Sedge. Cp (GA, NC, SC, VA): swamp forests, especially over calcareous substrates; rare (VA Rare). May-June. Se. VA south to FL, west to TX, north in the interior to IN, s. Ontario, MI, and MN. [= RAB, C, F, FNA, G, GW, K, M, S; > C. crus-corvi var. crus-corvi-F; > C. bayardii Fernald -- F; > C. cruscorvi var. virginiana Fernald]

Carex cumberlandensis Naczi, Kral, \& Bryson, Cumberland Sedge. Mt, Pd (NC, SC, VA), \{GA\}: rich, mesic, deciduous or
mixed forests; common. May; June. Sw. PA, s. OH, s. IL south to c. NC, c. SC, c. GA, sc. AL, e. MS, and w. TN; disjunct in nw. AR. [= FNA; included in the concept of \(C\). abscondita by earlier authors]

Carex dasycarpa Muhlenberg, Velvet Sedge. Cp (GA, SC): maritime forests, other sandy forests; rare (GA Rare). May-June. E. SC south to FL, west to MS. Gaddy \& Rayner (1980) report this species from a number of barrier islands in Beaufort and Charleston counties, SC. [= RAB, FNA, K, M, S]

Carex davisii Schweinitz \& Torrey (section Gracillimae), Davis's Sedge. Pd (VA): rich forests; rare. VT, Ontario, and MN south to VA (Fairfax County) (Steury 2004), e. WV, nc. TN (Chester et al. 1993), AR, and TX. First reported for VA by Steury (2004). [ = C, F, FNA, G, K, M]

Carex debilis Michaux. Cp, Pd (GA, NC, SC, VA), Mt (NC, SC, VA): swamps, bogs, other moist to wet habitats; common. May-August. MA west to s. IN, south to FL and TX. For other taxa often treated as varieties of C. debilis, see C. allegheniensis and C. flexuosa. [= M, S; C. debilis var. debilis -- RAB, C, F, FNA, G, K; C. debilis -- GW, W, in part (see also C. allegheniensis and C. flexuosa)]

Carex decomposita Muhlenberg, Cypress-knee Sedge, Epiphytic Sedge. Cp (GA, NC, SC, VA), Pd (VA): blackwater swamp forests, often growing on cypress knees, cypress bases, or fallen logs (often at or near water level); rare (GA Special Concern, NC Rare, VA Rare). NY west to MI, south to sw. GA (Jones \& Coile 1988), FL, and TX. See Gaddy \& Rayner (1980). [= RAB, C, F, FNA, G, GW, K, M, S]

Carex deflexa Hornemann. Mt (NC): seepage at high elevations; rare (NC Rare). Greenland west to AK, south to MA, n. NY, n. MI, and n. MN; apparently disjunct in the high mountains of w. NC. [= C, F, G, K, M; C. deflexa var. deflexa - FNA]

Carex digitalis Willdenow var. digitalis. Infraspecific taxa need separating: \{Mt, Pd, Cp (GA, NC, SC, VA): rich forests; common.\} April-June. ME west to WI, south to FL and e. TX. Naczi (1999b) reports a chromosome number of \(n=24\). [= F, FNA, K; C. digitalis - RAB, C, F, G, M, S, W, infraspecific taxa not distinguished]

Carex digitalis Willdenow var. floridana (L.H. Bailey) Naczi \& Bryson. Cp (GA, NC, SC, VA): rich forests; common. AprilJune. MD south to FL, west to TX. Naczi (1999b) reports a chromosome number of \(\mathrm{n}=24\). [= FNA; C. digitalis var. asymmetrica Fernald -- F, K; C. digitalis - RAB, C, F, G, M, S, W, infraspecific taxa not distinguished]

Carex digitalis Willdenow var. macropoda Fernald. Infraspecific taxa need separating: \{Mt, Pd, Cp (GA, NC, SC, VA): rich forests; common.\} April-June. PA and IL south to FL and TX. Naczi (1999b) reports a chromosome number of \(n=24\). [=F, FNA, K; < C. digitalis - RAB, C, F, G, M, S, W, infraspecific taxa not distinguished]
* Carex divisa Hudson, Divided Sedge. Cp (NC, VA): brackish marshes; rare, introduced from the Old World. May-June. [= RAB, C, F, FNA, G, K]
* Carex divulsa Stokes. Reported for Washington, DC; its occurrence in our area is uncertain. [= C, F; C. divulsa ssp. divulsa -FNA, K; C. virens -- G, M, misapplied]

Carex eburnea Boott, Bristle-leaf Sedge. Mt (GA, NC, SC, VA): calcareous cliffs, bluffs, and outcrops; common, rare south of VA (GA Special Concern, NC Rare). May. Newfoundland west to AK, south to w. VA, w. NC, nw. SC, c. AL, n. AR, NE, s. Alberta, and s . British Columbia; reports from TX are referrable to a new species. Locally abundant on limestone bluffs, easily recognized vegetatively by its wiry stems and leaves (ca. 0.5 mm wide). [ \(=\) RAB, C, F, FNA, G, K, M, S, W]

Carex echinata Murray ssp. echinata, Star Sedge. Mt (NC, VA): bogs; uncommon (NC Watch List). May-June. Ssp. echinata is circumboreal, ranging in North America from Newfoundland west to Saskatchewan, south to DE, PA, IN, IA, and ND, and in the mountains to w. NC and e. TN; also in w. North America from AK (Aleutians) and British Columbia south to CO, UT, and s. CA. Ssp. phyllomanica (Boott) Reznicek occurs along the western coast of North America from s. AK south to n. CA. [= FNA, K; C. muricata Linnaeus var. angustata (Carey) Carey ex Gleason -- RAB, G, misapplied; C. echinata var. echinata -- C; C. muricata var. cephalantha (Bailey) Wiegand \& Eames -- G; C. angustior Mackenzie -- F, M, S; C. cephalantha (Bailey) Bicknell -- F; C. muricata -W, in part]

Carex elliottii Schweinitz \& Torrey, Elliott's Sedge. Cp (GA, NC, SC): bogs; uncommon (NC Watch List). May-June. NC south to c. pen. FL and west to s. AL. [= RAB, FNA, GW, K, M, S]

Carex emmonsii Dewey ex Torrey, Emmons's Sedge. Cp (NC, SC, VA), Pd (GA, NC, SC, VA): dry, sandy woodlands; rare (NC Watch List). April-May. Nova Scotia west to WI, south to PA, NC, SC, and TN. [= RAB, F, W; = C. albicans Willdenow ex Sprengel var. emmonsii (Dewey ex Torrey) J. Rettig -- C, FNA, K; C. nigro-marginata Schweinitz var. minor (Boott) Gleason -- G; C. varia Muhlenberg ex Willdenow -- S, in part; C. albicans -- M, misapplied]

Carex emoryi Dewey in Torrey. Mt (VA): \{habitat\}; rare. May-June. NY and ND south to w. VA, s. IL, n. AR, and TX. [= C, F, FNA, K, M; C. stricta Lamarck var. elongata (Böckeler) Gleason -- G]

Carex exilis Dewey, Coastal Sedge. Cp (NC): peaty seepage bogs; rare (NC Threatened). May-June. Newfoundland and Labrador west to Ontario and n. MN, south to NJ, DE, MD, NY, and n. MI; disjunct southwards in sc. NC, se. MS, and sw. AL. The southern occurrences are remarkably disjunct from the Canadian, northern Coastal Plain, and Great Lakes distribution. [= RAB, C, F, FNA, G, K, M]
* Carex extensa Goodenough, Long-bracted Sedge. Cp (VA): salt marshes, introduced around seaports; rare, introduced from Europe. [= C, F, FNA, G, K, M]

Carex festucacea Schkuhr ex Willdenow, Fescue Sedge. Cp, Pd, Mt (NC, SC, VA), \{GA\}: uncommon (NC Watch LIst). MayJune. [= C, F, FNA, K; <C. festucacea -- RAB, GW, W, in part only; <C. festucacea -- G, in part only (also see C. straminea)] Carex fissa Mackenzie var. aristata Hermann. Cp (GA, SC): wet savannas; rare (GA Special Concern). Extreme se. SC (Jasper Co.), se. GA (Clinch County) (Sorrie 1998b) and s. MS (Bryson et al. 1996) south into n. and c. peninsular FL. The SC distribution is documented by a voucher (Crins 9848 \& D. Brunton) at MICH. Probably a species distinct from C. fissa. [= FNA, GW, K ; < C. fissa -- M, infraspecific taxa not distinguished]

Carex flaccosperma Dewey. Cp, Pd, Mt (GA), \{NC, SC, VA\} \{distribution and abundance needing additional herbarium investigation\} May-June. Se. VA south to FL, west to TX, north in the interior to s. MO. [= FNA, G, K, M, S; < C. flaccosperma -RAB, C, GW, in part only (also see C. glaucodea); C. flaccosperma var. flaccosperma -- F]

Carex flava Linnaeus, Yellow Sedge. Mt (VA): calcareous seeps; rare (VA Rare). June. Circumboreal, ranging south in

North America to NJ, PA, IN, ID, and British Columbia; disjunct in sw. VA (Giles County). First reported for VA by Wieboldt et al. (1998). [= C, K; > C. flava var. flava - F, G; > C. flava var. fertilis Peck -- F; > C. flava var. laxior (Kükenthal) Gleason -- G]

Carex flexuosa Muhlenberg ex Willdenow. Mt (NC, SC, VA): dry to moist upland forests, openings, granitic domes, rock outcrops; common. May-July. Newfoundland west to MN, south to VA and MO, and in the Appalachian Mountains to w. NC and e. TN. [= M, S; = C. debilis var. rudgei Bailey -- RAB, C, F, G, K; < C. debilis var. rudgei L.H. Bailey - FNA, in part; < C. debilis -- GW, W, in part]

Carex floridana Schweinitz, Florida Sedge. Cp (GA, NC, SC, VA), Pd (NC): dry, sandy woodlands; rare (GA Special Concern, NC Watch List, VA Watch List). March-May. E. NC south to FL, west to TX. [= FNA, K, M, S; = C. nigromarginata Schweinitz var. floridana (Schweinitz) Kükenthal -- RAB, F]

Carex folliculata Linnaeus. Mt (GA, NC, SC, VA), Pd, Cp? (NC): bogs, boggy forests, high elevation forests (spruce-fir); uncommon (GA Special Concern). May-July. Newfoundland west to WI, south to NC, e. TN, and sc. TN. [=FNA, K, M, S, W; = C. folliculata var. folliculata -- RAB, C, F, G; < C. folliculata -- GW, in part only (also see C. Ionchocarpa)]

Carex frankii Kunth. \{Pd, Mt, Cp (GA, NC, SC, VA)\}: bottomland forests; common. May-July. \} W. NY and s. Ontario west to MI and se. NE, south to GA, AR, and OK. [= FNA; < C. frankii-RAB, C, F, G, GW, K, M, S, W, in part only (also see C. aureolensis)]

Carex gholsonii Naczi \& Cochrane, Gholson’s Sedge. Cp (GA, NC, SC): moist calcareous forests, especially marl flats and bottomlands over coquina; rare. NC south to FL, west to AL. See Naczi, Bryson, \& Cochrane (2002). [= FNA]

Carex gigantea Rudge, Giant Sedge. Cp (GA, NC, SC, VA), Pd (GA, NC), Mt (GA): swamps, bottomland forests, cypress depressions; common (rare in Piedmont). June. DE south to s. FL, west to e. TX, north in the interior to nw. GA (Jones \& Coile 1988), IN and OK. [= RAB, C, F, FNA, G, GW, K, M, S]

Carex glaucescens Elliott, Blue Sedge, Southern Sedge. Cp (GA, NC, SC, VA), Mt (GA): blackwater swamps, pocosins, wet pine savannas, seepage bogs, other acid and peaty situations; common. July-September. E. MD south to c. peninsular FL, west to e. TX; disjunct in nw. GA (Jones \& Coile 1988) and c. TN. [= RAB, C, F, FNA, G, GW, K, M, S]

Carex glaucodea Tuckerman ex Olney. (NC, VA): \{distribution and abundance needing additional herbarium investigation\} May-June. MA and Ontario west to s. IN and MO, south to NC, sc. TN, and AR. [= FNA, G, K, M, S; C. flaccosperma -- RAB, C, GW, in part; C. flaccosperma Dewey var. glaucodea (Tuckerman ex Olney) Kükenthal -- F]

Carex godfreyi Naczi, Godfrey's Sedge. Cp (GA, NC, SC): calcareous swamps and bottomlands; rare. May-June. Se. NC south to c. peninsular FL and west to Panhandle FL and sw. GA. See Naczi (1993) for additional information. [= FNA, K; included in concept of \(C\). grisea by earlier authors]

Carex gracilescens Steudel. Pd, Mt (NC, SC, VA), Cp (VA), \{GA\}: nutrient-rich forests; rare (SC Rare). May-June. VT and s. Québec west to WI, south to SC, AL, LA, and e. TX. Naczi (1999b) reports a chromosome number of \(n=17,19,20\). [= RAB, F, FNA, K, M, S, W; C. gracilescens -- C, in part only (also see C. ormostachya); C. laxiflora var. gracillima (Boott) Boott ex B.L. Robinson \& Fernald -- G]

Carex gracillima Schweinitz. Mt (GA, NC, SC, VA): [= RAB, C, FNA, G, K, M, W; C. gracillima var. gracillima -- F]
Carex granularis Muhlenberg ex Willdenow. Mt (VA), Cp (GA, NC, SC, VA), Pd (NC, VA): moist, nutrient-rich forests, especially bottomlands, mostly over calcareous rocks (limestone, dolostone, coquina limestone) or mafic rocks (diabase); common, rare south of VA (NC Watch List). May-June. ME and Québec west to Saskatchewan, south to FL, OK, and ne. TX. Here interpreted to include C. haleana Olney. Naczi (1999b) found little correlation between the morphological and cytological variability of \(C\). granularis, and also little correlation of that variability with geography; he concluded that there was little support for recognition of infraspecific taxa. C. haleana Olney [= C. granularis var. haleana (Olney) Porter] is alleged to differ primarily in its more slender perigynia ( \(1.0-1.5 \mathrm{~mm}\) wide vs. \(1.5-2.5 \mathrm{~mm}\) ). See \(F\) and \(M\) for more information; further study is needed. [=RAB, C, FNA, G, GW, K, S, W; > C. granularis var. granularis - F; > C. granularis var. haleana (Olney) Porter -- F; > C. granularis - M, in a narrow sense; > C. haleana Olney -- M]

Carex gravida Bailey var. gravida. Pd (VA): fields; uncommon. [= C, F, G, K; < C. gravida - FNA, in part; = C. gravida -- M, in the narrow sense]
* Carex gravida Bailey var. Iunelliana (Mackenzie) F.J. Hermann. Pd (GA), \{NC, SC, VA\} (VA Watch List). Reported as new to MD (Calvert County) (Steury 1999). [= RAB, C, F, G, K; < C. gravida - FNA, in part; = C. Iunelliana Mackenzie -- M]

Carex grayi Carey. Cp, Pd (NC, SC, VA), Mt (VA): bottomland forests; common (rare in Mountains) (GA Special Concern). May-June. Sw. Québec west to WI and IA, south to GA and OK; apparently disjunct in Panhandle FL. [= RAB, C, FNA, K, W; = C. grayii -- G, GW, M, orthographic variant; > C. grayii var. grayii - F; > C. grayii var. hispidula A. Gray -- F; = C. asa-grayi Bailey -- S]

Carex grisea. (VA). \{distribution and abundance needing additional herbarium investigation\} May-June. [= FNA, K; C. grisea -- RAB, G, M, S, in part only (also see C. corrugata); C. amphibola -- GW, in part; C. amphibola var. turgida]

Carex gynandra Schweinitz. Mt (NC, SC, VA), Pd (NC, VA): mountain bogs, swamp forests, seepages; common. May-June. Newfoundland west to MN, south to WI, n. VA, w. NC, n. GA, e. TN, OH, and WI. This is the most montane and northern element of the C. crinita complex, and the usual one encountered in the Mountains of our area. [=C, FNA, K, M, S; = C. crinita Lamarck var. gynandra (Schweinitz) Schweinitz \& Torrey -- RAB, F, G, GW; < C. crinita -- W, in part]

Carex hirsutella Mackenzie. Mt, Pd, Cp? (NC, SC, VA) \{GA\}: forests; common. May-June. ME, s. Ontario, and IA, south to GA and ne. TX. [= F, FNA, K, M, S; = C. complanata Torrey \& Hooker var. hirsuta (Bailey) Gleason -- C, G; < C. complanata -RAB, GW, W, in part]
* Carex hirta Linnaeus. Cp (VA): dry sandy areas; rare, introduced from Europe. The report of C. hirta for NC (Burk 1961, RAB) is based on a misidentification of C. pumila (Reznicek 1993). [= C, F, FNA, G, K, M]

Carex hirtifolia Mackenzie. Mt (VA): nutrient-rich, though often rather dry, forests and woodlands; uncommon (VA Watch List). May-June. New Brunswick west to MN, south to MD, sw. VA, c. TN, KY, MO, and e. KS. [= C, F, FNA, G, K, M, W]

Carex hitchcockiana Dewey. Mt (NC, VA): rich moist forests, especially over limestone, other calcareous, or mafic rocks; uncommon (NC Rare, VA Watch List). June-July. MA west to MN, south to NC, sc. TN, and AR. [= C, F, FNA, G, K, M, W] Carex horm athodes Fernald. Cp (NC, VA): freshwater and slightly brackish tidal marshes; rare (NC Rare). [=F, FNA, K, M;
= C. straminea Willdenow ex Schkuhr var. invisa W. Boott -- C, G]
Carex howei Mackenzie, Howe's Sedge. Cp (NC, SC), Pd, Mt (NC), \{GA\}: bogs and seepages; uncommon. May-June. Nova Scotia west to MI and nw. IN, south to c. peninsular FL and e. TX, predominantly (but by no means strictly) on the Coastal Plain. See C. atlantica for discussion of the relationship between the two taxa. [= RAB, F, G, GW, M, S, W; = C. atlantica var. capillacea (Bailey) Cronquist -- C; = C. atlantica Bailey ssp. capillacea (Bailey) Reznicek -- FNA, K]

Carex hyalinolepis Steudel. Cp (GA, NC, SC, VA): marshes, swamp forests; uncommon (NC Watch List). May-June. NJ south to FL, west to TX, north in the interior to KS; disjunct around the Great Lakes in MI, IN, and s. Ontario. [= RAB, C, F, FNA, K, M, S; C. lacustris Willdenow var. laxiflora Dewey -- G; = C. hyalinolepsis -- GW, misspelling]

Carex hystericina Muhlenberg ex Willdenow, Porcupine Sedge. Mt (GA, VA), Pd (GA): calcareous marshes and wet meadows; common (GA Special Concern). June-July. New Brunswick west to British Columbia, south to w. VA, sc. TN, w. TX, and n. CA. [= C, FNA, G, K; = C. hystricina -- F, M, W, orthographic variant]

Carex impressinervia Bryson, Kral, \& Manhart. Pd (NC): moist forests; rare (US Species of Concern, NC Rare). April-May. Sc. NC south to AL and west to MS, apparently very rare and widely scattered. See Bryson, Kral, \& Manhart (1987) for additional information on this species. [= FNA, K]

Carex interior Bailey, Inland Sedge. Mt (VA): calcareous seepage areas; rare (VA Rare). May-June. Newfoundland and Labrador west to s. AK, south to w. VA, n. AR, n. AZ, and n. CA; disjunct in Mexico (Chihuahua). [= C, F, FNA, G, K, M, W]

Carex intumescens Rudge var. fernaldii Bailey. Mt (NC, VA): spruce-fir forests, northern hardwood forests, grassy balds; common. June-July. Newfoundland west to Manitoba, south to NY, n. PA, MI, MN, and, at higher elevations in the Appalachians, to w. VA, w. NC, and e. TN. See Uttal (1971) and Reznicek \& Ball (1974) for different views on the validity of this variety. [ \(=\mathrm{F}\); < C. intumescens -- RAB, C, FNA, G, GW, K, M, S, W, infraspecific taxa not distinguished]

Carex intumescens Rudge var. intumescens. Cp, Pd, Mt (GA, NC, SC, VA): bogs, wet forests; common. May-July. Nova Scotia west to WI, south to c. peninsular FL and e. TX. [=F; <C. intumescens -- RAB, C, FNA, G, GW, K, M, S, W, infraspecific taxa not distinguished]

Carex jamesii Schweinitz, James's Sedge. Pd (NC, SC, VA), Mt, Cp (VA), \{GA\}: nutrient-rich bottomlands and mesic slopes over calcareous or mafic rocks; uncommon. May-June. MD and NY west to MI, MN, and e. NE, south to c. SC, GA, and LA. Naczi (1999b) reports chromosome numbers of \(n=33,35\). [= RAB, C, F, FNA, G, K, M, W]

Carex joorii Bailey, Joor's Sedge, Hummock Sedge, Cypress-swamp Sedge. Cp (GA, NC, SC, VA), Pd (GA, NC, VA): swamps, upland depression swamps in the Piedmont, sphagnous wetlands; common, rare in the Piedmont. June-October. E. MD south to panhandle FL, west to e. TX, north in the interior to TN, MO, and OK. [= RAB, C, F, FNA, G, GW, K, M, S]

Carex juniperorum Catling, Reznicek, \& Crins. Mt (VA): calcareous glades and barrens; rare. This species was recently described, and is so far known only from alvars in s. Ontario, calcareous glades and barrens in s. OH and ne. KY, and has recently been found in Montgomery Co., VA (Belden et al. 2004). [= FNA, K]
* Carex kobomugi Ohwi, Sea Isle Sedge, Japanese Sedge. Cp (NC, VA): sand dunes; uncommon, introduced from Japan. March-July. C. kobomugi is distinctive in its short stout culms, and its terminal, headlike, dioecious inflorescences. This species is planted as a stabilizer of coastal dunes. [= C, F, FNA, G, K]

Carex kraliana Naczi \& Bryson, Kral's Sedge. Pd (NC, SC, VA), Mt, Cp (SC, VA), \{GA\}: mesic forests, slightly acidic to circumneutral: common. MD, OH, and IN south to FL and TX. See Naczi, Bryson, \& Cochrane (2002). [= FNA]

Carex lacustris Willdenow, Lakeshore Sedge. Cp, Mt (VA): marshes, swamp forests; rare (VA Rare). Québec west to Saskatchewan, south to e. VA, w. VA, and NE. [= C, F, FNA, K, M; C. lacustris var. lacustris -- G]

Carex laevivaginata (Kükenthal) Mackenzie. Cp, Pd (GA, NC, SC, VA), Mt (NC, SC, VA): marshes, swamp forests, alluvial forests; common. May-June. MA, MI, and MN, south to n. FL, AL, and MO. [= RAB, C, F, FNA, G, GW, K, M, W; = C. laevivaginata -- S, orthographic variant]

Carex lasiocarpa Ehrhart var. americana Fernald, Slender Sedge. Mt (NC, VA): in shallow water of alkaline spring seep, on hummocks in acidic basin marsh, and in high elevation fen over amphibolite; rare (VA Rare). A circumboreal species, ranging south in North America to NJ, WV, MD (C. Frye, pers. comm. 2000), VA, nw. NC, IA, and WA. First reported for VA by Wieboldt et al. (1998). Found for the first time in NC in the valley of Long Hope Creek (Ashe County, NC), in July 1999 by A.S. Weakley and P.D. McMillan. [= C, F, G, K; = C. lasiocarpa ssp. americana (Fernald) Hultén - FNA; < C. lasiocarpa -- M, W, infraspecific taxa not distinguished; C. lanuginosa Michaux (formerly misapplied to C. pellita)]

Carex laxiculmis Schweinitz var. copulata (Bailey) Fernald. (NC, VA). VA, Ontario, and WI south to NC, AL, and AR. Var. copulata (Bailey) Fernald, has sometimes been considered the hybrid C. digitalis \(\times\) laxiculmis; current evidence suggests that it is not a hybrid but is not consistently separable from C. laxiculmis (Manhart 1984). Naczi (1999b) reports chromosome numbers for the two varieties, \(\mathrm{n}=22,23,25\) for var. laxiculmis, and \(\mathrm{n}=23-24\) for var. copulata; normal pairing further suggests that var. copulata is not a hybrid. [=FNA, K; <C. laxiculmis -- RAB, G, K, S, W, infraspecific taxa not distinguished; = C. ×copulata (Bailey) Mackenzie - F, M]

Carex laxiculmis Schweinitz var. laxiculmis. Mt (GA, NC, SC, VA), Pd (NC, VA), Cp (VA): rich slope or alluvial forests; common. April-June. S. ME west to s. WI and s. IA, south to NC, nw. GA (Jones \& Coile 1988), n. AL, and MO. [= FNA, K; < C. laxiculmis -- RAB, G, K, S, W, infraspecific taxa not distinguished; = C. laxiculmis -- F, M (narrow sense)]

Carex laxiflora Lamarck. Mt, Pd, Cp (GA, NC, SC, VA): bottomland and other nutrient-rich forests; common. May-June. Varieties have been recognized; their appropriate disposition is uncertain. Var. laxiflora ranges from ME and s. Québec west to WI and IN, south to NC, TN, and AL; allegedly also in s. Mexico. Var. serrulata F.J. Hermann has been reported for our area by Hill \& Horn (1997). Its range is stated by F to be NY and PA to MI, IN, and TN. It differs in being distinctly scabrous (vs. smooth to scaberulous), and in having the bract sheaths with serrulate angles (vs. entire or erose angles). [=RAB, C, FNA, M, W; >C. laxiflora var. serrulata F.J. Hermann - F, K; > C. laxiflora var. laxiflora - F, K; C. laxiflora var. laxiflora -- G (in a broader sense); C. heterosperma Wahlenberg -- S]

Carex leavenworthii Dewey. Pd, Mt (GA), \{NC, SC, VA\}. [= RAB, C, F, FNA, G, K, M, S, W]
Carex leptalea Wahlenberg var. harperi (Fernald) Weatherby \& Griscom. Cp, Pd (GA, NC, SC, VA), Mt? (NC, SC, VA): bogs,
seeps, blackwater bottomlands, usually in saturated conditions with Sphagnum spp.; common. May-June. NJ south to FI, west to TX, inland in thye interior to IN and MO. Var. harperi is considered to differ from the typic variety in its larger perigynia, larger spikes, more aristate pistillate scales, and more southern range; it needs additional study. [= F, G; < C. leptalea - RAB, C, GW, M, S, W, infraspecific taxa not distinguished; C. leptalea ssp. harperi (Fernald) W. Stone -- FNA, K; C. harperi Fernald]

Carex leptalea Wahlenberg var. leptalea. Mt, Pd (NC, VA): bogs, seeps, usually in saturated conditions with Sphagnum spp.; common. May-June. Labrador west to AK, south to NC, TN, MO, SD, NM, and CA. [= F, G; < C. leptalea -- RAB, C, GW, M, S, W, infraspecific taxa not distinguished; C. leptalea ssp. leptalea -- FNA, K]

Carex leptonervia (Fernald) Fernald. Mt (NC, VA): nutrient-rich forests, such as rich, seepy northern hardwoods forests; rare (NC Rare, VA Watch List). May-June. Newfoundland west to MN, south to NJ, PA, IN, and WI, and in the Appalachians south to NC. [= RAB, C, F, FNA, G, K, M, S, W]

Carex lonchocarpa Willdenow. Cp (GA, NC, SC, VA): pocosin margins, small blackwater stream swamps; common. MayJuly. S. MD south to FL, west to LA. Recognition of C. lonchocarpa at the species level is supported by its distinctive achene micromorphology (Wujek \& Menapace 1986). [= FNA, K, M; C. folliculata Linnaeus var. australis Bailey -- RAB, C, F, G; C. folliculata -- GW, in part; C. smalliana Mackenzie -- S]

Carex longii Mackenzie, Long's Sedge. \{GA, NC, SC, VA\}. [= C, F, FNA, K; C. albolutescens -- RAB, W, misapplied; C. albolutescens -- G, GW, in part]

Carex louisianica Bailey. Cp (GA, NC, SC, VA), Pd (GA, NC): calcareous forests; common (rare in Piedmont). May-July. S. NJ south to c. peninsular FL, w. to TX, north in the interior to KY, IN, and MO; disjunct in ne. OH. [= RAB, C, F, FNA, G, GW, K, M, S, W]

Carex lucorum Willdenow ex Link var. austrolucorum J. Rettig, Appalachian Woodland Sedge. Mt (GA, NC, SC, VA): xeric to mesic wooded slopes, usually in oak forests and northern hardwood forests; uncommon (GA Special Concern, NC Watch List, VA Rare). C. lucorum var. austrolucorum is endemic to the Southern Appalachians, ranging from sw. VA south through w. NC and e. TN to nw. SC and ne. GA. It has been reported from further north, in sc. WV (Boone County) (Cusick 1996). Var. Iucorum differs in having the leaves broader (mostly 1.5-2.8 mm wide vs. mostly \(1.1-1.3 \mathrm{~mm}\) ), the beak averaging shorter ( 1.3 mm vs. 1.5 mm ), chromosome number \(n=20\) (vs. \(n=13\) ), and various details of flavonoid chemistry and achene micromorphology (see Rettig 1988 for details). While the two taxa can be difficult to tell apart on morphological grounds, they are clearly separate taxa. C. lucorum var. austrolucorum was first reported for South Carolina by Hill \& Horn (1997). [= FNA, K; C. pensylvanica Lamarck var. distans Peck -- RAB, F, G (misapplied as to our plants); C. lucorum -- C, M, S, infraspecific taxa not distinguished; C. pensylvanica -- W, in part]

Carex lupuliformis Sartwell ex Dewey, False Hop Sedge. Cp, Pd (NC, SC, VA), \{GA \(\}\) : wet forests, especially around ponds; rare (NC Rare, VA Rare). June-July. VT and Québec west to se. WI, south to c. peninsular FL and e. TX. [= RAB, C, F, FNA, G, K, M; C. Iupulina -- GW, in part]

Carex lupulina Muhlenberg ex Willdenow, Hop Sedge. Cp, Pd (GA, NC, SC, VA), Mt (GA, NC, VA): bottomland forests; common (rare in Mountains). June-September. Nova Scotia west to MN, south to c. peninsular FL and e. TX. [= RAB, C, F, FNA, G, K, M, S, W; C. Iupulina -- GW, in part only (also see C. lupuliformis); C. Iupulina var. pedunculata A. Gray -- F]

Carex lurida Wahlenberg. Mt, Pd, Cp (GA, NC, SC, VA): bogs, marshes, ditches; common. June-September. Nova Scotia west to MN, south to FL and Mexico. [= RAB, C, F, FNA, G, GW, K, M, S]

Carex lutea LeBlond, Golden Sedge. Cp (NC): wet savannas shallowly underlain by coquina limestone, with open camopy of Taxodium ascendens, Pinus palustris, and Liriodendron tulipifera; rare (US Species of Concern, NC Rare). May. Endemic to Pender and Onslow counties, NC, where associated with other narrow endemics, such as Thalictrum cooleyi and Allium species 1, and other rare species, such as Plantago sparsiflora, Parnassia caroliniana, Rhynchospora thornei, and others. See LeBlond et al. (1994) for additional information. [= FNA, K]

Carex magnifolia Mackenzie. Cp (GA, NC, SC), Mt (NC): bogs, acid swamps; uncommon? (rare in Mountains). April-May. E. NC south to FL, and disjunct in mountain bogs with Coastal Plain affinities, as in Henderson County, NC. C. magnifolia differs morphologically from C. abscondita in its larger perigynia, longer leaves, and much more strongly glaucous leaves; it has a more southern distribution and occurs in wetter, boggier habitats. Manhart (1984) found that it differed chemically from C. abscondita. Further study is needed to verify its taxonomic status. [=M, S; <C. abscondita -- RAB, FNA, K, in part]

Carex manhartii Bryson, Blue Ridge Purple Sedge, Manhart's Sedge. Mt (GA, NC, SC, VA): cove forests and montane oakhickory forests, mostly at medium to fairly high elevations, especially over mafic rocks (such as amphibolite) and calcareous rocks (such as marble), but occurring on more acidic substrates as well; uncommon (GA Threatened, NC Rare, SC Rare). April-May. Endemic to w. NC, sw. VA, nw. SC, ne. GA, and se. TN, in the Blue Ridge Mountains. Once considered very rare, this species is now known to be locally common in portions of sw. NC and adjacent ne. GA. For more information on the Virginia occurrence, see Belden et al. (2004). [= FNA, K, W; included in concept of C. purpurifera by most earlier authors]

Carex meadii Dewey, Mead's Sedge. Pd (NC, VA), Mt (VA): on low, moist clayey soils over mafic rocks (such as diabase) or calcareous rocks; rare (NC Rare, VA Watch List). May-June. NJ west to MI and Saskatchewan, south to nc. NC, GA, AR, sw. LA, and TX. The species forms large clonal patches with a distinctive bluish cast at the time of flowering and fruiting. Naczi (1999b) reports a chromosome number of \(n=28\). [= RAB, C, F, FNA, G, K, M, S, W]

Carex mesochorea Mackenzie. Pd, Cp (SC, VA), \{GA, NC\}: dry forests and woodlands; rare (VA Watch List). scattered in TN. attributed to NC and VA (Kartesz 1999). First reported for South Carolina by Hill \& Horn (1997). [= F, FNA, K, M, S; C. cephalophora -- RAB, W, in part; C. cephalophora Muhlenberg ex Willdenow var. mesochorea (Mackenzie) Gleason -- C, G]

Carex misera Buckley, Wretched Sedge. Mt (GA, NC): moderate to high elevation cliffs and rock outcrops; rare (GA Threatened). A Southern Blue Ridge endemic: nw. NC and w. TN south to ne. GA (Rabun County). Schell \& Waterway (1992) discuss interesting geographic patterns of allozyme diversity in this narrowly endemic species. [= RAB, FNA, K, M, S, W; C. juncea, apparently misapplied]

Carex mitchelliana M.A. Curtis, Mitchell's Sedge. Cp (GA, NC, SC, VA), Pd (GA, NC, SC), Mt (NC, SC): swampy woodlands and forests; rare. May-June. Se. MA west to PA and KY, south to panhandle FL, n. AL, and sc. TN. This species has a scattered
distribution throughout its range, and is apparently rare. Bruederle, Fairbrothers, \& Hanks (1989) and Bruederle (1999) providea dditional information about this species. Allozyme studies suggest that C. mitchelliana is less closely related to C. gynandra, C. crinita var. crinita, and C. crinita var. brevicrinis than they are to one another. [=C,F,FNA, K, M, S; C. crinita Lamarck var. mitchelliana (M.A. Curtis) Gleason -- RAB, G, GW; C. crinita -- W, in part]

Carex molesta Mackenzie ex Bright, Troublesome Sedge. (VA). (VA Watch List). \(\}[=\mathrm{F}, \mathrm{FNA}, \mathrm{G}, \mathrm{K}\); < C. brevior -- C, in part]

Carex muehlenbergii Schkuhr ex Willdenow var. enervis W. Boott. \{GA, NC, SC, VA\}. (VA Watch List). [= K; C. muhlenbergii -- RAB, W, infraspecific taxa not distinguished; C. muhlenbergii var. muhlenbergii -- C , in part; \(C\). muhlenbergii var. enervis -- F, G, orthographic variant; C. plana Mackenzie -- M, S]

Carex muehlenbergii Schkuhr ex Willdenow var. muehlenbergii. \{GA, NC, SC, VA\}. [= K; C. muhlenbergii -- RAB, W, infraspecific taxa not distinguished; C. muhlenbergii var. muhlenbergii -- \(C\), in a broader sense (also including var. enervis); \(C\). muhlenbergii var. muhlenbergii -- F, G, orthographic variant; C. muhlenbergii -- M , in the narrow sense; \(C\). muhlenbergii -- S , in part (also see C. austrina)]

Carex nigromarginata Schweinitz. Pd, Mt, Cp (GA, NC, SC, VA): dry woodlands and forests; common. March-May. DE and NJ west to WI, south to SC, GA, and TX. [= C, FNA, K, M, W; C. nigromarginata var. nigromarginata -- RAB, F; C. nigro-marginata var. nigro-marginata -- G, orthographic variant; C. nigro-marginata -- S, orthographic variant]

Carex normalis Mackenzie. Cp, Pd (GA, NC, SC, VA), Mt (NC, SC, VA): mesic forests; May-June. ME, Québec, and Ontario south to GA and AR. [= RAB, C, F, FNA, G, GW, K, W]

Carex oblita Steudel. Cp (GA, NC, SC, VA), Pd (GA, NC, SC), Mt (NC, SC): swamps and other wet habitats; common? (GA Special Concern, VA Watch List). NJ south to sc. GA, west to e. LA, mostly on the Coastal Plain, but extending much less commonly inland to the Piedmont and Mountains. [= M, S; C. venusta Dewey var. minor Böckler -- C, F, G, K; C. venusta -- RAB, FNA, GW, W, in part]
*? Carex oklahomensis Mackenzie, Oklahoma Sedge. Mt (NC, VA): seepage; rare (probably adventive from farther west) (NC Watch List, VA Rare). Se. MO west to KS, south to MS, AR, and ne. TX; disjunct (and probably adventive) in w. NC (Graham County) and w. VA (Giles County). First reported for VA by Wieboldt et al. (1998). [= F, FNA, K, M; C. stipata Muhlenberg ex Willdenow var. oklahomensis (Mackenzie) Gleason]

Carex oligocarpa Schkuhr ex Willdenow, Few-fruited Sedge. Mt (GA, NC, SC, VA), Pd (VA), Cp (GA, VA): rich forests, over calcareous or mafic rocks; common (rare in GA, NC, and SC) (GA Special Concern). May-June. MA west to MN, south to FL and TX. C. oligocarpa sensu stricto in SC (McMillan pers. comm., specimen at CLEMS). [= RAB, C, F, FNA, G, K, M, S, W]

Carex oligosperma Michaux. Mt (NC): bogs and seeps at high elevations; rare (NC Endangered). Newfoundland west to Mackenzie, south to CT, c. PA, n. IN, WI, and MN; disjunct in ne. OH, WV (Hardy County) and NC (Ashe, Avery, Mitchell, and Watauga counties). [= C, F, FNA, G, M; C. oligosperma var. oligosperma - K]

Carex ormostachya Wiegand, Necklace Spike Sedge. Mt (VA): northern hardwood forest; rare (VA Rare). S. Canada south to ME, MA, PA, w. VA (Augusta County), n. OH, MI, and WI. [= F, FNA, K, M; < C. gracilescens -- C, in part; = C. laxiflora var. ormostachya (Wiegand) Gleason -- G]
* Carex ovalis Goodenough. Mt (NC): disturbed areas; rare, introduced from Eurasia. Known to range in North America from Newfoundland and NY south to n. NC and ne. TN. [= FNA, K; C. leporina Linnaeus -- C, F, G, misapplied; C. tracyi Mackenzie]

Carex oxylepis Torrey \& Hooker. Cp, Pd (GA), \{NC, SC, VA\}. calcareous forests. Var. oxylepis widespread in TN; var. pubescens restricted in TN to c. TN. [= RAB, C, F, FNA, G, GW, M, S, W; C. oxylepis var. oxylepis -- K; C. oxylepis var. pubescens J.K. Underwood - K]

Carex pallescens Linnaeus, Pale Sedge. Mt (VA): grassy balds at high elevations, other grassy openings; rare (VA Rare). June-July. Circumboreal (in ne. North America and n. Eurasia); in North America ranging from Newfoundland, Québec, and MN, south to w. NC, e. TN, and MI. C. pallescens is reported to occur on Big Bald, Unicoi County, TN, immediately adjacent to the NC line (Churchill et al. 1992). [= C, FNA, G, K, M, W; C. pallescens var. neogaea Fernald -- F]

Carex pedunculata Muhlenberg ex Willdenow var. pedunculata, Longstalk Sedge. Mt (GA, NC, SC, VA): nutrient-rich dry to mesic forests, usually over calcareous or mafic rocks; rare (GA Special Concern, NC Rare, VA Watch List). April. Var. pedunculata ranges from Newfoundland, Saskatchewan, and ND, south to NJ, w. VA, sw. NC, nw. GA (Dade County) (Jones \& Coile 1988), n. AL, c. IN, c. IL, and n. IA. Var. erythrobasis (Léveillé \& Vaniot) Koyama occurs in Korea. It may well prove that these two widely disjunct taxa should be recognized at the species level. [=FNA; C. pedunculata -- C, F, G, K, M, W, infraspecific taxa not distinguished]

Carex pellita Muhlenberg. Mt (VA): wet meadows; uncommon. New Brunswick west to British Columbia, south to w. VA, w. TN, AR, and CA. McClintock \& Waterway (1994) discuss the distinctiveness of C. pellita and C. lasiocarpa, as well as the misapplication of the name C. lanuginosa to the species now properly called C. pellita. [=C, FNA, K; C. lanuginosa Michaux -- F, M, misapplied; C. lasiocarpa Ehrhart var. latifolia (Böckler) Gilly]

Carex pensylvanica Lamarck. Mt (GA, NC, SC, VA), Pd (NC, SC, VA), Cp (VA): dry to moist woodlands and forests, grassy balds, shale barrens, rock outcrops; common. April-June. ME west to s, Manitoba and ND, south to SC, n. GA, TN, and AR. [= FNA, K; C. pensylvanica var. pensylvanica -- RAB, C, F, G; C. pennsylvanica -- M, S, orthographic variant; C. pensylvanica -- W, in part (see also C. lucorum var. austrolucorum)]

Carex physorhyncha Liebmann ex Steudel, Bellow's-beak Sedge. Cp (GA, NC, SC, VA), Pd (GA, NC, SC), Mt (GA): dry woodlands; rare (NC Watch List). Se. VA south to FL, west to AR, OK, TX, and Mexico. [= RAB, F, M, S, W; C. albicans Willdenow ex Sprengel var. australis (Bailey) J. Rettig -- FNA, K]

Carex picta Steudel, Painted Sedge. Mt (GA): mesic forests; uncommon. S. IN south through KY and c. TN to nc. GA (Jones \& Coile 1988), c. AL, and LA. Reported (erroneously?) for VA (Kartesz 1999). Locally abundant and forming "doughnut clumps", sometimes aggregated to form a coarse turf. [= C, F, FNA, G, K, M, S]

Carex pigra Naczi, Lazy Sedge. Cp (NC, SC, VA), Pd (NC, SC), \{GA\}: moist forests; uncommon. May-June. Se. VA west to se. and sc. TN, south to n . FL, s. AL, and ne. MS. See Naczi (1997) for additional information. [= FNA, K; included in concept of \(C\).
flaccosperma and/or C. glaucodea by earlier authors]
Carex planispicata Naczi. Pd, Cp (GA, NC, SC, VA): rich to fairly acid mesic forests, on slopes and floodplains; common. C. NJ west to s. IN, se. MO, and se. OK, south to c. GA, s. MS, and se. TX. See Naczi (1999a) for additional information. [= FNA; C. grisea Wahlenberg var. rigida L.H. Bailey; C. amphibola var. rigida (L.H. Bailey) Fernald]

Carex plantaginea Lamarck, Plantainleaf Sedge. Mt (GA, NC, SC, VA), Pd (NC, SC, VA): rich cove forests, mostly over mafic or calcareous rocks, montane alluvial forests; uncommon (SC Rare, VA Watch List). April-May. New Brunswick west to MN, south to MD, NJ, VA, NC, ne. GA (Jones \& Coile 1988), e. TN, c. TN, KY, and s. IN. [= RAB, C, F, FNA, G, K, M, S, W]

Carex platyphylla Carey, Broadleaf Sedge. Mt (GA, NC, VA), Pd (NC, VA), Cp (VA): rich cove forests, mostly over mafic or calcareous rock; uncommon (GA Special Concern). April-June. ME and s. Québec west to WI, south to NC, e. TN, and MO. Naczi (1999b) reports a chromosome number of \(n=35\). [= RAB, C, F, FNA, G, K, M, S, W]

Carex polymorpha Muhlenberg, Variable Sedge. Mt (VA): dry, acidic ridgetop forests; rare (US Species of Concern, VA Endangered). May-June. ME south to MD, VA, and WV. Standley, Dudley, \& Bruederle (1991) studied genetic variability in this species. [= C, F, FNA, G, K, M, W]
* Carex praegracilis W. Boott, Freeway Sedge. Mt (VA): median of interstate highway; rare, introduced from w. North America. May-June. This species is apparently spreading through ne. North America as the result of the winter salting of highways. [= C, F, FNA, G, K, M]

Carex prairea Dewey ex Wood, Prairie Sedge. Mt (VA): calcareous wetlands; rare (VA Rare). Québec west to Yukon, south to NJ, w. VA, OH, NE, MT, and British Columbia. [= C, F, FNA, G, K, M]

Carex prasina Wahlenberg. Mt (GA, NC, SC, VA?), Pd (NC): ME, Ontario, and WI south to GA and MS. In nearly all TN counties adjacent to NC and VA. [= RAB, C, F, FNA, G, GW, K, M, S, W]

Carex projecta Mackenzie. Mt, Pd, Cp (NC, SC, VA), \(\{G A\}\) : moist forests; rare (NC Rare). May-June. [= RAB, C, F, FNA, G, K]
* Carex pumila Thunberg. Cp (NC): open disturbed sand flats; rare, introduced from Asia. May. See Reznicek (1993) for additional information. [= FNA, K; C. hirta -- RAB, misidentification]

Carex purpurifera Mackenzie, Limestone Purple Sedge. Mt (GA, NC, VA): moist, rich cove forests, at low elevations, over calcareous or mafic rocks; rare (GA Threatened, VA Rare). May-June. W. VA and KY south to n. GA and n. AL, mostly west of the Blue Ridge Mountains, but with scattered disjunct populations on calcareous or mafic sites in the Blue Ridge. Naczi (1999b) reports a chromosome number of \(n=17-19\). [=FNA, K; C. purpurifera - RAB, C, M, S, W, in part only (see also C. manhartii); C. laxiflora var. purpurifera (Mackenzie) Gleason -- G]

Carex radfordii Gaddy, Radford's Sedge. Mt (GA, NC, SC): very nutrient-rich, moist cove forests in the Blue Ridge Escarpment region, over calcareous or mafic rocks; rare (GA Special Concern, NC Rare). May-June. Endemic to the Blue Ridge Escarpment of sw. NC, nw. SC, and ne. GA. See Gaddy (1995) for additional information. Naczi (1999b) reports a different chromosome number for C. radfordii \((\mathrm{n}=23)\) than for the related C. purpurifera ( \(\mathrm{n}=17,18,19\) ). [= FNA, K]

Carex radiata (Wahlenberg) Small. \(\{G A, N C, S C, V A\}\). [=C, FNA, K; C. rosea -- RAB, G, W, in part; C. rosea -- F, M, S, misapplied]

Carex reniformis (Bailey) Small, Kidney Sedge. Cp (GA, NC, VA), Pd (NC), \{SC\}: rare (GA Special Concern, NC Rare). [= RAB, C, F, FNA, G, GW, K]

Carex retroflexa Muhlenberg ex Willdenow. \{GA, NC, SC, VA\}. See Downer \& Hyatt (2003). [= F, FNA, K, M, S; C. retroflexa -- RAB, W, in part (also see C. texensis); C. retroflexa var. retroflexa -- C, G]

Carex roanensis F.J. Hermann, Roan Mountain Sedge. Mt (GA, NC, VA): mesic forests; rare (GA Special Concern, VA Watch List). W. VA south to w. NC and e. TN. See Hermann (1947) for additional information. Closely related to C. virescens. Reported for VA by Wieboldt et al. (1998). Present in e. KY (M. Evans, pers. comm.). [= FNA, K, W]

Carex rosea Schkuhr ex Willdenow, Rosy Sedge. Pd (GA), \{GA, NC, SC, VA\}: dry to dry-mesic hardwood forests; uncommon (GA Special Concern). [= C, FNA, K; C. rosea -- RAB, G, W, in part (also see C. appalachica and C. radiata); C. convoluta -- F, M, S; C. flaccidula Steudel]

Carex rugosperma Mackenzie. Mt (SC, VA): distribution and habitats in our area obscure. Prince Edward Island west to MN, south to MD, VA, IN, IL, and MO. See C. umbellata for discussion. Reported for South Carolina by Hill \& Horn (1997). [= G, M; < C. umbellata -- RAB, C, W, in part; C. umbellata -- F, misapplied; = C. tonsa (Fernald) Bicknell var. rugosperma (Mackenzie) Crins FNA, K]

Carex ruthii Mackenzie, Ruth's Sedge. Mt (GA, NC, SC, VA): seepage areas, in forest or open areas; uncommon (NC Watch List, VA Watch List). May-June. A Southern Appalachian endemic: sw. VA south through w. NC and e. TN to nw. SC and n. GA. [= C, F, FNA, K, M, S; = C. muricata Linnaeus var. ruthii (Mackenzie) Gleason -- RAB, G; < C. muricata -- W, in part] Carex scabrata Schweinitz. Mt (GA, NC, SC, VA), Pd (VA): seepage slopes, brook-banks, often in shade; common (GA Special Concern). May-July. Nova Scotia west to MI, south to NJ, n. GA, OH, and MO. [= RAB, C, F, FNA, G, GW, K, M, S, W] Carex schweinitzii Dewey ex Schweinitz, Schweinitz's Sedge. Mt (VA): bogs; rare (VA Rare). June. VT west to n. MI, south to NJ (and MO?); disjunct in Newfoundland. The distribution of this species is local and fragmented. The alleged occurrences of \(C\). schweinitzii in w. NC are based on misidentification of C. utriculata. [= C, F, FNA, G, K, M, S]

Carex scoparia Sckuhr ex Willdenow var. scoparia. Mt (GA, VA), Pd, Cp (VA), \{NC, SC\}: bogs, swamp forests, marshes, seepy ledges, ditches; common (GA Special Concern). May-June. [= F, FNA, K; < C. scoparia -- RAB, C, G, GW, W, infraspecific taxa not distinguished]

Carex seorsa Howe. Cp, Pd (NC, SC), \{GA, VA\}: acidic swamp forests; common (GA Special Concern). May-June. MA south to GA in the Coastal Plain, scattered inland westwards to NY, OH, MI, IN, AR, and TN. [= RAB, C, FNA, G, GW, K, M, S, W] Carex shortiana Dewey, Short's Sedge. Mt (VA): calcareous bottomlands and meadows; rare (VA Watch List). May-June. PA, s. Ontario, IL, and IA, south to w. VA, e. TN, AR, and OK. [= C, F, FNA, G, K, M, W]

Carex siccata Dewey, Bronze Sedge. Mt (NC): grassy balds; rare (NC Endangered). Labrador and Newfoundland west to Yukon, south to CT, NY, PA, MI, and ID; disjunct in w. NC and e. TN (Roan Mountain). June-August. [= K; ? C. foenea Willdenow -

\section*{C; C. aenea -- RAB, F, G, W]}

Carex silicea Olney, Seabeach Sedge. Cp (VA): beaches and shores; rare (VA Rare). Newfoundland south to VA. [= C, F, FNA, G, K]

Carex socialis Mohlenbrock \& Schwegman. Cp (GA, NC, SC): blackwater and brownwater swamp forests and bottomlands; rare (GA Special Concern). Se. and sc. NC south to e. GA, west to e. TX, and north in the interior to s. IN, s. IL, and se. MO. [= C, FNA, K]

Carex sparganioides Muhlenberg ex Willdenow. Pd (GA), \(\{N C, S C, V A\} .[=R A B, F, F N A, K, M, W ; C\). sparganioides var. sparganioides -- C, G]
* Carex spicata Hudson. (VA). [= C, F, FNA, G, K, M]

Carex squarrosa Linnaeus. Pd (GA, NC, SC, VA), Cp (NC, VA), Mt (VA): bottomland forests; common. June-July. CT west to se. ME and NE, south to NC, n. SC, and AR. [= RAB, C, F, FNA, G, GW, K, M, S, W]

Carex sterilis Willdenow, Sterile Sedge. Mt (VA): mafic fens; rare (VA Rare). Newfoundland west to Saskatchewan, south to sw. VA (Grayson County), ne. TN, IL, and MO. Outside of our area, C. sterilis is primarily a species of calcareous fens or seepages First reported for VA by Wieboldt et al. (1998). [= C, F, FNA, G, K, M]

Carex stipata Muhlenberg ex Willdenow var. maxima Chapman. Cp (GA, NC, SC, VA), Pd (NC, SC, VA): marshes, ditches, alluvial forests; common. May-June. NJ south to FL, west to TX, north in the interior to s. MO, s. IN, and w. KY, primarily on the Coastal Plain. The validity of this variety needs additional study. [= RAB, C, F, FNA, G, K; < C. stipata -- GW, W, infraspecific taxa not distinguished; = C. uberior (C. Mohr) Mackenzie -- M, S]

Carex stipata Muhlenberg ex Willdenow var. stipata. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): marshes, ditches, alluvial forests; common. May-June. Newfoundland west to AK, south to SC, TN, KS, NM, and Mexico. [= RAB, C, F, FNA, G, K; < C. stipata -- GW, W, infraspecific taxa not distinguished; = C. stipata -- M, S, in the narrow sense]

Carex straminea Willdenow ex Schkuhr, Straw Sedge. (NC, VA) (VA Rare). [= F, FNA, K; C. straminea var. straminea -- C, G; C. richii (Fernald) Mackenzie -- M]

Carex striata Michaux var. brevis Bailey. Cp (NC, SC, VA): pocosins, limesink ponds, small depression ponds, clay-based Carolina bays, acid peaty swamps, wet savannas (dominated by Pinus serotina and/or Taxodium ascendens); common, rare in VA (VA Watch List). May-June. E. MA south to SC. See Reznicek \& Catling (1986) for discussion of the nomenclatural change. [= C, FNA, K; C. walteriana -- RAB, GW, M, S, infraspecific taxa not distinguished; C. walteriana Bailey var. brevis (Bailey) Bailey -- F, G]

Carex striata Michaux var. striata, Pocosin Sedge. Cp (GA, SC): pocosins, limesink ponds, small depression ponds, claybased Carolina bays, acid peaty swamps, wet savannas (dominated by Pinus serotina and/or Taxodium ascendens); uncommon. May-June. SC south to \(n\). FL and e. panhandle FL. [= C, FNA, K; C. walteriana Bailey -- RAB, GW, M, S, infraspecific taxa not distinguished; C. walteriana var. walteriana -- F, G]

Carex striatula Michaux. Mt, Pd, Cp (NC, SC, VA): bottomland and other nutrient-rich forests; common. May-June. Se. NY and PA west to TN, south to FL and TX. The distinction of this species as separate from C. laxiflora is problematic and requires additional study. Naczi (1999b) reports chromosome numbers of \(n=18,20\). [ \(=\) RAB, C, F, FNA, K, M, W; C. laxiflora var. angustifolia Dewey -- G; C. Iaxiflora -- S, misapplied]

Carex stricta Lamarck. Mt (GA, NC, VA), Pd, Cp (NC, VA), \{SC?\}: bogs, sedge meadows, depression ponds, old beaver ponds; common. May-June. Québec and Nova Scotia west to Manitoba, south to n. NC and TX. [= RAB, C, F, FNA, GW, K, M, S, W; C. stricta var. strictior (Dewey) Carey -- F; C. stricta var. stricta -- G; C. strictior Dewey -- M, S]

Carex styloflexa Buckley. Mt, Pd, Cp (GA, NC, SC, VA): bogs, wet forests; common. May-June. CT west to s. OH, south to FL and se. TX. [= RAB, C, F, FNA, G, K, M, S, W]

Carex suberecta (Olney) Britton, Prairie Straw Sedge. Mt (VA): calcareous wetlands; uncommon (VA Watch List). [= C, F, FNA, G, K]

Carex superata Naczi, Reznicek, \& B.A. Ford. Mt (VA), Pd (SC), \{GA\}: Nc. SC, sw. VA, sc. KY, and ne. MS, south to Panhandle FL and s. AL. Reported for sw. VA (as C. willdenowii var. megarrhyncha) by Wieboldt et al. (1998). [= FNA, K; < C. willdenowii -- RAB, F , in part; < C. willdenovii -- \(\mathrm{C}, \mathrm{G}, \mathrm{M}, \mathrm{S}\), in part (see also C. basiantha and \(C\). willdenowii) and orthographic variant; C. willdenowii Schkuhr ex Willdenow var. megarrhyncha Hermann -- K]

Carex swanii (Fernald) Mackenzie. Mt (GA, NC, SC, VA), Cp (NC, VA), Pd (VA): nutrient-rich forests, woodlands, and openings; common. May-June. Nova Scotia, s. MI, s. WI, south to nw. SC and ne. AR. [= RAB, C, F, FNA, G, K, M, S, W; = C. virescens Muhlenberg ex Willdenow var. swanii Fernald]
* Carex sylvatica Hudson. (NC). , rare, native of Europe. [= C, F, FNA, G, K, M]

Carex tenax Chapman. Cp (GA, NC, SC), Pd (GA): sandhills; rare. May-June. Sc. NC south to FL, west to MS; also in sw. LA and se. TX. [= RAB, FNA, K, M; C. validior Mackenzie -- S]

Carex tenera Dewey var. tenera, Slender Sedge. Pd (NC, VA), Mt (GA, VA), Cp (VA) \{SC\}: low forests; rare (NC Watch List, VA Rare). ne. TN, n. GA (Jones \& Coile 1988). [= F, FNA; C. tenera -- RAB, C, G, K, infraspecific taxa not distinguished]

Carex tetanica Schkuhr, Rigid Sedge. Mt, Cp (NC, VA), Pd (NC): moist forests; rare (NC Rare, VA Watch List). May-June. MA west to MN, NE, and Alberta, south to NJ, VA, and NC. [RAB, C, F, FNA, K, M; C. tetanica var. tetanica -- G]

Carex texensis (Torrey) Bailey. \{GA, NC, SC, VA\} See Downer \& Hyatt (2003). [= F, FNA, K, M, S; < C. retroflexa Muhlenberg ex Willdenow -- RAB, in part; = C. retroflexa var. texensis (Torrey) Fernald -- C, G]

Carex tonsa (Fernald) Bicknell. \{GA, SC, VA\} \{Distribution and habitats in our area obscure\}; common. Québec west to Alberta, south to VA, IN, and WI. See C. umbellata for discussion. [=F, G, K, M; C. umbellata -- RAB, C, W, in part; C. tonsa var. tonsa - FNA, K]

Carex torta F. Boott, Streambed Sedge, Twisted Sedge. Mt (GA, NC, SC, VA), Pd (NC, SC, VA): rocky streambeds, often dominant in patches in mountain streams; common (GA Special Concern). April-May. Nova Scotia west to Ontario, south to sc. NC, SC, nc. GA (Jones \& Coile 1988), AL, TN, and OH. See Gaddy (1981) for the first report of this species in SC. [= RAB, C, F, FNA, G, K, M, S, W]

Carex triangularis Böckler. Cp (SC), \{GA\}: moist forests; rare. April-June. [= RAB, F, FNA, G, K, M, S; < C. vulpinoidea --

GW, in part]
Carex tribuloides Wahlenberg var. sangamonensis Clokey. \{GA, NC, SC, VA\}: \{\} May-June. [= FNA, G, K; < C. tribuloides -- RAB, C, F, GW, W, in part, infraspecific taxa not distinguished]

Carex tribuloides Wahlenberg var. tribuloides. \(\{\mathrm{GA}, \mathrm{NC}, \mathrm{SC}, \mathrm{VA}\}\). May-June. [= FNA, G, K; < C. tribuloides -- RAB, C, F, GW, W, in part, infraspecific taxa not distinguished]

Carex trichocarpa Muhlenberg ex Willdenow. Mt (NC, VA), Pd (VA): wet meadows, marshes; uncommon (NC Watch List). May-July. Québec west to MN, south to DE, nw. NC, WV, IN, and MO. [= RAB, C, F, FNA, G, K, M, W]

Carex trisperma Dewey var. trisperma, Three-seeded Sedge. Mt (NC, VA): bogs and swamps at high elevations, usually growing in living Sphagnum, in shaded situations under shrubs or trees in montane wetlands; rare (NC Rare, VA Watch List). June. Labrador west to Saskatchewan, south to NJ, MD, OH, n. IN, IL, and MN; and in the mountains to w. NC and WV. Var. billingsii O.W. Knight is more northern, apparently ranging south to NJ and PA. It differs from var. trisperma in the following ways: leaves \(0.2-0.5 \mathrm{~mm}\) wide (vs. 1-2 mm wide), spikes 1-2 (vs. 1-3), perigynia 1-3 per spike (vs. 1-6), and perigynia \(2.5-3.3 \mathrm{~mm}\) long (vs. \(3.3-\) 4.0 mm long). It needs additional study. [=C, F, FNA, G, K, M; < C. trisperma -- RAB, W, infraspecific taxa not distinguished]

Carex turgescens Torrey, Pinebarren Sedge. Cp (GA, NC, SC): sandhill seepage bogs, streamhead pocosins, pocosinsandhill ecotones, canebrakes, in highly acidic, sandy-peaty soils; rare (NC Watch List). May-June. Sc. NC south to Panhandle FL, west to se. LA, a Southeastern Coastal Plain endemic. [= RAB, FNA, GW, K, M, S]

Carex typhina Michaux. Cp (GA, NC, SC, VA), Pd, Mt (NC, SC, VA): bottomland forests; common (uncommon in Mountains). June-July. ME and Québec west to WI and se. MN, south to GA and LA. [= RAB, C, F, FNA, G, GW, K, M, S, W]

Carex umbellata Schkuhr ex Willdenow. Pd, Mt (GA), \{NC, SC, VA\}. Distribution and habitats in our area obscure. Newfoundland west to Saskatchewan, south to VA, TN, IL, and MN. It seems very possible that southern members of the \(C\). umbellata complex may not correspond to any of the taxa "distinguished" in the northeastern United States. C. tonsa, C. rugosperma, and C. umbellata are circumscribed by various authors in different ways. This group needs critical study. [= FNA, G, K, M; C. umbellata -- RAB, C, W, in part only (also see C. rugosperma and C. tonsa); C. abdita Bicknell -- F]

Carex utriculata Boott, Beaked Sedge. Mt (NC, VA): wet meadows; rare (VA Rare). Boreal American, ranging south to DE, w. VA, nw. and sw. NC, ne. TN (Johnson County), IN, NE, NM, and CA. Recently verified for NC. [= C, FNA, K; C. rostrata Stokes var. utriculata (Boott) Bailey -- F, G; C. rostrata -- M, misapplied as to our material; C. schweinitzii - RAB, misidentification]

Carex venusta Dewey. Cp (GA, NC, SC, VA): swamps, peat bogs, mossy wetlands, and other wet habitats; common? (GA Special Concern, VA Watch List). Se. VA south to panhandle FL, on the Coastal Plain. [=M, S; =C.venusta var. venusta -- C, F, G, K; < C. venusta -- RAB, FNA, GW, W, in part (see also C. oblita)]

Carex verrucosa Muhlenberg. Cp (GA, NC, SC): pocosins, wet pinelands, pond cypress wetlands; uncommon. JulySeptember. Se. NC south to s. to FL, west to w. LA. [= RAB, FNA, GW, K, M, S; C. glaucescens Elliott var. androgyna M.A. Curtis]

Carex vesicaria Linnaeus var. vesicaria, Inflated Sedge. Mt (NC, VA): bogs, rare (VA Rare). Circumboreal, ranging south in North America to DE, w. VA, nw. NC, KY, IN, MO, NM, and CA. [= C, F; C. vesicaria -- FNA, G, in the broad sense; C. vesicaria var. monile (Tuckerman) Fernald - K; C. vesicaria -- M, in a narrower sense; C. monile Tuckerman]

Carex vestita Willdenow. Pd (NC, VA), Cp (VA): low forests; rare (NC Watch List, VA Rare). April-May. S. ME south to se. VA and nc. NC. [= RAB, C, F, FNA, G, K, M]

Carex virescens Muhlenberg ex Willdenow. Mt (GA, NC, SC, VA), Pd, Cp (VA): nutrient-rich forests, woodlands, and openings; common. May-June. S. ME, NY, and s. MI, south to e. VA, w. NC, nw. SC, and MO. [= RAB, C, F, FNA, G, K, M, S, W]

Carex vulpinoidea Michaux. Mt, Pd, Cp (GA), \{NC, SC, VA\}. [= RAB, F, FNA, G, M, S, W; C. vulpinoidea var. vulpinoidea -C, K; C. vulpinoidea -- GW, in part only (also see C. annectens and C. triangularis)]

Carex willdenowii Schkuhr ex Willdenow. Pd (NC, SC, VA), Mt, Cp (NC, VA): dry-mesic upland oak forests; common. MayJune. MA, VT, NY, s. Ontario, and c. IN, south to nc. SC, n. AL, and s. IL; disjunct in c. AR. Naczi (1999b) reports chromosome numbers of \(n=31,39\). [= FNA, K; C. willdenowii -- RAB, F, W, in part only (see also C. basiantha and C. superata); C. willdenovii -C, G, M, S, in part only (see also C. basiantha and C. superata) and orthographic variant]

Carex woodii Dewey, Wood's Sedge. Mt (GA, NC, SC, VA): moist slopes and cove forests over mafic rocks (such as amphibolite), ultramafic rocks (such as olivine), or felsic rocks; uncommon (GA Special Concern, NC Rare, SC Rare). May-June. NY west to Manitoba, south to NC, nw. SC, n. GA, and MO. This species forms clonal patches reminiscent of C. pensylvanica, but has perigynia glabrous and filled by the achene at maturity; the foliage also has a paler green cast. It has probably been much overlooked in the past. Naczi (1999b) reports chromosome numbers of \(n=22,26\). [ \(=\) RAB, C, F, FNA, K, M, W; = C. tetanica var. woodii (Dewey) Wood -- G]

Carex acidicola Naczi (section Griseae). In GA and AL (Naczi, Bryson, \& Cochrane 2002). [= FNA] \{not yet keyed\} Carex acutiformis Ehrhart. Introduced in MD (FNA, Kartesz 1999). [= FNA, K] \{not yet keyed\}
Carex alopecoidea Tuckerman. In n. WV and e. TN (Chester et al. 1993), DE, DC, MD (Standley in FNA 2002b). [= FNA, K] Carex backii Boott (section Phyllostachyae). Ranges south to ne. PA and NJ. [= C, F, FNA, G, K, M]
Carex bebbii Olney ex Fernald (section Ovales). Mt (VA): ; rare. South to NJ and c. PA (Rhoads \& Klein 1993); disjunct at Big Meadows, VA (Townsend, pers. comm. 2004). [= C, F, FNA, G, K] \{not yet keyed\}

Carex brunnescens (Persoon) Poiret var. brunnescens. Reported for our area by FNA. Resolve. [= F; C. brunnescens ssp. brunnescens -- FNA, K]

Carex brysonii (section Griseae). Ranging in the Cumberland Plateau of n. AL. See Naczi (1993) for additional information. [= FNA, K]

Carex bulbostylis Mackenzie (section Griseae). Reports for GA in Jones \& Coile (1988) are probably based on misidentifications. In TN (FNA, Kartesz 1999). [= K; Carex amphibola Steudel var. globosa (Bailey) Bailey] Carex castanea Wahlenberg (section Hymenochlaenae), Chestnut Sedge. In TN (FNA). [= C, F, FNA, G, K, M] Carex cephaloidea (Dewey) Dewey (section Bracteosae), ranges south to MD, NJ (Kartesz 1999), and s. PA (Rhoads \& Klein 1993). [= FNA, K; C. sparganioides Muhlenbergia ex Willdenow var. cephaloidea (Dewey) Carey -- C]

Carex deweyana Schweinitz var. deweyana (section Deweyanae) ranges south to ec. PA, in rich forests and openings. Naczi (1999b) reports a chromosome number of \(n=27\). [= C, F, FNA, K]

Carex diandra Schrank (section Heleoglochin) has been reported from TN on the basis of a destroyed specimen; it is a more northern species, known also to range south to PA and w. MD. [= FNA, K]

Carex distans Linnaeus (section Spirostachyae), introduced in MD and PA (Kartesz 1999). [= FNA, K] \{not yet keyed\}
Carex fissa Mackenzie var. fissa. Cp (VA): introduced at old railroad stockyard, well-established; rare, introduced from sc. United States. [= FNA, K]

Carex geyeri Boott, Elk Sedge (section Firmiculmes), occurs as a disjunct (introduced?) from w. North America in Centre County, PA (Rhoads \& Klein 1993). [= C, FNA, K]

Carex haydenii Dewey. Not known from our area, but approaching it from the north. Newfoundland and Québec west to SD, south to s. PA, MD (C. Frye, pers. Comm. 2000), IL, and IA. [= C, F, FNA, G, K, M]

Carex hyalina Boott, east to TN. [= FNA, K] \{not yet keyed\}
Carex limosa Linnaeus (section Limosae), ranges south to se. PA (Rhoads \& Klein 1993), NJ, and DE (Kartesz 1999). [= C, FNA, K]

Carex lucorum Willdenow ex Link var. lucorum (section Acrocystis), Northern Woodland Sedge, ranges from New Brunswick west to MN, south to MD (Cecil County; C. Frye, pers. comm. based on specimen at DOV) and PA. See C. Iucorum var.
austrolucorum for distinguishing characteristics. [= FNA, K; C. pensylvanica Lamarck var. distans Peck -- RAB, F, G; C. lucorum -C, M, S, infraspecific taxa not distinguished; C. pensylvanica -- W, in part]

Carex michauxiana Böckeler (section Rostrales). In MD (FNA). [= FNA, K] \{not yet keyed\}
Carex microdonta Torrey \& Hooker (section Granulares), east to AL and FL. [= FNA, K] \{not yet keyed\}
Carex molestiform is Reznicek \& P.E. Rothrock (section Ovales). Mt (VA). [= FNA; C. brevior, misapplied] \{not yet keyed\}
* Carex muricata Linnaeus ssp. lamprocarpa Čelakovský (section Bracteosae), a European alien, ranges south to e. PA (Rhoads
\& Klein 1993). [= FNA; C. muricata -- C, K, infraspecific taxa not distinguished]
Carex muskingumensis Schweinitz (section Ovales). Ranging east to KY and nc. TN. [= C, F, FNA, G, K]
Carex novae-angliae Schweinitz (section Acrocystis) ranges south to e. PA and WV (Kartesz 1999), occurring in moist forests.
It will key most closely to C. nigromarginata, from which it differs in having the lowest pistillate spike remote from the next lowest and not overlapping it. [= K]
* Carex opaca (F.J. Hermann) P.E. Rothrock \& Reznicek. Cp (VA): introduced at old railroad livestock yard, well-established; rare, introduced from sc. United States. [= FNA; C. bicknellii Britton var. opaca F.J. Hermann - K]

Carex ouachitana Kral, Manhart, \& Bryson (section Griseae). Disjunct in nc. TN from the Ouachita Mountain of AR and OK. [= FNA, K]

Carex pauciflora Lightfoot (section Leucoglochin), Few-flowered Sedge, south to bogs in WV (Grant, Randolph, and Tucker counties). [= C, FNA, K]
* Carex pendula Hudson (section Rhynchocystis), Pendulous Sedge, introduced in VA (FNA, Kartesz 1999), native of Europe. [= FNA, K] \{add synonymy\}

Carex pseudocyperus Linnaeus, south to NJ and PA (FNA, Kartesz 1999). [= FNA, K] \{not yet keyed\}
Carex retrorsa Schweinitz occurs in swampy forests and wet meadows south to DE, MD, and sc. PA (Rhoads \& Klein 1993,
Kartesz 1999). [= C, F, G, K, M]
Carex richardsonii R. Brown. Pd? (VA?): dry, rocky forests; rare if present. VT west to Alberta, south to DC, OH, IN, IA, and
SD. This species ranges south to DC (according to C); it is likely to be present in our area, in \(n\). VA. [= C, F, FNA, G, K, M] Carex sartwellii Dewey (section Holarrhenae), south to MD and PA (Kartesz 1999). [= FNA; C. sartwellii var. sartwellii -- K]
\{add synonymy\}
Carex sp. 1, Canebrake Sedge. Cp (GA, NC, SC, VA): canebrakes and acid swamps; uncommon. [<C. novae-angliae Schweinitz - FNA, in part] \{not yet keyed\} Carex sp. 2. Mt (NC, VA): ultramafic seepages; rare. Carex sprengelii Dewey ex Sprengel (section Hymenochlaenae), Sprengel's Sedge, Long-beaked Sedge, south to NJ, e. PA (Rhoads \& Klein 1993), and DE (Kartesz 1999). [= C, FNA, K, M] Carex thornei Naczi (section Griseae). Cp (GA): mesic decdiduous forests, often in the upper floodplain. Endemic to the drainage of the Apalachicola/Chattahoochee and Flint in s. GA and s. AL south to nw. FL. See Naczi, Bryson, \& Cochrane (2002). [= FNA]

Carex timida Naczi \& B.A. Ford. East to AL, TN, and KY. Related to C. jamesii and C. juniperorum, from which it was separated by Naczi \& Ford (2001). [= FNA]

Carex trisperma Dewey var. billingsii O.W. Knight, south to NJ and PA (Kartesz 1999). [= C, F, FNA, G, K, M; < C. trisperma -RAB, W, infraspecific taxa not distinguished] \{not yet keyed\}

Carex tuckermanii F. Boott occurs in calcareous swampy forests and wet meadows south to WV, sc. PA (Rhoads \& Klein 1993), NJ, and MD (FNA, Kartesz 1999). [= C, F, FNA, K; C. tuckermani -- G, M, orthographic variant] Carex wiegandii Mackenzie (section Stellulatae), south to c. PA (Rhoads \& Klein 1993). [= FNA, K]

\section*{Cladium P. Browne (Sawgrass, Twig-rush)}

A genus of 3-4 species, herbs, subcosmopolitan. References: Bridges, Orzell, \& Burkhalter (1993); Tucker in FNA (2002b); Goetghebeur in Kubitzki (1998b). Key based closely on Bridges, Orzell, \& Burkhalter (1993).

1 Plants 1-3 m tall, coarse, from short rhizomes, forming dense tussocks; leaves 3-15 dm long, 5-12 mm wide, stiff and flat (or broadly \(V\)-shaped), the margins and midrib (beneath) harshly serrate (saw-toothed); inflorescence a narrow panicle 3-9 dm
long, the branches bearing several fascicles of spikelets; achene base broadly rounded to truncate; [of tidal freshwater to brackish marshes or outer coastal plain calcareous savannas]
C. jamaicense

1 Plants \(0.4-1 \mathrm{~m}\) tall, relatively delicate, from creeping rhizomes, forming loosely tufted colonies; leaves \(1-3 \mathrm{dm}\) long, \(1-3 \mathrm{~mm}\) wide, flat to channeled (terete apically), margins only slightly scabrous; inflorescence 0.5-3 dm long, of 2-4 umbelliform cymes, the branches rigidly ascending and bearing simple glomerules of spikelets; achene base squarely truncate to slightly flaring; [of Coastal Plain acidic seepages and tidal freshwater to slightly brackish marshes, Mountain fens or bogs] ..... C. mariscoides

Cladium jamaicense Crantz, Sawgrass. Cp (GA, NC, SC, VA): in circumneutral to alkaline situations, including brackish marshes, and rarely somewhat inland in savannas underlain by coquina limestone; common (VA Rare). July-October. Se. VA south to s. FL, west to e. TX, and in the West Indies. This is, of course, the famous sawgrass which dominates many square miles in the Everglades of s. FL (where underlain by oolite). The leaves can cut flesh or clothing. C. jamaicense is sometimes treated as one component (ssp. jamaicense) of a multi-continental C. mariscus complex. [= RAB, C, F, FNA, G, GW; = C. mariscus (Linnaeus) Pohl ssp. jamaicense (Crantz) Kükenthal -- K; = Mariscus jamaicensis (Crantz) Britton -- S]

Cladium mariscoides (Muhlenberg) Torrey, Twig-rush, Fen-sedge. Cp (GA, NC, SC, VA), Mt (NC, VA): in strongly acidic to circumneutral situations, including acidic seepage at the margins of brackish marshes, in wet flats under Pinus serotina and Taxodium ascendens (Gaddy \& Rayner 1980), in mucky seepage bogs in the fall-line sandhills, in peaty fens and bogs in the Mountains (especially over mafic or ultramafic rocks, such as amphibolite); uncommon (NC Rare, SC Rare). July-September. Widespread and rather common north of the glacial boundary, with scattered and disjunct occurrences southward in VA, NC, SC, GA, panhandle FL, KY, s. AL, se. MS (Sorrie \& Leonard 1999), and e. TX. Bridges, Orzell, \& Burkhalter (1993) discuss in detail the phytogeography of this plant, particularly in reference to its southern occurrences, which are curiously fragmented and disjunct. [= RAB, C, F, FNA, G, K, W; = Mariscus mariscoides (Muhlenberg) Kuntze -- S]

\section*{Cymophyllus Mackenzie ex Britton (Fraser's Sedge)}

A monotypic genus, endemic to the Appalachians. Cymophyllus is a peculiar plant, generally considered a relict species most closely (but not very) related to Carex, but recent molecular evidence suggests that it may be best re-merged into Carex. References: Reznicek in FNA (2002b); Goetghebeur in Kubitzki (1998b).

Identification notes: The foliage slightly resembles some of the broader-leaved species of Carex (such as Clatyphylla or \(C\). plantaginea) or genera of the Liliaceae. Immediately distinctive, however, are the minutely undulate-scaberulous leaf margins.

Cymophyllus fraserianus (Ker-Gawler) Kartesz \& Gandhi, Fraser's Sedge, Lily-leaf Sedge. Mt (GA, NC, SC, VA): cove forests, mostly rather acidic and associated with Rhododendron maximum, at moderate elevations; uncommon (GA Threatened, NC Watch List, VA Watch List). May-June. A Southern and Central Appalachian endemic: w. MD and s. PA south through w. VA and WV to w. NC, e. TN, nw. SC, and n. GA (Jones \& Coile 1988). Kartesz \& Gandhi (1991) have shown that the Ker-Gawler's epithet fraserianus has priority over Andrews's fraseri. [= FNA, K; Cymophyllus fraseri (Andrews) Mackenzie -- RAB, C, F, G, S, W; Carex fraseriana Ker-Gawler; Carex fraseri Andrews]

Cyperus Linnaeus (Umbrella Sedge)
(see also Kyllinga)
A genus of about 500 species, herbs, of tropical and warm temperate areas. References: Goetghebeur in Kubitzki (1998b); Tucker, Marcks, \& Carter in FNA (2002b).

This treatment is adapted from a manuscript of Tucker, Marcks, \& Carter and other sources. It needs substantial customization and revision prior to publication. Key lead 4 in the main key is problematic.

1 Inflorescences unbranched (the spikelets sessile); spikelets 1-2-flowered; rachilla not or only slightly elongate; scales conspicuously keeled; lowest 2 scales of spikelet greatly reduced . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . see Kyllinga
1 Inflorescences branched (the spikes pedunculate); spikelets 1-many-flowered; rachilla elongate; scales generally broadly rounded; lowest 2 scales of spikelet not greatly reduced.

\section*{2 Stigmas 2; achenes lenticular.}

3 Achenes dorsiventrally flattened, borne with a flattened face toward the rachillas; [subgenus Juncellus] ..... Key A 3 Achenes laterally flattened, borne with an edge towards the rachilla; [subgenus Pycreus] . . . . . . . . . . . . . . . . Key B
2 Stigmas 3; achenes trigonous.
4 Spikelets borne in digitate clusters (rarely singly), or in umbellate or glomerulate heads; [subgenus Pycnostachys] . .
. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Key C
4 Spikelets borne in spikes on a conspicuous rachis.
5 Rachilla articulate at the base of each scale, the mature spike therefore disarticulating into segments consisting of a scale, an achene, and a cartilaginously thickened section of the rachilla (and its wings); [subgenus Diclidium]

Key D
5 Rachilla continuous, or articulate only at the base; [subgenus Cyperus] . . . . . . . . . . . . . . . . . . . . . . . . Key E

Key A -- subgenus Juncellus -- stigmas 2; achenes lenticular; achenes dorsiventrally flattened, borne with a flattened face toward the rachillas
1 Plants \(1-3(-6) \mathrm{dm}\) tall; leaf blades \(0-7 \mathrm{~cm}\) long \(\ldots \ldots\). . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. Iaevigatus
1 Plants to 10 dm tall; leaf blades \(20-40 \mathrm{~cm}\) long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [C. serotinus]

1 Plants 1-3 (-6) dm tall; leaf blades 0-7 cm long
[C. serotinus]

\section*{Key B -- subgenus Pycreus -- stigmas 2; achenes lenticular; achenes laterally flattened, borne with an edge tow ards the rachilla}

Key C -- subgenus Pycnostachys -- stigmas 3; achenes trigonous; spikelets borne in digitate clusters (rarely singly), or in umbellate or glomerulate heads

1 Scales folded in half their entire length (conduplicate).

\section*{2 Perennial.}

2 Annual.
5 Scales cuspidate, with a cusp 0.6-1.2 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. cuspidatus
5 Scales blunt or slightly mucronate.
6 Spikelets 30-20 per head; styles ca. 0.1 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. difformis
6 Spikelets 3-12 per head; styles 0.3-0.4 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. fuscus
1 Scales 2-keeled in the lower third to half (bicarinate).
7 Leaves bladeless; inflorescence bracts ca. 20, borne horizontally; stamens 3
[C. involucratus]
7 Leaves with leaf blades; inflorescence bracts 2-10, borne variously; stamens 1 (-2)
8 Stems sharply 3 -angled, the faces concave, the angles harshly scabrous; leaf blades and inflorescence bracts with conspicuous cross-veins
C. virens

8 Stems rounded, obscurely 3-faced, or 3-angled, the faces flat or convex, smooth or slightly scabrous; leaf blades and involucral bracts lacking conspicuous cross-veins.
9
9
9 Stems slightly scabrous, the prickles pointing downwards (retrorse) . . . . . . . . . . . . . . . .
10 Achene bases swollen, spongey
C. surinamensis

10 Achene bases not swollen and spongey.
11 Achenes narrowly ellipsoid to linear, about \(3-6 \times\) as long as wide.
12 Achenes ellipsoid to narrowly ellipsoid, 0.9-1.1 mm long, 0.3-0.4 mm wide, about \(3 \times\) as long as wide; style 0.2-0.4 mm long; stigmas 0.4-0.6 mm long . . . . . . . . . . . . . . . . . . . . C. entrerianus
12 Achenes linear, 1.2-1.4 mm long, \(0.2(-0.3) \mathrm{mm}\) wide, about \(5-6 \times\) as long as wide; style \(0.5-0.8\) mm long; stigmas 0.6-1.0 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. pseudovegetus
11 Achenes broadly ellipsoid, about 2-2.5× as long as wide (the stipe or cuneate base typically conspicuous).
13 Annual; longest inflorescence bract erect or strongly ascending; anther ca. 0.5 mm long

13 Perennial; longest inflorescence bract horizontal or slightly ascending (less than 30 degrees); anther 0.8-1.2 mm long.
14 Scales declined 3-45 degrees from the rachilla; achenes with a stipe . . . . . . C. eragrostis
14 Scales declined (45-) 60-90 degrees from the rachilla; achenes cuneate at the base
C. ochraceus

Key D -- subgenus Diclidium -- stigmas 3; achenes trigonous;
spikelets borne in spikes on a conspicuous rachis; rachilla articulate at the base of each scale, the mature spike therefore disarticulating into segments consisting of a scale, an achene, and a section of the rachilla (including its wings)

One species in our area
C. odoratus

\section*{Key E-- subgenus Cyperus -- stigmas 3; achenes trigonous; spikelets borne in spikes on a conspicuous rachis; rachilla continuous, or articulate only at the base}

1 Upper scales of the spikelet with a straight or excurved mucronate or cuspidate apex 0.4-1.2 mm long.
2 Plant a rhizomatous perennial, culms single
[C. schweinitzii]
2 Plant an annual, culms several, cespitose.
3 Achenes 0.2-0.6 mm wide; stamen 1; culms 2-16 cm tall.
4 Achenes \(0.5-0.6 \mathrm{~mm}\) wide, \(<2 \times\) as long as wide, cuneate to the base; scales \(1.0-2.0 \mathrm{~mm}\) wide, \(9-13\)-nerved; filaments ca. 2.5 mm long; anthers \(0.4-0.8 \mathrm{~mm}\) long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. granitophilus
4 Achenes (0.2-) 0.3-0.4 (-0.5) mm wide, \(>2 \times\) as long as wide, with a minute stipe at the base; scales \(0.5-1.0 \mathrm{~mm}\) wide, (5-) 7-9 (-11)-nerved; filaments ca. 1.5 mm long; anthers \(0.3-0.4 \mathrm{~mm}\) long . . . . . . . . . . . . C. squarrosus
3 Achenes \(0.5-1.1 \mathrm{~mm}\) wide; stamens 3 ; culms (2-) 6-50 cm tall.
5 Achenes obovoid, truncate at the apex; leaves flat to V-shaped; live plants not viscous to the touch

5 Achenes elipsoid, with a beak 0.5-1.2 mm long; leaves involute; live plants viscous to the touch . . C. oxylepis
1 Upper scales blunt, or with a mucro \(<0.3 \mathrm{~mm}\) long.
6 Spikelets linear, 1.2-1.6 mm wide; scales not overlapping, the tip of each scale just reaching or falling short of the base of the next scale on the same side of the rachilla
C. distans

6 Spikelets oblong-ovate to linear-oblong, (1.5-) 1.0-3.0 (-4.0) mm wide; scales overlapping, the tip of each scale reaching to at least the base of the next scale on the same side of the rachilla.
7 Spikelets strongly compressed, \(>2 \times\) as wide as thick (in cross-section); scales spreading or appressed.
8 Scales obovate-orbiculate, notched at the tip; styles less than 0.1 mm long.
9 Rachilla wingless; scales scarcely mucronate C. iria

9 Rachilla narrowly winged; scales distinctly mucronate
[C. amuricus]
8 Scales elliptic to oblong or ovate, acute to obtuse, not notched at the tip; styles 0.3-1.3 mm long.
10 Rachilla with hyaline, whitish, or straw-colored wings \(0.2-0.5 \mathrm{~mm}\) wide.
11 Culms terete (at least towards the base), nodose-septate; inflorescence bracts 2 (-4), all erect; leaf blades generally absent . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. articulatus
11 Culms trigonous, not nodose-septate; inflorescence bracts 3-7, horizontal, ascending, or reflexed; leaf blades present.
12 Scales persistent; rachilla persistent; elongate stolons up to 15 cm long present, bearing tubers.
13 Scales purplish red to reddish brown, with green midveins; base of culm indurate; stolons wiry, springy when dried . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. rotundus
13 Scales yellowish brown to brown; base of culm soft; stolons spongy, flexible when dried. 14 Style and stigma combined \(<4.2 \mathrm{~mm}\) long ...... C. esculentus var. leptostachyus 14 Style and stigma combined \(>4.2 \mathrm{~mm}\) long .... [C. esculentus var. macrostachyus]
12 Scales deciduous; rachilla deciduous; rhizomes up to 5 cm long present, not bearing tubers.
15 Scales 3.2-4.5 (-6) mm long; anthers 0.3-0.5 mm long; stigmas 3-4 mm long; achenes narrowly oblong . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. strigosus
15 Scales 1.5-2.5 (-3.1) mm long; anthers 0.7-1.8 mm long; stigmas 1-2 ( -3 ) mm long. 16 Achenes coarsely punctate . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. planifolius 16 Achenes smooth . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. grayi 10 Rachilla wingless, or with wings \(0-0.2 \mathrm{~mm}\) wide.

17 Longest inflorescence bract erect or strongly ascending . . . . . . . . . . . . . . . . . . . [C. schweinitzii]
17 Longest inflorescence bract horizontal, weakly ascending, or reflexed.
18 Longest inflorescence bract weakly ascending.
19 Rachis (to which the spikelets are attached) glabrous; achenes \(1.5-2.0 \mathrm{~mm}\) long; spikes subglobose to broadly ovoid; [of upland sites, of NC northwards] . . . . . . . . C. houghtonii
19 Rachis hispidulous; achenes 1.0-1.2 mm long; spikes loosely oblong-ovoid; [of wetland sites, of SC southwards] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. pilosus

21 Scales 2.5-3.8 mm long, usually fitting loosely over the mature achene, the margins spreading or loosely clasping it; spikelet with 5-22 scales
C. Iupulinus ssp. Iupulinus

21 Scales 1.8-2.5 mm long, usually fitting tightly over the achene, the margins tightly clasping it; spikelets with 3-7 scales . . . . . . . . . . . . . C. Iupulinus ssp. macilentus
7 Spikelets subterete or quadrangular, 1-1.5×as wide as thick (in cross-section); scales appressed. after the achenes fall; spikelets with (6-) 12-20 (-40) scales . . . . . . . . . . . . . . . . . . . . . . . . . . C. erythrorhizos
Scales persistent; rachillas either deciduous (the mature spikelets generaly falling as a single unit from the rachis) or persistent; rachilla wings persistent; spikelets with 2-8 scales.
23 Spikelets reflexed (some of the uppermost spreading to ascending).
24 Culms glabrous; leaves and inflorescence bracts nearly glabrous . . . . . . . . . . . . . . C. hystricinus
24 Culms (at least the upper portion) scaberulous or puberulent; leaves and inflorescence bracts puberulent on the upper surface.
lower surfaces; culm obtusely trigonous to nearly terete
C. plukenetii
lorescence rays smooth (or with a very few hairs), leaves and inflorescence bracts pubescen on the upper surface and on the midvein only on the lower surface; culm sharply 3 -angled

23 Spikelets ascending to spreading (some of the lowermost reflexed).
.
27 Spikelets ellipsoid, 2-3×as long as wide; spikelets with 1-2 (-3) fertile scales \(\ldots\) [C. aggregatus] ppis
............................................................................ C. strigosus
Scales reddish brown or tawny, the tips barely reaching the base of the next scale

Spikes ovoid, globose, or obovoid, \(1-2 \times\) as long as wide.
\(>4\) m long, achenes >2 mm long.
0 Spikes ellipsoid to obovoid.
31 Spikelets subquadrangular, the terminal scale elongate, forming a subulate tip to the spikelet; leaves and inflorescence bracts \(3-6 \mathrm{~mm}\) wide, smooth C. hystricinus leaves and inflorescence bracts mostly \(>10 \mathrm{~mm}\) wide, scabrous on the upper surfaces. 32 Spikes dense, with 50-90 spikelets, each with 3-6 (-7) fertile scales; achenes conspicuously falcate-curved, \(3-4 \times\) as long as wide
C. lancastriensis

2 Spikes loose, of 13-75 spikelets, each with 4-8 (-11) fertile scales; achenes straight, \(5-6 \times\) as long as wide
C. tetragonus

34 Spikelets linear, \(0.5-1.0 \mathrm{~mm}\) wide C. thyrsiflorus
compressed
35 Scales ascending; achenes oblong-fusiform, gradually narrowed to both ends .....
5 Scales appressed; achenes elongate, abruptly constricted at the tip.
36 Spikes loose, globose to hemispheric; spikelets angular in cross-section, with 3-8 fertile scales; scales yellow-greenish . . . . . . . . . . . . . . . . . . . . . . . C. croceu
Spikes tight, globose, oblong, or oblong-cylindric; spikelets subterete in cosssection, with 1-3 (-4) fertile scales; scales straw-colored or brown on the sides. 37 Spikes globose; spikelets (3.5-) 4.0-7.0 mm long; scales membranous, Spikes oblo firm, brown or straw-colored, 1.8-2.6 mm long; achenes 1.2-2.0 mm long ..
C. retrorsus

Cyperus acuminatus Torrey \& Hooker ex Torrey. Mt (NC, VA), \{GA\}: \{habitat\}; rare (VA Rare). IL west to ND, south to w. LA, TX, and \(n\). Mexico; disjunct from WA to s. CA; disjunct eastwards at scattered localities in VA, NC, TN, KY, and OH (where probably native, and NY and NH (where probably introduced). [= C, F, FNA, G, GW, K, W]

Cyperus articulatus Linnaeus. Cp (GA, SC): marshes; rare. July-September. Se. SC south to s. FL west to e. TX, and southinto tropical America. [= RAB, FNA, GW, K, S]

Cyperus bipartitus Torrey. Cp, Pd (NC, VA), Mt (GA, NC, VA), \{SC\}: low fields, ditches, marshes; uncommon. JulySeptember. ME and Québec west to MN and WA, south to GA, LA, TX, NM, AZ, and CA. [= C, FNA, GW, K, W; C. rivularis Kunth -- RAB, F, G, S]

Cyperus compressus Linnaeus. Cp, Pd (GA, NC, SC, VA): sandy fields, disturbed areas; common (uncommon in Piedmont). July-September. Pantropical and warm temperate, north in North America to s. NY, s. OH, s. IL, and e. TX. [= RAB, C, F, FNA, G, GW, K, S, W]

Cyperus croceus Vahl. Cp (GA, NC, SC, VA), Pd (GA), Mt (VA): savannas, pine flatwoods, disturbed areas; common. JulyOctober. NJ and MO south through the New World tropics. \{problems in circumscription; check specimens\} [=C, FNA, K; C. globulosus Aublet -- RAB, F, G, GW, S?, W, misapplied; C. multiflorus (Britton) Small -- S; C. retrorsus Chapman var. robustus (Böckler) Kükenthal -- RAB, K; C. plankii Britton -- S?]

Cyperus cuspidatus Kunth. Cp (GA, SC): sandy fields, disturbed areas; rare. July. S. SC south to FL, west to AL; and in New World tropics. [= RAB, FNA, GW, K, S]

Cyperus dentatus Torrey, Toothed Flatsedge. Cp (NC, SC), Mt (VA): low sandy areas; rare (NC Rare, VA Rare). JulyOctober. Nova Scotia and Québec south to e. SC; disjunct inland in WV, s. TN, and nw. IN. [= RAB, C, F, FNA, G, GW, K, S, W]

Cyperus diandrus Torrey. Cp, Pd (VA), Mt (GA, VA): \{habitat\}; rare (VA Rare). ME west to ND, south to VA, c. TN, n. AL, IL, MO, and IA. [= C, F, FNA, G, GW, K, S, W]

Cyperus difform is Linnaeus, Smallflower Umbrella Sedge. Cp (GA, NC, SC, VA): disturbed areas; rare, introduced from Old World tropics. See Bryson et al. (1996). [= C, F, FNA, G, GW, K]
* Cyperus distans Linnaeus f. Cp (NC): marshes; rare, probably introduced from tropical America (NC Watch List). JulySeptember. [= RAB, FNA, K, S]

Cyperus distinctus Steudel. Cp (GA, SC): marshes; rare (SC Rare). July-September. E. SC south to s. FL, west to e. LA. [= RAB, FNA, GW, K]

Cyperus echinatus (Linnaeus) Wood. Pd, Cp (GA, NC, SC, VA), Mt (GA, VA): sandy woodlands, forests, and fields; common. July-September. CT and NY west to s. OH, IL, and se. KS, south to n. FL, TX, and ne. Mexico. [= C, FNA, K; C. ovularis (Michaux) Torrey -- RAB, G, GW, S, W; C. ovularis var. ovularis -- F; C. ovularis var. sphaericus Böckler -- F]

Cyperus entrerianus Böckler. Cp (GA): \{habitat\}; rare. E. GA south to FL and west to e. TX. [= FNA, K] * Cyperus eragrostis Lamarck. Cp (SC); disturbed wetlands; rare, introduced from tropical America. See Bryson et al. (1996), Brown \& Marcus (1998). [= FNA, K]

Cyperus erythrorhizos Muhlenberg, Redroot Flatsedge. Cp, Pd (GA, NC, SC, VA), Mt (VA): marshes, ditches; uncommon. July-September. MA west to ND and WA, south to n. FL, LA, TX, AZ, and CA. [= RAB, C, F, FNA, G, GW, K, S, W; C. halei Torrey ex Britton -- S]

Cyperus esculentus Linnaeus var. Ieptostachyus Böckler, Yellow Nutsedge, Yellow Nutgrass, Wild Chufa, Earth-almond. Cp, Pd, Mt (GA, NC, SC, VA): fields, roadsides, disturbed areas; common. July-October. The species is pantropical and warm temperate. [= FNA; > C. esculentus var. leptostachyus - K, in a narrower sense; > C. esculentus var. sativus Böckler-- K; < C. esculentus -- RAB, C, F, G, GW, S, W, infraspecific taxa not distinguished; < C. Iutescens Torrey \& Hooker -- S]

Cyperus esculentus Linnaeus var. macrostachyus Böckler, Yellow Nutsedge, Yellow Nutgrass, Wild Chufa, Earth-almond. \{GA, NC, SC\} July-October. The species is pantropical and warm temperate. [= FNA; C. esculentus var. esculentus -- K, in a broad sense; < C. esculentus -- RAB, C, F, G, GW, S, W, infraspecific taxa not distinguished; < C. lutescens Torrey \& Hooker -- S]

Cyperus filicinus Vahl. Cp (GA, NC, SC, VA): brackish marshes; common. July-September. ME to s. FL, west to LA; West Indies. [= RAB, C, F, FNA, G, K, S; = C. polystachyos Rottböll var. filicinus (Vahl) C.B. Clarke; < C. polystachyos -- GW, infraspecific taxa not distinguished]

Cyperus filiculmis Vahl. Cp (GA, NC, SC, VA), Pd? (NC, SC, VA): sandy or rocky woodlands, forests, and fields; common. July-October. Se. MD south to s. peninsular FL, west to e. TX. [= FNA, RAB; < C. lupulinus ssp. lupulinus -- K, in part only (also see C. Iupulinus]

Cyperus flavescens Linnaeus. Mt, Pd, Cp (GA, NC, SC, VA): low fields, ditches, marshes; common. July-September. Pantropical and warm temperate, north in North America to MA, MI, MO, and KS. [= RAB, C, FNA, G, GW, K, S, W; C. flavescens var. poiformis (Pursh) Fernald -- F]

Cyperus flavicomus Michaux. Cp (GA, NC, SC, VA), Pd (GA, NC, SC): ditches, marshes; common (GA Special Concern). July-October. Se. VA and KY south through the New World tropics. [= C, FNA, K, W; C. albomarginatus (Martius \& Schrader ex Nees) Steudel -- RAB, F, G, GW; C. sabulosus (Martius \& Schrader ex Nees) Steudel -- S]
* Cyperus fuscus Linnaeus, Black Galingale, Brown Galingale. Cp (VA): \{habitat\}; rare, introduced from Eurasia. See McKenzie et al. (1998). [= C, F, FNA, G, K]

Cyperus granitophilus McVaugh, Granite Flatsedge. Pd (GA, NC, SC, VA), Cp, Mt (GA): granitic flatrocks, rarely on diabase flatrocks and Altamaha Grit glades; rare (NC Rare, VA Rare). Sc. VA south to ec. AL in the Piedmont; disjunct in se. and c. TN on sandstone and limestone and in sc. GA on Altamaha Grit. [= FNA, GW, K; included in concept of C. squarrosus by some earlier authors]

Cyperus grayi Torrey. Cp (GA, NC, SC, VA), Pd (NC, VA): dry soils; uncommon. July-September. NH south to GA. [= RAB, C, FNA, K, W; C. grayii -- F, G, orthographic variant; C. filiculmis var. oblitus Fernald \& Griscom -- F?]

Cyperus haspan Linnaeus. Cp (GA, NC, SC, VA), Pd (GA): marshes, low fields, ditches; common (VA Watch List). JulySeptember. Pantropical in distribution, north in North America to se. VA. [= RAB, C, FNA, G, GW, K, S; C. haspan var. americanus Böckler -- F]

Cyperus houghtonii Torrey, Houghton's Flatsedge. Pd (NC), Mt (VA): dry upland sites; rare (NC Rare, VA Rare). July. MA, VT, and Québec west to MN, south to w. VA, WV, nc. NC, and nw. IN. [= RAB, C, F, FNA, G, K, W]

Cyperus hystricinus Fernald. Cp, Pd (GA, NC, SC, VA), Mt? (GA, NC, SC): dry woodlands and forests; rare. JulySeptember. NJ south to n. FL, west to e. TX, mostly on the Coastal Plain. \{check specimens of this and relatives -- discrepancy between mapped and stated ranges\} [= C, FNA, K, S; C. retrofractus -- RAB, F, W, misapplied; C. retrofractus (Linnaeus) Torrey
var. hystricinus (Fernald) Kükenthal -- F, G]
Cyperus iria Linnaeus. Cp, Pd (GA, NC, SC, VA): marshes, ditches, disturbed wet areas; common, introduced from Old World. July-October. [= RAB, C, F, FNA, G, GW, K, S]

Cyperus laevigatus Linnaeus. Cp (NC): brackish marshes; rare, introduced from sw. North America nad New World tropics. [= RAB, FNA, K, S; C. careyi Britton -- S]

Cyperus lancastriensis Porter ex A. Gray. Pd (GA, NC, SC, VA), Cp, Mt (NC, SC, VA): dry woodlands, forests, and fields; common. July-September. NJ west to WV, OH, and MO, south to GA and AR. [= RAB, C, F, FNA, G, K, S, W]

Cyperus lanceolatus Poiret. Cp (GA): wet places; rare. Se. GA and ne. FL west to LA and c. TX (?). [= FNA, GW, K; C. densus Link -- S]

Cyperus lecontei Torrey ex Steudel. Cp (GA, NC, SC?): limesink ponds, low pinelands; rare (NC Rare). July-September. Se. NC south to s. FL, west to LA. Sorrie (1998b) reports it for e. GA (Glynn County). [= RAB, FNA, GW, K, S]

Cyperus lupulinus (Sprengel) Marcks ssp. Iupulinus. Cp (GA, NC, SC, VA), Mt, Pd (NC, SC, VA): \{additional herbarium check\} MA and VT west to MN, south to NC, n. SC, TX; disjunct in ID, WA, and OR. [= FNA, K; C. filiculmis Vahl -- RAB, S, W, in part; C. lupulinus -- C; C. filiculmis Vahl var. filiculmis -- F, G; C. martindalei Britton -- S]

Cyperus lupulinus (Sprengel) Marcks ssp. macilentus (Fernald) Marcks. Mt (GA, NC, VA), Cp (VA), \{SC\}: rare (GA Special Concern). \{additional herbarium check\} ME, Québec, and MN south to w. VA, w. NC, nw. GA, and MO. [=FNA, K; C. filiculmis Vahl -- RAB, S, W, in part; C. filiculmis Vahl var. macilentus Fernald -- F, G; C. lupulinus -- C]

Cyperus ochraceus Vahl. Cp (GA): wet areas; rare. Se. GA (Jones \& Coile 1988), FL, LA, TX, West Indies, Central America. [= FNA, GW, K, S]

Cyperus odoratus Linnaeus. Cp (GA, NC, SC, VA), Pd (GA, NC, VA), Mt (VA): low fields, marshes, ditches; uncommon. July-September. Pantropical, north in North America to MA, se. ME, Ontario, MN, KS, NM, AZ, and CA. [= RAB, C, F, FNA, G, GW, K, W; C. engelmannii Steudel -- RAB, F, G, GW, S; C. ferruginescens Böckler -- RAB, F; C. ferax L.C. Richard -- S; C. longispicatus J.B.S. Norton -- S; C. speciosus Vahl -- S]

Cyperus ovatus Baldwin. Cp (GA, NC, SC): sandy beaches, maritime forests, and pinelands; rare. July-October. Se. NC south to s. FL, west to s. AL. [= FNA, K; C. retrorsus Chapman var. cylindricus (Elliott) Fernald \& Griscom; > C. retrorsus var. deeringianus (Britton ex Small) Fernald ex Griscom -- RAB; < C. retrorsus -- C, G, GW, W, in part; > C. deeringianus Britton ex Small -- S]
* Cyperus oxylepis Nees ex Steudel. Cp (GA, SC) \{habitat\}; rare, introduced from South America. See Bryson et al. (1996). [= FNA, GW, K]
* Cyperus pilosus Vahl. Cp (SC): rice fields; rare, introduced from e. Asia. [= FNA, K]

Cyperus planifolius L.C. Richard. Cp (GA): brackish marshes; rare. Se. GA (Jones \& Coile 1988) south to s. FL; West Indies; Central and South America. [= FNA, GW, K; C. brunneus Swartz - S]

Cyperus plukenetii Fernald. Cp (GA, NC, SC, VA), Pd (NC, SC): sandhills, sandy woodlands, and dry, disturbed areas; common (rare in Piedmont) (VA Rare). July-October. NJ, KY, MO, and se. OK, south to c. peninsular FL and e. TX. [= RAB, C, F, FNA, K, W; C. retrofractus var. retrofractus -- G, misapplied; C. retrofractus -- S, misapplied]

Cyperus polystachyos Rottböll. Cp, Pd (GA, NC, SC, VA): low fields, ditches, and marshes; common. July-October. Pantropical and warm temperate, north in North America to ME, MA, KY, MO, and OK. [= FNA, GW; Cyperus polystachyos Rottböll var. texensis (Torrey) Fernald -- RAB, C, F, G, K, W; C. polystachyos var. polystachyos -- K; C. polystachyos var. paniculatus (Rottböll) C.B. Clarke; C. microdontus Torrey -- S; C. odoratus -- S, misapplied; C. paniculatus Rottböll -- S]

Cyperus pseudovegetus Steudel. Cp, Pd (GA, NC, SC, VA), Mt (GA, VA): marshes, ditches, depressions; common. JulyOctober. NJ and MA, west to s. IL, s. MO, and OK, south to FL and TX. [= RAB, C, FNA, G, GW, K, S, W; C. virens -- F, misapplied]
* Cyperus pumilus Linnaeus. Cp (GA): disturbed wet areas; rare, ilntroduced from the Old World, occurring in \(n\). FL and se. GA. [= FNA, GW, K]

Cyperus refractus Engelmann ex Böckler. Pd (GA, NC, SC, VA), Mt, Cp (NC, SC, VA): dry sandy or rocky woodlands and forests; rare (VA Watch List). July-September. NJ west to OH and MO, south to SC, GA, AL, and AR. [= RAB, C, F, FNA, G, K, S, W]

Cyperus retrofractus (Linnaeus) Torrey. Pd, Cp, Mt (GA, NC, SC, VA): dry sandy or rocky woodlands and fields; common. July-September. NJ west to s. OH, and se. MO, south to GA. AL, and AR. [=C, FNA, K; C. dipsaciformis Fernald -- RAB, F, S, W; C. retrofractus (Linnaeus) Torrey var. dipsaciformis (Fernald) Kükenthal -- G]

Cyperus retrorsus Chapman. Cp, Pd (GA, NC, SC, VA), Mt (NC, SC): dry woodlands, forests, and rock outcrops; common. July-October. S. NY south to FL, west to TX, mostly on the Coastal Plain, but north in the interior to KY and se. OK. [= C, G, GW, \(\mathrm{S}, \mathrm{W}\); C. retrorsus Chapman var. retrorsus -- RAB, K; C. retrorsus var. retrorsus -- F; C. retrorsus var. nashii (Britton) Fernald -- F; C. nashii Britton --- S; C. torreyi Britton -- S]
*? Cyperus rotundus Linnaeus, Purple Nutsedge, Nutgrass, Cocograss. Cp (GA, NC, SC, VA), Pd (GA, NC, SC), Mt (SC): gardens, fields, disturbed areas; common. June-October. Pantropical and warm temperate in distribution (though extending less far north than C. esculentus). [= RAB, C, F, FNA, G, GW, K, S]
* Cyperus sanguinolentus Vahl. Cp (GA): ditches, disturbed wet areas; rare, introduced from Asia, known in North America from e. GA west to LA. See Carter \& Bryson (2000) for detailed information. [= FNA; > Cyperus louisianensis Thieret -- K]

Cyperus squarrosus Linnaeus. Pd (GA, NC, SC, VA), Mt (VA), Cp (GA): moist depressions and seepages on granitic and other rocks, drawdown riverbanks, moist disturbed sites; rare (NC Watch List). July-September. Nearly cosmopolitan in distribution, in Old World and New World. Similar to the closely related C. granitophilus. [= C, FNA, K; C. aristatus Rottböll -- RAB, G, GW, W; C. inflexus Muhlenberg -- F, S]

Cyperus strigosus Linnaeus, False Nutsedge. Mt, Pd, Cp (GA, NC, SC, VA): marshes, ditches, wet disturbed areas; common. July-October. Québec west to SD, south to FL and TX; also in w. North America. [= RAB, C, FNA, GW, K, S, W; C. strigosus var. strigosus -- F, G; C. strigosus var. robustior Britton -- F; C. strigosus var. stenolepis (Torrey) Kükenthal -- G; C.
praelongatus Steudel -- S; C. stenolepis Torrey -- S]
Cyperus surinamensis Rottböll. Cp (GA, SC): "disturbed clay-sand beds" (RAB); rare. September-October. Se. SC south to s. FL, west to KS, OK, TX, and south into Mexico and tropical America. [= RAB, FNA, GW, K, S]

Cyperus tetragonus Elliott, Four-angled Flatsedge. Cp (GA, NC, SC): maritime forests and dunes; rare (NC Rare, SC Rare). July-September. E. NC south to FL; also reported for AZ and NM. [= RAB, FNA, K, S]

Cyperus thyrsiflorus Junghuhn. Cp (GA): swamps and streambanks; rare (GA Special Concern). Se. GA and FL peninsula west to se. TX. [= FNA, K; C. hermaphroditus (Jacquin) Standley - S, misapplied]

Cyperus virens Michaux. Cp (GA, NC), Pd (GA, NC?): marshes and ditches; rare. July-September. Se. NC south to c. peninsular FL, west to TX; West Indies, Mexico to Argentina. [= RAB, FNA, GW, K, S]
* Cyperus aggregatus (Willdenow) Endlicher, native of tropical America, has been collected as a waif in NJ, PA, AL, and FL. [= FNA, K; C. cayennensis (Lamarck) Britton - S; C. flavus (Vahl) Nees]
* Cyperus amuricus Maximowicz, native of e. Asia, is naturalized in DE, PA, NJ, and NY. [= FNA, G, K; C. microiria Steudel -F].
* Cyperus involucratus Rottböll, introduced from Africa, naturalized north at least to FL. [= FNA, K; C. alternifolius Linnaeus, misapplied]

Cyperus retroflexus Buckley. AL west to NM, south to Mexico. [= FNA, K] \{not yet keyed\}
Cyperus schweinitzii Torrey occurs in sandy soils from VT, MA, MN, and Albert, south to NJ, e. PA, n. KY, OH, MO, TX, NM, UT, and Mexico. It occurs in se. PA (Rhoads \& Klein 1993) and NJ. [= FNA, K]
* Cyperus serotinus Rottböll, naturalized in s. NJ, DE, and PA (Kartesz 1999). [= FNA, K]

\section*{Dulichium Persoon (Threeway Sedge)}

A monotypic genus, an herb, North American (known as fossils from Europe). References: Goetghebeur in Kubitzki (1998b); Mastrogiuseppe in FNA (2002b).

Identification notes: The combination of the distichous Cyperus-like spikelets and numerous, distinctly 3-ranked, cauline leaves makes Dulichium distinctive.

Dulichium arundinaceum (Linnaeus) Britton var. arundinaceum, Threeway Sedge. Cp, Pd, Mt (GA, NC, SC, VA): streambanks, marshes, bogs, ditches; common. July-September. Var. arundinaceum ranges from Newfoundland west to MN, south to FL and TX; also from MT and British Columbia south to CA. A second variety, var. boreale Lepage, is endemic in Québec. [= FNA; < D. arundinaceum -- RAB, C, F, G, GW, K, S, W, infraspecific taxa not distinguished]

Eleocharis R. Brown (Spikerush)
by Bruce A. Sorrie and Alan S. Weakley
A genus of about 120-200 species, herbs, cosmopolitan. A molecular study supported the monophyly of subgenus Limnochloa (Roalson \& Friar 2000). References: Smith et al. in FNA (2002b); Socorro González-Elizondo \& Peterson (1997); Roalson \& Friar (2000); Goetghebeur in Kubitzki (1998b).

Identification notes: "Scale" refers to the flower scales. "Sheath" refers to leaf sheaths. "Bristle" refers to perianth bristles.
1 Culms producing vegetative proliferations rather than normal fertile spikelets ...................................... Key A
1 Culms producing at least some fertile spikelets (vegetative proliferations may or may not also be present).
2 Spike 1-2 (-2.5)× as thick as the culm immediately below the spike, gradually expanded from the culm, the base of the spike narrowly cuneate; spike (3-) \(4-8 \times\) as long as wide; [subgenus Limnochloa] . . . . . . . . . . . . . . . . . . . . . . . . . Key B
2 Spike more than \(2 \times\) as thick as the culm immediately below the spike, abruptly expanded from the culm, the base of the spike broadly cuneate, rounded, or truncate; spike 1-3 (-4)× as long as wide.
3 Achenes with several distinct longitudinal ribs or low ridges, the intervening spaces with abundant, very narrow,

3 Achenes without longitudinal ribs, the surface smooth, granular, or honeycomb-like (E. tortilis and E. tuberculosa have indistinct ribs, but intervening cells are honeycomb-like, not thin horizontally; E. tricostata has 3 keel-like ribs, but achene surface appears granular).
4 Achenes lenticular or biconvex; styles 2-branched . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Key \(\mathbf{D}\)
4 Achenes trigonous or nearly terete; styles 3-branched . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Key E

Key A - spikerushes proliferating vegetatively, with no fertile spikelets present
\{key provisional and needing additional testing\}
1 Each culm producing secondary or tertiary whorls.
2 Base of whorl abruptly widened from culm, forming a distinct shoulder; whorl divisions many per whorl (commonly 20 or
more); whorl divisions usually 0.2 mm or less wide, finely capillary (often less than 0.1 mm , but same may apperoach 0.3 mm ); surface texture of divisions obviously beaded (under dissecting microscope)
E. confervoides

2 Base of whorl gradually widened from culm, vase-shaped, not forming a istinct shoulder; whorl divisions fewer per whorl (commonly 15 or less); whorl divisions usually 0.3 mm or more wide ( 0.5 mm or more, but the finest secondary or tertiary divisions as slender as 0.15 mm ); surface texture of divisions not beaded (under dissecting microscope) . . . E. vivipara
1 Each culm producing a single whorl of proliferations.
3 Upper portion of sheath firm, the edge closely red-dotted; sheath tip less than 1 mm long ................ E. vivipara
3 Upper portion of sheath thin and scarious, the edge not differently colored; sheath tip 1-2 mm long; plants usually more filiform and capillary than E. vivipara.
4 Spikelet proliferations distichous; lowest scale much shorter than the others . . . . . . . . . . . . . . . . . . . . . E. baldwinii
4 Spikelet proliferations polystichous or spirally disposed; lowest scale longer than others E. brittonii or E. microcarpa

\section*{Key B -- spikerushes with the spike about as thick as the culm (subgenus Limnochloa)}

1 Culm nodose-septate, about 5 mm in diameter . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . E. equisetoides
1 Culm not nodose-septate, 1-5 mm in diameter.
2 Spike \(3-5 \mathrm{~mm}\) in diameter, to 5 cm long, rounded to obtuse at the tip, densely flowered, the flowers (scales) 50-100 per spike, arranged in obvious spiral rows; culm 2-5 mm in diameter; [of estuarine and riverine marshes, or brackish interdune swale ponds on barrier islands].
3 Culms \(3-5 \mathrm{~mm}\) in diameter, live culms terete when fresh; tubercle base confluent with the summit of the achene ...

3 Culms 2-4 mm in diameter, sharply 3-4-angled when fresh; tubercle base distinctly constricted, forming a "waist" . .
E. quadrangulata

2 Spike 1-2 mm in diamater, to 2.5 cm long, sharply pointed at the tip, loosely flowered, the flowers (scales) 10-25, few enough that the spiral arrangement is not readily apparent; culm 0.5-1.5 (-2) mm in diameter; [of limesink (doline) ponds and Carolina bay lakes of the mainland].
4 Achene body \(0.8-1.5 \mathrm{~mm}\) long; scales mostly ca. 3.5 mm long; culms terete when fresh
E. elongata

4 Achene body \(1.5-2.5 \mathrm{~mm}\) long; scales mostly ca. 5 mm long; culms 3 -angled when fresh
E. robbinsii

\section*{Key C - spikerushes with achenes with several distinct longitudinal ribs with very narrow horizontal cells between}

1 Culms about 0.5 mm thick, firm, not wrinkling in drying; spikes \(3-6 \mathrm{~mm}\) long; [widespread] ..................... E. acicularis
1 Culms 0.6-1.0 mm thick, becoming wrinkled in drying; spikes 2-4 mm long; [of the Coastal Plain, known from Virginia Beach in 1934]
E. radicans

\section*{Key D - spikerushes with achenes lenticular or biconvex and styles 2-branched}

1 Apex of sheath thin, membranous, hyaline, often with a torn edge.
2 Achenes maturing purplish black to black; scales with prominent purple faces and green midrib .......... E. flavescens
2 Achenes maturing olive green to brownish; scales muted, without prominent markings.
E. olivacea

1 Apex of sheath firm, somewhat thickened, opaque, with a definite edge.
3 Rhizomatous perennials growing from thick horizontal rhizomes.
4 Basal (sterile) scales 2-3, the lowest not encircling the base of the spike; [of the Mountains, rarely the Piedmont] ...
E. palustris

4 Basal (sterile) scale solitary and spathiform, encircling the base of the spike; [of either the Mountains, upper Piedmont, or outer Coastal Plain].
5 Achenes prominently reticulate-pitted; [of the outer Coastal Plain] . . . . . . . . . . . E. fallax \{ambigens phase\}
5 Achenes smooth to faintly reticulate; [of the Mountains, rarely Piedmont, or outer Coastal Plain].
6 Culms slender to filiform; scales obtuse, 30-40 per spike; [of basic soils, of the Mountains and rarely Piedmont] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . E. erythropoda
6 Culms thicker, somewhat inflated; scales acute, 5-30 per spike; [of brackish habitats of the outer Coastal Plain]
E. halophila

3 Tufted or cespitose annuals without thick horizontal rhizomes.
7 Tubercle nearly or actually as broad as the achene, and appearing confluent with it, broader than high.
8 Tubercle flat-deltoid, \(1 / 4\) as high as the the achene; bristles shorter than the achene body; [plants of clay soils
only] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . E. engelmannii
8 Tubercle short-conic, \(1 / 3-1 / 2\) as high as the achene; bristles much exceeding the tubercle; [plants of a variety of soils]
E. obtusa

7 Tubercle less than \(2 / 3\) as broad as the achene, conic, taller than broad.
9 Achene body pale brown, about 1 mm long
[E. ovata]
9 Achene body black, 0.5-1.0 mm long.
10 Spikes lance-ovoid to subcylindric; achene body -.5-0.6 mm long . . . . . . . . . . . . . . . . . E. atropurpurea

\section*{Key \(E\) - spikerushes with achenes trigonous or nearly terete and styles 3-branched}

1 Achenes roughly and coarsely honeycomb-reticulate; plants usually forming dense, broad tussocks.
2 Tubercle much narrower than the achene; culms 'lazy', often reclining, distinctly 3 -angled, twisted . . . . . . . . . . E. tortilis
2 Tubercle as broad or broader than the achene; culms ascending to erect, subterete, not twisted
E. tuberculosa

1 Achenes smooth to finely honeycomb-reticulate.
3 Tubercle confluent with the achene summit, not constricted at the base.
4 Achenes bicolored, body black, tubercle whitish, depressed; [plant of freshwater ponds and Carolina bays]
4 Achenes unicolored, body and tubercle light brown or olive brown; [plants of brackish to saline marshes].
5 Plants diminutive, culms slender, rounded, 1-7 cm long, not arching and rooting . . . . . . . . . . . . . . E. parvula
5 Plants robust, culms broad, flattened, 20-80 (or more) long, at least some arching and rooting at tips
E. rostellata

3 Tubercle not confluent with the achene summit, constricted at the base.
6 Achenes with prominenet keel-like angles or ribs . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . E. tricostata
6 Achenes with rounded angles.
7 Scales 2-ranked; spikes usually 2-4-flowered . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . E. baldwinii \(7 \quad\) Scales spirally imbricate; spikes many-flowered.

8 Achenes white or very pale gray.
9 Bristles present.
10 Tubercle depressed-deltoid; scales rounded, appressed
E. brittonii

10 Tubercle conic or deltoid; scales acute to attenuate, the tips free
E. microcarpa

9 Bristles none.
11 Sheath base pinkish to straw-colored; spikes lane-ovate to oblong, 1.5-5 mm long .. E. brittonii
11 Sheath base purple-red; spikes ovoid, 2-3 mm long; [plant very rare, Santee Canal, SC, late
1800's] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . E. Enigrescens
8 Achenes yellowish, brown, or olive.
12 Horizontal rhizomes absent.
13 Achene body 1.2-1.5 mm long; tubercle slender-conic with narrow base; [of basic soils inland] .
. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . E. intermedia
13 Achene body 0.6-0.8 mm long; tubercle braod-conic with wide base; [of the Coastal Plain]
E. vivipara

12 Horizontal rhizomes present.
14 Achenes not honeycomb-reticulate.
15 Bristles present; culms rounded; [of coastal, brackish soils] . . . . . . . . . . . . . . . . E. albida
15 Bristles absent; culms strongly flattened; [of inland basic soils] . . . . . . . . . E. compressa
14 Achenes honeycomb-reticulate.
16 Achenes 1.2-1.7 mm long, at maturity normally with bristles ..... E. fallax \{fallax phase\}
16 Achenes 0.7-1.2 mm long, with or without bristles.
17 Mature achenes with bristles; achenes yellow or brown; culms 0.6-1.0 mm thick; [rare, on outer Coastal Plain of NC and SC] . . . . . . . . . . . . . . . . . . . . . . E. montevidensis
17 Mature achenes without bristles (present when immature, but drop off); achenes olive (yellow in E. elliptica); culms slender-wiry, 0.2-0.4 mm wide (0.4-0.8 in E. tenuis var. pseudoptera); [collectively widespread].
18 Culms 6-8-angled; mature achenes yellow to orange, with prominent transverse bands.
E. elliptica

18 Culms 4 (-5) angled; mature achenes olive, without transverse bands.
19 Culms 0.4-0.8 mm wide, prominently wing-angled; tubercle depressed
E. tenuis var. pseodoptera

19 Culms 0.2-0.4 mm wide, angles not wing-like; tubercle broadly conic or depressed.
20 Tubercle broadly conic, about \(1 / 4-1 / 5\) as high as the achene body . . .
E. tenuis var. tenuis

20 Tubercle depressed, about \(1 / 8\) as high as the achene body
E. tenuis var. verrucosa

Eleocharis acicularis (Linnaeus) Roemer \& J.A. Schultes. Cp, Pd (GA), \{NC, SC, VA\}. [= RAB, C, FNA, GW, K, S]
Eleocharis albida Torrey, White Spikerush. Cp (GA, NC, SC, VA): brackish pools; rare (GA Special Concern, VA Watch List). [= RAB, C, FNA, GW, K, S]

Eleocharis atropurpurea (Retz.) J. \& K. PresI. Cp (GA, NC, SC, VA*): clay-based Carolina bays, other pineland ponds, disturbed wetlands; rare (GA Special Concern, NC Watch List). Reported for South Carolina by Hill \& Horn (1997). [= C, FNA, GW, \(\mathrm{K}, \mathrm{S}\) ]

Eleocharis baldwinii (Torrey) Chapman, Baldwin Spikerush. Cp, Pd (GA), \{NC, SC, VA\}. (VA Rare). [= RAB, C, FNA, GW,

K; E. capillacea Kunth - S, misapplied; E. prolifera Torrey - S; E. baldwinii - S, in a narrower sense]
Eleocharis brittonii Svenson ex Small. \{GA, NC, SC\}. [= FNA, K, S; E. microcarpa Torrey -- RAB, C, GW, in part]
Eleocharis cellulosa Torrey. Cp (GA, NC, SC): fresh to brackish interdune swale ponds on barrier islands; rare (NC Rare).
July-September. E. NC south to s. FL, west to TX and Mexico; also in the West Indies, Bermuda, and Central America. See Gaddy \& Rayner (1980) for the report of this species in SC. [= RAB, FNA, GW, K, S]

Eleocharis compressa Sullivant var. compressa, Flattened Spikerush. Mt (GA, VA): limestone glades and barrens; rare (GA Special Concern, VA Rare). See Brown \& Marcus (1998). In nw. GA (Jones \& Coile 1988). [= FNA; E. compressa -- C, GW, K, infraspecific taxa not distinguished; E. elliptica -- Harvill, misapplied]

Eleocharis confervoides (Poiret) G. Tucker. Cp (GA): submersed in lakes and ponds; rare. GA and FL; West Indies; Central and South America; Asia; Africa; n. Australia. This taxon, often segregated into the monotypic genus Websteria, is widely distributed in tropical and subtropical regions of both hemispheres. Its retention in Eleocharis is supported by a molecular phylogenetic study (Roalson \& Friar 2000). [= Websteria confervoides (Poiret) S. Hooper -- FNA, GW, K; = Websteria submersa (C. Wright) Britton -- S; = Scirpus confervoides Poiret]

Eleocharis elongata Chapman. Cp (GA, NC): quiet waters of limesink (doline) ponds; rare (NC Rare). July-August. Se. NC south to FL, west to s. AL, s. MS, and TX (Sorrie \& Leonard 1999); also Jamaica. [= FNA, GW, K, S]

Eleocharis engelmannii Steudel, Engelmann Spikerush. (GA, NC, SC, VA) (NC Watch List). [= RAB, FNA, K, S]
Eleocharis equisetoides (Elliott) Torrey, Horsetail Spikerush. Cp (GA, NC, SC, VA): quiet waters of limesink (doline) ponds, natural lakes, borrow pits, ditches, artificial millponds; uncommon (NC Watch List, VA Rare). June-September. MA south to c. peninsular FL, west to se. TX; also near the Great Lakes from NY west to MI and MO. [= RAB, C, FNA, GW, K, S]

Eleocharis erythropoda Steudel, Bald Spikerush. \{GA, NC, VA\}. (GA Special Concern, NC Watch List). [= RAB, FNA, GW, K; E. palustris -- C, in part; E. calva Torrey - S]

Eleocharis fallax Weatherby. Cp (GA, NC, SC, VA): brackish marshes; rare (GA Special Concern). [= RAB, C, FNA, GW, K; E. ambigens Fernald - FNA]

Eleocharis flavescens (Poiret) Urban var. flavescens. (GA, NC, SC, VA). [=C, FNA, K; E. flavescens -- RAB, GW, infraspecific taxa not distinguished]

Eleocharis geniculata (Linnaeus) Roemer \& J.A. Schultes. (GA?, NC, SC). [= FNA, GW, K; E. caribaea (Rottböll) S.F.Blake -- RAB, C, S]

Eleocharis halophila (Fernald \& Brackett) Fernald. Cp (NC, VA): (NC Threatened, VA Rare). [= RAB, K; < E. palustris -- C, in part; < E. uniglumis (Link) Schultes - FNA; = E. uniglumis var. halophila Fernald \& Brackett]

Eleocharis intermedia J.A. Schultes, Matted Spikerush. Mt (VA): muddy calcareous seepage areas; rare (VA Rare). The fruiting culms are of widely different lengths, the lowermost sprawling and much shorter than the longer. [= C, FNA, K]

Eleocharis melanocarpa Torrey, Black-fruited Spikerush. Cp (GA), \{NC, SC, VA\}: (NC Watch List, VA Rare). MA south to FL, west to s. MS; disjunct in e. TX, s. MI, and n. IN (Sorrie \& Leonard 1999). [= RAB, C, FNA, GW, K, S]

Eleocharis microcarpa Torrey var. filiculmis Torrey. (NC, SC, VA). [= FNA; < E. microcarpa -- RAB, C, GW, K, in part only; E. torreyana Boeckeler - S, in part]

Eleocharis microcarpa Torrey var. microcarpa. (SC). [=FNA; < E. microcarpa -- RAB, C, GW, K, in part only; E. microcarpa - S, in part; E. torreyana Boeckeler - S, in part]

Eleocharis montevidensis Kunth, Sand Spikerush. Cp (GA, NC, SC): maritime wet grasslands; rare (GA Special Concern, NC Rare). Reported for SC by Nelson \& Kelly (1997). [= RAB, FNA, GW, K]

Eleocharis nigrescens (Nees) Steudel. Cp (SC): pond margins, flatwoods; rare. SC to FL; West Indies, Mexico; South America; Africa. [= FNA, GW, K; E. setifolia (A. Richard) Raynal; E. microcarpa -- RAB, in part; E. carolina Small -- S]

Eleocharis obtusa (Willdenow) J.A. Schultes. Cp, Pd, Mt (GA), \{NC, SC, VA\}. [=FNA, GW, K, S; E. ovata -- RAB, C, FNA, in part]

Eleocharis olivacea Torrey var. olivacea. \{GA, SC, VA\}. [= K; E. flavescens (Poiret) Urban var. olivacea (Torrey) Gleason -C, FNA; E. olivacea - S; E. flaccida (Reichenbach) Urban - S]

Eleocharis palustris (Linnaeus) Roemer \& J.A. Schultes, Small's Spikerush. \{NC, SC, VA\}. (NC Watch List, VA Watch List). E. smallii is sometimes separated as the eastern North American member of the north temperate E. palustris complex. [= FNA, K; E. smallii Britton; E. palustris -- RAB, C, in part]

Eleocharis parvula (Roemer \& J.A. Schultes) Link ex Bluff, Nees, \& Schauer, Little-spike Spikerush. Cp, Pd (GA), \{NC, SC, VA\}: shallow waters of managed impoundments. (NC Watch List). [= RAB, FNA, GW, K; E. parvula var. parvula -- C]

Eleocharis quadrangulata (Michaux) Roemer \& J.A. Schultes. Cp, Mt, Pd (GA, NC, SC, VA): pools, marshes; uncommon. June-September. MA west to Ontario and MI, south to n. FL and TX. [= RAB, C, FNA, GW, K, S]

Eleocharis radicans (A. Dietrich) Kunth, Rooting Spikerush. \{VA\}. (VA Rare). [= C, FNA, GW, K]
Eleocharis robbinsii Oakes, Robbins Spikerush. Cp (GA, NC, SC, VA), Mt (VA): quiet waters of limesink (doline) ponds, natural lakes; rare (NC Rare, VA Rare). July-August. Nova Scotia and New Brunswick west to Ontario, south to s. MS (Sorrie \& Leonard 1999); also near the Great Lakes, from NY west to IN and WI. [= RAB, C, FNA, GW, K, S]

Eleocharis rostellata (Torrey) Torrey, Beaked Spikerush. \{GA?, NC, SC, VA\}. (NC Rare, VA Watch List). [= RAB, C, FNA, GW, K]

Eleocharis tenuis (Willdenow) J.A. Schultes var. pseudoptera (Weatherby ex Svenson) Svenson. \{NC, VA\}. [= FNA, K; E. tenuis -- RAB, infraspecific taxa not distinguished; E. elliptica Kunth var. pseudoptera (Weatherby ex Svenson) L. Harms; E.capitata (Linnaeus) R. Brown - S, in part]

Eleocharis tenuis (Willdenow) J.A. Schultes var. tenuis. \(\{G A, N C, S C, V A\}\). [= FNA, K; E. tenuis -- RAB, infraspecific taxa not distinguished; E. capitata (Linnaeus) R. Brown - S, in part]

Eleocharis tenuis (Willdenow) J.A. Schultes var. verrucosa (Svenson) Svenson. (GA, SC, VA) (GA Special Concern, VA Watch List). [= FNA, K; E. verrucosa (Svenson) E. Harms -- GW; E. capitata (Linnaeus) R. Brown - S, in part] Eleocharis tortilis (Link) J.A. Schultes. Cp (GA), \{NC, SC, VA\}. [= RAB, C, FNA, GW, K]

Eleocharis tricostata Torrey, Three-angle Spikerush. \(\mathrm{Cp}(\mathrm{GA}),\{\mathrm{NC}, \mathrm{SC}, \mathrm{VA}\}\). (NC Watch List, VA Rare). [= RAB, C, FNA, GW, K, S]

Eleocharis tuberculosa (Michaux) Roemer \& J.A. Schultes. Cp, Pd (GA), \{NC, SC, VA \}. [= RAB, C, FNA, GW, K; E. simplex (Elliott) A. Dietrich - S; E. tuberculosa - S, in a narrower sense]

Eleocharis vivipara Link, Viviparous Spikerush. Cp (GA), \{NC, SC, VA\}. (NC Watch List, VA Rare). [= RAB, C, FNA, GW, K, S; E. curtisii Small]

Eleocharis aestuum Hines ex A. Haines. In DE, NJ, northwards. [= FNA]
Eleocharis bicolor Chapman, in GA, FL. [= FNA, K, S]
Eleocharis bifida S.G. Smith, in GA, TN, KY, AL. [= FNA]
Eleocharis elliptica Kunth, south to PA, NJ, and WV (Kartesz 1999, FNA). [= FNA, K; E. tenuis (Willdenow) J.A. Schultes var. borealis (Svenson) Gleason -- C]

Eleocharis interstincta (Vahl) Roemer \& J.A. Schultes. AL and FL southwards. [= FNA, K]
Eleocharis lanceolata Fernald. In nc. TN. [= FNA, K]
Eleocharis minima Kunth, is reported from specimens from sc. GA (Sorrie, pers. comm.). [= FNA, K; E. uncialis Chapman S]

Eleocharis montana (Kunth) Roemer \& J.A. Schultes. Cp (GA): In sw. GA (Jones \& Coile 1988). [= FNA, K; E. nodulosa (Roth) Schultes - S; E. montana var. nodulosa (Roth) Svenson]

Eleocharis ovata (Roth) Roemer \& J.A. Schultes. South to MD, DE, KY, NJ, PA (Kartesz 1999). [= FNA, K; E. ovata -- RAB, C, in part] \{keyed\}

Eleocharis wolfii (A. Gray) A. Gray ex Britton. Pd (GA): shallow ephemeral pools on granitic flatrocks; rare (GA Special Concern). In sc. TN, AL, and GA westwards. [= FNA, K]
subgenus Eleocharis
section Eleocharis
series Eleocharis
subseries Eleocharis: erythropoda, fallax, halophila, palustris, smallii
subseries Truncatae: compressa, elliptica, intermedia, montevidensis, tenuis, tricostata, verrucosa
series Albidae: albida
series Melanocarpae: melanocarpa
series Rostellatae: rostellata
series Tenuissimae
subseries Chaetariae: baldwinii, brittonii, microcarpa, nigrescens, setifolia, tortilis, tuberculosa, vivipara
section Eleogenus
series Ovatae: engelmannii, obtusa, ovata
series Maculosae
subseries Ocreatae: flavescens, olivacea
subseries Rigidae: atropurpurea, geniculata
section Parvulae: parvula
subgenus Limnochloa
section Limnochloa: cellulosa, elongata, equisetoides, quadrangulata, robbinsii
subgenus Scirpidium
section Scirpidium: acicularis, radicans

\section*{Eriophorum Linnaeus (Cottongrass, Cottonsedge, Bogwool)}

A genus of about 20 species, herbs, primarily north temperate, boreal, and arctic. References: Ball \& Wujek in FNA (2002b); Goetghebeur in Kubitzki (1998b).

1 Foliaceous bracts (subtending the head of spikelets) 2 or 3 , spreading, the inflorescence therefore appearing terminal. 2 Blade of the uppermost leaf on the stem much shorter than its sheath . . . . . . . . . . . . . . . . . . . . . . . . . . . . [E. gracile] 2 Blade of the uppermost leaf on the stem as long as the sheath or longer [E. tenellum]
1 Foliaceous bract (subtending the head of spikelets) solitary, erect, appearing as a continuation of the culm and the inflorescence therefore appearing lateral.
3 Scales (subtending the flower) prominently 3-7-nerved . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . E. virginicum
3 Scales (subtending the flower) 1-nerved . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [E. viridicarinatum]
Eriophorum virginicum Linnaeus, Tawny Cottongrass. Cp, Mt (GA, NC, SC, VA), Pd (NC, SC, VA): peaty sites, limited in habitat throughout the region, occurring in the Mountains in bogs and fens, in the Piedmont (formerly) in bogs, in the fall-line sandhills in burned-out pocosins, in the Coastal Plain in pocosins, acidic seeps, and peat-burn pools; rare (GA Special Concern, NC Watch List, VA Watch List). July-September. Labrador and Newfoundland west to Ontario and MN, south to se. NC, sw. NC, e. KY; disjunct in se. GA at Okefenokee Swamp. Very variable in size, from 5-15 dm tall, with heads ranging from 1-6 cm in diameter, the larger plants primarily in the Coastal Plain and the smaller in the Mountains. [= RAB, C, F, FNA, G, GW, K, S, W]

Eriophorum angustifolium Honckeny ssp. scabriusculum Hultén is erroneously attributed to NC and TN by Kartesz (1999). [=

\section*{K] \{not keyed\}}

Eriophorum gracile W.D.J. Koch ex Roth, Slender Cottongrass, south to s. PA (Rhoads \& Klein 1993), NJ, w. MD (C. Frye, pers comm. 2000), and DE (Kartesz 1999). [= C, FNA; E. gracile var. gracile -- K]

Eriophorum tenellum Nuttall, Conifer Cottongrass, south to se. PA (Rhoads \& Klein 1993) and NJ (Kartesz 1999). [= C, FNA, K]

Eriophorum vaginatum Linnaeus, south to PA and NJ (Ball \& Wujek in FNA 2002b). [= FNA; Eriophorum vaginatum Linnaeus var. spissum (Fernald) Boivin -- K] \{not yet keyed\}

Eriophorum viridicarinatum (Engelmann) Fernald, Darkscale Cottongrass, is seemingly indicated for our area by S; no documentation for this distribution is known. It does range south to e. and w. PA (Rhoads \& Klein 1993) and NJ (Kartesz 1999). [= C, FNA, K]

\section*{Fimbristylis Vahl (Fimbry)}

A genus of about 250-300 species, herbs, primarily warm temperate and tropical. References: Kral (1971)=Z; Kral in FNA (2002b); GW; Goetghebeur in Kubitzki (1998b). Key largely adapted from Z.

1 Style branches 3; achene trigonous or terete; plant an annual.
2 Achene trigonous; spikelets linear-oblong to lanceolate, 3-7 mm long; ligule present, as a line of short, pale hairs
2 Achene terete; spikelets subglobose to ovoid, 2-4 mm long; ligule absent F. miliacea

1 Style branches 2; achene lenticular or terete; plant an annual or perennial.
3 Plants diminutive annuals, the culms 1-6 (-15) cm tall.
4 Achene cylindrical, \(2-4 \times\) as long as wide, curved like a tiny banana; inflorescence bracts 1-2 cm long . F. perpusilla
4 Achene obovate, \(1-1.5 \times\) as long as wide, not curved; inflorescence bracts 4-10 cm long ................ F. vahlii
3 Plants small to large annuals or perennials, the culms (6-) 15-150 cm tall.
5 Plant a medium-sized to robust perennial, the culms generally 5-15 dm tall, either cespitose, with a hardened base, and deeply set in the substrate, or rhizomatous, the rhizomes either slender or thick
6 Plant cespitose, lacking rhizomes; bases of leaves hard, leathery, dark brown, deeply set in the substrate, the base of the plant generally \(5-15 \mathrm{~cm}\) below the ground surface; achene (1.3-) 1.5-2 mm long . . . . F. castanea
6 Plant rhizomatous, the rhizomes either thick and knotty or slender and scaly (rarely with both); bases of leaves often somewhat thickened, hardened, and brownish, the base of the plant not especially deeply set; achene 0.8 1.2 (-1.3) mm long.
\(7 \quad\) Plant a robust perennial to \(15(-20) \mathrm{dm}\) tall, with elongate, slender, scaly, pale-to-reddish rhizomes (excavate carefully); leaves usually flat or keeled, \(2-5 \mathrm{~mm}\) wide; stem usually flattened and scabrousedged above; ligule a line of short, pale hairs
F. caroliniana

7 Plant a medium-sized perennial to 10 dm tall, rhizomatous, the rhizomes short, thick, and knotty (rarely also with slender rhizomes); leaves usually involute, ca. 1 mm wide; stem usually terete or oval in crosssection, smooth; ligule absent or poorly developed . . . . . . . . . . . . . . . . . . . . . F. puberula var. puberula
5 Plant a small to medium-sized annual or perennial, the culms to 8 dm tall, neither rhizomatous (except \(F\). brevivaginata) nor with a hardened base deeply set in the substrate.
8 Spikelets pale, usually solitary ( -3 ) on the scape (and thus appearing somewhat like an Eleocharis) .........
8 Spikelets dark, usually in a complex inflorescence.
9 Face (one side) of the achene with 15 or more longitudinal rows of rounded pits, the achene margin noticeably paler . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . F. tomentosa
9 Face (one side) of the achene with 13 or fewer longitudinal rows of rectangular pits, the achene margin not noticeably paler.
10 Plant a perennial; leaves spreading, 2-5 mm wide; achenes lacking warts.
11 Plant bulbous at base, and also with scale-covered short rhizomes; spikelet scales glabrous or puberulent; [plant a rare native of rock outcrops in GA and AL] . . . . . . . . . . . F. brevivaginata
11 Plant neither bulbous nor rhizomatous; spikelet scales glabrous; [plant weedy, probably introduced in North America] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . F. dichotoma
10 Plant an annual; leaves spreading or ascending, 1-4 mm wide; achenes with or without warts.
12 Achenes with a few low warts on the edges; primary rays of umbel stiffly spreading (even deflexed), the inflorescence therefore often as broad as long or broader; leaves relatively hard, broad (averaging 2 mm wide), and spreading subdistichously . . . . . . . . . . . . . . . F. decipien
12 Achenes lacking warts or with warts scattered over the entire surface; primary rays of umbel spreading or ascending, the inflorescence generally longer than broad; leaves relatively soft . . .
*? Fimbristylis annua (Allioni) Roemer \& J.A. Schultes. Pd, Cp (GA, NC, SC, VA), Mt (NC, SC, VA): wet, disturbed areas, thin soils of rock outcrops; common, variously interpreted as entirely alien or partly native. July-September. Ranging north to VA and MO. [= C, FNA, G, GW, K, W, Z; F. dichotoma -- RAB, in part only; F. baldwiniana (J.A. Schultes) Torrey -- F, S]

Fimbristylis autumnalis (Linnaeus) Roemer \& J.A. Schultes. Cp, Pd, Mt (GA, NC, SC, VA): moist to wet disturbed areas; common. August-October. Throughout e. North America, from ME west to MN and SD and south to s. FL and TX; also widespread
in the Old World and New World tropics. [= RAB, C, F, FNA, G, GW, K, S, W, Z; F. autumnalis var. mucronulata (Michaux) Fernald -- F; F. geminata (Nees) Kunth -- S]

Fimbristylis brevivaginata Kral, Flatrock Fimbry. Pd (GA): pools and seepage over granite; rare (GA Special Concern). Also in the Cumberland Plateau of AL, on sandstone (Kral 1992). See Kral (1992) for details. [= FNA, K]

Fimbristylis caroliniana (Lamarck) Fernald. Cp (GA, NC, SC, VA): brackish or alkaline sands of marsh edges and dune swales, less typically in savannas or pine flatwoods; common (VA Watch List). July-September. NJ south to s. FL and west and south to TX and the Yucatan Peninsula. This species often grows in proximity to \(F\). castanea, which, however, occupies the brackish marsh itself. [= C, F, FNA, G, GW, K, Z; F. spadicea (Linnaeus) Vahl -- RAB, in part only; F. harperi Britton ex Small -- S]

Fimbristylis castanea (Michaux) Vahl. Cp (GA, NC, SC, VA): brackish marshes and dune swales; common. JulySeptember. NY (Long Island) south to s. TX and adjacent Mexico, and on the Yucatan peninsula and in the West Indies. Replaced southward (as in the West Indies and Central America by the closely related F. spadicea (Linnaeus) Vahl. [= C, F, FNA, G, GW, K, S, Z; F. spadicea (Linnaeus) Vahl -- RAB, in part only]
*? Fimbristylis decipiens Kral. Cp (GA, NC), Pd (GA): wet, disturbed areas; rare, possibly introduced. July-September. E. NC south to n . FL and west to e. TX. [= FNA, GW, K, Z]
* Fimbristylis dichotoma (Linnaeus) Vahl. Cp (GA, NC, SC, VA), Pd (GA): wet, disturbed areas; rare, presumably introduced. July-September. Ranging north to VA. [= FNA, GW, K, Z; F. dichotoma -- RAB, in part only (also see F. annua and F. tomentosa); F. diphylla (Retz.) Vahl -- S]

Fimbristylis miliacea (Linnaeus) Vahl. Cp, Pd (GA, NC, SC), Mt (NC, SC): disturbed wet ground; common, introduced from Asia. July-September. Kral (1971) suggests that it may have been introduced into se. United States early, in association with rice. In North America, now ranging from Central America and the West Indies north to NC, KY, and AR. [= RAB, C, FNA, GW, S, W, Z, misapplied?; F. littoralis Gaudichaud -- K]

Fimbristylis perpusilla Harper ex Small \& Britton, Harper's Fimbry. Cp (GA, NC, SC, VA): drawdown zones of natural depression ponds or exposed banks of blackwater rivers; rare (GA Endangered, NC Rare, SC Rare, VA Endangered). JulySeptember. The "range" consists of geographically scattered and "irregularly apparent" populations, usually on the drawdown zones of natural ponds or rivers, in the Coastal Plain from DE and e. MD south through e. VA, se. NC, and ne. SC, to sw. GA, and disjunct in the Cumberland Plateau of se. TN, where associated with other Coastal Plain species (Wofford \& Jones 1988). See Leonard (1981a, 1981b) and Leonard (1987) for the first reports of the species in SC and NC. The species characteristically occurs on dry to moist banks exposed in summer by falling water levels, often with other diminutive annuals, such as Hemicarpha micrantha, Oldenlandia uniflora, Juncus repens, Lindernia dubia, Eleocharis baldwinii, and Eragrostis hypnoides. At known locations it does not appear every year; presumably it is present in a seedbank which germinates only under favorable hydrologic (and other?) conditions. [= C, FNA, GW, K, S, Z]

Fimbristylis puberula (Michaux) Vahl var. puberula. Cp (GA, NC, SC, VA), Pd, Mt (NC, SC, VA): savannas, pine flatwoods, bogs, wet meadows or prairie-like areas; common (VA Rare). July-September. Var. puberula ranges from Long Island, NY south to s. FL and west to TX, KS, and NE; var. interior (Britton) Kral ranges from NE south to TX and west to NM and AZ. [=C, FNA, K, Z; F. spadicea (Linnaeus) Vahl -- RAB, W, in part only; F. drummondii (Torrey \& Hooker) Böckler -- F; F. puberula -- GW, S; F. anomala Böckler -- S]
* Fimbristylis schoenoides (Retzius) Vahl, an Asian introduction. Cp (GA): disturbed wetlands; uncommon, introduced from Asia. Reported for sw. GA (Jones \& Coile 1988) and also occurs in se. GA (B. Sorrie, pers. comm.). [= FNA, GW, K]
* Fimbristylis tomentosa Vahl. Cp (GA, NC, SC), Mt, Pd (NC, SC): wet, disturbed areas; uncommon, presumably introduced. July-September. Ranging north to NC, e. TN, and AR. [= FNA, GW, K, Z; F. dichotoma -- RAB, in part only]

Fimbristylis vahlii (Lamarck) Link. Cp (GA, SC?): on exposed silty or clayey sediments; rare (SC Rare). July. Primarily from MO south to MS and e. TX, but with scattered outliers as far away as NJ, SC (?), IL, and KS; also in western United States, Mexico, Central America. Note that the basis of the SC record is uncertain, and may be based on a misidentification of \(F\). perpusilla. [= RAB, C, F, FNA, G, GW, K, S, Z]

\section*{Fuirena Rottbøll (Umbrella-sedge)}

A genus of about 30 species, herbs, primarily in Africa and America, in tropical and warm temperate regions. References: Kral (1978a) \(=\) Z; Kral in FNA (2002b); Goetghebeur in Kubitzki (1998b).

1 Sheaths of leaves glabrous, the largest leaf blades \(0-2(-5) \mathrm{cm}\) long; plant strongly rhizomatous, the culms usually about 10 cm apart.
2 Blades of culm leaves \(<5 \mathrm{~cm}\) long; spikelets mostly lance-ovoid, sessile in terminal clusters and also often with additional sessile or peduncled clusters lower on the culm; involucrral bract longer than the spikelets
F. longa

2 Blades of culm leaves very short ( \(<0.5 \mathrm{~cm}\) long); spikelets mostly ovoid, sessile in terminal clusters; subtending involucral bract shorter than the spikelets
F. scirpoidea

1 Sheaths of leaves sparsely to densely hirsute, the largest leaf blades 10-15 cm long; plant more-or-less cespitose, annual or perennial, if perennial the rhizomes short and cormlike, the culms usually arising together.
2 Perianth bristles no longer than the achene stipe (not nearly reaching halfway up the achene body), without barbs (sometimes very finely toothed, the teeth ascending); blades of the perianth scales with a blunt or short-apiculate apex .
F. breviseta

2 Perianth bristles longer than the achene stipe, reaching the middle of or exceeding the achene body, strongly and retrorsely barbed; blades of the perianth scales with an acuminate to awned apex.
3 Perianth bristles reaching \(1 / 2\) to \(3 / 4\) the length of the achene body; anthers about 1.0 mm long; blades of the perianth scales mostly acuminate; perennial
F. squarrosa

3 Perianth bristles as long as or exceeding the achene body; anthers about 0.5 mm long; blades of the perianth scales mostly awned; annual . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . F. pumila

Fuirena breviseta (Coville) Coville in Harper, Short-bristled Umbrella-sedge. July-October. Cp (GA, NC, SC, VA): savannas, ditches, other wet habitats; common (VA Rare). A Southeastern Coastal Plain endemic: se. VA south to s. FL and west to e. TX, primarily in the outer Coastal Plain. [= C, F, FNA, G, GW, K, S, Z; < F. squarrosa -- RAB, in part only]

Fuirena longa Chapman, Chapman's Umbrella-sedge. Cp (GA): pond margins; rare, possibly introduced (GA Special Concern). Panhandle FL and sw. GA west to e. TX. Possibly a hybrid derivative of F. breviseta and F. scirpoidea. [= FNA, GW, K, S, Z]

Fuirena pumila (Torrey) Sprengel, Dwarf Umbrella-sedge. Cp (GA, NC, SC, VA): savannas, ditches, other wet habitats; common. July-October. Primarily a species of the Southeastern Coastal Plain, ranging from se. MA south to s. FL and west to TX, and also disjunct in the lowlands around the Great Lakes (as in n. IN and s. MI). [= RAB, C, F, FNA, G, GW, K, Z; F. squarrosa -- S, misapplied]

Fuirena scirpoidea Michaux, Southern Umbrella-sedge. Cp (GA, NC?): natural lakes, pineland depression ponds, wet savannas; rare (GA Special Concern, NC Watch List). July-October. A Southeastern Coastal Plain endemic: se. GA (Jones \& Coile 1988) and FL, west to se. TX, also in Cuba and apparently disjunct (or introduced?) in ne. NC and s. IL. Kral's (1978a) report of this species from ne. NC, where disjunct from the main body of the range in the deep South, needs further investigation. [= C, FNA, G, GW, K, S, Z]

Fuirena squarrosa Michaux, Hairy Umbrella-sedge. Cp (GA, NC, SC, VA), Pd (GA, NC, SC), Mt (NC): savannas, seepages, ditches, bogs, other wet habitats; common. July-October. NY (Long Island) south to \(n\). FL, west to c. TX, inland to w. NC, w. TN, KY, s. AR, and se. OK, mainly on the Coastal Plain, but less strictly limited to it than our other species. [= C, F, FNA, G, GW, K, W, \(Z\); < F. squarrosa -- RAB, in part only (also see F. breviseta); F. hispida Elliott -- S]

\section*{Hemicarpha Nees \& Arnott}
(see Lipocarpha)

\section*{Isolepis R. Brown (Club-rush)}

A genus of about 60 species, herbs, subcosmopolitan in distribution. Since Isolepis is more closely related to Cyperus than to Scirpus, in which it has often been included, its separation from Scirpus is clearly warranted. The generic delimitation of Isolepis in relation to Ficinia and Scirpoides is uncertain. References: Smith in FNA (2002b); Goetghebeur in Kubitzki (1998b).

1 Achenes 1.0-1.5 mm long; scales in middle of spikelet 1.8-2.0 mm long, with a short awn . . . . . . . . . . . . . . . . . . . . I. carinata
1 Achenes 0.7-0.9 mm long; scales in middle of spikelet 1.0-1.2 mm long, mucronate ................... . pseudosetacea
Isolepis carinata Hooker \& Arnott ex Torrey. Pd (GA, NC, SC), Cp (NC, VA): moist soils adjacent to granitic flatrocks, moist sandy sites, low fields; rare (VA Watch List). May-June. C. NC, TN, and se. KS south to panhandle FL and c. TX; also in CA. [= FNA, K; Scirpus koilolepis (Steudel) Gleason -- RAB, C, F, G, GW; Scirpus carinatus (Hooker \& Arnott ex Torrey) A. Gray -- S (not S. carinatus Sm.); Isolepis koilolepis Steudel]

Isolepis pseudosetacea (Daveau) Gandoger. Cp? (GA): moist soils; rare. E. GA west to sw. MO, AR, and c. TX. This species often grows intermixed with I. carinata and may be more widespread in our area. [= FNA; Isolepis molesta (M.C. Johnston) S.G. Smith -- K; Scirpus molestus M.C. Johnston]

\section*{Kyllinga Rottbøll (Greenhead Sedge)}

A genus of about 60 species, pantropical to warm temperate, especially in Africa. References: Delahoussaye \& Thieret (1967)=Z; Tucker (1987)=Y; Tucker (1984)=X; Tucker in FNA (2002b); Goetghebeur in Kubitzki (1998b).

1 Plant a rhizomatous perennial, mat-forming, the culms arising singly along the rhizome; anthers 0.8-1.1 mm long.
2 Achene 1.0-1.2 (-1.3) mm long; scale keel denticulate or smooth; stamen 2 (rarely 1); longest inflorescence bract erect .
K. brevifolia

2 Achene 1.5-1.8 mm long; scale keel smooth; stamens 2-3; longest inflorescence bract horizontal to slightly reflexed
K. gracillima

1 Plant a cespitose annual or perennial, the culms arising clumped; anthers 0.2-0.5 mm long.
3 Mature achene purple black, with stipe and apiculus contrastingly light in color; achene obovate, 0.7-0.8 (-0.9) mm wide; scale keel denticulate or smooth
K. odorata

3 Mature achene uniformly tan or light brown, not bicolored; achene oblong, 0.4-0.6 (-0.7) mm wide; scale keel denticulate

Kyllinga brevifolia Rottbøll, Perennial Greenhead Sedge. Pd (GA, NC, SC, VA?): moist soils of fields, ditches, lawns; rare. June-September. Pantropical, north in North America to n. NC, se. OK, and CA. Likely to occur in s. VA. [= FNA, K, S, X, Y; Cyperus brevifolius (RottbølI) Endlicher \& Hasskarl -- F, G, in part; Cyperus brevifolius -- RAB, GW, Z]
*? Kyllinga gracillima Miquel, Asiatic Greenhead Sedge. Cp (GA, NC, SC, VA), Pd (NC), Mt (NC, VA): river sand bars, tidal
marshes, tidal shores, moist soils of pastures and ditches; rare. See Bryson et al. (1996). K. gracillima Miquel (1866) appears to be the oldest valid combination in the genus Kyllinga, predating K. brevifolioides (Thieret \& Delahoussaye) Tucker (1987). Some authors consider this taxon to be introduced from e. Asia; others consider it possibly native. Its distribution in North America is still somewhat obscure (because of confusion with C. brevifolia), but it is currently known from scattered locations in NC, SC, VA, CT, PA, MD, TN, AL, GA, NJ, DE, AR, MS, and KY. Reported for South Carolina by Hill \& Horn (1997), as K. brevifolioides. [= FNA, K; Cyperus brevifolius (Rottbøll) Endlicher \& Hasskarl -- F, in part; Cyperus brevifolioides Thieret \& Delahoussaye -- RAB, C, GW, W, Z; K. brevifolioides (Thieret \& Delahoussaye) Tucker -- Y]

Kyllinga odorata Vahl, Whitehead Sedge. Cp (GA, NC, SC): moist soils of fields, ditches, lawns, shores of ponds and rivers, sand and gravel bars; common. July-September. Pantropical, north in North America to ne. NC and se. AR. Likely to occur in se. VA. [= K, S, X, Y; Cyperus sesquiflorus (Torrey) Mattfeld \& Kükenthal ex Kükenthal -- RAB, C, GW, Z]

Kyllinga pumila Michaux, Annual Greenhead Sedge. Cp, Pd, Mt (GA, NC, SC, VA): moist soils of fields, ditches, lawns, shores of ponds and rivers; common. July-October. Pantropical, north in North America to e. PA, MO, and e. KS. [= K, S, X, Y; Cyperus tenuifolius (Steudel) Dandy -- RAB, C, F, G, GW, W, Z]

\section*{Lipocarpha R. Brown}

A genus of about 35 species, herbs, pantropical and extending into warm temperate regions. References: Tucker (1987)=Z; Tucker in FNA (2002b); Goetghebeur in Kubitzki (1998b).

*? Lipocarpha aristulata (Coville) G. Tucker. Cp (SC): moist ground; rare. Se. SC south to FL, west to the mw. and w. United States; the eastern occurrences may be adventive. [= FNA, K, Z; Hemicarpha aristulata (Coville) Smyth -- F, GW; H. micrantha var. aristulata Coville -- C, G]

Lipocarpha maculata (Michaux) Torrey, American Lipocarpha. Cp (GA, NC, SC, VA): ditches, moist exposed soil; uncommon (VA Rare). July-September. Ranging from se. VA south to s. FL, west to AL. [= RAB, C, F, FNA, G, GW, K, S, Z]

Lipocarpha micrantha (Vahl) G. Tucker. Cp (NC, SC, VA), Pd (SC, VA), \{GA\}: riverbank draw-down zones, other moist sandy areas; rare (SC Rare, NC Rare, VA Rare). July-August. ME west to Ontario and MN, south to s. FL and TX; south into tropical America. Several recent authors have advocated submerging Hemicarpha in Lipocarpha, including Tucker (1987). [= FNA, K, Z; Hemicarpha micrantha (Vahl) Pax -- RAB, F, GW, S; Hemicarpha micrantha var. micrantha -- C; Hemicarpha micrantha var. minor (Schrader) Friedland -- G]

\section*{Oxycaryum Nees}

A monotypic genus of tropical and subtropical America and Africa. References: Bruhl in FNA (2002b).
* Oxycaryum cubense (Poeppig \& Kunth) Lye, Cuban Bulrush. Cp (GA): swamps, marshes, ponds, ditches; uncommon, aggressively weedy, probably adventive from the New World tropics. See Bryson et al. (1996). [= FNA, K; = Scirpus cubensis Poeppig \& Kunth - GW, S] \{not yet keyed\}

Rhynchospora Vahl (Beaksedge, Beakrush)
(contributed by Richard J. LeBlond)

A genus of about 250 species, subcosmopolitan, but concenrated in tropical and warm temperate America. See Thomas (1984) for the reasons for the inclusion of Dichromena in Rhynchospora. References: Gale (1944)=Z; Kral in FNA (2002b); Kral (1996, 1999); Goetghebeur in Kubitzki (1998b). Distributions given for tropical America are largely derived from Thomas (1992).

Identification notes: measurements and descriptions of the achene are of the achene body only, not including the tubercle, unless otherwise indicated.

\section*{Key to groups}

4 Bristles absent, or present and smooth, or antrorsely barbed and filiform.
5 Achene surface smooth, minutely pitted, or finely striate (not ridged, rugose, or reticulate) ........ Key E
5 Achene surface transversely ridged, rugose, or honeycombed-reticulate (sometimes faintly so) . . . Key F

Key A - beaksedges with tubercles 3-23 mm long
1 Spikelets in 1-4 globose clusters; tubercle 3-5 mm long; leaf blades 2-8 mm wide ............................ Rh. tracyi
1 Spikelets in more than 4 paniculate or corymbose clusters; tubercle 10-23 mm long; leaf blades 6-20 mm wide.
2 Longest bristles shorter than the achene.
Achene \(5-6 \mathrm{~mm}\) long, \(2.8-3.3 \mathrm{~mm}\) wide
Achene \(4.4-5.3 \mathrm{~mm}\) long, \(2.4-2.8 \mathrm{~mm}\) wide
Rh. corniculata var. corniculata Rh. corniculata var. interior
Longest bristles longer than or equaling the achene.
4 Plants cespitose; primary clusters with 10-50 (rarely 7 or fewer) densely clustered spikelets; achene (4.5-) 5-6 mm long.
5 Achene 3.0-3.8 mm wide; tubercle base \(1.8-2.4 \mathrm{~mm}\) wide; [primarily of fresh tidal marshes]
Rh. macrostachya var. colpophila
5 Achene 2.6-3.1 mm wide; tubercle base 1.0-1.8 mm wide; [primarily of non-tidal wetlands]
Rh. macrostachya var. macrostachya
4 Plants rhizomatous; primary clusters with 1-6 loosely clustered spikelets; achene (3.5-) 4.0-4.8 mm long.
6 Bristles 2-8 mm long, the central bristle longest on one face, shortest or absent on the other .... Rh. careyana
6 Bristles \(7-12 \mathrm{~mm}\) long, essentially of equal length . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Rh. inundata

\section*{Key B - beaksedges with basally-white bracts (White-bracted Sedges)}

1 Inflorescence bracts 3-6 (-7); basal bract (1.4-) 2-5 mm wide, the white portion (2.5-) 9-25 mm long, tapering gradually into the green portion; rhizomes slender, straight, (0.6-) 0.7-1.7 (-2.1) mm in diameter; achene 1.0-1.2 mm wide; tubercle broadly truncate on achene

Rh. colorata
1 Inflorescence bracts (5-) 6-10; basal bract 5-12 mm wide, the white portion 22-55 mm long, tapering abruptly into the green portion; rhizomes often bent and swollen at the nodes, 1.4-3.8 mm in diameter; achene 1.2-1.5 mm wide; tubercle decurrent on achene

Rh. Iatifolia

\section*{Key C-beaksedges with plumose bristles}

1 Spikelets 2-4 mm long, borne several to many in clusters, none of the spikelets on slender stalks; achene 1.4-1.8 mm long, 0.91.4 mm wide

Rh. plumosa
1 Spikelets (4-) \(5-8 \mathrm{~mm}\) long, borne singly or a few together in loose clusters, some or all spikelets on slender stalks; achene 1.72.6 mm long, \(1.2-2.0 \mathrm{~mm}\) wide.

2 Achene obovoid, 1.7-2.0 mm long, 1.2-1.5 mm wide, the tubercle seated on its summit without a constriction or basal flange; longer bristles no more than half as long as achene

Rh. breviseta
2 Achene broadly elliptic, 1.9-2.6 mm long, \(1.5-2.0 \mathrm{~mm}\) wide, its summit constricted below a collar-like flange at the base of the tubercle; longer bristles three-fourths to exceeding length of achene Rh. oligantha

\section*{Key D - beaksedges with bristles retrorsely barbed (at least distally) or antrorsely barbed and straplike (flattened)}

1 Bristles 8-25, retrorsely barbed distally, antrorsely barbed proximally; spikelets white, turning tan with age.
2 Spikelets with 2-3 florets; bristles 8-12; achene 1.6-2.1 mm long, 0.9-1.3 mm wide . . . . . . . . . . . . . . . . . . . . . . . Rh. alba
2 Spikelets with 1 floret; bristles 16-25; achene 2.0-2.4 mm long, 1.3-1.5 mm wide . . . . . . . . . . . . .......... Rh. macra
1 Bristles 6 or fewer, either retrorsely or (rarely) antrorsely barbed their entire length; spikelets variously brown, rufous, or tan (or very rarely white).
3 Spikelets 1-fruited, the solitary achene terminating the axis; clusters 1-7, globose to turbinate.
4 Clusters globose to hemispherical; achene (measured from base of bristles) 1.8-2.6 mm long, 1.1-1.8 mm wide; tubercle 1.4-2.4 mm long.
5 Achene 1.1-1.2 mm wide, 1.8 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Rh. cephalantha var. attenuata 5 Achene 1.2-1.8 mm wide, 2.1-2.6 mm long.

6 Spikelet clusters 1-3 (-4), subglobose to loosely hemispherical, the lateral clusters mostly subterminal ...
............................................................ . Rh. cephalantha var. cephalantha
6 Spikelet clusters 4-7, densely subglobose, the lowest clusters remote
Rh. cephalantha var. pleiocephala
4 Clusters globose to turbinate; achene (measured from base of bristles) 1.3-1.8 mm long, \(0.65-0.95 \mathrm{~mm}\) wide; tubercle 0.7-1.6 mm long.
7 Clusters turbinate to hemispheric (rarely subglobose), the lowest spikelets usually spreading-ascending to
spreading; larger leaves less than 2 mm wide; achene 1.6-1.8 mm long; tubercle 1.0-1.6 mm long
Rh. chalarocephala
7 Clusters globose to subhemispheric, the lowest spikelets usually reflexed; larger leaves more than 2 mm wide; achene 1.3-1.6 mm long; tubercle 0.7-1.2 mm long

Rh. microcephala
3 Spikelets 1-5 fruited (if 1-fruited, then the axis terminated by a sterile floret); clusters 2-many, ovoid to turbinate (rarely globose).
8 Clusters numerous, usually 20 or more; tubercle \(1.3-1.8 \mathrm{~mm}\) long; achene \(1.1-1.4 \mathrm{~mm}\) wide, \(1.5-2.0 \mathrm{~mm}\) long, the summit narrowly truncate, the faces umbonate, the margin thickened and wire-like; leaves \(2.5-7 \mathrm{~mm}\) wide Rh. glomerata var. glomerata
8 Clusters 2-8; tubercle 0.4-1.2 mm long; achene \(0.6-1.2 \mathrm{~mm}\) wide, 1.1-2.0 mm long, the summit more rounded than truncate, the faces lenticular, a wire-like margin narrow or not evident; leaves 0.2-3.5 mm wide.
9 Achene 0.6-0.8 mm wide, 1.1-1.3 mm long; tubercle \(0.4-0.6 \mathrm{~mm}\) long; bristles more-or-less equaling the achene [Rh. knieskernii]
9 Achene 0.8-1.2 mm wide, \(1.3-2.0 \mathrm{~mm}\) long; tubercle \(0.8-1.6 \mathrm{~mm}\) long; bristles more-or-less equaling the tubercle.
10 Inflorescence typically with 1 terminal and 1 lateral cluster, the clusters ovoid, with 1-10 spikelets each; achene 1.8-2.0 mm long, 0.8-1.0 mm wide, \(2-3 \times\) as long as wide; leaves \(0.2-0.4 \mathrm{~mm}\) wide

Rh. capillacea
10 Inflorescence with 1-6 lateral clusters, the clusters turbinate with usually more than 10 spikelets; achene 1.3-1.8 mm long, \(0.9-1.2 \mathrm{~mm}\) wide, \(1.5-2 \times\) as long as wide; leaves \(1.5-3.5 \mathrm{~mm}\) wide.

11 Scales chestnut brown, the inner with a mucro 0.1-0.2 mm long; longer bristles 0.4 mm shorter than to 0.3 mm longer than the tubercle; achene and tubercle 2.4-2.8 mm long; tubercle 0.9-1.2 mm long; [widespread in our area]

Rh. capitellata
11 Scales tan, the inner without a mucro, or mucro less than 0.05 mm long; longer bristles exceeding tubercle by 0.3-1.0 mm ; achene and tubercle 2.0-2.4 mm long; tubercle \(0.5-1.1 \mathrm{~mm}\) long; [of the Coastal Plain].

Rh. leptocarpa

\section*{Key E-beaksedges with bristles smooth, or antrorsely barbed and filiform, or absent, the achene surface smooth, minutely pitted, or finely striate}

Bristles \(12 \ldots\).
2 Leaves with a short taper at the tip, blunt to acute, but not long-acuminate; achene surface minutely pitted near the margin.
3 Basal leaves 4-6 mm wide, ciliate, rosulate; scales acuminate, the midrib ciliate; bristles 6 , less than one-half the length of the achene . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Rh. ciliaris
3 Largest basal leaves \(2.5-3 \mathrm{~mm}\) wide, eciliate, not rosulate; scales aristate, the midrib eciliate; bristles \(3-4\), 1 or more equaling or exceeding the tubercle

Rh. solitaria
2 Leaves long-acuminate at the tip; achene surface smooth or finely striate.
4 Scales white to pale tan; bristles absent or 1-3 rudimentary.
5 Base of plant not bulb-like, not enclosed in bladeless sheaths; achene 1.0-1.2 mm long, 0.8-1.0 mm wide ...
. Rh. chapmanii
4 Scales tan, rufous, or brown; bristles present (if rudimentary, then 4-6).
6 Achene 0.6-1.1 mm wide, pyriform, obovoid, or narrowly elliptic, pale to dark brown but not blackish; tubercle margin setose (bearing bristle-like projections).
7 Achene narrowly elliptic or narrowly obovoid, 1.2-1.5 mm long by 0.6-0.7 mm wide, twice as long as wide; tubercle 0.8-1.2 mm long
[Rh. curtissii]
7 Achene broadly elliptic to obovoid or pyriform, less than twice as long as wide; tubercle 0.4-1.5 mm long.
8 Leaves 2-4 (-5) mm wide; stipe subtending achene \(0.5-1.0 \mathrm{~mm}\) long \(\ldots \ldots .\). . . . . . . Rh. crinipes
8 Leaves 0.2-1.5 (-2) mm wide; stipe subtending achene less than 0.4 mm long.
9 Leaves to \(1.5(-2) \mathrm{mm}\) wide; achene \(1.0-1.7 \mathrm{~mm}\) long, \(0.9-1.1 \mathrm{~mm}\) wide; tubercle \(0.5-1.5 \mathrm{~mm}\) long.
10 Culms solitary to loosely cespitose by slender rhizomes; terminal internode straight; clusters turbinate to ovoid; achene \(1.0-1.3 \mathrm{~mm}\) long, uniformly medium to dark brown; tubercle 0.7-1.5 mm long; bristles usually of two lengths, some equaling the tubercle, and some equaling or shorter than the achene
[Rh. fusca]
10 Culms solitary to cespitose, without slender rhizomes; terminal internode often arched; clusters corymbose to hemispheric; achene 1.3-1.7 mm long, pale to reddish-brown, often translucent centrally, with a distinctly thickened wire-like margin; tubercle 0.5-1.0 mm long; all bristles more-or-less equaling the tubercle

Rh. harperi
9 Leaves filiform, less than 1 mm wide; achene \(0.8-1.3 \mathrm{~mm}\) long, \(0.6-0.9 \mathrm{~mm}\) wide; tubercle 0.4 0.8 mm long.

11 Culms without rhizomes; spikelets 2.5-4 mm long; achene translucent centrally; tubercle \(0.4-0.6 \mathrm{~mm}\) long

Rh. filifolia

11 Culms with delicate rhizomes; spikelets \(5-7 \mathrm{~mm}\) long; achene uniformly opaque; tubercle \(0.6-0.8 \mathrm{~mm}\) long

Rh. pleiantha
6 Achene more than 1 mm wide (except 0.8 mm wide in \(R h\). fernaldii with a blackish surface), suborbicular or broadly ellipsoid; tubercle margin smooth or roughened but not setose.
12 Achene 0.8 mm wide, \(0.9-1.0 \mathrm{~mm}\) long, blackish
Rh. fernaldii
12 Achene 1.1-1.7 mm wide, 1.3-2.0 mm long, brown to dark brown.
13 Tubercle 1.0-2.6 mm long, long-attenuate to subulate ....................... . . Rh. gracilenta
13 Tubercle \(0.2-0.8 \mathrm{~mm}\) long, triangular to triangular-attenuate or with a strap-like beak. 14 Bristles rudimentary to \(1 / 2\) as along as achene body.

15 Larger leaves 2-4 mm wide; mature culms to 13 dm long; floral fascicles (1-) 2-4; tubercle 0.4-0.7 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Rh. fascicularis var. fasciculari

15 Larger leaves to 1 mm wide; mature culms to 4.5 dm long; floral fascicles 1 (-2); tubercle \(0.2-0.5 \mathrm{~mm}\) long . .

Rh. debilis
14 Bristles more than \(1 / 2\) as long to exceeding achene body.
16 Basal leaves filiform to (rarely) 1.3 mm wide, the longer approaching length of culm; tubercle narrowed above the base into a strap-like beak

Rh. wrightiana
16 Basal leaves \(1.3-4 \mathrm{~mm}\) wide, all much shorter than the culm; tubercle triangular to triangular-attenuate.
17 Longer bristles equaling to exceeding the achene body; achene body elliptic, 1.1-1.3 mm wide; tubercle triangular-attenuate; larger basal leaves \(1.3-2.5 \mathrm{~mm}\) wide

Rh. fascicularis var. distans
17 Longer bristles less than \(1 / 2\) as long to rarely exceeding achene body; achene suborbicular, 1.2-1.5 mm wide; tubercle triangular; larger basal leaves 2-4 mm wide .

Rh. fascicularis var. fascicularis

\section*{Key F -- beaksedges with bristles smooth, or antrorsely barbed and filiform, or absent, the achene surface transversely ridged, rugose, or honeycombed-reticulate}

1 Bristles absent (or apparently so at \(10 \times\) ); achene \(0.5-0.7 \mathrm{~mm}\) wide; tubercle \(0.1-0.2 \mathrm{~mm}\) long, skull-cap like.
2 Achene including tubercle 1.0-1.2 mm long, the achene surface evidently reticulate and obscurely transversely ridged, the body ellipsoid; bristles present, white, barely visible at \(20 \times\), the longest shorter than the achene body

Rh. thornei
2 Achene including tubercle \(0.6-0.9 \mathrm{~mm}\) long, the body obovoid; bristles absent.
3 Achene surface smooth, faintly reticulate, not transversely ridged . . . . . . . . . . . . . . . . . . . . . . . . Rh. divergens

1 Bristles present or absent; if absent, then achene more than 1 mm long or 0.7 mm wide, and tubercle triangular to subulate. 4 Culms and leaves filiform.

5 Achene including tubercle \(1.0-1.2 \mathrm{~mm}\) long; tubercle minute, skullcap-like .
Rh. thornei
5 Achene including tubercle \(1.5-2.9 \mathrm{~mm}\) long; tubercle triangular to triangular-acuminate.
6 Tubercle \(0.3-0.7 \mathrm{~mm}\) long; bristles shorter than the achene . . . . . . . . . . . . . . . . . . . . . . . . . . . . Rh. rariflora
6 Tubercle 0.8-1.4 mm long; bristles subequaling to exceeding the tubercle . . . . . . . . . . . . . . . Rh. stenophylla
4 Culms stouter; leaves wider, not filiform.
7 Achene faces flat or concave; when one face is concave, the opposite face is sometimes slightly convex (slightly biconvex Rh. decurrens and Rh. microcarpa are keyed here for convenience).
8 Achene at least twice as long as wide, elliptic-oblong; tubercle subulate, 0.8-1.2 mm long ..... Rh. inexpansa
8 Achene less than twice as long as wide, obovate; tubercle triangular, 0.2-0.9 mm long.
9 Longer bristles exceeding the achene body.
10 Achene \(\pm 2.2 \mathrm{~mm}\) long, \(\pm 1.8 \mathrm{~mm}\) wide; tubercle \(\pm 0.9 \mathrm{~mm}\) long .................... Rh. punctata
10 Achene 0.8-1.2 mm long, 0.7-1.2 mm wide; tubercle \(0.2-0.5 \mathrm{~mm}\) long.
11 Larger leaves (3-) 4-6 mm wide; bristles exceeding tubercle; achene faces flattened Rh. elliottii
11 Larger leaves 1-3 (-4) mm wide, bristles half as long as achene to equaling tubercle; achene
faces slightly convex . . . . . . . . . . . . . . . . . . . . . . . . .
9 Longer bristles shorter than to equaling achene body, or absent.
12 Larger leaves 4-5 mm wide; achene 1.4-1.6 mm wide; tubercle 0.6-0.8 mm long, abruptly rising from a flaring basal collar

Rh. compressa
12 Larger leaves 1-3 (-4) mm wide; achene 0.7-1.3 mm wide; tubercle 0.15-0.5 mm long, without a flaring basal collar.
13 Bristles rudimentary or absent . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . R R R perplexa
13 Bristles one-half as long to equaling achene.
14 Achene 1.3-1.8 mm long, 0.9-1.2 mm wide, the faces flat with 10-12 transverse ridges ...
Rh. torreyana
14 Achene \(0.8-1.4 \mathrm{~mm}\) long, \(0.7-1.2 \mathrm{~mm}\) wide, the faces slightly biconvex with \(6-12\) transverse ridges.
15 Clusters elongate; achene \(1.0-1.4 \mathrm{~mm}\) long, \(0.8-1.0 \mathrm{~mm}\) wide, narrowly obovate to elliptic, averaging 8-12 transverse ridges; most tubercle bases convexly seated on the achene summit and somewhat decurrent along the achene margins, the tubercle

15 Clusters usually compact; achene 0.8-1.2 mm long, 0.7-1.2 mm wide, suborbicular to elliptic, averaging 6-7 transverse ridges; most tubercle bases flat across the achene summit, not decurrent, the tubercle surface usually dark, not waxy . . Rh. microcarpa
7 Achenes biconvex or tumid.
16 Achene dark reddish-brown to black, 1.4-4.2 mm long, 1.2-3.6 mm wide, the summit with a thickened bony to crustaceous rim surrounding the base of the tubercle.
17 Achene lenticular and transversely ridge, \(\pm 1.4 \mathrm{~mm}\) long, \(\pm 1.2 \mathrm{~mm}\) wide . . . . . . . . . . . . . . . . . Rh. culixa 17 Achene tumid, lightly pitted or cancellate in a honeycomb pattern, 1.5-4.2 mm long, 1.4-3.6 mm wide. 18 Leaves 4-8 mm wide; achene 3.0-4.2 mm long, 3.0-3.6 mm wide . . . . . . . . . . . Rh. megalocarpa 18 Leaves \(2-4 \mathrm{~mm}\) wide; achene no more than 2.7 mm long or 2.5 mm wide.

19 Achene \(2.0-2.7 \mathrm{~mm}\) long, \(2.0-2.5 \mathrm{~mm}\) wide
Rh. grayi
19 Achene 1.5-1.8 mm long, 1.4-1.7 mm wide . . . . . . . . . . . . . . . . . . . . . . . . . . . Rh. harveyi
16 Achene amber, reddish-brown, or black, 0.7-1.8 mm long, \(0.7-1.5 \mathrm{~mm}\) wide, the summit without a textured rim surrounding the base of the tubercle (if the base of the tubercle is rim-like, then it is distinguished from the summit of the achene by a constriction or articulation).
20 Bristles absent; achene 0.7-1.0 mm long.
21 Scales broadly ovate, obtuse to sub-acute; achene strongly transversely ridged; tubercle depressed, broader than long; style not persistent \(\qquad\) Rh. nitens
21 Scales lance-ovate, acute; achene weakly transversely ridged; tubercle triangular-lanceolate, as long as broad or longer; style usually persistent Rh. scirpoides
20 Bristles present (occasionally detached in \(R h\). decurrens and \(R h\). miliacea with achenes 1.0-1.4 mm long).
22 Bristles not exceeding the achene body.
23 Cluster branches stiff; bristles \(3 / 4\) or less as long as the achene; achene tumid above, somewhat compressed below, 1.0-1.8 mm long, 1.0-1.6 mm wide; tubercle conical-attenuate, the edges somewhat concave.
24 Larger leaves 3-4.5 mm wide; achene 1.3-1.8 mm long, 1.3-1.6 mm wide . . Rh. recognita 24 Larger leaves 1.5-2.5 mm wide; achene 1.0-1.4 mm long and wide.

25 Longer bristles \(1 / 3-1 / 2\) the length of the achene; achene surface alveoli longitudinally narrow (typically \(0.02-0.05 \mathrm{~mm}\) wide between the longitudinal walls), the latitudinal walls raised into horizontal ridges; tubercle base 0.6-0.7 mm wide

Rh. globularis var. globularis
25 Longer bristles 2/3-3/4 the length of the achene; achene surface alveoli nearly as wide as long (typically \(0.05-0.1 \mathrm{~mm}\) wide between the longitudinal walls), the latitudinal walls obscurely or not at all raised into horizontal ridges; tubercle base 0.7-0.9 mm wide

Rh. globularis var. pinetorum
23 Cluster branches flexuous; bristles one-half as long to equaling the achene (or longer in \(R h\). microcarpa); achene slightly biconvex, 0.8-1.4 mm long, 0.7-1.0 (-1.2) mm wide.
26 Clusters elongate; achene narrowly obovate to elliptic, averaging 8-12 transversed ridges; most tubercle bases convexly seated on the achene summit and somewhat decurrent along the achene margins, the tubercle surface often whitish-waxy

Rh. decurrens
26 Clusters usually compact; achene suborbicular to elliptic, averaging 6-7 transverse ridges; most tubercle bases flat across the achene summit, not decurrent, the tubercle surface usually dark, not waxy

Rh. microcarpa
22 Bristles equaling or longer than the tubercle.
27 Primary branches of the inflorescence spreading at right angles from the culm, each spikelet or small cluster on slender spreading or reflexed stalks Rh. miliacea
27 Primary branches of the inflorescence ascending.
28 Spikelets 6-9 mm long
Rh. odorata
28 Spikelets less than 5 mm long.
29 Tubercle 0.2-0.5 mm long, the edges smooth.
30 Spikelets \(3.5-4 \mathrm{~mm}\) long; bristles exceeding the tubercle; achene \(1.3-1.5 \mathrm{~mm}\) long, 1.2-1.3 mm wide Rh. saxicola
30 Spikelets 2.5-3 mm long; longer bristles about equaling the tubercle; achene 0.81.2 mm long, \(0.7-1.2 \mathrm{~mm}\) wide.

31 Inflorescence occupying the upper 1/4-1/2 of the culm, the lowest 2-4 nodes barren . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Rh. microcarpa 31 Inflorescence occupying 2/3-3/4 of the length of the culm, the lowest lateral panicle at the first or second node above the base

Rh. sulcata
29 Tubercle 0.4-0.8 mm long, the edges setose or uneven with waxy or crusty irregular protuberances.
32 Achene obovate to suborbicular, 1.2-1.6 mm wide, latitudinal alveoli walls strongly raised into transverse ridges . . . . . . . . . . . . . . . . . . . . . . Rh. caduca
32 Achene slenderly obovoid, \(0.8-1.0 \mathrm{~mm}\) wide, latitudinal alveoli walls weakly or not at all raised into transverse ridges

Rh. mixta

Rhynchospora alba (Linnaeus) Vahl, Northern White Beaksedge. Cp (GA, NC, SC, VA), Mt (GA, NC, VA): mountain bogs and fens, peaty situations in the Coastal Plain, such as low pocosins in peat domes or large Carolina bays, and floating peat mats in limesink (doline) ponds and bay lakes, possibly also in seepage bogs with abundant Sphagnum, generally occurring in the most open, harshest, and peatiest areas; rare (GA Special Concern, NC Rare, VA Rare). July-October. Widespread in northern North America, south to se. NC, nw. NC, ne. GA, ne. TN, MN, ID, and CA; disjunct in se. GA (Charlton Co., at the Okefenokee Swamp) (Williges \& Loftin 1995), s. AL (Escambia Co.; specimen at CLEMS), and the mountains of Puerto Rico. [= RAB, C, F, FNA, G, GW, K, S, W, Z]

Rhynchospora baldwinii A. Gray, Baldwin's Beaksedge. Cp (GA, NC, SC): wet savannas, seepages; uncommon (rare in Sandhills). July-August. Se. NC south to c. FL and west to LA. [= RAB, C, FNA, K, S, GW, Z]

Rhynchospora breviseta (Gale) Channell, Short-bristle Beaksedge. Cp (NC, SC): wet savannas; rare (NC Rare). JulySeptember. Se. NC south to c. FL and west to s. MS; West Indies. This species will colonize disturbances (roadsides, powerline corridors), but not aggressively. The leaf tips of Rh. breviseta are acute and minutely serrulate, while those of the closely related Rh. oligantha are blunt and smooth; these characters are, however, often difficult to determine. [= RAB, FNA, GW, K; Rh. oligantha A. Gray var. breviseta Gale -- Z]

Rhynchospora caduca Elliott, Angle-stem Beaksedge. Cp (GA, NC, SC, VA), Pd (NC, SC): savannas, hardwood swamps, other wet areas; uncommon (VA Watch List). July-September. E. and c. VA south to s. FL and west to TX, OK, and AR, north in the interior to sc. TN. This species is found at a few sites in the mountains of GA. See notes under Rh. miliacea. [= RAB, C, F, FNA, G, GW, K, S, W, Z; Rh. patula A. Gray --S]

Rhynchospora capillacea Torrey. Mt (VA): calcareous wetlands; rare (VA Rare). Newfoundland west to Saskatchewan, south to w. VA, ne. TN, and n. AR. [= C, F, FNA, G, K, Z]

Rhynchospora capitellata (Michaux) Vahl, Brownish Beaksedge. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): bogs and fens, seepages, and wet rock outcrops in the Mountains and upper Piedmont, also in wet habitats in the Coastal Plain of ne. NC and e. VA; common (rare in Piedmont and Coastal Plain). July-September. Widespread in e. North America, south to nc. GA. The only common beaksedge in the Mountains of our area. A somewhat similar species, Rh. knieskernii, occurs north of our area, but should be looked for here; they are discussed at the end of this genus. Sorrie (2000) has clarified the relationships and distinctions of this taxon with Rh. leptocarpa. [= C, F, G, S, W; Rh. capitellata -- RAB, FNA, GW, K, Z, in part (also see Rh. leptocarpa)]

Rhynchospora careyana Fernald, Carey's Horned Beaksedge. Cp (GA, NC, SC): limesink (doline) depression ponds and in intermittently flooded depression meadows; rare (NC Watch List). July-September. Apparently ranging from se. NC south to FL, but the range poorly known because of confusion with \(R h\). inundata, from which it is perhaps not specifically distinct. [= FNA, K, S; listed in synonymy under \(R h\). corniculata in GW, but would actually key to \(R h\). inundata]

Rhynchospora cephalantha A. Gray var. attenuata Gale, Small Bunched Beaksedge. Cp (GA?, NC, SC, VA): savannas, sandhill seeps, openings in streamhead pocosins; rare ( \(N C\) Watch List, VA Rare). July-October. The range of this variety is poorly known; is reported by Z from NC, SC, AL, and MS. Recent collections from MD and VA extend the range. See discussion in Sorrie et al. (1997). [= Z; Rh. cephalantha -- RAB, C, GW, K, in part, infraspecific taxa not distinguished; Rh. axillaris -- S, in part, the varieties not recognized]

Rhynchospora cephalantha A. Gray var. cephalantha, Common Bunched Beaksedge. Cp (GA, NC, SC, VA): savannas; common (VA Rare). July-October. S. NJ south to FL and west to LA. Often weedy, this species occurs commonly along wet roadsides, powerline corridors, and the like. [=F, G, Z; Rh. cephalantha -- RAB, C, FNA, GW, K, infraspecific taxa not distinguished; \(R h\). axillaris -- \(S\), infraspecific taxa not distinguished]

Rhynchospora cephalantha A. Gray var. pleiocephala Fernald \& Gale, Many-headed Bunched Beaksedge. Cp (GA, NC, SC, VA): savannas; uncommon (VA Rare). July-October. Se. VA south to FL and west to LA. [= F, G, Z; Rh. cephalantha -- RAB C, FNA, GW, K, infraspecific taxa not distinguished; Rh. axillaris -- S, infraspecific taxa not distinguished]

Rhynchospora chalarocephala Fernald \& Gale, Loose-head Beaksedge. Cp (GA, NC, SC, VA), Pd (NC, SC, VA), Mt (GA, NC, SC, VA): savannas, limesink ponds, and swamps, often weedy and occurring in abundance on wet roadsides and in powerline corridors; common (rare in Piedmont). July-September. S. NJ south to c. FL and west to LA; disjunct in nw. GA (Jones \& Coile 1988) and sc. TN (Coffee County). [= RAB, C, F, FNA, G, GW, K, W, Z]

Rhynchospora chapmanii M.A. Curtis, Chapman's Beaksedge. Cp (GA, NC, SC): savannas, seepage bogs, sandy margins of limesink (doline) ponds, and other wet, acid habitats; uncommon. July-September. Se. NC south to c. FL and west to e. LA; Belize, Nicaragua. [= RAB, FNA, GW, K, S, Z]

Rhynchospora ciliaris (Michaux) C. Mohr, Fringed Beaksedge. Cp (GA, NC, SC): savannas, sandhill seeps; uncommon. July-September. Se. NC south to s. FL and west to LA. [= RAB, FNA, GW, K, S, Z]

Rhynchospora colorata (Linnaeus) H. Pfeiffer, Narrowleaf Whitetop Sedge. Cp (NC, SC, VA): wet savannas, ditches, dune swales; uncommon (VA Rare). May-September. Primarily a Southeastern Coastal Plain endemic: se. VA south to FL and west to TX; Mexico (Tabasco, Chiapas, Yucatán), West Indies, Belize, Guatemala, Costa Rica, Venezuela. [= C, FNA, K; Dichromena colorata (Linnaeus) H. Pfeiffer -- RAB, F, G, GW, S]

Rhynchospora compressa Carey ex Chapman. Cp (GA, SC): savannas; rare. s. SC south to FL, west to e. LA. This species was reported for SC (Kartesz 1999), based on the South Carolina Plant Atlas (http://cricket.biol.sc.edu/herb/); McMillan (pers. comm.) states that the record is in error, based on a misidentified specimen. The species occurs in sc. GA (Jones \& Coile 1988) and has since been found in SC by McMillan (2003). [= FNA, GW, K, S, Z]

Rhynchospora corniculata (Lamarck) A. Gray var. corniculata, Short-bristle Horned Beaksedge. Cp, Pd (GA, NC, SC, VA): pondcypress savannas in Carolina bays, swamp forests, other wetlands; uncommon. July-September. Var. corniculata ranges from DE south to FL and west to LA, extending north into KY and MO, also in the West Indies. Var. interior, possibly not worth recognition, is distinguished by a shorter and narrower achene, the summit barely broader than the base of the tubercle, and occurs in the Mississippi drainage. [= C, F, G; Rh. corniculata (Lamarck) A. Gray -- RAB, FNA, GW, K, S, infraspecific taxa not distinguished]

Rhynchospora crinipes Gale, Alabama Beaksedge. Cp (GA, NC): sand-clay bars in bed of small blackwater river in the

Sandhills (NC) and Coastal Plain (GA); rare (US Species of Concern, GA Special Concern, NC Endangered). July-September. This very rare species is related to \(R h\). filifolia, but is a coarser plant, readily distinguishable by characters of the achene, culm, and leaves. Anderson (1988) discusses its systematics, habitat, and rarity. It has been reported only from a few locations in s. AL, w. FL, sc. GA, and sc. NC. Sorrie et al. (1997) report its occurrence in NC. [= FNA, GW, K, Z]

Rhynchospora culixa Gale, Georgia Beaksedge. Cp (GA): pine savannas, flatwoods; rare (GA Special Concern). GA and FL. [= K, Z; Rh. harveyi W. Boott var. culixa (Gale) Kral - FNA]

Rhynchospora debilis Gale, Savanna Beaksedge. Cp (GA, NC, SC, VA), Mt (GA): savannas, sandhill seeps; uncommon (VA Rare). July-September. Se. VA south to n. FL and west to se. TX (Brown \& Marcus 1998). Like a small version of \(R h\). fascicularis, often with several ascending, cespitose culms, each terminated by a single glomerule. [= RAB, C, F, FNA, GW, K, Z]

Rhynchospora decurrens Chapman, Swamp-forest Beaksedge. Cp (GA, NC, SC): swamp forests and river marshes, especially along blackwater rivers; rare (GA Special Concern, NC Rare). July-August. Se. NC south to s. FL and west to s. MS (Sorrie \& Leonard 1999). [= RAB, FNA, GW, K, S, Z]

Rhynchospora divergens Chapman ex M.A. Curtis, White-seeded Beaksedge. Cp (GA, NC, SC): wet savannas, especially in exposed sands; rare (NC Rare). May-September. Se. NC south to s. FL and west to se. TX; Bahamas, Mexico (Chiapas), Belize. Rh. divergens, Rh. pusilla, and Rh. thornei are all small, grass-like plants, very similar in appearance to one another. [= RAB, FNA, GW, K, S]

Rhynchospora elliottii A. Dietrich, Elliott's Beaksedge. Cp (GA, NC, SC): savannas, ditches, other wet habitats, often weedy; rare (NC Watch List). July-September. Se. NC south to nw. FL and west to e. TX. The achenes are typically flat or concave on one face, and flat or slightly convex on the other. See note under Rh. microcarpa. [= FNA, GW, K; Rh. schoenoides (Elliott) Wood -RAB, S, Z]

Rhynchospora fascicularis (Michaux) Vahl var. distans (Michaux) Chapman. Cp (GA, NC, SC, VA): savannas and limesink ponds; rare (VA Rare). June-September. Se. VA south to s. FL and west to s. MS (Sorrie \& Leonard 1999); West Indies. Appearing to merge with Rh. wrightiana on the outer Coastal Plain of NC. [= F, K, Z; Rh. fascicularis -- RAB, FNA, G, GW, infraspecific taxa not distinguished; Rh. distans (Michaux) Vahl -- S]

Rhynchospora fascicularis (Michaux) Vahl var. fascicularis, Fascicled Beaksedge. Cp (GA, NC, SC, VA): savannas, limesink ponds, ditches; common in the outer Coastal Plain, less common in the fall-line sandhills (VA Rare). June-September. Se. VA south to s. FL and west to se. TX; West Indies. [= F, K, Z; Rh. fascicularis -- RAB, FNA, G, GW, infraspecific taxa not distinguished; Rh. fascicularis -- S]

Rhynchospora fernaldii Gale, Fernald's Beaksedge. Cp (GA): pine flatwoods; uncommon. S. GA south to c. peninsular FL, west to s. MS. [= FNA, GW, K, Z]

Rhynchospora filifolia A. Gray, Threadleaf Beaksedge. Cp (GA, NC, SC, VA): sandy shores of limesink (doline) depressions, especially at the lower margin, savannas; uncommon, rare in the fall-line sandhills (VA Rare). July-September. S. NJ south to c. FL and west to e. TX; Cuba, Mexico (Tabasco), Belize, Nicaragua. [= RAB, C, F, FNA, G, K, S, Z; Rh. filifolia -- GW in part (see also Rh. harperi)]

Rhynchospora globularis (Chapman) Small var. globularis, Globe Beaksedge. Cp, Pd (GA, NC, SC, VA): sandy or peaty depressions, wet ditches, powerline corridors, savannas; uncommon, rare in Piedmont. June-September. Var. globularis apparently ranges from DE south to s. FL and west to c. TX and OK; north in the interior to nc. TN; also allegedly in \(n\). CA. Both var. globularis and var. pinetorum tend to produce shorter plants with smaller glomerules than Rh. recognita. Occasional achenes of var. globularis exhibit the wide alveoli of var. pinetorum near the base or summit, with little or no horizontal ridging, but centrally have narrow alveoli with pronounced horizontal ridges. The opposite condition occasionally occurs in var. pinetorum achenes, with narrow alveoli and horizontal ridging basally or at the summit, but wide alveoli and little or no ridging centrally. [=C, F, FNA, G, K, Z; \(R h\). globularis -- RAB, W, infraspecific taxa not recognized; Rh. globularis var. globularis -- GW, in part only (also see Rh. recognita); \(R h\). globularis -- \(S\), in the narrow sense]

Rhynchospora globularis (Chapman) Small var. pinetorum (Small) Gale, Small's Beakrush. Cp (NC, SC): wet calcareous savannas, maritime wet grasslands; rare (NC Rare). June-September. Var. pinetorum ranges from FL west to MS (Sorrie \& Leonard 1999) and LA, apparently disjunct to se. NC and ne. SC, and also in the West Indies. See note under var. globularis. [= FNA, GW, K, Z; Rh. pinetorum Small -- S]

Rhynchospora glomerata (Linnaeus) Vahl var. glomerata, Clustered Beaksedge. Cp, Pd, Mt (GA, NC, SC, VA): savannas, bogs, other wet habitats; common (uncommon in Sandhills, rare in Mountains). July-September. Var. glomerata ranges from s. NJ south to n . FL and west to e. TX, and inland in KY, TN, AR, and KS. Var. angusta Gale occurs in AR, LA, and e. TX. [= Z; Rh. glomerata -- RAB, C, F, FNA, G, GW, K, S, W, infraspecific taxa not distinguished]

Rhynchospora gracilenta A. Gray, Slender Beaksedge. Cp, Pd (GA, NC, SC, VA), Mt (NC, SC, VA): savannas, bogs; uncommon (rare in Piedmont and Mountains). July-September. NJ south to \(n\) FL and west to e. TX, north in the inland to nc. TN and AR; Cuba, Mexico (Chiapas), Belize, Nicaragua. [= RAB, C, F, FNA, G, GW, K, S, W, Z]

Rhynchospora grayi Kunth, Gray's Beaksedge. Cp (GA, NC, SC, VA): sandhills and other dry, sandy sites; uncommon (VA Rare). June-September. [= RAB, C, F, FNA, G, K, S, Z]

Rhynchospora harperi Small, Harper's Beaksedge. Cp (GA, NC, SC): peaty limesink depression ponds (dolines), from standing water to the upper margins of the pond-shore; rare (GA Special Concern, NC Rare). July-September. Se. NC south to FL and west to s. AL and s. MS (Sorrie \& Leonard 1999); disjunct in DE and MD; disjunct in Belize. See Nelson (1993) for first SC record, and LeBlond (1997) for additional information on the species, especially its distribution. [= FNA, K, S, Z; Rh. filifolia -- GW, in part]

Rhynchospora harveyi W. Boott, Harvey's Beaksedge. Cp (GA, NC, SC, VA), Mt (GA, NC), Pd (NC): savannas in the Coastal Plain, seepage bogs in the Sandhills, bogs in the Mountains and Piedmont; rare (VA Rare). July-August. Se. VA south to n. FL and west to TX and OK, and north in the interior to nc. TN and MO. [= RAB, C, F, G, GW, K, S, W, Z; Rh. harveyi var. harveyi - FNA]

Rhynchospora inexpansa (Michaux) Vahl, Nodding Beaksedge. Cp (GA, NC, SC, VA), Pd (GA): wet savannas, streamhead
pocosins where frequently burned, usually in peaty situations, often weedy, colonizing disturbances; common. July-September. Se. VA south to n. FL and west to e. TX and AR; West Indies. [= RAB, C, F, FNA, G, GW, K, S, Z]

Rhynchospora inundata (Oakes) Fernald, Narrow-fruit Horned Beaksedge. Cp (NC, SC?), \{GA, VA\}: in water of limesink dolines and clay-based Carolina bays. usually found in shallow water or at the lower margins of pond-shores, typically producing large colonies; rare (NC Watch List, SC Rare, VA Rare). July-September. Apparently ranging from e. MA south to s. FL and west to LA (the range, however, obscured by confusion with Rh. careyana). The relation of this species to Rh. careyana and to more northern entities of \(R h\). inundata remain unresolved. \([=C, F, F N A, G, G W, K, S ; R h\). inundata -- RAB, in part only (also see \(R h\). careyana)]

Rhynchospora latifolia (Baldwin ex Elliott) Thomas, Broadleaf Whitetop Sedge. Cp (GA, NC, SC): wet savannas; uncommon. May-September. A Southeastern Coastal Plain endemic: se. NC south to FL and west to se. TX; disjunct in sc. TN (Coffee County). [= FNA, K; Dichromena latifolia Baldwin ex Elliott -- RAB, S, GW]

Rhynchospora leptocarpa (Chapman ex Britton) Small. Cp (GA, NC, SC): seepage bogs, pocosins, especially in openings; uncommon. E. NC south to Panhandle FL, west to se. LA, in the Coastal Plain. It appears that Rh. leptocarpa is a valid species, a southeastern Coastal Plain relative of the more northern and montane Rh. capitellata (Sorrie 2000). Its occurrence in NC is reported by Sorrie et al. (1997). [= S; Rh. capitellata -- RAB, GW, K, Z, in part]

Rhynchospora macra (C.B. Clarke) Small, Southern White Beaksedge. Cp (GA, NC, SC): Sphagnum bogs in frequentlyburned streamhead pocosins, and in sandhill seepage bogs; rare (GA Special Concern, NC Endangered, SC Rare). July-September. Sc. NC south to n. FL and west to se. TX; Nicaragua, Puerto Rico. Rh. macra is a robust southern relative of \(R h\). alba. Like \(R h\). alba and \(R h\). pallida, it has scales which are at first bright white, "fading" in age to a medium tan or light brown. These three species are thus superficially most distinctive (from other Rhynchospora) in June, July, and August. The occurrence of this species in NC and SC is discussed by Sorrie et al. (1997). [= FNA, GW, K, S, Z]

Rhynchospora macrostachya Torrey ex A. Gray var. colpophila Fernald \& Gale, Virginia Horned Beaksedge. Cp (NC, VA): tidal freshwater marshes; uncommon (NC Watch List). July-September. Endemic to e. MD, e. VA, and ne. NC. [= F; Rh. macrostachya -- RAB, C, FNA, G, GW, K, S, infraspecific taxa not distinguished]

Rhynchospora macrostachya Torrey ex A. Gray var. macrostachya, Tall Horned Beaksedge. Cp (GA, NC, SC, VA), Mt (GA): marshes, swamps, upland depression ponds, other wetlands; uncommon (VA Watch List). July-September. E. MA south to FL and west to e. TX, north in the interior to sc. TN, s. MI, MO, and KS; disjunct (historically) in s. ME. This (and var. colpophila) are most readily distinguished from Rh. corniculata. Rh. inundata, and \(R h\). careyana by the large glomerules composed of numerous spikelets. [= F; Rh. macrostachya -- RAB, C, FNA, G, GW, K, S, infraspecific taxa not distinguished]

Rhynchospora megalocarpa A. Gray, Sandhill Beaksedge. Cp (GA, NC, SC): xeric sandhills; uncommon. June-August. Se. NC south to FL, west to MS. [= RAB, FNA, K, Z; Rh. dodecandra Baldwin ex A. Gray -- S]

Rhynchospora microcarpa Baldwin ex A. Gray, Southern Beaksedge. Cp (GA, NC, SC), Pd (NC, SC): swamp forests, claybased Carolina bays; rare (GA Special Concern, NC Watch List). July-August. E. NC south to s. FL and west to TX; West Indies (Cuba, Puerto Rico), Bahamas, Belize. This species is easily confused with Rh. elliottii and Rh. perplexa. Rh. elliottii is distinguished by leaves \(4-6 \mathrm{~mm}\) wide, bristles longer than the tubercle, flattish achene faces, and a tubercle that is longer than broad. Rh. microcarpa and Rh. perplexa have leaves \(1-3 \mathrm{~mm}\) wide and tubercles as broad as long or broader. In Rh. microcarpa, the achene is biconvex and the bristles are half as long as the achene to equaling the tubercle. In Rh. perplexa, the achene faces are flattish and the bristles are absent or rudimentary (less than half as long as the achene). [= RAB, F, FNA, GW, K, S, Z; Rh. microcarpa - K, in a broader sense (also see Rh. sulcata)]

Rhynchospora microcephala (Britton) Britton ex Small, Small-headed Beaksedge. Cp (GA, NC, SC, VA), Mt (GA): savannas, sandhill-pocosin ecotones; common. July-October. S. NJ south to c. FL and west to MS, also in Cuba. [= RAB, C, F, FNA, G, GW, K, S, Z; Rh. cephalantha A. Gray var. microcephala (Britton) Kükenthal]

Rhynchospora miliacea (Lamarck) A. Gray, Millet Beaksedge. Cp (GA, NC, SC, VA): swamp forests, including maritime swamp forests; rare (VA Rare). July-August. Se. VA south to s. FL and west to LA, also in the West Indies. The inflorescence branches of Rh. mixta and (less commonly) Rh. caduca can spread at right angles from the culm, superficially resembling \(R h\). miliacea. The three can be separated by tubercle length: the tubercle of \(R h\). miliacea is \(0.2-0.4 \mathrm{~mm}\) long, while those of \(R h\). mixta and \(R h\). caduca are \(0.4-0.9 \mathrm{~mm}\) long. [= RAB, C, F, FNA, G, GW, K, S, Z]

Rhynchospora mixta Britton, Mingled Beaksedge. Cp (GA, NC, SC): swamp forests, marshes; uncommon. June-August. Ne. NC south to c. FL and west to TX. See notes under Rh. miliacea. [= RAB, FNA, GW, K, S, Z; Rh. prolifera Small -- S]

Rhynchospora nitens (Vahl) A. Gray, Short-beak Beaksedge. Cp (GA, NC, SC, VA): wet savannas, limesink (doline) ponds, ditches, disturbed wet areas, often weedy; rare (NC Watch List, VA Rare). July-August. Primarily a Coastal Plain endemic: MA south to FL and west to se. TX; lowlands around the Great Lakes; West Indies, Belize, Nicaragua. [= C, FNA, K; Psilocarya nitens (Vahl) Wood -- RAB, F, G, GW, S]

Rhynchospora odorata C. Wright ex Grisebach, Fragrant Beaksedge. Cp (GA, NC, SC): maritime swamp forests and maritime wet grasslands; rare (NC Rare). June-August. E. NC south to s. Florida, and in the West Indies and Bahamas. First reported for SC by Nelson \& Kelly (1997). [= RAB, F, FNA, GW, K, Z; Rh. stipitata Chapman -- S]

Rhynchospora oligantha A. Gray, Feather-bristle Beaksedge. Cp (GA, NC, SC, VA): wet savannas, sandhill-pocosin ecotones, sandhill seepage bogs, sea-level fens, usually in rather peaty, acid places; rare (GA Special Concern, NC Rare, SC Rare, VA Rare). July-August. S. NJ south to n. FL and west to se. TX; Belize, Nicaragua. The leaf tips of Rh. oligantha are blunt and smooth, while those of the closely related \(R h\). breviseta are acute and minutely serrulate; these characters are, often difficult to determine, however. Considered to be absent between NC and NJ prior to its discovery in e. VA (Fleming \& Ludwig 1996). [= RAB, C, F, FNA, G, GW, K; Rh. oligantha -- S, in part only (presumably including Rh. breviseta): Rh. oligantha var. oligantha -- Z]

Rhynchospora pallida M.A. Curtis, Pale Beaksedge. Cp (NC, SC, VA): savanna-pocosin and sandhill-pocosin ecotones, peaty seepage bogs, usually growing in or near Sphagnum; rare (NC Watch List, SC Rare, VA Rare). July-September. Long Island, NY south through NJ to nc. SC, primarily in NJ and NC. Like Rh. alba and Rh. macra, it has scales which are at first bright white, "fading" in age to a medium tan or light brown. These three species are thus superficially most distinctive (from other

Rhynchospora) in June, July, and August. The bristle characters separate the three species easily. See Nelson (1993) for first SC record. [= RAB, C, F, FNA, G, GW, K, S, Z]

Rhynchospora perplexa Britton var. perplexa, Pineland Beaksedge. Cp (GA, NC, SC), Mt (GA), \{VA\}: savannas, sandhill seepage bogs; uncommon (VA Rare). July-September. Var. perplexa ranges from e. NC south to s. FL, west to TX, and north in the interior to ec. TN; also in the West Indies. Also see note under Rh. microcarpa. [=F; Rh. perplexa -- RAB, C, FNA, G, GW, K, \(\mathrm{S}, \mathrm{Z}\), infraspecific taxa not distinguished]

Rhynchospora perplexa Britton var. virginiana Fernald, Virginia Pineland Beaksedge. Cp (VA): savannas; rare (VA Rare). July-September. Var. virginiana Fernald, alleged to be endemic to se. VA, should be sought in NC. It is alleged to differ in several characters, including larger spikelets ( \(2.5-3.0 \mathrm{~mm}\) long vs. 2.0-2.5), the achene tubercles broadly rounded at the tip (rather than deltoid and acute). Also see note under Rh. microcarpa. [= F; Rh. perplexa -- RAB, C, FNA, G, GW, K, S, Z, infraspecific taxa not distinguished]

Rhynchospora pleiantha (Kükenthal) Gale, Coastal Beaksedge. Cp (GA, NC, SC): sandy margins of limesink depression ponds (dolines), typically in shallow water or at the lower margins of pond-shores; rare (GA Special Concern, NC Rare). JulySeptember. Se. NC south to c. and nw. FL and west to se. AL; also in Cuba. [= RAB, FNA, GW, K, Z; Rh. fusca - S, misapplied]

Rhynchospora plumosa Elliott, Plumed Beaksedge. Cp (GA, NC, SC): savannas, sandhill-pocosin ecotones, especially where the sandy surface dries out in summer (on Spodosols such as the Leon soil series); common. July-August. NC south to FL and west to se. TX; West Indies (Cuba), Belize, Honduras, Nicaragua. Rh. pineticola C.B. Clarke, from dry sandy pinelands of northern FL, is very similar to \(R h\). plumosa, differing in having leaves 2-3 mm wide and achenes 2.0-2.2 mm long. [= RAB, GW, K, \(\mathrm{S}, \mathrm{Z} ;\) Rh. plumosa - FNA, in part]

Rhynchospora punctata Elliott, Pineland Beaksedge. Cp (GA): wet savannas, pitcherplant bogs; rare (GA Special Concern). S. GA south to ne. FL. [= FNA, GW, K, S, Z]

Rhynchospora pusilla Chapman ex M.A. Curtis, Dwarf Beaksedge. Cp (GA, NC, SC), Pd (GA): wet savannas, especially in exposed wet sands of disturbed ground, such as roadsides; uncommon. June-September. E. NC south to s. FL and west to e. TX; West Indies, Mexico (Tabasco, Chiapas), Belize, Guatemala, Nicaragua. Rh. pusilla, Rh. divergens, and Rh. thornei are all small, grass-like plants, very similar in appearance to one another. [= FNA, GW, K; Rh. intermixta C. Wright -- RAB, S]

Rhynchospora rariflora (Michaux) Elliott, Few-flower Beaksedge. Cp, Pd (GA, NC, SC, VA): wet savannas, seepage bogs in the Sandhills, bogs in the Piedmont; common, rare in Piedmont (VA Watch List). July-September. S. NJ south to s. FL and west to e. TX; inland in ec. TN; West Indies, Belize, Honduras, Nicaragua. Resembling Rh. breviseta and Rh. oligantha, but the spikelets conspicuously smaller. A plant tentatively considered distinct from Rh. rariflora has been found in wet savannas and pocosin ecotones in Carteret County, NC; it differs most notably in its distinctly larger achenes and longer tubercles and bristles. It can be distinguished from \(R h\). rariflora as follows: achene \(1.36-1.8 \mathrm{~mm}\) long, \(1.4-1.5 \mathrm{~mm}\) wide; tubercle \(0.6-1.0 \mathrm{~mm}\) long; bristles \(2 / 3-4 / 5\) as long as the achene body (vs. 1.3-1.5 (-1.7) mm long, 1.1-1.4 mm wide; tubercle 0.3-0.6 ( -0.7 ) mm long; bristles \(1 / 3-1 / 2(-2 / 3)\) as long as the achene body). [= RAB, C, F, FNA, G, GW, K, S, Z]

Rhynchospora recognita (Gale) Kral, Cymose Beakrush. Cp, Pd, Mt (GA, NC, SC, VA): wet to dry low grounds, diabase glades, ditches, powerline corridors, savannas, moist seepage on rock outcrops, other wet areas; common. June-September. NJ south to FL, west to TX, north in the interior to nc. TN and around the Great Lakes; CA; West Indies; and Central America. As explained by Kral (1999), this taxon appears to warrant specific status. [= FNA, K; = Rh. globularis (Chapman) Small var. recognita Gale -- C, F, G, Z; < Rh. globularis -- RAB, W, infraspecific taxa not recognized; < Rh. globularis var. globularis -- GW, in part; Rh. cymosa Elliott -- S, misapplied]

Rhynchospora saxicola Small. Pd (GA, SC), Cp (GA): seepages on granitic outcrops and Altamaha Grit glades; rare. W. SC south into the Piedmont and rarely Coastal Plain of c. GA and ne. and ec. AL (Kral 1999). [= S; = Rh. globularis (Chapman) Small var. saxicola (Small) Kükenthal - FNA, K]

Rhynchospora scirpoides (Torrey) A. Gray, Long-beak Beaksedge. Cp (GA, NC, SC, VA): limesink ponds, usually at the lower margins of pond-shores, wet savannas, beaver ponds, and other wetlands with "drawdown" hydrology; rare (GA Special Concern, NC Rare, VA Rare). July-September. Se. MA south to the panhandle of FL and s. MS (Sorrie \& Leonard 1999), and disjunct in the lowlands around the Great Lakes. [= C, FNA, K; Psilocarya scirpoides Torrey -- RAB, GW, S; Psilocarya scirpoides var. grimesii Fernald \& Griscom -- F, G]

Rhynchospora solitaria Harper, Autumn Beaksedge. Cp (GA, SC): wet, sandy/peaty depressions; rare (GA Special Concern). Known from a few sites in the Gulf Coastal Plain of GA (Colquitt, Irwin, Tift, and Turner counties) (Sorrie 1998b) and SC (Berkeley County) (McMillan, pers.comm. and specimen at NCU). It resembles a delicate Rh. ciliaris; its distinctiveness is well described in Bridges \& Orzell (1992). It should be sought in seepage bogs in the fall-line sandhills and in wet savannas of the outer Coastal Plain. [= FNA, GW, K, S, Z]

Rhynchospora stenophylla Chapman, Coastal Bog Beaksedge. Cp (GA, NC, SC, VA): peaty seepage bogs, streamhead pocosins, savanna-pocosin ecotones, usually growing in Sphagnum, especially where frequently burned; rare (GA Special Concern, NC Watch List, SC Rare). July-September. Se. NC south to nw. FL and west to s. MS; disjunct in se. VA (Southampton Co.) (Belden et al. 2004). Reported for GA by Sorrie (1998b). [= RAB, FNA, GW, K, S, Z]

Rhynchospora sulcata Gale, Grooved Beaksedge. Cp (GA, SC): limesink ponds (dolines); rare. June-July. Se. SC south to GA (Jones \& Coile 1988) and FL. Perhaps not distinct from Rh. microcarpa. [= RAB, GW, Z; Rh. microcarpa Baldwin ex A. Gray K , in part]

Rhynchospora thornei Kral, Thorne's Beaksedge. Cp (GA, NC, SC), Mt (GA): in open sands in savannas underlain by marl, and nearby roadsides, moist limestone barrens and prairies (GA); rare (GA Special Concern, NC Endangered). Known from about 35 locations, in Cp of NC, SC, GA, FL, and AL; also in Ridge and Valley region of AL and GA, and Black Belt region of AL. Rh. thornei, Rh. divergens, and Rh. pusilla are all small, grass-like plants, very similar in appearance to one another, and they frequently co-occur. Recently discovered in SC (Georgetown Co.) by McMillan (2003). [= FNA, K]

Rhynchospora torreyana A. Gray, Torrey's Beaksedge. Cp (GA, NC, SC, VA): savannas, seepage bogs, often weedy; common, uncommon in VA, rare in GA (GA Special Concern). July-September. Se. MA south to GA. [= RAB, C, F, G, GW, K, S,

\section*{Z]}

Rhynchospora tracyi Britton, Tracy's Beaksedge. Cp (GA, NC, SC): cypress savannas and graminoid-dominated depressions, in small, clay-based Carolina bays or shallow limesink ponds (dolines), typically in shallow water or at the lower margins of pond-shores; rare (NC Rare, SC Rare). June-September. A Southeastern Coastal Plain endemic: s. NC south to FL, west to s. MS (Sorrie \& Leonard 1999); disjunct in sw. LA; West Indies, Belize. [= RAB, FNA, K, GW, S]

Rhynchospora wrightiana Böckler, Wright's Beaksedge. Cp (GA, NC, SC, VA): wet savannas; rare (NC Watch List, VA Rare). July-September. Se. VA south to c. FL and west to s . AL; West Indies. Appearing to merge with Rh. fascicularis var. distans on the outer Coastal Plain of NC. Leaves are most frequently filiform and less than 1 mm wide; rarely flat and to 1.3 mm wide. [= RAB, FNA, GW, K, Z; Rh. wrightiana - S, in part only (also see Rh. brachychaeta)]

Rhynchospora brachychaeta C. Wright. Cp (SC): cypress ponds, other depressions; rare. AL, FL, MS, and SC. Reported for SC by P. McMillan (pers. comm.). Kral in FNA considers this species possibly adventive. [= FNA, K, Z; Rh. wrightiana - S, in part]

Rhynchospora curtissii Britton has been reported from SC by Kral (1996) and for NC and SC by Kartesz (1999), but specimens so annotated are misidentified. An east Gulf Coastal Plain endemic, in Panhandle FL, AL, and s. MS (Sorrie \& Leonard 1999). [= FNA, GW, K, S, Z]

Rhynchospora fusca (Linnaeus) Aiton f., circumboreal, ranges south in North America to NJ, e. PA (Rhoads \& Klein 1993), MD, DE, and WV (Kartesz 1999). [= C, F, FNA, G, K, Z]

Rhynchospora knieskernii Carey, endemic to pinelands of NJ and DE. It has been reported, in error, from SC. [= C, F, FNA, G, K, Z]

Rhynchospora semiplumosa A. Gray, in Coastal Plain of GA. [= S; Rh. plumosa-FNA, GW, K, Z, in part] \{needs evaluation\}

Schoenoplectus (Reichenbach) Palla (Bulrush)
(see also Bolboschoenus)
A genus of about 50 species, herbs, cosmopolitan in distribution. Micromorphologic and anatomic studies have confirmed earlier opinions based on morphology that Schoenoplectus is not closely related to Scirpus (Strong 1994, Smith 1995, Schuyler, pers. comm.). Most investigators now also favor the separation of Bolboschoenus from Schoenoplectus (Pignotti \& Mariotti 2004). References: Strong (1994)=Z; Smith (1995)=Y; Smith in FNA (2002b); Goetghebeur in Kubitzki (1998b); Pignotti \& Mariotti (2004).

1 Main involucral bracts 2-8, spreading and foliaceous (the inflorescence thus appearing terminal); rhizomes bearing ovoid tubers; bristles persistent on the achene; achenes \(2.5-5 \mathrm{~mm}\) long (including body and apiculus)
[Bolboschoenus]
1 Main involucral bract 1 (rarely with an additional 1-2 lateral bracts), erect and terete or triangular, appearing as a continuation of the culm (the inflorescence thus appearing lateral, though in some species the longer inflorescence branches may overtop the bract); rhizomes not bearing tubers; bristles falling from the achene; achenes \(1.0-4.5 \mathrm{~mm}\) long (including body and apiculus). \(5 \quad\) Spikelets on stalks of varying lengths, at least some clearly not sessile.

6 Culms distinctly triangular in cross-section, more sharply so above than below, nearly terete near the base; [section Malacogeton]

Sch. etuberculatus
6 Culms terete throughout, or obscurely triangular above; [section Schoenoplectus].
\(7 \quad\) Spikelets appearing dull gray-brown, the scales copiously covered with red-brown dots (as seen at \(10 \times\) ) 6-15 mm long; lower and middle scales (3.0-) 3.5-4.0 mm long; culms firm, not easily compressed Sch. acutus var. acutus
7 Spikelets appearing reddish-brown, the scales not obviously dotted (as seen at \(10 \times\) ), 6-11 mm long; lower and middle scales (2.0-) 2.5-3.0 (-3.5) mm long; culms soft, easily compressed.
8 Perianth bristles plumose; spikelets acute; culms obscurely triangular near the inflorescence
Sch. californicus
8 Perianth bristles retrorsely barbed; spikelets obtuse; culms terete throughout their length
5 Spikelets all sessile, in a cluster at one point (rarely with 1 or 2 short branches to 5 mm long).
9 Spikelet solitary; leaves numerous; plant usually aquatic, the culms and leaves flaccid, supported by the water; [section Malacogeton] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Sch. subterminalis 9 Spikelets (1-) 2-several; leaves 1-4; usually of wet places, but the culms stiff and erect, not floating.

10 Rhizomatous perennial; culms triangular in cross-section, usually 5-20 dm tall.
11 Leaves elongate, more than half as long as the culms; achenes trigonous; styles 3-branched; [section Malacogeton]
11 Leaves short, less than half as long as the culms; achenes plano-convex; styles 2 ( -3 ) branched;
[Schoenoplectus pungens complex of section Schoenoplectus].
12 Main involucral bract 1-2.5 (-6) cm long, with no other reduced, scale-like bracts present; mature culms 4-10 mm wide; sides of the culm strongly concave, wing-angled; [strictly of brackish situations in the outer Coastal Plain] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Sch. americanus
12 Main involucral bract (1-) 3-18 cm long, with 1-2 additional, reduced, scale-like bracts present (resembling enlarged scales but lacking a flower); mature culms 1-6 mm wide; sides of the culm flat, slightly concave, or slightly convex; [of inland fresh and salty situations, widespread in our area] ....

Sch. pungens var. pungens

10 Cespitose annual or perennial; culms terete, \(1-6 \mathrm{dm}\) tall.
13 Perianth bristles absent; achenes 1.2-1.6 mm long, transversely rugose; [section Supini]. 14 Achenes biconvex to obscurely trigonous, the faces convex .......... Sch. erectus ssp. raynalii 14 Achenes biconvex, with a planar or concave area on the adaxial surface ............. Sch. hallii
13 Perianth bristles 5-6; achenes 1.5-2.0 mm long, smooth, finely pitted, or finely papillose; [section
Actaeogeton].
15 Achenes \(1.75-2.0 \mathrm{~mm}\) long, unequally biconvex (rounded on both faces, but less so on one than the other), rounded-obovate, broadly cuneate at the base, rounded at the apex ..... Sch. purshianus
15 Achenes 1.5-1.8 mm long, planoconvex (nearly flat on 1 face), obovate, cuneate at the base, subtruncate at the apex

Sch. smithii

Schoenoplectus acutus (Muhlenberg ex Bigelow) Á. Löve \& D. Löve var. acutus, Hardstem Bulrush, Great Bulrush. Cp (NC), Mt (VA), Pd (VA): marshes; rare (NC Rare, VA Rare). June-early August; August-October. The species is widespread in temperate North America; var. acutus is restricted to e. North America. [= FNA, K, Y; = Scirpus acutus Muhlenberg ex Willdenow -RAB , C, F, G, GW, W; Schoenoplectus lacustris Linnaeus ssp. glaucus (Smith) Hartman]

Schoenoplectus americanus (Persoon) Volk ex Schinzius \& R. Keller, Olney Threesquare. Cp (GA, NC, SC, VA): tidal freshwater to brackish marshes; rare (NC Watch List). Late May-June; June-September. Nova Scotia west to WA, south to South America. Schuyler (1974) discusses the need to replace the name S. olneyi (as traditionally applied) with S. americanus, traditionally applied to what must now be called S. pungens. Because of this nomenclatural change, the interpretation of much some information and records is now uncertain. [= FNA, K, Z; Scirpus americanus Persoon -- C; Scirpus olneyi -- RAB, F, G, GW, S]

Schoenoplectus californicus (C.A. Meyer) J. Soják, Giant Bulrush, Southern Bulrush, Tule. Cp (GA, NC, SC): marshes; rare. SC south to FL, west to TX, and extending s. into the New World tropics; on the west coast, from CA southward. [= FNA, K; = Scirpus californicus (C.A. Meyer) Steudel -- GW, S]

Schoenoplectus erectus (Poiret) Palla ex J. Raynal ssp. raynalii (Schuyler) K. Lye. Cp (GA, SC): sandy or peaty, seasonally wet soils (such as on pond shores); rare (GA Special Concern, SC Rare). September-October. Apparently ranging from SC south to n . FL, c. peninsular FL and sw. GA; also in the tropics of both hemispheres. [= FNA, K; Scirpus hallii A. Gray -- RAB, misapplied; Scirpus erismaniae Schuyler -- GW; Scirpus erectus Poiret]

Schoenoplectus etuberculatus (Steudel) J. Soják, Swamp Bulrush, Canby's Bulrush. Cp (GA, NC, SC, VA): beaver ponds, on peat in small depression ponds, in flowing blackwater streams; rare (GA Special Concern, NC Rare, VA Rare). July-August; August-September. DE south to \(n\). FL and west to e. TX (the distribution rather discontinuous); substantially disjunct in s. MO and RI. [= FNA, K, Z; = Scirpus etuberculatus (Steudel) Kuntze -- RAB, C, F, G, GW, S]

Schoenoplectus hallii (A. Gray) S.G. Smith, Sharpscale Bulrush. Cp (GA): pond shores in peaty sands; rare (GA Special Concern). It has also been reported for our area by RAB, and is apparently included in our area by C, as Scirpus supinus Linnaeus var. hallii (A. Gray) A. Gray, and by others; at least some of these reports are misidentifications of the similar Sch. erectus. It is reported for sw. GA by Jones \& Coile (1988) and Smith in FNA (2002b). It is very similar to Sch. erectus, differing in having the spikelet scales yellow brown (vs. reddish brown) and achenes concave on the ventral surface (vs. bulging on the ventral surface). [= FNA, K; = Scirpus supinus Linnaeus var. hallii (A. Gray) A. Gray - C; = Scirpus hallii A. Gray]

Schoenoplectus pungens (Vahl) Palla var. pungens, Common Threesquare, Chairmaker's Rush, Swordgrass. Cp (NC, SC, VA), Pd (NC, VA), Mt (VA), \{GA\}: marshes, rocky river beds; common. Mid May-June; June-September. The species is circumboreal, ranging in North America from Newfoundland west to AK, south to South America; var. pungens is widespread. This taxon has traditionally had the name Scirpus americanus applied to it; this name, however, is properly applied to the traditional Scirpus olneyi. Scirpus pungens (or Schoenoplectus pungens) becomes the correct name for this plant (Schuyler 1974). [= FNA, K, Y; Scirpus americanus -- RAB, F, G, GW, S, W, misapplied; = Scirpus pungens Vahl var. pungens -- C; < Schoenoplectus pungens -- Z, infraspecific taxa not distinguished]

Schoenoplectus purshianus (Fernald) M.T. Strong, Bluntscale Bulrush. Mt (GA, NC, SC, VA), Pd (GA, NC, VA), Cp (NC, VA): marshes; common. Late June-August; July-October. ME west to MN, south to nc. GA (Jones \& Coile 1988), AL, MS, TN, and KY. [= FNA, K, Z; Scirpus purshianus Fernald -- RAB, C, F, GW, W; Scirpus smithii var. williamsii (Fernald) Beetle - G; Scirpus debilis Pursh -- S, misapplied; Scirpus juncoides Roxburg var. digynus (Böckler) T. Koyama; Scirpus juncoides var. williamsii (Fernald) T. Koyama]

Schoenoplectus smithii (A. Gray) J. Soják, Smith's Bulrush, Bluntscale Bulrush. Cp (VA): gravelly intertidal beach; rare (VA Rare). July; Late July-August. Québec west to MN, south to NJ, DE, ne. VA, PA, n. OH, and IL. Reported from mountains of sw. VA. The varieties recognized by Smith in FNA (2002b) are of uncertain value; all three are in or approach our area. Var. smithii (south to DE, NJ, and PA) has perianth bristles absent or rudimentary. Var. levisetus (with a historic occurrence in VA) has 1-4 perianth bristles, much shorter than to equalling the achene, the bristles smooth or sparsely retrorsely barbed. Var. setosus (with records from NC, DE, and MD) has 4-6 perianth bristles, as long as or longer than the achene, and densely retrorsely barbed. [= K, Z; Scirpus smithii A. Gray -- C, F; Scirpus smithii var. smithii -- G; > Schoenoplectus smithii var. smithii - FNA; > Schoenoplectus smithii var. setosus (Fernald) S.G. Smith - FNA; > Schoenoplectus smithii var. levisetus (Fernald) S.G. Smith - FNA]

Schoenoplectus subterminalis (Torrey) J. Soják, Swaying Rush, Water Bulrush. Cp (GA?, NC, SC, VA), Mt (VA): beaver ponds, bogs, in highly acid water; rare (NC Rare, SC Rare, VA Rare). May-June; June-August. Newfoundland west to s. AK, south to se. NC, nc. SC, GA, panhandle FL, MO, UT (?), and n. CA (the distribution discontinuous, especially southwards). [= FNA, K, Z; = Scirpus subterminalis Torrey -- RAB, C, F, G, GW, S, W]

Schoenoplectus tabernaemontani (C.C. Gmelin) Palla, Softstem Bulrush, Great Bulrush. Cp (GA, NC, SC, VA), Mt (GA, NC, SC, VA), Pd (NC, SC, VA): marshes, sedge maedows, streambeds, riverbeds, calcareous fens; common. June-September. Newfoundland west to AK, south to South America; also in Europe. [= FNA, K, Y; Scirpus validus Vahl -- RAB, C, F, G, GW, S; Scirpus validus var. creber Fernald -- F; = Scirpus tabernaemontani K.C. Gmelin -- W; Schoenoplectus validus (Vahl) A. \& D. Löve --

Z; Schoenoplectus lacustris Linnaeus ssp. validus (Vahl) T. Koyama var. validus; = Scirpus lacustris Linnaeus var. tabernaemontani (C.C. Gmelin) Döll]

Schoenoplectus torreyi (Olney) Palla, Torrey's Bulrush, Torrey's Threesquare. Mt (VA): sinkhole ponds; rare (VA Rare). New Brunswick west to Manitoba, south to NJ, PA, WV, w. VA, MO, and NE. Known in VA only from natural ponds in Augusta and Rockingham counties. [= FNA, K, Z; = Scirpus torreyi Olney -- C, F, G, W]

Schoenoplectus deltarum (Schuyler) J. Soják, Delta Bulrush. Brackish marshes and other wetlands, AL and FL west to KS and TX. [= FNA, K; Scirpus deltarum Schuyler] \{not yet keyed\}
* Schoenoplectus mucronatus (Linnaeus) Palla, Rough-seed Bulrush. Weed (native of Eurasia) in rice fields and other disturbed situations, known fromold collections in PA, NJ, NY and more recently from KY and TN. [= FNA, K; Scirpus mucronatus Linnaeus] \{not yet keyed\}

The hybrid Schoenoplectus etuberculatus \(\times\) subterminalis has been collected in Hoke Co, NC and Lexington County, SC. It has sterile, malformed achenes.

Scirpus Linnaeus (Bulrush)
(also see Bolboschoenus, Isolepis, Oxycaryum, Schoenoplectus, and Trichophorum)
A genus of about 20 species, herbs, of circumboreal distribution, also with species in Australia, Malaysia, and South America. The complex of species including Sc. atrovirens, Sc. georgianus, Sc. hattorianus, Sc. flaccidifolius are difficult to identify, and some have doubted their validity. Although further work on this group is needed, they do generally appear to behave as biological species despite their morphological similarity. Schuyler (1967) writes that "the remaining species in the key differ in minute characteristics and often the most satisfactory means of identification is by carefully comparing specimens of them. Despite the close morphological similarity of these species, their characteristics are reasonably constant even in areas where they coexist and occasionally hybridize." References: Whittemore \& Schuyler in FNA (2002b); Schuyler (1967)=Z; Strong (1994)=Y; Goetghebeur in Kubitzki (1998b). Key adapted from C, GW, and Z.

1 Bristles smooth, without teeth along the margins, strongly contorted and greatly exceeding the achenes when extended. 2 Scales usually with inconspicuous midribs; mature bristles exceeding the scales and giving the inflorescence a woolly appearance; achenes 0.6-0.9 mm long, yellowish-gray to nearly white . . . . . . . . . . . . . . . . . . . . . . . . . Sc. cyperinus
2 Scales usually with prominent green midribs; mature bristles mostly contained within the scales; achenes 1.0-1.3 mm long, brown to purplish-brown when mature.
3 Perianth bristles (extended) shorter than, equal to, or slightly exceeding the achene; mature culms lax, the inflorescences lopping over to (or nearly to) the ground, with 2-3 lateral inflorescences in addition to the terminal one; rays of the inflorescence scabrous, ascending to divergent, with axillary bulblets

Sc. lineatus
3 Perianth bristles (extended) exceeding the achene by \(2-3 \times\); mature culms rigid, nearly upright, with 0-2 lateral inflorescences in addition to the terminal one; rays of the inflorescence glabrous, ascending, lacking axillary bulblets
...... Sc. pendulus
1 Bristles with retrorse or antrorse teeth along the margins, strongly contorted to nearly straight, shorter than to greatly exceeding the achenes when extended (or bristles absent or nearly so in Sc. georgianus).
4 Spikelets all solitary with distinct pedicels; mature scales with broad green midribs; achenes with protruding angles and

4 Spikelets all or mostly in glomerules with the pedicels scarcely developed; mature scales with midribs not usually green; achenes less sharply trigonous, the sides convex, flat, or slightly concave.
5 Culms with 10-20 leaves; spikelets broadly ovate; scales reddish-brown and, excluding the tips, about as wide as long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Sc. polyphyllus
5 Culms with 2-10 leaves; spikelets broadly ovate to narrowly ovate; scales brown or black and, excluding the tips, mostly longer than wide.
6 Bristle teeth thick-walled and sharp-pointed, densely arranged almost to the base of the bristle.
7 Plants cespitose with short, brownish rhizomes; leaf sheaths green throughout; scales broadest above the middle; achenes with well-developed receptacles and firmly attached bristles . . . . . Sc. ancistrochaetus
\(7 \quad\) Plants spreading with long, reddish rhizomes having conspicuous nodes and internodes; lower leaf sheaths red-tinged near their bases; scales usually broadest below the middle; achenes with poorlydeveloped receptacles from which the bristles readily detach

Sc. expansus
6 Bristle teeth thin-walled and with rounded tips, mostly restricted to the upper \(2 / 3\) of the bristle (or bristles absent or nearly so in Sc. georgianus).
8 Bristles 0-3, shorter than the achenes; teeth, if present, concentrated near the tips of the bristles Sc. georgianus
8 Bristles usually 5-6, shorter than to slightly longer than the achenes; teeth extending basally from the tips of all or at least some of the bristles.
9 Mature culms lax and reclining with the inflorescences lopping over to (or nearly to) the ground; glomerules usually with less than 15 spikelets; lower scales of spikelets slightly mucronate, blackish

9 Mature culms upright or nearly so; glomerules frequently with more than 15 spikelets; lower scales of spikelets mucronate, blackish or brownish.

10 Lower leaf blades and sheaths usually nodose-septate; spikelets ovate or narrowly ovate; scales mostly brownish; longer bristles frequently exceeding the achenes; achenes 1.0-1.3 mm long . .

\section*{Sc. atrovirens}

10 Lower leaf blades and sheaths nearly smooth; spikelets broadly ovate or ovate; scales mostly blackish; longer bristles usually shorter than or about equalling the achenes; achenes 0.8-1.1 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Sc. hattorianus

Scirpus ancistrochaetus Schuyler, Northeastern Bulrush. Mt (VA): mountain ponds; rare (US Endangered, VA Endangered). July-September. VT, MA, and NY south to PA, e. WV, and w. VA. See Bartgis (1992) and Schuyler (1962) for additional information on this species. [= FNA, K, Z; < Sc. atrovirens var. atrovirens -- C, in part only]

Scirpus atrovirens Willdenow, Black Bulrush. Pd, Mt, Cp (GA?, NC, SC, VA): marshes; common. July-September. Newfoundland west to MN, south to GA and TX; disjunct in AZ. [= FNA, K, Z; Scirpus atrovirens -- RAB, GW, S, W, in part only; Scirpus atrovirens var. atrovirens -- C, F, G, in part only]

Scirpus cyperinus (Linnaeus) Kunth, Woolgrass Bulrush. Cp, Mt, Pd (GA, NC, SC, VA): marshes, disturbed wet ground; common. July-September. Newfoundland west to British Columbia, south to FL, e. TX, and OR. The varieties may be worthy of recognition. [= RAB, C, F, FNA, G, GW, K, S, W; Scirpus cyperinus var. pelius Fernald -- F; Scirpus rubricosus Fernald -- F; Scirpus eriophorum Michaux -- G, S]

Scirpus divaricatus Elliott. Cp (GA, NC, SC, VA): swamp forests; common, uncommon in VA (VA Watch List). JulySeptember. Se. VA south to n. FL, west to e. TX, s. TN, and s. MO. [= RAB, C, F, FNA, G, GW, K, S, Z]

Scirpus expansus Fernald, Woodland Bulrush. Mt (NC, SC, VA), Pd (GA, NC, SC, VA), Cp (VA): bogs, marshes, streambeds; common (GA Special Concern). July-September. ME west to MI, south to ne. GA and OH. [= RAB, C, F, FNA, G, GW, K, W, Z; Scirpus sylvaticus Linnaeus -- S, misapplied]

Scirpus flaccidifolius (Fernald) Schuyler, Reclining Bulrush. Cp (NC, VA): bottomlands; rare (US Species of Concern, NC Rare, VA Rare). July-September. Endemic to se. VA and ne. NC. A recent status survey (Ludwig 1993) found the following characters to be most useful in distinguishing Sc. flaccidifolius from Sc. georgianus growing in the same region: bristles 1.2-1.4 mm long (vs. absent or mostly less than 0.2 , rarely to 1.0 mm long in Sc. georgianus), spikelets \(1.5-2.1 \mathrm{~mm}\) wide (vs. 1.1-2.2 mm wide), spikelets 3-9 (-12) per glomerule (vs. 4-23), and inflorescence rays \(5.5-17.9 \mathrm{~cm}\) long (vs. \(3.5-13.5 \mathrm{~cm}\) long). Bristle length was the only character which consistently separated the 2 species; other characters showed overlapping values of possibly statistical value. [= FNA, K, Z; Scirpus atrovirens var. atrovirens -- C, in part; Scirpus atrovirens Willdenow var. flaccidifolius Fernald -- F]

Scirpus georgianus Harper, Georgia Bulrush. Mt, Pd (GA, NC, SC, VA): marshes, wet areas, ditches; common. JulySeptember. Prince Edward Island west to NE, south to GA and e. TX. [= FNA, K, S, Z; Scirpus atrovirens -- RAB, GW, W, in part only; Scirpus atrovirens var. atrovirens -- C, in part; Scirpus atrovirens Willdenow var. georgianus (Harper) Fernald -- F, G]

Scirpus hattorianus Makino, Northern Bulrush. Mt (NC, VA): seepages, ditches, marshes, mostly at moderate to high elevations; uncommon (VA Watch List). July-September. Newfoundland to w. Ontario and WI, south to MD, NC, OH, and IN. [= FNA, K, Z; Scirpus atrovirens -- RAB, GW, W, in part only; Scirpus atrovirens var. atrovirens -- C, F, G, in part]

Scirpus lineatus Michaux. Cp (GA, NC, SC, VA): swamp forests over coquina limestone ("marl"); rare (NC Rare, VA Watch List). May-July. Se. VA south to c. FL, west to LA. [= C, FNA, GW, K, Z; Scirpus fontinalis Harper -- RAB, F, S; Scirpus fontinalis var. virginiana Fernald -- G]

Scirpus pendulus Muhlenberg. Mt (GA, VA), Pd, Cp (NC, SC, VA): wet ground over limestone, diabase, or other circumneutral rocks; rare (NC Rare). June-July. ME west to MN, SD, and CO, south to NC, ne. FL, NM, and n. Mexico. [= C, FNA, GW, K, W, Z; Sc. lineatus -- RAB, F, G, S, misapplied; Sc. pendulinus, misspelling]

Scirpus polyphyllus Vahl. Mt, Pd (GA, NC, SC, VA), Cp (VA): marshes, mountain bogs; common. July-September. MA and VT west to IL and s. MO, south to nc. GA (Jones \& Coile 1988) and AL. [= RAB, C, F, FNA, G, GW, K, S, W, Z]

Scirpus atrocinctus Fernald ranges south to WV (Grant, Hampshire, Harrison, Pendleton, Pocahontas, Randolph, and Tucker counties). It is a northern relative of Sc. cyperinus, by some not considered distinct. It differs in having spikelets mostly solitary with distinct pedicels (vs. solitary with distinct pedicels or in glomerules with pedicels scarcely developed), scales usually blackish (vs. reddish-brown to brownish, or rarely blackish), and flowering and maturing achenes roughly a month earlier than nearby Sc. cyperinus. [= FNA, K]

Scirpus longii Fernald has been reported as occurring in e. NC by Radford, Ahles, \& Bell (1968) and Fernald (1950). This report is in error. It does range south to NJ (Kartesz 1999). [= FNA, K]

Scirpus microcarpus J. \& K. Presl ranges south to WV (Monongalia, Pocahontas, Randolph, and Tucker counties). It should key straightforwardly to key lead 21, differing however from all later species in the key in having the styles mostly 2 -parted (vs. 3parted) and the achenes 2 -angled (vs. 3-angled). [= FNA, K]

Scirpus pallidus (Britton) Fernald ranges south to se. PA (Rhoads \& Klein 1993) and NJ (Kartesz 1999). [= FNA, K]
Scirpus pedicellatus Fernald, south to NJ, PA, OH, and KY (Kartesz 1999). [= FNA, K]

Scleria Bergius (Nutrush)
(contributed by Richard J. LeBlond)
A genus of about 250 species, herbs, pantropical, and locally extending into warm temperate regions. This treatment attempts to recognize the stablest and most distinctive Scleria entities. Intermediate and otherwise difficult-to-classify specimens are occasionally encountered within some species groups, suggesting hybridization or incomplete speciation. This is particularly true within the S. ciliata/pauciflora group (here boldly treated as four species and two varieties). This complex genus likely will continue to challenge and exasperate those who study it. References: Kessler (1987)=Z; Fairey (1967)=Y; Reznicek, Fairey, \& Whittemore
in FNA (2002b); Core (1936); Goetghebeur in Kubitzki (1998b).
Identification notes: Scleria superficially resembles Rhynchospora in the field, but mature specimens are readily recognized by the terete white, gray, or black bony achenes. Hardened achenes are necessary for reliable identification to species. In the key, achene length includes hypogynium when present. The scale character applies only to the ultimate bracteate structure clasping the achene.

1 Base of achene without hypogynium (a circular, angular, lobed, or tuberculate disk differing in texture and structure from the achene body), the achene base constricted, pitted, and/or ribbed, but appearing as a continuation of the achene body.
2 Achene body papillose-verrucose, often characterized by raised and undulating transverse ridges; spikelets verticillate in (2-)3-5(-9) sessile clusters \(\qquad\) Scl. verticillata
2 Achene body smooth or longitudinally ribbed; spikelets in a single cluster.
3 Triangular base of achene with a pair of pits on each of the three sides; achene 2-3 mm long ...... Scl. georgiana
3 Triangular base of achene lacking pits in the three concave sides; achene \(3-4 \mathrm{~mm}\) long . . . . . . . . . . . Scl. baldwinii
1 Base of achene with hypogynium.
4 Achene body smooth (often longitudinally ribbed); hypogynium with 0 , 8 , or 9 tubercles.
5 Hypogynium with 8 or 9 minutely papillate tubercles
Scl. oligantha
5 Minutely papillate portion of hypogynium continuous, not divided into separate tubercles.
6 Achene 1-2 mm long; culm 1-2 mm wide at base; leaves \(1-3 \mathrm{~mm}\) wide
Scl. minor
6 Achene \(2-4 \mathrm{~mm}\) long; culm 2.5-6 mm wide at base; leaves \(5-9 \mathrm{~mm}\) wide.
7 Plants cespitose to short-rhizomatous; sheaths brown or straminous to reddish, glabrous to glabrate on the ventral surface except for a pubescent and often thickened summit; achenes 2.0-3.3 mm long, 1.12-1.38 \(\times\) as long as wide (averaging 1.24); of wet to mesic habitats Scl. triglomerata
7 Plants long-rhizomatous to cespitose; sheaths purple to reddish, the ventral surface uniformly pubescent; achenes \(2.8-4.0 \mathrm{~mm}\) long, \(1.35-1.54 \times\) as long as wide (averaging 1.45 ); mostly of dry to dry-mesic habitats Scl. nitida
4 Achene reticulate or papillose, rarely smooth (most often from apparent abortion or abnormal development); hypogynium with 3 tongue-shaped lobes, or 3 or 6 tubercles.
8 Hypogynium of 3 tongue-shaped lobes appressed to the underside of the achene (appearing nearly bract-like); achene reticulate, the pits generally squarish or rectangular and arranged regularly in rows, rarely smooth (apparently by abortion or abnormal development).
9 Achene pubescent (occasionally becoming glabrate); lower lateral inflorescences on long, filiform, usually drooping peduncles; bract of the uppermost lateral inflorescence usually reaching from 1/3-3/4 the length of the terminal internode; terminal internode \(6-30 \mathrm{~cm}\) long Scl. muehlenbergii
9 Achene glabrous; lower lateral inflorescences sessile or on short-erect peduncles; bract of the uppermost lateral panicle usually reaching \(3 / 4\) the length of to exceeding the terminal internode; terminal internode \(3-8 \mathrm{~cm}\) long

Scl. reticularis
8 Hypogynium with 3 or 6 tubercles; achene papillose, sometimes reticulate (if so, the pits generally variable in shape and not forming regular rows), or rarely smooth.
10 Achenes 1.5-2 mm long, the hypogynium with 6 paired but distinctly separate tubercles.
11 Culms, leaves, and bracts glabrous or sparsely hirtellous, but not copiously villous-ciliate
Scl. pauciflora var pauciflora
11 Culms, leaves, and bracts copiously villous-cilliate with spreading hairs \(0.5-1 \mathrm{~mm}\) long
Scl. pauciflora var. caroliniana
10 Achenes 2.0-3.6 mm long, the hypogynium with 3 tubercles, these often 2 -lobed, the lobes united (becoming separate in \(S\). species 1 with achenes smoothish and more than 2.5 mm long).
12 Achenes 2-2.5(-3) mm long, 1.5-2.0(-2.3) mm wide; larger leaves 1-3.5 mm wide; culms, sheaths, blades, and bracts glabrous to moderately pubescent or ciliate.
13 Culms, sheaths, blades, and bracts glabrous; plants of sandy soils (e.g., spodosols) Scl. ciliata var glabra
13 Culms and/or sheaths hairy; blades and bracts ciliate; plants of loamy sands (e.g., ultisols)
Scl. ciliata var. ciliata
12 Achenes 2.6-3.3(-3.6) mm long, 2.0-2.6 mm wide; larger leaves \(3-7 \mathrm{~mm}\) wide; culms, sheaths, blades, and bracts moderately to densely pubescent and/or ciliate; plants usually of loamy soils (e.g., ultisols and alfisols).
14 Herbage pubescent between as well as along primary sheath and adaxial leaf surface nerves and culm angles; most pistillate scales pubescent with appressed hairs \(0.1(-0.2) \mathrm{mm}\) long, the keel similarly pubescent or ciliate with hairs (0.1-)0.2 mm long; achene body distinctly papillose, 2.0-2.4 (2.5) mm wide, averaging 2.2 mm , the length:width ratio 1.2-1.5 (-1.7); hypogynium with 3 usually lobed tubercles Scl. elliottii
14 Herbage pubescence restricted to primary sheath and leaf surface nerves and culm angles; pistillate scales glabrous, the keel ciliate with glutinous hairs, the longer \(0.5-1.0 \mathrm{~mm}\); achene body smoothish, uneven with low, broad non-papillose rises, (2.3-) 2.4-2.6 mm wide, averaging 2.5 mm , the length:width ratio 1.1-1.25; hypogynium with 3 deeply lobed tubercles, or 6 paired but separate tubercles

Scl. species 1

Scleria baldwinii (Torrey) Steudel, Baldwin's Nutrush. Cp (GA, NC, SC): wet savannas, under Pinus serotina, P. palustris, and/or Taxodium ascendens; rare (NC Rare, SC Rare). June-July. Se. NC south to FL and west to se. TX; also in Cuba and the Bahamas (Sorrie \& LeBlond 1997). S. baldwinii is a more robust plant, with larger achenes, than S. georgiana. [= RAB, FNA, K, GW]

Scleria ciliata Michaux var. ciliata, Hairy Nutrush. Cp, Pd (GA, NC, SC, VA), Mt (NC, SC): wet to dry sandy thickets and flatwoods, typically on sandy soil; frequent, rare in the mountains, rare in VA (VA Rare). May-August. VA south to FL, west to MO and TX, and in the West Indies, Mexico, and Central America. [= FNA, S, Y; S. ciliata -- RAB, C, F, G, GW, W, in part, infraspecific taxa not distinguished; S. ciliata var. ciliata - K, in part only]

Scleria ciliata Michaux var. glabra (Chapman) Fairey, Smooth Nutrush. Cp (GA, NC, SC, VA?): savannas and flatwoods; frequent in the outer Cp of NC and SC. NC (VA?) south to FL, west to TX. S. ciliata var. curtissii (Britton) Kessler (=S. pauciflora Muhl. ex Willd. var. curtissii (Britton) Fairey) is currently of uncertain taxonomic standing. It is distinguished by its reticulate, nonpapillose achenes, but such a condition has been observed in achenes with the hypogynium lobing of both S. ciliata and \(S\). pauciflora (as suggested by the synonymy), and may only represent a form or condition. [= FNA, Y, K; S. brittonii Core ex Small -S; S. ciliata -- RAB, C, F, G, GW, W, in part, infraspecific taxa not distinguished; S. ciliata var curtissii (Britton) Kessler -- Z; S. pauciflora Muhl. ex Willd. var. curtissii (Britton) Fairey -- K]

Scleria elliottii Chapman, Broad-leaved Hairy Nutrush. Cp (GA, NC, SC, VA): savannas, flatwoods, pine-oak woodlands, meadows, bogs, and clay-based Carolina bays, typically on loamy sands; occasional. May-September. VA south to FL, west to TX, MO, OK. The descriptions of S. elliottii in \(S\) and of S. ciliata Michaux var. elliottii (Chapman) Fernald in \(F\) do not include the entity here treated as S. elliottii var. 1. [=S; S. ciliata Michaux var. elliottii (Chapman) Fernald -- F, FNA, Y; S. ciliata var. ciliata -- K, in part only; S. ciliata -- RAB, C, G, GW, W, in part only]

Scleria georgiana Core, Georgia Nutrush. Cp (GA, NC, SC): pine savannas, cypress savannas, depression meadows, mostly on the outer coastal plain; rare (NC Rare). June-August. NC south to s. FL, west to TX; and in the West Indies, Central and South America. See note under S. baldwinii. [= RAB, FNA, GW, K; S. gracilis Elliott -- S (name preoccupied)]

Scleria minor W. Stone, Slender Nutrush. Cp, Mt (NC, SC, VA): wet savannas and peaty seepages in the Coastal Plain and Sandhills, bogs in the Mountains; rare (NC Watch List, VA Rare). June-August. NJ south to FL, west to se. TX. [= RAB, C, F, FNA, G, K, W; S. triglomerata -- GW, S, in part]

Scleria muehlenbergii Steudel, Pitted Nutrush. Cp, Pd (GA, NC, SC, VA), Mt (NC, SC, VA): open wet sand, pine savannas and flatwoods, depression meadows, cypress savannas, limesink ponds, bogs; common. June-September. NY (Long Island), NJ, and NC south to FL, west to TX, north in the interior to MO and IN; also in the West Indies, Bahamas (Sorrie \& LeBlond 1997), Mexico, and Central America. S. muehlenbergii is adapted to a variety of freshwater wetland habitats, while S. reticularis is primarily restricted to the drawdown zones of limesink (doline) ponds and clay-based Carolina bays. Also see notes under S. reticularis. In normal specimens, the achene reticulation ridges are sharp-edged and steeply sloped (compare S. reticularis). The achene pubescence is often tawny, and achenes appearing superficially glabrous often have a tawny residue under magnification. [= FNA, K; S. reticularis Michaux -- RAB, C, GW, W, in part; S. muhlenbergii - F, orthographic variant; S. reticularis var. pubescens Britton -G; S. setacea Poiret -- S]

Scleria nitida Willdenow, Shining Nutrush. Cp, Mt, Pd (NC, SC, VA) \{GA?\} (complete distribution by province by state has yet to be determined): dry sandy or rocky soil of pine/scrub oak woodlands, ridgetop forests at lower elevations in the Mountains such as pine/oak heaths, and heath balds. May-October. MA, VA, and KY south to FL, west to LA and MO (also see note under S. triglomerata). S. flaccida Steudel, here synonymized because of achene and sheath characters, is a poorly known entity with pendulous capillary axillary peduncles and swamp habitat as in S. oligantha, but with an unlobed hypogynium; \(F\) gives a range of se. VA to FL and LA. [= F, G; S. triglomerata Michaux -- RAB, C, FNA, GW, K, S, W, in part; S. flaccida Steudel -- F]

Scleria oligantha Michaux, Few-flowered Nutrush. Cp, Pd (GA, NC, SC, VA), Mt (NC, SC, VA): dry to moist forests and woodlands, swamp forests; common. June-September. NJ and MO south to FL and TX, also in Puerto Rico, Mexico, and Central America. The long, filiform, arching lateral peduncles are distinctive. [= RAB, C, F, FNA, G, GW, K, S, W]

Scleria pauciflora Muhlenberg ex Willdenow var. caroliniana A. Wood, Carolina Nutrush. Cp (GA, NC, SC, VA?): savannas; uncommon. June-September. NH west to MI, south to n. FL, TN, and MO. [= F, FNA, G, K; S. pauciflora -- RAB, C, GW, S, W, in part, infraspecific taxa not distinguished]

Scleria pauciflora Muhlenberg ex Willdenow var. pauciflora, Papillose Nutrush. Cp, Pd, Mt (GA, NC, SC, VA): wet to dry pine flatwoods, pine savannas, depression meadows; common. June-September. NJ west to KS, south to FL and TX, also in Cuba. Typification of S. pauciflora is controversial and unresolved at this time (Fairey \& Whittemore 1999). [= F, FNA, G, K; S. pauciflora -- RAB, C, GW, S, W, in part, infraspecific taxa not distinguished]

Scleria reticularis Michaux, Netted Nutrush. Cp (GA, NC, SC): limesink ponds, clay-based Carolina bays; rare (NC Rare). June-September. MA south to FL, west to TX, north to IN, MI, and WI. Reports from Mexico are based on S. muehlenbergii. See notes under S. muehlenbergii. In normal specimens, the achene reticulation ridges are soft-edged and obliquely sloped. Occasional stipitate-capitate fungal growth on the achene has been mistaken for pubescence (a condition perhaps restricted to herbarium specimens), apparently contributing to the unwarranted agglomeration of this distinctive taxon and S. muehlenbergii. There is conbtroversy about typification of the name Scleria reticularis (Camelbeke, Reznicek, \& Goetghebeur 2003). [=F,FNA, K, S; S. reticularis -- RAB, C, GW, W, in part only (also see S. muehlenbergii); S. reticularis var. reticularis -- G]

Scleria species 1, Smooth-seeded Hairy Nutrush. Cp, Pd (NC): wet savannas shallowly underlain by coquina limestone in Cp , and apparently in diabase glades in Pd. May-September. Currently known only from Granville, Onslow, and Pender counties, NC. On the Coastal Plain, it is associated with other narrow endemics such as Thalictrum cooleyi, Allium sp. 1, and Carex lutea.

Scleria triglomerata Michaux, Tall Nutrush. Cp, Mt?, Pd (GA, NC, SC, VA): wet to mesic flatwoods, savannas, and hardwood forests; frequent. May-September. VT and Ontario west to MN, south to FL and TX. S. triglomerata sensu lato also occurs in Puerto Rico and Mexico, and may include S. nitida. [= F, G; S. triglomerata -- RAB, C, FNA, GW, K, S, W, in part only]

Scleria verticillata Muhlenberg ex Willdenow, Savanna Nutrush. Cp (GA, NC, SC, VA), Mt (VA): wet calcareous savannas of the outer coastal plain, freshwater marshes and maritime wet grasslands on barrier islands influenced by salt spray and shell
deposits, wet calcareous or mafic fens or seepages in the mountains, calcareous grasslands; rare (NC Rare, VA Rare). JulySeptember. MA and Ontario west to MN, south to FL and TX, also in the West Indies, Mexico, Central and South America. This species is a distinct calciphile, with only scattered occurrences in or near our area. The roots are strongly fragrant. [= RAB, C, F, FNA, G, GW, K, S]

Scleria distans Poiret in J. Lamarck et al. Cp (GA): pine flatwoods, bogs, savannas; rare. GA and FL west to se. TX; tropical America. Known from scattered counties in the Coastal Plain of GA (Jones \& Coile 1988). [= FNA; S. hirtella Sw. -- GW, K, S, Y, Z, misapplied] \{add to key\}

\section*{Trichophorum Persoon (Deergrass)}

A genus of about 10 species, herbs, primarily circumboreal, but with disjunct occurrence in montane tropical Asia and montane tropical South America. Trichophorum has long been recognized as distinct from Scirpus by many authors (especially in Europe and Asia). Molecular and other studies have clearly confirmed that these species are more closely allied to Eriophorum than to Scirpus, and their removal from Scirpus creates a more natural classification (Strong 1994). Trichophorum resembles Eriophorum in most morphologic characters, and shares with it a generally boreal and north temperate distribution. Trichophorum alpinum (Linnaeus) Persoon demonstrates previous confusion over the affinities of the group; it has been variously treated (by those who do not recognize Trichophorum) as Eriophorum alpinum Linnaeus or Scirpus hudsonianus (Michaux) Fernald. References: Crins in FNA (2002b); Strong (1994)=Z; Goetghebeur in Kubitzki (1998b).

1 Culms terete or nearly so, smooth; [(in our area) of moderate to high elevation cliffs] . . . . T. caespitosum ssp. caespitosum 1 Culms sharply triangular in cross-section, the angles scabrous; [plants of low to moderate elevation forests, woodlands, and bluffs] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . T. Tlanifolium

Trichophorum caespitosum (Linnaeus) Schur ssp. caespitosum, Deergrass, Deerhair Bulrush. Mt (GA, NC, SC): cliffs receiving fog/cloud deposition and seepage, mostly at high elevations, over amphibolite, granite, gneiss, or schist, notably at Grandfather Mountain, Roan Mountain, Whiteside Mountain, and Chimney Rock; rare (GA Special Concern, NC Rare). JulySeptember. A circumboreal tundra species, south in North America to the mountains of New England and fens in NY, and to n. IL, MN, montane UT, and OR, common in wet tundra and on alpine summits, disjunct (from NY) to about a dozen sites in the Southern Appalachians of w. NC, e. TN, sw. SC, and ne. GA (Jones \& Coile 1988). The disjunct southern occurrences are certainly relicts of a more widespread distribution during the Pleistocene. Reported for South Carolina by Hill \& Horn (1997) and Hill (1999).
[Trichophorum caespitosum -- K; Scirpus cespitosus var. callosus Bigelow -- RAB, F, G; Scirpus cespitosus Linnaeus -- C, W; Trichophorum cespitosum - FNA, orthographic variant; Scirpus caespitosus -- S, orthographic variant; Baeothryon cespitosum (Linnaeus) A. Dietrich]

Trichophorum planifolium (Sprengel) Palla. Pd, Mt (VA): woodlands, bluffs, forests; uncommon. ME west to Ontario, south to sc. VA, e. WV, KY, OH, and se. MO. See Crins (1989a) for an interesting discussion of this species. [= FNA, K, Z; = Scirpus verecundus Fernald -- C, F, G, W; = Scirpus clintonii -- S, misapplied]

Websteria S.H. Wright
(see Eleocharis)

\section*{DIOSCOREACEAE R. Brown 1810 (Yam Family)}

A family of about 3-20 genera and 600-880 species, of tropical and warm temperate regions. References: Raz in FNA (2002a); Huber in Kubitzki (1998a).

\section*{Dioscorea Linnaeus 1753 (Yam)}

A genus of about 575-850 species, vines, of tropical and warm temperate regions of the Old World and New World. Huber in Kubitzki (1998a) advocates the division of the large and unwieldy Dioscorea into separate genera. Dioscorea (broadly defined) has a wide variety of economic uses, especially in the tropics, where it is most diverse. Various species are cultivated for their edible tubers (yams, not to be mistaken for sweet potatoes, Ipomoea batatas, often referred to colloquially as "yams" in the southern United States), especially in Africa. Oral contraceptives were developed from extracts of Dioscorea. Many other uses are described in AIShehbaz \& Schubert (1989). References: Raz in FNA (2002a); AI-Shehbaz \& Schubert (1989)=Y; Ward (1977c)=Z; Huber in Kubitzki (1998a).

1 Leaves halberd-shaped or sagittate, the sides with a concave portion (D. polystachya) or continuously convex ( \(D\). alata); aerial tubers often present in the leaf axils; perennial from large, vertically-oriented tubers; [non-native species, usually in disturbed areas, especially in bottomlands]; [section Enantiophyllum].
2 Stems broadly winged; leaf margins sagittate, the sides continuously convex . . . . . . . . . . . . . . . . . . . . . . . . D. alata 2 Stems terete, not winged; leaf margins halberd-shaped, the sides with a concave portion .............. D. polystachya
1 Leaves cordate-ovate, the sides of the leaves continuously convex; aerial tubers never present; perennial from rhizomes < 1.5
cm in diameter; [native species, usually of forests and woodlands]; [section Macropoda].
3 Staminate inflorescences usually of 1 large and 1-2 smaller secondary panicles in each axil (of upper stem leaves); filaments inwardly curved, ca. 0.4 mm long; anther lobes connate; tepals oblong; [of SC south] . . . . . . . . . . . D. floridana
3 Staminate inflorescence a single panicle in each axil (of median or upper leaves); filaments straight, ca. 0.2 mm long; anther lobes separate; tepals ovate; [widespread in our area].
4 Lower leaves in whorls of 4-7, upper leaves alternate; stem terete in cross-section; rhizomes 10-15 mm in diameter, often contorted and much-branched D. quaternata

4 All leaves alternate (rarely the lowermost approximate, with short internodes, and appearing nearly whorled); stem polygonal in cross-section, with 8-14 narrowly-winged ribs; rhizomes \(5-10 \mathrm{~mm}\) in diameter, usually relatively straight and little-branched
D. villosa
* Dioscorea alata Linnaeus, White Yam, Great Yam. Cp (GA): disturbed areas, in moist soils; rare, introduced from se. Asia. [= FNA, K, Y, Z]

Dioscorea floridana Bartlett, Florida Wild Yam. Cp (GA, SC): mesic to dry forests, swampy forests; uncommon. June-July; August-November. SC south to n. FL, on the Coastal plain. D. floridana is "the most distinctive of North American species" (AIShehbaz \& Schubert 1989). [= FNA, K, S, Y, Z; = D. villosa Linnaeus var. floridana (Bartlett) Ahles -- RAB]
* Dioscorea polystachya Turczaninow, Cinnamon Vine, Chinese Yam. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): thickets, disturbed areas, bottomland forests; uncommon, native of China. June-August. [= FNA; = D. batatas Decaisne -- RAB, C, F, G, W, Z; = D. oppositifolia Linnaeus -- K, Y, misapplied]

Dioscorea quaternata J.F. Gmelin, Whorled Wild Yam. Mt, Pd (GA, NC, SC, VA): moist forests; common. April-June; September-October. This species has been shown to be quite distinct from \(D\). villosa. It has a more northern and montane range than \(D\). villosa, ranging from \(N J, N Y\), s. Ontario, WI, MN, and IA south to \(n\). FL and LA, centered, and most abundant, in the Appalachians. The status of \(D\). glauca requires further investigation (see Ward 1977c). [= C, F, G, K, S, Y, Z; < D. villosa var. villosa -- RAB; D. glauca Muhlenberg ex Bartlett -- S ; < D. villosa -- FNA, W, in part]

Dioscorea villosa Linnaeus, Common Wild Yam. Cp, Pd, Mt? (GA, NC, SC, VA): moist forests and woodlands; uncommon. April-June; September-November. MA and RI south to \(n\). FL, primarily in the Coastal Plain. Various specific and infraspecific taxa are here combined. Ward (1977c) states that "a recent study at Duke University by Shu-fun Au, unfinished due to the death of its author, tentatively recognized \(D\). hirticaulis and \(D\). floridana but combined all other entities without distinction under \(D\). villosa." Further study is needed. Al-Shehbaz \& Schubert (1989) indicate that the lectotype of \(D\). villosa has pubescent stems; nomenclatural changes are apparently needed, if varietal status of the 2 varieties here recognized proves warranted. [= Y; > D. villosa var. villosa -- C; <> D. villosa var. villosa-- RAB (also see D. quaternata); <D. villosa -- FNA, K; > Dioscorea villosa Linnaeus var. hirticaulis (Bartlett) Ahles - RAB, C; > D. hirticaulis Bartlett -- F, G, S, Z; > D. villosa -- F, G, S, W, Z]

\section*{ERIOCAULACEAE Palisot de Beauvois 1828 (Pipewort Family)}

A family of about 10 genera and 1100 species, of tropical and warm temperate regions (few in cold temperate regions), especially America, and most diverse in n. South America. References: Kral in FNA (2000); Kral (1966c)=Z; Stützel in Kubitzki (1998b).

1 Scape glabrous, \(10-110 \mathrm{~cm}\) tall at maturity; roots thickened, septate (not requiring magnification), unbranched; leaves with obvious air spaces; petals 2 , fused below; stamens (3-) usually 4 ( -6 ), the anthers black at maturity . . . . . . . . . . . . Eriocaulon
1 Scape pubescent (in our species, or very rarely nearly glabrous), 6-40 cm tall at maturity; leaves lacking obvious air spaces; roots fibrous or spongy, not septate; petals 3 or absent; stamens 2-3, the anthers yellow at maturity.
2 Scape pubescent with eglandular hairs; roots fibrous, branched, dark; heads white, gray, or brown; leaves bright green, tapering gradually through most of their lengths, herbaceous in texture . . . . . . . . . . . . . . . . . . . . . . . . . Lachnocaulon
2 Scape pubescent with glandular hairs (or a mixture of glandular and eglandular hairs); roots spongy, unbranched, pale; heads yellowish-tan or gray; leaves bluish green, narrowly linear to the abruptly flared base, stiff in texture

Syngonanthus

\section*{Eriocaulon Linnaeus 1753 (Pipewort)}

A genus of about 400 species, of tropical and warm temperate regions (few in cold temperate areas). References: Kral in FNA (2000); Kral (1966c)=Z; Stützel in Kubitzki (1998b). Key based on Kral in FNA (2000).

1 Receptacle and/or base of flowers copiously hairy; some or most of perianth parts with chalk white hairs; heads overall appearing white, \(5-20 \mathrm{~mm}\) in diameter when in full flower or fruit.
2 Heads hard (little compressed by a plant press and feeling hard and knotty when squeezed between finger and thumb); leaves dark green, the tip acute to obtuse; scape sheaths shorter than most leaves; involucral bracts straw-colored, the apex acute; receptacular bracteoles pale, the apex narrowly acuminate; pistillate flower petals adaxially glabrescent; terminal cells of club-shaped hairs of the perianth whitened, the basal cells often uncongested and transparent. 3 Leaves to 1 cm wide, with acute to rounded tip; heads \(7-15 \mathrm{~mm}\) in diameter; [widespread in our area] E. decangulare var. decangulare

3 Leaves to 2 cm wide, with rounded tip; heads \(13-20 \mathrm{~mm}\) in diameter; [of the East Gulf Coastal Plain, known from Panhandle FL and s. AL] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [E. decangulare var. latifolia]
2 Heads soft (much flattened by a plant press, and easily compressed when fresh between finger and thumb); leaves pale
green, the tip attenuate-subulate; scape sheaths longer than most leaves; involucral bracts gray or dark, the apex rounded or obtuse; receptacular bracteoles gray to dark gray, the apex acute; pistillate flower petals adaxially villous; all cells of club-shaped hairs on perianth white.
4 Mature heads \(10-20 \mathrm{~mm}\) in diameter; leaves \(5-30 \mathrm{~cm}\) long; petals of staminate flowers conspicuously unequal; [plants primarily of seasonally flooded ponds] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . E. compressum
4 Mature heads \(5-10 \mathrm{~mm}\) in diameter; leaves (1-) 2-5 (-7) cm long; petals of staminate flower nearly equal E. texense
1 Receptacle and/or base of flowers glabrous or sparingly hairy; receptacular bracteoles and/or perianth parts glabrous or hairy, the hairs club-shaped, clear or white; heads dark gray or white, \(3-4 \mathrm{~mm}\) (E. koernickianum, E. parkeri, and E. ravenelii), or 4-10 mm ( \(E\). aquaticum and \(E\). lineare) in diameter when in full flower or fruit.
5 Stamens 6; pistil 3-carpellate . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . E. cinereum
5 Stamens 4; pistil 2-carpellate
6 Heads 4-10 mm in diameter when in full flower or fruit; outer involucral bracts usually reflexed, obscured by bracteoles and flowers.
\(7 \quad\) Inner involucral bracts, receptacular bracts, and sepals darkened, usually gray to nearly black; young heads dark; seeds very faintly reticulate, not papillate; [of ne. North America]
E. aquaticum
\(7 \quad\) All bracts of staminate and pistillate flowers straw-colored or pale with grayish midzone, sepals of pistillate flowers basally pale, darkening towards the tip to grayish, gray-green, or gray-brown; heads (young and mature) pale; seeds faintly rectangular-reticulate, often papillate in lines; [of the se. Coastal Plain] . . . . . . . . E. lineare
6 Heads \(3-4 \mathrm{~mm}\) in diameter when in full flower or fruit; outer involucral bracts neither reflexed nor obscured by bracteoles and flowers.
8 Bracts straw-colored, greenish, or light gray to gray, dull, the margins often erose or lacerate, the apex blunt to obtuse; [of tidal waters and large natural lakes of the outer Coastal Plain] . . . . . . . . . . . . . . . . . . . . . E. parkeri 8 Bracts dark, gray to blackish, very shiny, the margins all nearly entire, the apex acute; [of moist acidic sites]. 9 Bracts orbicular or broadly oblong, the apex rounded or apiculate; bract margins and apex hairy; perianth hairy; seed not pale-reticulate
E. koernickianum

9 Bracts narrowly ovate to oblong or spatulate, the apex acute; bracts and perianth parts (except sometimes the petals) glabrous; seed conspicuously pale-reticulate
E. ravenelii

Eriocaulon aquaticum (Hill) Druce, Seven-angled Pipewort. Cp (NC, VA), Mt (VA): July-October. New Brunswick and Newfoundland west to Ontario and MN, south to e. NC, VA, AL, and IN; also Great Britain and Ireland. The name E. septangulare is invalid. E. aquaticum is the correct name if the species is interpreted to include both northern European and northeastern North American plants. If North American plants are distinct from European, the correct name is E. pellucidum. [= C, FNA, K; > E. pellucidum Michaux -- RAB; = E. septangulare Withering -- F, G, GW, W, Z, invalid name]
* Eriocaulon cinereum R. Brown, Ashy Pipewort. Pd (SC): drawdown shore of manmade lake; rare, introduced from Australasia. See Kilpatrick \& McMillan (2003). [= FNA, GW, K, Z]

Eriocaulon compressum Lamarck. Cp (GA, NC, SC, VA), Pd (NC), Mt (NC, VA): ponds, lakes, other depressions, wetter places in pine flatwoods and pine savannas; common. June-October. NJ south to FL, west to e. TX. [= RAB, C, F, FNA, G, GW, K, \(\mathrm{S}, \mathrm{W}, \mathrm{Z}\) ]

Eriocaulon decangulare Linnaeus var. decangulare, Common Ten-angled Pipewort. Cp (GA, NC, SC, VA), Pd (GA, NC, SC), Mt (NC, SC): wet savannas and pine flatwoods, bogs, seasonally flooded ponds; common. June-October. NJ south to FL, west to sw. AR and e. TX; Mexico, Central America. [= FNA, K; < E. decangulare -- RAB, C, F, G, GW, S, W, Z]

Eriocaulon koernickianum van Heurck \& Mueller-Aargau, Dwarf Pipewort. Pd (GA): seepage areas on granite flatrocks; rare (GA Special Concern). W. AR and e. OK south to e. TX; disjunct in c. GA. See Watson et al. (2002) for information on variation within the species. [= FNA, K; = E. kornickianum -- GW, orthographic variant]

Eriocaulon lineare Small. Cp (GA): seepage bogs; rare. Sw. GA, south peninsular FL and west to s. AL. It has been reported for NC (Kral in FNA 2000), but this is apparently in error. Kral \& Sorrie (1998) have proposed the conservation of the name \(E\). lineare with a conserved type, as the designated type actually represents \(E\). texense. [= FNA, GW, K, S]

Eriocaulon parkeri B.L. Robinson, Estuary Pipewort. Cp (NC, VA): natural lakes, tidal marshes; uncommon. S. Canada south to e. NC. [= C, F, FNA, G, GW, K, Z]

Eriocaulon ravenelii Chapman. Cp (GA, SC): wet pine savannas; rare. July-September. SC south to s. peninsular and Panhandle FL. [= RAB, FNA, GW, K, S, Z]

Eriocaulon texense Körnick, Texas Hatpins. Cp (GA, NC, SC): sandhill seepage bogs, Altamaha Grit outcrops; rare (GA Special Concern). Sc. NC south to Panhandle FL, west to e. TX. [= FNA, GW, K, Z]

Eriocaulon decangulare Linnaeus var. latifolium Chapman ex Moldenke, Panhandle Pipewort, is restricted to Panhandle FL and s. AL. It appears to warrant taxonomic status, but needs additional study. [= FNA, K; < E. decangulare -- GW, S, Z]

\section*{Lachnocaulon Kunth 1841 (Bogbuttons)}

A genus of 7 species, herbs, of se. North America and Cuba. References: Kral in FNA (2000); Kral (1966c)=Z; Stützel in Kubitzki (1998b).

1 Trichomes at the tips of the receptacular bracts translucent, the head therefore showing the brown color of the bractlets ..... 1 Trichomes at the tips of the receptacular bracts milky white, opaque, the head therefore appearing gray to white, obscuring the
brown color of the bractlets.
2 Mature heads 4-7 mm across; seeds obviously longitudinally striate (as seen at \(10 \times\) magnification) .......... . L. anceps
2 Mature heads \(3.5-4.0 \mathrm{~mm}\) across; seeds not obviously longitudinally striate, the striations obscure and very fine (not
\(\qquad\)
Lachnocaulon anceps (Walter) Morong, Common Bogbuttons. Cp (GA, NC, SC, VA), Pd (GA, NC?), Mt? (GA?): moist to dry sands, moist peats, in pinelands, sometimes locally abundant in open disturbed areas where competition has been removed; common (VA Rare). May-October. S. NJ south to FL, west to se. TX; disjunct in ec. TN. [= RAB, C, F, FNA, G, GW, K, Z; > L. anceps - S; > L. floridanum -- S; > L. glabrum Körnick -- S]

Lachnocaulon beyrichianum Sporleder ex Körnick, Southern Bogbutton. Cp (GA, NC, SC): upper margins of Coastal Plain doline ponds (sometimes under scrub oaks), flatwoods; rare (GA Special Concern, NC Rare, SC Rare). May-September. Se. NC south to c. peninsular FL. [= RAB, FNA, GW, K, S, Z]

Lachnocaulon minus (Chapman) Small, Brown Bogbutton. Cp (GA, NC, SC): upper margins of Coastal Plain doline ponds, other pineland situations; uncommon (NC Watch List). May-October. E. NC south to c. peninsular FL, west to Panhandle FL and se. AL. [= RAB, FNA, GW, K, Z; > L. minus - S; > L. eciliatum Small -- S]

Lachnocaulon digynum Körnick. Pine savannas, bogs; rare. AL and FL west to TX. [= FNA, GW, K, S, Z] \{not yet keyed\}
Lachnocaulon engleri Ruhland. Pondshores, pine savannas; rare. AL and FL. [= FNA, GW, K, S, Z] \{not yet keyed\}

\section*{Syngonanthus Ruhland 1900 (Yellow Hatpins)}

A genus of about 200 species, primarily of tropical America, but some in Africa and Madagascar; ours is the only temperate species. References: Kral in FNA (2000); Kral (1966c)=Z; Stützel in Kubitzki (1998b).

Syngonanthus flavidulus (Michaux) Ruhland, Yellow Hatpins, Bantam-buttons. Cp (GA, NC, SC): pine savannas, pine flatwoods, borders of pineland ponds, and adjacent ditches; uncommon (NC Watch List). May-October. Se. NC south to s. FL, west to \(s\). AL. [= RAB, FNA, GW, K, S, Z]

\section*{HAEMODORACEAE R. Brown 1810 (Bloodwort Family)} (see also MELANTHIACEAE)

A family of about 14 genera and 100 species, herbs, of semicosmopolitan distribution, but centered in Australia. The Haemodoraceae is primarily a family of the Southern Hemisphere; Lachnanthes is the only member native to e. North America. Lophiola has usually been treated in the Haemodoraceae; recent evidence, however, indicate that it is better placed in the Nartheciaceae (or Liliaceae sensu lato); see Lophiola (Nartheciaceae) for additional details. References: Robertson (1976)=Z; Simpson in Kubitzki (1998b); Robertson in FNA (2002a).

\section*{Lachnanthes Elliott 1816 (Redroot)}

A monotypic genus, an herb, of e. North America and the West Indies. References: Simpson in Kubitzki (1998b); Robertson in FNA (2002a); Gandhi (1999)=Y.

Lachnanthes caroliniana (Lamarck) Dandy, Redroot. Cp (GA, NC, SC, VA), Mt (VA): wet savannas, pocosin edges, shores of Coastal Plain depression ponds (and similar ponds in the mountains of Virginia), ditches, wet disturbed ground; common, rare in Mountains (VA Rare). June-early September; September-November. The range is almost strictly on the Coastal Plain, and rather disjunct: s. Nova Scotia, from MA to DE, from se. VA south to FL and west to LA, with inland disjunctions in w. VA and sc. TN (Coffee County); also in Cuba. A very distinctive plant when in flower, with its densely woolly inflorescence and flowers. When not in flower, recognizable by its equitant (iris-like) base and bright red roots. The correct spelling of the specific epithet has been disputed; the original spelling was "caroliana," and Gandhi (1999) argues convincingly that it is a correctable typographic error. [= RAB, C, FNA, GW, W, Y; = Lachnanthes caroliana -- K, Z, an orthographic variant; = L. tinctoria (J.F. Gmelin) Elliott -- F, G; = Gyrotheca tinctoria (J.F. Gmelin) Salisbury -- S]

\section*{HEMEROCALLIDACEAE R. Brown 1810 (Day-lily Family)}

A family of about 13 genera and 50 species, herbs, of temperate, subtropical, and tropical regions. The circumscription of this family is uncertain; it is often treated as monotypic, excluding (for instance) the Phormiaceae. References: Zomlefer (1998, 1999); Clifford, Henderson, \& Conran in Kubitzki (1998a).

Hemerocallis Linnaeus 1753 (Day-lily)
A genus of about 15-30 species, temperate, of e. Asia. References: Zomlefer (1998)=Z; Straley \& Utech in FNA (2002a).

1 Flowers tawny-orange (or many variants thereof), not fragrant; inner tepal margins wavy ........................ H. fulva 1 Flowers lemon-yellow, fragrant; inner tepal margins planar . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . H. Iilioasphodelus
* Hemerocallis fulva (Linnaeus) Linnaeus, Orange Day-lily, Tawny Day-lily. Cp, Pd, Mt (NC, SC, VA): commonly cultivated, frequently escaping to forests, streambanks, suburban woodlands, lawns, waste places; common, introduced from Asia. Late Mayearly July. [= RAB, C, FNA, G, K, W, Z; H. fulva var. fulva - F; H. fulva var. kwanso Regel -- F]
* Hemerocallis lilioasphodelus Linnaeus, Yellow Day-lily, Lemon Day-lily. Pd (NC): less commonly cultivated, only rarely escaping; rare, introduced from Asia. May-July. [= C, FNA, K, Z; = H. flava (Linnaeus) Linnaeus -- F, G]

\section*{HOSTACEAE B. Mathew 1988 (Hosta Family)}

A family of a single genus, of about 25 species, of temperate e. Asia. This family is closely related to the Agavaceae, and its inclusion there may prove warranted. References: Kubitzki in Kubitzki (1998a).

\section*{Hosta Trattinick 1812 (Hosta, Plantain-lily)}

A genus of about 25-40 herbs, of temperate Asia, widely cultivated (since at least the \(8^{\text {th }}\) century), and with numerous cultivars. References: Kubitzki in Kubitzki (1998a); Utech in FNA (2002a). Key based on Utech in FNA (2002a).

1 Flowers long-tubular, to 13 cm long, white, fragrant . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . H. plantaginea
1 Flowers campanulate to urceolate, \(4-5.5 \mathrm{~cm}\) long, blue or purplish, not fragrant.
2 Leaves lanceolate to oblong, \(10-17 \mathrm{~cm}\) long, \(5-7.5 \mathrm{~cm}\) wide, with 5-6 lateral veins on each side of the midvein; flowers purplish violet; anthers purple
H. lancifolia

2 Leaves ovate to cordate, the blade 20-30 cm long, 15-20 cm wide, with 7-9 lateral veins on each side of the midvein; flowers bluish purple; anthers spotted purple . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . H. ventricosa
* Hosta lancifolia Engler, Narrowleaf Plantain-lily. [distr]: widely planted as a shade ornamental, rarely persistent; common in cultivation, rarely persistent, "native" of Japan (probably only of garden origin). [= FNA, K]
* Hosta plantaginea (Lamarck) Ascherson, Fragrant Plantain-lily. [distr]: widely planted as a shade ornamental, rarely persistent; common in cultivation, rarely persistent, native of China. [= FNA, K]
* Hosta ventricosa (Salisbury) Stearn, Blue Plantain-lily. Mt (NC): [distr]: widely planted as a shade ornamental, rarely persistent; common in cultivation, rarely persistent, native of China). [= FNA, K]

\section*{HYACINTHACEAE Batsch 1786 (Hyacinth Family)}
(also see AGAVACEAE)
A family of about 67 genera and 900 species, herbs, nearly cosmopolitan. References: Speta in Kubitzki (1998a); Pfosser et al. (2003).

1 Tepals united into a perianth tube longer than the free portion; [subfamily Hyacinthoideae, tribe Hyacintheae].
2 Perianth tube \(<2 \times\) as long as the lobes; corolla spreading and open at the mouth ....................... Hyacinthus
2 Perianth tube \(>2 \times\) as long as the lobes; corolla contracted at the mouth ............................... Muscari
1 Tepals free or fused only at the extreme base.
3 Bracts 2 per flower; tepals fused at the extreme base; tepals blue (less commonly white or pink); [subfamily Hyacinthoideae, tribe Hyacintheae]

Hyacinthoides
3 Bracts 0-1 per flower; tepals free; tepals white, with a greenish stripe on the outer surface; [subfamily Ornithogaloideae]

\section*{Hyacinthoides Medikus 1791 (Bluebell)}

A genus of \(3-4\) species, herbs, of se. Europe and \(n\). Africa. The narrow circumscription of Scilla (excluding Hyacinthoides) is supported by molecular phylogenetic studies (Pfosser et al. 2003). References: Stace (1997)=Z; McNeill in FNA (2002a); Speta in Kubitzki (1998a). Key based on Stace (1997).

1 Racemes erect; perianth campanulate; anthers blue . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . H. hispanica

* Hyacinthoides hispanica (P. Miller) Rothm., Spanish Bluebell. Pd (VA): persistent after cultivation; rare, introduced from Europe. [= FNA, K, Z; = Endymion hispanicus (P. Miller) Chouard]
* Hyacinthoides nonscripta (Linnaeus) Choard ex Rothm., English Bluebell. Pd (VA): persistent after cultivation; rare,
introduced from Europe. [= K, Z; = Scilla non-scripta (Linnaeus) Hoffmannsegg \& Link -- C, G; = Scilla nonscripta (Linnaeus)
Hoffmannsegg \& Link -- F; = Hyacinthoides non-scripta - FNA, orthographic variant; = Endymion nonscripta (Linnaeus) Garcke]

\section*{Hyacinthus Linnaeus 1753 (Hyacinth)}

A genus of 3 species, herbs, of w. Asia. References: Stace (1997)=Z; Speta in Kubitzki (1998a).
* Hyacinthus orientalis Linnaeus, Hyacinth. Pd (VA): persistent after cultivation; rare, introduced from w. Asia. [=K, Z]

\section*{Muscari P. Miller 1754 (Grape-hyacinth)}

A genus of about 50 species, herbs, of Europe, Mediterranean areas, and w. Asia. References: Stace (1997)=Z; Straley \& Utech in FNA (2002a); Speta in Kubitzki (1998a).

1 Raceme 10-20 cm long; pedicels of the terminal flowers > 5 mm long; flowers brown (the lower and fertile) and blue (the upper and sterile); leaves flat, mostly \(8-20 \mathrm{~mm}\) wide
M. comosum

1 Raceme 1-5 cm long in flower (somewhat longer in fruit); pedicels \(<5 \mathrm{~mm}\) long; flowers all blue to blue-black; leaves flat, channeled, or terete, mostly \(1-8 \mathrm{~mm}\) wide.
2 Leaves flat or channeled, 3-8 mm wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . M. botryoides
2 Leaves nearly terete, 1-3 mm wide M. neglectum
* Muscari botryoides (Linnaeus) P. Miller, Compact Grape-hyacinth. Pd (NC, VA), Mt (VA): cultivated as an ornamental, persistent and naturalized in lawns, old fields, suburban woodlands, and disturbed areas; uncommon, introduced from Europe. March-April; May-June. [= RAB, C, F, FNA, G, K, S, Z]
* Muscari comosum (Linnaeus) P. Miller, Tassel Grape-hyacinth. Pd, Cp (VA), \{GA, NC\}: cultivated as an ornamental, persistent and naturalized in lawns, old fields, suburban woodlands, and disturbed areas; rare, introduced from Europe. MarchApril; May-June. [= C, F, FNA, G, K, Z]
* Muscari neglectum Gussoni ex Tenore, Grape-hyacinth. Pd, Cp (NC, SC, VA), Mt (VA), \{GA\}: cultivated as an ornamental, persistent and naturalized in lawns, old fields, suburban woodlands, and disturbed areas; common, introduced from Europe. MarchApril; May-June. [= FNA, K, Z; = M. racemosum (Linnaeus) Lamarck \& Augustin de Candolle -- RAB, C, F, G, S; ? M. atlanticum Boissier \& Reuter -- W]

Ornithogalum Linnaeus 1753 (Star-of-Bethlehem)
A genus of about 50 species, herbs, of Mediterranean s. Europe, n. Africa, east to w. Asia. References: Straley \& Utech in FNA (2002a); Speta in Kubitzki (1998a).

1 Lower pedicels < 1 cm long, about as long as the upper pedicels (and shorter than the perianth segments); leaves mostly 8-15 mm wide; scape \(2-5 \mathrm{dm}\) tall
1 Lowest pedicels \(2-6 \mathrm{~cm}\) long, longer than the upper pedicels (and longer than the perianth segments); leaves mostly \(2-5 \mathrm{~mm}\) wide; scape \(1-3 \mathrm{dm}\) tall.

\section*{O. umbellatum}
* Ornithogalum nutans Linnaeus, Drooping Star-of-Bethlehem. Pd (NC, VA), Cp, Mt (VA): lawns and suburban woodlands; cultivated and rarely naturalized or persistent, introduced from w. Asia. March-April. [= RAB, C, F, FNA, G, K]
* Ornithogalum umbellatum Linnaeus, Star-of-Bethlehem, Snowflake, Nap-at-noon. Pd, Cp (NC, SC, VA), Mt (NC, VA), \{GA\}: lawns, old fields, bottomlands, forests; commonly cultivated and persistent and naturalizing, introduced from Europe. March-May. [= RAB, C, F, FNA, G, K, S, W]

\section*{Schoenolirion} (see AGAVACEAE)

\section*{HYDROCHARITACEAE Jussieu 1789 (Frog's-bit Family)}

A family of about 17 genera and 80 species, aquatic herbs, cosmopolitan. The Hydrocharitaceae is here circumscribed traditionally; it should perhaps include Najas, as suggested by Haynes, Holm-Nielsen, \& Les in Kubitzki (1998b). References: Haynes in FNA (2000), Cook in Kubitzki (1998b).

1 Leaves in a basal rosette, either elongate with parallel sides, or petiolate with a leaf blade.
2 Leaves differentiated into petiole and blade, the blade ovate to orbicular Limnobium
2 Leaves straplike, elongate, linear, the sides parallel and not differentiated into petiole and blade Vallisneria
1 Leaves in whorls along the stem.
3 Leaves in whorls of 2-3 (no whorls with more than 4 leaves) Elodea
3 Leaves in whorls of 3-8 (some or most whorls with 4 or more leaves).
4 Leaves mostly \(2-3 \mathrm{~cm}\) long, finely toothed with slender, weak teeth on the margins and rarely also the midrib
beneath; fresh leaves not noticeably rough to the touch; leaf whorls generally crowded on all stems; petals white, 911 mm long

Egeria
4 Leaves mostly 1-2 cm long, toothed with stout, sharp teeth on the margins and also on conical bases along the midrib beneath; fresh leaves noticeably rough to the touch; leaf whorls crowded on terminal portions of stems, remote on older stems; petals translucent, 2-5 mm long Hydrilla

\section*{Egeria Planchon 1849 (South American Waterweed)}

A genus of 2 species, aquatic herbs, native of tropical America (now subcosmopolitan in tropical and warm temerate regions by naturalization). References: Haynes in FNA (2000), Cook in Kubitzki (1998b).

Egeria densa Planchon, Brazilian Waterweed, "Elodea," "Anacharis." Cp, Mt (GA, NC, SC, VA), Pd (GA): ponds and stagnant water of streams or rivers; uncommon, introduced from South America. May-November. This is the "Elodea" or "Anacharis" of the aquarium trade. [= RAB, FNA, GW, K, W; = Elodea densa (Planchon) Caspary -- F; = Anacharis densa (Planchon) Victorin -- G; = Philotria densa (Planchon) Small \& St. John -- S]

\section*{Elodea Michaux 1803 (Waterweed)}

A genus of about 5-12 species, aquatic herbs, native of temperate America. References: Haynes in FNA (2000); Cook in Kubitzki (1998b).

1 Flowers perfect, with 3 stamens . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [E. schweinitzii]
1 Flowers unisexual, the staminate with 9 stamens.
2 Well-developed leaves (1-) avg. \(2(-5) \mathrm{mm}\) wide, mostly \(2-5 \times\) as long as wide; staminate spathe \(4-8(-15) \mathrm{mm}\) long, the flower at anthesis on an elongated, very slender, flexuous stalk; sepals of pistillate flowers 2-4.5 mm long E. canadensis

2 Well-developed leaves (0.3-) avg. \(1.3(-2) \mathrm{mm}\) wide, mostly \(5-10 \times\) as long as wide; staminate spathe \(2-3 \mathrm{~mm}\) long, the flower at anthesis separating from the spathe (and plant) at maturity; sepals of pistillate flowers \(1-1.5 \mathrm{~mm}\) long \(\boldsymbol{E}\). nuttallii

Elodea canadensis Michaux, Common Waterweed. Cp, Pd, Mt (NC, VA), \{SC\}: lakes, ponds, stagnant waters of streams; common (rare in NC). July-September. Québec west to Saskatchewan, south to NC, OK, NM, and CA. [= RAB, C, F, FNA, GW, K, W; = Anacharis canadensis (Michaux) Planchon -- G; > Philotria canadensis (Michaux) Britton -- S, in part (also see E. nuttallii)]

Elodea nuttallii (Planchon) St. John, Nuttall's Waterweed, Free-flowered Waterweed. Cp, Mt (NC, VA), Pd (VA): lakes, ponds, stagnant waters of streams; uncommon. July-September. ME and Québec west to MN and ID, south to NC, TN, OK, and NM. [= RAB, C, F, FNA, GW, K, W; = Anacharis nuttallii Planchon -- G; > Philotria canadensis -- S, in part; Philotria linearis Rydberg -- S]

Elodea schweinitzii (Planchon) Caspary, Schweinitz's Waterweed, is known only from eighteenth century collections in e. PA and NY. Haynes in FNA (2000) rejects it as a valid taxon. [= C, G, K]

Hydrilla L.C. Richard 1814 (Hydrilla)
A monotypic genus, an aquatic herb, native to the Old World. References: Haynes in FNA (2000); Cook in Kubitzki (1998b).
* Hydrilla verticillata (Linnaeus f.) Royle, Hydrilla. Pd (NC, SC, VA), Cp (GA, NC, VA): ponds, lakes; uncommon (but locally very abundant), introduced from the old World. June-August. This species has become a serious aquatic weed. Reported for SC by Nelson \& Kelly (1997). [= C, FNA, GW, K]

\section*{Limnobium L.C. Richard 1814 (Frog's-bit)}

A genus of 1-2 species, of se. North America and tropical America. References: Haynes in FNA (2000); Cook in Kubitzki (1998b).
Limnobium spongia (Bosc) L.C. Richard ex Steudel, American Frog's-bit. Cp (GA, NC, SC, VA): swamps, marshes, ponds, pools; uncommon. June-September. NJ and MD south to n. FL, west to e. TX, north in the interior in the Mississippi Embayment to s. MO and s. IL; disjunct around the Great Lakes (as in n. IN and w. NY); also in tropical America. Often free-floating, the leaves with prominently large cells below. [= RAB, C, F, FNA, G, GW, K, S]

\section*{Vallisneria Linnaeus 1753 (Eelgrass)}

A genus of 2-10 species, aquatic herbs, of tropical and warm temperate regions of the Old and New World. References: Haynes in FNA (2000), Cook in Kubitzki (1998b).

Vallisneria americana Michaux, Eelgrass, Water-celery, Tapegrass. Cp (GA, NC, SC, VA), Pd (VA), Mt (GA, VA): lakes, rivers, estuaries, sounds; common. July-October. Nova Scotia and Québec west to ND, south to FL, TX, NM, AZ; and south into tropical America. [= RAB, F, FNA, G, GW, K, S, W; V. americana var. americana -- C; > V. neotropicalis Victorin]

\section*{HYPOXIDACEAE R. Brown 1814 (Stargrass Family)}

A family of about 9 genera and 100-220 species, herbs, subcosmopolitan (though not well distributed in the northern hemisphere of the Old World, and especially diverse in South Africa). The recognition of Hypoxidaceae at the family level is supported by a variety of authors, on morphologic and molecular grounds (see Judd 2000 for summary). References: Nordal in Kubitzki (1998a); Herndon in FNA (2002a); Judd (2000).

\section*{Hypoxis Linnaeus 1759 (Stargrass)}

A genus of about 50-150 species, herbs, of tropical and warm temperate regions of the Old and New World, with a center of diversity in South Africa. References: Judd (2000)=Z; Herndon in FNA (in prep.); Nordal in Kubitzki (1998a). Key based on Herndon in FNA (2002a).

1 Leaves glabrous, or with a few trichomes near the base; seeds black.
2 Leaves filiform, 0.3-1.0 mm wide, stiff; floral bracts much smaller than pedicel, often less than 1 mm ; ovaries densely pubescent; seeds with truncated pebbling
H. juncea

2 Leaves over 2 mm wide, soft and flexible; seeds coarsely muricate.
3 Ovaries longer than broad, cylindric, with scattered trichomes; floral bracts usually exceeding pedicels; tepals equaling or shorter than ovaries . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . H. curtissii
3 Ovaries as broad at long or nearly so, deltate, densely pubescent; pedicels much longer than bracts or flowers;

1 Leaves evenly pubescent, at least near the base; seeds black or brown.
4 Pedicels much longer than bracts or flowers; seeds black.
5 Leaves flattened, more than 1 mm wide; seeds coarsely muricate . . . . . . . . . . . . . . . . . . . . . . . . . . . . . H. hirsuta
5 Leaves filiform, 0.3-12.0 mm wide; seeds with truncated pebbling . . . . . . . . . . . . . . . . . . . . . . . . . . . . . H. juncea
4 Pedicels less than twice as long as subtending bracts; seeds black or brown.
6 Anthers greater than 2 mm long; flowers much longer than pedicels; floral bracts exceeding pedicels; seeds with round pebbling, black . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . H. rigid
6 Anthers less than 2 mm long; \{floral bracts character\}; seeds muricate and brown, or with rounded pebbling and black-iridescent.
7 Tepals 1.5 to 2 times as long as ovaries; seeds pebbled, black but with with iridescent membranous coats ....
H. sessilis

7 Tepals less than 1.5 times length of ovaries, usually about equal; seeds minutely muricate, dark brown ......
H. wrightii

Hypoxis curtissii Rose in Small, Swamp Stargrass. Cp (GA, NC, SC): swamp forests, alluvial forests, water courses; uncommon. March-June; May-July. E. NC south to FL, west to e. TX. [= FNA, K, Z; = H. hirsuta (Linnaeus) Coville var. leptocarpa (Engelmann \& A. Gray) Fernald -- RAB; < H. hirsuta - C, in part; = H. leptocarpa (Engelmann \& A. Gray) Small -- GW]

Hypoxis hirsuta (Linnaeus) Coville, Common Stargrass. Mt, Pd, Cp (GA, NC, SC, VA): in a wide variety of dry to moist forests; common. March-June; May-July. S. ME west to Saskatchewan and ND, south to GA and e. TX. [= FNA, GW, Z; = H. hirsuta var. hirsuta -- RAB; < H. hirsuta -- C, K, in part]

Hypoxis juncea Sm., Fringed Stargrass. Cp (GA, NC, SC): wet pine savannas; rare. April-May (-later, especially in response to fire); May-June.(-later, especially in response to fire). Se. NC south to FL, west to s. AL. [= RAB, FNA, GW, K, Z]

Hypoxis rigida Chapman, Savanna Stargrass. Cp (GA, NC, SC): wet pine savannas; rare. April (-later, especially in response to fire); May.(-later, especially in response to fire). Se. NC south to FL, west to e. TX. [= RAB, FNA, GW, Z; < H. hirsuta -K, in part]

Hypoxis sessilis Linnaeus, Glossy-seed Stargrass. Cp (GA?, NC, SC, VA): wet pine savannas; rare. April (-later, especially in response to fire); May (-later, especially in response to fire). NC south to FL, west to e. TX, s. AR, and se. OK. [= RAB, FNA, GW, K, Z; > H. longii Fernald -- C; > H. sessilis - C]

Hypoxis wrightii (Baker) Brackett, Bristleseed Stargrass. Cp (GA, NC, SC, VA): wet pine savannas; common. March-April (later, especially in response to fire); April-May (-later, especially in response to fire). Se. VA south to FL, west to TX; disjunct in the West Indies (Cuba, Bahamas, Jamaica, Hispaniola, Puerto Rico). [= FNA, K, Z; H. micrantha Pollard -- RAB, C, GW, misapplied]

IRIDACEAE de Jussieu 1789 (Iris Family)
A family of about 65-82 genera and 1700-1810 species, herbs, of cosmopolitan distribution (most diverse in s. Africa). References: Goldblatt in FNA (2002a); Goldblatt, Manning, \& Rudall in Kubitzki (1998a).

\title{
Flora of the Carolinas, Virginia, and Georgia, Working Draft of 10 June 2005 -- IRIDACEAE
}

Alophia Herbert (Propellor-flower)
Alophia drummondii (Graham) R.C. Foster, Propellor-flower. MS west to TX and OK. [= K] \{add to synonymy; not yet keyed\}

Belamcanda Adanson 1763 (Blackberry-lily)
(see Iris)
A monotypic genus, an herb, native of e. Asia. Wilson (2004) suggests that Belamcanda is phylogenetically nested within Iris and should be included there; Goldblatt \& Mabberley (2005) make the appropriate nomenclatural combination. References: Goldblatt in FNA (2002a); Goldblatt, Manning, \& Rudall in Kubitzki (1998a).

Calydorea Herbert 1843 (Ixia)
A genus of about 8 species, of warm temperate and tropical America. The circumscription relative to Nemastylis is uncertain. References: Goldblatt in FNA (2002a); Goldblatt, Manning, \& Rudall in Kubitzki (1998a).

Calydorea coelestina (Bartram) Goldblatt \& Henrich, Bartram's Ixia, is apparently endemic to FL (Chafin 2000). The single GA record is by P.O. Schallert, a notoriously sloppy collector, and should therefore be discounted unless additional information comes to light. The species does occur in FL, near the GA border. [= FNA, K; = Salpingostylis coelestina (Bartram) Small -- S; = Nemastylis coelestina (Bartram) Nuttall; = Sphenostigma coelestinum (Bartram) R.C. Foster; = Ixia coelestina Bartram]

Crocosmia Planchon 1851 (Montbretia)
A genus of 8-9 species, herbs, native of sub-Saharan Africa. References: Goldblatt in FNA (2002a); Goldblatt, Manning, \& Dunlop (2004); Goldblatt, Manning, \& Rudall in Kubitzki (1998a).
* Crocosmia \(\times\) crocosmiiflora (V. Lemoine) N.E. Brown [C. aurea \(\times\) pottsii], Montbretia. Cp (NC, SC): disturbed areas, especially in moist to wet sites, including salt marshes, the parents os the hybrid both native to sub-Saharan Africa. Late June-July. [= FNA, K; = C. ×crocosmiflora -- RAB, orthographic variant]

\section*{Crocus Linnaeus 1753 (Crocus)}

A genus of about 80 species, herbs, from Mediterranean Europe to w. China. References: Goldblatt, Manning, \& Rudall in Kubitzki (1998a).

Various species of Crocus are cultivated and are long-persistent at old house sites. [not treated]

Gladiolus Linnaeus 1754 (Gladiolus)
A genus of about 255 species, largely of Africa. References: Goldblatt in FNA (2002a); Goldblatt, Manning, \& Rudall in Kubitzki (1998a). Key based on FNA.

1 Inner tepals 60-70 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . GI. \(\times\) gandavensis
1 Inner tepals <60 mm long.
2 Tepals white, cream, orange, or red; perianth tube plus dorsal sepal 60-95 mm long ........ [GI. dalenii ssp. dalenii]
2 Tepals pink, reddish, or light purple, with white markings on the outer 3 tepals.
3 Anthers \(10-13 \mathrm{~mm}\) long; capsules oblong, \(18-24 \mathrm{~mm}\) long; seeds winged
GI. communis
3 Anthers ca. 15 mm long; capsules globose, \(10-12 \mathrm{~mm}\) long; seeds not winged
[GI. italicus]
* Gladiolus communis Linnaeus, False Corn-flag. Cp (NC, SC), Pd (GA): cultivated as ornamentals; commonly cultivated, rarely persisting or weakly spreading. Introduced in TN and KY, as well. [= FNA; G. papilio Hooker - RAB, K, misapplied; Gladiolus communis Linnaeus ssp. byzantinus (P. Miller) A. Hamilton - K; G. byzantinus P. Miller]
* Gladiolus \(\times\) gandavensis Van Houtte [G. dalenii \(\times\) oppositiflorus]. Cp (GA, NC, SC, VA), Pd, Mt (NC): cultivated as ornamentals; commonly cultivated, rarely persisting or weakly spreading. Goldblatt suggests that as many as 5 species are involved in the origin of the large-flowered garden gladiolus. [= RAB, FNA, K; G. hortulanus Bailey]
* Gladiolus dalenii Van Geel ssp. dalenii. Introduced in AL and LA. [= FNA]
* Gladiolus italicus P. Miller. Introduced in TN. [= FNA, K; G. segetum Ker-Gawler]

A genus of about 5 species, herbs, in se. North America and temperate South America. References: Goldblatt in FNA (2002a).
Herbertia lahue (Molina) Goldblatt, Prairie-nymph, occurs in prairies and marshes in the Gulf States, from AL and FL west to TX. [= FNA; > H. lahue ssp. caerulea (Herbert) Goldblatt - K; > H. caerulea Herbert - S]
\[
\text { Iris Linnaeus } 1753 \text { (Iris, Flag, Blackberry-lily) }
\]

A genus of about 225 species, herbs, of Eurasia, n. Africa, and North America. Wilson (2004) suggests that Belamcanda is phylogenetically nested within Iris and should be included there; Goldblatt \& Mabberley (2005) make the appropriate nomenclatural combination. References: Henderson in FNA (2002a); Goldblatt in FNA (2002a); Goldblatt \& Mabberley (2005)=Z; Wilson (2004); Goldblatt, Manning, \& Rudall in Kubitzki (1998a).

\section*{Subg. Iris: germanica, pallida}

Subg. Limniris, section Lophiris: cristata
Subg. Limniris, section Limniris, series Vernae: verna var. smalliana, verna var. verna
Subg. Limniris, section Limniris, series Tripetalae: tridentata
Subg. Limniris, section Limniris, series Sibirica: sibirica
Subg. Limniris, section Limniris, series Laevigatae: pseudacorus, versicolor, virginica var. shrevei, virginica var. virginica
Subg. Limniris, section Limniris, series Hexagonae: hexagona, fulva, brevicaulis, savannarum, giganticaerulea
Subg. Limniris, section Limniris, series Prismaticae: prismatica
Iris brevicaulis Rafinesque, Short-stem Iris, Lamance Iris. (GA): bogs, seeps, marshes; rare (GA Special Concern). East to AL, GA, TN, KY. [= C, F, FNA, G, GW, K; I. foliosa Mackenzie \& Bush - S; I. mississippiensis Small - S]

Iris cristata Aiton, Dwarf Crested Iris. Mt, Pd (GA, NC, SC, VA), Cp (NC, VA): April-May; June-July. MD west to IN and MO, south to NC, AL, MS, AR, and e. OK. [= RAB, C, F, FNA, G, K, W; Neubeckia cristata (Aiton) Alefani -- S]
* Iris domestica (Linnaeus) Goldblatt \& Mabberley, Blackberry-lily. Pd (GA, NC, SC, VA), Mt (NC, SC, VA), Cp (GA): dry woodlands, forests, edges of granitic flatrocks, suburban areas; rare, introduced from e. Asia. June-August. [= Z; = Belamcanda chinensis (Linnaeus ) de Candolle - RAB, C, F, FNA, G, K, S, W]
* Iris ensata Thunberg, Japanese Iris. (NC). Cultivated and rarely escaped in se. PA (Rhodes \& Klein 1993). [=K]
*? Iris fulva Ker-Gawler, Red Flag, Copper Iris. s. IL, MO, and TN south to GA, AL, and LA (introduced elsewhere). [= C, F, FNA, G, GW, K, S]
* Iris germanica Linnaeus, German Iris, Fleur-de-Lys. Pd (NC, VA), Cp, Mt (VA), \{GA, SC\}: ponds, ditches, other wetlands; April-May. [= RAB, C, F, FNA, G, K; I. flavescens Delile - K; I. \(\times\) germanica, interpreted as a hybrid]

Iris hexagona Walter, Anglepod Blue Flag. Cp (GA, SC): May-June. SC south to FL. [= RAB, FNA, GW, S; I. hexagona var. hexagona - K; I. kimballiae Small - S; I. alabamensis Small-S]
* Iris pallida Lamarck in J. Lamarck et al., Sweet Iris, is cultivated and persistent around buildings in GA and elsewhere (FNA). [= F, FNA, K]

Iris prismatica Pursh ex Ker-Gawler, Slender Blue Iris, Slender Blue Flag. Cp (NC, SC, VA), Pd (VA), Mt (NC), \{GA\}: MayJune; June-July. Nova Scotia south to GA, disjunct in w. NC (Henderson County) and sc. TN (Coffee County). [= RAB, C, FNA, G, GW, K, S, W; I. prismatica var. prismatica - F; I. prismatica var. austrina Fernald -- F]
* Iris pseudacorus Linnaeus, Water Flag, Yellow Flag. Mt, Pd, Cp (NC, VA), \{GA, SC\}: native of Eurasia and Africa. MayJune; August-October. [= RAB, C, F, FNA, G, GW, K, S, W]

Iris savannarum Small. \{GA\}. In GA and FL. [= FNA, S; I. hexagona Walter var. savannarum (Small) R.C. Foster - K]
Iris tridentata Pursh. Cp (GA, NC, SC): wet savannas, pine flatwoods, margins of pineland pools; rare (GA Special Concern).
Late May-June; August-October. Se. NC south to n. FL. [= RAB, FNA, GW, K; I. tripetala -- S, misapplied]
Iris verna Linnaeus var. smalliana Fernald ex M.E. Edwards, Upland Dwarf Iris. Mt, Pd (GA, NC, SC, VA), Cp (GA): AprilMay; June-early August. Sc. PA and WV south to w. NC, e. TN, n. GA, se. GA, Panhandle FL and AL. [= RAB, F, FNA, K, W; < I. verna -- C, G; < Neubeckia verna (Linnaeus) Alefani -- S]

Iris verna Linnaeus var. verna, Coastal Plain Dwarf Iris, Sandhill Iris. Cp, Pd (GA, NC, SC, VA): March-May; May-June. MD south to se. SC and e. GA, primarily on the Coastal Plain, but extending into the Piedmont. [= RAB, F, FNA, K; < I. verna -- C, G; < Neubeckia verna (Linnaeus) Alefani -- S]

Iris versicolor Linnaeus, Northern Blue Flag, Poison Flag. Mt (VA): May-July. Reported as occurring as far south as VA in C, F, and W. [= C, FNA, G, K, S?, W]

Iris virginica Linnaeus var. shrevei (Small) E. Anderson. Mt, Pd (NC, SC, VA): May; July-September. Sw. Québec to MN, south to w. NC, n. AL, e. TN, AR, and e. KS. [= C, F, K; < I. virginica -- RAB, FNA, W; = I. shrevei Small -- G, S]

Iris virginica Linnaeus var. virginica, Southern Blue Flag. \(\mathrm{Cp}, \mathrm{Pd}(\mathrm{NC}, \mathrm{SC}, \mathrm{VA}),\{\mathrm{GA}\}\) : April-May; July-September. Se. VA south to FL, west to e. TX, north in the interior to w. TN; disjunct in sc. TN. [= C, F, K; <I. virginica -- RAB, FNA, W; = I. virginica -\(G, S\), in the narrow sense]

Iris giganticaerulea Small, Giant Blue Iris, in AL, MS, and LA. [= FNA, K; I. rivularis Small - S]
* Iris sanguinea Hornemann ex Donn, Japanese Iris. \{NC\} [=K]
* Iris sibirica Linnaeus, Siberian Iris, is cultivated and may escape or persist in our area. [= FNA, K]
* Iris xiphium Linnaeus, introduced in c. TN. [= K]

\section*{Nemastylis Nuttall 1835 (Celestial-lily)}

A genus of about 5 species, herbs, of s. North America and Central America. The circumscription relative to Nemastylis is uncertain. References: Goldblatt in FNA (2002a); Goldblatt, Manning, \& Rudall in Kubitzki (1998a).

Nemastylis geminiflora Nuttall, Prairie Celestial, Prairie Pleatleaf, east to AL. [= FNA, K; Ixia acuta Bartram; Nemastylis acuta Herbert]

\section*{Sisyrinchium Linnaeus 1753 (Blue-eyed-grass, Irisette)}

A genus of about 80 species, herbs, of the Americas. Sisyrinchium is a very difficult genus, with a number of taxonomic questions remaining in our area. References: Cholewa \& Henderson in FNA (2002a)=Z; Hornberger (1991)=Y; Goldblatt, Manning, \& Rudall in Kubitzki (1998a).

1 Corolla urceolate-campanulate, the segments widely flaring; annual; flowers lavendar, pink, magenta, white, or yellowish-white; [plants usually occurring in distinctly weedy habitats, such as roadsides and lawns]
S. rosulatum

1 Corolla stellate-rotate; perennial; flowers blue, violet, or white; [plants occurring in various habitats].
2 Inflorescences paired (rarely solitary) and sessile (rarely the outer inflorescence with a peduncle to 7 mm long), closely subtended by a leaf-like bract; outer spathe bract connate 0-1 (-1.5) mm.
3 Stems 1.5-3.4 mm wide, flattened, obviously winged; outer spathe bract 14-30 mm long; capsule 2.8-4.0 mm long .
S. albidum

3 Stems 0.5-1.0 mm wide, wiry, not winged; outer spathe bract 12-15 mm long; capsules 2.0-3.3 mm long
S. capillare

2 Inflorescences solitary, terminating the stem or branch, not paired; outer spathe bract connate (0.7-) 2-6 mm.
4 Stems mostly simple, unbranched (sometimes some plants in a population slightly branched).
5 Stems (1.5-) 2.0-3.7 mm wide; capsule 4.0-6.8 mm long . . . . . . . . . . . . . . . . . . S. montanum var. crebrum
5 Stems 0.5-1.0 (-2.0) mm wide; capsule 3.2-5.5 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. mucronatum
4 Stems mostly branched, with 1-5 nodes.
6 Stems with 2-5 nodes, the branching dichotomous; tepals white, recurved at maturity (like a miniature, white Lilium superbum); [endemic to low to medium elevation forests in the Blue Ridge Escarpment region of sw. NC and nw. SC] \(\qquad\) S. dichotomum

6 Stems with 1-3 nodes, the branching uneven; tepals violet to blue (rarely white), not notably recurved at maturity; [widespread].
7 Widest stems (0.5-) 0.8-1.9 mm wide.
8 Leaf bases not persistent as a fibrous tuft; capsules dark brown to black, 2.0-4.1 mm long . . . . . . .

8 Leaf bases persistent as a fibrous tuft; capsules light to medium brown, 2.9-4.3 mm long S. fuscatum \(7 \quad\) Widest stems 2.3-5.7 mm wide.

9 First internode equal to or shorter than the longest leaves, or if equalling the leaves then the hyaline margin on the inner spathe bract acute to acuminate; upper stem scabrous [S. xerophyllum]
9 First internode equalling or longer than the longest leaves, if equalling the leaves then the hyaline margin of the inner spathe bract broadly obtuse or acute at the apex; upper stem generally glabrous. 10 Leaf bases not persistent or not fibrous; outer spathe bract \(18-38 \mathrm{~mm}\) long, the margins connate \(4-6 \mathrm{~mm}\); capsules dark brown to black, 4.0-7.0 mm long
S. angustifolium

10 Leaf bases persistent as a basal tuft of fibers; outer spathe bract \(18-26 \mathrm{~mm}\) long, the margins basally connate 2-4 mm; capsules tan, 2.5-4.8 mm long . . . . . . . . . . . . . . . . . . . . . . . S. nashii

Sisyrinchium albidum Rafinesque. March-May. Cp, Mt (NC, SC, VA), Pd (NC, SC), \{GA\}: woodlands, savannas?, mesic sandhills, open limestone barrens; uncommon (VA Rare). March-May; May-June. S. NY west to s. WI, south to panhandle FL, and LA. [= C, F, FNA, G, K, S, Y, Z; S. albidum -- RAB, W, in part only (also see S. capillare); S. scabrellum Bicknell -- S]

Sisyrinchium angustifolium P. Miller. March-June. Mt, Pd, Cp (NC, SC, VA), \(\{G A\}\) : woodlands, forests, meadows, sandhill swales; common. March-June; May-July. VT, NH, and s. Ontario west to WI, e. KS, and OH, south to GA, AL, LA, and TX. [= RAB, C, F, FNA, G, GW, K, W, S, Y, Z; S. graminoides Bicknell -- G, S]

Sisyrinchium atlanticum Bicknell, Atlantic Blue-eyed-grass. Cp, Pd, Mt (NC, SC, VA), \{GA\}: dry, sandy or rocky places; common. March-June; June-August. Nova Scotia and ME west to OH, IN, and MO, south to FL and LA. [= C, F, FNA, G, GW, K, S, W, Y, Z; S. mucronatum var. atlanticum (Bicknell) Ahles -- RAB]

Sisyrinchium capillare Bicknell, Wiry Blue-eyed-grass. Cp (NC, SC, VA): wet pine savannas and flatwoods; uncommon. March-June; May-June. Se. VA south to GA (and FL?), west to AL. [= C, F, FNA, G, GW, K, S, Z; S. albidum -- RAB, W, in part]

Sisyrinchium dichotomum Bicknell, White Irisette, Isothermal Irisette. Mt, Pd (NC, SC): dry to mesic woodlands and forests, usually over mafic rocks (such as amphibolite), at low to moderate elevations ( \(400-1000 \mathrm{~m}\) ) in the Blue Ridge escarpment; rare (US Endangered, NC Endangered, SC Rare). May-June; June-August. Endemic to Henderson, Polk, and Rutherford counties, NC, and Greenville County, SC. [= FNA, K, W, Z]

Sisyrinchium fuscatum Bicknell. Cp, Pd (NC, SC, VA): wet pine savannas, marshy areas; common (VA Watch List). Late April-June; June-October. E. VA (or extreme se. PA?) south to FL, west to MS. [= C, K, S, Z; S. arenicola Bicknell -- RAB, F, FNA,

G, GW; S. incrustatum Bicknell -- S; S. rufipes Bicknell -- S]
Sisyrinchium montanum Greene var. crebrum Fernald. Mt (NC?, VA?): habitat in our area not known; rare. May-July. Ranging from.... The status of this taxon in our area is not clear. S. montanum var. crebrum is reported for VA by \(F\), and \(S\). montanum (variety not specified) is reported for NC and VA by C and G. FNA and Z considers var. crebrum to range south only to NY, and var. montanum south only to OH and PA. Herbarium documentation is needed. [= F, K; S. montanum -- G, infraspecific taxa not distinguished; S. angustifolium -- S, misapplied]

Sisyrinchium mucronatum Michaux. Mt (NC, SC, VA), Pd, Cp (NC, VA): April-June; June-July. [= C, F, FNA, GW, G, K, S, W, Z; S. mucronatum var. mucronatum -- RAB]

Sisyrinchium nashii Bicknell, Nash's Blue-eyed-grass. Cp, Pd (NC, SC): woodlands and forests; uncommon. April-June. NC and TN south to FL and MS. [= FNA, K, W, Z; S. fibrosum Bicknell -- S]
*? Sisyrinchium rosulatum Bicknell, Lawn Blue-eyed-grass. Cp (NC, SC, VA), Pd (SC): lawns, roadsides; uncommon. AprilMay; May-June. NC south to FL, west to e. TX. Perhaps only adventive in our area. [= RAB, FNA, GW, K, S, Y, Z; S. exile Bicknell]

\footnotetext{
Sisyrinchium campestre Bicknell, Prairie Blue-eyed-grass. MS and MI west to SD and NM. [= K]
Sisyrinchium langloisii Greene ranges east to AL, GA, and TN. It will key to couplet 8, where difficulties will be encountered. Like \(S\). atlanticum, its leaf bases are not persistent in a fibrous tuft, but it differs in having the dark ovary and capsules not contrasting strongly with the much lighter foliage. [= FNA]

Sisyrinchium miamiense Bicknell, reported for SC (Kartesz 1999). \{investigate\} [= FNA, K] \{not yet keyed\}
Sisyrinchium pruinosum Bicknell, ranges east to AL. [= FNA]
Sisyrinchium sagittiferum Bicknell, ranges east to AL (FNA). [= FNA]
Sisyrinchium xerophyllum Greene, Florida Blue-eyed-grass, occurs in FL and allegedly s. GA; it is also alleged to occur in NC (FNA). [= FNA, K, S, Z]
}

\section*{JUNCACEAE A.L. de Jussieu 1789 (Rush Family)}

A family of about 8 genera and 350-440 species, herbs (and a few shrubs), largely of temperate regions of the Old and New World. References: Brooks \& Clemants in FNA (2000); Balslev in Kubitzki (1998b); Drábková et al. (2003).

1 Leaves terete or flat, glabrous (or scabrous); capsule with more than 3 seeds; [often in wetlands] . . . . . . . . . . . . . . . . Juncus
1 Leaves flat, pubescent; capsule with 3 seeds; [rarely in wetlands] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Luzula

\section*{Juncus Linnaeus 1753 (Rush)}
(original draft contributed by Brian van Eerden, with some updating, but needing additional work to complete)
A genus of about 250-300 species, herbs, of cosmopolitan distribution. Drábková et al. (2003) indicate that Juncus trifidus may not be part of Juncus, and may be as closely related to Luzula. References: Brooks \& Clemants in FNA (2000); Kirschner et al. (2002b, 2002 c) \(=\) Y; Clemants (1990); Balslev in Kubitzki (1998b); Zika (2003)=Z; Drábková et al. (2003); F; GW; RAB. The key based, in part, on those references.
subgenus Juncus, section Juncus: acutus, roemerianus
subgenus Juncus, section Graminifolii: filipendulus, marginatus, repens
subgenus Juncus, section Iridifolii: polycephalus
subgenus Juncus, section Ozophyllum: abortivus, brachycephalus, brevicaudatus, caesariensis, canadensis, pelocarpus, subcaudatus, trigonocarpus
subgenus Agathryon, section Tenageia: bufonius
subgenus Agathryon, section Steirochloa: gerardii, coriaceus, [brachyphyllus], georgianus, secundus, dichotomus, tenuis, anthelatus, interior, dudleyi
subgenus Agathryon, section Juncotypus: gymnocarpus, [filiformis], inflexus, effusus var. solutus, pylaei, balticus
UNCERTAIN placement (probably not a Juncus): trifidus
Identification Notes: For identification of most rushes, it is important to collect plants with mature capsules and seeds. Care must also be taken to collect specimens with uninjured heads, especially for the group of rushes in key D; the long beaks of the capsules are often fragile and easily broken off.

1 Inflorescence appearing lateral; leaf blade at base of inflorescence erect, resembling a continuation of the stem ....... Key A
1 Inflorescence appearing terminal; leaf blade at base of inflorescence not appearing as a continuation of the stem.
2 Leaf blades without cross-partitions (non-septate) . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Key B
2 Leaf blades with cross-partitions at regular intervals (septate) (sometimes obscure on dried leaves; if so, rest leaf on hard surface and run fingernail over it, or split leaf lengthwise in two to see septae); [subgenus Septati].
3 Mature seeds \(0.7-2.5 \mathrm{~mm}\) long, with short to long appendaged ends (usually obscure on J. subcaudatus); seeds between 0.7-0.9 mm long broadly ellipsoid, > 0.2 mm wide and finely ribbed . . . . . . . . . . . . . . . . . . . . . . . . . . Key
3 Mature seeds \(<0.7 \mathrm{~mm}\) long, without appendaged ends; ends usually blunt or slightly pointed; seeds between \(0.5-\)

\section*{Flora of the Carolinas, Virginia, and Georgia, Working Draft of 10 June 2005 -- JUNCACEAE}
0.7 mm long narrowly ellipsoid, \(<0.1 \mathrm{~mm}\) wide and usually coarsely ribbed.

4 Flowers solitary (sometimes up to three) along branches of the inflorescence; flowers often aborted; inflorescence diffuse, with slender, flexuous branches
J. abortivus

4 Flowers in clusters (glomerules) of 3 or more; inflorescence compact or diffuse.
5 Capsule with beak greater than \(1 / 3\) the length of the capsule body, the body tapering gradually (abruptly with J. scirpoides vars. 1 and 2) into elongate beak; flowers in dense, spherical or hemispherical heads . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Key D
5 Capsule with short beak or tip, this less than \(1 / 4\) the length of the capsule body (the body not tapering into elongate beak); flowers in dense turbinate to hemispherical heads (except for J. brachycarpus, with flowers in spherical heads)

Key E

\section*{Key A -- rushes with inflorescence appearing lateral}

1 Flowers borne in clusters of 2-6; single bracteole subtending cluster present at base of pedicel; leaf spine-tipped; [subgenus Juncus]............................................................................................. . J. roemerianus
1 Flowers borne singly on the branches of the inflorescence, each flower subtended by two bracteoles in addition to the bracteole at the base of the pedicel; leaf not spine tipped.
2 Sheaths at base of plant (at least some) with well developed blades; leaf blade arising from base of inflorescence (apearing as a continuation of the culm) channeled on one side; [subgenus Poiophylli] . . . . . . . . . . . . . . . . . J. coriaceus
2 Sheaths at base of plant without blades; leaf blade arising from base of inflorescence not channeled; [subgenus Genuini]. 3 Perianth much shorter than capsule (about \(1 / 2\) as long as the capsule); capsule tapering at the summit, pointed; petal tips rounded to obtuse J. gymnocarpus

3 Perianth about equalling capsule (much greater than \(1 / 2\) as long as the capsule); capsule rounded at the summit, often depressed, with or without small mucros; petal tips acute to acuminate.
4 Stems coarsely grooved, with 10-20 ridges just below the inflorescence, firm; sepals slightly exceeding petals and capsule; perianth 2.7-3.6 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . J. pylaei
4 Stems finely grooved, with 25-30 fine striations just below the inflorescence, weak, usally easily compressed; sepals usually same length as petals; perianth 1.9-2.8 mm long . . . . . . . . . . . . . . . . . J. effusus ssp. solutus

\section*{Key B -- rushes with inflorescence appearing terminal and leaf blades non-septate}

1 Flowers borne singly on branches of inflorescence; each flower subtended by two bracteoles (in addition to bracteole at base of very short pedicels); [subgenus Poiophylli].
2 Auricles of leaf-sheath well prolonged; scarious; tongue-like or deeply cleft and appearing fringed.
3 Auricles entire, tongue-like; flowers more than 3 per flowering culm . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . J. tenuis
3 Auricles deeply cleft, appearing fringed; flowers 1-3 per flowering culm . . . . . . . . . . . . . . . . . . . . . . . . . . J. trifidus
2 Auricles of leaf-sheath only slightly prolonged and thickened, not scarious, or auricles not present.
4 Cauline leaves present (in addition to basal leaves).
5 Annual, without stiffened roots or persistent leaf bases; inflorescence consituting \(1 / 3\) or more of the total height of the plant
J. bufonius

5 Perennial, rhizomatous; inflorescence constituting \(1 / 10\) or less of the total height of the plant
J. gerardii var. gerardii

4 Cauline leaves absent (all leaves arising from basal or near-basal sheaths).
6 Bract at base of inflorescence longer than the inflorescence; capsule unilocular, the partitions of each capsule wall (valve) not extending to the center of capsule, leaving a hollow space, best seen by holding mature capsule horizontally and removing one valve and seeds); leaf blades flat to terete.
7 Mature auricles straw-colored and dull; inner leaf sheaths pinkish
7 Mature auricles yellow and glossy; inner leaf sheaths brown J. dichotomus

7 Mature auries yellow and glossy, inner eaf sheaths brown ............................... . J. dudleyi
6 Bract at base of inflorescence shorter than the inflorescence; capsule trilocular, the partitions of each valve extending to the center of capsule, leaving no hollow space; leaf blades flat.
8 Perianth more than 4 mm long; flowers not secund . . . . . . . . . . . . . . . . . . . . . . . . . . . . J. georgianus
8 Perianth less than 4 mm long, flowers secund . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . J. secundus
1 Flowers in clusters (glomerules) of two or more; individual flowers not subtended by a pair of bracteoles; [subgenus Graminifolii].
9 Perianth 6.0-10.0 mm long, capsule linear; stems soft, weak, commonly creeping and rooting at the nodes, forming submersed or emersed mats in still or flowing water J. repens

9 Perianth less than 6.0 mm long; stems various, but not as above.
10 Stems cespitose, clustered into small tussocks; rhizome absent or thin (less than 2.0 mm wide), less than 5.0 cm long, and knotty (not slender, flexuous and cord-like) glomerules \(5-15\) flowered; seeds less than 0.5 mm long, plump, finely ribbed, both ends apiculate (but without distinct tails) . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . J. marginatus
10 Stems loosely clustered (more than 3 cm apart) on stout ( \(>2.0 \mathrm{~mm}\) wide), knotty rhizomes, or solitary on slender (1.0-1.5 mm wide), flexuous and cord-like rhizomes; glomerules \(2-5\) flowered; seeds more than 0.5 mm long (on average; sample seeds from several different capsules); seeds narrow, ellipsoidal, coarsely ribbed, with both ends tailed.

11 Rhizome slender (1.0-1.5 mm wide), flexuous, cord-like, \(5-20 \mathrm{~cm}\) long; stems mostly solitary; inflorescence short, compact, from \(2-8 \mathrm{~cm}\) long, usually shorter than 5 cm ; glomerules usually less than 30 per inflorescence . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . J. longii
11 Rhizome stout (2.0-4.0 mm wide), stiff, knotty, less than 5 cm long (between culms); stems usually loosely clustered; inflorescence diffuse to slightly compact, 4-20 cm long, usually longer than 8 cm ; glomerules usually more than 30 per inflorescence

\section*{Key C -- rushes with inflorescence appearing terminal, septate leaf blades, and tailed seeds}

1 Leaves papillate-scabrid (usually visible to the eye, easily visible under \(10 \times\) ), appearing light bluish-green; seeds \(2.0-2.5 \mathrm{~mm}\) long; longest petals more than 4.0 mm long
J. caesariensis

1 Leaves glabrous; seeds 0.7-2.2 mm long; longest petals less than 4.0 mm long.
2 Seeds 1.2-2.2 mm long; seed body less than \(1 / 2\) the length of the seed.
3 Largest, mature capsules 4.0-5.0 mm long, 2.0 mm longer than perianth; glomerules 3-7 flowered; mature capsules dark reddish-purple; mature seeds 1.9-2.2 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . J. trigonocarpus
3 Largest, mature capsules \(3.0-4.0 \mathrm{~mm}\) long, \(<1.5 \mathrm{~mm}\) longer than perianth; glomerules 5 to many-flowered; mature capsules light reddish brown to straw-colored; mature seeds 1.2-1.8 mm long . . . . . . . . . . . . . . . . . J. canadensis
2 Seeds 0.7-1.2 mm long; seed body more than \(1 / 2\) the length of the seed.
4 Petals obtuse to subacute, with wide scarious margins . . . . . . . . . . . . . . . . . . . . . . . . . . . . . J. brachycephalus
4 Petals acuminate, with narrow scarious margins.
5 Inflorescence narrow, the branches erect; mature capsules dark brown; glomerules 2-7 flowered
J. brevicaudatus

5 Inflorescence open, the lower branches spreading to ascending (not erect); mature capsules straw-colored; glomerules 5-20 flowered J. subcaudatus var. subcaudatus

\section*{Key D -- rushes with inflorescence appearing terminal, septate leaf blades, and strongly-beaked capsules}

1 Leaves flattened; oval to elliptic in cross section.
2 Leaves with incomplete septae; heads ca. 10 mm wide; mature seeds narrowly elliptic; tips of dehisced capsules united, valve tips not spreading
J. polycephalus

2 Lower leaves with complete septae; heads ca. 12 mm wide; mature seeds broadly elliptic; tips of dehisced capsules split, valve tips spreading . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . J. validus var. validus 1 Leaves terete.

3 Uppermost stem leaf (first leaf below the inflorescence bract and/or the inflorescence bract equalling or exceeding the inflorescence; stamens 6 .
4 Heads 6-20-flowered, 6-9 mm in diameter; auricles cartilaginous, 0.5-1.0 mm long .................. J. nodosus
4 Heads 25-100-flowered, 10-14 mm in diameter; auricles membranaceous, 2.5-4.0 mm long . . . . . . . . . . . J. torreyi
3 Uppermost stem leaf and/or inflorescence bract not exceeding the inflorescence; stamens 3.
5 Uppermost stem leaf (first leaf below the lowest leaf of the inflorescence) non-septate and much shorter than its sheath
J. megacephalus

5 Uppermost stem leaf septate and longer than its sheath.
6 Heads spherical, entire (not divided into several subglomerules); mature capsule 3.0-4.5 mm long; capsule body lanceolate, tapering gradually into elongate beak ............................ . J. scirpoides var. scirpoides
6 Heads hemispherical, lobulate (divided into 3-8 subglomerules); mature capsule 2.0-3.0 mm long; capsule body ovoid, abruptly and very narrowly beaked, or body gradually tapering into elongate beak.
7 Capsule beak exserted \(0.5-1.0 \mathrm{~mm}\) above perianth (visible to the eye); petals and sepals unequal, the petals shorter than the sepals; subglomerules well separated, outline of each subglomerule visible to the eye; leaf blades of the inflorescences thin, not stiff; seeds with light reticulate lines ... J. scirpoides var. 1
7 Capsule beak not exserted beyond perianth (no capsule or beak apparent to the eye); petals and sepals equal to subequal (if subequal, the petals longer than the sepals); subglomerules usually closely packed, outline of each subglomerule not visible to the eye; leaf blades of the inflorescence thin, stiff, sharppointed; seeds with dark reticulate lines
J. scirpoides var. 2

\section*{Key E -- rushes with inflorescence appearing terminal, septate leaf blades, and weakly-beaked capsules}

1 Mature capsule 1/2-1/3 length of perianth; flowers in dense, spherical heads . . . . . . . . . . . . . . . . . . . . . . . . J. brachycarpus
1 Mature capsule \(>3 / 4\) length of perianth; flowers in dense hemispherical or turbinate heads.
2 Mature capsule 4.0-5.2 mm long, 2 mm or more longer than perianth \(\ldots . . . .\). . . .
2 Mature capsule 2.4-4.0 ( -4.0 ) mm long, subequal to perianth to about 1 mm longer.
3 Capsules exceeding perianth by about 1 mm ( \(>0.5 \mathrm{~mm}\) longer); panicles \(2-8 \mathrm{~cm}\) long.
4 Culm to \(6(-10) \mathrm{dm}\) long; cauline leaves (1-) 3-6; heads 6-8 mm in diameter; perianth 1.8-3 mm long; stamens 6 ; capsules chestnut to dark brown
J. articulatus

4 Culm to 2.5 dm long; cauline leaves 1-3; heads 2-5 mm in diameter; perianth 1.8-2.5 mm long; stamens 3; capsules stramineous . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . J. debilis
3 Capsules slightly shorter than to slightly exceeding perianth (<0.5 mm longer); panicles 4-16 cm long.
5 Leaves to 40 cm long; panicles of 5-50 heads; perianth 2.6-3.9 mm long, inner and outer tepals about equal in length; capsule straminous, \(2.8-4 \mathrm{~mm}\) long
J. acuminatus

5 Leaves to 16 cm long; panicles of 10-100 (-200) heads; perianth 1.8-2.9 mm long; inner tepals slightly shorter than outer; capsule dark purple to chestnut brown, 2.4-2.9 mm long
J. elliottii

Juncus abortivus Chapman. Cp (GA, NC, SC, VA): ditches, along pond and stream margins, seepage slopes, disturbed open areas; uncommon. July-October. Se. VA to FL Panhandle. The septae along the narrow leaf blades of J. abortivus are often difficult to detect. [= RAB, F, GW, K, S; = J. pelocarpus E. Meyer var. crassicaudex Engelmann -- C, G; < J. pelocarpus - FNA, in the broad sense]

Juncus acuminatus Michaux. Cp, Pd, Mt (GA, NC, SC, VA): throughout, in damp soils; common. June-August. ME and N.S. to Ont. and MN, south to n . FL, TX and n. Mexico; British Columbia to CA. [= RAB, C, F, FNA, G, GW, K, S, W]

Juncus articulatus Linnaeus, Jointleaf Rush. Mt (VA), Cp (NC): wet open ground; rare (NC Watch List). July-September. Nearly cosmopolitan; in North America from Newfoundland to AK, south to NC and CA. J. articulatus reaches its southern limit in NC where it is known only from Dare County. [= RAB, C, F, FNA, G, K; J. articulatus var. obtusatus Engelmann -- F]

Juncus biflorus Elliott. Cp, Pd, Mt (GA, NC, SC, VA): pine savannas, pine flatwoods, mesic areas in sandhill-pocosin ecotones, roadsides, low fields in the Piedmont; common (uncommon in the Mountains). June-October. MA to MI and MO, south to TX and FL. The characters used to split this species from J. longii and J. marginatus (rhizome length and thickness, glomerule number, seed size and shape) are somewhat variable, and intermediates between these three taxa are frequent, particularly in se. United States. Due to this intergradation, J. biflorus and J. longii are sometimes treated as synonyms or varieties of J. marginatus, but Knapp (2004) supports their recognition. Since all three taxa in this group, fitting the typical species descriptions, are found in our area, they are here recognized at the species level. It is interesting to note that most of the plants in our area displaying typical taxonomic characters are found in natural, or undisturbed habitats; many of the confusing intermediates appear to occur in disturbed wetlands (roadside ditches, cleared aeas). Further investigation of these disturbed-area populations is necessary. [=RAB, F, K, W; < J. biflorus -- C, G, in part only (also including J. longii); < J. marginatus -- FNA, GW, in part only (also including J. biflorus and J. longii); J. aristulatus Michaux var. biflorus (Elliott) Small-- S]

Juncus brachycarpus Engelmann, Short-fruited Rush. Pd (GA, NC, SC, VA), Cp (NC, SC, VA), Mt (GA): wet, sandy soil; rare (NC Watch List). June-September. MA to IL, south to SC, wc. GA, and TX. [= RAB, C, F, FNA, G, GW, K, S]

Juncus brachycephalus (Engelmann) Buchenau. Mt (GA, VA), Pd, Cp (GA): calcareous wetlands. [= FNA, K]
Juncus brevicaudatus (Engelmann) Fernald, Short-tailed Rush. Mt (NC, VA): bogs and seeps at high elevations; rare (NC Watch List). July-September. Newfoundland to Manitoba south to MN, PA, and in mountains south to NC. [= RAB, C, F, FNA, G, K, W]

Juncus bufonius Linnaeus var. bufonius, Toad Rush. Cp, Pd (GA, NC, SC, VA), Mt (NC, VA): wet, open ground, roadsides, dried pools; common (rare in upper Piedmont, Sandhills, and Mountains). June-November. Cosmopolitan. [= C, F, G, K; < J. bufonius -- RAB, FNA, GW, S, W, infraspecific taxa not distinguished]

Juncus caesariensis Coville, New Jersey Rush. Cp (VA), Mt (NC): sphagnous seepages in the Coastal Plain of VA, seeps and bogs at low to moderate elevations in the Mountains of NC; rare (US Species of Concern, NC Rare). July-October. Found in 1992 from a seepage bog in Clay County, NC, and in 1993 from a bog in Henderson County, NC, where associated with northern disjuncts. Rare throughout its range, it is known only from several sites in NJ, MD, VA, NC, and Nova Scotia (Newell \& Newell 1994). The scabrid leaf blades and large seeds quickly separate this species from the other long-tailed rushes. It should be looked for along seepage slopes and bogs in the fall-line sandhills and the outer Coastal Plain. [= C, F, FNA, G, K]

Juncus canadensis J. Gay ex Laharpe, Canadian Rush. Cp (GA, NC, SC, VA), Pd, Mt (NC, VA): lake, pond and stream margins, swamps, bogs, seepage slopes, wet meadows, ditches; common in Coastal plain and Sandhills, rare in Piedmont and Mountains. July-October. Newfoundland to MN, south to c. peninsular FL, TN, and LA. J. canadensis is here treated as a single, polymorphic species. Fernald and others have described up to 5 forms and varieties of J. canadensis, based on variation in flower and capsule size (from 2.5 mm to nearly 4.0 mm ), shape of the glomerules (densely flowered and subglobose to few-flowered and turbinate), and structure and size of the inflorescence (congested to open). Further study is necessary to determine whether any of these taxa should be recognized in NC. [= RAB, C, FNA, GW, K, S, W; > J. canadensis var. canadensis - F; > J. canadensis var. euroauster Fernald -- F]

Juncus coriaceus Mackenzie. Cp, Pd, Mt (GA, NC, SC, VA): stream and pond margins, swamps, flatwoods depressions, roadside ditches; common (rare in Mountains). June-September. S. NJ to n. FL, west to e. TX, north in the interior KY, AR, and OK. [= RAB, C, F, FNA, G, GW, K, W; J. setaceus Rostkovius -- S, misapplied]

Juncus debilis A. Gray, Weak Rush. Cp, Pd, Mt (GA, NC, SC, VA): marshy shores, stream and pond margins, along puddles in wet, disturbed clearings, ditches; common (uncommon in Piedmont). May-August. RI to MO, south to n. FL and e. TX. [= RAB, C, F, FNA, G, GW, K, S, W]

Juncus dichotomus Elliott. Cp, Pd, Mt (GA, NC, SC, VA): often in disturbed, open, wet areas, ditches, wet meadows; common (rare in western Piedmont and Mountains). June-October. MA to c. peninsular FL, west to OK and TX. The character used to separate J. platyphyllus (Wiegand) Fernald from J. dichotomus (flat leaf blade vs. terete leaf blade) does not appear to be reliable; leaf blades from culms in the same clump may vary from flat to slightly involute to completely terete. [=FNA, GW, W; > J. dichotomus - RAB, F, in a narrower sense; > J. platyphyllus (Wiegand) Fernald -- RAB, F; = J. tenuis var. dichotomus (Elliott) A. Wood -- C (including J. platyphyllus); > J. dichotomus var. dichotomus - G, K, S; > J. dichotomus var. platyphyllus Wiegand -- G, K, S]

Juncus diffusissimus Buckley, Diffuse Rush, Slim-pod Rush. Cp, Pd, Mt (GA, NC, SC, VA): low, wet open areas, ditches, margins of ponds and streams; uncommon (rare in Piedmont). May-September. Mostly Coastal Plain from se. VA to n. FL, west to
e. and n. cen. TX; also s. IN to MO, KA, OK, TN, KY. [= RAB, C, F, FNA, G, GW, K, S, W]

Juncus dudleyi Wiegand, Dudley's Rush. Mt, Pd (VA), Cp (SC, VA): calcareous seepages and fens. First reported for South Carolina by Hill \& Horn (1997). [= FNA, K; = J. tenuis Willdenow var. dudleyi (Wiegand) F.J. Hermann -- C]

Juncus effusus Linnaeus ssp. solutus (Fernald \& Wiegand) Hämet-Ahti, Common Rush, Soft Rush. Cp, Pd, Mt (GA, NC, SC, VA): moist soil, marshes, margin of streams, ponds, lakes and swamps, low meadows; common. June-September. Newfoundland to MN, south to FL and Mexico. Ssp. effusus is European, and also occurs (allegedly introduced) in the ne. United States. [= Z; < J. effusus Linnaeus var. solutus Fernald \& Wiegand -- C, F, GW, K; < J. effusus -- RAB, FNA, S, W, infraspecific taxa not distinguished (also including J. pylaei); < J. effusus Linnaeus var. solutus Fernald \& Wiegand -- G, in part only (also including var. pylaei); J. griscomii Fernald -- F, G; Juncus effusus Linnaeus var. conglomeratus (Linnaeus) Engelmann - K]

Juncus elliottii Chapman, Elliott's Rush. Cp (GA, NC, SC, VA), Pd (GA, NC): margins of ponds and lakes, depressions in savannas and flatwoods, wet, disturbed clearings, roadside ditches; uncomon (rare in Piedmont). May-September. Coastal plain, DE to cen. penin. FL, west to se. TX. Capsules of J. elliottii are similar in shape to J. acuminatus, but the presence of tubiferous roots, shorter perianth ( \(2.0-2.5 \mathrm{~mm}\) long vs. \(2.5-3.5 \mathrm{~mm}\) ) and fewer-flowered glomerules (3-8 flowered vs. 5-many flowered) clearly distinguishes J. elliottii from J. acuminatus. [= RAB, C, F, FNA, G, GW, S; < J. elliottii var. elliottii - K]

Juncus georgianus Coville. Pd (GA, NC, SC): shallow depressions in granitic outcrops; rare (NC Watch List). June-August. An endemic of the Southeastern Piedmont, restricted to granitic flatrocks of NC, SC, GA, and ec. AL. [= RAB, FNA, K, S, W] Juncus gerardii Loiseleur var. gerardii, Blackfoot Rush, Blackgrass. Cp, Mt (VA): [=K; < J. gerardii -- C, FNA, infraspecific taxa not distinguished]

Juncus gymnocarpus Coville, Seep Rush. Mt (GA, NC, SC): bogs, seeps, streambanks; rare (GA Special Concern, NC Rare). July-September. Local, mountains of e. PA, w. NC, e. TN, nw. SC and ne. GA, Coastal Plain of se. AL, s. MS (Sorrie \& Leonard 1999), and n. cen. Panhandle FL. In our area, J. gymnocarpus is scattered in mountain bogs and seeps throughout the mountain region; it reaches its most general occurrence in the escarpment gorge region of Transylvania, Macon, and Jackson counties, NC, where it also occurs along streambanks, especially in the vicinity of waterfalls. [= RAB, C, F, FNA, G, GW, K, S, W]

Juncus longii Fernald. \(\mathrm{Cp}(\mathrm{GA}, \mathrm{NC}, \mathrm{VA}), \mathrm{Pd}(\mathrm{GA}, \mathrm{NC}, \mathrm{SC}), \mathrm{Mt}\) ? ( NC ): usually in very wet, often inundated sites, bogs, ditches, rooting in clay or peat; uncommon (NC Watch List). June-August. MD south through VA, NC, SC to MS (Knapp 2004); more extensive distributions are based on misattribution. [= RAB, F, K; J. biflorus -- C, G, in part only (treated as a form of \(J\). biflorus); J. marginatus -- FNA, GW, in part only (also including J. biflorus and J. longii); J. aristulatus Michaux var. aristulatus -- S] Juncus marginatus Rostkovius. Cp, Pd, Mt (GA, NC, SC, VA): wet meadows, bogs, generally throughout in wet, sandy or peaty soil; common. June-September. Nova Scotia to Ontario, south to FL and TX. [= RAB, C, G, K, S, W; J. marginatus var. marginatus -- F; < J. marginatus -- FNA, GW, in part only (also including J. biflorus and J. longii)]

Juncus megacephalus M.A. Curtis, Large-headed Rush. Cp (GA, NC, SC, VA): brackish and freshwater marshes, bogs, ditches, wet, open places; uncommon. June-August. Coastal Plain, VA to s. FL, west to se. TX; e. MD (Sorrie, pers. comm.). [= RAB, C, F, FNA, G, GW, K, S]

Juncus nodosus Linnaeus var. nodosus. Mt (VA): [= K; < J. nodosus - FNA, infraspecific taxa not distinguished]
Juncus polycephalus Michaux, Many-headed Rush. Cp (GA, NC, SC): sandy pond margins, ditches, savannas; uncommon. July-September. Coastal plain, NC to s. FL, west to e. TX; TN. [= RAB, F (probably misapplied), FNA, GW, K, S] Juncus pylaei Laharpe, Common Rush. Cp, Pd, Mt? \{NC, SC, VA\}: moist soil, marshes, margin of streams, ponds, lakes and swamps, low meadows; common \{herbarium collections need to be studied to determine actual range of this variety in NC; var. solutus as well\}. June-September. Throughout eastern North America, south to NC. [= C, K, Z; = J. effusus Linnaeus var. pylaei (Laharpe) Fernald \& Wiegand -- F; < J. effusus -- RAB, FNA, S, W, in part; J. effusus var. costulatus St. John -- F; J. effusus Linnaeus var. solutus Fernald \& Wiegand -- G, in part only]

Juncus repens Michaux, Creeping Rush. Cp (GA, NC, SC, VA), Pd, Mt (GA): streams, ponds, lakes, ditches, wet depressions in flatwoods, cypress savannas; common (rare in Piedmont and Mountains). June-October. DE to s. FL, west to TX, north into OK and TN. This species commonly forms dense mats -- a useful field character. [= RAB, C, F, FNA, G, GW, K, S] Juncus roemerianus Scheele, Black Needle Rush. Cp (GA, NC, SC, VA): coastal tidal marshes, forming dense stands at and above mean high tide, above the Spartina alterniflora zone; common. January-June; May-October. MD to s. FL, west to se. TX. See Eleuterius (1977) for additional information on this species. [= RAB, C, F, FNA, G, GW, K, S] Juncus scirpoides Lamarck var. scirpoides. Cp, Pd, Mt (GA, NC, SC, VA): wet, open, disturbed areas, ditches, sandhill pocosin ecotones and seepage bogs, savannas and wet pine flatwoods, wet meadows; common (rare in Mountains). June-October. S. NY to s. FL, mostly Coastal Plain and Piedmont; west to TX; IN to MI, MO, OK. J. scirpoides is here tentatively divided into three taxa: J. scirpoides var. scirpoides, the nominate form with spherical heads and well exserted, gradually tapered, \(3.0-4.5 \mathrm{~mm}\) long capsules; var. 1 (which may prove to be only a form of var. scirpoides) with distinctly lobulate heads, and short (<3.0 mm long), slightly exerted capsules; and var. 2 (which may prove to be a good species) with somewhat lobulate heads, short (< 3.0 mm long) included, and distinctly bottle-shaped capsules. Vars. 1 and 2 may possibly be either J. scirpoides var. compositus Harper or J. scirpoides var. meridionalis Buchenau, varieties which are poorly described or ignored in southeastern United States manuals. Type specimens of these two varieties need to be studied to determine the application of these names. [=F; < J. scirpoides -- RAB, C, FNA, G, GW, K, S, W, infraspecific taxa not distinguished]

Juncus scirpoides Lamarck var. 1. Cp (NC, SC): roadsides, wet, open, disturbed areas, ?; uncommon. Seen only in NC and SC (from UNC herbarium). June-October. [<J. scirpoides -- RAB, FNA, GW, K, S?, in part only, infraspecific taxa not distinguished; J. scirpoides var. meridionalis Buchenau -- \(F\), application uncertain]

Juncus scirpoides Lamarck var. 2. Cp (GA, NC, SC?, VA?): savannas, pine flatwoods, seepage slopes, roadside ditches; common. Coastal plain, NC, GA, FL, AL, MS, LA, TX, VA?, SC?. June-October. [< J. scirpoides -- RAB, FNA, GW, K, S?, in part only, infraspecific taxa not distinguished; J. scirpoides var. meridionalis Buchenau -- F, application uncertain]

Juncus secundus Beauvois ex Poiret. Pd, Mt (GA, NC, SC, VA), Cp (VA): dry fields, rock outcrops; rare (NC Watch List). June-September. ME to IN, south to e. OK, n. AL, and n. GA. [= RAB, C, F, FNA, G, K, S, W]

Juncus subcaudatus (Engelmann) Coville \& Blake var. subcaudatus, Somewhat-tailed Rush. Mt (GA, NC, SC, VA), Pd, Cp
(VA): bogs, mossy woods and other wet places; common. July-October. Nova Scotia to NY, southwest to MO and southeast to GA. J. subcaudatus is one of the more difficult rushes to identify. Although it is grouped with J. canadensis, J. brevicaudatus and the other long-tailed rushes, its seeds lack distinct, long appendages. In general appearance it matches \(J\). acuminatus quite well; mature seed size and mature capsule size ( \(J\). subcaudatus capsules are generally well exserted above the perianth, while \(J\). acuminatus capsules are equal to only slightly exserted above the capsule) need to be examined in order not to confuse the two taxa. [= F, K; < J. subcaudatus -- RAB, C, F, FNA, G, W, infraspecific taxa not distinguished]

Juncus tenuis Willdenow, Path Rush. Cp, Pd, Mt (GA, NC, SC, VA): dry or moist soil along roadsides and paths, fields; common (uncommon in se. Coastal Plain). Semicosmopolitan in North America. June-September. J. tenuis as it is here treated includes \(J\). tenuis var. anthelatus Wiegand, the most common variety in NC, which has a more open inflorescence and slightly smaller perianth than var. tenuis, and also J. tenuis var. williamsii Fernald, which has a more congested inflorescence with arched to recurved inflorescence branches. [= RAB, F, FNA, G, GW, K, S, W; J. tenuis var. tenuis -- C (in a broad sense); >J. tenuis var. tenuis - F; > J. tenuis var. anthelatus Wiegand -- F; > J. tenuis var. williamsii Fernald -- F, K; > J. anthelatus (Wiegand) R.E. Brooks - FNA]

Juncus torreyi Coville, Torrey's Rush. Mt (GA, VA), Pd (VA), \{NC\}. [= FNA, K]
Juncus trifidus Linnaeus, Highland Rush. Mt (NC, VA): rock crevices at high elevations, on greenstone, mica scist, amphibolite, and hornblende gneiss; rare (NC Endangered). June-September. The species is circumboreal, occurring in arcticalpine situations in \(n\). Europe and \(n\). North America where it ranges from Newfoundland to Québec, south to s. New England and NY; disjunct in VA (Stony Man, Page County) and NC (Craggy Pinnacle, Craggy Dome, and Craggy Gardens, Buncombe County; Eagle Cliff, Mitchell County; Three Top Mountain, Ashe County), and WV (North Fork Mountain, Pendleton County). As with many circumboreal species of polymorphic nature, there is disagreement over the recognition of infraspecific taxa. Var. monanthos (Jacquin) Bluff \& Fingerhuth or ssp. monanthos (Jacquin) Ascherson \& Graebner has often been applied to e. North American J. trifidus, but should apply (if considered valid at all) only to J. trifidus of limestone areas of Europe. Although Hämet-Ahti (1980) correctly showed that Appalachian \(J\). trifidus (from acidic and mafic gneisses and schists) does not belong to J. monanthos ( \(J\). trifidus ssp. monanthos, J. trifidus var. monanthos), her treatment of Appalachian plants as ssp. carolinianus Hämet-Ahti has been controversial. This treatment follows Clemants (1990), who concludes that the primarily vegetative characters used to separate Appalachian plants from the European (blade lengths and relative positions) are too variable to warrant recognition of subspecies or varieties in the taxon. Further study is warranted. [= Y; < FNA, S; > J. trifidus var. monanthos (Jacquin) Bluff \& Fingerhuth -- RAB, F, G, W, misapplied; > J. trifidus ssp. carolinianus Hämet-Ahti -- C, K]

Juncus trigonocarpus Steudel. Cp (GA, NC, SC), Pd (GA, NC): seepage slopes, bogs, along stream margins, ditches; common, rare in Piedmont. July-October. Coastal plain, NC to FL Panhandle, west to e. TX. Young J. trigonocarpus and J. canadensis are often confused; once mature, however, the two can usually be separated by capsule color alone. Although J. canadensis capsules redden, they never approach the dark reddish-purple tone of J. trigonocarpus. Seed and capsule size are also distinct for the two taxa. [= RAB, FNA, GW, K, S]

Juncus validus Coville var. validus, Vigorous Rush. Cp (GA, NC, SC, VA), Pd (GA, SC), Mt (GA): stream and pond margins, roadside ditches, wet, open, often disturbed ground; uncommon. July-September. NC to \(n\). FL, west to TX, OK and MO. [= FNA, K; < J. validus -- RAB, C, F, G, GW, S, W, infraspecific taxa not distinguished]
* Juncus acutus Linnaeus ssp. leopoldii (Parlatore) Snogerup. Cp (GA): \{habitat unknown\}; rare. Reported for se. GA by Jones \& Coile (1988). [= FNA, K, Y]

Juncus balticus Willdenow var. littoralis Engelmann. Mt (VA): open calcareous wetlands; rare. [= K; = J. arcticus Willdenow var. littoralis (Engelmann) Boivin - C; <J. arcticus Willdenow var. balticus (Willdenow) Trautvetter - FNA; = J. balticus ssp. littoralis (Engelmann) Snogerup - Y] \{add to key; add synonymy\}

Juncus brachyphyllus Wiegand. East to TN. [= FNA, K, Y]
Juncus filiformis Linnaeus, Thread Rush, south to e. PA, w. PA, and WV. [= C, FNA, K]
Juncus filipendulus Buckley, Texas Plains Rush. Mt (GA): prairies, limestone barrens; rare (GA Special Concern). East to GA, TN, KY. In calcareous soils. [= FNA, K] \{not yet keyed\}

Juncus glomeratus Batson. Reputedly endemic to GA. \{where is the description, not in IPNI, the epithet glomeratus used at least twice before in Juncus...\} [= K]
* Juncus inflexus Linnaeus. Mt (VA): Introduced in VA (Harvill et al. 1992; Kartesz 1999). (investigate). [= FNA, K] \{not yet keyed\}

Juncus interior Wiegand var. interior east to TN. Reported for VA and NC (Kartesz 1999). \{investigate\} [=K; < J. tenuis
Willdenow var. tenuis -- C, in part; < J. interior - FNA, infraspecific taxa not distinguished]
Juncus militaris Bigelow, Bayonet Rush, south to MD, DE, and ne. PA (Kartesz 1999). [= C, FNA, K]
Juncus nodatus Coville, east to KY, TN, AL, and FL (Kartesz 1999). [= FNA, K]
Juncus pelocarpus E. Meyer. Cp (VA): sea-level fens; rare. [= K; = J. pelocarpus var. pelocarpus -- C; < J. pelocarpus FNA, Y, in the broad sense (also including J. abortivus)]

\section*{Luzula Augustin de Candolle 1805 (Wood-rush)}

A genus of about \(75-115\) species, cosmopolitan. References: Coffey Swab in FNA (2000); Kirschner et al. (2002a)=Z; Balslev in Kubitzki (1998b). Key adapted in part from Coffey Swab in FNA (2000), C, and F.

1 Flowers borne singly or in small clusters of (1-) 2-4 (-8); inflorescences branched, unbranched, or dichasial.
2 Flowers borne in small clusters of (1-) 2-4 (-8); perianth white to pink; inflorescences dichasial; seeds lacking an appendage (or with a inconspicuous appendage); [alien species, naturalized north of our area]; [subgenus Luzula, section

2 Flowers borne singly; perianth tan to brown (the margins of the segments often translucent); inflorescences erect or lax, branching or not; seeds with a conspicuous appendage; [native species, widespread in our area]; [subgenus Pterodes]. 3 Inflorescences simple, with an occasional pedicel branching from the base of a flower; apical appendages of seeds 0.6-1.5 (-2.1) mm long; seed/appendage length ratio 0.8-1.7 . . . . . . . . . . . . . . . . . . L. acuminata var. acuminata 3 Inflorescences usually branching, the pedicels commonly paired; apical appendages of seeds 0.4-1.1 mm long; seed/appendage length ratio 1.0-2.8 . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . L. acuminata var. carolina
1 Flowers borne in dense glomerate clusters (glomerules); inflorescences spikelike or umbellate; [subgenus Luzula, section Luzula].
4 Inflorescence branches divergent, at least some widely spreading; glomerules capitate to broadly ovoid, not cylindric

4 Inflorescence branches erect, none widely spreading; glomerules often cylindric (less commonly merely capitate).
6 Seeds 0.9-1.3 mm long; caruncle 0.5-0.7 mm long; plants producing several basal bulblets (white swollen leaf bases)
6 Seeds 1.1-1.7 mm long; caruncle 0.2-0.5 mm long; plants not producing basal bulblets L. multiflora var. multiflora
Luzula acuminata Rafinesque var. acuminata. Mt, Pd (NC, SC, VA): moist forests; common. April-August. Newfoundland west to Manitoba, south to SC and AR. [= RAB, C, F, FNA, G, GW, K; = Juncoides saltuense (Fernald) Small -- S; < L. acuminata -W; = L. acuminata ssp. acuminata - Z]

Luzula acuminata Rafinesque var. carolinae (S. Watson) Fernald. Mt, Pd, Cp (GA, NC, SC, VA): moist forests; common. April-August. MA, NY, PA, and se. OH south to n. FL and AR. Perhaps better treated at the species level. [= RAB, C, F, FNA, G, GW, K; = Juncoides carolinae (S. Watson) Kuntze -- S; < L. acuminata -- W; = L. acuminata ssp. carolinae (S. Watson) Z. Kaplan Z]

Luzula bulbosa (Wood) Smyth \& Smyth. Pd, Mt (GA, NC, SC, VA), Cp (NC, VA): dry forests and fields; common. MarchAugust. MA, PA, IN, and NE south to n. FL, LA, and c. TX. [= RAB, C, F, FNA, GW, K, Z; = L. campestris (Linnaeus) Augustin de Candolle var. bulbosa Wood -- G; = Juncoides bulbosum -- S; < L. multiflora -- W, in part]

Luzula echinata (Small) F.J. Hermann. Mt, Pd, Cp (GA, NC, SC, VA): forests, bogs; common. Se. MA, se. NY PA, WV, and IA south to GA, AL, MS, and e. TX. March-August. [= RAB, C, FNA, GW, K, Z; >L. echinata var. echinata - F; > L. echinata var. mesochorea F.J. Hermann - F; = L. campestris (Linnaeus) Augustin de Candolle var. echinata (Small) Fernald \& Wiegand -- G; = Juncoides echinatum Small -- S; < L. multiflora -- W, in part]

Luzula multiflora (Ehrhart) Lejeune var. multiflora. Mt, Pd, Cp (VA), \{NC?, SC?\}: forests; common. March-August. Newfoundland and Ontario, south to VA, KY, and MO. [=F; < L. multiflora -- RAB, C; L. campestris (Linnaeus) Augustin de Candolle var. multiflora (Ehrhart) Celak -- G; = L. multiflora ssp. multiflora var. multiflora -- K; = L. multiflora ssp. multiflora - FNA, Z; < L. multiflora -- W, in part]
* Luzula luzuloides (Lamarck) Dandy \& Wilmott ssp. luzuloides, is a native of Europe, naturalized in ne. North America as far south as se. PA (Rhoads \& Klein 1993). It may occur in our area. [= FNA, Z; < L. luzuloides -- C, K]

\section*{JUNCAGINACEAE L.C. Richard 1808 (Arrowgrass Family)}

A family of 3-4 genera and 20 species, of temperate and boreal regions of the Old and New World. References: Haynes \& Hellquist in FNA (2000); Thieret (1988); Haynes, Les, \& Holm-Nielsen in Kubitzki (1998b).

Triglochin Linnaeus 1753 (Arrowgrass)
A genus of about 12 species, cosmopolitan. References: Haynes \& Hellquist in FNA (2000); Thieret (1988)=Z; Haynes, Les, \& Holm-Nielsen in Kubitzki (1998b).

Triglochin striata Ruiz \& Pavón, Southern Arrowgrass. Cp (GA, NC, SC, VA): brackish to nearly freshwater marshes; uncommon (VA Watch List). May-October. The species has an extensive range, occurring in tropical Central and South America, Africa, and Australia; in North America, it ranges from MD south to FL and west to LA, and also on the west coast in CA and OR. [= FNA; = T. striatum - RAB, C, F, G, GW, K, S, Z, orthographic variant]

Triglochin maritima Linnaeus. South to MD and DE. It has the fruit much longer than broad, \(2.5-9 \mathrm{~mm}\) long (vs. fruit globose, \(1.5-2 \mathrm{~mm}\) in diameter in \(T\). striatum). T. maritimum has the ovaries and stigmas 6 . It occurs in both brackish coastal habitats and inland boggy ones. [= FNA; = T. maritimum \(-\mathrm{K}, \mathrm{Z}\), orthographic variant] \{not yet keyed\}

Triglochin palustris Linnaeus. South to PA. It has the fruit much longer than broad, 2.5-9 mm long (vs. fruit globose, 1.5-2 mm in diameter in \(T\). striatum). T. palustris has the ovaries and stigmas 3. It occurs in both brackish coastal habitats and inland boggy ones. [= FNA, K; = T. palustre - Z, orthographic variant] \{not yet keyed\}

LEMNACEAE A. Gray 1821 (Duckweed Family)
[see ARACEAE]

\title{
LILIACEAE de Jussieu 1789 (Lily Family) \\ (also see AGAVACEAE, ALLIACEAE, ALSTROEMERIACEAE, AMARYLLIDACEAE, ASPARAGACEAE, COLCHICACEAE, HEMEROCALLIDACEAE, HOSTACEAE, HYACINTHACEAE, HYPOXIDACEAE, MELANTHIACEAE, NARTHECIACEAE, RUSCACEAE, SMILACACEAE, THEMIDACEAE, TOFIELDIACEAE, TRILLIACEAE)
}

As here interpreted narrowly, the Liliaceae constitutes about 11 genera and 550 species, of the Northern Hemisphere. There has been much recent investigation and re-interpretation of evidence regarding the upper-level taxonomy of the Liliales, with strong suggestions that the broad Liliaceae recognized by Cronquist (1981) is artificial and polyphyletic. Cronquist (1993) himself concurs, at least to a degree: "we still await a comprehensive reorganization of the lilies into several families more comparable to other recognized families of angiosperms." Dahlgren \& Clifford (1982) and Dahlgren, Clifford, \& Yeo (1985) synthesized an early phase in the modern revolution of monocot taxonomy. Since then, additional research, especially molecular (Duvall et al. 1993, Chase et al. 1993, Bogler \& Simpson 1995, and many others), has strongly validated the general lines (and many details) of Dahlgren's arrangement. The most recent synthesis (Kubitzki 1998a) is followed as the basis for familial and generic taxonomy of the lilies and their relatives (see summary below). References: Angiosperm Phylogeny Group (1998, 2003); Tamura in Kubitzki (1998a).

Our "liliaceous" genera (members of orders placed in the Lilianae) are therefore divided as shown below, largely following Kubitzki (1998a) and some more recent molecular analyses.

\section*{ALISMATALES}

TOFIELDIACEAE: Pleea, Tofieldia, Triantha.
LILIALES
ALSTROEMERIACEAE: Alstroemeria.
COLCHICACEAE: Colchicum, Uvularia.
LILIACEAE: Clintonia, Erythronium, Lilium, Medeola, Prosartes, Streptopus, Tricyrtis, Tulipa.
MELANTHIACEAE: Amianthium, Anticlea, Chamaelirium, Helonias, Melanthium, Schoenocaulon, Stenanthium, Veratrum,
Toxicoscordion, Xerophyllum, Zigadenus.
SMILACACEAE: Smilax.
TRILLIACEAE: Trillium. (or to be included in MELANTHIACEAE)
ASPARAGALES
AGAVACEAE: Camassia, Manfreda, Schoenolirion, Yucca. (or to be included in ASPARAGACEAE)
ALLIACEAE: Allium, Ipheion, Nothoscordum.
AMARYLLIDACEAE: Crinum, Galanthus, Hymenocallis, Leucojum, Lycoris, Narcissus, Sternbergia, Zephyranthes. (or to be included in ALLIACEAE)
ASPARAGACEAE: Asparagus.
HEMEROCALLIDACEAE: Hemerocallis. (or to be included in XANTHORRHOEACEAE)
HOSTACEAE: Hosta. (or to be included in ASPARAGACEAE)
HYACINTHACEAE: Hyacinthoides, Hyacinthus, Muscari, Ornithogalum. (or to be included in ASPARAGACEAE)
HYPOXIDACEAE: Hypoxis.
IRIDACEAE: Belamcanda, Calydorea, Crocus, Crocosmia, Gladiolus, Iris, Nemastylis, Sisyrinchium.
ORCHIDACEAE: Aplectrum, Arethusa, Calopogon, Cleistes, Coeloglossum, Corallorhiza, Cypripedium, Epidendrum, Epipactis,
Galearis, Goodyera, Habenaria, Hexalectris, Isotria, Liparis, Listera, Malaxis, Platanthera, Pogonia, Ponthieva, Pteroglossaspis, Spiranthes, Tipularia, Triphora, Zeuxine.
RUSCACEAE: Convallaria, Liriope, Maianthemum, Nolina, Polygonatum. (or to be included in ASPARAGACEAE)
THEMIDACEAE: Dichelostemma. (or to be included in ASPARAGACEAE)
DIOSCOREALES
BURMANNIACEAE: Apteria, Burmannia.
DIOSCOREACEAE: Dioscorea.
NARTHECIACEAE: Aletris, Lophiola, Narthecium.

\section*{PANDANALES}

STEMONACEAE: Croomia.

\section*{Key to LILIACEAE (sensu stricto)}

\section*{[FAMILY KEY NEEDS REWORKING]}

1 Acaulescent herb with 1-several basal leaves; flowers on a leafless scape; tepals yellow or white.
2 Flowers in an umbel at the summit of a leafless scape; fruit a berry; [subfamily Medeoloideae] . . . . . . . . . . . . . . Clintonia
2 Flowers solitary and scapose; tepals yellow or white; fruit a capsule; [subfamily Lilioideae, tribe Tulipeae] . Erythronium
1 Caulescent herb, with leaves on the stem; flowers not scapose; tepals orange, red, yellow, or white).
3 Leaves alternate, at 1-6 nodes; [subfamily Lilioideae, tribe Tulipeae]
3 Leaves either whorled, at 1-2 nodes only (Medeola) or whorled and/or alternate at 7 or more nodes (Lilium).
4 Leaves occurring in a single whorl, with fertile plants with a second whorl of leaflike bracts subtending the flowers; flowers yellow; [subfamily Medeoloideae]

Medeola
4 Leaves occurring at several nodes, these variously whorled and/or alternate; flowers orange, red, or yellow;

\section*{Clintonia Rafinesque 1819}

A genus of 5 species, of temperate to subarctic e. Asia and North America. References: Utech in FNA (2002a); Tamura in Kubitzki (1998a).

1 Flowers yellow; berry blue (rarely to whitish-blue); leaf margins glabrous or slightly ciliate; [mostly of high elevations] .........
\(\quad \ldots \ldots \ldots \ldots \ldots \ldots\). . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. borealis
1 Flowers white (often marked with purple); berry black; leaf margins copiously retrorsely ciliate, the cilia 2-4 mm long; [plants of middle elevations]
C. umbellulata

Clintonia borealis (Aiton) Rafinesque, Bluebead-lily. Mt (GA, NC, VA): spruce-fir forests, northern hardwood forests, less commonly in red oak forests; common (GA Special Concern). Late May-June; July-September. Labrador west to Manitoba, south to NJ, PA, and n. IN, and in the mountains to w. NC, e. TN, and n. GA (Jones \& Coile 1988). [= RAB, C, F, FNA, G, K, S, W]

Clintonia umbellulata (Michaux) Morong, Speckled Wood-lily. Mt (GA, NC, SC, VA): red oak and other oak forests, mesic to dry ridges and slopes, less commonly in northern hardwood forests, generally at lower elevations than C. borealis, though the two species can co-occur; common. Mid May-June; August-October. An Appalachian endemic: c. NY west to s. OH, south to n. GA (Jones \& Coile 1988). Clintonia alleghaniensis Harned, differing from C. umbellulata in its ultramarine blue berry (vs. black) is known from a number of sites in VA, MD, and \(W V\). It has been variously interpreted as a species, a hybrid of \(C\). borealis and \(C\). umbellulata, or merely an odd form of C. umbellulata; it needs further study. [= RAB, C, F, FNA, G, K, W; = Xeniatrum umbellulatum (Michaux) Small -- S; > C. alleghaniensis Harned]

\section*{Erythronium Linnaeus 1753 (Trout Lily)}

A genus of about 25 species, north temperate and subarctic, of North America and Eurasia (especially diverse in w. North America). References: Parks \& Hardin (1963)=Z; Mathew (1992)=Y; Allen \& Robertson in FNA (2002a); Tamura in Kubitzki (1998a).

Keying Note: Stolons are white shoots produced from the bulb. Most run horizontally, either underground or along the ground surface but beneath leaf litter. Flowering individuals often produce no stolons. The stolon characters in the key below are those of non-flowering individuals and refer to horizontal stolons only.

Erythronium albidum Nuttall, White Trout Lily, Blonde Lilian. Mt (GA, VA), Pd (VA): rich, mesic forests, in very nutrient-rich alluvial soils; rare (VA Rare). March-April. S. Ontario west to MN, south to n. VA, nw. GA, KY, sc. TN, MO, and OK. [= C, K, S, W, Y; E. albidum var. albidum -- F, G]

Erythronium americanum Ker-Gawler ssp. americanum, American Trout Lily. Pd (NC, SC, VA), Mt, Cp (NC, VA): moist bottomland or slope forests, especially over mafic rocks; common in VA, much rarer in NC (NC Watch List). February-April; April-May. New Brunswick west to Ontarion and MN, south to sc. NC, c. TN, AR, and OK. It is much rarer than E. umbilicatum in NC. E. americanum is a tetraploid \((2 n=48)\); Parks \& Hardin suggest the possibility that it is an allotetraploid involving \(E\). rostratum and \(E\). umbilicatum as parents. E. americanum is larger-flowered, more graceful, and later-blooming than \(E\). umbilicatum ssp. umbilicatum. [= FNA, GW, K, Y, Z; < E. americanum -- RAB, F, G, S (also see E. umbilicatum); < E. americanum -- C, W]

Erythronium am ericanum Ker-Gawler ssp. harperi (W. Wolf) Parks \& Hardin, Harper's Trout Lily. Mt (GA): moist forests; rare. Ne. TN and nc. TN south to extreme se. TN, nw. GA, and nc. AL. [= FNA, GW, K, Y, Z; < E. americanum -- S, in part]

Erythronium umbilicatum Parks \& Hardin ssp. monostolum Parks \& Hardin, Southern Appalachian Trout Lily. Mt (NC): high elevation coves, slopes, and grassy balds; uncommon. March-May; April-June. Ssp. monostolum is endemic to the high mountains of NC and TN. It approaches the VA border and should be sought, especially in the Grayson Highlands area. E. umbilicatum ssp. monostolum is a diploid \((2 \mathrm{n}=24)\). [= FNA, GW, K, Y, Z; <E. americanum -- RAB, F, G, S; < E. umbilicatum -- C, W]

Erythronium umbilicatum Parks \& Hardin ssp. umbilicatum, Dimpled Trout Lily. Mt, Pd, Cp (GA, NC, SC, VA): moist bottomland or slope forests, or in rather dry upland habitats; common. February-April (May?); April-June. VA and e. WV south through NC, SC, and e. TN to c. GA, e. AL, and panhandle FL. E. umbilicatum ssp. umbilicatum is a diploid \((2 n=24)\). Mathew (1992) suggests the possibility that an earlier name, E. nuttallianum Roemer \& Schultes, may apply to this taxon; the two locations mentioned on the type, Pennsylvania and Albany, NY, are outside the known range of the species, however. [= FNA, GW, K, Y, Z; < E. americanum -- RAB, F, G, S; <E. umbilicatum -- C, W]

Erythronium rostratum W. Wolf, Beaked Trout Lily, ranges from c. TN, MO, and se. KS, south to c. AL, wc. LA, and se. OK. [= FNA, GW, K, Y, Z; < E. americanum -- S, in part]

\section*{Lilium Linnaeus 1753 (Lily)}

A genus of about 110 species, of temperate northern hemisphere (especially e. Asia). Many taxonomic problems remain in this genus of showy ornamentals. References: Adams \& Dress (1982)=Z; Skinner \& Sorrie (2002)=X; Wherry (1946)=Y; Skinner in FNA (2002a); Henry (1946); Tamura in Kubitzki (1998a).

1 Dark bulblets produced in many leaf axils; [escaped exotic]
L. lancifolium

1 Dark bulblets never produced; [native (except L. formosanum), though some species also cultivated].
2 Flowers white; leaves narrowly linear; [escaped exotic
L. formosanum

2 Flowers orange or yellow; leaves lanceolate, oblanceolate, or obovate.
3 Flowers erect, facing upwards; tepals clawed.
4 Leaves (at least some of them) whorled or verticillate; [of the Mountains]
L. philadelphicum var. philadelphicum

4 Leaves all alternate; [of the Coastal Plain] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . L. catesbaei
3 Flowers nodding or declined, facing downwards or to the side; tepals narrowed to the base, but not clawed.
5 Leaves smooth on the margins and veins below, or minutely crenulate with scattered to moderately dense translucent papillae (at \(10 \times\) or more), these rounded and broader than tall (if present).
6 Leaves oblanceolate to obovate, thick in texture (subcoriaceous); inflorescence an umbel of 1-4 (rarely more) flowers; flowering plants \(0.4-1.5 \mathrm{~m}\) tall; leaves alternate and whorled, often as many as \(1 / 2\) or more of the nodes bearing a single leaf
L. michauxii

6 Leaves lanceolate, thin in texture; inflorescence a raceme of (1-) 3-30 (-70) flowers; flowering plants 1-3 m tall; leaves mostly whorled, only a few of the lowermost and/or uppermost nodes bearing a single leaf.
L. superbum

5 Leaves densely papillose-scabrid on the margins and usually also the veins beneath (at \(10 \times\) or more), the papillae elongate (taller than broad).
7 Leaves mostly alternate (the majority of nodes with a single leaf), typically with 1-3 (-5) whorls mid-stem, the remainder of the leaves alternate; plants with both bulbs and rhizomes; tepals recurved 180-360 degrees from the flower axis; inner tepals (petals) \(1.25-1.5 \times\) as wide as the outer tepals (sepals); [of sphagnous sandhill seepage bogs of the upper Coastal Plain]
L. pyrophilum

7 Leaves mostly whorled (the majority of nodes with whorls of leaves, typically with 5-15 whorls, sometimes with several alternate leaves at the very bottom and top of the stem; plants with bulbs only; tepals recurved 25-90 degrees from the flower axis; inner tepals (petals) ca. \(1 \times\) as wide as the outer tepals (sepals); [of various moist to wet habitats of the Mountains, occasionally cultivated and escaped elsewhere].
8 Anthers \(5-15 \mathrm{~mm}\) long; filaments strongly outcurved, the anthers borne far apart; tepals strongly recurved, usually more than 150 degrees from the axis of the individual flower; [west of the Blue Ridge, in our area in nw. GA and also approaching our area in e. TN] .......... L. michiganense 8 Anthers 4-10 mm long; filaments straight or nearly so, the anthers thus borne close together; tepals slightly to moderately recurved, from 10-120 degrees from the axis of the individual flower; [fairly widespread in the Mountains and Piedmont in our area, westwards and northwards].
9 Flowers \(3-4 \mathrm{~cm}\) in diameter; pistil \(3-4 \mathrm{~cm}\) long; tepals \(3-5.5 \mathrm{~cm}\) long, deep red, mucronate by extension of the midrib, reflexed less than 45 degrees from the flower axis, the terminal third of the tepals generally gently incurved; anthers 4-6 mm long, completely included within the perianth when viewed from the side

9 Flowers 4.5-9 cm in diameter; pistil 4-6 cm long; tepals 6-8 cm long, yellow, orange to brick-red, acuminate, reflexed 60-120 degrees from the flower axis; anthers \(5-10 \mathrm{~mm}\) long, exserted to fully included within the perianth when viewed from the side.
10 Perianth yellow (rarely orange to red); mid-cauline leaves \(5-10 \times\) as long as wide ........ L. canadense var. canadense

10 Perianth orange to red; mid-cauline leaves \(2-5 \times\) as long as wide
L. canadense var. editorum

Lilium canadense Linnaeus var. canadense, Yellow Canada Lily. Mt (NC, VA): wet meadows; uncommon (NC Rare). JuneJuly; late July-September. Apparently ranging from New Brunswick to NC, mostly east of or in the Appalachians; the range is obscured by different interpretations of var. canadense and var. editorum, by spread from cultivation, and by collections of cultivated plants not clearly so indicated. Some of our plants are definitely var. canadense. [= F; < L. canadense -- RAB, C, FNA, G, GW, S; = L. canadense ssp. canadense -- K, W, Z; = L. canadense ssp. typicum -- Y]

Lilium canadense Linnaeus var. editorum Fernald, Red Canada Lily. Mt, Pd (GA, NC, SC, VA): wet meadows, forest openings; uncommon (GA Special Concern, NC Rare, SC Rare). June-July; late July-September. According to Adams \& Dress (1982), who emphasize tepal color in distinguishing the infraspecific taxa, ranging from New Brunswick west to s. Ontario, south (mostly in and west of the Appalachians) to n . GA and n . AL. Wherry (1946) and F emphasize leaf shape, and secondarily flower color, restricting var. editorum to a range from PA west to s . IN, south to AL. There has been considerable confusion between \(L\). canadense var. editorum and L. grayi, and populations in sw. VA appear to show some intergradation between the two. [=F; <L. canadense -- RAB, C, FNA, G, GW, S; = L. canadense ssp. editorum (Fernald) Wherry -- K, W, Y, Z]

Lilium catesbaei Walter, Pine Lily, Catesby's Lily, Leopard Lily. Cp (GA, NC, SC, VA): pine savannas sandhill seeps; uncommon (VA Rare). Mid June-mid September; September-November. Se. NC south to FL and west to LA, on the Coastal Plain. [= GW, S; > L. catesbaei var. catesbaei -- RAB; > L. catesbaei var. longii Fernald - RAB, C, F, G; > L. catesbaei ssp. catesbaei -- K; > L. catesbaei ssp. longii (Fernald) Wherry -- K, Y; > L. catesbaei ssp. typicum -- Y]
* Lilium formosanum A. Wallace, Formosa Lily. Cp (NC): escaped from cultivation; rare, introduced from Asia. This species is introduced at various locations in the Southeast, including Florida and Louisiana (Kartesz 1999), and has been documented from Richmond Co. NC (Sorrie, pers. comm.). FNA states that this material may actually represent L. philippinense Baker. [= FNA, K]

Lilium grayi S. Watson, Gray's Lily, Roan Lily. Mt (NC, VA): bogs, seepages, grassy balds, moist forests, and wet meadows, at medium to high elevations; rare (US Species of Concern, NC Threatened, VA Rare). June-July; August-September. A Southern Appalachian endemic: sw. VA, nw. NC, and ne. TN. Clearly related to L. canadense (especially through the somewhat intermediate L. canadense var. editorum), L. grayi appears to be adapted for pollination by Ruby-throated Hummingbirds (Adams \& Dress 1982). See L. canadense var. editorum for additional comments. The two most important strongholds for this rare lily (each with thousands of individuals) are the Roan Mountain massif (Avery and Mitchell counties, NC and Carter County, TN), where it was first found, and Long Hope Valley (Watauga and Ashe counties, NC). Otherwise, it tends to occur in very small, isolated populations in bogs, wet pastures, and seeps. In addition to the characters in the key, L. grayi can be distinguished in sterile condition from the 2 more common species of the Mountains by leaves, which are widest near the midpoint, typically \(4-6 \times\) as long as wide (vs. distinctly wider towards the apex in L. michauxii, and widest near the midpoint but typically \(10 \times\) or more as long as wide in \(L\). superbum). Certainly one of our most beautiful wild plants! [= RAB, C, F, G, K, S, W, Y, Z]
* Lilium lancifolium Thunberg, Tiger Lily. Pd (NC, VA): disturbed areas, trash heaps; rare, introduced from Asia. The more familiar name, L. tigrinum, must be rejected in favor of the older L. lancifolium (Ingram 1968). [= C, FNA, K; L. tigrinum Ker-Gawler -- F, G]

Lilium michauxii Poiret, Carolina Lily. Mt, Pd, Cp (GA, NC, SC, VA): dry upland forests, ridges, slopes, and ridges; common (uncommon in Coastal Plain). July-August; September-October. S. VA, e. TN, n. AL, c. MS, and e. LA south to s. SC, panhandle FL, s. AL, s. MS, and s. LA. [= C, F, FNA, G, GW, K, W, X, Y, Z; < L. michauxii -- RAB (also see L. pyrophilum); = L. carolinianum Michaux -- S]

Lilium michiganense Farwell, Michigan Lily. Mt (GA): wet prairies and calcareous flatwoods; rare (GA Special Concern). Ontario and MN south to e. TN, KY, nw. GA, AL, AR, and e. OK. [= C, F, FNA, K; < L. superbum -- G, in part; = L. canadense Linnaeus ssp. michiganense (Farwell) Boivin \& Cody]

Lilium philadelphicum Linnaeus var. philadelphicum, Wood Lily. Mt (GA, NC, VA): grassy balds, moist to wet meadows (especially in thin soils over rock), open woodlands; rare (GA Special Concern, NC Rare, VA Watch List). June-July; AugustOctober. The species ranges from ME west to British Columbia, south to NC, nw. GA (Jones \& Coile 1988), KY, IL, IA, NE, and NM. Var. philadelphicum, distinguished by the leaves whorled at 3-6 nodes, 10-15 (-25) mm wide, the capsule 2.5-3.5 (-5) cm long, is eastern and mainly Appalachian, ranging from ME and s. Ontario south to NC, GA, and KY. Var. andinum (Nuttall) Ker-Gawler, distinguished by the leaves whorled at 1-2 nodes, \(3-10 \mathrm{~mm}\) wide, the capsule \(4-8 \mathrm{~cm}\) long, is western, ranging from \(\mathrm{OH}, \mathrm{MN}\), and British Columbia south to NM. [= C, F, G, K; < L. philadelphicum -- RAB, FNA, S, W; = L. philadelphicum ssp. philadelphicum -- Y]

Lilium pyrophilum M.W. Skinner \& Sorrie, Sandhills Bog Lily. Cp (NC, SC, VA): peaty seepage bogs in the Sandhills and peaty swamp margins in the upper Coastal Plain; rare (US Species of Concern, NC Rare). July. See Skinner \& Sorrie (2002) for detailed information on this species. Superficially, this plant is somewhat similar to L. michauxii, in its one to several, nodding flowers with recurved tepals, relatively few whorls of leaves, and relatively few leaves per whorl. In addition to the character used in the key, this plant differs from L. michauxii in the following ways: flowers not fragrant or only slightly so (vs. flowers strongly fragrant), leaves generally widest near the middle (vs. widest towards the tip), leaves only slightly paler below and lacking a pronounced waxy sheen (vs. leaves strongly bicolored, the lower surface much paler and with a waxy sheen), and habitat in sphagnous, peaty bogs (vs. in xeric to mesic, sandy to loamy soils). [= FNA, X; < L. michauxii -- RAB (misapplied to these plants); \(\neq\) L. iridollae M.G. Henry - K, misapplied]

Lilium superbum Linnaeus, Turk's-cap Lily, Lily-royal. Mt (GA, NC, VA), Pd (GA, NC, VA), Cp (GA, NC, SC, VA): cove forests and moist forests, moist ravines, blackwater stream swamps; common (rare in Piedmont, rare in NC Coastal Plain). July-

August; September-October. MA and s. NY south to ne. NC, panhandle FL, and c. MS, southwards primarily in the Appalachians, but extending across the Piedmont to the Coastal Plain of VA and ne. NC, and with a similarly odd extension south of the southern terminus of the Appalachians into the Coastal Plain of GA, w. FL, AL, and MS. The plants of blackwater swamps of se. VA and ne. NC are very narrow-leaved and yellow-tepaled; this form, atypical in habitat, range, and morphology has been referred to as "Lilium species \(1^{\prime \prime}\) (Weakley 1993). Further study is needed to determine whether it is a distinct taxon (species, or variety of \(L\). superbum) or only a form. [= C, F, FNA, GW, K, S, W, X, Y, Z; < L. superbum -- G, in a broader sense (including L. michiganense)]

Lilium iridollae M.G. Henry. Coastal Plain bogs. AL and Panhandle FL. [= FNA; < L. iridollae -- K, in part (also see L. pyrophilum)]

Medeola Linnaeus 1753 (Indian Cucumber-root)

A monotypic genus, an herb of eastern North America. References: Utech in FNA (2002a); Tamura in Kubitzki (1998a).

Identification notes: Medeola is sometimes mistaken (when sterile) for Isotria; Medeola has a wiry stem, floccose-pubescent, Isotria a fleshy, glabrous stem.

Medeola virginiana Linnaeus, Indian Cucumber-root. Mt, Pd, Cp (GA, NC, SC, VA): moist forests, usually with acidic soils; common. Mid April-mid June; September-October. Québec and Ontario west to MN, south to GA, panhandle FL and LA. The tuber is white, crisp, tasting cucumber-like, usually about 5 cm long and 5 mm in diameter. Bell (1974) describes patterns of vegetative growth. Flowering plants have a second, smaller whorl of leaves; the flowers are borne on recurved pedicels beneath the top whorl of leaves. In fruit, however, the pedicels are ascending or erect, bringing the fruits above the top whorl. When the berries are ripe, the leaves of the upper whorl become scarlet at the base, presumably acting as an attractant to animals. [= RAB, C, F, FNA, G, GW, K, S, W]

\section*{Prosartes D. Don 1839 (Fairybells, Mandarin)}

A genus of 6 species, of temperate e. North America, w. North America, and e. Asia. Dahlgren, Clifford, \& Yeo (1985) suggest that American species of Disporum are generically distinct from Asiatic species and should be segregated in the genus Prosartes, a distinction made as long ago as 1839. Asian Disporum species lack the distinctly reticulate venation of our plants, have strictly glabrous foliage (vs. pubescent), have spurred tepals (vs. unspurred), blue or black berries (vs. red or straw-colored), tripartite stigma (vs. not), and other differences (Jones 1951). Further study of generic limits by Shinwari et al. (1994) shows that the separation into Prosartes of the American species often assigned to Disporum is clearly warranted, based on morphological and karyological grounds. Prosartes is much more closely related to Streptopus than to (Asian) Disporum; (Asian) Disporum is more closely related to Uvularia. References: Johnson (1968)=Z; Shinwari et al. (1994)=Y; Jones (1951); Tamura, Utech, \& Kawano (1992); Shinwari et al. (1994)=X; Utech in FNA (2002a); Tamura in Kubitzki (1998a).

1 Fruit glabrous, ellipsoid, weakly triangular in cross-section, the surface smooth and shiny, red when ripe; tepals greenish, unspotted; leaves relatively many, small, and moderately spreading relative to the stem; leaf glabrous on the surface above (except for sparsely pubescent on the midrib and main veins), densely pubescent on the midrib below, sparsely pubescent on the surface below; leaf pubescence weak, often twisted or curled apically (as seen at 10-20×), the leaf therefore very soft to the touch
P. Ianuginosa

1 Fruit pubescent, strongly 3-lobed (or 1-or 2-lobed by abortion), the surface textured and dull, whitish-tan when ripe; tepals whitish, spotted with purple; leaves relatively few, large, and widely spreading relative to the stem; leaf sparsely pubescent on the surface and veins above and below; leaf pubescence stiff, generally straight and perpendicular to the surface (as seen at 10-20×), the leaf therefore slightly rough to the touch . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. \(\boldsymbol{m a c u l a t a}\)

Prosartes lanuginosa (Michaux) D. Don, Yellow Mandarin, Yellow Fairybells. Mt (GA, NC, SC, VA), Pd (VA): deciduous forests, especially coves; common. April-May; August-September. Primarily an Appalachian species: NY and s. Ontario south to \(n\). GA (Jones \& Coile 1988) and AL. [= FNA, K, X, Y; = Disporum lanuginosum (Michaux) Nicholson -- RAB, C, F, G, S, W, Z]

Prosartes maculata (Buckley) A. Gray, Spotted Mandarin, Nodding Mandarin. Mt (GA, NC, VA): nutrient-rich deciduous forests, especially cove forests; rare (NC Watch List, VA Rare). April-May; July-August. This species occurs primarily to the west of NC, known from AL, n. GA, KY, MI, w. NC, OH, TN, w. VA, and WV; its distribution is rather fragmented, and the species is considered rare or uncommon in every state in its range. The fruits are more reminiscent of Uvularia than of Prosartes lanuginosa. [= FNA, K, X, Y; = Disporum maculatum (Buckley) Britton -- RAB, C, F, G, S, W, Z]

\section*{Streptopus Michaux 1803 (Twisted-stalk)}

A genus of about 7 species, temperate to subarctic in Europe, e. Asia, and North America. References: Utech in FNA (2002a); Fassett (1935)=Z; Tamura in Kubitzki (1998a).

1 Leaf margins and nodes not coarsely ciliate; leaves strongly cordate-clasping; fruit ellipsoid

1 Leaf margins and nodes coarsely ciliate; leaves sessile to somewhat cordate-clasping (especially the lower leaves of robust individuals); fruit globose
S. Ianceolatus var. lanceolatus

Streptopus amplexifolius (Linnaeus) Augustin de Candolle var. amplexifolius, White Mandarin, Pagoda-bells. Mt (NC, VA): moist forests and seepages at high elevations; rare (NC Rare, VA Rare). Late April-early June; late July-September. The species is circumboreal, the range fragmented. Fassett recognized seven varieties, the plants in our area being var. americanus. The species ranges from Greenland and Labrador to MN, south (in the mountains and disjunctly) to NC, and in the west from AK (and Kamchatka) south to NM and AZ, in Japan, and in the Alps in Europe. [= K; < S. amplexifolius -- RAB, FNA, W, infraspecific taxa not distinguished; > S. amplexifolius var. americanus J.A. \& J.H. Schultes -- C, F, G, Z; Tortipes amplexifolius (Linnaeus) Small -- S]

Streptopus lanceolatus (Aiton) Reveal var. Ianceolatus, Eastern Rose Mandarin, Eastern Twisted-stalk. Mt (GA, NC, VA): moist forests at high elevations; uncommon (GA Rare). Late April-early June; late July-September. Fassett (1935) recognized four varieties in S. roseus. Reveal (1993) determined that the correct name for the species widely known as \(S\). roseus is \(S\). lanceolatus (Aiton) Reveal, and he transferred Fassett's varieties. Fassett (and Reveal) considered S. lanceolatus var. lanceolatus [S. roseus var. perspectus Fassett] to range from s. Labrador west to MI, south to NJ and PA, and in the mountains to w. NC, e. TN, and ne. GA (Jones \& Coile 1988). S. lanceolatus var. longipes (Fernald) Reveal [S. roseus var. longipes (Fernald) Fassett] is midwestern, from s. Ontario and nw. PA west to MI, WI, MN, and s. Manitoba. Var. curvipes (Vail) Fassett is western, ranging from AK to se. British Columbia and nw. OR. Var. roseus was considered to be a Southern Appalachian endemic, differing from var. perspectus only in having the pedicel-peduncles entirely glabrous (vs. ciliate with few to many multicellular hairs). The number of hairs on the peduncles varies constantly, and recognition of two varieties in e. North America does not appear warranted; all of our material is then S. lanceolatus var. lanceolatus [S. roseus var. roseus (in a broader sense)], which does differ significantly from the more western varieties. [= K; < S. roseus -- RAB, S, W; > S. roseus var. roseus -- C, F, G, K, Z, in a narrow sense; > S. roseus var. perspectus Fassett -- C, F, G, Z; < S. lanceolatus - FNA; > S. lanceolatus var. roseus (Michaux) Reveal -- K]

\section*{Tricyrtis Wallich 1826 (Toadlily)}

A genus of about 18 species, of e. Asia. References: Tamura in Kubitzki (1998a).
* Tricyrtis hirta (Thunberg) Hooker, Toadlily, native of e. Asia, is cultivated as an ornamental and may escape or persist, as in se. PA (Rhoads \& Klein 1993). [= K]

\section*{Tulipa Linnaeus 1753 (Tulip)}

A genus of about 150 species, of temperate Eurasia (especially w. and c. Asia). References: Tamura in Kubitzki (1998a); Straley \& Utech in FNA (2002a).
* Tulipa sylvestris Linnaeus, Tulip, Dutch-lily, is very commonly cultivated and is "occasionally naturalized in moist meadows, fields and roadsides" in se. PA (Rhoads \& Klein 1993) and MD (Kartesz 1999). [= FNA, K]

\section*{MARANTACEAE Petersen in Engler \& Prantl 1888 (Arrowroot Family)}

A family of about 31 genera and 550 species, herbs and vines, nearly pantropical (absent from Australia), and rarely extending ino subtropical and warm temperate regions. References: Kennedy in FNA (2000); Andersson in Kubitzki (1998b).

Thalia Linnaeus 1753 (Thalia)
A genus of 6-7 species, in subtropical and tropical America. References: Kennedy in FNA (2000); Andersson in Kubitzki (1998b).
Thalia dealbata Fraser ex Roscoe, Powdery Thalia. Cp (GA, SC): swamp forests, wet ditches, brackish marshes; rare (GA Rare). May-September; June-October. Ne. SC south to FL, west to TX and OK. [= RAB, FNA, GW, K, S]

\section*{MAYACACEAE Kunth 1840 (Bogmoss Family)}

A family of a single genus and 4-10 species, of tropical to warm-temperate America and Africa. References: Faden in FNA (2000); Stevenson in Kubitzki (1998b).

\section*{Mayaca Aublet 1775 (Bogmoss)}

A genus of 4-10 species, of tropical to warm-temperate America and Africa. References: Faden in FNA (2000); Stevenson in Kubitzki (1998b).

Mayaca fluviatilis Aublet, Bogmoss. Cp (GA, NC, SC): marshes, streams, swamp forests, shores of natural lakes, seepage areas, in saturated soil or variously submersed; common. May-July. Se. NC south to FL, west to se. TX; apparently also in tropical America. The two species previously recognized appear to be only different growth forms, induced by different hydrologic conditions. [= FNA, GW, K; > M. aubletii Michaux -- RAB, S; > Mayaca fluviatilis - RAB, S, in a narrower sense]

\section*{MELANTHIACEAE Batsch 1802 (Bunchflower Family)}

A family of about 16 genera and 170 species, mostly temperate and northern hemisphere, but extending into South America. Further modifications of the circumscription of the Melanthiaceae (and re-assignments of genera) may be needed; see Zomlefer et al. (2001) and Tamura et al. (2004). References: Dahlgren, Clifford, \& Yeo (1985); Zomlefer (1997a, 1999)=Z; Zomlefer (1996, 2003); Tamura in Kubitzki (1998a); Zomlefer et al. (2001).

Stenanthium

```

Amianthium A. Gray 1837 (Fly-poison)

A monotypic genus, an herb of temperate e. North America. Zomlefer et al. (2001) confirm that Amianthium should be treated as a monotypic genus. Amianthium has a chromosome number of \(2 \mathrm{n}=32\) (Zomlefer \& Smith 2002). Like Zigadenus, containing very toxic alkaloids. References: Zomlefer (1997)=Z; Zomlefer \& Judd (2002)=Y; Utech in FNA (2002a); Tamura in Kubitzki (1998a).

Amianthium muscitoxicum (Walter) A. Gray, Fly-poison. Mt, Pd, Cp (GA, NC, SC, VA): mesic forests, pine savannas, meadows; common. May-July; July-September. S. NY, PA, MO, and OK, south to panhandle FL, MS, and AR. [=FNA, K, Y; = A. muscaetoxicum -- RAB, C, F, FNA, G, GW, W (an orthographic variant); = Chrosperma muscaetoxicum (Walter) Kuntze -- S; = Zigadenus muscitoxicus (Walter) Regel -- Z]

\section*{Anticlea Kunth 1843 (Death-camas)}

Anticlea has a chromosome number of \(2 \mathrm{n}=32\) (Zomlefer \& Smith 2002). References: Zomlefer \& Judd (2002)=Y; Zomlefer et al. (2001); Schwartz in FNA (2002a).

Anticlea glauca Kunth, White Death-camas. Mt (NC, VA): limestone and dolostone woodlands, glades, cliffs, and outcrops; rare (NC Rare, VA Watch List). July-August; September-October. A. glauca is ther more eastern component of a complex variously treated as two species or a single variable species, with or without recognized varieties or subspecies. A. elegans (in the broadest sense) ranges from Québec and NY west to AK, south to n. OH, n. IN, n. IL, MO, IA, NM, AZ, and n. Mexico; disjunct in the mountains of VA and NC. Two taxa have often been recognized, at the specific, subspecific, or varietal level. The more eastern taxon (epithet "glauca" - see synonymy below) ranges from New Brunswick west to ND, south to NC, TN, and MO, and is distinguished by glaucous foliage, paniculate inflorescence, and tepals often purplish or brownish basally. The more western taxon (epithet "elegans"), occurring east to the MN and MO, has the foliage greener, the inflorescence often only racemose, and the tepals yellow. [< Anticlea elegans (Pursh) Rydberg -- Y; = Zigadenus elegans Pursh ssp. glaucus (Nuttall) Hultén -- K; = Z. glaucus Nuttall -- RAB , F, W, Z; = Z. elegans var. glaucus (Nuttall) Preece -- C; Z. elegans - FNA; = Zygadenus glaucus -- G (an orthographic variant); =? Anticlea chlorantha (Richardson) Rydberg -- S]

\section*{Chamaelirium Willdenow 1808 (Devil's-bit)}

A monotypic genus, an herb of temperate e. North America. References: Zomlefer (1997)=Z; Tamura in Kubitzki (1998a); Utech in FNA (2002a).

Chamaelirium luteum (Linnaeus) A. Gray, Devil's-bit. Mt, Pd, Cp (GA, NC, SC, VA): moist slopes, bottomlands, wet savannas; common (rare in Coastal Plain). March-May; September-November. MA west to Ontario, OH, s. IN, and AR, south to FL and LA. The ecological amplitude and morphologic variability of this species is surprising; it needs additional, more careful, study.

Ch. obovale Small (or other previously unnamed entities) may warrant recognition at some level. [= RAB, C, F, FNA, G, GW, K, W, Z; > Ch. luteum - S, in a narrower sense; > Ch. obovale Small -- S]

\section*{Helonias Linnaeus 1753 (Swamp Pink)}

A monotypic genus, an herb of temperate e. North America. Although Helonias has traditionally been considered a monotypic genus, Takahashi \& Kawano (1989) have suggested that the closely related Heloniopsis and Ypsilandra (both of e. Asia) may be congeneric. References: Zomlefer (1997)=Z; Utech in FNA (2002a); Tamura in Kubitzki (1998a).

Helonias bullata Linnaeus, Swamp Pink. Mt (GA, NC, SC, VA), Cp (VA): bogs, usually under dense shrubs in peaty soils, in the VA Coastal Plain in acidic sandy seepage swamps; rare (US Threatened, GA Threatened, NC Threatened, SC Rare, VA Endangered). April-May; June-July. S. NY and NJ to e. VA on the Coastal Plain, and from w. VA through w. NC to nw. SC and ne. GA (Jones \& Coile 1988) in the Blue Ridge Mountains. The flowering scape elongates markedly in fruit, reaching 1 m in height. [= RAB, C, F, FNA, GW, G, K, S, W, Z]

Melanthium Linnaeus 1753 (Bunchflower)
(see Veratrum)

\section*{Schoenocaulon A. Gray 1837 (Feathershank)}

A genus of about 10 species of \(s\). North America, Central America, and n. South America. Schoenocaulon has a chromosome number of \(2 \mathrm{n}=16\) (Zomlefer \& Smith 2002). References: Tamura in Kubitzki (1998a); Frame in FNA (2002a).

Schoenocaulon dubium (Michaux) Small, Florida Feathershank. Cp (GA): dry pine savannas, sandhills; rare (GA Special Concern). S. GA south to peninsular FL. [= FNA, K, S]

Stenanthium (A. Gray) Kunth 1843 (Featherbells, Featherfleece)
A genus of about 4-5 species, herbs of North America and e. Asia. Stenanthium, as redefined by Zomlefer \& Judd (2002), has a chromosome number of \(2 n=20\) (Zomlefer \& Smith 2002). References: Zomlefer \& Judd (2002)=Y; Zomlefer (1997)=Z; Utech in FNA (2002a); Schwartz in FNA (2002a); Tamura in Kubitzki (1998a). Key adapted in part from F, the taxa and key needing evaluation and (probably) alteration.

1 Tepals obovate, the tip rounded-obtuse.
2 Inflorescence a raceme; flowers all bisexual; plants 3-10 dm tall; flowering April-early June; [(in our area) of the Coastal Plain] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. densum
2 Inflorescence a panicle of racemes; lower flowers of the inflorescence branches bisexual and fertile, the upper staminate or superficially perfect but the pistils nonfunctional (not producing fruits); plants 5-20 dm tall; flowering July-August; [(in our area) of the Mountains]
S. leimanthoides

1 Tepals lanceolate, the tip acute-acuminate.
3 Larger leaves to 30 mm wide, thin and membranous-translucent, not strongly ribbed; panicle dense, the branches stiffly ascending, the flowers crowded; perianth \(5-10 \mathrm{~mm}\) long, greenish; capsules oblong or subcylindric, \(9-10 \mathrm{~mm}\) long, erect; seeds \(5-8 \mathrm{~mm}\) long; leaves distributed all along the stem, nearly as dense just below the panicle as at the base; plant to 2.2 m tall and the stem to 2 cm in diameter near its base; [of bogs and wet meadows] ... S. gramineum var. robustum

3 Larger leaves to 15 mm wide, firm to coriaceous, strongly ribbed; panicle diffuse, the branches ascending, spreading, or drooping, the flowers scattered; perianth 3-8 (-10) mm long, whitish; capsules ovoid to urceolate, 6-9 mm long, deflexed; seeds \(5-5.5 \mathrm{~mm}\) long; leaves mainly near the base, rapidly reduced upwards; plant to 1.9 m tall and the stem to 1 cm in diameter near its base; [of dry to moist upland forests].
4 Perianth \(5-10 \mathrm{~mm}\) long; plant to 1.9 m tall, the stem \(4-10 \mathrm{~mm}\) in diameter near the base
S. gramineum var. gramineum

4 Perianth 3-4.5 (-5.0) mm long; plant to 1.0 m tall, the stem \(1.5-5 \mathrm{~mm}\) in diameter near the base.

> S. gramineum var. micranthum

Stenanthium densum (Desrousseaux) Zomlefer \& Judd, Crow-poison. Cp (GA, NC, SC, VA): pine savannas, pine flatwoods; common, rare in VA (VA Rare). April-early June; late May-July. Se. VA south to FL and west to se. TX, on the Coastal Plain. See Z. leimanthoides for discussion of the taxonomy of the 2 species. Z. densus is superficially very similar to Amianthium muscitoxicum; Z. densus has a conical capsule, \(2 \times\) or more as long as broad (vs. about \(1 \times\) as long as broad), a bladeless purple sheath, \(3-8 \mathrm{~cm}\) long, enclosing the leaves at the base (vs. sheath absent, all leaves with blades), and basal leaves usually \(1-3\) in number, 3-6 (-10) mm wide (vs. mostly 4 or more in number, mostly \(7-10 \mathrm{~mm}\) wide). [= Y; = Zigadenus densus (Desrousseaux) Fernald -- RAB, C, GW, K, Z; < Zigadenus densus (Desrousseaux) Fernald - FNA, in a broad sense (also including S. leimanthoides); = Zygadenus densus -- G (an orthographic variant); Tracyanthus angustifolius (Michaux) Small -- S]

Stenanthium gramineum (Ker-Gawler) Morong var. gramineum, Common Featherbells. Cp, Pd (GA, NC, VA), Mt (NC):
moist forests, grassy balds, to 1700 m in elevation; uncommon. July-early September; August-October. PA west to IL and MO, south to ne. NC, panhandle FL, and TX. [= F, K; < S. gramineum -- RAB, C, FNA, G, S, W, Z]

Stenanthium gramineum (Ker-Gawler) Morong var. micranthum Fernald, Small Featherbells. Mt (GA, NC, SC, VA), Pd (GA, NC, VA): dry upland forests and woodlands; uncommon. July-early September; August-October. W. VA and TN south to panhandle FL and n. AL. [=F, K; < S. gramineum -- RAB, C, FNA, G, S, W, Z]

Stenanthium gramineum (Ker-Gawler) Morong var. robustum (S. Watson) Fernald, Giant Featherbells, Bog Featherbells. Mt (NC, VA?): wet meadows, bogs; rare (NC Watch List). July-early September; August-October. PA south to w. NC. [=F, K; = S. robustum S. Watson -- S; < S. gramineum -- RAB, C, FNA, G, W, Z]

Stenanthium leimanthoides (A. Gray) Zomlefer \& Judd, Pinebarrens Death-camas. Mt (NC, VA), Cp (GA): high elevation rock outcrops, shrub balds, seepage areas at high elevations, in the Coastal Plain in sandhill bogs and wet pine savannas; rare (GA Special Concern, NC Rare, VA Rare). July-August; September-October. As currently interpreted, with a peculiar and disjunct range, occurring on the Coastal Plain of se. NY (Long Island), NJ, and DE, in the mountains from WV and VA south through w. NC to (allegedly) AL, and on the Gulf Coastal Plain, from s. GA to LA. Unpublished studies involving (primarily) Gulf Coast populations of S. leimanthoides have questioned its distinctness from S. densum. Our plants seem very distinct in many ways. Perhaps inflorescence characters do not reliably distinguish the 2 taxa and so-called \(S\). leimanthoides of the Gulf Coast is a paniculate form of \(Z\). densus (the real distinguishing characters not at present clear). S. leimanthoides in the east follows much the same phytogeographic patterns as Leiophyllum buxifolium and Xerophyllum asphodeloides; the 3 species occurring together in the Pine Barrens of the s. NJ Coastal Plain and at 1900 m elevation on the summit of Grandfather Mountain, Avery County, NC! [= Y; = Zigadenus leimanthoides A. Gray -- RAB, C, F, GW, K, W, Z; < Zigadenus densus (Desrousseauz) Fernald - FNA, in a broad sense; = Zygadenus leimanthoides -- G (an orthographic variant); = Oceanoros leimanthoides (A. Gray) Small -- S]

\section*{Veratrum Linnaeus 1753 (White-hellebore)}

A genus of about 55 species, herbs of temperate Northern Hemisphere. Veratrum is here interpreted broadly, including Melanthium following the molecular phylogeny work of Zomlefer et al. (2003). References: Zomlefer (1997)=Z; McNeal \& Shaw in FNA (2002a); Bodkin \& Utech in FNA (2002a); Tamura in Kubitzki (1998a); Zomlefer et al. (2003).

1 Leaves all linear, 1-2 (-3) cm wide; tepals greenish white to creamy white (sometimes fading brownish); [section
Fuscoveratrum] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . V. virginicum
1 Leaves (at least the basal) oblanceolate to obovate or elliptic, \(3-15 \mathrm{~cm}\) wide (the upper leaves sometimes linear); tepals yellowish green, green, or maroon.
2 Leaves strongly plicate, 6-15 cm wide; tepals pubescent, 8-13 mm long, 3-5 mm wide, with a conspicuous pair of glands near the base of the tepal blade (these sometimes more or less fused); filament free from the tepals; [section Veratrum]
V. viride

2 Leaves not at all to slightly plicate, \(3-14 \mathrm{~cm}\) wide; tepals glabrous, 4-9 mm long, \(1-3 \mathrm{~mm}\) wide ( \(3-5 \mathrm{~mm}\) wide in \(V\). latifolium), with either conspicuous (V. latifolium) or diffuse (V. parviflorum and V. woodii) glands; filament fused to the basal claw of the tepal; [section Fuscoveratrum].
3 Tepals 3-5 mm wide, the blade of the tepal abruptly narrowed to a claw, the blade nearly as wide as long, with undulate margins, and 2 conspicuous succulent glands; leaves \(1-7 \mathrm{~cm}\) wide . . . . . . . . . . . . . . . . . . . . V. Iatifolium
3 Tepals 1-3 mm wide, the blade gradually narrowed to the base, the blade much longer than wide, with entire margins, and with diffuse glandular areas; leaves \(3-12.5 \mathrm{~cm}\) wide.
4 Tepals pale to olive green, 4-7 mm long; ovaries glabrous; leaves 4.5-14 cm wide; [common, of the Mountains in our area] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . V. parviflorum
4 Tepals dark maroon, 6-9 mm long; ovaries densely pubescent; leaves 3-10 cm wide; [rare disjunct in our area]
V. woodii

Veratrum latifolium (Desrousseaux) Zomlefer, Crisped Bunchflower. Mt (GA, NC, SC, VA), Pd, Cp (NC, SC, VA): moist forests; uncommon (rare in Coastal Plain and Piedmont) (GA Special Concern). July-August; September-October. An Appalachian endemic: CT south to NC and SC. [= Z; = Melanthium hybridum Walter -- RAB, C, F, G, W, misapplied; = Melanthium latifolium Desrousseaux -- FNA, K, S]

Veratrum parviflorum Michaux, Mountain Bunchflower. Mt (GA, NC, SC, VA): moist to rather dry forests, up to at least 1700 m ; common. July-early September; August-October. A Southern Appalachian endemic: WV and KY south to VA, NC, n. GA, and TN. [= RAB, C, G, W, Z; = Melanthium parviflorum (Michaux) S. Watson -- F, FNA, K, S]

Veratrum virginicum (Linnaeus) Aiton, Bog Bunchflower, Virginia Bunchflower. Cp (GA, NC, SC, VA), Mt, Pd (NC, SC, VA): savannas, bogs, seepage bogs, wet forests; uncommon (SC Rare). June-August; August-October. Widespread in e. North America. This species is superficially quite similar to Zigadenus glaberrimus, which, in addition to characters given in the family key, has the stem glabrous (vs. pubescent in M. virginicum). [= Z; Melanthium virginicum Linnaeus -- RAB, C, F, FNA, G, GW, K, W; Melanthium dispersum Small -- S; Melanthium virginicum - S, in a narrower sense]

Veratrum viride Aiton, White-hellebore, Indian Poke, Green Hellebore, Cornhusk Lily. Mt (GA, NC, VA), Pd (VA): seeps, streambanks, wet boulderfields; common (GA Special Concern). June-August; July-September. Québec and Ontario south in the mountains to NC, TN, and ne. GA. The closely related V. eschscholtzii A. Gray, sometimes treated as V. viride ssp. eschscholtzii
(A. Gray) A. \& D. Löve or V. viride var. eschscholtzii (A. Gray) Breitung, is western, ranging from AK to OR. This plant is strongly poisonous; an insecticide was formerly manufactured from the roots. [= RAB, C, F, G, GW, S, W, Z; < V. viride -- K, in the broad sense; = V. viride var. viride -- FNA]

Veratrum woodii J.W. Robbins ex Wood, Ozark Bunchflower, Wood's False-hellebore. Mt (GA, NC), Cp (GA): circumneutral soil of woodlands over mafic rocks (such as amphibolite) or other calcareous substrates; rare (GA Rare, NC Rare). July; September. Primarily Ozarkian, but extending in scattered populations eastwards as far as sw. GA, nw. GA, sc. TN, and sw. NC (Polk County). [= C, F, G, Z; = Melanthium woodii (J.W. Robbins ex Wood) Bodkin -- FNA, K; ?= V. intermedium Chapman -- S]

Xerophyllum Michaux 1803 (Turkeybeard, Beargrass)
A genus of 2 species, rather woody herbs of temperate North America. The other species in the genus is the western beargrass, \(X\). tenax (Pursh) Nuttall, widely distributed in the western Cordillera. References: Zomlefer (1997)=Z; Utech in FNA (2002a); Tamura in Kubitzki (1998a).

Xerophyllum asphodeloides (Linnaeus) Nuttall, Turkeybeard, Beargrass, Mountain-asphodel. Mt (GA, NC, SC, VA), Pd (NC, SC, VA): dry ridges and slopes in the mountains, primarily in dry, strongly acidic sites which burn periodically, such as pine/heath woodlands and forests, heath balds, and xeric oak forests, most of the populations in the Blue Ridge Escarpment, often associated with Pinus rigida or \(P\). pungens, disjunct to similar sites on quartzite monadnocks of the upper Piedmont; uncommon (GA Rare, NC Watch List, SC Rare). May-June; July-August. In two disjunct areas; the Coastal Plain of s. NJ and DE, and the Southern Appalachians from w. VA south to e. TN, w. NC, nw. SC, and ne. GA. Sterile plants resemble tussocks of a bunchgrass, but the leaf bases are white and flattened and are obviously not those of a grass. The leaves remain green throughout the winter. \([=R A B, C, F\), FNA, G, K, W, Z]

\section*{Zigadenus Michaux 1803 (Death-camas)}
(also see Anticlea, Stenanthium)
As redefined, a monotypic genus of se. North America. A molecular systematics study by Zomlefer et al. (2001) gives strong support to a treatment recognizing Zigadenus as monotypic (Zigadenus glaberrimus), Anticlea (including for our area the former Zigadenus elegans ssp. glaucus), Stenanthium (including for our area Stenanthium spp. and the former Zigadenus densus and Z. leimanthoides). Zigadenus (as redefined) has a tentatively reported chromosome number of \(2 \mathrm{n}=52\) (Zomlefer \& Smith 2002). References: Zomlefer (1997)=Z; Tamura in Kubitzki (1998a); Zomlefer et al. (2001); Schwartz in FNA (2002a).

1 Leaves strongly keeled, (5-) 10-20 mm wide; plant colonial, from thick, hard, horizontal, short-creeping rhizomes covered with fibrous old leaf bases; inner tepals (petals) \(7-17 \mathrm{~mm}\) long, distinctly clawed, acute-acuminate, bearing 2 glands well above the base

Zigadenus glaberrimus
1 Leaves slightly or not at all keeled, 2-12 mm wide; plant solitary, from a bulbous or semibulbous base; inner tepals (petals) 3-6 or 7-12 mm long, clawed or not, bearing either a single (sometimes obscure to essentially invisible) gland near the base or a bilobed gland well above the base.
2 Inner tepals (petals) 7-12 mm long, clawed, with a single bilobed gland borne well above the base; [of calcareous habitats in the Mountains] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [see Anticlea elegans]
2 Inner tepals 3-6 mm long, not clawed, with a single, unlobed gland borne near the base (this often difficult or impossible to see, consisting only of a greenish line at the very base of the tepal); [of acid habitats of the Mountains and Coastal Plain]; [section Oceanoros].
3 Inflorescence a raceme; flowers all bisexual; plants 3-10 dm tall; flowering April-early June; [(in our area) of the Coastal Plain] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [see Stenanthium den
3 Inflorescence a panicle of racemes; lower flowers of the inflorescence branches bisexual and fertile, the upper staminate or superficially perfect but the pistils nonfunctional (not producing fruits); plants 5-20 dm tall; flowering JulyAugust; [(in our area) of the Mountains]
[see Stenanthium leimanthoides]

Zigadenus glaberrimus Michaux, Large Death-camas, Snakeroot. Cp (GA, NC, SC, VA): sandhill seepage bogs, pine savannas, pocosin edges; common, rare in VA (VA Rare). Late June-early September; August-November. Se. VA south to panhandle FL, west to se. TX, on the Coastal Plain. This species is superficially more similar to Melanthium virginicum than to the other species of Zigadenus. Z. glaberrimus has the stem and inflorescence axis glabrous (vs. scurfy-pubescent in M. virginicum). [= RAB , C, F, FNA, GW, K, Z; = Zygadenus glaberrimus -- G, S (an orthographic variant)]

\section*{NAJADACEAE de Jussieu 1789 (Naiad Family)}

A family of a single genus and about 40 species, nearly cosmopolitan. The Najadaceae should perhaps be merged into the Hydrocharitaceae (Haynes, Holm-Nielsen, \& Les 1998b). References: Haynes in FNA (2000); Haynes (1979)=Z; Haynes \& Hellquist (1996); Haynes, Holm-Nielsen, \& Les in Kubitzki (1998b).

A genus of about 40 species, nearly cosmopolitan. Probably better included in the Hydrocharitaceae (Angiosperm Phylogeny Group (2003). References: Haynes in FNA (2000); Haynes (1979)=Z; Haynes \& Hellquist (1996); Haynes, Holm-Nielsen, \& Les in Kubitzki (1998b).

Identification notes: counts of leaf-teeth do not include the broadened, sheathing base of the leaf. Seeds are necessary for the identification of most species.

1 Plants dioecious; lower side of the midvein of the leaves prickly; [subgenus Najas] . . . ........................ [N. marina]
1 Plants monoecious; lower side of the midvein of the leaves smooth; [subgenus Caulinia].
2 Leaf-teeth multicellular, evident at \(10 \times\) magnification, \(7-15\) per side; leaves becoming recurved late in the season; seedcoat pitted, the areoles distinctly wider than long, in ca. 12-18 ladder-like rows . . . . . . . . . . . . . . . . . . . . . . . . . . N. minor
2 Leaf-teeth unicellular, not evident at \(10 \times\) magnification, more than 20 per side (except 13-17 per side in N. gracillima); leaves spreading to ascending; seed-coat smooth or pitted, if present the areoles longer than wide or about as long as wide.
3 Seeds smooth, glossy, obovate, broadest above the middle; anthers 1-locular . . . . . . . . . . . . . . . . . . . . N. flexilis
3 Seeds pitted, dull, cylindric, fusiform, or elliptic, broadest at the middle; anthers 1- or 4-locular.
4 Style offset from the apex of the seed; anthers unilocular
N. gracillima

4 Style at the apex of the seed; anthers 4-locular . . . . . . . . . . . . . . N. guadalupensis var. guadalupensis
Najas flexilis (Willdenow) Rostkovius \& Schmidt, Northern Naiad. Cp, Pd, Mt (VA): lakes and rivers; uncommon. JulyAugust. Newfoundland west to Ontario, south to VA, MD, MO, and NE; also in the west from Alberta and Saskatchewan south to OR and UT. [= C, F, FNA, G, K, S, W, Z; = Naias flexilis - S, orthographic variant]

Najas gracillima (A. Braun ex Engelmann) Magnus, Slender Naiad, Bushy Naiad. Mt, Cp (NC, SC, VA), Pd (NC, VA): ponds and lakes; uncommon. July-October. Nova Scotia west to MN, south to NC, AL, and MO; disjunct in CA. Haynes (1979) reports that this species cannot tolerate pollution and is apparently declining in abundance. [= RAB, C, F, FNA, G, K, W, Z]

Najas guadalupensis (Sprengel) Magnus var. guadalupensis, Common Naiad, Southern Naiad. Cp, Pd, Mt (GA, NC, SC, VA): lakes and rivers; common. July-October. Var. guadalupensis ranges from ME west to Alberta and WA, south to \(n\). South America. Haynes (1979) interprets the species as including 3 other varieties -- var. floridana Haynes \& Wentz (in FL, north to AL and GA and to be sought in SC), var. muenscheri (Clausen) Haynes (endemic to the Hudson River), and var. olivacea (Rosendahl \& Butters) Haynes (nearly limited to states bordering the Great Lakes). They differ in characteristics of the leaf and seed (see Haynes 1979). Haynes \& Hellquist (1996) treat all infraspecific taxa as subspecies rather than varieties. [= C, Z; < Najas guadalupensis -RAB, F, G, GW, W, infraspecific taxa not distinguished; = Najas guadalupensis ssp. guadalupensis - FNA, K; Naias guadelupensis - S, orthographic variant and infraspecific taxa not distinguished]

Najas minor Allioni, Spinyleaf Naiad. Pd, Mt, Cp (GA, NC, SC, VA): ponds, lakes, and reservoirs, particularly where eutrophic; uncommon, native of Eurasia. July-October. This species is apparently a rather recent introduction to North America, now widespread in e. North America. Haynes (1979) reports that it is becoming more abundant in e. North America because of its tolerance for polluted, eutrophic waters. [=RAB, C, F, FNA, G, GW, K, W, Z]

Najas filifolia Haynes, Narrowleaf Naiad. Cp (GA): lakes; rare (GA Special Concern). Sw. GA (Jones \& Coile 1988) to FL (Haynes in FNA 2000). [= FNA, K; Najas ancistrocarpa, misapplied] \{not yet keyed; add synonymy\}

Najas guadalupensis (Sprengel) Magnus var. floridana Haynes \& Wentz, in GA and FL. [= Z; = Najas guadalupensis ssp. floridana Haynes \& Wentz) Haynes \& C.B. Hellquist - FNA, K; < Najas guadelupensis - GW] \{not yet keyed; add synonymy\}

Najas marina Linnaeus, Holly-leaf Naiad, occurs both n . and s . of our area and should be sought. It occurs in brackish or calcareous waters. It is dioecious (vs. monoecious in our 4 species), and has the lower side of the midvein of the leaves prickly (vs. smooth in our 4 species). [= FNA, K; = Naias marina - S, orthographic variant] \{add synonymy\}

\section*{NARTHECIACEAE E.M. Fries 1846 (Bog-asphodel Family)}

As circumscribed here (excluding Tofieldiaceae), a family of about 4 genera and 40 species, of e. Asia, e. North America, n. Europe, and the Guyana Shield of \(n\). South America. Reveal \& Zomlefer (1998) place the Nartheciaceae in the monotypic order Nartheciales. References: Zomlefer (1997b, 1999); Reveal \& Zomlefer (1998); Tamura in Kubitzki (1998a).

\section*{Aletris Linnaeus 1753 (Colic-root, Stargrass)}

As circumscribed here (including Metanarthecium), a genus of about 30 species, of e. North America and e. Asia. References: Weigant (2002)=X; Ward (1978)=Y; Zomlefer (1997b)=Z; Tamura in Kubitzki (1998a); Sullivan in FNA (2002a).

\footnotetext{
1 Perianth white to creamy-white (rarely pinkish).
2 Perianth 6-10 mm long, cylindric at anthesis, \(2-3 \times\) as long as broad, the perianth lobes narrowly deltoid (longer than broad); fruiting perianth markedly constricted above the middle
A. farinosa

2 Perianth 4-6 mm long, campanulate at anthesis, ca. \(1 \times\) as long as broad, the perianth lobes broadly deltoid (about as long as broad); fruiting perianth somewhat narrowed above the base
A. obovata

1 Perianth golden yellow (often faded in dried specimens).
}

3 Perianth short-cylindric or campanulate at anthesis, \(1-2 \times\) as long as broad, the perianth lobes not spreading; [flowering May-July] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. A aur
3 Perianth long-cylindric at anthesis, \(2.5-4 \times\) as long as broad, the perianth lobes spreading somewhat; [flowering MarchMay]
A. Iutea

Aletris aurea Walter, Golden Colic-root. Cp (GA, NC, SC, VA): pine savannas, seepage bogs, pine flatwoods; uncommon (VA Rare). Mid May-July; August. S. MD south to c. peninsular FL, west to e. TX and se. OK. Flowering several weeks later than A. farinosa when growing together. [= RAB, C, F, FNA, G, GW, K, S, X, Y, Z]

Aletris farinosa Linnaeus, Northern White Colic-root, Mealy Colic-root, Stargrass. Cp, Mt, Pd (GA, NC, SC, VA): pine savannas, pine flatwoods, seepage bogs, upland woodlands, roadbanks; common. Late April-early June; July-August. S. ME, s. Ontario, and se. MN south to s. GA, FL (Wunderlin 1998), LA, and TX, the only species of the genus not restricted (or nearly so) to the Coastal Plain. [= RAB, C, F, FNA, G, GW, K, S, W, X, Z]

Aletris Iutea Small, Yellow Colic-root. Cp (GA): pine savannas; uncommon. E. GA (in immediate proximity to the SC border) south to s. FL, and west to e. LA (Weigant 2002). The report by F of A. lutea Small as far north as se. VA is in error. A specimen collected in se. NC has recently been annotated as A. lutea, but it appears to be A. farinosa. [= FNA, GW, K, S, X, Y, Z]

Aletris obovata Nash ex Small, Southern White Colic-root. Cp (GA, SC): pine savannas; rare (SC Rare). May-early June; August. Se. SC south to c. peninsular FL, west to s. MS. [= RAB, FNA, GW, K, S, X, Y, Z]

\section*{Lophiola Ker-Gawler 1814 (Golden Crest)}

A monotypic genus, of temperate e. North America. As here interpreted to include L. americana and L. septentrionalis, Lophiola is monotypic, consisting only of \(L\). aurea. Lophiola is quite unlike any other genus, and its familial position has been problematic. Often treated in the Haemodoraceae (as in RAB, C, G, GW), Lophiola is better placed in the Nartheciaceae (or a very broad Liliaceae), as shown by studies of anatomy, pollen ultrastructure, and chemistry, though its placement in that family is also not without problems (Edwards, Churchill, \& Weiss 1970, Simpson \& Dickison 1981, Simpson 1983, Zavada 1983, Zavadu, Xu, \& Edwards 1983, Ambrose 1985). References: Zomlefer (1997b)=Z; Tamura in Kubitzki (1998a); Robertson in FNA (2002a).

Lophiola aurea Ker-Gawler, Golden Crest. Cp (GA, NC): mucky depressions in wet savannas, and in adjacent ditches; rare (GA Special Concern, NC Endangered). Late May-June; August-September. A species of Southeastern Coastal Plain affinities, but with a peculiar, fragmented distribution, occurring primarily on the Gulf Coast from FL and sw. GA west to MS, with disjunct segments of range in se. NC, n. DE and s. NJ, and Nova Scotia. Only a few populations remain in NC. [= C, FNA, K, S, Z; > L. americana (Pursh) Wood -- RAB, F (the NJ-DE material), G, GW; > L. septentrionalis Fernald -- F (the Nova Scotian material)]

\section*{Narthecium Hudson 1762 (Asphodel)}

A genus of about 8 species, many narrow disjuncts, collectively with a very fragmented distribution in the temperate Northern Hemisphere. References: Small (1924)=Z; Zomlefer (1997b) =Y; Utech in FNA (2002a); Tamura in Kubitzki (1998a); Schumacher (1947) \(=\) X; Sorrie \& Weakley (in prep.)=Q.

1 Tepals 4-6 mm long; capsule 10-14 mm long; pedicels stout, about as long as the subtending bracts; [of Coastal Plain seeps and savannas] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . N. \(\boldsymbol{N}\) americanum
1 Tepals 6-9 mm long; capsule \(8-10 \mathrm{~mm}\) long; pedicels slender, distinctly longer than the subtending bracts; [of mountain bogs]

Narthecium americanum Ker-Gawler, Yellow Asphodel. Cp (SC): wet seepages or savannas; rare (US Species of Concern, NC Endangered, SC Rare). June-July; August-September. S. NJ and DE; disjunct in c. SC. It is still possible that this species will be relocated in our area, perhaps in mucky seepages in the Sandhills. [=C,F,G, Q, X; < Narthecium americanum -- RAB, FNA, GW, K, W, Y, in part only (also see N. montanum); = Abama americana (Ker-Gawler) Morong -- S, Z]

Narthecium montanum (Small) C.H. Grey, Appalachian Yellow Asphodel. Mt (NC): bogs; rare (apparently extinct). With the drainage of the bogs of East Flat Rock, Henderson County, this species was apparently extirpated. It is still possible that it will be relocated, in bogs in Henderson or Transylvania counties, NC. Small \((1924,1933)\) considered the NC mountain population a distinct species, based on its longer, more slender pedicels, larger sepals, petals, and stamens, and smaller capsules. Schumacher (1947), in the most thorough worldwide assessment of Narthecium, agreed, and Sorrie \& Weakley (in prep.) concur, based on an herbarium analysis of the characters of all taxa in the genus. The morphological distinctions (and geographic disjunction) between \(N\). montanum and \(N\). americanum are as great or greater as those between most species recognized worldwide in the genus. [= \(Q\), X; < Narthecium americanum - RAB, FNA, GW, K, W, Y, in part; = Abama montana Small -- S, Z]

NOLINACEAE Nakai 1943 (Beargrass Family) (see RUSCACEAE)

ORCHIDACEAE (Orchid Family)

A family of about 800 genera and 19,000 species, perennial (rarely annual), mycotrophic herbs and vines. Only a small minority of orchid species worldwide are terrestrial rather than epiphytic; only Epidendrum magnoliae in our flora shows the common epiphytic habit. References: Luer (1972) and Luer (1975)=L; Correll (1950)=X; Romero-González, Fernández-Concha, Dressler, Magrath, \& Argus in FNA (Williams \& Williams (1983); Brown (2003); Homoya (1993); Correll (1937); Pridgeon et al. (1999a, 1999b, 1999c).

Subfamily Cypripedioideae: Cypripedium
Subfamily Orchidoideae
Tribe Orchideae
Subtribe Orchidinae: Coeloglossum, Galearis, Habenaria, Platanthera
Tribe Cranichideae
Subtribe Cranichidinae: Ponthieva
Subtribe Goodyerinae: Goodyera
Subtribe Spiranthinae: Spiranthes
Subfamily Vanilloideae
Tribe Pogonieae: Cleistes, Isotria, Pogonia
Keying Note: Flowering plants are necessary for use of the key to genera.
1 Plant epiphytic, growing on the branches or trunks of trees in swamps . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Epidendrum
1 Plant terrestrial, growing on soil.
2 Leaves absent at flowering, or with a solitary leaf with a purplish undersurface withering at about the time of flowering.
3 Flowers with a spur.
3 Flowers without a spur.
4 Flowers white, the lip, sepals, and petals all predominantly white . . . . . . . . . . . . . . . . . . . . . . . . . Spiranthes
4 Flowers pink, greenish, yellowish, or purplish, the lip sometimes white or marked with white, the sepals and petals colored.
5 Flower solitary; lip strongly bearded . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Arethusa
5 Flowers in spikes or racemes; lip not bearded.
6 Lip with 2 fleshy ridges near the base; pollinia 4; plants mycoparasitic and never with leaves .......

6 Lip with 3-7 ridges near the base or extending most of the length of the lip; pollinia 4 or 8; plants either mycoparasitic and never with leaves, or with a plicate winter leaf withering shortly before flowering.
\(7 \quad\) Plants with a plicate winter leaf withering shortly before flowering (the withered remnant usually detectable); pollinia 4; veins of the petals and sepals not strikingly different in color than the intervein areas; lip with 3 ridges Aplectrum
\(7 \quad\) Plants never with leaves and saprophytic; pollinia 8; veins of the petals and sepals strikingly different in color than the intervein areas; lip with 5-7 ridges.

Hexalectris
2 Leaves present at flowering (Cleistes with a foliaceous bract at the summit of the stem).

\section*{8 Leaf solitary.}

9 Leaf basal.
10 Flower with a spur . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Platanthera 10 Flower without a spur.

11 Flower solitary; leaf plicate . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Arethusa
11 Flowers in a raceme or spike.
12 Flowers relatively large, purple, pink, to rarely white, the lip oriented upwards . . . . . Calopogon
12 Flowers relatively small, whitish, the lip oriented downwards . . . . . . . . . . . . . . . . Spiranthes
9 Leaf cauline.
13 Flower solitary (-4), pink (rarely nearly white); [subfamily Vanilloideae; tribe Pogonieae].
14 Sepals brown to purple, linear or narrowly oblanceolate, 3-6.5 cm long, about 5 mm wide; leaf coriaceous

Cleistes
14 Sepals pink (rarely white), elliptic or oblanceolate, 1.3-2.7 cm long, 3-11 mm wide; leaf herbaceous .
. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Pogonia
13 Flowers in spikes or racemes, 5-many, reddish, yellowish, or greenish.
15 Flower without a spur; petals, sepals, and lip 1-3 mm long . . . . . . . . . . . . . . . . . . . . . . . . . Malaxis
15 Flower with a spur; petals, sepals, and lip 3-25 mm long . . . . . . . . . . . . . . . . . . . . . . Platanthera
8 Leaves 2-many.
16 Lip inflated, pouch-like or slipper-like, \(2-6 \mathrm{~cm}\) long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Cypripedium
16 Lip not inflated, or if so, then 0.3-1.1 cm long.
17 Leaves basal (sometimes with bladeless sheaths upwards on the stem).
18 Leaves plicate.
19 Lip oriented upwards; flowers pink to white
Calopogon
19 Lip oriented downwards; flowers greenish, purplish-brown, or yellowish.
20 Leaves ovate to elliptic, \(2-5 \times\) as long as wide; plant \(1-3 \mathrm{dm}\) tall ................ . Liparis
20 Leaves linear-lanceolate, more than \(10 \times\) as long as wide; plant \(3-14 \mathrm{dm}\) tall

18 Leaves smooth, often creased at the midrib, but not plicate.
21 Lip with a spur.
22 Flowers bicolored, the lip white, the sepals and petals pink; leaves \(2 \ldots\). . . . . . Galearis
22 Flowers not bicolored, the lip, petals, and sepals similarly colored; leaves 2-5.
23 Lip deeply divided into 3 linear segments; leaves \(3-5 \ldots \ldots . \ldots\). . . . . . Habenaria
23 Lip entire; leaves 2 . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Platanthera
21 Lip without a spur.
24 Leaf blades more-or-less horizontally oriented, flat against the ground or 1-2 cm above it.
25 Lip oriented upwards . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Ponthieva
25 Lip oriented downwards.
26 Leaves variegated with white; lip saccate . . . . . . . . . . . . . . . . . . . . . . Goodyera
26 Leaves green, not variegated; lip not saccate . . . . . . . . . . . . . . . . . Spiranthes
24 Leaf blades ascending.
27 Leaves linear to lanceolate, 2-4 . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Spiranthes
27 Leaves elliptic to ovate, 2.
28 Lip broadest near its apex . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Liparis
28 Lip broadest near its base, tapering to the apex . . . . . . . . . . . . . . . . . Malaxis
17 Leaves cauline.
29 Leaves plicate; lip saccate . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Epipactis
29 Leaves smooth, often creased at the midrib, but not plicate; lip not saccate.
30 Leaves whorled, terminating the stem Isotria 30 Leaves alternate or opposite, not terminating the stem.

31 Leaves 2, opposite, near the middle of the stem . . . . . . . . . . . . . . . . . . . . . . . . . . Listera
31 Leaves (2-) 3-many, alternate, variously distributed on the stem.
32 Lip without a spur.
33 Leaves ovate, 0.8-2.0 cm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Triphora
33 Leaves linear, 1-8 cm long ....................................... Zeuxine
32 Lip with a spur; leaves linear, lanceolate, or narrowly elliptic, 5-40 cm long (at least the larger more than 5 cm long).
34 Lip divided into 3 linear divisions, the divisions not further divided, fringed, or eroded . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Habenaria
34 Lip not divided into 3 divisions, or divided into 3 divisions but the divisions not linear.
35 Spur saccate, 2-3 mm long, the orifice minute . . . . . . . . . . Coeloglossum 35 Spur elongate and slender, 4-50 mm long, the orifice larger . . Platanthera

Aplectrum Torrey 1818 (Puttyroot, Adam-and-Eve)
A genus of 2 species, 1 in e. North America and 1 in Japan (Sheviak \& Catling in FNA (2002a). References: Sheviak \& Catling in FNA (2002a).

Identification notes: Like Tipularia, Aplectrum has a single, overwintering leaf, purplish on the underside, and withering prior to the appearance of the flowering stalk; they are readily separable by leaf shape, texture, and veining (see Tipularia).

Aplectrum hyemale (Muhlenberg ex Willdenow) Torrey, Puttyroot, Adam-and-Eve. Mt, Pd (GA, NC, SC, VA), Cp (VA): rich, mesic forests; common. May-June. Québec and MN, south to SC, GA, AL, and OK. [= RAB, C, F, FNA, G, GW, K, L, S, W, X]

\section*{Arethusa Linnaeus 1753 (Dragon's-mouth, Bog-rose, Arethusa)}

A monotypic genus (Sheviak \& Catling in FNA 2002). References: Sheviak \& Catling in FNA (2002a).
Identification notes: The combination of the following characters serves to separate Arethusa from other, vaguely similar, genera: flowers magenta, solitary and scapose, the lip descending, the other 2 petals and 3 sepals erect or ascending. Calopogon has a leafy stem, the inflorescence a raceme, the lip crested but oriented upwards. Pogonia has solitary, pale pink flowers, with a descending, bearded lip, but the stem has a well-developed, flat leaf, 1-2.5 cm wide, the flower is subtended by a well-developed, leaf-like, floral bract, and the 2 lower sepals are spreading-descending. Cleistes has 3 brown to purplish brown sepals.

Arethusa bulbosa Linnaeus, Dragon's-mouth, Bog-rose, Arethusa. Mt (NC, SC, VA): bogs; rare (NC Endangered, SC Rare, VA Rare). May-June. Widespread in ne. North America, south to NJ and IN and to NC and SC in the mountains, rare south of ME, MI, and MN. The lanceolate, plicate leaf ( \(15-30 \mathrm{~cm}\) long, 2-4 mm wide) develops after flowering, the flowering plant thus consisting (aboveground) of the solitary scape only. The lip is crested with fimbriate ridges, marked with yellow and purple. [= RAB, C, F, FNA, G, GW, K, L, S, W, X]

A genus of 5 species (one with two varieties), endemic to e. North America. The only other taxon is C. tuberosus var. simpsonii (Chapman) Magrath of s. FL. References: Goldman, Magrath, \& Catling in FNA (2002a); Trapnell, Hamrick, \& Giannasi (2004)=Z. Goldman, van den Berg, \& Griffith (2004)=Y. Key adapted from Goldman, Magrath, \& Catling in FNA (2002a).

Identification notes: The lip is oriented upwards.
1 Petals wider towards the tip than towards the base; lip usually as wide as or wider than long; flowers strongly fragrant . . . . . .
. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. multiflorus

1 Petals equal or narrower towards the tip than towards the base; lip usually narrower than long; flowers scentless or mildly fragrant.
2 Leaf appressed to the inflorescence during flowering; flowers less than 1 cm apart; flowers not fragrant; flowers of each plant opening simultaneously
C. barbatus

2 Leaf not appressed to the inflorescence during flowering; flowers more than 1 cm apart; flowers faintly to distinctly fragrant; flowers of each plant opening nearly simultaneously to sequentially.
3 Lateral sepals \(10-15 \mathrm{~mm}\) long, falcate, widely spreading
C. pallidus

3 Lateral sepals \(15-28 \mathrm{~mm}\) long, weakly falcate to straight.
4 Flowers of each plant opening nearly simultaneously; dilated distal portion of middle lip lobe usually much narrower than long, triangular to broadly rounded; stugma typically flat against column surface; corms elongate, forked.
C. oklahomensis

4 Flowers of each plant opening sequentially; dilated distal portion of midd;e lip lobe usually much wider than long, typically anvil-shaped; stigma at angle to column surface; corms globose to elongate, not forked
C. tuberosus var. tuberosus

Calopogon barbatus (Walter) Ames, Bearded Grass-pink. Cp (GA, NC, SC): savannas, sandhill seeps; rare (NC Watch List, SC Rare). April-early May. A Southeastern Coastal Plain endemic: se. NC south to c. FL and west to e. LA. [= RAB, FNA, GW, K, L, X, Y, Z; = Limodorum parviflorum (Lindley) Nash -- S]

Calopogon multiflorus Lindley, Many-flowered Grass-pink. Cp (GA, NC, SC?): pine savannas, pine flatwoods, pitcher plant bogs; rare (GA Special Concern, NC Rare). May-June. A Southeastern Coastal Plain endemic: FL and e. GA to LA, with disjunct populations in Onslow Co., NC. Reported for SC (Charleston-Berkeley Co. line) (P. McMillan 2000). [= FNA, GW, K, L, X, Y, Z; = Limodorum multiflorum (Lindley) C. Mohr -- S]

Calopogon oklahomensis D.H. Goldman, Oklahoma Grass-pink. Cp (GA, SC): pine savannas; rare. E. SC and MN south to s. GA and e. TX. [= FNA, Y, Z]

Calopogon pallidus Chapman, Pale Grass-pink. Cp (GA, NC, SC, VA): savannas, sandhill seeps; uncommon (VA Rare). May-July. A Southeastern Coastal Plain endemic: se. VA south to FL and west to LA. [= RAB, C, F, FNA, G, GW, K, L, X, Y, Z; = Limodorum pallidum (Chapman) C. Mohr -- S]

Calopogon tuberosus (Linnaeus) Britton, Sterns, \& Poggenburg var. tuberosus, Common Grass-pink. Cp, Mt, Pd (GA, NC, SC, VA): savannas, sandhill seeps, floating peat mats, in the Piedmont and Mountains in bogs; uncommon, rare in Mountains and Piedmont (VA Watch List). April-July. Widespread in e. North America, also in Cuba and the West Indies; var. simpsonii (Chapman) Magrath occurs in FL, Cuba, and the West Indies. [= FNA, K, L, Y, Z; = C. pulchellus R. Brown -- F, G, RAB, X; < C. tuberosus -- C, GW, W, infraspecific taxa not distinguished; = Limodorum tuberosum Linnaeus -- S]

\section*{Cleistes L.C. Richard ex Lindley 1840 (Spreading Pogonia, Rosebud Orchid)}

As traditionally circumscribed, a genus of about 55 species, primarily of tropical America. The circumscription of this genus is uncertain (Cameron \& Chase 1999; Cameron et al. 1999; Pridgeon et al. 1999c); it appears that North American "Cleistes" is not closely related to South American Cleistes (which includes the type of the genus), and either a new genus will need to be named to house our two species, or alternatively, Pogonia, Isotria, and N. American "Cleistes" could be combined into Pogonia (a generic disposition popular many decades ago). References: Catling \& Gregg (1992)=Z; Gregg \& Catling in FNA (2002a); Gregg (1991).

1 Column 13-19 mm long; lip 21-33 (-38.5) mm long, the basal 3/4 of the central keel of the lip with 5-7 discontinuous and irregular ridges; sepals (25-) 30-40 (-44) mm long; petals 20-30 mm long; distance between median leaf and floral bract 3-16 cm ; fresh flowers with strong vanilla scent (Coastal Plain populations) or odorless (Mountain and upper Piedmont populations)

Column 21-25 (-29) mm long; lip (26-) 34-56 mm long, the basal \(3 / 4\) of the central keel of the lip with 1-3 parallel, continuous low ridges; sepals (31-) 40-56 (-65) mm long; petals \(35-50 \mathrm{~mm}\) long; distance between median leaf and floral bract 9-20 cm ; fresh flower with daffodil-like odor
C. divaricata

Cleistes bifaria (Fernald) Catling \& Gregg, Small Spreading Pogonia. Mt (GA, NC, SC, VA), Cp, Pd (GA, NC, SC): savannas, sandhill seeps, moist to fairly dry meadows, dry ridgetops under pines (where seasonally moist); uncommon (GA Special Concern, VA Rare). May-July. The species ranges in the Mountains and Piedmont from WV south through w. VA, e. KY, w. NC, and e. TN to w. SC, n. GA and n. AL, and in the Coastal Plain from se. NC to c. peninsular FL and west to e. LA (Catling \& Gregg 1992). Catling \& Gregg (1992) make a convincing case for the recognition of C. bifaria and C. divaricata as specifically distinct, based on differences in morphology, range, phenology (in the sympatric portions of their ranges), and floral fragrance. The co-occurrence of
the two species at such sites as the Green Swamp, Brunswick County, NC, where phenologically separated, supports their taxonomic status. Where co-occurring, C. bifaria flowers on average about 10 days before C. divaricata. More recent studies (Smith et al. 2004) suggest the probability that montane and Coastal Plain populations of "C. bifaria" represent 2 different species. [= FNA, K, Z; < C. divaricata -- RAB, C, G, GW, K, L, S, W, X, in part only; = C. divaricata var. bifaria Fernald -- F; = Pogonia bifaria (Fernald) P.M. Brown \& Wunderlin]

Cleistes divaricata (Linnaeus) Ames, Large Spreading Pogonia. Cp (GA, NC, SC, VA): pine savannas; uncommon (VA Rare). May-mid June. The species ranges from s. NJ to sw. GA and ne. FL, in the Coastal Plain. [= FNA, K, Z; < C. divaricata -RAB, C, G, GW, K, L, S, W, X, in part only (see also C. bifaria); = C. divaricata var. divaricata -- F; = Pogonia divaricata (Linnaeus) R. Brown]

\section*{Coeloglossum Hartman 1820 (Frog Orchid, Long-bracted Orchid)}

Usually regarded as a monotypic genus, of north temperate regions of the Old and New World. However, Coeloglossum is probably not distinct from Dactylorhiza Neck. ex Nevski; Coeloglossum is the older name, and Dactylorhiza is suggested for nomenclatural conservation (Pridgeon et al. 1997, 1999b; Bateman et al. 1997). The taxonomic and nomenclatural outcome is uncertain. References: Sheviak \& Catling in FNA (2002a); Bateman, Pridgeon, \& Chase (1997)=Z.

Coeloglossum viride (Linnaeus) Hartman var. virescens (Muhlenberg ex Willdenow) Luer, Long-bracted Frog Orchid. Mt (NC, VA): moist woods; uncommon, rare south of VA (NC Rare). April-June. The species is circumboreal; var. virescens is e. Asian and North American, in e. North America south in the Appalachians to NC. It is generally more "southern" than the typic var. viride, which is more completely circumboreal, widespread in n . Eurasia and far northern North America. [= K, L, W; = Habenaria viridis (Linnaeus) R. Brown var. bracteata (Muhlenberg ex Willdenow) Reichenbach ex A. Gray -- RAB, C, F, G, X; < Coeloglossum viride (Linnaeus) Hartman - FNA; = Coeloglossum bracteatum (Muhlenberg ex Willdenow) Parlatore -- S; < Dactylorhiza viridis (Linnaeus) R.M. Bateman, Pridgeon, \& M.W. Chase -- Z]

\section*{Corallorhiza Gagnebin 1755 (Coralroot)}

A genus of about 15 species, distributed in north temperate regions of the Old and New World. The closest relative of Corallorhiza in our flora is Aplectrum (Freudenstein 1992). The mycotrophic nature of Corallorhiza is well established, but the exact means of the transfer of nutrients from the fungal hyphae to the orchid is not yet understood. References: Freudenstein (1992, 1997, 1999)=Z; Magrath \& Freudenstein in FNA (2002a).

1 Lip with two lateral teeth or lobes; lateral sepals spreading to down-curved.
2 Middle lobe of lip expanded slightly or not at all distally, the ratio of the width of the dilated part to the base of the mid-lobe less than 1.5; floral bracts averaging \(0.5-1.0 \mathrm{~mm}\) long . . . . . . . . . . . . . . . . . . . . . . . . . . . C. maculata var. maculata
2 Middle lobe of the lip distinctly expanded, the ratio of the width of the dilated part to the base of the midlobe greater than 1.5; floral bracts averaging 1.0-2.8 (-4.5) mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. maculata var. occidentalis

1 Lip without lateral teeth or lobes (though sometimes erose or minutely toothed near its apex); lateral sepals arching, upcurved, or forward-directed.
3 Sepals and petals \(5-7.5 \mathrm{~mm}\) long; dorsal sepal more than 4.5 mm long, 3-nerved; flowering April-July. 4 Lip with prominent, thickened, involute margins; flowering mid to late July . . . . . . . . . . . . . . . . . . . . . . . . C. bentleyi 4 Lip planar; flowering April-May . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. wisteriana
3 Sepals and petals \(3-4.5 \mathrm{~mm}\) long; dorsal sepal less than 4.5 mm long, 1 -nerved; flowering August-October.
5 Perianth closed or nearly so (cleistogamous); lip 1.7-2.2 mm wide, straight; column lacking or with only poorly developed basal ventral auricles; stigma 0.2-0.5 mm wide . . . . . . . . . . . . . . C. odontorhiza [cleistogamous form]
5 Perianth open (chasmogamous); lip 2.1-3.7 mm wide, bent downwards at a nearly right angle; column with 2 prominent auricles at the base on the ventral surface; stigma \(0.7-1.0 \mathrm{~mm}\) wide
C. odontorhiza [chasmogamous form]

Corallorhiza bentleyi Freudenstein. Mt (VA): \{habitat\}; rare. This species is known from Morgan County, WV and Giles County, VA. The species was recently named and was known (at the time of publication) from only a single population (Freudenstein 1999). It has since been found in VA. It is most closely related to C. striata Lindley. [= FNA, Z]

Corallorhiza maculata (Rafinesque) Rafinesque var. maculata, Eastern Spotted Coralroot. Mt (GA, NC, VA): moist forests, northern hardwood forests; uncommon (GA Special Concern). July-August. Var. maculata is irregularly distributed in much of North America, primarily northern, from Newfoundland Québec, and MN south to PA, OH, and IN, and south in the Appalachians to ne. GA, in the west from British Columbia south to s. CA, s. AZ, and s. NM. Var. mexicana (Lindley) Freudenstein ined. is restricted to Mexico. [= FNA, Z; < C. maculata -- RAB, C, F, G, K, L, S, W, X, infraspecific taxa not distinguished]

Corallorhiza maculata (Rafinesque) Rafinesque var. occidentalis (Lindley) Ames, Western Spotted Coralroot. Mt (VA): forests; rare (VA Rare). May-July. Var. occidentalis (Lindley) Ames has a distribution similar to var. maculata, except that in the east it ranges south only to PA, s. Ontario, and WI, with disjunct populations in e. WV (Pocahontas County; Morton et al. 2004) and VA. [= FNA, Z; < C. maculata -- RAB, C, F, G, K, L, S, W, X, infraspecific taxa not distinguished]

Corallorhiza odontorhiza (Willdenow) Poiret, Autumn Coralroot. Mt, Pd, Cp (GA, NC, SC, VA): forests; uncommon. AugustOctober. The cleistogamous form is the more common, and is widespread in e. North America, from ME, NY, s. Ontario, MI, and MN south to SC, c. GA, c. AL, n. MS, c. AR, and e. OK. The chasmogamous form is less common, and is scattered in ne. United

States and adjacent Canada, in Ontario, CT, PA, MI, IA, IN, DC, NC, and TN, and in Mexico (Chiapas, Distrito Federal, Guerrero, Hidalgo, Jalisco, México, Michoacán, Morelos, Oaxaca, Puebla, Sonora), Guatemala, and Nicaragua. It may be recognized as a variety; see synonymy. [=RAB, C, F, G, L, S, W, X; >C. odontorhiza var. pringlei (Greenman) Freudenstein -- FNA, K, Z; >C. odontorhiza var. odontorhiza - FNA, K, Z; > C. pringlei Greenman]

Corallorhiza wisteriana Conrad, Spring Coralroot. Mt, Pd, Cp (GA, NC, SC, VA): moist forests; rare (NC Watch List). AprilMay. Widespread in e. North America, from NJ, PA, OH, IN, IL, MO, and OK south to FL, and TX, and also in the Rockies from MT and \(w\). SD south to \(s\). Mexico. [= RAB, C, F, FNA, G, K, L, S, W, X, Z]

Corallorhiza trifida Chatelain, south to DC \{specimen at NCU\}, MD, WV, PA, and NJ (Magrath \& Freudenstein in FNA 2002, Kartesz 1999). [= FNA, K] \{not yet keyed; add synonymy\}

\section*{Cypripedium Linnaeus 1753 (Lady's-slipper)}

A genus of about 40-50 species, north temperate in distribution. References: Sheviak (1994)=Z; Case et al. (1998); Wallace \& Case (2000) \(=\) Y; Sheviak in FNA (2002a); Pridgeon et al. (1999c). Key to yellow-flowered species adapted from Sheviak (1994).

1 Plant scapose, with 2 basal leaves; pouch-like lip of flower with a longitudinal fissure, pink (rarely nearly white); [section Acaulia].
C. acaule

1 Plant caulescent, with (2) 3-7 leaves alternate on the stem; pouch-like lip of flower with a rounded orifice, yellow or pink (rarely white).
2 Pouch-like lip of flower pink and white (rarely all white); lateral petals and dorsal sepal white, not twisted, obtuse to acute; [section Obtusipetala] C. reginae

2 Pouch-like lip of flower yellow or white; lateral petals and dorsal sepal brown, purplish brown, or yellow, slightly to strongly twisted, acuminate-attenuate; [section Cypripedium].
3 Pouch-like lip of flower white, \(1.5-2.5 \mathrm{~cm}\) long; orifice margin acute on the apical margin; [of calcareous barrens] ... C. candidum

3 Pouch-like lip of flower bright yellow, pale yellow, or rarely white, (2.0-) 2.2-6.3 cm long (if pale yellow or white, then > 4 cm long); orifice margin rounded-octuse on the apical margin; [of various habitats].
4 Dorsal sepal 3.5-5.0 cm wide; pouch orifice 2.7-4.5 cm long; pouch-like lip 4.5-6.3 cm long, pale yellow or creamy white; plants robust, typically \(5-8 \mathrm{dm}\) tall . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. kentuckiense
4 Dorsal sepal \(1.5-2.9 \mathrm{~cm}\) wide; pouch orifice \(0.5-1.3 \mathrm{~cm}\) long; pouch-like lip (2.0-) 2.2-5.8 cm long, medium to rich yellow; plants not as robust, typically 2-5 (-6) dm tall.
5 Outer surface of uppermost sheathing bract glabrous or sparsely or inconspicuously pubescent when young; pouch-like lip \(15-29 \mathrm{~mm}\) long; flower scent intense and sweet .... [C. parviflorum var. makasin] 5 Outer surface of uppermost sheathing bract densely and conspicuously silvery-pubescent when young, or rarely glabrescent; pouch-like lip \(2.0-5.4 \mathrm{~cm}\) long; flower scent moderate to faint, rose-like or pungentmusty.
6 Pouch-like lip 2.2-3.4 cm long; sepals and lateral petals usually densely and minutely spotted with dark reddish brown or purple, thus appearing uniformly dark . . . . . C. parviflorum var. parviflorum
6 Pouch-like lip (2.0-) 3.0-5.8 cm long; sepals and lateral petals unmarked (greenish-yellow), or more often streaked, blotched, striped or reticulately marked with dark reddish brown or purple (but generally not extensively blotched)
C. parviflorum var. pubescens

Cypripedium acaule Aiton, Pink Lady's-slipper, Moccasin-flower. Pd, Mt (GA, NC, SC, VA), Cp (NC, SC, VA): dry to mesic, acid forests and woodlands, often under pine or other conifers; common. April-July. Newfoundland west to n. Alberta, south to NC, SC, TN, n. IN, and MN. [= RAB, C, F, FNA, G, K, L, W, X; = Fissipes acaulis (Aiton) Small -- S]

Cypripedium candidum Muhlenberg ex Willdenow, White Lady's-slipper. Mt (VA): calcareous barrens; rare (VA Rare). NY and NJ west to ND, south to w. VA and MO. [= C, F, FNA, G, K, L, X]

Cypripedium kentuckiense C.F. Reed, Kentucky Yellow Lady's-slipper. Cp (GA, VA): sandy ravine bottoms and springhead seeps along small streams; rare (GA Special Concern, VA Rare). First reported for our area by Weldy et al. (1996). C. kentuckiense C.F. Reed is similar to C. parviflorum var. pubescens and, in addition to the site discovered in e. VA, reaches e. TN (Franklin and Scott counties, Cumberland Plateau) and e. KY. Case et al. (1998) studied isozymes of C. kentuckiense and related Cypripedium spp.; the recognition of \(C\). kentuckiense as a species was supported. [= C, FNA, K, Y, Z; often included in a broad concept of \(C\). calceolus, C. pubescens, or \(C\). calceolus var. pubescens by most earlier authors]

Cypripedium parviflorum Salisbury var. parviflorum, Small Yellow Lady's-slipper. Mt (GA, NC, VA): mesic forests, seepy forests over amphibolite, other habitats; rare (NC Watch List). April-June. Rather widespread in North America, south in the east to NC and GA. The exact range, abundance, and habitats of this variety in our area are obscure, because of confusion with the more northern var. makasin (Farwell) Sheviak and small-flowered forms of var. pubescens. See Sheviak (1994) for a discussion of why North American plants of yellow lady's-slippers are recognized as a species distinct from the European C. calceolus Linnaeus. [= FNA, \(\mathrm{Y}, \mathrm{Z} ;<\mathrm{C}\). calceolus Linnaeus var. pubescens -- RAB, \(\mathrm{G}, \mathrm{X}\), in part; = C. parviflorum -- K, S , in the narrow sense; \(=C\). calceolus var. parviflorum (Salisbury) Fernald -- C, F, L, W]

Cypripedium parviflorum Salisbury var. pubescens (Willdenow) Knight, Large Yellow Lady's-slipper. Mt (GA, NC, SC, VA), Pd (GA, NC, SC, VA), Cp (VA): rich mesic forests; uncommon (NC Watch List, SC Rare). April-June. Widespread in e. North America. [= FNA, Y, Z; < C. calceolus Linnaeus var. pubescens (Willdenow) Correll -- RAB, G, X, in part only (also see C. parviflorum var. parviflorum); = C. pubescens Willdenow -- K, S; = C. calceolus var. pubescens (Willdenow) Correll -- C, F, L, W]

Cypripedium reginae Walter, Showy Lady's-slipper, Queen Lady's-slipper. Mt (GA?, NC*, VA): over circumneutral to basic rocks, or (allegedly) in mossy wet forests under Rhododendron; rare (NC Watch List, VA Rare). May-June. Widespread in ne. North America, south to NC (?), GA, TN, and AR. The native occurrence of this species in NC is questionable; the only definite specimen from the state is from an implausible habitat for the species (highly acid humus under rhododendron). [= RAB, C, F, FNA, G, K, L, S, W, X]

Cypripedium parviflorum Salisbury var. makasin (Farwell) Sheviak ranges south to PA and NJ (Kartesz 1999). Var. makasin is the northern, small-flowered plant, characteristically of calcareous fens, often confused with var. parviflorum. It may reach our area. [ \(=\mathrm{K}, \mathrm{Y}, \mathrm{Z}\) ]

Epidendrum Linnaeus 1759 (Green-fly Orchid)
A genus of about 1000 species, of tropical (and rarely subtropical) America. References: Hágsater in FNA (2002a).
Epidendrum magnoliae Muhlenberg, Green-fly Orchid. Cp (GA, NC, SC): epiphytic on limbs of trees, especially Taxodium, in blackwater river swamps, usually on relatively horizontal limbs mixed with Pleopeltis polypodioides, also rarely in crevices of Altamaha Grit outcrops; uncommon (NC Rare, SC Rare). July-October. The northernmost epiphytic orchid: se. NC south to FL and west to LA; also in ne. Mexico. It is locally rather common, but rarely seen as it occurs in blackwater swamps, on upper limbs of Taxodium, Nyssa, and other trees, mixed with Pleopeltis. See Correll (1936) for additional discussion of this species at its northern limit. Hágsater (2000) indicates that E. magnoliae Muhlenberg has nomenclatural priority over E. conopseum R. Brown. [= FNA; = E. conopseum Aiton f. - RAB, \(\mathrm{L}, \mathrm{X}\); >E. conopseum var. conopseum -K ; = Amphiglottis conopsea (Aiton filius) Small -- S]

Epipactis Zinn 1757 (Helleborine)
A genus of about 25 species, of w. North America, Eurasia, and n. Africa (Brown \& Argus in FNA 2002). References: Brown \& Argus in FNA (2002a).

Epipactis helleborine (Linnaeus) Crantz, Broad-leaved Helleborine. Mt (GA, NC, VA): forests; rare, introduced from Europe. June-September. This species has been collected a handful of times in various parts of the mountains, some of the colonies dating back to the early 1960's; it has become common in ne. United States and se. Canada. [= C, F, FNA, K, L, X; = E. latifolia (Linnaeus) Allioni -- G]

Eulophia R. Brown ex Lindley 1823
(also see Pteroglossaspis)
A genus of about 215 species, pantropical (Romero-González in FNA 2002). References: Romero-González in FNA (2002a).
Eulophia alta (Linnaeus) Fawcett \& Rendle, Wild Coco. Cp (GA): flatwoods, swamps; rare. S. GA south through the FL peninsula into the West Indies, Mexico, Central America, and South America. [= FNA, GW, K; = Platypus altus (Linnaeus) Small S]

Galearis Rafinesque 1833 (Showy Orchis)
A genus of 3-6 species, of e. North America and e. Asia. References: Sheviak \& Catling in FNA (2002a); Pridgeon et al. (1999b).
Galearis spectabilis (Linnaeus) Rafinesque, Showy Orchis. Mt (GA, NC, SC, VA), Pd (NC, VA), Cp (VA): rich, deciduous forests, most typically over calcareous or mafic rocks; common (SC Rare). April-July. New Brunswick and Québec west to MN, south to GA and AR. [= FNA, K, L, W; = Orchis spectabilis Linnaeus -- RAB, C, F, G, X; = Galeorchis spectabilis (Linnaeus) Rydberg -- S]

Goodyera R. Brown 1813 (Rattlesnake Orchid)
A genus of about 55-100 species, widespread in distribution but primarily Northern Hemisphere. References: Kallunki in FNA (2002a); Pridgeon et al. (1999c).

1 Leaves dark green, the upper surface variegated with pale green, the midrib only irregularly and narrowly pale green, most of the network of pale green variegations broad ( \(0.5-1 \mathrm{~mm}\) wide), with a dark green center line (thus the variegations appearing double), the outlines of the variegations finely and irregularly toothed; inflorescence secund, primarily one-sided, or loosely spiraled. \(\qquad\) G. repens

1 Leaves blue-green, the upper surface variegated with white, the midrib broadly whitened (1-3 mm wide), the remainder of the network of white variegations narrow (less than 0.5 mm wide), generally lacking any internal variation in color, the outlines of

Goodyera pubescens (Willdenow) R. Brown, Downy Rattlesnake-orchid. Mt, Pd, Cp (GA, NC, SC, VA): dry to moist forests and woodlands; common. June-August. New Brunswick west to Ontario and MN, south to panhandle FL, MS, and AR. One of the commonest of orchids in much of its range. [= RAB, C, F, FNA, G, K, L, W, X; = Peramium pubescens (Willdenow) MacM. -- S]

Goodyera repens (Linnaeus) R. Brown, Lesser Rattlesnake-orchid. Mt (NC, SC, VA): moist forests, usually under conifers and rhododendrons; uncommon (NC Watch List, VA Watch List). June-September. A circumboreal species of northern North America and Eurasia, this species reaching its southern limit in e. North America in NC and SC. [= FNA, K, L, W; > Goodyera repens var. ophioides Fernald -- RAB, C, F, G, X; > Peramium ophioides (Fernald) Rydberg -- S]

Goodyera tesselata Loddiges, Checkered Rattlesnake-plantain, south to MD, PA, and NJ (Kallunki in FNA 2002, Kartesz 1999). [= FNA, K] \{not yet keyed; add synonymy\}

\section*{Habenaria Willdenow 1805 (Longspur Orchid, Habenaria) (also see Coeloglossum, Platanthera)}

A genus of about 600 species, tropical and subtropical in the Old World and New World. References: Sheviak in FNA (2002a); Pridgeon et al. (1999b).
```

1 Spur 4-10 cm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . H. quinqueseta
1 Spur 0.4-1.4 cm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . H. repens

```

Habenaria quinqueseta (Michaux) A. Eaton, Long-horned Habenaria. Cp (GA, SC): pine flatwoods, pinelands, Altamaha Grit outcrops, rarely in swamps; rare (GA Special Concern, SC Rare). August-October. H. quinqueseta (in the narrow sense) ranges from SC south to \(s\). FL, west to se. TX. The related \(H\). macroceratitis Willdenow, differing in its spur 12-18 cm long (vs. 4-10 cm) occurs in peninsular FL; also in the West Indies, Mexico, Central America, and n. South America. [= FNA, K; = H. quinqueseta var. quinqueseta \(-\mathrm{L} ;<\mathrm{H}\). quinqueseta -- RAB, GW, S, X, in a broad sense (including \(H\). macroceratitis)]

Habenaria repens Nuttall, Water-spider Orchid, Floating Orchid. Cp (GA, NC, SC, VA?): blackwater swamps, pools, banks of creeks and rivers; rare (NC Watch List, VA Rare). April-November. NC south to FL and west to TX; West Indies, Mexico, Central America, and n. South America. Reported from se. VA. [= RAB, FNA, GW, K, L, S, X]

\section*{Hexalectris Rafinesque 1825 (Crested Coralroot)}

A genus of about 7 species, mycotrophic, of s. North America. References: Catling \& Engel (1993)=Z; Catling (2004)=Y; Goldman, Coleman, Magrath, \& Catling in FNA (2002a).

Hexalectris spicata (Walter) Barnhart var. spicata, Crested Coralroot, Brunetta. Pd, Mt, Cp (GA, NC, SC, VA): dry forests and woodlands, especially over mafic or calcareous rocks, such as diabase, gabbro, calcareous siltstone, and dolomite (though sometimes in distinctly acid situations); rare (NC Rare, VA Watch List). July-August. Var. spicata is widespread in se. North America, ranging from MD, OH, and MO south to FL, TX, and Mexico. Var. arizonica (S. Watson) Catling \& Engel, an autopollinating relative, is distributed from e. TX west to \(A Z\), south into Mexico. The yellow and purple flowers borne on a brown stem present a very peculiar color combination. The genus is primarily Mexican. [= FNA, Y, Z; < H. spicata -- RAB, C, F, G, K, L, S, W, X, infraspecific taxa not distinguished]

Isotria Rafinesque 1808 (Whorled Pogonia, Five-leaves, Fiveleaf Orchid)
A genus of 2 species, of e. North America. Cameron \& Chase (1999) indicate that Isotria should perhaps be included in a more broadly circumscribed Pogonia (as was often done prior to 1922). References: Mehrhoff \& Homoya in FNA (2002a).

Identification notes: Sterile Isotria is sometimes confused with Medeola. Medeola has a wiry-textured stem, with floccose hairiness, at least towards the base. Isotria has a fleshier stem lacking hairs.

1 Sepals 12-30 mm long, greenish-brown; lip 10-15 mm long; pedicel of fruit (0-) 5-10 (-15) mm long; plant glaucous, the stem whitish-green
I. medeoloides

1 Sepals 35-60 mm long, purple-brown; lip 20-25 mm long; pedicel of fruit (12-) 20-55 mm long; plant scarcely glaucous (if at all), the stem generally purplish
I. verticillata

Isotria medeoloides (Pursh) Rafinesque, Small Whorled Pogonia, Little Five-leaves. Mt (GA, NC, SC), Pd (NC, VA), Cp (NC): moist forests, in the mountains and upper Piedmont usually with Pinus strobus; rare (US Endangered, GA Threatened, NC Endangered, SC Rare, VA Endangered). May-June. Widespread (but very local) in ne. North America, from s. ME and MI south to c. and e. WV, w. VA, w. NC, e. TN, and n. GA. The reproductive biology of this species was studied by Vitt \& Campbell (1997). Van Alstine et al. (1996) discuss the habitats of known occurrences in Virginia. [= RAB, C, F, FNA, G, K, L, W, X; = I. affinis (C.F. Austin) Rydberg -- S; = Pogonia affinis C.F. Austin]

Isotria verticillata (Muhlenberg ex Willdenow) Rafinesque, Large Whorled Pogonia, Larger Five-leaves. Mt, Pd, Cp (GA, NC, SC, VA): moist to dry forests; common (uncommon in GA, SC, NC). April-July. Widespread in e. North America, from ME and MI south to panhandle FL and e. TX. [= RAB, C, F, FNA, G, K, L, S, W, X; = Pogonia verticillata (Muhlenberg ex Willdenow) Nuttall]

\section*{Liparis L.C. Richard 1817 (Wide-lip Orchid, Twayblade)}

A genus of about 250-350 species, cosmopolitan. Regerences: Magrath in FNA (2002a).
1 Lip (8-) 10-12 mm long, pale purple; pedicels 11-18 mm long, equal to or longer than the capsule . .............. L. Iiliifolia
1 Lip 4-5.5 mm long, yellowish-green; pedicels 3-7 mm long, shorter than the capsule . . . . . . . . . . . . . . . . . . . . . . . L. loeselii
Liparis Iiliifolia (Linnaeus) L.C. Richard ex Ker-Gawler, Large Twayblade, Mauve Sleekwort, Russet-witch, Brown Wide-lip Orchid. Mt (GA, NC, SC, VA), Pd (GA, NC, VA), Cp (NC, VA): moist forests, floodplains; uncommon (SC Rare). May-July. VT and Ontario west to MN, south to GA and AR; also in China. [= RAB, C, F, FNA, G, GW, K, L, S, W, X]

Liparis loeselii (Linnaeus) L.C. Richard, Fen Orchid, Loesel's Twayblade, Bog Twayblade, Yellow Wide-lip Orchid. Mt (NC, VA), Cp (NC, VA), Pd (VA): seepages at moderate to high elevations in the mountains, mucky bay swamps (dominated by Persea palustris and Magnolia virginiana) at about sea level on the Outer Banks, and other moist, seepy habitats, especially over mafic or calcareous rocks; rare (NC Rare, VA Rare). May-July. Nova Scotia and Québec west to Mackenzie and British Columbia, south to ne. NC, sw. NC, AL, AR, KS, NE, and WA. [= RAB, C, F, FNA, G, GW, K, L, S, W, X]

\section*{Listera R. Brown 1813 (Twayblade)}

A genus of about 25 species, boreal, north temperate, and south temperate (Magrath \& Coleman in FNA 2002). References: Magrath \& Coleman in FNA (2002a).

1 Lip usually cleft about one-third its length, the two lobes oblong, with rounded apices . . . . . . . . . . . . . . . . . . . . . . . . L. smallii 1 Lip usually cleft about two-thirds its length, the two lobes linear, with acute apices.

2 Lip 6-10 mm long, lacking prominent teeth near the base (but with 2 vertically-oriented lobes); pedicels and raceme axis glandular-puberulent; sepals and petals 1-2 mm long..
L. australis

2 Lip 3-5 mm long, with 2 prominent teeth near the base, these diverging horizontally; pedicels and raceme axis glabrous; sepals and petals 1-5-3 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . L. cordata var. cordata

Listera australis Lindley, Southern Twayblade. Cp (GA, NC, SC, VA), Pd (GA), Mt (NC): swamps, second terraces in floodplain forests, wet woods under Rhododendron maximum; uncommon (GA Special Concern, NC Watch List, SC Rare). MarchJuly. Mainly a Southeastern Coastal Plain species, from NJ south to FL and west to e. TX, but also scattered north into VT and s. Canada. [= RAB, C, F, FNA, G, GW, K, L, W, X; = Ophrys australis (Lindley) House -- S]

Listera cordata (Linnaeus) R. Brown var. cordata, Heartleaf Twayblade, Lesser Twayblade. Mt (NC): habitat not known; rare (NC Watch List). June-July. A widespread circumboreal species of \(n\). Eurasia and \(n\). North America, south to NC (at least formerly, not seen in this century). Var. cordata is widespread in ne. United States and widespread in Canada; var. nephrophylla (Rydberg) Hultén is widespread in nw. North America. [= FNA, K, L; <L. cordata -- RAB, C, F, G, W, X, infraspecific taxa not distinguished]

Listera smallii Wiegand, Appalachian Twayblade, Small's Twayblade, Kidneyleaf Twayblade. Mt (GA, NC, SC, VA): shaded swamps, wet slopes, nearly always beneath Rhododendron maximum; uncommon (GA Special Concern, SC Rare, VA Watch List). June-July. A Southern and Central Appalachian endemic: s. PA south to nw. SC and ne. GA. [= RAB, C, FNA, G, GW, K, L, W, X; = Ophrys smallii (Wiegand) House -- S]

Listera convallarioides (Swartz) Nuttall was attributed to NC by Correll (1950); this record is almost certainly an error. \{not keyed \(\}\)

\section*{Malaxis Solander ex Swartz 1788 (Adder's-mouth)fYucca}

A genus of about 250-300 species, nearly cosmopolitan. References: Catling (1991)=Z; Catling \& Magrath in FNA (2002a). Key adapted from Catling (1991).

1 Leaves 2-5; lip oriented upwards, erect, entire, obtuse to acuminate . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . M. spicata
1 Leaf solitary; lip oriented downwards, deflexed, 3-lobed (the central lobe smaller than the 2 lateral lobes).
2 Lip pointed, acuminate, lacking lateral lobes
2 Lip bifid, with 2 well-developed lateral lobes on either side of a smaller central lobe.
3 Pedicels (4-) 5-10 (-13) mm long (and more than 5 mm long in plants with inflorescences over 45 mm long); basal lobes of the lip not prominent, \(0.4-1.1 \mathrm{~mm}\) long, mostly less than \(1.5 \times\) as long as the apical lateral lobes and less than \(0.6 \times\) as long as the length from the base to the tip of the mid-lobe; inflorescences densely flowered above, the lower flowers soon withering . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . M. unifolia
3 Pedicels 3-5 (-5.8) mm long (even in plants with inflorescences over 80 mm long); basal lobes of the lip prominent,
0.75-1.1 mm long, usually \(1.5-2(-2.5) \times\) as long as the apical lateral lobes and 0.6 or more \(\times\) as long as the length from the base to the tip of the mid-lobe; inflorescences loosely flowered above, the lower flowers withering slowly
M. bayardii

Malaxis bayardii Fernald, Appalachian Adder's-mouth. Mt (NC, VA), Pd (NC, SC), Cp (SC, VA): dry, open, upland forests, shale barrens; rare (NC Rare, VA Watch List). July-September. S. NY and se. MA south through CT, RI, NJ, PA, and VA to w. and c. NC, mostly in the mountains (but somewhat disjunct on the Coastal Plain of VA). See Catling (1991) for further discussion of the distinction of \(M\) bayardii from M. unifolia. [= F, FNA, K, Z; < M. unifolia -- RAB, C, G, GW, L, S, W, X, in part]

Malaxis spicata Swartz, Florida Adder's-mouth. Cp (GA, NC, SC, VA): maritime swamp forests, calcareous but mucky swamps in the outer Coastal Plain, spring-fed swamps, wet hammocks; rare (GA Special Concern, NC Rare, VA Rare). JulyAugust. Se. VA south to FL; n. West Indies. [= RAB, C, FNA, G, GW, K, L, S, X; M. floridana (Chapman) Kuntze -- F]

Malaxis unifolia Michaux, Green Adder's-mouth. Cp, Mt, Pd (GA, NC, SC, VA): bogs, moist forested slopes, in the Sandhills in longleaf-oak-hickory forests; uncommon (rare in Piedmont and Coastal Plain). June-August. Newfoundland and FL west to MN, IA, MO, e. OK, and e. TX; also in Mexico, Cuba, the West Indies, and Central America. [= F, FNA, K, Z; < M. unifolia -- RAB, C, G, GW, L, S, W, X, in part only (also see M. bayardii)]

Malaxis brachypoda (A. Gray) Fernald, White Malaxis, ranges as far south as sc. PA (Rhoads \& Klein 1993) and NJ (Kartesz 1999), in moist forests and bogs; it is additionally reported by \(F\) to range south to the Mountains of TN, the documentation unknown. [ \(=\mathrm{F}, \mathrm{K}\); = M. monophyllos (Linnaeus) Swartz var. brachypoda (A. Gray) Morris \& Eames -- C, FNA, G, L, X; = M. monophyllos (Linnaeus) Swartz ssp. brachypoda (A. Gray) Á. \& D. Löve]

\section*{Platanthera L.C. Richard 1817 (Fringed Orchid, Fringeless Orchid)}

A genus of about 200 species, largely of the temperate northern hemisphere, extending south into tropical Central America and tropical se. Asia. References: Sheviak in FNA (2002a); Reddoch \& Reddoch (1993); Pridgeon et al. (1999b).

Identification Notes: hybrids are frequent and are not keyed; they are generally intermediate in characters and are found in mixed populations of the two parents. Further information follows the species accounts.

1 Lip entire, finely toothed, or eroded (neither fringed nor deeply divided into 3 lobes).
2 Leaves basal, 1 or 2, orbicular, (5-) \(8-25 \mathrm{~cm}\) wide, prostrate on the ground, the stem naked or with a few bladeless bracts. 3 Stem bractless .
[P. hookeri] 3 Stem with bracts.

4 Corolla spur 28-47 mm long; hemipollinarium 4.6-6.8 mm long; seeds (0.72-) 0.76-0.97 mm long [P. macrophylla]

2 Leaves cauline, 1-10 or more, mostly lanceolate, 1-5 cm wide, ascending, the stem with at least 1 (usually several) bladed leaves.
5 Lip 11-15 mm long; spur mostly \(40-50 \mathrm{~mm}\) long
P. integrilabia

5 Lip 2-8 mm long; spur 4-23 mm long.
\(6 \quad\) Flowers green, greenish-white, yellowish-green, yellowish-white, or dull-white.
7 Larger stem leaves usually 1 , rarely 2 , near the middle of the stem; raceme 2-9 cm long, 2-3.5 cm in diameter; lip without a tubercle on the upper surface near the base, also lacking lateral auricles near the base
P. clavellata

7 Larger stem leaves usually \(2(-5)\), near the middle of the stem or towards its base; raceme \(5-20 \mathrm{~cm}\) long, \(1.2-2 \mathrm{~cm}\) in diameter; lip with a tubercle on the upper surface near the base, also usually with 2 lateral auricles.
8 Most bracts of the inflorescence shorter than the flowers they subtend (the lowermost few exceeding the flowers); flowers sparsely distributed; lip orbicular, 1-1.5× as long as broad, yellowish-green P. flava var. flava

8 Most bracts of the inflorescence exceeding the flowers they subtend (the uppermost few sometimes shorter than the flowers); flowers densely distributed; lip oblong, 2-3x as long as broad, green
P. flava var. herbiola \(6 \quad\) Flowers golden-yellow or bright-white.

9 Flowers golden-yellow; spur 4-8 mm long; lip minutely crenulate, directed downwards . . . . . . . . P. integra 9 Flowers bright-white; spur 11-23 mm long; lip entire, directed upwards . . . . . . . . . . . . . . . . . . . P. nivea
1 Lip either fringed, deeply divided into 3 lobes, or both.
10 Lip not deeply divided into 3 lobes, deeply fringed; flowers white, yellow, orange.
11 Flowers white; spur \(15-50 \mathrm{~mm}\) long.
12 Spur 15-26 mm long, ca. \(1 \times\) as long as the ovary; lip narrowed to a very short isthmus (between the base an dthe fringed portion) . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. blephariglottis var. blephariglottis
12 Spur 30-50 mm long, ca. \(2 \times\) as long as the ovary; lip narrowed to an extended isthmus
P. blephariglottis var. conspicua

11 Flowers yellow to orange; spur 5-33 mm long.
13 Spur 20-33 mm long, exceeding the 12-27 mm long ovary; undivided portion of lip 8-12 mm long ... P. ciliaris

13 Spur 4-17 mm long, equal to or shorter than the ovary; undivided portion of lip 4-6 mm long.
14 Spur 4-10 mm long, shorter than the 7-13 mm long ovary; spur orifice keyhole-shaped or triangular .... P. cristata

14 Spur 8-17 mm long, about as long as the \(10-19 \mathrm{~mm}\) long ovary; spur orifice circular . ...... P. chapmanii
10 Lip deeply divided into 3 lobes, the lobes deeply fringed, shallowly fringed, eroded, or entire; flowers purple or greenishwhite or yellowish-white.
15 Lateral lobes of lip deeply fringed (nearly or entirely to the point of junction with the central lobe of the lip); flowers greenish-white or yellowish-white.
16 Perianth greenish-white; lateral petals linear-spatulate, less than 2 mm wide, blunt, entire to inconspicuously crenulate; lateral sepals deflexed . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. Iacera
16 Perianth white or cream; lateral petals cuneate to broadly obovate, 4-12 mm wide, toothed; lateral sepals divergent
P. leucophaea

13 Lateral lobes of lip entire, eroded, or shallowly fringed (generally no more than half way from the apex to the point of junction with the central lobe of the lip); flowers purple (or rarely white in albino forms).
17 Lobes of lip eroded or entire, few (if any) of the segments more than 1 mm long
P. peramoena

17 Lobes of lip shallowly fringed, most or all of the segments more than 1 mm long.
18 Lobes of lip fringed from a third to a half of the way to the base of the lobes; opening to nectary widely rounded (the pollen sacs spread widely apart); spur 20-26 mm long . . . . . . . . . . . . . . . . P. grandiflora
18 Lobes of the lip fringed less than a third of the way to the base of the lobes; opening to nectary dumbbell-shaped (the pollen sacs close together); spur \(12-20 \mathrm{~mm}\) long
P. psycodes

Platanthera blephariglottis (Willdenow) Lindley var. blephariglottis, Small White Fringed Orchid. Cp (GA, NC, SC, VA): seepages, sandhill-pocosin ecotones; uncommon (GA Special Concern). July-September. Newfoundland west to MI, south to GA. [= FNA, K, L; < Habenaria blephariglottis (Willdenow) Hooker var. blephariglottis -- RAB, X, in part; Habenaria blephariglottis var. blephariglottis -- F, in part only (possibly misapplied); < Habenaria blephariglottis -- GW, infraspecific taxa not distinguished; Blephariglottis blephariglottis (Willdenow) Rydberg -- S, in part only (possibly misapplied); < Platanthera blephariglottis (Willdenow) Lindley -- W, infraspecific taxa not distinguished; = Platanthera blephariglottis]

Platanthera blephariglottis (Willdenow) Lindley var. conspicua (Nash) Luer, Large White Fringed Orchid. Cp (GA, NC, SC): savannas, seepages, sandhill-pocosin ecotones; uncommon (but locally abundant) (GA Special Concern, VA Rare). JulySeptember. NC south to FL, west to TX. Previous studies (such as Hardin 1961) used different characters, and interpreted the infraspecific taxa differently. [= FNA, K, L; < Habenaria blephariglottis (Willdenow) Hooker var. blephariglottis -- RAB, X, in part only; Habenaria blephariglottis var. conspicua (Nash) Ames -- C, F; < Habenaria blephariglottis -- GW, infraspecific taxa not distinguished; Blephariglottis conspicua (Nash) Small -- S, in part (also see Platanthera integrilabia); Blephariglottis blephariglottis (Willdenow) Rydberg -- S, in part only (possibly misapplied); Platanthera conspicua (Nash) P.M. Brown]

Platanthera chapmanii (Small) Luer, Chapman's Orange-fringed Orchid. Cp (GA): pine savannas; rare (GA Special Concern). S. GA and n. FL; e. TX. Previously generally confused with the hybrid between \(P\). ciliaris \(\times\) cristata ( \(P\). \(\times\) chapmanii). See Folsom (1984) and Brown (2004). [= FNA, K; = Blephariglottis chapmanii Small - S] \{add synonymy\}

Platanthera ciliaris (Linnaeus) Lindley, Yellow Fringed Orchid. Cp, Mt, Pd (GA, NC, SC, VA): savannas, moist roadbanks, meadows, pastures; common (rare in Piedmont). July-September. Widespread in e. North America, P. ciliaris is probably our most common and least habitat-specific Platanthera. [= FNA, K, L, W; = Habenaria ciliaris (Linnaeus) R. Brown -- RAB, C, F, G, GW, X; = Blephariglottis ciliaris (Linnaeus) Rydberg -- S]

Platanthera clavellata (Michaux) Luer, Small Green Wood Orchid. Mt, Pd, Cp (GA, NC, SC, VA): seepages, bogs, swamps, other wet places; common (uncommon in Piedmont). June-September. Widespread in e. North America. [= FNA, K, L, W; = Habenaria clavellata (Michaux) Sprengel -- C, G, GW, X; > Habenaria clavellata var. wrightii Olive -- RAB; > Habenaria clavellata (Michaux) Sprengel var. clavellata -- RAB, F; = Gymnadeniopsis clavellata (Michaux) Rydberg -- S]

Platanthera cristata (Michaux) Lindley, Crested Fringed Orchid, Golden Fringed Orchid. Cp (GA, NC, SC, VA), Mt (NC, SC, VA): savannas, bogs, moist roadsides; uncommon (rare in Mountains). June-September. P. cristata is more limited to the Coastal Plain than the related \(P\). ciliaris, ranging from s. MA south to FL and west to TX, and also inland in KY, TN, AR, SC, and NC. [= FNA, K, L, W; = Habenaria cristata (Michaux) R. Brown -- RAB, C, F, G, GW, X; = Blephariglottis cristata (Michaux) Rafinesque -- S]

Platanthera flava (Linnaeus) Lindley var. flava, Southern Rein Orchid, Southern Gypsy-spike. Cp, Pd (GA, NC, SC, VA): shaded wet places, such as swampy forests; uncommon (rare in Piedmont) (VA Watch List). March-September. Var. flava has a scattered range in se. and sc. United States, primarily (but not solely) on the Coastal Plain, north to MD and IL; remarkably disjunct in s. Nova Scotia, where it occurs associated with other disjuncts from the Souteastern Coastal Plain. See Homoya (1993) for additional discussion of the two varieties of \(P\). flava; he suggests that specific status may be warranted. [= FNA, K, L; = Habenaria flava (Linnaeus) R. Brown var. flava -- RAB, C, F, G, X; < Habenaria flava -- GW, infraspecific taxa not distinguished; >Perularia scutellata (Nuttall) Small -- S; > Perularia bidentata (Elliott) Small -- S]

Platanthera flava (Linnaeus) Lindley var. herbiola (R. Brown) Luer, Tubercled Rein Orchid, Northern Gypsy-spike. Mt (GA, NC, VA): bogs, seepages; rare (GA Special Concern, NC Rare, VA Watch List). May-September. Var. herbiola is more northern, widespread in ne. North America, south (in the mountains) to NC. See Homoya (1993) for additional discussion of the two varieties of \(P\). flava; he suggests that specific status may be warranted. [= FNA, K, L, W; = Habenaria flava (Linnaeus) R. Brown var. herbiola (R. Brown) Ames \& Correll -- RAB, C, F, G, X; = Perularia flava (Linnaeus) Farwell -- S, apparently misapplied]

Platanthera grandiflora (Bigelow) Lindley, Large Purple Fringed Orchid, Plume-royal. Mt (GA, NC, VA): bogs, seepages, moist places at high elevations; rare (NC Rare, VA Rare). June-August. Widespread in ne. North America, south in the mountains to NC and n. GA. [= FNA, K, L, W; = Habenaria psycodes (Linnaeus) Sprengel var. grandiflora (Bigelow) A. Gray -- RAB, C, G, X; = Habenaria fimbriata (Aiton) R. Brown -- F; = Blephariglottis grandiflora (Bigelow) Rydberg -- S]

Platanthera integra (Nuttall) A. Gray ex Beck, Golden Fringeless Orchid, Yellow Fringeless Orchid. Cp (GA, NC, SC), Mt, Pd
(NC): savannas in the Coastal Plain, bogs in the Mountains and Piedmont; rare (GA Special Concern, NC Threatened, SC Rare). July-September. Essentially endemic to the Southeastern Coastal Plain, ranging from s. NJ south to FL and west to se. TX, with disjunct occurrences in TN (Eastern Highland Rim) and in bogs at low elevations of the Blue Ridge of NC. It is apparently now extirpated in the Mountains and Piedmont of NC. [= FNA, K, L; = Habenaria integra (Nuttall) Sprengel -- RAB, C, F, G, GW, X; = Gymnadeniopsis integra (Nuttall) Rydberg -- S]

Platanthera integrilabia (Correll) Luer, Monkey-face Orchid, White Fringeless Orchid. Mt (GA, NC, SC, VA), Pd (GA): bogs, red maple - gum swamps, seeps and streeambanks; rare (US Species of Concern, GA Threatened, NC Endangered, SC Rare, VA Rare). July-September. Endemic to KY, e. TN, sw. VA, w. NC, nw. SC, n. GA, n. AL, and n. MS, primarily in the Cumberland Plateau. See Zettler, Ahuja, \& McInnis (1996) for a discussion of pollination. [=FNA, K, L, W; = Habenaria blephariglottis (Willdenow) Hooker var. integrilabia Correll -- RAB, F, X; = Habenaria correlliana Cronquist -- C; ? Habenaria blephariglottis var. holopetala (Lindley) A. Gray]

Platanthera lacera (Michaux) G. Don, Green Fringed Orchid, Ragged Fringed Orchid, Ragged Orchid. Mt, Pd, Cp (GA, NC, SC, VA): swamps, bogs, seepages; uncommon, rare in Piedmont and Coastal Plain (SC Rare). June-August. Widespread in ne. North America, south to SC, GA, AL, AR, and OK. Var. terrae-novae (Fernald) Luer is not distinct, and is based on hybrid swarms involving P. lacera and P. psycodes (Catling 1997). [= FNA, K, W; = Habenaria lacera (Michaux) R. Brown -- RAB, C, G, GW, X; > Habenaria lacera var. lacera -- F; = Blephariglottis lacera (Michaux) Farwell -- S; > Platanthera lacera var. lacera -- L]

Platanthera leucophaea (Nuttall) Lindley, Prairie Fringed Orchid. Mt (VA): damp calcareous meadows; rare (US Threatened, VA Rare). May-July. ME west to NE, south to w. VA, nw. PA, c. OH, c. IN, IL, MO, and OK. [= FNA, K, W; = Habenaria leucophaea (Nuttall) A. Gray var. leucophaea -- C; = Habenaria leucophaea (Nuttall) A. Gray -- G, X]

Platanthera nivea (Nuttall) Luer, Snowy Orchid, Bog-spike. Cp (GA, NC, SC): wet savannas; rare (GA Special Concern, NC Rare). May-September. Essentially a Southeastern Coastal plain endemic, P. nivea ranges from s. NJ south to FL and west to TX, disjunct in Coffee County, TN (Eastern Highland Rim). This species is even more irregular than most Platanthera in its flowering, whole populations sometimes not flowering for a number of years. The flowers are so white as to seem illuminated from within. This species was once locally abundant in the outer Coastal Plain of the Carolinas and further south; Correll (1950) describes "large colonies of this species which form a blanket of white over the landscape." See also the picture in B.W. Wells' Natural Gardens of North Carolina. [= FNA, K, L; = Habenaria nivea (Nuttall) Sprengel -- RAB, C, F, G, GW, X; = Gymnadeniopsis nivea (Nuttall) Rydberg -- S]

Platanthera orbiculata (Pursh) Lindley, Large Round-leaved Orchid, Dinner-plate Orchid. Mt, Pd (NC, VA): moist hardwood forests, especially over amphibolite; uncommon (rare in Piedmont). June-September. Newfoundland and Labrador west to AK, south to PA (and in the mountains to NC and TN), OH, IN, MN, SD, and OR. Reddoch \& Reddoch (1993) have shown that \(P\). orbiculata differs from \(P\). macrophylla at the species level; see note below for further discussion. Pollination is by night-flying moths, likely noctuids. [= FNA; = Habenaria orbiculata (Pursh) Lindley -- RAB; = Habenaria orbiculata var. orbiculata -- C, F; < Habenaria orbiculata -- G, W, X, in a broad sense (also including P. macrophylla); = Platanthera orbiculata var. orbiculata -- K, L; = Lysias orbiculata (Pursh) Rydberg -- S]

Platanthera peramoena (A. Gray) A. Gray, Purple Fringeless Orchid, Purple Spire Orchid, Pride-of-the-peak. Mt (GA, NC, SC, VA), Pd (NC, VA), Cp (VA): bogs, seepages, moist forests; rare (GA Special Concern, NC Rare, SC Rare, VA Rare). JuneOctober. NJ, s. PA, OH, c. IL, and se. MO south to nw. SC, n. GA, n. AL, c. MS, and c. AR. See Spooner \& Shelly (1983) for a review of information about this species. [=FNA, K, L, W; = Habenaria peramoena A. Gray -- RAB, C, F, G, GW, X; = Blephariglottis peramoena (A. Gray) Rydberg -- S]

Platanthera psycodes (Linnaeus) Lindley, Small Purple Fringed Orchid, Butterfly Orchid. Mt (GA, NC, SC, VA): northern hardwood forersts, other moist forests, seepages, bogs; uncommon (GA Special Concern). June-August. Widespread in ne. North America, south in the mountains to n. GA. [= FNA, K, L, W; = Habenaria psycodes (Linnaeus) Sprengel var. psycodes -- RAB, C, G, X; = Habenaria psycodes -- F, GW; = Blephariglottis psycodes (Linnaeus) Rydberg -- S]

Platanthera aquilonis Sheviak, south to NJ and PA. [= FNA; P. hyperborea (Linnaeus) Lindley var. hyperborea -- K, misapplied; Habenaria hyperborea (Linnaeus) R. Brown var. hyperborea, misapplied] \{not keyed; add synonymy\}

Platanthera hookeri (Torrey \& A. Gray) Lindley, Hooker's Orchid, ranges south to s. PA, in rich moist forests. [= FNA, K, L; = Habenaria hookeri Torrey -- C, F, G, X]

Platanthera huronensis (Nuttall) Lindley, south to NJ (Sheviak 2002, Kartesz 1999) and PA (Kartesz 1999). [= FNA, K; = Habenaria hyperborea (Linnaeus) R. Brown var. huronensis (Nuttall) Farwell] \{not keyed; add synonymy\}

Platanthera macrophylla (Goldie) P.M. Brown is apparently reported from NC and VA by Luer (1975). I have seen no verification of this distribution, nor is it validated by Reddoch \& Reddoch (1993) or Sheviak in FNA (2002). P. macrophylla does range south to sw. PA and might be expected in montane VA. It generally occurs in coniferous swamps, from Nova Scotia west to n. MI, south to sw. PA and MD (Kartesz 1999). [= FNA, K; = P. orbiculata var. macrophylla (Goldie) Luer -- L; = Habenaria orbiculata (Pursh) Torrey var. macrophylla (Goldie) B. Boivin -- C, F; < Habenaria orbiculata -- G, X, in a broad sense (also including P. macrophylla)]

The following hybrids are known from our area (others should be expected):
Platanthera \(\times\) andrewsii (M. White) Luer [P. lacera \(\times\) psycodes]. This hybrid is known from several locations in the Mountains. It is distinguished by characteristics intermediate between the two parents, especially the purple to pale lavender flowers, the central lobe of the lip long and narrow and deeply fringed. [= FNA]

Platanthera \(\times\) bicolor (Rafinesque) Luer [P. blephariglottis \(\times\) ciliaris]. This hybrid is rather common in the Coastal Plain, and can sometimes be found by the hundreds where both parents are abundant. The flowers from a distance appear a pale, creamy orange; when observed more closely, they prove to be bicolored, the broader portions pale orange, the fringed portions white. [= FNA]

Platanthera \(\times\) canbyi (Ames) Luer [P. blephariglottis \(\times\) cristata]. This hybrid is known from a few locations in the Coastal Plain. It is intermediate between the parents. [= FNA]

Platanthera \(\times\) channellii Folsom [ \(P\). ciliaris \(\times\) cristata]. This hybrid is known from several sites in the Coastal Plain (Charleston County, SC), Piedmont (Iredell County, NC), and Mountains (Henderson County, NC). It can be distinguished by its intermediate morphology, especially the spur 11-15 mm long. Folsom (1984) and Brown (2004) discuss the closely related P. chapmanii (Small) Luer, ranging from se. GA to panhandle FL, and in e. TX, which they recognize as a species, based on its occurrence in populations independent of its parents, pollination biology, and subtle morphologic distinction from \(P\). \(\times\) channellii. [=FNA; P. \(\times\) chapmaniimisapplied]

\section*{Platythelys Garay (Jug Orchid)}

A genus of about 9 species, of the New World tropics and subtropics. References: Ackerman in FNA (2002a).
Platythelys querceticola (Lindley) Garay, Jug Orchid. Wet hammocks and swamps. FL, AL, MS, and LA; Mexico; West Indies; central America; South America. Known from FL counties (Franklin and Nassau) adjacent to GA. [= FNA, K; = Erythrodes querceticola (Lindley) Ames - L, X; = Physurus querceticola Lindley - S; ? P. latifolia (Linnaeus) Garay \& Ormerod] \{not yet keyed\}

Pogonia Antoine Laurent de Jussieu 1789 (Rose Pogonia, Pogonia)
(also see Cleistes, Isotria)
A genus of 3 species, of temperate e. North America and e. Asia. Cameron \& Chase (1999) indicate that molecular analyses indicate that there may be merit in the traditional broad circumscription of Pogonia to include Isotria and N. American taxa of Cleistes. References: Catling \& Sheviak in FNA (2002a).

Pogonia ophioglossoides (Linnaeus) Ker-Gawler, Rose Pogonia, Snakemouth, Beardflower, Ettercap, Addermouth. Cp (GA, NC, SC, VA), Mt (NC, SC, VA), Pd (GA, NC, SC, VA): savannas, bogs, especially in open peaty or gravelly situations; uncommon (rare in Piedmont and Mountains) (VA Watch List). May-June. Widespread in e. North America. [= RAB, C, FNA, G, GW, K, L, S, W, X; > P. ophioglossoides var. ophioglossoides -- F]

\section*{Ponthieva R. Brown 1813 (Shadow Witch)}

A genus of about 30-53 species, of tropical and warm temperate America. References: Ackerman in FNA (2002a); Pridgeon et al. (1999b).

Ponthieva racemosa (Walter) C. Mohr, Shadow Witch. Cp (GA, NC, SC, VA): bottomlands, floodplains, moist ravines, nearly always over calcareous rock ("marl" or coquina limestone); rare (GA, Special Concern, NC Rare, SC Rare, VA Watch List). September-October. Se. VA south to FL and west to se. TX; disjunct in the Eastern Highland Rim, TN, and south into Central and South America. The basal rosette of leaves, white (suffused with green) flowers in fall, and habitat are distinctive. [= RAB, C, F, FNA, G, GW, K, S, X; P. racemosa var. racemosa -- L]

Pteroglossaspis Reichenbach filius 1878 (Wild Coco)
A genus of \(7-10\) species, of s. North America, Cuba, Colombia, and tropical Africa (Romero-González in FNA 2002). References: Romero-González in FNA (2002a).

Identification notes: The long (to 7 dm ), plicate leaves are distinctive among our orchids. Small individuals can be mistaken for Calopogon when not in bloom. Pteroglossaspis differs, however, in having the stem covered from node to node by a succession of sheaths (vs. the sheaths much shorter) and in having the leaves 2-3 on a separate shoot emerging from the corm before the bloomstalk (vs. leaf 1 , on the bloom-stalk).

Pteroglossaspis ecristata (Fernald) Rolfe, Spiked Medusa, Smooth-lipped Eulophia. Cp (GA, NC, SC): mesic pinelands with blackjack oak, other sandhills and dry-mesic to mesic longleaf pinelands; rare (US Species of Concern, GA Special Concern, NC Endangered, SC Rare). June-September; July-November. Se. NC south to FL, west to LA; West Indies (Cuba). One of the rarest orchids in our region. [= FNA, K; = Eulophia ecristata (Fernald) Ames -- RAB, L, X; = Triorchos ecristatus (Fernald) Small -- S]

\section*{Spiranthes L.C. Richard 1817 (Ladies'-tresses, Pearl-twist, Spiral Orchid)}

A genus of about 30-40 species, mainly north temperate, but with species scattered in other areas. The Spiranthes flora of our region is still rather poorly understood. This treatment, already rather different from RAB (1968) will undoubtedly change further. References: Sheviak \& Brown in FNA (2002a); Luer (1975); Sheviak (1991); Pridgeon et al. (1999c). Key adapted largely from

\section*{Identification notes: flowering plants are necessary for identification of the species.}

1 Rachis of inflorescence with all hairs not glandular, tapering to a pointed tip; [flowering March-September] ....... S. vernalis
1 Rachis of inflorescence either glabrous or with some or all hairs gland-tipped, capitate or clavate.
2 Lip bright yellow or orange-yellow, with greenish veins; sepals and petals pure white; [flowering May-July] ..... S. Iucida
2 Lip either white, or lip yellowish and lacking greenish veins; sepals and petals creamy, ivory, yellow, or greenish; flowering February-December].
3 Lip with conspicuous, terminally widened, greenish (rarely yellowish) diverging veins extending nearly to the tip; [flowering March-July].
4 Flowers white, with green veins; sepals appressed; flowers 6-9 mm long . . . . . . . . . . . . . . . . . . . . . S. praecox 4 Flowers creamy green, with darker green veins; flowers \(10-17 \mathrm{~mm}\) long . . . . . . . . . . . . . . . . . . S. sylvatica
3 Lip lacking conspicuous, terminally widened, greenish diverging veins (veins not terminally widened); [collectively flowering February-December].
5 Rachis glabrous; flowers gaping from near middle, the tubular portion less than 3 mm long; lip pure white; [flowering June-September]
S. tuberosa

5 Rachis pubescent or glabrous; flowers gaping only from beyond the middle, the tubular portion more than 3 mm long; lip white, creamy, yellow, or centrally green; [collectively flowering February-December].
6 Inflorescence with 3 or 4 flowers per cycle of spiral, the spiral usually tight and obscure, but then with 3 or 4 secondary ranks of flowers evident; [collectively flowering August-December] .................. Key A
6 Inflorescence with 5 or more flowers per cycle of spiral, the spiral usually open and obvious; [collectively flowering February-December] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Key B

\section*{Key A}

1 Petals ca. 6 mm long; lower portion of stem with recurved-spreading leaves . . . . . . . . . . . . . . . . . . S. ovalis var. erostellata
1 Petals 7.5 mm long or longer; leaves wholly basal, or lower portion of stem with recurved-spreading blades, or leaves absent at flowering.
2 Lip only slightly or not at all differentiated from the petals; buds often failing to open (but setting seed through
agamospermy); column normal, or abnormal or aborted; leaves usually absent at flowering . . . . . . . . . . . . . . . S. cernua
2 Lip clearly differentiated from petals; buds opening into normal flowers; column normal; leaves present or absent at flowering.
3 Basal calli relatively short and conic,a wide as high, and usually less than 1 mm long; lateral sepals free and spreading, often over the top of the flower; leaves absent at flowering; [of dry calcareous barrens of the Ridge and Valley and westward, in our area in sw. VA] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. magnicamporum
3 Basal calli 1-2 mm long; lateral sepals more or less appressed (very rarely spreading over the top of the flower); leaves present at flowering; [of various dry to wet sites, collectively widespread in our area].
4 Upper margin of the lateral sepals obviously separated from the adjacent margin of the dorsal sepal, the separation abrupt at the base (commonly by about 1 mm ); lip strongly curving from the claw (the resulting angle 20-60 degrees), cuneate at the base; perianth creamy, yellowish, or greenish white; [of upland, dry to mesic sites] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. ochroleuca
4 Upper margin of the lateral sepals touching (or nearly so) the adjacent margin of the dorsal sepal, or only gradually separated with distance from the base; lip not strongly curving from the claw (angle less than 30 degrees), cordate to truncate at the base; perianth white to creamy or ivory, the center of the lip ivory to pale yellowish or rarely greenish; [primarily of wet sites, such as bogs, fens, marshes, bottonland swamps]. 5 Plants to about 50 cm tall, not colonial; leaves comparatively slender, flaccid-membranaceous with thickened midrib, the petioles of the basal leaves less than 6 mm wide; leaves wholly basal or the lower sheaths with ascending-spreading blades; perianth usually \(8-11 \mathrm{~mm}\) long; lip membranaceous to fleshy, less than 7 mm long; [widespread in our area] S. cernua

5 Plants to over 100 cm tall, forming clonal colonies via stolons; leaves broad, stiffly aerenchymatous-
thickened, the petioles of basal leaves 7 mm or more wide; leaves up the stem, with spreading recurved blades on the lower cauline sheaths, frequently also on the upper, with leaves extending to the inflorescence; perianth \(10-15 \mathrm{~mm}\) long (sometimes smaller in depauperate plants); lip fleshy, usually over 7 mm long; [of the Coastal Plain]
S. odorata

\section*{Key B}

1 Lateral sepals widely diverging from the base, \(8-10 \mathrm{~mm}\) long; lip dilated at base, oblong toward tip, yellow centrally; inflorescence secund to twisted usually only a half-turn from bottom to top; [flowering late October-December] . . S. Iongilabris
1 Lateral sepals spreading to appressed, not widely diverging, \(3.8-10 \mathrm{~mm}\) long; lip ovate to oblong-quadrate, lacking a distinct basal dilation, white or creamy centrally; inflorescence usually with several spiral cycles (rarely nearly secund); [flowering February-November].
2 Lip with lacerate-dentate tip; leaves usually linear, more than \(30 \times\) as long as wide, persistent and present at flowering;
[flowering May-August] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. Iaciniata

2 Lip with undulate to crisped tip; leaves lanceolate to ovate or obovate, less than \(30 \times\) as long as wide, either persistent and present at flowering, or withering prior to flowering.
3 Flowers comparatively large and stout, the perianth \(5-12 \mathrm{~mm}\) long, white to yellowish, the lip often darker centrally but not green or greenish yellow; leaves ascending, relatively slender, not ovate or obovate, present at flowering; rachis conspicuously and densely glandular-pubescent; [flowering August-November].
4 Lip truncate at the tip, 5-7.5 mm long; flowers yellowish, creamy, or ivory, arcuate-nodding for most to all the length of the perianth; [of PA northwards] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [S. casei var. casei]
4 Lip acute to rounded at the tip, usually more than 7.5 mm long; flowers white to yellowish, arcuate-nodding only at the base of the perianth; [widespread in our area] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. cernua
3 Flowers comparatively small and slender, the perianth usually less than 5.5 mm long; leaves strictly basal, spreading and ovate to obovate or oblanceolate; rachis glabrous or densely but minutely glandular-pubescent; [flowering February-September].
5 Rachis densely pubescent; flowers yellowish to pale greenish yellow, the lip yellow centrally; [flowering February-April]; [of s. SC southwards and westwards] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. brevilabris
5 Rachis glabrous or sparsely and minutely pubescent; flowers yellowish to white, the lip yellowish or green centrally; [flowering February-September]; [collectively widespread in our area].
6 Flowers yellowish to pale greenish yellow; lip yellow centrally . . . . . . . . . . . . . . . . . . . . . . . . S. floridana \(6 \quad\) Flowers white, lip green centrally.

7 Leaves oblanceolate, withering at anthesis; lateral sepals spatulate, green at base; flowering February-May . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . .
7 Leaves ovate to obovate or elliptic, spreading, present or absent at anthesis; lateral sepals acuminate, white throughout; flowering July-September.
8 Flowers densely arranged on the spike (ratio of spike length in mm : flower number less than 2.3); entire plant essentially glabrous; leaves usually absent at anthesis; [flowering earlier, mostly July]
s. lacera var. gracilis

8 Flowers laxly arranged on spike (ratio of spike length in mm : flower number equal to or greater than 2.3); inflorescence capitate-pubescent; leaves usually persisting through anthesis; [flowering later, mostly August-September]
S. lacera var. lacera

Spiranthes brevilabris Lindley. \(\mathrm{Cp}(\mathrm{GA}, \mathrm{SC}\) ): pine savannas; rare (GA Rare). Se. SC south to s. GA and \(n\). FL, and west to se. TX, in dry to moist open sites. [= FNA, K; = Spiranthes gracilis (Bigelow) Beck var. brevilabris (Lindley) Correll - GW]

Spiranthes cernua (Linnaeus) L.C. Richard, Nodding Ladies'-tresses. Mt, Pd, Cp (GA, NC, SC, VA): bogs, swamps, ditches, usually in acidic, sphagnous situations; common (uncommon in Piedmont and Coastal Plain). July-November. Widespread in e. North America. [= FNA, G, K, L, W; = Spiranthes cernua var. cernua -- RAB, C, F, GW, L, X; < Spiranthes cernua var. cernua - F, X, in part; = Ibidium cernuum (Linnaeus) House -- S]

Spiranthes eatonii Ames ex P.M. Brown, Eaton's Ladies'-tresses. Cp (GA, NC, SC, VA): dry to moist pine flatwoods; uncommon (GA Rare). February-May. A Southeastern Coastal Plain endemic: se. VA south to FL, west to se. TX. Apparently previously confused with S. lacera, S. floridana, S. brevilabris, and S. tuberosa, but distinctive in the combination of spring blooming season, white flowers, and basal, narrowly oblanceolate leaves (Brown 1999). [= FNA, K]

Spiranthes floridana (Wherry) Cory, Florida Ladies'-tresses. Cp (GA, NC, SC): wet savannas, other moist sites; rare (GA Rare, NC Rare). April-May. A Southeastern Coastal Plain endemic: se. NC south to FL and west to TX, a Southeastern Coastal Plain endemic. [= FNA, K; = Spiranthes brevilabris Lindley var. floridana (Wherry) Luer - L; = Spiranthes gracilis (Bigelow) Beck var. floridana (Wherry) Correll -- RAB, GW, X; = Ibidium floridanum Wherry -- S]

Spiranthes lacera (Rafinesque) Rafinesque var. gracilis (Bigelow) Luer, Southern Slender Ladies'-tresses. Mt, Pd, Cp (GA, NC, SC, VA): fields, meadows, pastures, woodlands; uncommon. August-September. Widespread in se. North America, north to s. NH, MI, WI, and KA. [= C, FNA, K, L, W; = Spiranthes gracilis (Bigelow) Beck var. gracilis -- RAB, GW, X; = Spiranthes gracilis --F (sensu stricto); < Spiranthes gracilis -- G (apparently including S. lacera var. lacera); = Ibidium gracile (Bigelow) House -- S]

Spiranthes lacera (Rafinesque) Rafinesque var. lacera, Northern Slender Ladies'-tresses. Mt (NC, VA): clearings, openings; rare. July. Nova Scotia and New Brunswick west to Saskatchewan, south to sw. NC, w. VA, TN, and MO. The occurrence of this species in NC is documented by a specimen at DUKE, collected at 5200 feet elevation on Tusquitee bald. [= C, FNA, K, L, W; = Spiranthes lacera -- F (sensu stricto); ? Spiranthes gracilis -- G, L, X (in part)]

Spiranthes laciniata (Small) Ames, Lace-lip Ladies'-tresses. Cp (GA, NC, SC), \{VA?\}: pond cypress depressions and savannas, swamps; rare (NC Rare, SC Rare). May-August. A Southeastern Coastal plain endemic: NJ south to FL and west to se. TX. [= RAB, C, FNA, K, L, X; = Spiranthes \(\times\) laciniata -- F, GW; = Ibidium laciniatum (Small) House -- S]

Spiranthes longilabris Lindley, Giant Spiral Orchid. Cp (GA, NC, SC): wet savannas; rare (GA Rare, NC Threatened, SC Rare). Late October-December. A Southeastern Coastal Plain endemic: se. NC south to FL and west to LA. [= RAB, FNA, GW, K, L, X; = Ibidium longilabre (Lindley) House -- S]

Spiranthes Iucida (H.H. Eaton) Ames, Shining Ladies'-tresses. Mt (NC, VA): sunny seepage over amphibolite or other basic rock; rare (NC Rare, VA Rare). June. Widespread in ne. United States, south to NC, e. TN, sc. TN (Chester et al. 1993), c. AL, MO, and KS. The species was reported for NC by Fernald (1950) and by Small (1933), but was not treated by RAB; its occurrence in NC was verified in 1992 by its discovery in a seepage area in Ashe County. [= C, F, FNA, G, K, L, W, X; Ibidium plantagineum (Rafinesque) House -- S]

Spiranthes magnicamporum Sheviak, Great Plains Ladies'-tresses. Mt (GA, VA): grassy barrens and glades over limestone; rare (GA Endangered, VA Rare). Primarily in the Great Plains, from ND south to TX, east (often as widely disjunct populations) to sw. Ontario, se. PA, sw. VA (Ludwig 1999), KY, TN, and nw. GA. [= C, FNA, K, L; < S. cernua -- G, in part (included in a broad
concept of S. cernua by earlier authors); < Spiranthes cernua var. cernua -- \(\mathrm{F}, \mathrm{X}\), in part]
Spiranthes ochroleuca (Rydberg) Rydberg, Yellow Nodding Ladies'-tresses. Mt (NC, SC?, VA): meadows and pastures at moderate to high elevations, up to at least 1500 m in elevation; rare (NC Rare, VA Rare). September-October. Largely northeastern, extending south in the mountains to NC. See Sheviak \& Catling (1980) and Catling (1983a) for further information on this species. [= FNA, K, L, W; = Spiranthes cernua var. ochroleuca (Rydberg) Ames -- C, F, X; = Ibidium ochroleucum (Rydberg) House -- S]

Spiranthes odorata (Nuttall) Lindley, Fragrant Ladies'-tresses, Marsh Ladies'-tresses. Cp (GA, NC, SC, VA): swamps and marshes; uncommon (VA Rare). September-November. A Southeastern Coastal Plain endemic: se. VA south to FL and west to se. TX. [= F, FNA, G, K, L; = Spiranthes cernua var. odorata (Nuttall) Correll -- RAB, C, GW, L, X; = Ibidium odoratum (Nuttall) House -- S]

Spiranthes ovalis Lindley var. erostellata Catling, Oval Ladies'-tresses. Pd (NC, SC, VA), Cp (GA, NC, SC), Mt (GA, VA): swamp forests, bottomland forests; uncommon (GA Rare). August-November. Var. erostellata is fairly widespread in se. North America, ranging from sc. PA, MI, and IL south to panhandle FL, s. MS, and s. LA. Var. ovalis is limited to AR, LA, and TX, differing in having a viscidium and rostellum. See Catling (1983b) for further information about this variety and its biology. [= C, FNA, K, W; < Spiranthes ovalis -- RAB, F, G, GW, L, X, infraspecific taxa not distinguished; < Ibidium ovale (Lindley) House -- S; ? Spiranthes montana Rafinesque]

Spiranthes praecox (Walter) S. Watson, Grass-leaved Ladies'-tresses, Giant Ladies'-tresses. Cp (GA, NC, SC, VA), Pd (NC, VA), Mt (GA, VA): savannas, swamps, bogs; uncommon (rare in Piedmont). March-July. A Southeastern Coastal plain endemic: NJ south to FL and west to TX. [< S. praecox -- RAB, C, F, FNA, G, GW, K, L, W, X (also see S. sylvatica); < Ibidium praecox (Walter) House -- S (also see S. sylvatica)]

Spiranthes sylvatica P.M. Brown, Woodland Ladies'-tresses, Pale Green Ladies'-tresses. Cp (GA, NC, SC, VA): live oak hammocks, other woodlands; rare (GA Rare). Late March-early May. VA south to c. peninsular FL, west to e. TX. [<S. praecox -RAB, C, F, FNA, G, GW, K, L, X; < Ibidium praecox (Walter) House -- S]

Spiranthes tuberosa Rafinesque, Little Ladies'-tresses, Little Pearl-twist. Mt, Pd, Cp (GA, NC, SC, VA): in a wide variety of habitats, especially relatively well-drained woodlands and fields; common. June-September. Widespread in se. North America, north to MA, OH, and MO. [= C, FNA, G, K, L, W; > S. grayi Ames -- RAB, L, X; > Spiranthes tuberosa var. grayi (Ames) Fernald -F; > Spiranthes tuberosa var. tuberosa - F; Ibidium beckii (Lindley) House -- S, misapplied]

Spiranthes vernalis Engelmann \& A. Gray, Spring Ladies'-tresses. Cp, Pd, Mt (GA, NC, SC, VA): savannas, bogs, marshes, fairly dry fields; common (uncommon in Piedmont, rare in Mountains). March-July (-early September in the mountains). MA to FL and west to TX and SD, also in Mexico and Central America. [= RAB, C, F, FNA, G, GW, K, L, W, X; = Ibidium vernale (Engelmann \& A. Gray) House -- S]

Spiranthes casei Catling \& Cruise var. casei, ranging from Nova Scotia and ME west to WI, south to PA, in moist to dry open sites. [= FNA, K] \{not keyed; add to synonymy\}

Spiranthes ovalis Lindley var. ovalis, . Cp (GA): [= FNA, K] \{not yet keyed; add to synonymy\}
Spiranthes romanzoffiana Chamissso, south to PA. [= FNA, K] \{not yet keyed; add to synonymy\}

\section*{Tipularia Nuttall 1818 (Cranefly Orchid)}

A genus of 3 species; the other species of the genus are e. Asian (1 in Japan and 1 in the Himalayas) (Catling \& Sheviak in FNA 2002). References: Catling \& Sheviak in FNA (2002a).

Identification notes: The leaves are present during the winter, withering before the flowering stalk appears, the plant thus occasionally mistaken for one of the saprophytic orchids. The leaves are usually purple underneath, a characteristic shared with Aplectrum, but Tipularia leaves are ovate, less than 10 cm long, and are not notably plicate along the veins (vs. Aplectrum, with leaves narrowly elliptic, \(10-20 \mathrm{~cm}\) long, and notably plicate along the very prominent, white, cartilaginous veins).

Tipularia discolor (Pursh) Nuttall, Cranefly Orchid. Pd, Cp, Mt (GA, NC, SC, VA): in a wide variety of mesic to rather dry forests; common. July-September. Se. MA, s. NY, OH, IN, and s. MI south to FL and TX. Along with Goodyera pubescens, Tipularia is one of the commonest orchids in NC (indeed in e. North America). [=RAB, C, F, FNA, G, K, L, W, X; = T. unifolia (Muhlenberg) Britton, Sterns, \& Poggenburg -- S]

\section*{Triphora Nuttall 1818 (Three Birds Orchid)}

A genus of about 25 species, of e. North America, the West Indies, and Central and South America (Medley in FNA 2002). References: Medley in FNA (2002a).

Triphora trianthophora (Swartz) Rydberg ssp. trianthophora, Three Birds Orchid, Nodding Pogonia, Nodding Ettercap. Mt (GA, NC, SC, VA), Cp, Pd (NC, SC, VA): humid forests and swamps, rhododendron thickets, especially on rotten logs or on humus; rare (GA Rare, NC Watch List, SC Rare, VA Rare). July-September. The species is widespread (but scattered) in e. North America, and south into Central America. Ssp. trianthophora occurs Maine and Ontario west WI, south to FL amd e. TX; disjunct in nc. Mexico; ssp. mexicana (S. Watson) Medley occurs from Mexico south to Central America. The flowers are extremely ephemeral, making the species very difficult to locate. [= FNA; < T. trianthophora - RAB, C, F, G, GW, K, L, S, W, X, infraspecific taxa not distinguished]

\section*{Zeuxine Lindley 1826 (Soldier Orchid)}

A genus of about 26 species, of tropical and subtropical Old World (introduced elsewhere). References: Ackerman in FNA (2002a)
* Zeuxine strateumatica (Linnaeus) Lindley, Lawn Orchid, Soldier Orchid. Cp (GA): lawns, rare, introduced from Asia. [= FNA, GW, K, L]

\section*{POACEAE or GRAMINEAE (Grass Family)}

A family of about 670 genera and 10,000 species, cosmopolitan. References: Flora of North America Editorial Committee (2003a)=FNA; Hitchcock and Chase (1950)=HC; Blomquist (1948).
[note: only a small portion of the key to genera complete]

\section*{Key A -- tribe Andropogoneae}

1 Leaves ovate-lanceolate, 2-10 cm long, 2.5-7× as long as wide; plants weak-stemmed annuals, branching, decumbent, rooting at the lower nodes; [alien weeds].
2 Leaves cordate-clasping at base; spikelets not paired, unaccompanied by a vestige . . . . . . . . . . . . . . . . . . . Arthraxon 2 Leaves tapering to a broadly cuneate base; spikelets paired (one of the pair sometimes vestigial) ....... Microstegium 1 Leaves lanceolate to linear, either longer or proportionately narrower; plants either perennial or coarse annuals with erect and mostly unbranched culms.
3 Spikelets embedded in the thickened rachis (the inflorescence thus like an ear of corn), or fitting into grooves in the thickened rachis (the inflorescence thus cylindrical and resembling a rat's tail), or the pistillate inflorescences enclosed in a hard, bead-like, pearly-white, modified bract.
4 Spikelets unisexual, with male and female spikelets in separate inflorescences or in different parts of the same inflorescence.
5 Internode narrower than and more-or-less enclosed by the female spikelet . . . . . . . . . . . . . . . . . . . . . . . Coix 5 Internode broader than and more-or-less enclosing the female spikelet.

6 Racemes of mixed sex, female below, male above . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Tripsacum
6 Racemes of single sex . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Zea
4 Spikelets, or at least one of each pair, bisexual.
7 Pedicels fused to the internode; [coarse alien grass of disturbed habitats] . . . . . . . . . . . . . . . . . . . Rottboellia
7 Pedicels free from the internodes; [either a native coarse grass of pinelands or prairie-like areas, or a short alien grass of lawns and disturbed areas].
8 Sessile spikelet smooth or pitted; culms 50-200 cm tall; [native grass of pinelands or prairie-like areas] . . .
Coelorachis
8 Sessile spikelet with pectinate margins; culms 5-40 cm tall; [alien grass of lawns and disturbed areas] ...
3 Spikelets not embedded or fitting into grooves in the rachis, the rachis slender (the spikelets visibly separate and often pedicelled).
9 Pedicelled spikelet similar to the sessile spikelet, both fertile.
10 Spikelets falling in pairs together with sections of the disarticulating rachis . . . . . . . . . . . . . . . . Saccharum 10 Spikelets falling separately from the persistent rachis.

11 Panicle contracted, spikelike; glumes membranous . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Imperata
11 Panicle loose; glumes cartilaginous or coriaceous . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Miscanthus
\(9 \quad\) Pedicelled spikelet differing from the sessile in shape and sex (sometimes represented only by a pedicel). 12 Spikelets awned, the awn 10-20 cm long.

13 First glume lacking glands; panicle open, the branches \(5-8 \mathrm{~cm}\) long
Chrysopogon
13 First glume with a row of punctate, concave glands; panicle contracted, spikelike . . . . . . . . Heteropogon
12 Spikelets awned or not, if awned the awn less than 5 cm long.
14 Inflorescence a panicle, the branches not subtended by sheaths.
15 Pedicelled spikelet represented by pedicel only; apex of sheath bearing 2 auricles 1-10 mm long;
[native] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Sorghastrum
15 Pedicelled spikelet present, staminate; apex of sheath truncate; [alien]
. Sorghum
14 Inflorescence of 1-13 digitate (whorled) racemes borne at the summit of a peduncle, the peduncle subtended by a raceme sheath.
16 Racemes 1 per peduncle and raceme sheath
Schizachyrium
16 Racemes 2-13 per peduncle and raceme sheath.
17 Pedicels of the pedicelled (reduced or absent) spikelets terete or slightly flattened and grooved on one side only

Andropogon
17 Pedicels of the pedicelled (reduced or absent) spikelets strongly flattened and grooved on both sides, the central portion thin or membranous

Bothriochloa

(see Elymus, Elytrigia, Pascopyrum)

Agrostis Linnaeus (Bentgrass)
(also see Polypogon)

\section*{References: Tucker (1996)=Z.}

1 Palea 1/2-3/4 as long as the lemma, 0.6-1.2 mm long; plants introduced, often (though not always) in disturbed habitats; plants flowering (collectively) June-October; [subgenus Agrostis].
2 Ligule mostly 0.5-2 mm long, truncate; panicle branches naked towards the base, diffuse when in fruit, the spikelets wellseparated A. capillaris

2 Ligule mostly 2.5-6 mm long, acute, rounded, or truncate; panicle branches (some of them) with spikelets to near the base, the spikelets usually agglomerated.
3 Leaves 3-8 mm wide; inflorescence triangular-ovoid, the branches widely spreading at maturity, usually reddish; plant with rhizomes, without stolons A. gigantea

3 Leaves mostly \(1-3 \mathrm{~mm}\) wide; inflorescence narrowly ovoid, the branches ascending at maturity, usually tan; plant without rhizomes, with or without stolons.
4 Stolons well developed; leaves mostly less than 5 cm long . . . . . . . . . . . . . . . A. stolonifera var. palustris
4 Stolons poorly developed or absent; leaves mostly more than 7 cm long . . . . . A. stolonifera var. stolonifera
1 Palea less than \(2 / 5\) as long as the lemma, \(0-0.5 \mathrm{~mm}\) long; plants native, typically in more or less natural habitats; plants flowering (collectively ) March-November; [subgenus Vilfa].
5 Lemma usually awned (sometimes unawned), the awn inserted near the apex, 4-10 mm long, straight, very delicate and flexuous; annual, flowering April-June A. elliottiana

5 Lemma awned or not, the awn (when present) inserted either near the middle of the lemma or near the apex, 0-6 mm long, straight or bent, neither delicate nor flexuous; perennial, flowering (collectively) March-November.
6 Lemma with a 3-6 mm long, geniculate awn inserted near the middle; [of high elevation rock outcrops]. A. mertensii 6 Lemma awnless or with a 0-3 mm long, straight awn inserted near the tip; [of various habitats].

7 Spikelets 1.2-2 mm long; anthers 0.3-0.6 mm long; plants flowering March-July A. hyemalis

7 Spikelets (1.8-) 2.2-3.5 (-3.7) mm long; anthers (collectively) 0.3-1.2 mm long; plants flowering June-November.
8 Leaves mostly involute, 1-2 (-3) mm wide; panicle branches mostly forking well beyond the middle . . . . .
8 Leaves flat, 2-6 mm wide; panicle branches mostly forking at or below the middle.
9 Lemma 1.8-3 mm long, minutely but copiously scabrous (at \(20 \times\) or more); anthers 0.7-1.2 mm long; spikelets (2.3-) 2.7-3.5 (-3.7) mm long, usually clustered near the tips of the branchlets; panicle branches scabrous; culms to 15 dm tall; [of wet savannas and other wet habitats of the Coastal Plain]

9 Lemma 1.4-2 mm long, glabrous; anthers 0.3-0.6 mm long; spikelets (1.8-) 2.2-2.7 (-3.2) mm long, usually not clustered near the tips of the branchlets; panicle branches glabrous to scabrous; culms to 10 dm tall; [of various habitats, nearly throughout our area]
A. perennans

Agrostis altissima (Walter) Tuckerman, Coastal Bog Bentgrass. Cp (GA, NC, SC, VA), Mt (VA): wet savannas, sinkhole ponds, edges of swamp forests; rare (NC Watch List, VA Watch List). October-November. MA (?) and NJ south to se. LA, primarily on the Coastal Plain. [=F, HC, Z; A. perennans -- RAB, GW, K, in part; A. perennans var. elata (Pursh) A. Hitchcock -- C, G, S]

Ammophila Host (Beach-grass)
References: Tucker (1996)=Z.

Ammophila breviligulata Fernald, American Beach-grass. Cp (NC, *SC, VA): dunes; common. August-September. Newfoundland south to about Cape Hatteras, Dare County, NC, and on shores around the Great Lakes; planted further south. As a native grass, Ammophila ranged south only to NC, where it was rare; it is now commonly planted ("sprigged") in the Carolinas as a sand-binder and is now common south into SC. [= RAB, C, F, G, HC, K, S, Z]
* Ammophila arenaria (Linnaeus) Link, European Beach-grass, is introduced in MD and PA (Kartesz 1999). [= K] \{not yet keyed\}

\section*{Amphicarpum Kunth (Peanut-grass, Goober-grass)}

The genus consists only of the two species treated here, remarkable for their dimorphic spikelets, some of them cleistogamous and subterranean ("goobers"), others aerial and chasmogamous. A series of publications over the past century make Amphicarpum one of the best studied "useless" grasses anywhere (Holm 1896; Weatherwax 1934; Gray \& Fairbrothers 1971; McNamara \& Quinn 1977; Cheplick \& Quinn 1982, 1983, 1986, 1987, 1988a, 1988b; Cheplick 1989). References: Wipff in FNA (2003a).

1 Leaf blades hirsute with pustular-based hairs on both surfaces, the margins ciliate (and also slightly cartilaginous-thickened);
[of moist to wet, peaty or sandy-peaty soils] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. amphicarpon
1 Leaf blades glabrous, the margins cartilaginous-thickened; [of seasonally flooded natural ponds] . . . . . A. muhlenbergianum
Amphicarpum amphicarpon (Pursh) Nash, Pinebarrens Peanut-grass, Pinebarrens Goober-grass. Cp (GA, NC, SC, VA), Pd (VA): wet, peaty, open soils, especially peat-burns in pocosin edges, primarily in the outer Coastal Plain, responding strongly to fire; uncommon, rare in VA (VA Rare). August-October. An Atlantic Coastal Plain endemic, scattered and rather rare, from e. MA to GA. If one carefully excavates young plants in spring or summer, they will generally be found to be connected to last year's subterranean spikelet. [= FNA; = Amphicarpum purshii Kunth -- RAB, C, F, G, GW, K; = Amphicarpon amphicarpon (Pursh) Nash - S]

Amphicarpum muhlenbergianum (J.A. Schultes) Hitchcock, Florida Peanut-grass, Florida Goober-grass, Blue Maiden-cane. Cp (GA, NC, SC): clay-based Carolina bays in the inner Coastal Plain; rare (NC Rare, SC Rare). August-October. A Southeastern Coastal Plain endemic: FL and s. AL north to se. NC, rare north of s. GA. First found in NC in the late 1980's by M. Boyer. [= RAB, FNA, GW; = A. muehlenbergianum -- K, orthographic variant; = Amphicarpon floridanum Chapman -- S]

\section*{Andropogon Linnaeus (Broomsedge, Bluestem)}
(also see Bothriochloa and Schizachyrium)

The difference between this treatment and that in RAB may cause some users to react with skepticism, dismay, or alarm, but I am confident that it represents a much truer description of the genus. Campbell's work (1983, et seq.) has greatly clarified the taxonomy of Andropogon in e. North America. Great confusion and disagreement were previously the rule in dealing with the \(A\). virginicus-A. glomeratus complex. Campbell's careful morphologic work has provided workable technical characters which distinguish the taxa he recognizes.

I have generally followed Campbell (1983, et seq.) in his circumscriptions of taxa. I disagree, however, with his strongly morphologic species concept and the basis for his decisions regarding the rank of the taxa (species, variety, and "variant," an informal, English name for a subvarietal entity). Campbell bases the rank recognition of taxa on their "morphological distance" from one another, as determined by the sum of non-matching characters out of 33 characters analyzed. In general, he regards species as separated by a morphologic distance of 9 or more, varieties by 6 or more, and variants by 3 or more. Such an approach fails to take into account additional evidence of the ecological preferences, geographic distributions, reproductive isolation, evolutionary pathways, and population biology of the taxa.
states that "there are ample opportunities for gene flow between taxa because they frequently grow together and flower at the same time of day and (mostly) at the same time of year. I have observed two taxa growing within one to three meters of one another over our hundred times. In only five of these opportunities for hybridization were there plants whose intermediate morphology suggested that they were hybrids. In the rare instances where hybridization does take place, there are few mature hybrid individuals. I have found only twelve putative hybrid individuals in the five localities where hybridization is suspected. The parents outnumber these hybrids by between five and one hundred or more to one." In discussing A. virginicus var. glaucus (here treated as A. capillipes) he states "the drylands variant ... produces generally shorter raceme sheaths, racemes, and spikelets; its flowers are more frequently chasmogamous, and unlike the wetlands variant, it has no hairs below the raceme sheath. In addition, it grows in better-drained soil and has a narrower geographic range ... I have seen these taxa growing within one to three meters of one another at three localities in northwestern Florida. At only one of these was there difficulty in classifying any individual: a single plant on a slope between a bog inhabited by the wetlands variant and a roadside lined with the drylands variant..."

Some additional examples would be Campbell's discussion of several closely related taxa in the A. glomeratus complex. "Andropogon glomeratus var. glomeratus and the robust variant of var. pumilus have inflorescences so similar in shape that most previous workers have united them and have overlooked the differences between them. The robust variant is taller, usually with rather smooth sheaths and with shorter, more ciliate, and darker ligules, narrower raceme sheaths, and lower glume keels that are scabrous below the middle. Although both taxa grow in wet sites, the robust variant is weedier, shows a greater tolerance for drier conditions and various soil types, and has a wider geographic range." His discussion of A. glomeratus var. glaucopsis and var. hirsutior is also worth repeating. "Often the two grow together in populations of thousands of individuals. Because they grow together so frequently and are morphologically so alike, the possibility that they are not distinct taxa but merely genetic segregates of one another has been carefully considered. Based on observations of several hundred seedlings grown from seeds from both taxa (growing together in nature), there is no evidence for [mere] genetic segregation. The glaucousness/greenness and pubescence/glabrousness of the stem sheaths are discernible in the seedlings within a few weeks of germination."

Taxa differing in numerous morphologic characters, with different (though overlapping) geographic ranges, with different ecological preferences (often rather narrowly segregated by hydrology), and (when they do occur in proximity to one another) showing little or no sign of introgression or hybridization are probably better treated as biological species. Thus, I have treated a number of Campbell's varieties as species. Several of his "variants" also seem to warrant taxonomic recognition, at varietal or specific rank. In fact, he elevated several in Campbell (1986). References: Campbell (1983)=Z; Campbell in FNA (2003a). Key adapted in part from Z.

Identification notes: A thorough understanding of the architecture of the inflorescences of Andropogon is necessary in order to identify them successfully. The parts will be described, beginning from the apex of a branch of the inflorescence. Spikelets occur in pairs, the sessile spikelet (usually just referred to as the spikelet) and the pedicelled spikelet, which is usually vestigial or absent (except in A. gerardii) and sterile (except in A. gerardii, where it is staminate). The first or lower glume of the sessile spikelet has two keels, and the presence and location of antrorse prickle hairs (scabrousness) is an important character in the A. glomeratus complex. The length of the sessile spikelet is an important character; it should be measured exclusive of the awn, borne at the apex of the lemma. Awn length is also a useful taxonomic character. The pedicelled spikelet is borne on the pedicel, which is attached at the base of the sessile spikelet and typically angles away from it at about a 45 degree angle. The rachis internode extends from the base of one sessile spikelet to the next sessile spikelet above, breaking apart (upon dehiscence) just below the next spikelet and remaining attached to the sessile spikelet below. The dispersal unit consists of a sessile spikelet sitting in the \(V\) shape formed by (on one side) the pedicel and pedicelled spikelet and (on the other side) the rachis internode. Both the pedicel and the rachis internode are usually pubescent with long hairs, and the color of those hairs and their distribution are useful characters.

While the dispersal units are still attached to one another, the rachis internodes form a continuous and more-or-less straight rachis. The dispersal units attached together in an unbranched sequence are termed a raceme, whose length is a useful character. Two or more racemes are attached digitately at the summit of the peduncle (in Schizachyrium only a single raceme is found). The number of racemes attached is an important character. A raceme sheath subtends the peduncle, often more or less surrounding the peduncle and the racemes. The length of the peduncle (distance between the points of attachment of the raceme sheath and the racemes) is an important character. The length and width (at its widest point) of the raceme sheath are very useful characters, used throughout the key. The racemes, peduncle and subtending raceme sheath make up an inflorescence unit. The overall inflorescence is more-or-less complexly branched; its overall size and shape are very useful in recognizing the various taxa, but variation in such a subjective (and environmentally plastic) character has added to the taxonomic confusion in Andropogon. The use of inflorescence shape in the key has been minimized, but is often mentioned in the discussion of each species. The number of inflorescence units per plant varies from species to species, in some species rarely exceeding 10, in others ranging upwards to 500 or 600. The absence or presence of hairs immediately below the raceme sheath is useful in some groups.

There are several important characters of the foliage. A. capillipes and A. glaucopsis have culm sheaths and leaf blades that are strongly glaucous; this is usually very obvious, but can be tested for by running the finger along the surface of the leaf (a white coating of wax will come off on the finger). The key often calls for the ligule length; measure the longest portion of the undivided portion of the ligule. The ligule often has an erose or ciliate upper margin; measure the length of the ciliations. The length of leaf blade is measured from the ligule to the leaf apex; do not include the leaf sheath, which is often long and (especially late in the year) only loosely sheathing the culm or even divergent it. Whether the culm is antrorsely scabrous or smooth is better determined by touch than by sight. Choose several mid-culm sheaths, run one's finger downwards and upwards along the sheath surface (near the collar is best). If the sheath is antrorsely scabrous one will feel a somewhat greater resistance to moving the finger downwards than upwards.

1 Pedicellate spikelet staminate, as large as the sessile, fertile spikelet; sessile spikelets \(>7 \mathrm{~mm}\) long; [section Andropogon] . .

1 Pedicellate spikelet sterile, vestigial or absent; sessile spikelets \(<7 \mathrm{~mm}\) long; [section Leptopogon].
2 Leaves strongly glaucous (often nearly white with a powdery wax that can be rubbed off on the fingers), glabrous.
3 Ligules (0.9-) \(1.5(-2.0) \mathrm{mm}\) long, with ciliations \(0-0.2 \mathrm{~mm}\) long; leaf blades usually (33-) avg. \(40(-75) \mathrm{cm}\) long; pubescence beneath raceme sheaths moderate to dense; raceme sheaths (2.0-) 2.4-3.6 (-4.4) cm long, (1.3-) 2.0-2.5 (-3.0) mm wide
A. glaucopsis

3 Ligules (0.2-) 0.4 (-0.5) mm long, with ciliations \(0.3-1.2 \mathrm{~mm}\) long; leaf blades (12-) avg. 19 ( -38 ) cm long; pubescence beneath raceme sheaths absent to dense; raceme sheaths (2.1-) 2.9-4.3 (-6.0) cm long, (2.7-) 3.1-3.8 (-5.5) mm wide.
4 Summit of branchlet below attachment of raceme sheath pubescent with hairs 2-4 mm long; raceme sheaths (2.4-) 3.2-4.8 (-6.0) cm long; spikelets (3.0-) 3.5-3.9 (-4.4) mm long; racemes (1.5-) 2.0-3.0 (-4.0) cm long; leaves 2.5-6.5 mm wide, averaging 5 mm ; upper floret lemma awn 0.9-2.1 mm long, averaging 1.4 mm
A. capillipes var. 1 ["wetland variant"]

4 Summit of branchlet below attachment of raceme sheath glabrous; raceme sheaths (2.1-) 2.6-3.8 (-4.9) cm long; spikelets (2.6-) 3.2-3.5 (-3.9) mm long; racemes (1.4-) 1.7-2.4 (-3.2) cm long; leaves 2-5 mm wide, averaging 3.5 mm ; upper floret lemma awn \(0.6-1.5 \mathrm{~mm}\) long, averaging 1.1 mm

\section*{A. capillipes var. 2 ["dryland variant"\}}

2 Leaves green (to somewhat glaucous, but never powdery white), pubescent or glabrous.
5 Upper culm sheaths distinctly broadened and strongly overlapping, often largely hiding the raceme sheaths before senescence (but in some forms with the raceme sheaths strongly exserted); culms mostly less than 1 m tall (to 1.4 m tall) \(\qquad\) A. elliottii

5 Upper culm sheaths reduced, not strongly overlapping, not hiding the raceme sheaths after anthesis; culms mostly more than 1 m tall (except \(A\). perangustatus, \(A\). tracyi, and small forms of \(A\). virginicus).
6 Many or all peduncles longer than the subtending raceme sheaths at maturity, racemes then fully exserted above the apex of the raceme sheath.
7 Inflorescence branches arching outwards in pronounced curves; racemes (1.2-) 1.5-2.1 (-2.6) cm long; awn (0.2-) avg. 0.7 (-1.1) cm long; spikelets (4.1-) 4.4-4.6 (-5.0) mm long ......... A. brachystachyus
7 Inflorescence branches erect; racemes (2.2-) 2.6-6 cm long; awn 0.5-2.0 cm long; spikelets (4.3-) 4.9-6.5 (7.5) mm long.

8 Lower glumes more or less folded; stamen 1; racemes (2.2-) 2.6-4.3 (-5.3) cm long; awn (0.5-) avg. \(0.8(-1.6) \mathrm{cm}\) long; spikelets (4.3-) 4.9-5.4 ( -6.1 ) mm long . . . . . . . . . . . . . . . . . . . . . . . A. arctatus
8 Lower glumes flat; stamens 3; racemes 3-6 cm long; awn 1-2 cm long; spikelets (4.5-) 5-6.5 (-7.5) mm long
A. ternarius var. ternarius

6 Peduncles all shorter than the subtending raceme sheaths at maturity, at least the bases of the racemes not exserted above the apex of the raceme sheath.
9 Inflorescence units with (2-) 4-7 (-13) racemes; raceme sheaths (4.1-) 5.3-8.0 (-10-1) mm wide; hairs of the rachis internode and pedicel yellow-tawny when dry
A. mohrii

9 Inflorescence units with 2-5 (-7) racemes; raceme sheaths (1.5-) 2.0-4.8 (-6.3) mm wide; hairs of the rachis internode and pedicel gray to whitish when dry.
10 Postflowering peduncles less than 10 mm long.
11 Culm sheaths antrorsely scabrous (often hirsute as well); leaf blades usually more than 35 cm long.
12 Ligules (0.6-) \(0.8(-1.3) \mathrm{mm}\) long (usually \(<1 \mathrm{~mm}\) long), with ciliations \(0.2-0.9 \mathrm{~mm}\) long; raceme sheaths (1.5-) 2.0-2.5 (-3.0) mm wide (usually \(<2.5 \mathrm{~mm}\) wide); keels of first glume often scabrous below the middle . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. tenuispatheus
12 Ligules (0.7-) 1.2 (-2.2) mm long (usually \(>1 \mathrm{~mm}\) long), with ciliations \(0.0-0.3 \mathrm{~mm}\) long; raceme sheaths (2.0-) 2.4-3.4 (-4.7) mm wide (usually \(>2.5 \mathrm{~mm}\) wide); keels of first glume scabrous only above the middle, smooth below.
13 Inflorescences oblong to obpyramidal; spikelets (3.8-) 4.1-4.4 (-5.0) mm long; anthers usually not marcescent within spikelet; mature peduncles (4-) 11-35 (-60) mm long (usually some of them > 10 mm long) . . . . . . . . . . A. glomeratus var. glomeratus
13 Inflorescences (linear to) oblong; spikelets (3.4-) 3.6-3.8 (-4.6) mm log; anthers usually marcescent within spikelets; peduncles (2-) 3-5 (-8) mm long

11 Culm sheaths not scabrous (often hirsute); leaf blades less than 35 cm long (except in \(A\). glomeratus var. pumilus).
14 Leaves glabrous.
15 Ligules (0.8-) 1.1 (-1.5) mm long, with ciliations 0-0.1 mm long; basal leaves often filiform, less than 1.5 mm wide, strongly erect . . . . . . . . . . . . . . . A. perangustatus
15 Ligules (0.2-) \(0.5(-0.8) \mathrm{mm}\) long, with ciliations \(0.2-1.3 \mathrm{~mm}\) long; basal leaves usually more than 2 mm wide, soon arching.
16 Culm internodes green (or glaucous just below the node only); raceme sheaths (2.2-) 2.5-3.8) (-4.5) cm long, (1.7-) 2.4-3.1) (-4.0) mm wide; peduncles (1-) 4-9 (30) mm long; racemes \(2(-3)\) per inflorescence unit
A. virginicus var. decipiens

\section*{Flora of the Carolinas, Virginia, and Georgia, Working Draft of 10 June 2005 -- POACEAE}

16 Culm internodes glaucous; raceme sheaths (2.8-) 3.3-4.7 (-6.7) cm long, (3.0-) 3.2-3.8 (-5.2) mm wide; peduncles (2-) 3-4 (-6) mm long; racemes 2-4 (-7) per inflorescence unit, at least some inflorescence units (especially at culm and branch apices) with 3 or more racemes
A. virginicus var. virginicus ['smooth variant']

14 Leaves pubescent, at least on the margin near the collar.
17 Keels of first glume often scabrous below the middle; leaves usually more than 44 cm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. tenuispatheus
17 Keels of first glume scabrous only above middle; leaves usually less than 31 cm long.
18 Pubescence of young culm sheaths appressed; spikelets usually more than 4 mm long; hairs on rachis internode and sterile pedicel dense, long; callus hairs \(1.5-5 \mathrm{~mm}\) long
A. longiberbis

18 Pubescence of young culm sheaths spreading; spikelets mostly less than 4 mm long; hairs on rachis internode and sterile pedicel rather sparse and short; callus hairs 1-2.5 mm long.
19 Raceme sheaths (2.2-) 2.5-3.8 (-4.5) cm long, (1.7-) 2.4-3.1 (-4.0) mm wide racemes 2 (3) per inflorescence unit; spikelets (3.0-) 3.3-3.6 (-4.0) mm long
A. virginicus var. decipiens

19 Raceme sheaths (2.3-) 3.4-5.2 (-6.7) cm long, (2.7-) 3.3-4.0 (-5.5) mm wide; racemes 2-5 (-7) per inflorescence unit; spikelets (2.9-) 3.7-3.9 (-4.7) mm long
A. virginicus var. virginicus 10 Postflowering peduncles more than 15 mm long

20 Culm sheaths antrorsely scabrous (often hirsute as well).
21 Ligules (1.0-) 1.2 (-2.0) mm long, with ciliations \(0-0.3 \mathrm{~mm}\) long; keels of first glume scabrous only above middle . . . . . . . . . . . . . . . . . . . . A. glomeratus var. glomeratus
21 Ligules (0.6-) 0.8 (-1.3) mm long, with ciliations 0.2-0.9 mm long; keels of first glume often scabrous below middle ........................................... A. tenuispatheus
20 Culm sheaths not scabrous (often hirsute).
22 Culms less than 1.2 m tall; leaf blades less than 30 cm long and 3 mm wide; inflorescence units rarely more than \(20 / \mathrm{culm}\).
23 Raceme sheaths (2.2-) 2.5-3.8 (-4.5) cm long; spikelets (3.0-) 3.3-3.6 (-4.0) mm long; leaf blades (2.5-) \(3.6(-5.5) \mathrm{mm}\) wide
A. virginicus var. decipiens

23 Raceme sheaths (2.6-) 4.1-6.6 (-8.5) cm long; spikelets (3.0-) 3.4-5.1 (-5.5) mm long; leaf blades (0.8-) \(1.8(-3.0) \mathrm{mm}\) wide.
24 Ligules (0.8-) 1.1 (-1.5) mm long, with ciliations \(0-0.1 \mathrm{~mm}\) long
A. perangustatus

24 Ligules (0.2-) 0.4 (-0.5) mm long, with ciliations (0.1-) \(0.2-0.8 \mathrm{~mm}\) long . A. tracyi
22 Culms usually more than 1.2 m tall; leaf blades often more than 30 cm long and 3 mm wide; inflorescence units usually more than 20/culm.
25 Inflorescence branches arching outwards in pronounced curves; awn mostly less than 1 cm long; spikelets (4.1-) 4.4-4.6 (-5.0) mm long; anther more than 1.7 mm long . . . .
A. brachystachyus

25 Inflorescence branches erect; awn mostly more than 1 cm long; spikelets (3.0-) 3.3-3.8 (-4.5) mm long; anther less than 1.5 mm long.
26 Raceme sheaths (1.5-) 2.0-2.5 (-3.0) mm wide; keels of first glume often scabrous below middle; culms to 2.5 m tall; leaves to 109 cm long and 9.5 mm wide \(\qquad\) A. tenuispatheus

26 Raceme sheaths (1.7-) 2.4-3.1 (-4.0) mm wide; keels of first glume scabrous only above middle; culms less than 1.7 m tall; leaves less than 35 cm long and 5.5 mm wide ..................................... A. virginicus var. decipiens
\{add A. floridanus\}
* Andropogon arctatus Chapman, Florida Bluestem. Cp (NC): moist disturbed ground; rare, apparently introduced from farther south (NC Watch List). This curious record (the specimen at GH, collected by Randolph and Randolph in 1922 in Pamlico County, NC, annotated as \(A\). arctatus by Campbell) is likely a waif. The species is native to pinelands from \(n\). FL west to w. panhandle of \(F L\) and adjacent s. AL, south to s. FL. [= FNA, HC, K, S, Z]

Andropogon brachystachyus Chapman, Shortspike Bluestem. Cp (GA, SC): moist to wet pinelands, natural pond margins, bogs, disturbed roadsides; rare (GA Special Concern). Se. SC (McMillan et al. 2002) south to FL, south to s. FL, west to e. FL Panhandle. A. brachystachyus is considered by some to range north to NC. [= FNA, K, Z; = A. brachystachys -- GW, HC, S, orthographic variant]

Andropogon capillipes Nash var. 1, Wetland White Bluestem. Cp (GA, NC, SC): wet savannas, ditches adjacent to savannas, depressional wetlands; common. September-October. S. NJ south to s. FL and west to e. TX; also in the Bahamas (Sorrie \& LeBlond 1997). Campbell (1983) informally describes two "variants" of this species (which he treats at the varietal level, as \(A\). virginicus var. glaucus). A. capillipes is clearly a species distinct from A. virginicus; moreover, the substantial morphological and ecological differences between Campbell's two "variants" (which he describes as nearly always sharply distinct, even when
growing in close proximity) warrant recognition as good species, or at least as varieties. [ \(\ll A\). virginicus -- RAB, in part only; < \(A\). virginicus var. glaucus Hackel -- F, FNA, in part only; <A. capillipes -- GW, HC, K, S, infraspecific taxa not distinguished; = \(A\). virginicus var. glaucus "wetlands variant" -- Z; = A. virginicus var. dealbatus Mohr ex Hackel]

Andropogon capillipes Nash var. capillipes, Dryland White Bluestem. Cp (GA, NC, SC): dry to mesic pine flatwoods, sandhills, adjacent roadbanks; uncommon. September-October. Se. NC south to s. FL and west to s. AL. See A. capillipes var. 1 for discussion of these two taxa. The type of A. capillipes (collected by A.H. Curtiss in FL) is of this taxon; Nash (1900) states that it occurs "in dry soil, North Carolina to Florida" and emphasizes that it is "abundantly distinct from A. virginicus, to which it is related." [<< A. virginicus -- RAB, in part only; < A. virginicus var. glaucus Hackel -- F, FNA, in part only; < A. capillipes -- GW, HC, K, S, infraspecific taxa not distinguished; = A. virginicus var. glaucus "drylands variant" -- Z]

Andropogon elliottii Chapman. Cp, Pd, Mt (GA, NC, SC, VA): dry to moist forests, woodlands, fields, and disturbed areas; common (uncommon in Mountains). September-October. Widespread in se. United States, from s. NJ west to s. IN, s. IL, s. MO, south to s. FL and TX. Campbell (1983) argued that the name A. elliottii should be replaced by A. gyrans; Ward (2004c) argues for retention of the traditional A. elliottii. [= RAB, F, G, HC, S; A. gyrans Ashe -- C, W; A. campyloracheus Nash -- RAB, S; A. gyrans var. gyrans -- FNA, K, Z; A. elliottii var. gracilior Hackel -- F, G; A. elliottii var. projectus Fernald \& Griscom -- G]

Andropogon floridanus Scribner, Florida Bluestem. Cp (GA): longleaf pine sandhills; rare. September-October. S. GA west to FL Panhandle, south to s. FL. Reported for e. and s. GA (FNA, Jones \& Coile 1988). [= FNA, HC, K, S]

Andropogon gerardii Vitman, Big Bluestem, Turkeyfoot. Cp, Pd, Mt (GA, NC, SC, VA): in a wide variety of habitats, usually rather dry, such as sandhills, glades, cliffs, and rock outcrops, in the Piedmont in woodlands, former prairie-like sites, woodlands, open forests, and river-scour grasslands, in the Mountains in glades, riverside scour areas, and rarely in grassy balds, ascending to at least 1600 m over mafic rocks (on Old Field Bald, Watauga and Ashe counties, NC); common. July-October. Québec west to Saskatchewan, south to FL and AZ. Some favor treating A. hallii Hackel as a subspecies of A. gerardii (Wipff 1996c). I do not agree, but if that course is followed, then our eastern taxon should be known as A. gerardii ssp. gerardii. [= RAB, C, FNA, G, GW, HC, K, W; A. gerardii var. gerardii -- F; A. provincialis Lamarck -- S]

Andropogon glaucopsis Elliott, Chalky Bluestem. Cp (GA, NC, SC, VA): wet savannas, pine flatwoods, ditches, wet disturbed sites; uncommon (VA Watch List). September-October. Se. VA south to c. peninsular FL and west to e. TX. The extent of the western Gulf Coastal Plain distribution (to e. TX) is based on specimens in Texas herbaria (Sorrie, pers. comm.). [=GW, K; \(\ll\) A. virginicus --- RAB, in part only; = A. virginicus var. glaucopsis (Elliott) A.S. Hitchcock -- F, HC; = A. glomeratus var. glaucopsis (Elliott) A.S. Hitchcock -- FNA, Z; << A. glomeratus -- S, in part]

Andropogon glomeratus (Walter) Britton, Sterns, \& Poggenburg var. glomeratus. Cp, Pd, Mt (GA, NC, SC, VA): swamps, wet savannas, pine flatwoods, wet disturbed sites; common. September-October. S. MA south to c. peninsular FL and west to s. MS, primarily on the Coastal Plain, but scattered inland to w. PA, WV, c. KY, c. TN and AR. [= FNA, K, Z; <<A. virginicus -- RAB, in part only; = A. virginicus var. abbreviatus (Hackel) Fernald \& Griscom -- C, F, G, GW; < A. glomeratus -- HC, S, W, infraspecific taxa not distinguished]

Andropogon glomeratus (Walter) Britton, Sterns, \& Poggenburg var. hirsutior (Hackel) C. Mohr. Cp (GA, NC, SC, VA): wet savannas, pine flatwoods, adjacent ditches, other wet disturbed sites; common. September-October. E. MD south to c. peninsular FL west to se. LA. This taxon should be recognized at the specific level, but the appropriate combination has not been made. [= FNA, K, Z; <<A. virginicus -- RAB, in part only; A. virginicus var. glaucopsis (Elliott) A.S. Hitchcock - G?, mispplied; = A. virginicus var. hirsutior (Hackel) A.S. Hitchcock; < A. glomeratus -- HC, S, infraspecific taxa not distinguished]

Andropogon longiberbis Hackel, Longbeard Bluestem. Cp (GA, NC, SC): dry sandy soils of sandhills and dunes; rare (GA Special Concern, NC Watch List). September-October. Se. NC south to s. and w. FL, and in the Bahamas. [= FNA, HC, K, S, Z]

Andropogon mohrii (Hackel) Hackel ex Vasey, Tawny Bluestem, Bog Bluestem. Cp (GA, NC, SC, VA): wet savannas, sphagnous bogs; rare (GA Special Concern, NC Rare, VA Rare). September-October. Se. VA south to n. FL, west to LA. [= RAB, C, F, G, GW, HC, K, S; = A. liebmannii Hackel var. pungensis (Ashe) C.S. Campbell -- FNA, Z]

Andropogon perangustatus Nash, Narrow-leaved Bluestem. Cp (GA, NC, SC, VA): clay-based Carolina bays and boggy wetlands; rare (NC Watch List, VA Watch List). August-October. E. VA south to c. peninsular FL, east to e. TX. Growth form, general appearance, and habitat (dense bluish tussocks with very narrow leaves and long ligules, growing in wet areas such as claybased Carolina bays) make A. perangustatus readily recognizable. [= HC, S; = A. gyrans Ashe var. stenophyllus (Hackel) C.S. Campbell -- FNA, K, Z; = A. elliottii Chapman var. stenophyllus (Hackel) D,B. Ward]

Andropogon tenuispatheus (Nash) Nash. Cp (GA, NC, SC, VA), Pd (GA, NC, SC): moist, disturbed sites; common (VA Watch List). September-October. Se. VA and c. OK south to s. FL and w. TX, also south into Central America and the Caribbean. \([\ll A\). virginicus -- RAB, in part only; = A. glomeratus (Walter) Britton, Sterns, \& Poggenburg var. pumilus Vasey ex Dewey -- FNA, K, Z ("robust variant"); < A. glomeratus -- HC, S, infraspecific taxa not distinguished]

Andropogon ternarius Michaux var. ternarius, Splitbeard Bluestem. Cp, Pd, Mt (GA, NC, SC, VA): dry to moist soils; common (uncommon in Mountains). September-October. Var. ternarius ranges from DE west to KY and s. MO, south to FL and TX. Var. cabanisii (Hackel) Fernald \& Griscom is endemic in s. and c. peninsular FL. [= FNA, K, Z; < A. ternarius -- RAB, C, F, G, W, infraspecific taxa not distinguished; A. ternarius var. glaucescens (Scribner) Fernald \& Griscom -- F; = A. ternarius -- HC, S, in the narrow sense]

Andropogon tracyi Nash, Tracy's Bluestem. Cp, Pd (GA, NC, SC): dry sandy or clayey soils of sandhills, disturbed sites; rare (NC Watch List). September-October. E. NC south to s. FL and west to MS. [= FNA, HC, K, S, Z]

Andropogon virginicus Linnaeus var. decipiens C.S. Campbell, Deceptive Bluestem. Cp (GA, NC, SC, VA): savannas, flatwoods, disturbed pinelands; uncommon (VA Watch List). September-October. Se. VA south to s. FL and west to w. FL; also in the Bahamas (Sorrie \& LeBlond (1997). [= FNA, K, Z (1986); <<A. virginicus -- RAB, S, in part only; <A. virginicus var. virginicus -F, G, HC, Z (1983 -- "deceptive variant"), in part only]

Andropogon virginicus Linnaeus var. virginicus, Old-field Broomstraw, Broomsedge, "Sedge Grass", "Sage Grass". Cp, Pd, Mt (GA, NC, SC, VA): old fields, roadbanks, disturbed sites; common. September-October. Widespread, from MA west to MI and e. KA, south to FL and e. TX, and in the Caribbean and Central America. Campbell (1983) recognized 3 "variants" within \(A\).
virginicus var. virginicus; the "deceptive variant" he later (1986) described formally as var. decipiens (see above). The "old-field variant" is the common "variant" in our area, occurring abundantly throughout the state. It has green stem internodes and the leaves usually pubescent, at least on the margins near the collar. The "smooth variant" is known only from the Coastal Plain and is apparently rare in our area, known from NC and SC (Berkeley and Marion counties; P. McMillan, pers. comm.). It has glaucous stem internodes and glabrous leaves. It is unclear whether the "smooth variant" warrants taxonomic recognition. [= FNA, K, Z ("oldfield variant" and "smooth variant"); <<A. virginicus -- RAB, S, W, in part only; <<A. virginicus var. virginicus -- C (in a very broad sense); <A. virginicus var. virginicus -- F, G, HC, in part only (also see var. decipiens); <A. virginicus var. tetrastachyus (Elliott) Hackel -- F]

\section*{Anthenantia Palisot de Beauvois (Silkyscale)}

The genus is sometimes considered to contain only the two species treated here; others include one or two tropical species sometimes treated in Leptocoryphium in Anthaenantia. Clayton \& Renvoize (1986) state that "Anthenantia is the etymologically correct version of three alternative spellings given by Beauvois." References: Wipff in FNA (2003a); Crins (1991)=Z; Kral (2004)=Y; Clayton \& Renvoize (1986).

1 Leaves mostly 3-5 mm wide, ascending to erect, not squarrose (lacking a sharp bend outward at the summit of the sheath), medium green, with a very short taper to a blunt or rounded apex, the lower sheaths crowded and keeled (therefore distichous), generally suffused with purple; spikelets usually purple (fading tan); leaf margins scaberulous . . . . . . . . . . . . . . . . . . A. rufa 1 Leaves mostly \(5-10 \mathrm{~mm}\) wide, spreading, usually squarrose (with a sharp bend outward at the summit of the sheath), yellowish green, with a long taper to a sharp apex, the lower sheaths not crowded, keeled, or distichous, green; spikelets usually green (fading yellow); leaf margins papillose-ciliate towards the base
A. villosa

Anthenantia rufa (Nuttall) J.A. Schultes, Purple Silkyscale. Cp (GA, NC, SC): wet savannas in the outer Coastal Plain, seepage bogs and moist sandhill-pocosin ecotones in the fall-line sandhills; rare (NC Watch List, SC Rare). September-October. Se. NC south to \(n\). FL and west to w. LA. A. rufa inhabits much wetter habitats than the similar A. villosa, and is more typical of the outer Coastal Plain. Plants without culms are reminiscent of the Liliaceae. [= FNA, Y; = Anthaenantia rufa -- RAB, GW, HC, K, S, Z, orthographic variant]

Anthenantia villosa (Michaux) Palisot de Beauvois, Green Silkyscale. Cp (GA, NC, SC): sandhills, especially in submesic swales; uncommon (rare in the outer Coastal Plain). September-October. Se. NC south to s. FL and west to e. TX. A. villosa is found in drier habitats than A. rufa, most typically in upland swales in the sandhills. [= FNA, Y; = Anthaenantia villosa -- RAB, HC, K, S, Z, orthographic variant]

\section*{Anthoxanthum Linnaeus (Vernal Grass)}

\section*{Aristida Linnaeus (Three-awn Grass)}

A genus of about 250-300 species, widespread in the tropics, subtropics, and warm temperate zones. References: Allred in FNA (2003a); Allred (1986)=Z; Allred (1984, 1985); Peet (1993)=Y; Ward (2001)=X; Henrard (1929)=Q; Kesler, Anderson, \& Hermann \((2003)=V\). Key adapted, in part, from Z.

Identification notes: the awns must be dry and relatively mature to assume their characteristic positions (immature awns and moist mature awns are erect and parallel). It is sometimes useful to dry a collection unpressed. Beware, however, that drying followed by dispersal can take place very quickly under the right conditions (such as the dashboard of a hot car)!

1 Plant a perennial, forming dense tussocks, the leaves primarily basal, usually very numerous, mostly more than 3 dm long, 0.5 -
1.5 mm wide, almost always tightly involute; flowering only in the growing season following fire.

2 Base of blade and collar (and often the upper sheath) with conspicuous tuft or bearding of woolly to villous pubescence (sometimes deciduous on foliage more than a year old); leaves usually glabrous above the basal 2 cm of the blade; [of s . SC south]
A. beyrichiana

2 Base of blade, collar, and upper sheath lacking a conspicuous tuft of woolly to villous pubescence; leaves with 2 lines of villous pubescence on either side of the midrib on the lower surface extending nearly or entirely the length of the blade (sometimes deciduous on foliage more than a year old); [of \(n\). SC and NC] .
1 Plant an annual or perennial, forming small tufts (or solitary), the leaves primarily cauline, usually few, mostly less than 3 dm long (if as long as 3 dm then more than 2 mm wide), flat to slightly folded, but not wiry; flowering not strongly triggered by fire.
3 First glume 3-7 nerved
A. oligantha

3 First glume 1-2-nerved.
4 Lateral awns less than 8 mm long; plant an annual.
5 Central awn 1-27 mm long, not spirally coiled at its base (above the awn column), either straight, curving, or contorted (when dry); lateral 2 awns \(0-18 \mathrm{~mm}\) long, contorted at base and more-or-less divergent.
6 Central awn (8-) 12-27 mm long; lateral awns (1-) 6-18 mm long . . . . . . . A. Iongespica var. geniculata 6 Central awn mostly 1-10 (-14) mm long; lateral awns 0-5 (-8) mm long . . A. Iongespica var. Iongespica
5 Central awn \(3-8 \mathrm{~mm}\) long, spirally coiled at its base (above the awn column) like a corkscrew, \(1 / 2\) to 3 full turns (when dry); lateral 2 awns \(0.7-4 \mathrm{~mm}\) long, straight, erect.
7 First glume \(1 / 2\) to \(2 / 3\) as long as the second glume; lemma 6-11 mm long, glabrous to scaberulous
7 First glume as long as or nearly as long as the second glume; lemma 3-8 mm long, sparsely appressedpubescent
4 Lateral awns more than 8 mm long; plant an annual or perennial.
8 Sheaths lanose or floccose (the hairs kinked and intertwined); nodes of the panicle axis with tufts of lanose or floccose hairs
A. Ianosa

8 Sheaths glabrous to pilose (the hairs straight and usually appressed, not intertwined); nodes of the panicle axis glabrous or pilose.
9 Awn column (the connivent awns twisted together) or lemma beak (slender, narrowed, and twisted portion of lemma body below the awns) \(7-30 \mathrm{~mm}\) long; lemma body (including the beak, if present) separated from the awns (or awn column) by an articulation zone, the awns (or awn column) disarticulating at maturity from the lemma.
10 Panicle spiciform, broadest near the middle, dense, the spikelets overlapping strongly; awns (10-) 2030 mm long, borne at the summit of a twisted lemma beak \(7-30 \mathrm{~mm}\) long; culms simple or with very few branches; plants perennial \(\qquad\) A. spiciformis 10 Panicle almost corymbiform, broadest above the middle, open, the spikelets overlapping only slightly; awns \(30-40 \mathrm{~mm}\) long, not including the \(8-15 \mathrm{~mm}\) long column formed by the twisting together of the 3 awn bases; culms often much-branched; plants annual
A. tuberculosa

9 Awn column or lemma beak absent or less than 7 mm long; lemma body not separated from the awns by an articulation zone.
11 Spikelets borne singly at each node of the main axis, the inflorescence thus a spike or raceme
A. mohrii

11 Spikelets 2 or more per node of the main axis at most nodes (a few nodes may have single spikelets), often with side branches present as well, the inflorescence thus a panicle or raceme.
12 First glume \(1 / 3\) to \(3 / 4\) as long as the second glume; awns \(40-100 \mathrm{~mm}\) long
A. purpurea var. longiseta

12 First glume more than \(3 / 4\) as long as the second glume; awns \(8-40 \mathrm{~mm}\) long.
13 Annual.
A. Iongespica var. geniculata

13 Perennial.
14 Central awn 15-40 mm long; first glume prominently 2-keeled, (8-) 9-14 mm long when mature . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. palustris
14 Central awn 8-25 mm long; first glume either 1-keeled and 6-14 mm long, or weakly 2keeled and 5.5-9 (-10) mm long when mature.
15 Central awn about \(2 \times\) as thick as the lateral awns, divergent to reflexed; first glume 1-keeled or weakly 2-keeled; [plants of moist to wet habitats].
16 Basal internode of the culm 0.3-0.6 mm wide; most nodes of the inflorescence with 1-2 spikelets; all awns spreading, the central spirally twisted basally and often contorted by as much as 180 degrees (best seen in fresh material); central awn \(15-20 \mathrm{~mm}\) long, lateral awns \(11-16 \mathrm{~mm}\) long, the ratio of the lateral:central awn length 0.69-0.80; lemma callus beard 0.61.0 mm long .

16 Basal internode of the culm 0.7-1.2 mm wide; most nodes of the inflorescence with 3 or more spikelets; central awn spreading to slightly deflexed, not spirally twisted basally, the lateral awns ascending to erect (best seen in fresh material); central awn 13-22 mm long, lateral awns 8-15 mm long, the ratio of the lateral:central awn length \(0.55-0.69\); lemma callus beard 0.2-0.6 mm long
A. virgata

\section*{Flora of the Carolinas, Virginia, and Georgia, Working Draft of 10 June 2005 -- POACEAE}

15 Central awn less than \(1.5 \times\) as thick as the lateral awns, erect to divergent; first glume 1-keeled (rarely weakly 2 -keeled); [plants of dry habitats].
17 Culms mostly more than 10 dm tall and \(3-6 \mathrm{~mm}\) in diameter near the base; awns \(8-15 \mathrm{~mm}\) long; panicle branches 4 cm or more long; callus ca. 1.0 mm long
A. condensata

17 Culms 5-8 (-10) dm tall and 1-4 mm in diameter near the base; awns 12-25 mm long; panicle branches \(1-4 \mathrm{~cm}\) long; callus \(0.4-0.8 \mathrm{~mm}\) long.
18 First glume \(1-4 \mathrm{~mm}\) longer than the second glume (rarely about equal to it); awns \(15-25 \mathrm{~mm}\) long, straight or slightly contorted at the base; leaf blades 1-3 mm wide, usually curling . . . . . . . . A. purpurascens
18 First glume shorter than or about equal to the second glume; awns 1218 mm long, spirally contorted at the base; leaf blades about 1 mm wide, usually not curling
A. tenuispica

Aristida beyrichiana Trinius \& Ruprecht, Southern Wiregrass. Cp (GA, SC): sandhills, savannas, from very dry to seasonally saturated soils; common. September-November. S. SC south to s. FL, west to s. MS. See Peet (1993) for discussion of the taxonomy and ecology of this species; also see comments under A. stricta, which also apply here. Ward (2001) proposes varietal status for A. stricta and A. beyrichiana. [= K, Y; A. stricta -- RAB, FNA, GW, HC, S, V, Z, in part; A. stricta Michaux var. beyrichiana (Trinius \& Ruprecht) D.B. Ward - X]

Aristida condensata Chapman, Big Three-awn. Cp (GA, NC, SC): dry sandy soils of sandhills; rare (NC Watch List, SC Rare). August-October. Sc. NC south to s. FL, west to s. MS (Sorrie \& Leonard 1999). [= RAB, FNA, HC, K, S, Z]

Aristida curtissii (A. Gray ex S. Watson \& Coulter) Nash, Curtiss's Three-awn. Cp, Pd (GA, NC, SC, VA): roadsides, disturbed areas, bare eroding soil; uncommon. August-October. ME west to WY, south to FL, AR, OK, and CO, perhaps largely or entirely adventive in our area. See \(Z\) for a discussion of the rationale for reducing \(A\). curtissii to a variety of \(A\). dichotoma. C reduces it to a variety of the more western A. basiramea Engelmann ex Vasey. For now, and for simplicity, I prefer to retain the two as species. [= RAB, G, HC, S; = A. basiramea Engelmann ex Vasey var. curtissii (A. Gray ex S. Watson \& Coulter) Shinners -C ; = A. dichotoma Michaux var. curtissii A. Gray -- F, FNA, K, W, Z]

Aristida dichotoma Michaux, Fork-tip Three-awn. Cp, Pd, Mt (GA, NC, SC, VA): roadsides, fields, disturbed areas, bare eroding soil; common. August-October. ME west to WI, south to FL and TX. See A. curtissii for comments. [= RAB, C, G, HC, S; A. dichotoma var. dichotoma -- F, FNA, K, W, Z]

Aristida lanosa Muhlenberg ex Elliott, Woollysheath Three-awn. Cp, Pd (GA, NC, SC, VA): dry sandy soils of sandhills and fields; common, rare in Piedmont (VA Watch List). August-October. NJ south to FL, west to TX, north in the interior to MO and OK. [= RAB , C, F, FNA, G, HC, K, S, Z; A. lanosa var. macera Fernald \& Griscom -- F]

Aristida longespica Poiret var. geniculata (Rafinesque) Fernald, Eastern Slim-spike Three-awn. Cp, Pd (GA, NC, SC, VA), Mt (NC, SC, VA): disturbed areas; common? August-October. The distribution and habitats of the 2 varieties in our area are poorly known, pending further field and herbarium investigation. [=C, F, FNA, HC, K, Z; A. longespica -- RAB, G, W, infraspecific taxa not distinguished; A. intermedia Scribner \& Ball -- F, G, S]

Aristida longespica Poiret var. Iongespica, Eastern Slim-spike Three-awn. Cp, Pd (GA, NC, SC, VA), Mt (NC, SC, VA): disturbed areas; uncommon? August-October. The distribution and habitats of the 2 varieties in our area are poorly known, pending further field and herbarium investigation. [=C, F, FNA, HC, K, Z; A. longespica -- RAB, G, W, infraspecific taxa not distinguished; \(A\). longespica -- S , in the narrow sense]

Aristida mohrii Nash, Mohr's Three-awn. Cp (GA, SC): sandhills; rare. August-October. Panhandle FL and sw. GA west to s. AL; apparently disjunct in SC (Chesterfield and Richland counties). [= FNA, HC, K, S, Z]

Aristida oligantha Michaux, Prairie Three-awn. Pd, Cp, Mt (GA, NC, SC, VA): roadsides, fields, disturbed areas; common. August-October. VT west to SD, south to FL and TX, scattered elsewhere as a weed. [= RAB, C, F, FNA, G, HC, K, W, S, Z]

Aristida palustris (Chapman) Vasey, Longleaf Three-awn. Cp (GA, NC, SC): wet pine savannas, limesink depressions; uncommon. August-October. Se. NC south to FL, west to TX; apparently disjunct on the Cumberland Plateau of KY. [= C, FNA, K, S, Z; = A. affinis (Schultes) Kunth -- RAB, F, G, GW, HC, misapplied]

Aristida purpurascens Poiret, Arrowfeather. Cp, Pd, Mt (GA, NC, SC, VA): dry habitats, especially in dry sandy soils; common. August-October. MA west to WI and KS, south to FL and TX. In the Sandhills occurring in two forms, one green, the other strongly glaucous-blue. [= RAB, C, G, HC, S, W; > A. purpurascens var. purpurascens \(-\mathrm{F} ;>\mathrm{A}\). purpurascens var. minor Vasey -- F; = A. purpurascens var. purpurascens -- FNA, K, Z]
* Aristida purpurea Nuttall var. Iongiseta (Steudel) Vasey, Red Three-awn. Cp (SC): disturbed areas; rare, adventive from further west. August-October. Also reported from NC, but the collection is from a Soil Conservation Service test nursery, and there is no evidence of naturalization. [= C, FNA, K, Z; A. longiseta var. robusta Merrill -- F; A. longiseta Steudel -- G, HC]

Aristida simpliciflora Chapman, Southern Three-awn, Chapman's Three-awn. Cp (GA, NC): wet pine savannas; rare (GA Special Concern, NC Rare). Sw. GA west through the FL Panhandle and c. AL to s. MS (Sorrie \& Leonard 1999), and south into central Peninsular Florida; also in se. NC, where apparently disjunct (it should be searched for in SC). A. simpliciflora was believed to be a Gulf Coastal Plain endemic until found by R. LeBlond in 1999 in wet savannas in se. NC (Green Swamp savannas, Brunswick County; Old Dock Savanna, Columbus County; and The Neck Savanna, Pender County). It is reported for sw. GA (Jones \& Coile 1988, Kartesz 1999). Harper also reports it for c. GA. [= FNA, HC, K, S, Z]

Aristida spiciform is Elliott, Bottlebrush Three-awn, Spike Three-awn. Cp (GA, NC?, SC): wet pine savannas and seepage areas; rare (NC Watch List). August-October. E. SC (McMillan et al. 2002) south to FL, west to MS. Allred (1986) also reports this species from NC, but the documentation is unknown to me. [= RAB, FNA, GW, HC, K, S, Z]

Aristida stricta Michaux, Carolina Wiregrass, Pineland Three-awn. Cp (NC, SC), Pd (NC): Coastal Plain pinelands of nearly all sorts, ranging from the driest white-sand sandhills to seasonally saturated pine savannas dominated by a mixture of longleaf pine
and pond pine, largely or entirely replaced in the wettest savannas by Sporobolus teretifolius, Sporobolus pinetorum, Muhlenbergia expansa, Ctenium aromaticum, and Calamovilfa brevipilis; also in Piedmont areas adjacent to the Coastal Plain and formerly supporting fire-maintained longleaf pine woodlands; common, rare in Piedmont. September-November. Ne. NC (south of Albemarle Sound and the Roanoke River), south to ne. SC (Lee and Kershaw counties). A. stricta was the keystone species of much of the upland Coastal Plain of the Carolinas. Its flammable foliage facilitated the spread of lightning-set fires that maintained the biologically rich pine savanna, sandhill, and pine flatwood ecosystems once widespread in our area. Though still locally common in parts of the Sandhill region and in portions of Brunswick, Pender, Onslow, and Carteret counties, NC, A. stricta is much rarer than formerly. The conversion of vast acreages of former pinelands to agriculture, pine tree farms, and developed areas has taken its toll over the years. In the twentieth century, suppression of fire has also led to the destruction of \(A\). stricta. More recently, pine-straw raking is leading to the serious decline of A. stricta in its few remaining strongholds on public lands. A. stricta has little tolerance for ground disturbance. See Peet (1993) for discussion of the taxonomy and ecology of this species. Ward (2001) proposes varietal status for A. stricta and A. beyrichiana. [=K, Y; A. stricta -- RAB, FNA, GW, HC, S, V, Z, in part only (also see A. beyrichiana); A. stricta var. stricta - X]

Aristida tenuispica A.S. Hitchcock, Southern Arrowfeather. Cp (GA, NC, SC): sandy habitats in the Coastal Plain; uncommon? August-October. NC south to FL and west to MS. [= HC, S; A. purpurascens Poiret var. tenuispica (A.S. Hitchcock) Allred -- FNA, K, Z]

Aristida tuberculosa Nuttall, Seabeach Needlegrass. Cp (GA, NC, SC, VA): sandhills, coastal dunes (in VA), other dry, sandy habitats such as sandy roadsides; common, rare in VA (VA Watch List). August-October. Se. NH south to NJ and disjunct in e. VA in the outer Coastal Plain; from sc. NC south to Panhandle FL and west to s. MS (Sorrie \& Leonard 1999), mostly in the inner Coastal Plain; and also near the Great Lakes in sw. MI, n. IN, n. IL, s. WI, se. MN, and e. IA. The curious trimodal distribution is unexplained. [= RAB, C, F, FNA, G, HC, K, S, Z]

Aristida virgata Trinius. \(\mathrm{Cp}(\mathrm{GA}, \mathrm{NC}, \mathrm{SC}, \mathrm{VA}), \mathrm{Pd}(\mathrm{GA})\), Mt (NC): moist to wet savannas, mountain bogs (Henderson Co., NC), other moist habitats; common. August-October. S. NJ south to FL, west to TX, primarily on the Coastal Plain. [= RAB, C, F, G, GW, HC, S; A. purpurascens Poiret var. virgata (Trinius) Allred -- FNA, K, Z]
* Aristida adscensionis Linnaeus, Sixweeks Three-awn, has been reported as an introduction (from western United States) in SC (FNA, Kartesz 1999). \{investigate\} [= F, FNA, G, K] \{not yet keyed; add synonymy\}

Aristida basiramea Engelmann ex Vasey, Forktip Three-awn. Occurs in VA, SC, etc. (FNA). [=F, FNA, G, K; = A. basiramea var. basiramea - C] \{not yet keyed; add synonymy\}

Aristida gyrans Chapman, Corkscrew Three-awn. Cp (GA): dry pinelands; rare (GA Special Concern). E. GA and w. Panhandle FL, south to s. FL. In Bryan, Long, and Montgomery counties in e. GA (Sorrie 1998b), and in wc. GA (J. Allison, pers. comm.). [= FNA, K, S] \{not yet keyed; add synonymy\}

Aristida ramosissima Engelmann ex A. Gray. East to Panhandle FL, c. TN, and e. KY (FNA) and might occur in our area. It is similar to \(A\). oligantha and will key to it; it differs in having the central awn of the lemma 9-30 mm long (vs. 30-70 mm long), and the awn of the second glume 3-7 mm long (vs. \(7.5-17 \mathrm{~mm}\) long). [= C, F, FNA, G, K, S] \{not yet keyed; add synonymy\}

Allred (1986) reports the collection of several additional non-native species from our area, including A. divaricata Willdenow from sw. United States (from a Soil Conservation Service test nursery in Chapel Hill, NC) and uncertainly identified material of an Australian species (from a wool-combing mill at Jamestown, SC). There is no evidence that either are naturalized.

\section*{Arrhenatherum Palisot de Beauvois (False Oatgrass)}

References: Tucker (1996)=Z.
1 Base of culm consisting of a series of adjacent (moniliform) corms ca. 1 cm in diameter .......... A. elatius var. bulbosum
1 Base of culm not swollen or cormose . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . A. elatius var. elatius

This variety was apparently cultivated for the edible tubers in Bronze Age Europe (Tucker 1996). Cited for VA in HC. [= C, F, G, HC, K, Z; A. elatius -- RAB, GW, W, infraspecific taxa not distinguished; A. elatius var. tuberosum -- S]
* Arrhenatherum elatius (Linnaeus) J. \& K. Presl var. elatius, Tall Oatgrass. Pd (GA, NC, VA), Mt, Cp (NC, VA): meadows, fields, roadsides; common, introduced from Europe. May-June. [= C, F, G, HC, K, S, Z; A. elatius -- RAB, GW, W, infraspecific taxa not distinguished]

\section*{Arthraxon Palisot de Beauvois (Basket Grass)}

References: van Welzen (1981)=Y; Thieret in FNA (2003a); Kiger (1971)=Z.
Identification notes: Sometimes confused (especially before flowering) with Microstegium, but Arthraxon has distinctly cordateclasping leaves, which Microstegium lacks. Also vegetatively similar to Oplismenus.
* Arthraxon hispidus (Thunberg) Makino var. hispidus, Basket Grass. Cp, Pd, Mt (GA, NC, SC, VA): moist ditches, bottomlands, disturbed areas; common, native of se. Asia. September-October. Like Microstegium, Arthraxon appears to be
steadily increasing its abundance in our area. [= FNA, Y; A. hispidus -- C, GW, K, Z, infraspecific taxa not distinguished; A. hispidus var. cryptatherus (Hackel) Honda -- RAB, F, G, HC, W]

\section*{Arundinaria Michaux (Cane)}

Both species of Arundinaria were much reduced by the foraging of free-range livestock in the eighteenth and early nineteenth centuries and by fire suppression in the late nineteenth century and throughout the twentieth century. "Canebrakes," large areas dominated by cane, were described in many historical accounts and apparently occupied large parts of the landscape of the Coastal Plain, also occurring in the Piedmont and low Mountains. References: Tucker (1988)=Y; McClure (1973)=Z; McClure (1963); Judziewicz et al. (2000)=X; Triplett, Weakley, \& Clark (in prep.)=Q. The key adapted from Y and Z.

1 Rhizomes lacking air canals; midstem sheaths mostly shorter than the corresponding internode; leaf blades glabrescent above; lemmas hirsute, greenish, the transverse veinlets clearly visible; lodicules translucent, marginally ciliate; ovary and grain with hooked apex; flowers borne on normal, leafy shoots; culms top 10 m tall
1 Rhizomes with longitudinal air canals (visible in cross-section as a cylinder of hollow canals 1 mm or less from the outer surface); midstem sheaths mostly longer than the corresponding internode; leaf blades pubescent above; lemmas glabrous, reddish, the transverse veinlets inconspicuous; lodicules transparent, entire; ovary and grain without hooked apex; flowers borne on specialized, non-leafy shoots; culms to 4 m tall
A. tecta

Arundinaria gigantea (Walter) Walter, Giant Cane. Mt, Pd, Cp (GA, NC, SC, VA): swamps, floodplains; common. April-July. Widespread in se. North America, ranging from s. DE s. OH, south to FL and e. TX. There has been much disagreement over the recognition of one, two, or several taxa of cane in the Southeastern United States. This species reaches heights of 6-7 (-10) m and is supposed to flower only once every 40-50 years. A. macrosperma Michaux is controversial, sometimes considered to be a synonym of A. gigantea or to represent hybridization or introgression between A. gigantea and A. tecta. [= HC, Q, S, Y; A. gigantea -- RAB, C, GW, in part only, also see A. tecta; A. gigantea ssp. gigantea -- K, X, Z; A. gigantea (Walter) Walter ssp. macrosperma (Michaux) McClure - X; A. macrosperma Michaux]

Arundinaria tecta Walter, Switch Cane, Small Cane. Cp, Pd (GA, NC, SC, VA): savannas, pocosins, canebrakes, generally (but not solely) in wetlands; common. April-July. Primarily a Southeastern Coastal Plain endemic: e. VA to FL and s. AL. A. tecta is a smaller plant than A. gigantea (normally 1-2 m tall, but reaching heights of up to 4 m where fire-suppressed), and flowers more frequently, supposedly every 3-4 years (Tucker 1988), probably actually in response to fire. [= HC, Q, S, Y; A. gigantea -- RAB, C, GW, in part; A. gigantea ssp. tecta (Walter) McClure -- K, X, Z]

Arundinaria sp. 1, Hill Cane. Mt, Pd (GA, NC, SC): dry to moist forests on slopes; common. The short plants on mountain slopes south of Asheville are autumn-deciduous, whereas "rivercane" appears to be evergreen. Additional study of this complex is underway. [= Q; apparently and implicitly included in the concept of either A. tecta or A. gigantea by earlier authors] \{not yet keyed\}

\section*{Arundo Linnaeus (Giant Reed)}

A genus of 3 species, widespread in the tropics, subtropics and warm-temperate areas. References: Allred in FNA (2003a).
* Arundo donax Linnaeus, Giant Reed. Cp, Pd (GA, NC, SC, VA), Mt (NC, VA): disturbed areas; uncommon, introduced from the Old World. September-October. Var. versicolor, with leaves transversely striped white and green, is better considered only as a form or cultivar. [= RAB , F, FNA, HC, K, S; A. donax var. donax - HC; A. donax var. versicolor (P. Miller) Stokes -- HC]

Avena Linnaeus 1753 (Oats)

References: Tucker (1996)=Z.
1 Lemmas pubescent with brown hairs; lemmas with long bent awns
A. fatua

1 Lemmas glabrous or scabrous; lemmas unawned or with relatively straight awns
A. sativa
* Avena fatua Linnaeus, Wild Oats. (VA). \{needs herbarium checks\}. [= C, F, G, HC, K]
* Avena sativa Linnaeus, Oats. Mt (NC, SC, VA), Pd, Cp (GA, NC, SC, VA): fields and disturbed areas; commonly cultivated, uncommonly escaping. May-June. An important crop, but apparently only a weed until transported from the Middle East to the moister central Europe, where cultivated beginning about 3000 BP (Hancock 2004). [= RAB, HC, G, K, S, W, Z; A. sativa var. orientalis (Schreber) Alefeld -- F; A. sativa var. sativa - F]

\section*{Axonopus Palisot de Beauvois (Carpet Grass)}

A genus of ca. 100 species, primarily tropical and subtropical. Phylogenetic studies suggest that Axonopus may be included in Paspalum. References: Barkworth in FNA (2003a).
```

1 Spikelets 4-6 mm long

1 Spikelets $1.5-2.8 \mathrm{~mm}$ long.
2 Spikelets 1.5-2.2 mm long; leaf blades mostly $8-10 \mathrm{~mm}$ wide $\ldots \ldots$. . . . . . . . . . . . . . . . . . . . . . . . . . . A. compressus

Axonopus compressus (Swartz) Palisot de Beauvois, Southern Carpet Grass. Cp (GA, SC, VA?): lawns; rare, probably introduced. Reported for VA by HC. Sometimes used as a lawn grass in the deep South. [= FNA, HC, K, S; Paspalum]

Axonopus fissifolius (Raddi) Kuhlm., Common Carpet Grass. Cp, Pd (GA, NC, SC, VA): sandy forests, roadsides, lawns; common. June-October. VA south to FL, west to TX and OK, and extending into tropical America. [= FNA, K; A. affinis Chase -RAB, GW, HC, W; = Paspalum fissifolium Raddi]

Axonopus furcatus (Flügge) A.S. Hitchcock, Big Carpetgrass. Cp (GA, NC, SC, VA), Pd (GA, NC, SC): sandy forests, bottomlands, roadsides, lawns; common. July-October. Se. VA south to FL, west to TX and AR. [= RAB, C, F, FNA, G, GW, HC, $\mathrm{K}, \mathrm{S}$; = Paspalum furcatum Flügge]

Bambusa Schreber (Bamboo)

* Bambusa vulgaris Schrad. ex J.C. Wendl., Common Bamboo, is reported for SC (Kartesz 1999). \{investigate\} [= K]

## Bothriochloa Kuntze (Beardgrass, Cane Bluestem)

A genus of ca. 35 species, widespread in tropical and subtropical regions of the Old and new World. References: Allred in FNA (2003a); Vega (2000)=Z; Allred \& Gould (1983)=Y. Key adapted from Allred in FNA (2003a).

1 Sessile spikelets 4.5-8.5 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . B. barbinodis
1 Sessile spikelets $3-4.5 \mathrm{~mm}$ long.
2 Pedicellate spikelets about as long as the sessile spikelets.
3 Rachises longer than the branches
[B. bladhii]
3 Rachises shorter than the branches ...................................... . . . . ischaemum var. songarica
2 Pedicellate spikelets much shorter than the sessile spikelets.
4 Panicles reddish when mature; hairs below the sessile spikelets sparse and ca. 1/4 as long as the spikelets, not obscuring the spikelets
[B. bladhii]
4 Panicles silvery-white or tannish when mature, hairs below the sessile spikelets dense and $>1 / 2$ as long as the spikelets, somewhat obscuring the spikelets . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . B. Iaguroides ssp. torreyana

* Bothriochloa barbinodis (Lagasca y Segura) Herter, Cane Bluestem, Pinhole Bluestem. Cp, Pd (SC): disturbed areas; rare, introduced from w. United States. [= FNA, K; Bothriochloa perforata (Trinius ex E. Fourn.) Herter - Z; Andropogon barbinodis Lagasca y Segura -- HC; Bothriochloa barbinodis (Lagasca y Segura) Herter var. perforata (Trinius ex E. Fourn.) Gould; Andropogon perforatus Trinius ex E. Fourn.]
* Bothriochloa ischaemum (Linnaeus) Keng var. songarica (Ruprecht ex Fischer \& C.A. Meyer) Celarier \& Harlan, King Ranch Bluestem. Cp (SC): disturbed places; rare, introduced from western North America. Reported for SC (Kartesz 1999). [= K, Z; B. ischaemum - FNA, infraspecific taxa not distinguished]
* Bothriochloa laguroides (Augustin de Candolle) Herter ssp. torreyana (Steudel) Allred \& Gould, Silver Bluestem. Cp (GA, SC), Pd (GA): disturbed areas; rare, introduced from. Reported for SC (Kartesz 1999), ne. GA (Jones \& Coile 1988; Allred \& Gould 1983), e. TN, and c. TN (Chester et al. 1993), in some cases as B. saccharoides var. torreyana. [= FNA, K, Y, Z; B. saccharoides (Sw.) Rydberg var. torreyana (Steudel) Gould]
* Bothriochloa bladhii (Retzius) S.T. Blake, Australian Bluestem, is reported from e. TN (according to specimen cited by FNA and Z) and FL. [= FNA, K, Z] \{add synonymy\}

Bothriochloa pertusa (Linnaeus) A. Camus, Pitted Bluestem. Introduced at scattered sites in e. North America, including FL, LA, MD, and MS (FNA, Kartesz 1999). [= FNA, K, Z] \{not yet keyed; add synonymy\}

## Bouteloua Lagasca y Segura (Grama)

A genus of about 40 species, of the Western Hemisphere. References: Herrera Arrieta, Peterson, \& de la Cerda Lemus (2004)=X; Columbus (1999)=Z; Gould (1979)=Y; Wipff in FNA (2003a); Snow in FNA (2003a). Key based in part on Wipff in FNA (2003a)

[^5]Panicle branches terminating in a spikelet . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . B. gracilis
Panicle branches extending beyond the base of the terminal spikelets . . . . . . . . . . . . hirsuta var. hirsuta

Bouteloua curtipendula (Michaux) Torrey var. curtipendula, Side-oats Grama. Mt (GA, VA), Pd (GA): dry rocky slopes and bluffs over limestone or serpentine, limestone glades; uncommon. July-September. S. CT west to MT, south to VA, e. TN, nw. GA, AL, panhandle FL, TX, AZ, and CA; also in Central and South America. The older literature refers to B. curtipendula as introduced in SC, but the single specimen documenting its occurrence there appears to be from experimental plantings at Clemson University; there is apparently no evidence of its establishment. B. curtipendula occurs on serpentine in the Piedmont of Georgia (Allison, pers. comm.). Var. caespitosa Gould \& Kapadia is cespitose rather than rhizomatous and occurs in sw. United States. [= C, FNA, K, Y; B. curtipendula -- RAB, F, G, HC, S, W, infraspecific taxa not distinguished]

Bouteloua dactyloides (Nuttall) J.T. Columbus, Buffalo Grass. Mt (VA), Pd, Cp (GA): disturbed areas; rare, introduced from w. North America. [= Z; Buchloe dactyloides (Nuttall) Engelmann - C, F, FNA, G, HC, K]

* Bouteloua gracilis (Willdenow ex Kunth) Lagasca y Segura ex Griffiths, Blue Grama. Cp (SC): disturbed areas; rare, introduced from western North America. Reported for SC (Gould 1979). [= F, FNA, K, Y; Bouteloua gracilis var. gracilis - HC]
* Bouteloua hirsuta Lagasca y Segura var. hirsuta, Hairy Grama. Cp (GA, SC): disturbed areas; rare, introduced from western North America. Reported for SC and GA (Kartesz 1999). [= K, Y; Bouteloua hirsuta - F, HC, infraspecific taxa not distinguished; Bouteloua hirsuta ssp. hirsuta - FNA]

Brachiaria<br>(see Urochloa)

## Brachyelytrum Palisot de Beauvois (Shorthusk)

The only other species of the genus is B. japonicum Hackel, of s. Japan, Korea, and ec. China (Saarela et al. 2003, Tucker 1988). References: Saarela et al. (2003)=Z; Tucker (1988)=Y; Stephenson (1971); Voss (1972); Campbell, Garwood, \& Specht (1986). Key based in part on Saarela et al. (2003).

1 Lemmas hirsutulous or minutely scabrous, the longest hairs (0.06-) 0.08-0.14 (-0.2) mm long (not evident at 10×); lemma (0.7-) 0.8-1.2 (-1.4) mm wide; widest leaf blade (8-) 10-14 (-16) mm wide; second glume (0.6-) avg. 1.2 ( -3.0 ) mm long; [plants of the Mountains] B. aristosum

1 Lemmas hirsute with hairs (0.2-) 0.4-0.8 (0.9) mm long (easily seen at $10 \times$ ); lemma (0.8-) 1.1-1.5 (-1.8) mm wide; widest leaf blade (9-) 11-17 (-20) mm wide; second glume (0.2-) avg. 2.2 (7.0) mm long; [plants widely distributed in our area]. B. erectum

Brachyelytrum aristosum (Michaux) Trelease in Branner \& Coville, Northern Shorthusk. Mt (GA, NC, VA): moist forests, mostly at moderate to high elevations, such as northern hardwoods and spruce-fir; rare (GA Special Concern, NC Watch List). JulyAugust. Fairly widespread in ne. North America, south in the mountains to sw. NC and n. GA. In MI, B. septentrionale flowers about 10 days before co-occurring $B$. erectum, with strongly synchronized anthesis of each species occurring on a single day (Stephenson 1971)). Reputed intermediates and hybrids between the two taxa are apparently based on the use of ambiguous characters. [= $Z$; Brachyelytrum septentrionale (Babel) G. Tucker - K, Y; B. erectum -- RAB, G, HC, S, W, in part; B. erectum var. septentrionale Babel -- F; B. erectum var. glabratum (Vasey ex Millspaugh) Koyama \& Kawano -- C]

Brachyelytrum erectum (Schreber ex Sprengel) Palisot de Beauvois, Common Shorthusk. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): mesic forests, in the Mountains at lower elevations than B. septentrionale); common (uncommon in Piedmont, rare in Coastal Plain). June-August. MA, NY, OH, MI, and s. WI south to FL and TX. [= K, Y, Z; B. erectum -- RAB, G, HC, S, W, in part only (see also B. septentrionale); B. erectum var. erectum -- C, F]

## Brachypodium Palisot de Beauvois

* Brachypodium sylvaticum (Hudson) Palisot de Beauvois ssp. sylvaticum, Slender False Brome. Pd (VA): roadsides and yards; rare, introduced from Europe. [= FNA; < B. sylvaticum - HC, K, infraspecific taxa not distinguished]

## Briza Linnaeus (Quaking Grass)

References: Tucker (1996)=Z.

* Briza maxima Linnaeus, Greater Quaking Grass. Cp (GA): disturbed areas; rare, introduced. Reported in e. GA (Jones \& Coile 1988). [= K] \{not yet keyed; add synonymy\}
* Briza minor Linnaeus, Lesser Quaking Grass. Cp (GA, NC, SC, VA), Pd (GA, NC, SC): fields, disturbed areas; common, introduced from Europe. April-June. [= RAB, C, F, G, GW, HC, K, S, Z]
* Briza media Linnaeus, Perennial Quaking Grass, reported for scattered locations in PA (Rhoads \& Klein 1993), MD, DE, and AL (Kartesz 1999). [= K] \{not yet keyed; add synonymy\}

1 Lemmas rounded or weakly keeled (the whole spikelet therefore terete to somewhat laterally flattened); first glume either 3-5-nerved or 1-3-nerved.
2 First glume 1 ( -3 ) nerved (only 1 nerve well-developed).
3 Longer lemma awns 1-6 (-8) mm long; plants perennial; [native and introduced species, collectively of disturbed and natural habitats].
4 Plants with creeping rhizomes, forming clonal colonies; both surfaces of leaves glabrous or glabrescent;
[section Bromopsis] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . B. inermis

4 Plants not strongly rhizomatous, the stems solitary or tufted; surfaces of leaf blades usually pubescent (sometimes sparsely so).
5 Pedicels erect or ascending, mostly shorter than the spikelet; leaves $2-3 \mathrm{~mm}$ wide; [introduced, of disturbed habitats]; [section Bromopsis]
5 Pedicels ascending at first, later arching-drooping, mostly longer than the spikelet; leaves 4-15 mm wide; [native, mostly of forests]; [section Pnigma].
6 Lemmas glabrous (or very minutely pubescent) on the back, hairy along the lower margins with long hairs
B. ciliatus

6 Lemmas uniformly hairy over the entire back-surface (or rarely entirely glabrous).
7 Culms with 10-20 leaves, often weak and leaning or reclining; junction of sheaths and base of leaf blades with 2 well-developed flanges prolonged into auricles or divergent spurs; second glume primarily 5-nerved; flowering late, with anthesis August-October .
B. latiglumis

7 Culms with 6-10 leaves, erect; junction of sheaths and base of leaf blades lacking flanges or auricles; second glume primarily 3 -nerved; flowering earlier, anthesis from May-August.
8 Underleaf surfaces with a conspicuous satiny sheen (when fresh); summit of sheath opposite the ligule with a conspicuous tuft of hairs
B. nottowayanus

8 Underleaf surfaces lacking a conspicuous satiny sheen; summit of sheath opposite the ligule lacking a conspicuous tuft of hairs . . . . . . . . . . . . . . . . . . . . . . . . . B. pubescens
3 Longer lemma awns 10-60 mm long; plants annual; [introduced species of disturbed habitats]; [section Genea].
9 Panicle dense, spikelike
B. rubens

9 Panicle open, not spikelike.
10 First glume 13-20 mm long; second glume $20-30 \mathrm{~mm}$ long; lemma awns $35-60 \mathrm{~mm}$ long . . ... . B. rigidus
10 First glume $5-14 \mathrm{~mm}$ long; second glume $8-17 \mathrm{~mm}$ long; lemma awns $10-30 \mathrm{~mm}$ long.
11 First glume $7-14 \mathrm{~mm}$ long; second glume $9-17 \mathrm{~mm}$ long; lemma awns $18-30 \mathrm{~mm}$ long .... B. sterilis
11 First glume 5-7 mm long; second glume 8-11 mm long; lemma awn (7-) 10-17 mm long
B. tectorum

2 First glume 3-5 nerved (at least 3 nerves well-developed).
12 Lemma awn 2-3 mm long; plant perennial; [native species of dry woodlands]; [section Pnigma] ........... B. kalmii
12 Lemma awn 3-12 mm long (or 0-6 mm long in B. secalinus); plant annual; [introduced species of disturbed habitats]; [section Bromus].
13 Panicle compact, the lateral branches erect or ascending, the pedicels less than 10 mm long (shorter than the spikelets) B. hordeaceus ssp. hordeaceus

13 Panicle relatively open, the lateral branches erect, ascending, or spreading, the pedicels more than 15 mm long (longer than the spikelets).
14 Margins of the lemmas involute in fruit, wrapping around the grain, exposing the rachilla . . B. secalinus 14 Margins of the lemmas gaping, overlapping in fruit.

15 Panicle branches erect or ascending, relatively stiff and straight $\qquad$ B. racemosus

15 Panicle branches spreading (at least the lower), either relatively stiff and straight, or flexuous and lax. 16 Panicle branches stiff; lemma awns 5-12 mm long, straight . . . . . . . . . . . . . . B. commutatus
16 Panicle branches flexuous and lax; lemma awns 7-15 mm long, flexuous ...... B. japonicus

* Bromus catharticus Vahl, Rescue Grass. Cp, Pd (GA, NC, SC, VA), Mt (NC, SC, VA): disturbed areas; common, native of South America. April-June. [= RAB, F, G, HC, K, W, X, Y; Bromus willdenowii Kunth -- C; Bromus unioloides Kunth -- S]

Bromus ciliatus Linnaeus, Fringed Brome. Mt (NC, VA): seepage areas, edges of fens, moist areas near high elevation creeks, grassy balds, high elevation woodlands, mostly over amphibolite or other mafic rocks; rare (NC Rare, VA Rare). JulyAugust. Widespread in n. North America: Labrador to AK, south in the east to PA, and in the mountains to NC. Known in NC only from Bluff Mountain and Long Hope Valley, Ashe and Watauga counties, and Roan Mountain, Mitchell County. [= RAB, C, G, HC, S, W, X, Y; > Bromus ciliatus var. ciliatus - F, K; = Bromopsis ciliata (Linnaeus) Holub]

* Bromus commutatus Schrader, Hairy Chess, Meadow Brome. Pd, Mt (GA, NC, SC, VA), Cp (NC, SC, VA): disturbed areas; common, native of Europe. May-June. The relationship and relative distribution of this species and Bromus racemosus is poorly known for our area. See Bromus racemosus for further comments. [= C, F, HC, K, S, X, Y; < Bromus commutatus -- RAB, in part only (also see Bromus racemosus); < Bromus racemosus -- G, W, in part]
* Bromus erectus Hudson, Short-branched Brome. Mt, Pd (VA): disturbed areas; rare, native of Europe. [= C, F, G, HC, K, S, X; = Bromopsis erecta (Hudson) Fourr.]

Bromus hordeaceus Linnaeus ssp. hordeaceus, Soft Chess, Lopgrass. Mt (NC, VA), Pd (VA), Cp (SC, VA): disturbed areas; rare, native of Europe. July. [= K, X; Bromus mollis Linnaeus -- RAB, F, G, HC, misapplied; < Bromus hordeaceus -- C, Y, infraspecific taxa not distinguished]

Bromus inermis Leysser, Smooth Brome, Hungarian Brome. Cp (NC, SC, VA), Mt (NC, VA), Pd (VA): disturbed areas; rare, native of Europe. June-July. [= RAB, C, G, HC, S, W, X, Y; Bromus inermis var. inermis -- F; Bromus inermis ssp. inermis var. inermis -- K; = Bromopsis inermis (Leysser) Holub]

* Bromus japonicus Thunberg ex Murray, Japanese Chess. Mt, Pd, Cp (GA, NC, SC, VA): disturbed areas; common, native of Asia. May-June. [= RAB, C, G, K, S, W, X, Y; > Bromus japonicus var. japonicus - F, HC; > Bromus japonicus var. porrectus Hackel -- F, HC]

Bromus kalmii A. Gray, Kalm Brome. Mt (VA): shale woodlands and barrens; rare (VA Rare). ME west to SD, south to MD, w. VA, and IA. Distinctive for its few leaves (usually 3-4) clustered near the base, the spikelets large and approximate to one another in a narrow, nodding panicle. [= C, F, G, HC, K, X]

Bromus latiglumis (Shear) A.S. Hitchcock, Riverbank Brome, Auricled Brome, Hairy Woodbrome, Flanged Brome. Mt (NC, VA), Pd (VA): alluvial soils along rivers; rare (NC Watch List). August-October. Widespread in ne. North America, from ME to MT, south to NC and OK. Flowering many weeks later than co-occurring B. pubescens. In NC apparently only along large rivers flowing west through the Appalachians into the Mississippi River drainage, notably the New and the French Broad. [= F, G, HC, K, X; < Bromus purgans Linnaeus -- RAB, in part; Bromus altissimus Pursh -- C ; < Bromus latiglumis -- Y , in part (also see Bromus nottowayanus)]

Bromus nottowayanus Fernald, Satin Brome, Nottoway River Brome, Virginia Brome. Pd (NC, VA), Cp, Mt (VA): moist forests, especially along small stream bottoms; rare (NC Watch List). June-August. The range of this species is poorly known, owing to confusion between it, B. pubescens and B. latiglumis. It is apparently known from MD, VA, and NC, west to TN, IL, IN, MO, and AR. McKenzie \& Ladd (1995) report on the biology and taxonomy of this species. [= C, F, HC, K, X; < Bromus purgans Linnaeus -- RAB, in part; < Bromus latiglumis -- Y, in part; = Bromopsis nottowayana (Fernald) Holub]

Bromus pubescens Muhlenberg ex Willdenow, Common Eastern Brome, Canada Brome. Mt, Pd (GA, NC, SC, VA), Cp (GA, VA): mesic forests, generally on rocky slopes, common. May-August. Widespread in e. North America: s. Ontario west to Alberta, south to $F L$ and $A Z$. [ $=\mathrm{C}, \mathrm{K}, \mathrm{W}, \mathrm{X}, \mathrm{Y} ;<$ Bromus purgans Linnaeus -- RAB, S, misapplied (and also including Bromus latiglumis and Bromus nottowayanus); Bromus purgans Linnaeus -- F, G, misapplied; Bromus purgans var. purgans - HC; Bromus purgans var. laeviglumis (Scribner ex Shear) Swallen -- HC; Bromus laeviglumis -- sensu S, misapplied (?); = Bromopsis pubescens (Muhlenberg ex Willdenow) Holub]

* Bromus racemosus Linnaeus, Smooth Brome. Pd, Cp, Mt? (NC, SC, VA): disturbed areas, native of Europe. May-June. The relative distribution, abundance, and habitats in our area of this species and B. commutatus poorly understood. Additional characters are as follows (from Stace 1997): lemmas 6.5-8 mm long (vs. 8-11 mm long in B. commutatus), anthers $\mathrm{mostly} 1.5-3 \mathrm{~mm}$ long (vs. mostly 1-1.5 mm long), spikelets $10-16 \mathrm{~mm}$ long (vs. $15-28 \mathrm{~mm}$ long), lowest rachilla segment mostly $0.7-1 \mathrm{~mm}$ long (vs. mostly 1.3-1.7 mm ). [= C, F, HC, K, X; < Bromus commutatus -- RAB, in part; < Bromus racemosus -- G, W, in part only (also see Bromus commutatus)]
* Bromus rigidus Roth, Ripgut Brome, Ripgut Grass. Cp (NC, SC, VA), Pd (GA, NC): disturbed areas; rare, native of Mediterranean Europe. April. [= RAB, C, F, G, HC, K; Bromus diandrus Roth - Y; Bromus diandrus var. ?? -- Z]
* Bromus rubens Linnaeus, Foxtail Chess, Red Brome. Cp (SC, VA): disturbed areas; rare, introduced from Mediterranean Europe. Specimens in our area come from areas around wool-combing plants, and were likely introduced on wool from w. United States, where this European species is well-established. [= C, G, K, X; Bromus madritensis Linnaeus -- F, misapplied; = Bromus madritensis ssp. rubens (Linnaeus) Husnot]
* Bromus secalinus Linnaeus, Cheat, Common Chess, Ryebrome. Pd, Cp, Mt (GA, NC, SC, VA): disturbed areas; common, native of Europe. May-June. [= RAB, C, F, G, HC, K, S, W, X, Y]
* Bromus sterilis Linnaeus, Barren Brome, Poverty Brome, Cheatgrass. Pd (NC, VA), Mt, Cp (VA): disturbed areas; rare, native of southern Europe. May-June. [= RAB, C, F, G, HC, K, S, W, X, Y, Z]
* Bromus tectorum Linnaeus, Downy Brome, Downy Chess, Downy Cheat, Junegrass, Cheatgrass. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): disturbed areas; common, native of Europe. April-June. [= RAB, C, F, G, HC, K, S, W, X, Y; Bromus tectorum ssp. tectorum -- Z]
* Bromus arvensis Linnaeus has been reported as introduced for nc. GA (Jones \& Coile 1988) and for VA, MD, PA, and NJ (Kartesz 1999). \{investigate\} [= K] \{not yet keyed\}
* Bromus briziformis Fischer \& C.A. Meyer. Reported as an introduction in ne. North America, south to MD, NJ, PA, DE (Kartesz
1999). [= K] \{not yet keyed\}
* Bromus carinatus Hooker \& Arnott. Reported by Jones \& Coile (1988) for nc. GA. [= K] \{not yet keyed\}
* Bromus madritensis Linnaeus. Reported introduced in VA and MD (Kartesz 1999). \{investigate\} [= K] \{not yet keyed\}
* Bromus ramosus Hudson. Introduced. Reported for DC and MS (Kartesz 1999). [= K] \{not yet keyed\}
* Bromus squarrosus Linnaeus. Introduced. Reported for KY and NJ (Kartesz 1999). [= K] \{not yet keyed\}

Buchloe Engelmann (Buffalo Grass)
(see Bouteloua)

Calamagrostis Adanson (Reed-grass)

References: Marr, Hebda, \& Greene in FNA (in prep.); Tucker (1996)=Z; Greene (1980).
1 Awn sharply bent; callus hairs $1 / 2$ or less the length of the lemma; [subgenus Ankylatherae].
2 Plant densely tufted, delicate, the culms 30-60 cm tall, with 2-3 nodes; leaves 1-2 mm wide, involute; callus hairs about 1 mm long (less than $1 / 2$ the length of the lemma) . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. cainii
2 Plant rhizomatous or loosely tufted, coarse, the culms $60-120 \mathrm{~cm}$ tall, with $3-5$ nodes; leaves 4-8 mm wide, flat; callus hairs about 2 mm long (less than $1 / 2$ the length of the lemma) . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. porteri ssp. porteri
1 Awn straight; callus hairs $3 / 4$ as long as to equal to the lemma.
3 Panicle loose, spreading, 3.5-6 cm wide; callus hairs 2-3 mm long (about $3 / 4$ the length of the lemma); [subgenus Calamagrostis] $\qquad$ C. canadensis

3 Panicle dense, erect, 1.5-4 cm wide; callus hairs 3-4 mm long (about equal to the lemma); [subgenus Orthatherae]
C. cinnoides

Calamagrostis cainii A.S. Hitchcock, Cain's Reed-grass. Mt (NC): high elevation rocky summits; rare (US Species of Concern, NC Endangered). July-September. Endemic to a few mountain-tops in the Southern Appalachians, C. cainii, once thought to be endemic to Mount LeConte, TN, was discovered at two sites in NC in 1989 and 1990 -- Mount Craig, Yancey County, and Craggy Pinnacle, Buncombe County (Wiser 1991). This species is more likely to be mistaken (especially superficially) for an Agrostis than for any of the other Calamagrostis in our area, but is distinguishable by its larger spikelets (5-6 mm long, rather than 1.3-2 mm ) and the presence of a callus beard. [= FNA, HC, K, W, Z]

Calamagrostis canadensis (Michaux) Palisot de Beauvois var. canadensis, Bluejoint, Canada Reed-grass. Mt (GA, NC, VA): wet meadows along streams, high elevation openings, such as grassy balds and cliff bases; uncommon (NC Rare). August. Widespread and common across n. North America, reaching its southern limit in the east in w. NC, e. TN (Chester et al. 1993), and ne. GA (Rabun Bald, Rabun County). [=FNA, G, HC, K; < C. canadensis -- RAB, C, S, W, Z, infraspecific taxa not distinguished; $C$. canadensis var. robusta Vasey -- F]

Calamagrostis cinnoides (Muhlenberg) W.P.C. Barton, Nuttall's Reed-grass. Mt (GA, NC, SC, VA), Cp, Pd (NC, SC, VA): savannas, bogs, and other wet sites; common. July-October. ME and NY south to n. GA (Jones \& Coile 1988), AL, and LA, primarily on the Coastal Plain. The replacement of the familiar C. cinnoides is suggested for nomenclatural reasons (Kartesz 1999). [= RAB, C, F, G, GW, HC, K, S, W, Z; = C. coarctata Torrey ex Eaton - K]

Calamagrostis porteri A. Gray ssp. porteri, Porter's Reed-grass. Mt (GA, NC, SC, VA), Pd (VA): dry to dry-mesic forests, forest edges, cliff bases; uncommon, rare in NC (GA Special Concern, NC Rare). NY to AL, in the Appalachians, with disjunct populations s. MO and w. AR; it was first reported from NC by Ware (1973). In addition to the key characters above, it can be distinguished from C. canadensis by its having leaf sheaths pubescent at the summit (Matthews \& Radford 1985). [= K; C. porteri -C, F, G, HC, W, Z]

Calamagrostis canadensis (Michaux) Palisot de Beauvois var. macouniana (Vasey) Stebbins. Reported for VA (FNA). Reported south to NJ and KY only (Kartesz 1999). [= FNA, G, HC, K; C. canadensis - C, Z, infraspecific taxa not distinguished; C. macouniana (Vasey) Vasey] \{not yet keyed\}

Calamagrostis porteri A. Gray ssp. insperata (Swallen) C.W. Greene, ranges east to KY and TN (Kartesz 1999). [= K; C. insperata Swallen - HC] \{not yet keyed\}

Calamagrostis stricta (Timm) Koeler ssp. inexpansa (A. Gray) C.W. Greene ranges south to n. WV (Preston and Randolph counties). [= K; C. stricta -- C, infraspecific taxa not distinguished; C. neglecta (Ehrhart) Gaertner, Mey., and Scherb. var. neglecta F] \{not yet keyed\}

Calamovilfa (A. Gray) Hackel ex Scribner \& Southworth (Sandreed)
Reeder \& Ellington (1960) studied various anatomic features of Calamovilfa, and determined that its closest relative was Sporobolus. A molecular phylogenetic study of Sporobolus and closely related genera suggests that Calamovilfa should be included in Sporobolus (Ortiz-Diaz \& Culham 2000). References: Thieret (1966)=Z. Key based in part on Thieret in FNA (in prep.).

Identification notes: Superficially somewhat similar to Sporobolus pinetorum, S. floridanus, and S. curtissii (herbarium specimens of the two species have been regularly confused), Calamovilfa is distinguished by its leaves tapered to either end and longacuminate (vs. parallel-margined and abruptly acute in Sporobolus) and tendency to form larger, clonal patches (Sporobolus forms wiregrass-like bunches or clumps). In flower or fruit, the Calamovilfa can be distinguished by characters of the spikelet, by vegetative characters, or by its coarser, generally taller culms, with the panicle branches usually spreading (rather than always ascending in Sporobolus). The three have very similar bases, unlike any other grasses in our area -- the lower leaf sheaths are indurated and shiny, forming a hard, polished, knotty, and fire-proof covering over the short-creeping rhizome. Aristida stricta has a somewhat similar base, but less indurated, less creeping, and with an unpolished appearance. Positive identification in sterile condition is not difficult.

1 Panicles narrow, the branches appressed-ascending; [of the Coastal Plain of FL] . . . . . . . . . . . . . . . . . . . . . . . . [C. curtissii]
1 Panicles broad, the bracnches ascending-spreading; [either of the Coastal Plain of SC northwards, or of the interior].
2 Spikelets 6-7.4 mm long; glumes acute to acuminate, usually arcuate; lemmas 5.5-7 mm long, usually arcuate; [of river scour areas in the rocky inland parts of the South]
[C. arcuata]
2 Spikelets 4-5.8 mm long; glumes acute, straight; lemmas 4-5.4 mm long, straight; [of pineland habitats of the Coastal

Calamovilfa brevipilis (Torrey) Scribner, Pinebarren Sandreed. Cp (NC, SC, VA), Pd (NC): savanna-pocosin ecotones, sandhill seepage bogs, pocosins; rare (NC Watch List, SC Rare, VA Rare). June-October. A "bimodal endemic", with two areas of distribution: Pine Barrens of NJ and the Coastal Plain (very rarely lower Piedmont) of e. NC, n. SC, and s. VA. Var. heterolepis Fernald, no longer considered valid, refers to the NC-SC material; var. calvipes Fernald, no longer considered valid, refers to the VA material. Like Aristida stricta, this grass is dependent on fire for flowering (it will also sometimes flower in response to mowing or other disturbance). Suppression of the natural fire regime has led to its substantial decline and the severe contraction of its range in the Southeast, since fire exclusion in its seepage or ecotone habitat leads to rapid invasion by shrubs and competitive elimination of Calamovilfa and many other herbs. [= RAB, C, FNA, G, GW, HC, K, S, Z; > C. brevipilis var. heterolepis Fernald -- HC; > C. brevipilis var. calvipes Fernald -- F, HC]

Calamovilfa arcuata K.E. Rogers occurs in Morgan and Cumberland counties, TN, in the Cumberland Plateau, and in AL. [= FNA, K]

Calamovilfa curtissii (Vasey) Scribner of FL is a closely related sibling species of $C$. brevipilis. It occurs in the FL Panhandle and e. peninsular FL. [= FNA, GW, HC, K, S, Z]

Catapodium Link 1827
References: Soreng et al. (2003)=Z.

* Catapodium rigidum (Linnaeus) Dony, native to Europe, is known from collections from wool-combing mills in South Carolina; it is probably not established. [= Z ; = Desmazeria rigida (Linnaeus) Tutin -- K; = Scleropoa rigida (Linnaeus) Grisebach]

Cenchrus Linnaeus (Burgrass, Sandspur)

References: Stieber \& Wipff in FNA (2003a); Crins (1991)=Z.
\{vegetative characters\} \{VA distribution of C. tribuloides $\}$

Identifications note: Spikelets of Cenchrus are subtended by an involucre of spines and/or bristles which are (in most of our species) fused into a bur. Bristles are narrow-based and terete. Spines are broad-based, and somewhat flattened (not terete) in cross-section, at least basally.

1 Involucre of bristles only, these not fused into a bur; perennial, to 2 m tall
C. myosuroides

1 Involucre of spines fused into a coherent bur, sometimes also with bristles; annual or perennials, to 1 m tall.
2 Spines in a single whorl, subtended by numerous smaller, narrower bristles . . . . . . . . . . . . . . . . . . . . . C. echinatus
2 Spines in multiple whorls or irregular in their disposition (if few and in a single whorl, then not subtended by smaller, narrower bristles).
3 Burs (excluding the spines) 9-16 mm long, 4-6 mm wide, the spines 4-8 mm long; spikelets 1 (-2) per bur, concealed; leaf blades $3-14 \mathrm{~mm}$ wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. tribuloides
3 Burs (excluding the spines) 5.5-12 mm long, 2.5-6 mm wide, the spines $2-7 \mathrm{~mm}$ long; spikelets $2-4$ per bur, exserted at the tip; leaf blades $1-5(-7) \mathrm{mm}$ wide.
4 Spines slender, 45-75, 3.5-7 mm long; spikelets 6-8 mm long . . . . . . . . . . . . . . . . . . . . . . . . . C. longispinus
4 Spines stout, 6-10 (-40), 2-5 mm long; spikelets $3.5-6 \mathrm{~mm}$ long . . . . . . . . . . . . . . . . . . . . . . . . . . C. spinifex
Cenchrus echinatus Linnaeus, Southern Sandspur, Bristly Sandspur, Hedgehog Grass. Cp (GA, NC, SC), Pd (GA, SC): fields, roadsides, disturbed areas; common (uncommon in NC). June-October. NC (and DC?) south to FL, west to CA, south into the tropical America. [= RAB, C, HC, K, S, Z]

Cenchrus longispinus (Hackel) Fernald, Northern Sandspur, Common Sandspur. Cp, Pd, Mt (GA, NC, SC, VA): fields, roadsides, disturbed areas, lawns; common (uncommon in Mountains). June-October. ME west to OR, south to FL, TX, and CA. [= RAB, C, F, FNA, K, W, Z; C. pauciflorus Bentham -- HC, S, misapplied]

* Cenchrus myosuroides Kunth. Cp (SC): roadsides, disturbed areas; rare, introduced from further south. December. SC south to FL, west to TX, south into the West Indies and other parts of tropical America. [= RAB, FNA, HC, K, S, Z]

Cenchrus spinifex Cavanilles, Coastal Sandspur. Cp (GA, NC, SC, VA), Pd (GA, SC, VA), Mt (VA): fields, roadsides, disturbed areas; common (rare in NC and VA). July-October. VA south to FL, west to AR and KS, south into tropical America. [= FNA, K; < C. incertus M.A. Curtis -- RAB, C, F, G, HC, S, Z]

Cenchrus tribuloides Linnaeus, Dune Sandspur. Cp (GA, NC, SC, VA), Pd*, Mt* (VA): dunes, sandy fields, sandy woodlands in the outer Coastal Plain; common. August-October. NY (Long Island) south to FL, west to TX, south into tropical America. This is the sandspur so familiar and disliked by beach-goers in our area. [= RAB, C, F, FNA, HC, K, S, W, Z]

Cenchrus brownii Roemer \& J.A. Schultes. Reported for NC (Kartesz 1999) and GA (FNA). \{investigate\} [= FNA, K] \{not yet keyed; add to synonymy\}

Cenchrus gracillimus Nash. Reported for sc. GA by Jones \& Coile (1988) and FNA. [= FNA, K] \{not yet keyed; add to

## Chasmanthium Link (Spanglegrass, Spikegrass)

A genus of 5 species endemic to se. North America. References: Sánchez-Ken \& Clark in FNA (2003a); Yates (1966a, 1966 c)=Z.

1 Panicle branches elongate, pendulous; spikelets (15-) 20-40 mm long, with 6-20 flowers . . . . . . . . . . . . . . . . . . Ch. Iatifolium
1 Panicle branches short, erect or ascending; spikelets $5-18 \mathrm{~mm}$ long, with 2-8 (-11) flowers.
2 Fully-developed spikelets $12-18 \mathrm{~mm}$ long, $8-12 \mathrm{~mm}$ wide.
3 Axils of the spikelets and panicle branches glabrous; empty lemmas 9 (-2); [se. NC south to c. peninsular FL and e. FL panhandle] Ch. nitidum 3 Axils of the spikelets and panicle branches with a tuft of long hairs; empty lemmas 2-4; [w. FL panhandle west to e. LA (Florida parishes)] [Ch. ornithorhynchum]
2 Fully-developed spikelets 4-9 mm long, 3-7 mm wide.
4 Collar (junction of leaf and sheath) glabrous or nearly so; leaves $3-7 \mathrm{~mm}$ wide . . . . . . . . . . . . . . . . . . . . Ch. laxum 4 Collar (junction of leaf and sheath) pilose; leaves $6-12 \mathrm{~mm}$ wide.

5 Inflorescence with divergent branches; [in outer Coastal Plain calcareous sites from SC southwards] ........ .
Ch. sessiliflorum var. 1
5 Inflorescence with appressed branches; [more widespread in our area] . . Ch. sessiliflorum var. sessiliflorum
Chasmanthium latifolium (Michaux) Yates, River Oats, Fish-on-a-pole. Pd, Mt, Cp (GA, NC, SC, VA): riverbanks, streambanks, bottomland forests, seepages and glades over mafic or calcareous rock, usually in nutrient-rich soils; common (uncommon in Coastal Plain and Mountains). June-October. Widespread in se. North America, north to NJ, OH, IL, and KS. [= C, FNA, GW, K, W, Z; = Uniola latifolia Michaux -- RAB, F, G, HC, S]

Chasmanthium laxum (Linnaeus) Yates, Slender Spikegrass. Cp, Pd (GA, NC, SC, VA), Mt (GA, NC, SC): savanna-pocosin ecotones, sandhill-pocosin ecotones, moist hardwood swamps, other moist habitats; common (rare in Mountains). June-October. Widespread in se. North America, north to s. NY, KY, and OK. See Ch. sessiliflorum for comments on the suggestion that these two taxa are only varietally distinct. [= C, FNA, GW, K, W, Z; = Uniola laxa (Linnaeus) Britton, Sterns, \& Poggenburg -- RAB, F, G, HC, S ; = Chasmanthium laxum var. laxum]

Chasmanthium nitidum (Baldwin) Yates, Shiny Spanglegrass. Cp (GA, NC, SC): blackwater swamp forests; rare (NC Rare, SC Rare). September-November. A Southeastern Coastal Plain endemic: se. NC south to c. FL and west to se. AL. [=FNA, GW, K, Z; = Uniola nitida Baldwin -- RAB, HC, S]

Chasmanthium sessiliflorum (Poiret) Yates var. 1, Coastal Hammock Longleaf Spikegrass. Cp (GA, SC): calcareous hammocks; rare. August-October. An additional taxon warrants recognition: it is characterized by divergent panicle branches and occurs in outer Coastal Plain calcareous sites (J. Allison, pers. comm.). [< Chasmanthium sessiliflorum (Poiret) Yates - C, FNA, GW, K, W, Z, in part; < Uniola sessiliflora Poiret -- RAB, F, G, HC, in part; < Uniola longifolia Scribner -- S, in part; < Chasmanthium laxum (Linnaeus) Yates var. sessiliflorum (Poiret) L. Clark, in part]

Chasmanthium sessiliflorum (Poiret) Yates var. sessiliflorum, Longleaf Spikegrass. Cp (GA, NC, SC, VA), Pd (GA, SC): moist hardwood forests, swamps, other moist habitats; rare (NC Watch List, VA Watch List). August-October. Widespread in se. North America, north to se. VA, TN, AR, and OK. This species and Ch. laxum are morphologically somewhat similar, but their treatment as varieties of a single species is completely unwarranted. They frequently co-occur (especially on the Gulf Coastal Plain), growing side by side, and show no sign of intergradation. [< Chasmanthium sessiliflorum -- C, FNA, GW, K, W, Z, in part; < Uniola sessiliflora Poiret -- RAB, F, G, HC, in part; < Uniola longifolia Scribner -- S, in part; < Chasmanthium laxum (Linnaeus) Yates var. sessiliflorum (Poiret) L. Clark, in part]

Chasmanthium ornithorhynchum (Steudel) Yates, Birdbill Spikegrass. S. AL and w. FL panhandle west to e. LA (Florida Parishes). Also reported for NC and SC (FNA 2003a). \{investigate\} [= FNA, GW, K, Z; = Uniola ornithorhyncha Steudel - S]

```
Chloris Swartz (Finger-grass, Chloris)
```

(also see Eustachys)
References: . Key based partly on C.
1 Inflorescence verticillate, typically the panicle branches in 2-5 verticels; perennial; fertile lemma inconspicuously appressedpilose; spikelets not imbricate Ch. verticillata
1 Inflorescence digitate, the panicle branches in a single verticel at the apex of the culm; annual; lemma conspicuously longciliate; spikelets imbricate Ch. virgata

* Chloris verticillata Nuttall, Windmill-grass. Mt (VA), \{SC $\}$ : disturbed areas, bottomland fields; rare, introduced from further west. [= C, F, G, HC, K]
* Chloris virgata Swartz, Feather Finger-grass, Showy Chloris. Pd (GA, NC, SC), Cp (GA): disturbed areas; rare, introduced from tropical America. [= RAB, C, F, G, HC, K]
* Chloris barbata Sw. Reported for SC (Kartesz 1999). [= K] \{not keyed; add synonymy\}
* Chloris canterei Arech. var. grandiflora (Roseng. \& Izag.) D.E. Anderson. Reported for SC (Kartesz 1999). [= K] \{not keyed; add to synonymy\}
* Chloris cucullata Bisch. Reported for SC (Kartesz 1999). [= K] \{not keyed; add to synonymy\}
* Chloris divaricata R. Brown. Reported for SC (Kartesz 1999). [= K] \{not keyed; add to synonymy\}
* Chloris gayana Kunth. Reported for NC (Kartesz 1999). [= K] \{not keyed; add to synonymy\}
* Chloris pectinata Bentham. Reported for SC (Kartesz 1999). [= K] \{not keyed; add to synonymy\}
* Chloris truncata R. Brown. Reported for SC (Kartesz 1999). [= K] \{not keyed; add to synonymy\}
* Chloris ventricosa R. Brown. Reported for SC and VA (Kartesz 1999). [= K] \{not keyed; add to synonymy\}

Numerous additional species are reported for SC (Kartesz 1999) based on collections at wool-combing mills. It is doubtful that these are anything other than non-established waifs.

## Chrysopogon Trinius (Goldbeard)

References: Hall \& Thieret in FNA (2003a); Veldkamp (1999).
Chrysopogon pauciflorus (Chapman) Bentham ex Vasey, Florida Goldbeard, Florida Rhaphis. Cp (NC): sandhill; rare (NC Watch List), perhaps only introduced. FL and Cuba; its occurrence in se. NC (at Carolina Beach State Park) is plausible either as a native, disjunct occurrence or as an introduction. [= FNA, HC, K; = Rhaphis pauciflora (Chapman) Nash -- S]

Cinna Linnaeus 1753 (Woodreed)
(also see Limnodea)
References: Brandenburg, Blackwell, \& Thieret (1991); Tucker (1996)=Z; Brandenburg \& Thieret (2000).
1 Spikelets (3.5-) 4-6 (-7.5) mm long; glumes firm, subherbaceous, rather dull, hyaline only narrowly and marginally, the second glume prominently 3 -nerved.
c. arundinacea

1 Spikelets (2-) 2.5-4 (-5) mm long; glumes (at least the first and sometimes the second as well) glistening, hyaline except the midrib, the second glume 1-nerved (very rarely 3-nerved)
C. Iatifolia

Cinna arundinacea Linnaeus, Common Woodreed, Sweet Woodreed. Cp, Pd, Mt (GA, NC, SC, VA): bottomland forests, rocky bars in rivers, other low, wet habitats; common. August-October. New Brunswick and MN south to south to GA and TX. [= RAB, C, G, GW, K, S, W, Z; > C. arundinacea var. inexpansa Fernald \& Griscom -- F, HC]

Cinna latifolia (Treviranus ex Goepp.) Grisebach, Drooping Woodreed, Slender Woodreed. Mt (NC, VA): moist forests at high elevations; rare (NC Watch List, VA Rare). June-August. Circumboreal, occurring in n. Eurasia and n. North America, south in North America to NC, TN, n. IL, MN, UT, NM, and CA. [= RAB, C, F, G, HC, K, W, Z]

## Coelorachis Brongniart (Jointgrass)

A genus of about 20 species, widespread in the Old World and New World tropics and subtropics. Generic circumscription has been controversial and uncertain. References: Allen in FNA (2003a); Veldkamp, Koning, \& Sosef (1986)=Z.

1 Culms round in cross-section . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. cylindrica

Lower glume smooth . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. tuberculosa

Coelorachis cylindrica (Michaux) Nash, Carolina Jointgrass. Pd (GA, NC, SC), Cp (GA): open woodlands and roadsides, probably in areas formerly prairie-like and fire-maintained, perhaps now extirpated in our area; rare (NC Rare). June-August. Fairly widespread in se. North America, north to NC and SC (at least formerly), MS, MO, and TX. [= C, FNA, K; = Manisuris rugosa (Nuttall) Kuntze -- RAB, F, G, GW, HC; = Manisuris campestris (Nuttall) A.S. Hitchcock -- S; = Mnesithea cylindrica (Michaux) Koning \& Sosef - Z]

Coelorachis rugosa (Nuttall) Nash, Wrinkled Jointgrass. Cp (GA, NC, SC, VA), Pd (GA): limesink ponds (dolines), depression meadows, clay-based Carolina bays, wet savannas, always in places with a seasonally high water-table; rare (NC Watch List, VA Rare). June-October. A Southeastern Coastal Plain endemic: s. NJ south to FL and west to TX. [= C, FNA, K; = Manisuris cylindrica (Michaux) Kuntze -- RAB, F, G, GW, HC, S; = Mnesithea rugosa (Nuttall) Koning \& Sosef - Z]

Coelorachis tesselata (Steudel) Nash, Pitted Jointgrass. Cp (GA): wet savannas and bogs; rare. Southeasatern Coastal Plain endemic: sw. GA and FL west to e. LA. [= FNA, K; = Manisuris tesselata (Steudel) Scribner - GW, HC, S; = Mnesithea tesselata (Steudel) Koning \& Sosef - Z]

Coelorachis tuberculosa (Nash) Nash, Smooth Jointgrass. Cp (GA): pond margins; rare. Southeastern Coastal Plain
endemic: sw. GA (Mitchell County) (Sorrie 1998b) west to s. AL, and in the Florida peninsula. [= FNA, K; = Manisuris tuberculosa Nash - GW, HC, S; = Mnesithea tuberculosa (Nash) Koning \& Sosef - Z]

## Coix Linnaeus

A genus of about 5 species, native to tropical Asia. References: Thieret in FNA (2003a).

* Coix lacryma-jobi Linnaeus, Job's-tears, reported for se. PA by Rhoads \& Klein (1993), TN (Thieret in FNA 2003a), and NJ (Kartesz 1999). [= FNA, K]

## Cortaderia Stapf (Pampasgrass)

A genus of ca. 20 species, native to South America. References: Allred in FNA (2003a).

* Cortaderia selloana (J.A. \& J.H. Schultes) Ascherson \& Graebner, Pampasgrass. Cp (GA, SC), Pd (GA): disturbed areas; rare, introduced from South America. This grass is a popular ornamental, rarely escaping. [= RAB, FNA, HC, K]

## Ctenium Panzer (Toothache Grass)

A genus of about 20-22 species, of tropical and subtropical Africa and the Americas. References: Barkworth in FNA (2003a); Longhi-Wagner \& Renvoize (2004).

1 Spikelets with numerous glands in rows on the back of the second glume; plant short-rhizomatous (nearly cespitose); [widespread in the Coastal Plain of our area] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Ct. aromaticum
1 Spikelets with very few or no glands on the back of the second glume; plant rhizomatous (the rhizomes slender and scaly); [restricted to se. GA southwards]

Ct. floridanum

Ctenium aromaticum (Walter) Wood, Toothache Grass, Orange Grass. Cp (GA, NC, SC, VA): wet savannas, pocosin-savanna ecotones, seepage bogs, sandhill-pocosin ecotones, sandhill seeps; common (VA Rare). June-August (or later in response to late summer fires). Southeastern Coastal Plain endemic: se. VA south to FL and west to LA. The entire plant is aromatic and numbs the mouth, tongue, and lips when chewed, hence the specific epithet and common names. Like many species of the longleaf pine ecosystem, toothache grass generally flowers only following fire (MacRoberts \& MacRoberts 1992). Sterile clumps can be recognized by the rather broad, bicolored leaves (bluish on the upper surface, bright green on the lower surface). [= RAB , C, F, FNA, G, GW, HC, K; = Campulosus aromaticus (Walter) Trinius -- S]

Ctenium floridanum (A.S. Hitchcock) A.S. Hitchcock, Florida Toothache Grass. Cp (GA): dry pinelands, sandhills, upper ecotones of pineland pools; rare (GA Special Concern). June-September. Southeastern Coastal Plain endemic: se. GA to ne. FL. Like Ct. aromaticum, generally flowering only following fire. [= FNA, GW, HC, K; = Campulosus floridanus A.S. Hitchcock -- S]

Cynodon L.C. Richard (Bermuda Grass)
A genus of ca. 9 species, native to the tropical Old World. References: Barkworth in FNA (2003a).

* Cynodon dactylon (Linnaeus) Persoon var. dactylon, Bermuda Grass, Scutch Grass. Cp, Pd, Mt (GA, NC, SC, VA): lawns, gardens, roadsides, pastures, fields, disturbed areas; common, introduced from Eurasia. May-October. [= FNA; < C. dactylon -RAB, C, F, G, HC, K, W, infraspecific taxa not distinguished; = Capriola dactylon (Linnaeus) Kuntze -- S]

Cynosurus Linnaeus 1753 (Dog's-tail, Dogtail Grass)
References: Tucker (1996)=Z.
1 Panicle linear-oblong, 1-10 (-14) cm long, 0.4-1 cm wide; leaves 1-3 (-4) mm wide; perennial; fertile lemma 3-4 mm long, plus a $0-1 \mathrm{~mm}$ long mucro; [section Cynosurus]
C. cristatus

1 Panicle ovoid, 1-4 (-8) cm long, 0.7-2 cm wide; leaves (2-) 3-10 mm wide; annual; fertile lemma 4.5-7 mm long, plus a 6-16 mm long awn; [section Falona] C. echinatus

* Cynosurus cristatus Linnaeus, Crested Dog's-tail. Mt (NC), \{VA\}: lawns, roadsides; rare, introduced from Eurasia. JuneJuly. [= RAB, C, F, G, HC, K, Z]

Cynosurus echinatus Linnaeus, Rough Dog's-tail. Cp (NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA): lawns, roadsides; rare, introduced from Eurasia. May-June. [= RAB, C, F, HC, K, Z]

## References: Tucker (1996)=Z.

* Dactylis glomerata Linnaeus, Orchard Grass, Cock's-foot. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): pastures, fields, woodland edges, roadsides; common (less common in Coastal Plain, especially in NC and SC), introduced from Europe. MayOctober. In Europe there are various chromosome races, often accorded subspecies or species status. Their status in North America has been little investigated. See various references cited in Tucker (1996) for further information about these taxa in Europe. [= RAB, C, F, G, HC, S, W; D. glomerata var. detonsa Fries -- F; D. glomerata var. ciliata Petermann -- F; D. glomerata ssp. glomerata -- K, Z; D. glomerata ssp. aschersoniana (Graebner) Thellung -- K; D. aschersoniana Graebner]

## Dactyloctenium Willdenow (Crowfoot Grass)

* Dactyloctenium aegyptium (Linnaeus) Willdenow, Crowfoot Grass. Cp (GA, NC, SC, VA), Pd (GA, NC, SC): lawns, roadsides, disturbed areas; common, introduced from Old World tropics. June-November. [= RAB, C, F, G, HC, K, S]
* Dactyloctenium radulans (R. Brown) Palisot de Beauvois is introduced in SC (Kartesz 1999). \{investigate\} [= K] \{not yet keyed\}

## Danthonia Augustin de Candolle (Oat-grass)

A genus of about 20 species, of North America, Europe, and the Americas, but the generic limits are unclear. References: Darbyshire in FNA (2003a).

Danthonia compressa Austin ex Peck, Mountain Oat-grass. Mt, Pd (GA, NC, SC, VA), Cp (VA): grassy balds, thin soils around rock outcrops, woodlands; common (uncommon in upper Piedmont only). June-August. Fairly widespread in e. North America, primarily Appalachian, from s. Canada to SC and TN. [= RAB, C, F, FNA, G, HC, K, S, W]

Danthonia epilis Scribner, Bog Oat-grass. Cp (NC, SC, VA), Mt (GA, NC, VA?), Pd (NC): peaty bogs in the Coastal Plain and Mountains, seeps around rock outcrops in the Piedmont and Mountains, granitic domes; rare (GA Special Concern, NC Watch List, VA Watch List). April-June. The range is apparently bogs in pinelands from NJ to SC, in mountain bogs in NC, VA (?), and GA, in seepage in the Cumberland Plateau and Blue Ridge of TN and AL. This taxon appears to be valid, with a distinct range, habitat, and variety of morphologic characters separating it from D. sericea, but further study is needed. Material from the mountains seems to differ from Coastal Plain material. RAB's description of the habitat as "dry woods, rare; pied. of N.C." appears to be in error. Blomquist listed the taxon (as a variety) for bogs in the mountains of sw. NC. It has since been found in bogs in the Sandhills region of NC and in seepage bogs in the adjacent Piedmont. [ $=\mathrm{F}, \mathrm{HC}, \mathrm{K}, \mathrm{S} ;=\mathrm{D}$. sericea var. epilis (Scribner) Blomquist -- RAB, C; < D. sericea Nuttall - FNA, in part]

Danthonia sericea Nuttall, Silky Oat-grass. Cp, Pd, Mt (GA, NC, SC, VA): dry woodlands, especially common in sandy soils in the Coastal Plain, dry oak, oak-pine, and pine forests in the Piedmont and low Mountains; common (uncommon in the Mountains). April-June. Primarily a Coastal Plain species northwards, ranging from e. MA south to FL and west to LA. [=F, HC, K, S, W; = D. sericea var. sericea -- RAB, C, G; < D. sericea - FNA, in part]

Danthonia spicata (Linnaeus) Palisot de Beauvois ex Roemer \& J.A. Schultes, Poverty Oat-grass. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): dry woodlands, rock outcrops, shale barrens; common. May-July. Newfoundland and British Columbia south to FL and NM. [= RAB, C, FNA, G, HC, K, S, W; < D. spicata var. longipila Scribner \& Merr. -- F; < D. spicata var. spicata - F; < D. allenii Austin -- F]

## Deschampsia Palisot de Beauvois (Hairgrass)

## References: Tucker (1996)=Z.

1 Awn 2-3 mm long, straight or nearly so, scarcely (or not at all) exserted beyond the tips of the glumes; lemmas smooth; leaf blades flat or folded at the midvein (V-shaped in cross-section); ligule 3-10 (-17) mm long; [section Deschampsia]
D. cespitosa ssp. glauca

1 Awn 4-8 mm long, geniculate, exserted beyond the tips of the glumes; lemmas minutely scabrous; leaf blades involute, appearing filiform (rounded in cross-section); ligule 0.5-3 (-5) mm long; [section Avenaria]
D. flexuosa var. flexuosa

Deschampsia cespitosa (Linnaeus) Palisot de Beauvois ssp. glauca (Hartman) Hartman, Tufted Hairgrass. Mt (NC, VA): thin soil of rock outcrops or barrens over calcareous, mafic, and ultramafic rocks (such as serpentinized olivine, amphibolite, limestone, and dolostone); rare (NC Rare, VA Rare). June-July. D. cespitosa is a complex species, with a complicated polyploid and aneuploid series, variously subdivided (or not) by various taxonomists. As a whole, D. cespitosa is circumboreal, ranging south in North America to NJ, sw. NC, WV, IL, MN, and AZ. Ssp. glauca is the most widespread American subspecies, and extends the farthest south. Other subspecies occur farther north and in Eurasia. In our area, D. cespitosa is at its southern limit and is a rare species limited to barrens and outcrops over mafic or ultramafic rocks. [= K; = D. caespitosa var. glauca (Hartman) Lindman f. -RAB, F; < D. cespitosa -- C, Z, infraspecific taxa not distinguished; D. cespitosa var. cespitosa -- G; D. caespitosa var. caespitosa -HC; D. cespitosa ssp. cespitosa var. glauca (Hartman) Lindman f.; Aira caespitosa Linnaeus -- S; D. caespitosa -- W]

Deschampsia flexuosa (Linnaeus) Trinius var. flexuosa, Common Hairgrass, Wavy Hairgrass. Mt (GA, NC, SC, VA), Pd, Cp (NC, VA): grassy balds, high elevation rocky summits, rocky or sandy woodlands; common (uncommon in Piedmont and Coastal Plain) (SC Rare). April-August. Circumboreal, ranging south in North America to n. GA, OH, WI, and MN; disjunct in AR and OK, and in Mexico. [=F, K; < D. flexuosa -- RAB, C, G, HC, W, Z, infraspecific taxa not distinguished; < Aira flexuosa Linnaeus -- S]

* Deschampsia elongata (Hooker) Munro. Introduced in SC. [= K] \{not keyed; add synonymy\}

Desmazeria Dumortier
(see Catapodium)

## Diarrhena Palisot de Beauvois (Beakgrain)

A genus of about 4 species of perennial grasses of e. North America and e. Asia. References: Brandenburg, Estes, \& Collins (1991)=Z. Key from Z.

1 Callous pubescent on all mature lemmas except the first; lemmas widest below the middle and gradually tapering into a cusp at the apex, those of the first floret $7.1-10.8 \mathrm{~mm}$ long; mature fruit $1.3-1.8 \mathrm{~mm}$ broad, gradually tapering into a broad, blunt beak

1 Callous glabrous on all mature lemmas; lemmas widest near or above the middle and more-or-less abruptly contracted into a cusp at the apex, those of the first floret 4.6-7.5 mm long; mature fruit 1.8-2.5 mm broad, abruptly contracted into a bottlenoseshaped beak
D. obovata

Diarrhena americana Palisot de Beauvois, Eastern Beakgrain. Mt (GA, NC, VA): rich moist forests, usually over calcareous rocks; rare (NC Rare, VA Watch List). July-August; August-October. W. VA and WV west to IN, south to TN, sw. NC, and nw. GA (Jones \& Coile 1988); disjunct in MO. [= K, Z; = Diarrhena americana var. americana -- C, G; < Diarrhena americana -- F, HC, W, in part only (also see Diarrhena obovata); < Diarina festucoides Rafinesque -- S, in part only (also see Diarrhena obovata]

Diarrhena obovata (Gleason) Brandenburg, Western Beakgrain. Pd (VA): alluvial forests; rare (VA Rare). July-August; August-October. Sw. PA and IN west to SD, KA, south to w. VA, nc. TN, and ne. TX. First reported for our area by Fleming \& Ludwig (1996). The floodplain of the Potomac River (in Fairfax County, VA) has a number of disjuncts of species with more midwestern affinities, including Diarrhena obovata, Erigenia bulbosa, Valeriana pauciflora, and Erythronium albidum (Fleming \& Ludwig 1996). [= K, Z; = Diarrhena americana var. obovata Gleason -- C, G; < Diarrhena americana -- F, HC, W, in part]

## Dichanthelium (A.S. Hitchcock \& Chase) Gould (Witch-grass)

 contributed by Richard J. LeBlond"We admit that our failure to distinguish the several named taxa ... was born of despair!" -- Godfrey \& Wooten (1979).
"The recognition of only four species and six varieties in this complex [sabulorum] to which almost 50 species names have been applied admittedly is somewhat arbitrary and certainly not entirely satisfactory." -- Gould \& Clark (1978).

Dichanthelium has often been treated as a subgenus Dichanthelium of Panicum. It is most readily (though not consistently) separated from Panicum by the following combination of features: plants producing over-wintering rosettes of leaves often shorter and broader than the culm leaves; plants producing simple culms with terminal panicles in spring, the culms branching and producing panicles only on branches in the summer and autumn.

Perhaps the most complex and confusing genus in our region, Dichanthelium requires careful collection and close observation of several characters to determine to which taxon a specimen belongs, or at least to which taxa it seems most closely aligned. A taxon that is distinct in one part of its range may be indistinguishable from another taxon elsewhere. This is particularly true of Coastal Plain species adapted to natural (and now human) disturbances. Although hybridization is frequently suspected in Dichanthelium, documentation of natural hybrids is rare.

When collecting specimens in the field, mature spikelets are essential. This is determined by examining the usually whitish fertile lemma, which is firm and plump at maturity. Immature spikelets often are longer than mature ones (they shorten as they fatten); only mature spikelet length is used in the various manuals and keys. It is also important to note whether a plant is in its "vernal" or
"autumnal" fruiting phase before collecting. "Vernal" plants produce panicles only at the summits of the culms (typically April-June). "Autumnal" plants produce panicles from leafy axillary branches below the summit (typically July-September). The autumnal panicles in most species are much smaller than the vernal panicles (and often hidden by fascicled leaves), but the spikelets are the same. When collecting autumnal plants, it is important to select specimens still possessing their vernal leaf blades and panicles, even though these will likely be senescent. It is also important to collect the whole plant, with the basal rosette intact (whether senescent or of current year's growth). When several plants are growing together, compare the culm, leaf, and spikelet features for differences; Dichanthelium taxa are gregarious.

When analyzing the character of the culm internodes and nodes, look at the first elongate internode above the base (the lowest internode is often very short and uncharacteristic). Determining whether a node is bearded is often difficult. A bearded node usually is characterized by pubescence that is longer and of a different orientation or structure than that of the internodes and sheaths. Nodes with short pubescence generally are not regarded as bearded. Lower nodes are more likely to be bearded than upper nodes. When analyzing sheaths, look at those on the lower half of the culm. Senescent vernal sheaths often lose their pubescence (though in some species hair papillae are evident). All references in the key to sheath glabrousness or pubescence is without regard to the presence or absence of marginal hairs (cilia). A sheath that is glabrous except for marginal cilia is called glabrous. All culm leaves should be analyzed for blade characters; in general, the key relies on the size and character of the vernal blades. A "cordate" blade is one where the basal lobes of the blade extend outward and partially surround the culm when the culm is enclosed by the sheath. As with sheaths, references in the key to blade glabrousness or pubescence is without regard to marginal cilia. The ligule is an important diagnostic character for many Dichanthelium taxa; at least three ligules per specimen should be examined before making conclusions about its structure and length. Ligules form a distinct ring from a cartilaginous base at the inner summit of the sheath; in some species the ligule is membranous, but in most it is pubescent. Care must be taken to distinguish the pubescence of the ligule from any pubescence emanating from the inner surface of the blade base, and from marginal cilia. Ligules of senescent vernal leaves frequently lose their integrity. Spikelet shape as well as length should be determined only from mature spikelets. Measure the length from the base of the first glume (usually at an articulation) to the apex of the second glume or sterile lemma (whichever is longer). A micrometer is essential for determining the length of spikelets, first glumes, ligules, and various pilosity features. Sometimes one-tenth of a millimeter is all that separates two Dichanthelium taxa.

Certain characters, particularly node bearding, cordate/non-cordate blade bases, and ligule length, can be quite variable, and an effort has been made to account for this variability in the key. Nonetheless, some specimens just won't "fit," and the road not taken may have to be reconsidered.

References: Gould and Clark (1978), abbreviated as Z; Freckmann (1981), abbreviated as Y; Lelong (1984), abbreviated as X; LeBlond (2001), abbreviated as Q; Davidse and Polh (1992); Hansen \& Wunderlin (1988); Hitchcock \& Chase (1910); Freckmann \& Lelong (2002). The treatment of Dichanthelium sect. Lanuginosa (=D. acuminatum group) is based closely on Y. The contributor must take responsibility for the treatment of sect. Angustifolia (including D. hirstii), sections Dichotoma and Ensifolia (the $D$. dichotomum group), and for sect. Lancearia. Other treatments are based largely on Z .

Key A - Plants densely tufted, often cushion-forming; leaves basally disposed, the blades ascending or spreading-ascending, not forming a distinct rosette of basal leaves shorter than the culm leaves; autumnal culms branching basally or from the lower nodes

1 Spikelets 2.4-4.5 mm long.
2 Nodes, internodes, and sheaths glabrous; blades 4-13 cm by 5-8 mm, the surfaces smooth, glabrous; spikelets 2.4-2.9 mm .long, glabrous; not known.to.prod.u.ce. axillar.y. (a.u.tum.n.a.l). inflorescences.
2 Nodes bearded or otherwise pubescent; internodes and sheaths variously pubescent to glabrate; blades 6-35 cm by 2-5 mm , one or both surfaces scabrous and often pubescent; spikelets $1.7-4.5 \mathrm{~mm}$ long, glabrous or pubescent; plants produce axillary (autumnal) inflorescences.
3 Spikelets 2.8-3.8 (-4.5) mm long, the second glume and sterile lemma pointed or beaked and extended beyond the summit of the fertile lemma; first glume $1.2-2 \mathrm{~mm}$ long
D. depauperatum

3 Spikelets 1.7-2.8 mm long, the second glume and sterile lemma blunt or broadly pointed, not extending beyond the summit of the fertile lemma; first glume 0.7-1.2 mm long
D. linearifolium

1 Spikelets 0.9-2.3 mm long.
4 Longer blades more than 6 cm ; if only 6 cm , then sheaths retrorsely long-pilose ( $D$. laxiflorum).
5 Spikelets 1.2-1.5 mm long, glabrous
[D. dichotomum var. glabrifolium]
5 Spikelets 1.7-2.3 (-2.8) mm long, pubescent.
6 Longer blades $10-35 \mathrm{~cm}$ long by $2-4 \mathrm{~mm}$ wide; sheaths glabrous to variously pilose, but not conspicuously retrorsely long-pilose; nodes variously pubescent to glabrate; spikelets 1.7-2.3 (-2.8) mm long D. linearifolium
6 Longer blades 6-18 cm long by 7-12 mm wide; sheaths conspicuously retrorsely long-pilose; nodes bearded with retrorse or spreacing hairs; spikelets 1.9-2.3 mm long
D. laxiflorum

4 Longer blades $1.5-6 \mathrm{~cm}$; sheaths glabrous or pubescent, but not retrorsely long-pilose.
7 Blades 1-3 mm wide, glabrous, eciliate or basally ciliate; spikelets 0.9-1.4 mm long.
8 Spikelets pubescent, 1.2-1.4 mm long; blades involute, often falcate, 2.5-6 cm long

8 Spikelets glabrous, 0.9-1.2 mm long; blades flat, not falcate, 1.5-4 (-5) cm long
[D. chamaelonche ssp. breve]
D. chamaelonche ssp. chamaelonche

7 Blades $3-8 \mathrm{~mm}$ wide; spikelets $1.1-2.1 \mathrm{~mm}$ long (if less than 1.5 mm , then blades either pubescent on one or both surfaces or ciliate to the apex).
9 Spikelets pubescent, 1.5-2.1 mm long; blade surfaces glabrous . . . . . . . . . D. strigosum var. leucoblepharis
$9 \quad$ Spikelets glabrous, $1.1-1.8 \mathrm{~mm}$ long; blade surfaces pubescent or glabrous.
10 Blades pilose; spikelets 1.1-1.6 mm long
D. strigosum var. strigosum

10 Blades .g.labr.ous, or .sparsely. pillo.s.e. only near.the.adaxial base; spikele.ts .1.4-1.. 8 mm . lon.g.
D. strigosum var. glabrescens

## Key B-Spikelets 3.3-5.2 mm long

1 Nodes (at least lower) densely bearded with retrorse hairs; spikelets 3.7-5.2 mm long.
2 Ligule 2.5-4 mm long; internodes pubescent with long ascending or spreading hairs; blades 8-15 cm long by 10-25 mm wide; first glume $1.8-2.5 \mathrm{~mm}$ long
D. ravenelii

2 Ligule 0.4-0.9 (-1.3) mm long; internodes glabrous to puberulent; blades $7-12 \mathrm{~cm}$ long by $12-40 \mathrm{~mm}$ wide; first glume $1.5-$ 2.2 mm long
D. boscii

1 Nodes glabrous, pubescent, or sparsely pilose; spikelets (2.4-) 3.3-4.2 mm long.
3 Ligule 1.6-3 mm long; blades $4-9 \mathrm{~mm}$ wide, more than $10 \times$ as long as wide . . . . . D. oligosanthes var. oligosanthes
3 Ligule 0.3-1.5 mm long; if larger blades less than 9 mm wide and mostly $15 \times$ or more as long, then ligule $0.5-1 \mathrm{~mm}$ long (D. fusiforme).

4 Larger blades 2-6 (-8) mm wide, mostly $15 \times$ or more as long as wide; spikelets fusiform to elliptic, acute, basally constricted . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . D. fusiforme
4 Larger blades $6-35 \mathrm{~mm}$ wide, mostly $10 \times$ or less as long as wide; spikelets broadly elliptic to obovate, rounded to sub-acute, not basally constricted.
5 Spikelets strongly papillose-hispid with spreading hairs $0.5-1 \mathrm{~mm}$ long; blades papillose-hispid $\ldots$. [D. leibergii] 5 Spikelets glabrous to pubescent with hairs less than 0.5 mm long; blades glabrous, scabrous, or pubsecent.

6 Ligules $1-1.5 \mathrm{~mm}$ long; blades $5-10 \mathrm{~cm}$ long by $6-15 \mathrm{~mm}$ wide, glabrous or pubescent, basally rounded; spikelets glabrous to pubescent . . . . . . . . . . . . . . . . . . . . . . . . . D. oligosanthes var. scribnerianum
6 Ligules 0.3-1 mm long; blades 7-35 cm long by 8-35 mm wide, glabrous or scabrous, basally cordate or rounded; spikelets pubescent to glabrate.
7 Sheaths (at least lower) papillose-hispid with spreading hairs; blades 10-28 cm long; spikelets 2.4-3.6 mm long; first glume 1.2-1.8 mm long D. clandestinum

7 Sheaths glabrous, pubescent, or sparsely pilose; blades $7-18 \mathrm{~cm}$ long; spikelets 2.9-4.1 mm long; first glume 1.5-2.2 mm long.
8 Larger blades $15-32 \mathrm{~mm}$ wide, $4-7 \times$ as long as wide, basally cordate; sheaths glabrous to sprasely pilose . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . D. Iatifolium
8 Larger blades $10-20 \mathrm{~mm}$ wide, $6-9 \times$ as long as wide, basally rounded; sheaths pubescent
[D. xanthophysum]

## Key C-Spikelets 2.1-3.2 mm long, larger leaves $13-25 \mathrm{~mm}$ wide

1 Culm nodes, at least the lower, bearded (often retrorsely).
2 Ligule a stramineous to light brown membrane (with or without ciliate or lacerate extensions); peduncle and often internodes scabrous . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . D. scabriusculum
2 Ligule entirely of white hairs; peduncle and internodes either smooth or densely hairy (velvety).
3 Lower internodes glabrous, without a viscid band below the nodes; larger blades 7-14 mm wide
D. dichotomum group

3 Lower internodes densely hairy except for a viscid band below the nodes; larger blades $10-20 \mathrm{~mm}$ wide

1 Culm nodes glabrous or slightly hairy, but not bearded.
4 Second glume and sterile lemma acute to short-acuminate, conspicuously longer than the fertile lemma; spikelets glabrous (occasionally sparsely pubescent in scabriusculum).
5 Panicle rachis pellucid-punctate; ligule a stramineous to light brown membrane, with or without terminal ciliations; peduncle and often internodes scabrous; first glume 0.3-0.6 (-0.8) mm long, reniform to suborbicular
D. scabriusculum

5 Panicle rachis not pellucid-punctate; ligule entirely of white hairs; peduncle and internodes smooth; first glume 0.7 1.2 mm long, ovate to lanceolate
D. yadkinense

4 Second glume and sterile lemma blunt to subacute, shorter than, equaling, or barely exceeding the fertile lemma;
spikelets pubescent (sometimes sparsely so in clandestinum).
6 Sheaths, at least the lower, papillose-hispid with spreading hairs; blades 10-28 cm long ........ D. clandestinum
6 Sheaths glabrous, puberulent, finely pubescent, or sparsely pilose; blades $5-18 \mathrm{~cm}$ long.
7 Ligule 0-0.3 mm long; spikelets 2.2-3.2 mm long by 1.1-1.3 mm wide; first glume 0.7-1.4 (-1.8) mm long . . . . . .
D. commutatum var. commutatum

7 Ligule 0.4-0.7 mm long; spikelets 2.9-3.9 mm long by 1.6-2.0 mm wide; first glume 1.5-2.2 mm long
D. Iatifolium

## Key D-Spikelets 2.1-3.2 mm long, larger culm blades less than 13 mm wide, at least the lower culm nodes bearded with a usually spreading-ascending collar of dense and/or longish hairs

1 Ligule with a dense ring of short hairs $0.5-1 \mathrm{~mm}$ long in front of a usually less dense ring of longer hairs (pseudoligule) 1-5 mm long.
2 Nodes retrorsely bearded; internode and sheath hairs spreading to restrorse; blade surfaces velvety-pubescent or longpilose.
3 Spikelets 2.5-3.2 mm long; longer hairs of pseudoligule 1-3 mm long; blade surfaces velvety-pubescent; panicle rachis densely pubescent; [of cedar glades and dry limestone soils] . . . . . . . . . . . . . . . . . . [D. malacophyllum]
3 Spikelets $1.8-2.5 \mathrm{~mm}$ long; longer hairs of pseudoligule $3-5 \mathrm{~mm}$ long; blade surfaces long-pilose; panicle rachis sparsely pilose; [of dry sandy soil of pine and oak woodlands] . . . . . . . . . . . D. villosissimum var. villosissimum
2 Node beard hairs spreading to ascending; internode and sheath hairs ascending to appressed; blade surfaces glabrate to appressed-pubescent.
4 Spikelets 2.5-3.1 mm long; lower culm blades usually glabrous adaxially except for long hairs at or near the margin (appearing ciliate), appressed-pubescent abaxially . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . D. ovale var. ovale
4 Spikelets 2.1-2.6 mm long; lower culm blades usually sparsely appressed-pubescent on both surfaces, eciliate or ciliate at the base only
D. ovale var. addisonii

1 Ligule a single structure, without a pseudoligule.
5 Ligule 2-5 mm long, ciliate
D. acuminatum group

5 Ligule less than 2 mm long, ciliate or membranous.
6 Ligule a stramineous to light brown membrane, with or without terminal ciliations; peduncle scabrous but not hairy.
7 Panicle rachis smooth, pellucid-punctate; first glume 0.3-0.6 (-0.8) mm; larger leaves $10-25 \mathrm{~cm}$ long, 8-15 mm wide; ligule $0.5-1.3 \mathrm{~mm}$ long; lowest elongate culm internode $>2 \mathrm{~mm}$ in diameter; lowest nodes usually glabrous or pubescent
D. scabriusculum

7 Panicle rachis scabrous, not pellucid-punctate; first glume $0.7-1.1 \mathrm{~mm}$ long; larger leaves $7-12 \mathrm{~cm}$ long, 6-9 mm wide; ligule 0.3-0.6 mm long; lowest elongate culm internode $<1.7 \mathrm{~mm}$ in diameter; lowest nodes usually retrorsely bearded
D. species 9 (= cryptanthum)

6 Ligule entirely of white hairs; peduncle variously hairy or glabrous, but not scabrous.
8 Culms to 1.5 m tall, with a broad, glabrous, viscid band below the nodes; blades of the lower leaves typically villous or velvety-pubescent.
D. scoparium

8 Culms rarely exceeding 1 m , without a viscid band below the nodes; blades various.
9 Sheaths retrorsely pilose with hairs 2-3 mm long; basal leaves usually numerous, ascending, similar in size and shape to the culm leaves; culms branching only at the base
D. laxiflorum

9 Sheaths glabrous or pilose (if pilose, then hairs not both retrorse and 2-3 mm long); basal leaves rosette-
forming, usually much smaller than the culm leaves; culms branching at the nodes in age.
10 Culm internodes glabrous to sparsely pilose; culm nodes bearded with long retrorse hairs; blade surfaces glabrous to velvety-pubescent ................................ D. dichotomum group
10 Culm internodes, at least the lower, strigose, pilose, or villous; culm nodes bearded with ascending or spreading hairs; blade surfaces glabrous or variously hairy.
11 Lower nodes bearded with erect-ascending, soft, and long hairs; mid-culm blades usually $20 \times$ or more as long as wide.
12 Spikelets 2.9-4.0 mm long, fusiform to elliptic, acute, basally constricted; first glume 1.4-2.6 mm long
D. fusiforme

12 Spikelets 1.5-3.1 mm long, obovate to elliptic-obovate, obtuse to sub-acute, not basally constricted; first glume $0.6-1.5 \mathrm{~mm}$ long.

13 Spikelets 1.5-2.2 mm long; first glume $0.6-0.8 \mathrm{~mm}$ long; blades to 8 cm long, usually involute . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . D. aciculare
13 Spikelets 2.1-3.1 mm long; first glume $0.8-1.5 \mathrm{~mm}$ long; blades to 12 cm long, usually flat except at tip
D. angustifolium

11 Lower and often mid-culm nodes bearded with spreading, stiffish, and short-to-long hairs; midculm blades usually $15 \times$ or less as long as wide.
14 Blades stiff, often longitudinally ribbed, at least the lower villous or strongly pilose on the abaxial surface, and usually strongly pilose at least basally on the adaxial surface
D. consanguineum

14 Blades not noticeably stiff nor longitudinally ribbed, pubescent or strigose underneath, glabrous above or with a few long hairs near the base.
15 Spikelets 2.5-3.1 mm long; lower culm blades usually glabrous adaxially except for long hairs at or near the margin (appearing ciliate), appressed-pubescent abaxially
D. ovale var. ovale

15 Spikelets 2.1-2.6 mm long; lower culm blades usually sparsely appressed-pubescent on both surfaces, eciliate or ciliate at the base only . . . . . . . D. ovale var. addisonii

Key E-Spikelets 2.1-3.2 mm long, larger culm blades less than 13 mm wide, culm nodes not bearded, the lowermost sometimes puberulent or sparsely pilose

Ligule $1.6-4 \mathrm{~mm}$ long
D. oligosanthes var. oligosanthes

1 Ligule no more than 1.5 mm long.
2 Blades, at least the lower, cordate or subcordate at the base, mostly 6-12 mm wide.
3 Spikelets obpyriform when viewed dorsally, strongly plano-convex when viewed laterally, usually markedly reddishpurple basally; fertile lemma papillose
D. species 2 (=webberianum)

3 Spikelets elliptic to elliptic-obovoid when viewed dorsally or laterally, greenish to faintly purple-tinged basally; fertile lemma not papillose.
4 Lowermost internodes crisp-puberulent; larger culm blades 4-8 (-11) cm long, 5-10 (-12) mm wide, broadest near the base, spreading from the culm
D. commutatum var. ashei

4 Lowermost internodes glabrous to puberulent to sparsely pilose; larger culm blades $6-14 \mathrm{~cm}$ long, 6-13 mm wide, broadest at or just below the middle, erect or erect-spreading, narrowed below to a moderately subcordate base
D. boreale

2 Blades tapering to the base, $2-12 \mathrm{~mm}$ wide.
$5 \quad$ Ligule a stramineous to light brown membrane, with or without terminal ciliations.
6 Panicle rachis smooth, pellucid-punctate; first glume 0.3-0.6 (-0.8) mm long; larger leaves $10-25 \mathrm{~cm}$ long, 8-15 mm wide; ligule $0.5-1.3 \mathrm{~mm}$ long; lowest elongate culm internode $>2 \mathrm{~mm}$ in diameter; lowest nodes usually glabrous or pubescent D. scabriusculum

6 Panicle rachis scabrous, not pellucid-punctate; first glume $0.7-1.1 \mathrm{~mm}$ long; larger leaves $7-12 \mathrm{~cm}$ long, 6-9 mm wide; ligule 0.3-0.6 mm long; lowest elongate culm internode $<1.7 \mathrm{~mm}$ in diameter; lowest nodes usually retrorsely bearded
D. species 9 (= cryptanthum)

5 Ligule of short white hairs or absent.
7 Leaves basally disposed, usually matted or cushion-forming, larger than the mid and upper culm leaves; blade margins uniformly papillose-ciliate; culms branching only at the base, 0.5-3.5 dm tall; internodes glabrous or sparsely pubescent . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . D. strigosum var. leucoblepharis
7 Basal leaves rosette-forming, usually much smaller than culm leaves; blade margins glabrous, or ciliate only below the middle (or papillose-ciliate throughout in =lancearium, which has densely puberulent internodes); culms branching at the nodes in age, $1.5-7.5 \mathrm{~mm}$ tall.
8 Blades of mid-culm leaves typically long and stiff, acuminate, linear or narrowly lanceolate, usually more than $10 \times$ as long as wide, only $2-5 \mathrm{~mm}$ wide when less than 8 cm long.
$9 \quad$ Spikelets 2.9-4.0 mm long, fusiform to elliptic, acute, basally constricted; first glume 1.4-2.6 mm long
D. species 8 (=fusiforme)

9 Spikelets 1.5-3.1 mm long, obovate to elliptic-obovate, obtuse to sub-acute, not constricted basally; first glume $0.6-1.5 \mathrm{~mm}$ long.
10 Spikelets $1.5-2.2 \mathrm{~mm}$ long; first glume $0.6-0.8 \mathrm{~mm}$ long; blades to 8 cm long, usually involute D. aciculare

10 Spikelets 2.1-3.1 mm long; first glume $0.8-1.5 \mathrm{~mm}$ long; blades to 12 cm long, usually flat except at tip . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . D. angustifolium
8 Blades of mid-culm leaves lanceolate, thin or firm but not stiff, usually less than $10 \times$ as long as wide,
usually 7 mm or more wide when as much as 8 cm long.
11 Spikelets 2.9-3.8 mm long, broadly elliptic, rounded at the summit, with broad and thick nerves ..... D. oligosanthes var. scribnerianum

11 Spikelets 2.1-2.9 mm long, elliptic or obovate, rounded or pointed at the summit, the nerves often raised, but not broad and thick.
12 Culm internodes and sheaths glabrous or sparsely pilose.

13 Spikelets obpyriform when viewed dorsally, strongly plano-convex when viewed laterally; first glume and base of second glume usually strongly reddish-purple

## D. species 2 (=webberianum)

13 Spikelets variously shaped but not obpyriform when viewed dorsally, biconvex to elliptic when viewed laterally; first and second glumes various.
14 Culms tending to be stiffly erect; blades erect or erect-spreading, broad, usually but not always tapering from just below the middle to both ends, often yellowish green; plants not or only sparingly branched in age, not developing leafy fascicles of reduced leaves and inflorescences
D. boreale

14 Culms not stiffly erect; leaves usually spreading, broad or narrow, dark to bright green; plants often freely branched in age, becoming top-heavy with a mass of fascicled, reduced leaves and inflorescences $\qquad$
12 Culm internodes crisp-puberulent (sparsely so in D. species 2 (=webberianum); sheaths puberulent or glabrous.
15 Spikelets elliptic, sub-acute to pointed, greenish or faintly purple-tinged basally D. commutatum var. ashei

15 Spikelets strongly plano-convex when viewed laterally, obpyriform when viewed dorsally, broadly rounded, usually markedly reddish-purple basally.
16 Fertile lemma and palea papillose; spikelets 2.2-2.6 mm long; lower culm blades 6-12 mm wide, glabrous
D. species 2 (=webberianum)

16 Fertile lemma and palea smooth (minutely reticulate but not papillose); spikelets (1.8) 1.9-2.2 (-2.3) mm long; lower culm blades 4-8 mm wide, glabrous, glabrate, or puberulent (especially abaxially)
D. species 3 (=lancearium)

## Key F - Spikelets $\mathbf{0 . 8 - 2 . 0} \mathbf{m m}$ long, lower culm internodes variously hairy

1 Longer hairs of ligule 2-5 mm long.
2 Ligule without a distinct ring of short hairs in front of the long hairs . . . . . . . . . . . . . . . . . . . . . D. acuminatum group
2 Ligule with a distinct ring of short hairs in front of the long hairs.
3 Peduncle, panicle axis, and sheaths puberulent with hairs 0.1 mm long; larger blades 3-6 cm long, 3-5 mm wide; spikelets 1.3-1.7 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . D. meridional
3 Peduncle panicle axis hairs longer than 0.1 mm ; sheaths and internodes densely clothed with straight retrorse (occasionally spreading to spreading-ascending) hairs often 4 mm long or longer
D. villosissimum var. villosissimum
1 Longer hairs of ligule less than 2 mm long.
4 Culm leaves basally crowded, ascending, usually matted or cushion-forming, larger than the mid and upper culm blades.
5 Sheaths conspicuously retrorsely long-pilose; longer blades 6-18 cm long by 7-12 mm wide; spikelets 1.9-2.3 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . D. Iaxiflorum
5 Sheaths variously pubescent or glabrous, but not conspicuously retrorsely long-pilose; longer blades 2-6 cm long by 1-8 mm wide; spikelets $0.9-2.1 \mathrm{~mm}$ long.
6 Blades 1-4 mm wide, glabrous, the margins eciliate or basally ciliate; spikelets 0.9-1.5 mm long, glabrous; autumnal form branched from lower and mid nodes as well as from basal nodes.
7 Blades 1.5-4 (-5) cm long; spikelets 0.9-1.2 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . D. chamaelonche
7 Blades .4-12.(-20). cm.long, som.e at le.a.s.t. $7 . \mathrm{cm}$. long; spikelets.1.2-1.5.mm long
[D. dichotomum var. glabrifolium]
6 Blades 2-10 mm wide, pubescent or glabrous, the margins coarsely papillose-ciliate throughout; spikelets 1.12.1 mm long, glabrous or pubescent; autumnal form branched from basal nodes only.
8 Spikelets pubescent, $1.5-2.1 \mathrm{~mm}$ long; blade surfaces glabrous ..... D. strigosum var. leucoblepharis
8 Spikelets glabrous, 1.1-1.8 mm long; blade surfaces pubescent or glabrous.
9 Blades pilose; spikelets 1.1-1.6 mm long . . . . . . . . . . . . . . . . . . . . D. strigosum var. strigosum
9 Blades glabrous, or sparsely pilose only near the adaxial base; spikelets $1.4-1.8 \mathrm{~mm}$ long
D. strigosum var. glabrescens
4 Culm leaves not basally crowded, the lowest leaves spreading and rosette-forming, usually smaller than the culm leaves.
10 Blades of mid-culm leaves typically long and stiff, acuminate, linear or narrowly lanceolate, often involute, only 2-5 mm wide when less than 8 cm long D. aciculare
10 Blades of mid-culm leaves lanceolate, thin or firm but not stiff, usually 5 mm or more wide when as much as 8 cm long.
11 Internodes variously hairy but not crisp-puberulent.
12 Internodes sparsely pilose; ligule less than 1 mm long; blades with a white cartilaginous margins about 0.2 mm wide; spikelets $1.4-1.7 \mathrm{~mm}$ long
12 Internodes (sparsely-) moderately to densely pubescent to pilose; ligule 1-5 mm long; blades either lacking a white cartilagionous margin, or margin less than 0.2 mm wide; spikelets $1.1-2.5 \mathrm{~mm}$ long.
13 Larger mid-culm blades $4-7 \mathrm{~cm}$ long, $4-7 \mathrm{~mm}$ wide, glabrous to sparsely pubescent adaxially; ligule 1-
5 mm long; spikelets $1.1-1.5 \mathrm{~mm}$ long
D. Ieucothrix

13 Larger mid-culm blades 3-6 cm long, 3-5 mm wide, long-pilose adaxially; ligule often with a ring of hairs less than 1 mm and scattered longer hairs to 4 mm ; spikelets 1.3-1.7 mm long . D. meridionale 11 Internodes crisp-puberulent.

14 Ligule $0.7-1.5 \mathrm{~mm}$ long; first glume acute; spikelets elliptic when viewed dorsally, biconvex or elliptic when viewed laterally, not strongly nerved D. columbianum

14 Ligule less than 0.5 mm long; first glume obtuse to truncate; spikelets obovate when viewed dorsally, plano-convex when viewed laterally, strongly nerved.
15 Spikelets 1.5-1.8 mm long; first glume 0.5-0.8 mm long; lower culm blades $2-5 \mathrm{~mm}$ wide D. portoricense

15 Spikelets (1.8-) 1.9-2.2 (-2.3) mm long; first glume 0.8-1.2 mm long; lower culm blades 4-8 mm wide
D. species 3 (=lancearium)

## Key G - Spikelets $\mathbf{0 . 8 - 2 . 0} \mathbf{m m}$ long, lower culm internodes glabrous

1 Ligule $1-5 \mathrm{~mm}$ long.
2 Ligule 1-2 mm long; sheaths sparsely to moderately spreading short-pilose; internodes glabrous; nodes retrorsely bearded; leaves $1-4 \mathrm{~cm}$ long, $2-5 \mathrm{~mm}$ wide; spikelets $1.2-1.4 \mathrm{~mm}$ long
D. sp. 10 (=curtifolium)

2 Ligule (1.5-) 2-5 mm long; sheaths glabrous to variously pubescent; internodes glabrous or pubescent; nodes glabrous, or bearded with ascending, spreading, or tangled hairs; leaves $3-10 \mathrm{~cm}$ long, 3-10 mm wide; spikelets $0.8-1.9 \mathrm{~mm}$ long . .
D. acuminatum group

1 Ligule less than 1 mm long.
3 Basal leaves rosette-forming, usually much smaller than the culm leaves, not matted or cushion-forming; culms branching at the mid and upper nodes in age.
4 Blades of mid-culm leaves typically long and acuminate, linear or narrowly lanceolate, usually 10-20× as long as wide, only $2-5 \mathrm{~mm}$ wide when less than 8 cm long.
5 Spikelets papillose-pubescent; blades 1-2 (-3) mm wide; panicle 2-3 cm wide; first glume $0.8-1.0 \mathrm{~mm}$ long, acute; culms to 4 dm tall
D. species 5 (=neuranthum)

5 Spikelets glabrous; blades $3-8 \mathrm{~mm}$ wide; first glume $0.3-1.1 \mathrm{~mm}$ long, truncate to acute; culms to 10 dm tall.
6 Leaves 3-8 mm wide; panicle (8-) 20-40 mm wide; first glume $0.6-1.1 \mathrm{~mm}$ long, blunt to acute

4 Blades of mid-culm leaves lanceolate, mostly $10 \times$ or less as long as wide, usually 7 mm or more wide when as much as 8 cm long.
7 Spikelets elliptic, oblong, or obovate; lower culm blades $3-12(-15) \mathrm{mm}$ wide, thin, tapered to the base; plants often freely branching in age, becoming top-heavy with a mass of fascicled, reduced leafy branches and inflorescences
D. dichotomum group

7 Spikelets broadly elliptic to suborbicular; lower culm blades $6-30 \mathrm{~mm}$ wide, thickish, broad, and cordate to subcordate at the base; plants sparingly branched in age, not becoming top-heavy with fascicled, reduced leafy branches and inflorescences.
8 Spikelets 0.9-1.2 mm long; longer blades 6-8 cm long, erect to erect-ascending . . . . . . . D. erectifolium 8 Spikelets 1.2-1.9 mm long; longer blades $8-20 \mathrm{~cm}$ long, ascending or the uppermost erect.

9 Mid-culm blades 6-11 (-14) mm wide, the uppermost 3-9 cm long
sphaerocarpon . . . . . . . . . .........

9 Mid-culm blades, at least some, $15-30 \mathrm{~mm}$ wide, the uppermost $10-15 \mathrm{~cm}$ or more long $D$. polyanthes
3 Basal leaves similar to or larger than the mid and upper culm leaves, often matted or cushion-forming; culms branching at the base (also at mid and upper nodes in D. chamaelonche vars. and D. dichotomum var. glabrifolium).
10 Longer blades more than 6 cm ; if only 6 cm , then sheaths retrorsely long-pilose ( $D$. laxiflorum).
11 Spikelets 1.2-1.5 mm long, glabrous
[D. dichotomum var. glabrifolium]

11 Spikelets 1.7-2.3 (-2.8) mm long, pubescent.
12 Longer blades $10-35 \mathrm{~cm}$ long by $2-4 \mathrm{~mm}$ wide; sheaths glabrous to variously pilose, but not conspicuously retrorsely long-pilose; nodes variously pubescent to glabrate; spikelets 1.7-2.3 (-2.8) mm long

12 Longer blades 6-18 cm long by 7-12 mm wide; sheaths conspicuously retrorsely long-pilose; nodes bearded with retrorse or spreading hairs; spikelets $1.9-2.3 \mathrm{~mm}$ long
D. laxiflorum

10 Longer blades $1.5-6 \mathrm{~cm}$; sheaths glabrous or pubescent, but not retrorsely long-pilose.
13 Blades 1-3 mm wide, glabrous, eciliate or basally ciliate; spikelets 0.9-1.4 mm long.
14 Spikelets pubescent, 1.2-1.4 mm long; blades involute, often falcate, 2.5-6 cm long
14 Spikelets glabrous, 0.9-1.2 mm long; blades flat, not falcate, $1.5-4(-5) \mathrm{cm}$ long
D. chamaelonche ssp. chamaelonche

13 Blades 3-8 mm wide; spikelets 1.1-2.1 mm long (if less than 1.5 mm , then blades either pubescent on one or both surfaces or ciliate to the apex).
15 Spikelets pubescent, $1.5-2.1 \mathrm{~mm}$ long; blade surfaces glabrous ..... D. strigosum var. leucoblepharis 15 Spikelets glabrous, 1.1-1.8 mm long; blade surfaces pubescent or glabrous.

## Key to the Dichanthelium acuminatum group

1 Internodes glabrous.
2 Ligule 1-2 mm long; sheaths sparsely to moderately spreading short-pilose; nodes retrorsely bearded; leaves 1-4 cm long, 2-5 mm wide; spikelets 1.2-1.4 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . D. sp. 10 (=curtifolium)
2 Ligule (1.5-) 2-5 mm long; sheaths glabrous to variously pubescent, but not spreading short-pilose; nodes glabrous or pubescent, but not bearded; leaves $4-11 \mathrm{~cm}$ long, $4-8 \mathrm{~mm}$ wide.
3 Panicles $8-12 \mathrm{~cm}$ long, $1 / 4-1 / 3$ as wide, bearing 250 or more spikelets; spikelets $1.4-1.6 \mathrm{~mm}$ long; ligule (1.5-) 2-3 mm long; larger blades $7-11 \mathrm{~cm}$ long, often tinged with purple . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . D. spretum
3 Panicles $3-8 \mathrm{~cm}$ long, more than $1 / 2$ as wide, bearing less than 200 spikelets; spikelets $1.1-1.6 \mathrm{~mm}$ long; ligule 2-5 mm long; larger blades $4-10 \mathrm{~cm}$ long.
4 Longer hairs of ligule 2-3 mm long; spikelets 1.1-1.5 mm long; blades often tinged with purple, the larger 4-8 cm long
D. Iongiligulatum

4 Longer hairs of ligule 3-5 mm long; spikelets 1.4-1.6 mm long; blades often yellowish-green, the larger 5-10 cm long
D. acuminatum var. lindheimeri

1 Internodes variously pubescent.
5 Peduncle, panicle axis, and/or sheaths of vernal culms puberulent with hairs 0.1 mm long, sometimes also pubescent with longer hairs, but never grayish-villous; larger blades 2-7 cm long, 2-7 mm wide.
6 Spikelets 0.8-1.1 mm long; blades 2-4.5 cm long, 2-5 mm wide; sheaths sparsely puberulent, lacking papillose-based longer hairs
D. wrightianum

6 Spikelets 1.1-1.7 mm long; mid-culm blades generally 3-7 cm long and $3-7 \mathrm{~mm}$ wide; sheaths with some papillosebased hairs 2 mm or more long.
7 Larger mid-culm blades $4-7 \mathrm{~cm}$ long, $4-7 \mathrm{~mm}$ wide, glabrous to sparsely pubescent adaxially; ligule 1-5 mm long; spikelets 1.1-1.5 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . D. Ieucothrix
$7 \quad$ Larger mid-culm blades $3-6 \mathrm{~cm}$ long, $3-5 \mathrm{~mm}$ wide, long-pilose adaxially; ligule often with a ring of hairs less than 1 mm and scattered longer hairs to 4 mm ; spikelets $1.3-1.7 \mathrm{~mm}$ long . . . . . . . . . . . . . . D. meridionale
5 Peduncle, panicle axis, and sheaths of vernal culms glabrous, or pilose, or grayish-villous with some shorter hairs 0.2-0.5 mm long, but not puberulent with hairs 0.1 mm long; larger blades $4-12 \mathrm{~cm}$ long, $4-12 \mathrm{~mm}$ wide.
8 Sheaths and internodes of vernal culms gray-villous with a dense, tangled, or matted mixture of slender hairs 2-4 mm long, variously ascending, spreading, and retrorse, papillose or non-papillose, often with shorter hairs beneath; blades velvety-pubescent on abaxial surface.
9 Culms $15-60 \mathrm{~cm}$ tall and less than 1.5 mm thick; panicle broadly ovoid, 5-8 cm long and more than half as wide D. acuminatum var. acuminatum

9 Culms 40-70 (-80) cm tall, the larger usually more than 60 cm long and 2 mm thick; panicle contracted, $8-11 \mathrm{~cm}$ long and less than half as wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . D. acuminatum var. thurowii
8 Sheaths and internodes of vernal culms glabrous, or papillose-pilose to hispid with ascending straight hairs 1-3 mm long; blades appressed-pilose to puberulent abaxially, but not velvety.
10 Peduncle, panicle axis, and often middle and upper internodes glabrous; sheaths, at least near mid-length, lacking hairs or papillae; larger blades 4-8 mm wide, glabrous abaxially; spikelets 1.3-1.6 mm long
D. acuminatum var. lindheimeri

10 Peduncle, panicle axis, and internodes pubescent to pilose; sheaths papillose-pilose to hispid, the hairs tending to break off but leaving evident papillae; larger blades $6-10 \mathrm{~mm}$ wide, short-pilose to glabrate abaxially; spikelets $1.5-2.0 \mathrm{~mm}$ long
D. acuminatum var. fasciculatum

## Key to the Dichanthelium dichotomum Group

1 Lower cauline nodes glabrous or puberulent, but not bearded.
2 Spikelets glabrous.
3 Cauline leaves mostly basally disposed, strongly ascending, much larger than the 2-3 remote middle and upper cauline leaves of fertile culms; spikelets 2.4-2.9 mm long; culms branch from basal and lower nodes, but are not known to produce autumnal inflorescences . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [D. nudicaule]
3 Cauline leaves well-distributed along the culm, more than three, gradually reduced upwards and often spreading; spikelets 0.9-2.6 mm long; culms produce autumnal inflorescences from lower, middle, and/or upper nodes, if from lower only, then spikelets only $0.9-1.2 \mathrm{~mm}$ long.
4 Fertile lemma and palea densely papillose; culms weak, soon sprawling over other vegetation .... D. Iucidum 4 Fertile lemma and palea smooth, with few or no papillae; culms stiffer, erect to ascending.

5 Spikelets 0.9-1.5 mm long; vernal blades $1-4 \mathrm{~mm}$ wide.
6 Spikelets 0.9-1.2 mm long; blades 1.5-4 (-5) cm long, 1-2.5 (-3) mm wide, mostly 15-20 times as long as wide; autumnal plants cushion-forming . . . . . . . . . . . . . D. chamaelonche ssp. chamaelonche

6 Spikelets 1.2-1.5 mm long; blades 1-12 (-20) cm long; autumnal plants not cushion-forming.
7 Blades 1-3 (-5) cm long, 1.5-3 (-4) mm wide, about 10 times as long as wide; autumnal plants sparsely tufted . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . D. ensifolium
7 Blades 4-12 (-20) cm long (the longer at least 7 cm ), 2-4 mm wide, 20-30 (-50) times as long as wide
[D. dichotomum var. glabrifolium]
5 Spikelets 1.4-2.6 mm long; vernal blades $3-15 \mathrm{~mm}$ wide (if spikelets less than 1.6 mm long and vernal blades less than 5 mm wide, then larger blades more than 5 cm long in $D$. caerulescens).
8 Widest vernal cauline blades $7-15 \mathrm{~mm}$ wide; upper sheaths often glutinous-warty; spikelets 2.1-2.6 mm long, some or most acute to beaked, second glume and sterile lemma extending $0.3-0.5 \mathrm{~mm}$ beyond fertile lemma in at least some spikelets
D. yadkinense

8 Widest vernal cauline blades $3-10 \mathrm{~mm}$ wide; upper sheaths not glutinous-warty; spikelets $1.4-2.3$ mm long, blunt to subacute, second glume and sterile lemma often equal to or shorter than fertile lemma, or extending less than 0.3 mm beyond it.
9 Spikelets $1.4-1.8 \mathrm{~mm}$ long; first glume $0.3-0.8 \mathrm{~mm}$ long; fertile lemma 1.3-1.5 mm long; mature vernal panicles usually short-exerted with ascending branches; fresh foliage bluish-glaucous . .
D. caerulescens

9 Spikelets 1.7-2.3 mm long; first glume 0.6-1.1 mm long; fertile lemma 1.6-1.9 mm long; mature vernal panicles exerted with spreading branches; fresh foliage not bluish-glaucous.
10 Vernal cauline blades stiffly erect; [of wet pine savannas and open swamps]
D. dichotomum var. roanokense

10 Vernal cauline blades spreading to deflexed, flexuous; [of wet-mesic to dry woods and thickets]
D. dichotomum var. dichotomum

2 Spikelets pubescent.
11 Spikelets 1.2-1.7 mm long; fertile lemma and palea smooth; culms erect
12 Blades involute and often falcate, 3-6 cm long, about 1.5 mm wide when flattened, 20-50 times as long as wide; lower internodes often strigose; spikelets $1.2-1.4 \mathrm{~mm}$ long; culms $5-20 \mathrm{~cm}$ long [D. chamaelonche ssp. breve]
12 Blades neither involute (except apically) nor falcate, 1-7 cm long, 1.5-7 mm wide, about 10 times as long as wide; lower internodes glabrous or sparsely pilose, but not strigose; spikelets 1.1-1.7 mm long; culms 15-60 cm long.
13 Blades 1-3 (-5) cm long, 1.5-3 (-4) mm wide, the cartilaginous margins typically gray-green to white-beige and about 0.1 mm wide; spikelets $1.2-1.5 \mathrm{~mm}$ long; culms to 40 cm long
D. ensifolium 13 Blades 2-7 mm long, 3-6 mm wide, the cartilaginous margins typically white-beige and about 0.2 mm wide; spikelets (1.2-) 1.4-1.7 mm long; culms to 60 cm long
D. tenue

11 Spikelets (1.5-) 1.7-2.7 mm long, if shorter than 1.8 mm then fertile lemma and palea densely papillose; culms soon sprawling.
14 Spikelets (1.5-)1.7-2.3 mm long, glabrous (rarely pubescent); first glume 0.7-1.1 mm long; fertile lemma and palea densely papillose at 20×
D. Iucidum

14 Spikelets 2.2-2.7 mm long, pubescent; first glume $1.0-1.4 \mathrm{~mm}$ long; fertile lemma and palea smooth or with a few weak papillae at 20×
D. sphagnicola

1 Lower cauline nodes bearded, the hairs usually retrorse.
13 Spikelets glabrous.
14 Spikelets 0.9-1.4 mm long; vernal cauline blades 1.5-4 (-5) cm long and 1-5 mm wide; internodes or sheaths glabrous or pubescent.
15 Spikelets 1.2-1.4 mm long; sheaths spreading-pilose; vernal cauline blades 2-5 mm wide; ligule 1-2 mm long; node beard hairs usually spreading or reflexed; internodes glabrous . D. sp. 10 (=curtifolium)
15 Spikelets 0.9-1.2 mm long; sheaths glabrous; vernal cauline blades 1-2 (-3) mm wide; ligule less than 1 mm long; node beard hairs erect and often only partially encircling the node; internodes glabrous or puberulent D. chamaelonche

14 Spikelets 1.4-2.3 mm long; vernal cauline blades $5-12 \mathrm{~cm}$ long and $3-15 \mathrm{~mm}$ wide; internodes and sheaths glabrous. 16 Spikelets $1.8-2.3 \mathrm{~mm}$ long; first glume $0.6-1.1 \mathrm{~mm}$ long; fertile lemma $0.8-1.0 \mathrm{~mm}$ wide; widest vernal blades 3-8 (-10) mm wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . D. dichotomum var. dichotomum
16 Spikelets $1.4-1.9 \mathrm{~mm}$ long; first glume $0.3-0.6(-0.7) \mathrm{mm}$ long; fertile lemma $0.6-0.8 \mathrm{~mm}$ wide; widest vernal blades $7-15 \mathrm{~mm}$ wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . D. dichotomum var. ramulosum
13 Spikelets pubescent.
17 Spikelets 1.2-1.4 mm long; sheaths spreading-pilose; vernal cauline blades 1-4 cm long and 2-5 mm wide; ligule 1-2 mm long D. sp. 10 (=curtifolium)

17 Spikelets 1.4-2.8 mm long; sheaths glabrous to appressed-pilose; vernal cauline blades $5-12 \mathrm{~cm}$ long and $5-15 \mathrm{~mm}$ wide; ligule less than 1 mm long.
18 Usually all culm nodes bearded; internodes glabrous, or middle and upper internodes and peduncle sparsely to moderately spreading short-hairy, sometimes also glandular; upper as well as lower vernal sheaths and both surfaces of cauline blades pubescent, often densely so; spikelets (1.5-) 1.8-2.1 mm long; [of dry rocky or sandy basic soil and barrens]
18 Often only lower culm nodes bearded; internodes glabrous; at least middle and upper cauline blades glabrous; spikelets $1.4-2.8 \mathrm{~mm}$ long; [mostly of wet acid soils and mesic to dry woodlands].

19 Spikelets (2.0-) 2.2-2.8 mm long; first glume $0.5-1.3 \mathrm{~mm}$ long; fertile lemma $1.8-2.3 \mathrm{~mm}$ long; lowest vernal cauline blades pubescent at least abaxially . . . . . . . . . . . . . . . . . . . . . . D. mattamuskeetense
19 Spikelets 1.4-2.2 mm long; first glume 0.3-0.9 mm long; fertile lemma 1.4-1.7 mm long; lowest vernal cauline blades glabrous.
20 Spikelets $1.7-2.2 \mathrm{~mm}$ long; first glume $0.6-0.9 \mathrm{~mm}$ long; fertile lemma $0.7-1.0 \mathrm{~mm}$ wide
D. dichotomum var. nitidum

20 Spikelets $1.4-1.9 \mathrm{~mm}$ long; first glume $0.3-0.6(-0.8) \mathrm{mm}$ long; fertile lemma $0.6-0.8 \mathrm{~mm}$ wide
D. dichotomum var. ramulosum

Dichanthelium aciculare (Desvaux ex Poiret) Gould \& Clark, Needle Witch Grass. Cp, Pd (GA, NC, SC, VA): sandy woods and fields; common in Coastal Plain, uncommon in Piedmont. May-October. NJ south to n. FI, west to TX and OK, also in West Indies and $n$. South America. Blades typically are strongly involute. Can be confused with autumnal forms of $D$. ovale var. addisonii, which has vernal blades $5-10 \mathrm{~mm}$ wide. See note at end of descriptions regarding Panicum chrysopsidifolium. [Panicum aciculare Desvaux ex Poiret -- RAB, F, G, HC, S; P. aciculare -- C, in part; D. aciculare ssp. aciculare - FNA; P. bennettense M.V. Brown -- HC, S; D. aciculare -- K, Z, in part]

Dichanthelium acuminatum (Swartz) Gould \& Clark. var. acuminatum, Woolly Witch Grass. Cp, Pd (GA, NC, SC, VA): on dryish sandy or clayey soils of open woods and disturbed areas; common. May-October. MA south to FL, west to TX, also in West Indies, Mexico, Central America, and n. South America. Internodes and sheaths gray-villous with usually non-papillate hairs. Plants tend to be low and "bushy" with several spreading-ascending culms and dense autumnal branching. See note at end of descriptions regarding Panicum chrysopsidifolium. [= Y; Panicum lanuginosum Elliott -- RAB, in part; P. lanuginosum var. lanuginosum -- C, F, G; P. leucothrix Nash -- C, in part; P. auburne Ashe -- F, G, HC, S; D. acuminatum ssp. acuminatum - FNA; P. lanuginosum (sensu stricto) -- HC, S; D. acuminatum var. acuminatum -- K, Z, in part; D. acuminatum var. implicatum (Scribner) Gould \& Clark --K, Z, in part; $P$. acuminatum Swartz var. acuminatum -- X , in part]

Dichanthelium acuminatum (Swartz) Gould \& Clark var. fasciculatum (Torrey) Freckmann, Slender-stemmed Witch Grass. Mt, Pd, Cp (GA, NC, SC, VA): open or cut-over woods, thickets, fields, meadows, and shores, frequently on disturbed soils; frequent (less common in the Coastal Plain). May-August. Newfoundland south to FL, west to CA, north to s. British Columbia. Typically much less pilose than var. acuminatum, the hairs usually papillate. See note at end of descriptions regarding Panicum glutinoscabrum. [= Y; Panicum lanuginosum Elliott -- RAB, in part; P. lanuginosum var. fasciculatum (Torrey) Fernald -- C, F, G; P. lanuginosum var. tennesseense (Ashe) Gleason -- C, G; P. lanuginosum var. implicatum (Scribner) Fernald -- C, F, G; D. acuminatum ssp. fasciculatum (Torrey) Freckmann \& Lelong - FNA; P. implicatum Scribner -- HC; P. huachucae Ashe -- HC, S; P. huachucae var. fasciculatum (Torrey) Hubb. -- HC; P. tennesseense Ashe -- HC, S; P. huachucae var. silvicola Hitchcock \& Chase -- S; D. acuminatum var. acuminatum -- K, Z, in part; D. acuminatum var. implicatum (Scribner) Gould \& Clark --Z, in part; $P$. acuminatum Swartz var. fasciculatum (Torrey) Lelong -- X; P. acuminatum var. unciphyllum (Trinius) Lelong -- X , in part]

Dichanthelium acuminatum (Swartz) Gould \& Clark var. lindheimeri (Nash) Gould \& Clark, Lindheimer's Witch Grass. Pd, Cp, Mt (GA, NC, SC, VA): open or cut-over woods, thickets, fields, meadows, and shores, often on wet soils; uncommon in Piedmont, rare in Coastal Plain and Mountains. May-September. Nova Scotia west to Manitoba, south to FL and MO, west to s. CA. Internodes as well as sheaths often nearly glabrous. Panicle axis sometimes sparsely pilose at branch nodes, but otherwise glabrous. [= Y; Panicum lanuginosum Elliott -- RAB, in part; P. lanuginosum var. lindheimeri (Nash) Fernald -- C, G, in part; P. lanuginosum var. septentrionale Fernald -- C, F, G; P. lanuginosum var. lindheimeri-- F; D. acuminatum ssp. lindheimeri (Nash) Freckmann \& Lelong - FNA; P. spretum Schultes -- GW, in part; P. lindheimeri Nash -- HC, S; D. acuminatum var. acuminatum -- K, Z, in part; D. acuminatum var. lindheimeri -- K, Z; P. acuminatum Swartz var. lindheimeri (Nash) Lelong -- X; D. lanuginosum (Elliott) Gould var. lindheimeri (Nash) Harvill]

Dichanthelium acuminatum (Swartz) Gould \& Clark var. thurowii (Scribner \& J.G. Smith) Gould \& Clark, Thurow's Witch Grass. Cp (GA): in dry open woods, woodland edges, dry prairies, brushy pastures; occasional (possibly rare in GA). May?October? Occasional from GA to AR and e. TX. [= K, Y, Z; D. acuminatum (Swartz) Gould \& Clark. ssp. acuminatum - FNA, in part; Panicum thurowii Scribner \& J.G. Smith -- HC, S]

Dichanthelium angustifolium (Elliott) Gould, Narrow-leaved Witch Grass. Cp, Pd, Mt (GA, NC, SC, VA): sandy pinelands and fields; common in Coastal Plain and Piedmont, rare in mountains. May-October. NJ south to FL, west to AR and e. TX. Vernal blades typically are flat (often involute distally). Can be confused with $D$. consanguineum, which has spreading-pilose nodes and blades $10-15 \times$ as long as wide; $D$. angustifolium blades typically are $20 \times$ or more as long as wide. Plants with involute blades to 8 cm long, spikelets 2.1-2.5 mm long, and first glumes $0.7-1.1 \mathrm{~mm}$ long are referable to Panicum arenicoloides, here included in $D$. angustifolium. They are transitional to D. aciculare. [Panicum angustifolium Elliott -- RAB, F, G, HC, S; P. aciculare Desvaux ex Poiret -- C, in part; D. aciculare ssp. angustifolium (Elliott) Frechmann \& Lelong - FNA; P. arenicoloides Ashe -- HC, S; D. aciculare -- K, Z, in part]

Dichanthelium annulum (Ashe) LeBlond, Ringed Witch Grass. Pd (GA, NC, VA), Mt (VA): dry sandy or rocky soil of open woods, dry grasslands, and barrens, and glades over serpentine, limestone, calcareous shales, and other high pH dry soils; rare (NC Significantly Rare, VA Rare List). May-October. NJ, IN, and MO south to AL and MS, primarily in the Appalachian Province with very few occurrences in the Coastal Plain. One of the more distinctive taxa within the D. dichotomum group by morphology, habitat, and range. Plants from se. MA with all leaves pubescent, glabrous internodes, and spikelets 2.2-2.5 mm long were described as Panicum annulum var. glabrescens, but belong to D. mattamuskeetense. [= Q; P. dichotomum Linnaeus - RAB, C, GW, in part; Panicum annulum Ashe -- F, G, HC, S; D. dichotomum ssp. mattamuskeetense (Ashe) Freckmann \& Lelong - FNA, in part; D. dichotomum (Linnaeus) Gould - K, Z, in part; P. dichotomum var. mattamuskeetense (Ashe) Lelong - X, in part]

Dichanthelium boreale (Nash) Freckmann, Northern Witch Grass. Pd, Mt (GA, NC, VA): open woods and grassy slopes, usually in moist soil; rare (NC Watch List, VA Watch List). April-September. Newfoundland and Ontario south to NC, GA, and AR. Our plants are =Panicum bicknellii, regarded as a "putative hybrid" (along with $=P$. calliphyllum) by FNA, which cites WV as the southern limit of $D$. boreale. [= K, Z; Panicum bicknellii Nash -- RAB, F, G, HC, S; P. boreale Nash -- C, F, G, HC; P. calliphyllum

Ashe - F, HC; including D. boreale sensu FNA; P. bicknellii var. calliphyllum (Ashe) Gleason - G]
Dichanthelium boscii (Poiret) Gould \& Clark, Bosc's Witch Grass. Pd, Mt, Cp (GA, NC, SC, VA): shaded mesic to dry woodlands; common. April-September. MA and IL south to n. FL and e. TX. [= FNA, K, Z; Panicum boscii Poiret -- RAB, C, F, G, HC, S; P. boscii var. molle (Vasey) Hitchcock \& Chase -- F, HC, S]

Dichanthelium caerulescens (Hackel ex Hitchcock) Correll, Blue Witch Grass. Cp (NC, VA): marshes, swamps, wet pinelands, maritime grasslands, damp sandy soil; rare (NC Watch List, VA Watch List). June-October. NJ to NC, and from FL to LA, also in the Bahamas and West Indies. Not treated by FNA, where it presumably would have been placed in synonymy with $D$. dichotomum ssp. roanokense. [= Q; Panicum dichotomum Linnaeus -- RAB, GW, in part; P. caerulescens Hackel ex Hitchcock -- F, HC, S; P. roanokense Ashe -- G, in part; D. dichotomum var. dichotomum -- K, Z, in part; P. dichotomum var. roanokense (Ashe) Lelong -- X, in part]

Dichanthelium chamaelonche (Trinius) Freckmann \& Lelong, Carpet Witch Grass. Cp (GA, NC, SC, VA): moist pine savannas and flatwoods, pineland pondshores; occasional to rare (VA Watch List). April-September. Se. VA south to FL, west to LA, also in Cuba and Belize. Internodes can be glabrous or puberulent, and nodes glabrous, pubescent, or bearded, but the glabrous spikelets $0.9-1.2 \mathrm{~mm}$ long are diagnostic. The concept of this taxon in FNA (as ssp. chamaelonche) appears to include $D$. dichotomum var. glabrifolium (see descriptions of Floridian D. chamaelonche ssp. breve and D. dichotomum var. glabrifolium at end of this treatment). [Panicum chamaelonche Trinius -- RAB, G, GW, HC, S; P. ensifolium Baldwin -- C, in part; D. chamaelonche ssp. chamaelonche - FNA, in part; D. dichotomum (Linnaeus) Gould var. ensifolium (Baldwin) Gould \& Clark -- K, Z, in part; P. chamaelonche var. chamaelonche -- X; "D. sp. 6 (=chamaelonche)" of earlier drafts]

Dichanthelium clandestinum (Linnaeus) Gould, Deer-tongue Witch Grass. Mt, Pd, Cp (GA, NC, SC, VA): shaded to filtered woodlands, ditches and low areas, and often in moist sandy soil; common (uncommon in Coastal Plain). May-October. Nova Scotia and Québec south to n. FL, west to IA, KA, and TX. [= FNA, K, Z; Panicum clandestinum Linnaeus -- RAB, C, F, G, HC, S, X]

Dichanthelium columbianum (Scribner) Freckmann, American Witch Grass. Pd, Cp (GA, NC, SC, VA), Mt (NC, VA): dry to moist thin woods and open ground, usually in sandy soil; uncommon. June-October. S. ME, s. Ontario, and WI south to GA, TN, and IL. [= Panicum columbianum Scribner -- RAB, C, F, G, HC, S; P. columbianum var. oricola (Hitchcock \& Chase) Fernald -- F; D. acuminatum ssp. columbianum (Scribner) Freckmann \& Lelong - FNA; P. columbianum var. thinium Hitchcock \& Chase -- HC; P. oricola Hitchcock \& Chase -- HC; P. tsugetorum Nash -- HC, S; D. sabulorum (Lamarck) Gould \& Clark var. thinium (Hitchcock \& Chase) Gould \& Clark -- K, Z, in part; P. acuminatum Swartz var. unciphyllum (Trinius) Lelong -- X, in part]

Dichanthelium commutatum (Schultes) Gould var. ashei (Pearson ex Ashe) Mohlenbrock, Ashe's Witch Grass. Cp, Pd, Mt (GA, NC, SC, VA): dry rocky or sandy woods and openings; common. May-October. MA south to FL and MS, west to MI, MO, and OK. [Panicum commutatum Schultes var. ashei (Pearson ex Ashe) Fernald -- F, G; D. commutatum ssp. ashei (Pearson ex Ashe) Freckman \& Lelong - FNA; P. ashei Pearson ex Ashe -- HC, S; P. commutatum, in part - RAB, C; D. commutatum, in part - K; "D. commutatum var. 1 (=ashei)" of previous drafts]

Dichanthelium commutatum (Schultes) Gould var. commutatum, Variable Witch Grass. Cp, Mt, Pd (GA, NC, SC, VA): low, shaded, moist woodlands and woodland edges, and dry, thin, often rocky woods and thickets; common. May-October. ME south to FL, west to MI, MO, OK, and TX, also in Mexico. [= K; Panicum commutatum Schultes -- RAB, C, F, G, HC, S; P. mutabile Scribner \& Smith ex Nash -- F, G, HC, S; D. commutatum ssp. commutatum Freckmann \& Lelong -- FNA; D. commutatum ssp. equilaterale (Scribner) Freckmann \& Lelong -- FNA; D. commutatum ssp. joori (Vasey) Freckmann \& Lelong -- FNA; P. joorii Vasey -- HC, S; P. equilaterale Scribner -- HC, S]

Dichanthelium consanguineum (Kunth) Gould \& Clark, Kunth's Witch Grass. Cp, Pd (GA, NC, SC, VA): moist or dry sandy soils of pinelands; common in the Coastal Plain, uncommon in the Piedmont (VA Rare List). April-September. Range-wide distribution occasional from se. VA south to FL, west to TX and IN. Often not easily separated from D. angustifolium and D. ovale. It is distinguished from $D$. angustifolium by spreading-hirsute nodes and leaves $10-15 \times$ as long as wide ( $D$. angustifolium has beardless nodes, or nodes bearded with erect-ascending soft hairs, and longer leaves $20 \times$ or more as long as wide). $D$. consanguineum is distinguished from $D$. ovale by having strongly pilose upper blade surfaces ( $D$. ovale upper blade surfaces are glabrous or with a few long hairs basally). The hairs of $D$. consanguineum frequently are strongly papillate. [= FNA, K, Z; Panicum consanguineum Kunth -- RAB, C, F, G, HC, S]

Dichanthelium depauperatum (Muhlenberg) Gould, Starved Witch Grass. Pd, Mt, Cp (GA, NC, SC, VA): dry soils of grasslands and open woods, often on disturbed soils of roadsides and ditches; common (rare in Coastal Plain). May-September. Newfoundland and MN south to GA and TX. [= FNA, K, Z; Panicum depauperatum Muhlenberg -- RAB, C, F, G, HC, S; P. depauperatum var. psilophyllum Fernald -- F, G]

Dichanthelium dichotomum (Linnaeus) Gould var. dichotomum, Forked Witch Grass. Cp, Pd, Mt (GA, NC, SC, VA): wetmesic to dry woods, thickets, and woodland openings; common throughout. May-October. S. Canada and MI south to FL and TX. Plants with bearded nodes and larger leaves are referable to Panicum dichotomum var. barbulatum (here included) but intermediates abound. [= Q; Panicum dichotomum Linnaeus -- RAB, C, GW, in part; P. dichotomum -- F, G, HC, S; P. dichotomum var. barbulatum (Michaux) Wood -- F; D. dichotomum ssp. dichotomum - FNA; P. barbulatum Michaux -- HC, S; D. dichotomum var. dichotomum -- K, Z, in part; $P$. dichotomum var. dichotomum -- X]

Dichanthelium dichotomum (Linnaeus) Gould var. nitidum (Lamarck) LeBlond, Shining Witch Grass. Cp (GA, NC, SC, VA), Pd (NC), Mt (SC, VA): moist sandy or peaty soil of wet pine savannas and pocosin ecotones, wet meadows near the coast, swamps, and marshes; occasional to frequent in Coastal Plain, rare in Piedmont and Mountains. PA and NJ south to FL, west to MO and TX; also the Bahamas (Sorrie \& LeBlond 1997) and West Indies, and Mexico to Venezuela. [= Q; Panicum dichotomum Linnaeus -RAB, C, GW, in part; P. nitidum Lamarck -- F, HC, S; D. dichotomum ssp. nitidum (Lamarck) Freckmann \& Lelong - FNA; P. nitidum var. nitidum -- G; D. dichotomum var. dichotomum - K, Z, in part; P. dichotomum var. nitidum (Lamarck) Wood -- X]

Dichanthelium dichotomum (Linnaeus) Gould var. ramulosum (Torrey) LeBlond, Branched Witch Grass. Cp, Pd, Mt (GA, NC, SC, VA): floodplain forests, swamps, openings, and borders of streams and ponds, and occasionally in dry upland woods; widespread. May-October. MA and MI south to FL and TX. [= Q; Panicum dichotomum Linnaeus -- RAB, C, GW, in part; P. microcarpon Muhlenberg ex Elliott -- F, HC, S; D. dichotomum ssp. microcarpon (Muhlenberg ex Elliott) Freckmann \& Lelong - FNA;
P. nitidum Lamarck var. ramulosum Torrey -- G; D. dichotomum var. dichotomum -- K, Z, in part; P. dichotomum var. ramulosum (Torrey) Lelong -- X]

Dichanthelium dichotomum (Linnaeus) Gould var. roanokense (Ashe) LeBlond, Roanoke Witch Grass. Cp (GA, NC, SC, VA): wet pine savannas, swamp openings, and wet peaty meadows; uncommon (NC Watch List). May-September. DE south to FL, west to e. TX; also in Jamaica. See note under D. caerulescens regarding FNA treatment. [= Q; Panicum dichotomum Linnaeus -RAB, C, GW, in part; P. roanokense Ashe -- F, HC, S; D. dichotomum ssp. roanokense (Ashe) Freckmann \& Lelong - FNA; P. roanokense -- G, in part; $D$. dichotomum var. dichotomum -- K, Z, in part; $P$. dichotomum var. roanokense (Ashe) Lelong -- X, in part]

Dichanthelium ensifolium (Baldwin ex Elliott) Gould, Small-leaved Witch Grass. Cp, Pd (GA, NC, SC, VA): wet to mesic peaty, sandy, or mucky soils, often in open pinelands or with sphagnum; common in Coastal Plain, rare in Piedmont and Mountains. May-October. NJ south to FL, west to e. TX and AR. Plants with pubescent spikelets are frequent. [D. ensifolium ssp. ensifolium FNA; Panicum ensifolium Baldwin ex Elliott - RAB, C, G, GW, in part; P. ensifolium - F, HC, S; P. flavovirens Nash - HC; P. vernale Hitchcock \& Chase - HC; D. dichotomum (Linnaeus) Gould var. ensifolium (Baldwin ex Elliott) Gould \& Clark $-K, Z$, in part; $P$. ensifolium var. ensifolium - X, in part]

Dichanthelium erectifolium (Nash) Gould \& Clark, Erect-leaved Witch Grass. Cp (GA, NC, SC): limesink ponds, depression meadows, cypress savannas, pine savannas; rare (NC Watch List). May-August. Se. NC to FL, west to LA, also in Cuba. [= FNA, K, Z; Panicum erectifolium Nash -- RAB, GW, HC, S]

Dichanthelium fusiforme (Hitchcock) Harvill, Spindle-fruited Witch Grass. Cp (GA, NC, SC, VA): dry to moist sand of open pine and pine/oak woods and clearings; rare (NC Significantly Rare, VA Watch List). May-November. Se. VA south to FL, west to MS, also in West Indies, Mexico, Central America, and Venezuela; perhaps most abundant in FL. Autumnal blades often flat. The autumnal form of $D$. oligosanthes var. oligosanthes can be very similar to $D$. fusiforme if the vernal blades of the former are missing. They are best separated by ligule length ( $0.5-1 \mathrm{~mm}$ in fusiforme, $1.5-3 \mathrm{~mm}$ in oligosanthes) and the more attenuated ends of the fusiforme spikelet. [Panicum fusiforme Hitchcock -- RAB, F, G, HC, S; P. aciculare Desvaux ex Poiret -- C, in part; D. aciculare ssp. fusiforme (Hitchcock) Freckmann \& Lelong - FNA; D. aciculare -- K, Z, in part; "D. species 8" and "D. aciculare var. 2" of earlier drafts]

Dichanthelium hirstii (Swallen) Kartesz, Hirsts' Witch Grass. Cp (GA, NC): pond-cypress savannas and limesink depressions; rare (US Candidate, NC Endangered). June-September. This distinctive species is known from only seven sites: two in NC, one in DE, two in NJ (one not seen since 1992), and two historical populations in GA. Described in 1961 (Swallen 1961), it is treated by some taxonomists as part of the D. aciculare group and by others as part of the D. dichotomum group; its affinities appear to lie with the former. See Schuyler (1996) for a discussion of the taxonomic distinctiveness of this species. The occurrence of this species in NC is documented in LeBlond \& Sorrie (2001). [= K; P. aciculare Desvaux ex Poiret -- C, in part; D. dichotomum ssp. roanokense (Ashe) Freckmann \& Lelong - FNA, in part]

Dichanthelium latifolium (Linnaeus) Harvill, Broad-leaved Witch Grass. Mt (GA, NC, SC, VA): open or shady well-drained forests; rare (NC Watch List). Late May-September. ME south to n. GA, west to WI and MS. [= FNA; Panicum latifolium Linnaeus -- RAB, C, F, G, HC, S; D. Iatifolium (Linnaeus) Gould \& Clark -- K, Z, a later combination]

Dichanthelium laxiflorum (Lamarck) Gould, Open-flower Witch Grass. Cp, Pd, Mt (GA, NC, SC, VA): open or shaded woodlands, often in moist soil; common. April-September. MD south to FL, west to TX, north to IN, also in Mexico, Central America, and West Indies. [= FNA, K, Z; Panicum laxiflorum Lamarck -- RAB, C, F, G, HC, S; P. xalapense H.B.K. -- HC, S; P. xalapense var. strictirameum Hitchcock \& Chase -- HC, S]

Dichanthelium leucothrix (Nash) Freckmann, Roughish Witch Grass. Cp, Pd (GA, NC, SC, VA): wet sandy, peaty, or mucky soil of pinelands; occasional in Coastal Plain, rare in Piedmont (VA Watch List). May-October. S. NJ south to FL, west to TX, also in TN, West Indies and n . South America. A micrometer is needed to measure the very short puberulence ( 0.1 mm ) that distinguishes this taxon, D. meridionale, and $D$. wrightianum from other members of the D. acuminatum group. [= K, Y; Panicum leucothrix Nash -- RAB, F, G, HC, S; P. leucothrix -- C, in part; D. acuminatum ssp. leucothrix (Nash) Freckmann \& Lelong - FNA; P. spretum Schultes -- GW, in part; P. acuminatum Swartz var. leucothrix (Nash) Lelong -- X; D. acuminatum (Swartz) Gould \& Clark var. implicatum (Scribner) Gould \& Clark -- Z, in part]

Dichanthelium linearifolium (Scribner) Gould, Low White-haired Witch Grass. Pd, Mt (GA, NC, VA - reported from SC by FNA): dry open woods; rare (NC Watch List). May-October. Se. Canada and MN south to GA and TX. [= FNA, K, Z; Panicum linearifolium Scribner -- RAB, C, F, G, HC, S; P. linearifolium var. werneri (Scribner) Fernald -- F, G; P. werneri Scribner -- HC]

Dichanthelium longiligulatum (Nash) Freckmann, Long-ligule Witch Grass. Cp, Pd (GA, NC, SC, VA): limesink ponds, depression meadows, cypress savannas, pine savannas, bogs, swamps; frequent in Coastal Plain, rare in Piedmont. MaySeptember. NJ and PA south to FL, also in TN, e. TX, and Central America. Intermediate forms between this taxon and D. spretum occur. [= K, Y; Panicum longiligulatum Nash -- RAB, HC, S; P. lanuginosum Elliott var. lindheimeri (Nash) Fernald -- C, G, in part; D. acuminatum ssp. longiligulatum (Nash) Freckmann \& Lelong - FNA; P. spretum Schultes -- GW, in part; P. acuminatum Swartz var. Iongiligulatum (Nash) Lelong -- X; D. acuminatum (Swartz) Gould \& Clark var. Iongiligulatum (Nash) Gould \& Clark -- Z]

Dichanthelium Iucidum (Ashe) LeBlond, Bog Witch Grass. Cp, Pd, Mt (GA, NC, SC, VA): wet meadows, sphagnous swamps, bogs, wet woods, sphagnous streamhead pocosins, baygalls; frequent (uncommon in Mountains). May-October. MA and MI south to FL and TX. Vernal culms soon recline, producing a tangled mass. The papillose fertile lemma is diagnostic. [= Q; Panicum dichotomum Linnaeus -- RAB, C, GW, in part; P. Iucidum Ashe -- F, G, HC, S; P. lucidum var. opacum Fernald -- F, HC; D. dichotomum ssp. lucidum (Ashe) Freckmann \& Lelong - FNA, in part; D. dichotomum var. dichotomum -- K, Z, in part; $P$. dichotomum var. lucidum (Ashe) Lelong -- X, in part]

Dichanthelium mattamuskeetense (Ashe) Mohlenbrock, Mattamuskeet Witch Grass. Cp (NC, SC, VA): wet savannas, meadows, borders of pocosin shrub swamps, thickets; occasional in Coastal Plain (VA Watch List). May-October. Se. MA south to ne. SC. Typically a robust plant, often richly tinged with dark purple-maroon. [= Q; Panicum dichotomum Linnaeus -- RAB, C, GW, in part; P. mattamuskeetense Ashe --F, G, HC, S; P. mattamuskeetense var. clutei (Nash) Fernald -- F; D. dichotomum (Linnaeus) Gould ssp. mattamuskeetense (Ashe) Freckmann \& Lelong - FNA, in part; P. annulum Ashe var. glabrescens Gleason - G; P. clutei Nash -- HC, S; D. dichotomum var. dichotomum -- K, Z, in part; P. dichotomum var. mattamuskeetense (Ashe) Lelong -- X, in part]

Dichanthelium meridionale (Ashe) Freckmann, Matting Witch Grass. Pd, Cp, Mt (GA, NC, SC, VA): dry to damp sand of shores and woods; occasional. May-October. Sw. Nova Scotia and MA to MN, south to e. NC, n. GA, and n. AL. A micrometer is needed to measure the very short puberulence $(0.1 \mathrm{~mm})$ that distinguishes this taxon, $D$. leucothrix, and $D$. wrightianum from other members of the $D$. acuminatum group. [= K, Y; Panicum lanuginosum Elliott -- RAB, in part; $P$. leucothrix Nash -- C, in part; $P$. meridionale Ashe -- F, G, HC, S; P. meridionale var. albemarlense (Ashe) Fernald -- F; D. acuminatum (Swartz) Gould \& Clark ssp. implicatum (Scribner ex Nash) Freckmann \& Lelong - FNA; P. albemarlense Ashe -- HC, S; P. acuminatum Swartz var. unciphyllum (Trinius) Lelong -- X, in part; D. acuminatum var. implicatum (Scribner) Gould \& Clark -- Z, in part]

Dichanthelium oligosanthes (Schultes) Gould var. oligosanthes, Few-flowered Witch Grass. Cp, Pd (GA, NC, SC, VA): sandy fields and open woods; occasional in Coastal Plain, rare in Piedmont (VA Watch List). April-October. MA and MN south to FL and TX. See note under D. fusiforme. [= K, Z; Panicum oligosanthes Schultes -- RAB, HC, S; P. oligosanthes -- C, G, in part; $P$ oligosanthes var. oligosanthes -- F; D. oligosanthes ssp. oligosanthes -- FNA]

Dichanthelium oligosanthes (Schultes) Gould var. scribnerianum (Nash) Gould, Scribner's Witch Grass. Mt, Pd (GA, VA), Cp (NC, VA): calcareous maritime forests, dry thin woods and openings, dry prairies, usually in basic soil; uncommon in Mountains, rare in Piedmont and Coastal Plain (NC Watch List). April-November. Sw. ME to s. British Columbia, south to se. NC, n. GA, and CA, also in n. Mexico. Throughout the U.S., but infrequent in the southeastern and western states. [= K, Z; Panicum oligosanthes Schultes -- C, G, in part; P. oligosanthes var. scribnerianum (Nash) Fernald -- F; D. oligosanthes ssp. scribnerianum (Nash) Freckmann \& Lelong - FNA; P. scribnerianum Nash -- HC, S]

Dichanthelium ovale (Elliott) Gould \& Clark var. addisonii (Nash) Gould \& Clark, Low Stiff Witch Grass. Cp (GA, NC, SC, VA): dry to damp sandy woods and fields; uncommon (VA Watch List). May-October. MA and MN south to FL and TX, also in n. Mexico. See note under D. ovale var. ovale. [=K, Z; Panicum commonsianum Ashe -- RAB, C, F, G, HC, S; P. commonsianum var. addisonii (Nash) Fernald -- F, G; P. mundum Fernald -- F, G, HC; P. villosissimum var. pseudopubescens (Nash) Fernald -- F, G; D. ovale ssp. pseudopubescens (Nash) Freckmann \& Lelong - FNA; P. pseudopubescens Nash -- HC, S; P. addisonii Nash -- HC, S; $P$. wilmingtonense Ashe -- HC, S; P. ovale Elliott var. pseudopubescens (Nash) Lelong -- X]

Dichanthelium ovale (Elliott) Gould \& Clark var. ovale, Oval-flowered Witch Grass. Cp (GA, NC, SC, VA): dry to damp sandy pinelands; rare (NC Watch List, VA Rare List). May-October. NY to WI, south to FL and e. TX. Infrequent over most of its range except FL. In our region, the D. ovale double ligule character is more evident in var. ovale, with var. addisonii often having only a single ligule about 1 mm long. Also see note under $D$. consanguineum, and note at end of descriptions regarding Panicum malacon (placed in synonymy here). [= K, Z; Panicum ovale Elliott -- RAB, HC, S, X; D. ovale ssp. ovale - FNA; P. malacon Nash -- HC, S; P. ovale var. ovale -- X]

Dichanthelium polyanthes (Schultes) Mohlenbrock, Small-fruited Witch Grass. Pd, Mt, Cp (GA, NC, SC, VA): damp to dry soil of open woods and ditches; common (absent from the outer Coastal Plain south of the Neuse River). June-October. VA to s. IL, south to GA and e. TX. [= FNA; Panicum polyanthes Schultes -- RAB, C, F, G, GW, HC, S; D. sphaerocarpon (Elliott) Gould var. isophyllum (Scribner) Gould \& Clark -- K, Z]

Dichanthelium portoricense (Desvaux ex Hamilton) B.F. Hansen \& Wunderlin, Puerto Rican Witch Grass. Cp (GA, NC, SC): moist pine savannas and flatwoods; frequent in North Carolina, uncommon in South Carolina. May-September. NC south to FL, west to TX, also in West Indies. [Panicum portoricense Desvaux ex Hamilton -- RAB, HC, S; D. portoricense ssp. portoricense FNA; D. sabulorum (Lamarck) Gould \& Clark var. thinium (Hitchcock \& Chase) Gould \& Clark -- K, Z, in part; P. portoricense var. portoricense -- X]

Dichanthelium ravenelii (Scribner \& Merrill) Gould, Ravenel's Witch Grass. Cp, Pd (GA, NC, SC, VA): dry sandy or rocky thin woods and openings, sometimes in moist soils; common (VA Watch List). May-October. DE south to FL, west to e. TX, north to IA. [= FNA, K, Z; Panicum ravenelii Scribner \& Merrill -- RAB, C, F, G, HC, S]

Dichanthelium scabriusculum (Elliott) Gould \& Clark, Tall Swamp Witch Grass. Cp, Pd (GA, NC, SC, VA): moist, low, open or shaded woodlands, often along streams or ditches; common in Coastal Plain, uncommon in Piedmont (VA Watch List). MayOctober. Se. MA south to FL, west to e. TX and AR. [Panicum scabriusculum Elliott - F, HC, S; P. scabriusculum - RAB, C, GW, in part; P. aculeatum Hitchcock \& Chase - F, G, HC, S; D. scabriusculum - FNA, K, Z, in part; P. scabriusculum var. scabriusculum G]

Dichanthelium scoparium (Lamarck) Gould, Velvet Witch Grass. Cp, Pd, Mt (GA, NC, SC, VA): moist sandy soil of woodland openings and ditches; common (uncommon in Mountains). May-October. MA and MI south to FL and TX, also in Mexico and West Indies. The dense, velvety pubescence of the internodes, sheaths, and blades of this taxon, combined with the viscid band below the nodes, are diagnostic. [= FNA, K, Z; Panicum scoparium Lamarck -- RAB, C, F, G, GW, HC, S]

Dichanthelium species 2 (=webberianum), Webber's Witch Grass. Cp (GA, NC, SC): moist pine savannas and flatwoods; uncommon. May-August. Disjunct in se. NC and SC from GA and FL. [Panicum webberianum Nash -- RAB, HC, S; D. portoricense (Desvaux ex Hamilton) B.F. Hansen \& Wunderlin ssp. patulum (Scribner \& Merrill) Freckmann \& Lelong - FNA, in part; D. sabulorum (Lamarck) Gould \& Clark var. patulum (Scribner \& Merrill) Gould \& Clark -- K, Z, in part; P. portoricense Desvaux ex Hamilton var. nashianum (Scribner) Lelong -- X, in part]

Dichanthelium species 3 (=lancearium), Nash's Witch Grass. Cp, Pd (GA, NC, SC, VA): moist pine savannas and flatwoods, moist to dry openings in maritime forests, dry pine and oak sandhills; common in Coastal Plain, uncommon in Piedmont (VA Watch List). May-September. Se. VA to FL, west to e. TX, also in West Indies and Central America. This and D. portoricense appear to intergrade in our region, and =lancearium is treated as part of $D$. portoricense ssp. patulum in FNA, whose concept of ssp. patulum includes Panicum webberianum ( $D$. species 2 here) and $P$. patentifolium, both of which appear to merit recognition (=webberianum as a species and =patentifolium as at least a variety). [Panicum lancearium Trinius -- RAB, C, F, G, HC, S; P. lancearium var. patulum (Scribner \& Merrill) Fernald -- F; D. portoricense (Desvaux ex Hamilton) B.F. Hansen \& Wunderlin ssp. patulum (Scribner \& Merrill) Freckmann \& Lelong - FNA, in part; P. patulum (Scribner \& Merrill) Hitchcock -- HC, S; D. sabulorum (Lamarck) Gould \& Clark var. patulum (Scribner \& Merrill) Gould \& Clark -- K, Z, in part; P. portoricense Desvaux ex Hamilton var. nashianum (Scribner) Lelong -- X, in part]

Dichanthelium species 5 (=neuranthum), Nerved Witch Grass. Cp (GA, NC): maritime wet grasslands and wet savannas
near the coast; rare (GA Special Concern, NC Significantly Rare). May-September. Disjunctly in se. NC, se. SC, GA, FL, s. MS, TX, Bahamas, Cuba, and Belize. Treated as D. aciculare ssp. neuranthum in FNA, but distinctive morphology and habitat argue for recognition as a species. Can occur with the similar-appearing $D$. caerulescens, from which it differs by having spikelets that are longer, blunt, and pubescent; longer first glumes; leaves $15 \times$ or more as long as wide; and a narrower panicle. [Panicum neuranthum Grisebach -- RAB, HC, S; D. aciculare (Desvaux ex Poiret) Gould \& Clark ssp. neuranthum (Grisebach) Freckmann \& Lelong - FNA; D. aciculare -- K, Z, in part]

Dichanthelium species 9 (=cryptanthum), Hidden-flowered Witch Grass. Cp (NC, SC): wet meadows and ditches, streamside openings (NC Significantly Rare). May-September. NC (or NJ?) to MS (or TX?) (previous concepts of this taxon and its range are unclear). In the field, this taxon can be mistaken for $D$. yadkinense; it is readily distinguished by its scabrous peduncle and membranous ligules. [Panicum cryptanthum Ashe -- F, HC, S; P. scabriusculum Elliott -- RAB, C, GW, in part; D.
scabriusculum (Elliott) Gould \& Clark -- FNA, K, Z, in part; P. scabriusculum var. cryptanthum (Ashe) Gleason - G]
Dichanthelium species 10 (=curtifolium), Short-leaved Witch Grass. Cp (SC), Mt (NC): bogs, sphagnous streamhead swamps, mountain streams; uncommon in Coastal Plain, rare in Piedmont and Mountains. April-September. Ranging disjunctly in w. NC and e. TN, e. SC, FL, and MS. The combination of characters is quite distinctive for the genus in our region. [Panicum curtifolium Nash - RAB, HC, S; D. ensifolium (Baldwin ex Elliott) Gould ssp. curtifolium (Nash) Freckmann \& Lelong - FNA; D. acuminatum (Swartz) Gould \& C.A. Clark var. implicatum (Scribn.) Gould \& C.A. Clark - K, Z, in part; Panicum ensifolium Baldwin ex Elliott var. curtifolium (Nash) Lelong - X]

Dichanthelium sphaerocarpon (Elliott) Gould, Round-fruited Witch Grass. Cp, Pd, Mt (GA, NC, SC, VA): moist or dry thin woods, meadows, and ditches, often in dry sandy soil; common. May-October. MA, VT, OH, and KA south to FL and TX, also in Mexico. [= FNA, K, Z; Panicum sphaerocarpon Elliott -- RAB, C, F, G, HC; P. sphaerocarpon var. inflatum (Scribner \& J.G. Smith) Hitchcock \& Chase -- F, G, HC, S]

Dichanthelium sphagnicola (Nash) LeBlond, Peaty Witchgrass. Cp (GA): edges of cypress swamps, in sphagnous bogs, moist shady places; poorly known and possibly very rare. May-October. GA (Chatham County) to FL; should be sought in se. SC. Treated in synonymy with Panicum dichotomum by RAB, but no specimen is known from the Carolinas. This species is similar to $D$. lucidum in appearance, and differs most readily by its larger pubescent spikelets with smooth fertile lemma and palea. [= Q; Panicum dichotomum Linnaeus - RAB, in part; D. dichotomum (Linnaeus) Gould ssp. lucidum (Ashe) Freckmann \& Lelong - FNA, in part; P. sphagnicola Nash - HC, S; D. dichotomum var. dichotomum - K, Z, in part; P. dichotomum var. lucidum (Ashe) Lelong $X$, in part]

Dichanthelium spretum (Schultes) Freckmann, Eaton's Witch Grass. Pd, Cp, Mt (GA, NC, SC, VA): wet sands and peats of bogs, savannas, meadows, and shores; rare (NC Watch List, VA Watch List). May-September. ME south to n. FL, LA and e. TX. Intermediate forms between this taxon and D. Iongiligulatum occur. [=K, Y; Panicum spretum Schultes -- RAB, C, F, G, HC, S; D. acuminatum (Swartz) Gould \& Clark ssp. spretum (Schultes) Freckmann \& Lelong - FNA; P. spretum -- GW, in part; P. acuminatum Swartz var. densiflorum (Rand \& Redfield) Lelong --X; D. acuminatum var. densiflorum (Rand \& Redfield) Gould \& Clark -- Z]

Dichanthelium strigosum (Muhlenberg) Freckmann var. glabrescens (Grisebach) Freckmann, Hairless Witch Grass. Cp (GA): low, open sandy pinelands and hammocks. May-October. S. GA and FL west to LA; also in West Indies, Belize. Included in synonymy with Panicum strigosum by RAB, but no specimen from the Carolinas has been found. [= K; D. strigosum ssp. glabrescens (Grisebach) Freckmann \& Lelong - FNA; Panicum strigosum Muhlenberg - GW, in part; P. polycaulon Nash -- HC, S; D. leucoblepharis (Trinius) Gould \& Clark var. glabrescens (Grisebach) Gould \& Clark - Z]

Dichanthelium strigosum (Muhlenberg) Freckmann var. leucoblepharis (Trinius) Freckmann, Dwarf Witch Grass. Cp, Mt (GA, NC, SC): sandy, acidic soils of pinelands; occasional in Coastal Plain, rare in Mountains. May-October. NC south to FL, west to TX, also in Mexico. [= K; Panicum ciliatum Elliott -- RAB, HC, S; D. strigosum ssp. leucoblepharis (Trinius) Freckmann \& Lelong - FNA; P. strigosum Muhlenberg var. leucoblepharis (Trinius) Lelong -- X; D. leucoblepharis (Trinius) Gould \& Clark var. leucoblepharis -- Z]

Dichanthelium strigosum (Muhlenberg) Freckmann var. strigosum, Rough-hairy Witch Grass. Cp (GA, NC, SC, VA): in moist soils of pine flatwoods, savannas, and pocosins, also in boggy situations; uncommon (VA Rare List). May-September. Se. VA south to FL, west to TX, also in TN, e. Mexico, Mesoamerica, n. South America, and West Indies. [= K; Panicum strigosum Muhlenberg -- RAB, C, F, G, GW, HC, S; D. strigosum ssp. strigosum - FNA; P. strigosum var. strigosum -- X; D. leucoblepharis (Trinius) Gould \& Clark var. pubescens (Vasey) Gould \& Clark -- Z]

Dichanthelium tenue (Muhlenberg) Freckmann \& Lelong, White-edged Witch Grass. Cp, Pd, Mt (GA, NC, SC, VA): wet peaty or sandy soil pineland savannas, flatwoods, bogs, and meadows; common in Coastal Plain, occasional in Piedmont, rare in Mountains. May-October. NJ south to FL, west to TX, also in Mesoamerica and Cuba. This treatment of $D$. tenue includes plants from northern Alabama formerly recognized as Panicum concinnius, with spikelets 1.2-1.4 mm long but otherwise possessing the characters of D. tenue. [= FNA; Panicum tenue Muhlenberg -- RAB, C, F, HC, S; P. albomarginatum Nash -- F, HC, S; P. trifolium Nash -- F, G, HC, S; P. concinnius Hitchc. \& Chase - HC, S; P. ensifolium Baldwin -- G, in part; D. dichotomum (Linnaeus) Gould var. tenue (Muhlenberg) Gould \& Clark -- K, Z, in part; "D. sp. 7 (=tenue)" of earlier drafts]

Dichanthelium villosissimum (Nash) Freckmann var. villosissimum, White-haired Witch Grass. Cp, Pd, Mt (GA, NC, SC, VA): dry sandy soil of open woods and prairies; frequent (VA Watch List). April-September. MA south to FL, west to TX, also in Mexico and Mesoamerica. Appearing to be related to $D$. ovale based on such characters as the double ligule. [=K, $Y ; P a n i c u m$ villosissimum Nash -- RAB, C, HC, S; P. villosissimum var. villosissimum -- F, G; D. ovale (Elliott) Gould \& Clark ssp. villosissimum (Nash) Freckmann \& Lelong - FNA; P. ovale Elliott var. villosum (A. Gray) Lelong -- X; D. acuminatum (Swartz) Gould \& Clark var. villosum (A. Gray) Gould \& Clark -- Z]

Dichanthelium wrightianum (Scribner) Freckmann, Wright's Witch Grass. Cp (GA, NC, SC, VA): limesink ponds and meadows, cypress savannas, pine savannas, bogs; uncommon (VA Watch List). May-September. MA south to FL, west to TX, also in Cuba and Mesoamerica. A micrometer is needed to measure the very short puberulence ( 0.1 mm ) that distinguishes this taxon, D. meridionale, and D. leucothrix from other members of the D. acuminatum group. [= FNA, K, Y; Panicum wrightianum Scribner -RAB, C, F, G, HC, S; P. spretum Schultes -- GW, in part; D. acuminatum (Swartz) Gould \& Clark var. wrightianum (Scribner) Gould

## \& Clark -- Z]

Dichanthelium yadkinense (Ashe) Mohlenbrock, Spotted-sheath Witch Grass. Pd, Cp, Mt (GA, NC, SC, VA): floodplain forests, thickets, bottomlands, and swamps, often on alluvial deposits; frequent in Piedmont, occasional in Coastal Plain, uncommon in Mountains. May-October. NJ and MI south to GA and TX, also in Mexico. Sheaths often with wart-like glands. This taxon resembles $D$. species 9 (=cryptanthum), from which it differs most readily by its hairy ligule (vs. membranous) and smooth peduncle (vs. antrorsely scabrous). [= Q; Panicum dichotomum Linnaeus -- RAB, GW, in part; P. yadkinense Ashe -- C, F, G, HC, S; D. dichotomum ssp. yadkinense (Ashe) Freckmann \& Lelong - FNA; D. dichotomum var. dichotomum -- K, Z, in part; P. dichotomum var. yadkinense (Ashe) Lelong -- X]

Dichanthelium chamaelonche (Trinius) Freckmann \& Lelong ssp. breve (Hitchcock \& Chase) Freckmann \& Lelong, Short Witch Grass, endemic to c. and s. FL, primarily near the east coast. [=FNA; Panicum breve Hitchc. \& Chase - HC, S; D. dichotomum (Linnaeus) Gould var. breve (Hitchcock \& Chase) Gould \& Clark - K, Z; P. chamaelonche Trinius var. breve (Hitchcock \& Chase) Lelong - X]

Dichanthelium dichotomum (Linnaeus) Gould var. glabrifolium (Nash) Gould \& Clark, Smooth-leaved Witch Grass, endemic to peninsular FL, mostly near the west coast. Like $D$. chamaelonche ssp. breve, this taxon appears to be more closely related to $D$. chamaelonche than to D. dichotomum or D. ensifolium. [=K, Z; Panicum glabrifolium Nash - HC, S; P. chamaelonche Trinius var. chamaelonche - X, in part]

Dichanthelium leibergii (Vasey) Freckmann, Leiberg's Witch Grass, NY and PA west to Alberta, ND, and KS. [= FNA, K, Z; Panicum leibergii (Vasey) Scribner -- C, F, G, HC]

Dichanthelium malacophyllum (Nash) Gould, Soft-leaf Witch Grass, KY and TN west to KS and TX. Primarily a plant of cedar glades and dry calcareous soils. Reported from SC by FNA, but source of record has not been identified. [= FNA, K, Z; Panicum malacophyllum -- F, G, HC, S]

Dichanthelium nudicaule (Vasey) B.F. Hansen \& Wunderlin, ranges from the FL Panhandle and s. AL west to MS. [= Q Panicum nudicaule Vasey]

Dichanthelium wilcoxianum (Vasey) Freckmann is shown as occurring in SC and MS on the range map in FNA, but the source of these records is not known for this plant primarily of dry prairies in the Upper Midwest. It is not treated here.

Dichanthelium xanthophysum (A. Gray) Freckmann, Slender Witch Grass, ME south to PA, west to SD; Nova Scotia to Saskatchewan. [= FNA, K, Z; Panicum xanthophysum A. Gray -- C, F, G, HC]

Panicum chrysopsidifolium Nash is treated variously by the cited sources. According to $Z$, who examined an isotype collection and found the ligule to be 2.5 mm long, it belongs to $D$. acuminatum var. acuminatum. Plants referred to by HC all have ligules less than 1 mm long, and apparently belong to the $D$. aciculare complex. These plants are described as having densely villous nodes, internodes, sheaths, and blades; the blades $5-10 \mathrm{~cm}$ long and $3-5 \mathrm{~mm}$ wide; and spikelets $1.9-2.2 \mathrm{~mm}$ long, obovate, and villous. HC gives a range of se. VA to FL, west to TX, along the Coastal Plain in sandy oak or pine woods. This entity needs further scrutiny.

Panicum glutinoscabrum Fernald is an entity known only locally from "boggy spots" in southeastern Virginia. It is treated as a full species by F, but is placed in synonymy with Dichanthelium scoparium (Lamarck) Gould by FNA; with D. acuminatum (Swartz) Gould \& Clark var. acuminatum by Z; with P. lanuginosum Elliott var. fasciculatum (Torrey) Fernald by C; and with P. huachucae Ashe var. fasciculatum (Torrey) Hubb. by HC. Panicum glutinoscabrum is described as having culms 7-9 dm high; elongate internodes with cinereous puberulence and black, warty, viscid glands; villous nodes; glutinous-warty and scabrous sheaths and blades; ligule 4-5 mm long; minutely puberulent panicle axis; spikelets ellipsoid, subacute, 1.7-1.8 mm long, pubescent; first glume subacute, $0.6-0.7 \mathrm{~mm}$ long. Y concedes that "I am not able to render a decision on the poorly known $P$. glutinoscabrum Fernald, but I suggest that it is a hybrid between a member of the $D$. acuminatum complex and $D$. scoparium (Lam.) Gould - the latter contributing the genes for height and viscid sheaths."

Panicum malacon Nash, here placed in synonymy with Dichanthelium ovale var. ovale, needs additional study. It is distinguished by HC and $S$ as having spikelets $3-3.2 \mathrm{~mm}$ long with a first glume situated conspicuously below the second glume and sterile lemma, half or more as long as the spikelet; and leaves $3-5 \mathrm{~mm}$ wide, puberulent beneath, and puberulent to glabrous above. The leaf width and puberulence characters are not consistent with descriptions of $D$. ovale, and the placement of $P$. malacon within $D$. ovale by current treatments (including this one) may be in error. The description of $P$. malacon in RAB differs greatly from that of HC and S , and falls well outside the range of $D$. ovale characters. In RAB, $P$. malacon is described as having spikelets $3.5-4 \mathrm{~mm}$ long, and leaves $5-14 \mathrm{~mm}$ wide. This description may be based on specimens from the Sandhills of SC at NCU identified as $P$. malacon and matching the RAB description. These specimens appear to be misidentified collections of $D$. oligosanthes var. oligosanthes.

## Digitaria Haller (Crab Grass)

A genus of about 200 species, primarily in the tropics and subtropics. Most of our species occur primarily in disturbed situations; their original distributions and habitats are now obscure. References: Wipff in FNA (2003a); Webster (1987)=Z; Wipff \& Hatch (1994) $=$ Y; Wipff (1996b) $=$ X; Webster (1980).

1 Inflorescence an open panicle; spikelets long-pedicellate, borne singly at the ends of long panicle branches; [section Pennatae]

1 Inflorescence of 2-several spikelike racemes borne digitately or in close proximity near the summit of the culm; spikelets sessile or short-pedicellate, borne more-or-less closely spaced along the racemes.
2 Rachis of each raceme narrow, trigonous, only slightly (if at all) winged.
3 Spikelets 1.7-2.2 mm long; plants 3-10 dm tall; racemes to 10 cm long; upper sheaths glabrous, lower sheaths
glabrous to sparsely pilose
D. filiformis var. filiformis
3 Spikelets 2.0-2.8 mm long; plants 8-15 dm tall; racemes to 25 cm long; upper sheaths glabrous or pilose, lower sheaths densely pilose $\qquad$ . .
achis of each raceme broad ( $0.5-1 \mathrm{~mm}$ wide), winged, the wings as wide as or wider than the rachis proper.
4 Lower sheaths glabrous; second glume $0.75-1 \times$ as long as the first glume; fertile lemma dark brown or black at maturity.
5 Hairs of the spikelet not minutely capitate; second glume ca. 0.75 as long as the first glume; spikelets averaging 1.5 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . D. violascens 5 Hairs of the spikelet minutely capitate; second glume ca. $1 \times$ as long as the first glume; spikelets averaging 2.0 mm long
D. ischaemum

4 Lower sheaths pilose; second glume 1/3-3/5 (to $4 / 5$ in $D$. ciliaris) as long as the first glume; fertile lemma white, tan, or grayish-brown at maturity.
6 Spikelets $1.5-1.8 \mathrm{~mm}$ long, villous with crinkled hairs; pedicels glabrous, terete in cross-section ... D. serotina
6 Spikelets (1.7-) 2.4-4.1 mm long, glabrous, scabrous, or pubescent with straight hairs; pedicels scabrous, 3angled in cross-section; [section Digitaria].
7 Spikelets (1.7-) 2.5-3.4 mm long, averaging 3.0 mm long or shorter; leaf blades pilose over the upper surface
D. sanguinalis

7 Spikelets 2.6-4.1 mm long, averaging 3.1 mm long or longer; leaf blades glabrous except for a few hairs on the upper surface at the base.
8 Lower lemma of the sessile spikelet with 5 equidistant nerves; lowermost inflorescence node glabrous or pubescent with hairs less than 0.4 mm long; apex of the first glume rounded to truncate
D. bicornis

8 Lower lemma of sessile spikelet with the lateral nerves crowded to the margins; lowermost inflorescence node pubescent with hairs more than 0.4 mm long; apex of the first glume acute
D. ciliaris

Digitaria bicornis (Lamarck) Roemer \& J.A. Schultes. Cp (GA, NC, SC): sandy fields, lawns, roadsides, disturbed places; common. Webster (1980) believed that this species is likely to occur in VA and MD, as well. Whether or not it is introduced is unclear; it is now widely distributed in the tropics and subtropics worldwide. [= FNA, K, Z]

Digitaria ciliaris (Retzius) Köler, Southern Crab Grass. Cp (GA, NC, SC, VA), Pd, Mt (GA, NC, SC): sandy fields, roadsides, and disturbed areas; common? August-October. [= C, FNA, K, Z; D. sanguinalis var. ciliaris (Retzius) Parlatore -- F, HC]

Digitaria cognata (J.A. Schultes) Pilger, Fall Witch Grass. Cp, Pd (GA, NC, SC, VA): sandy fields and roadsides; common (VA Rare). July-October. Wipff \& Hatch (1994) discuss the reasons for including Leptoloma in Digitaria. [= FNA; = Digitaria cognata var. cognata -- K ; = Leptoloma cognatum (J.A. Schultes) Chase -- RAB, C, F, G, HC, S; = D. cognatum ssp. cognatum -- Y]

Digitaria filiformis (Linnaeus) Köler var. filiformis. Cp, Pd, Mt (GA, NC, SC, VA): fields, roadsides, disturbed areas; common. September-October. Var. filiformis, with pubescent spikelets, is widespread in e. North America. Var. laeviglumis (Fernald) J. Wipff, with glabrous spikelets, occurs in New England. Var. dolichophylla (Henrard) J. Wipff occurs in s. FL, Cuba, and PR. See Wipff (1996) for additional discusion. [= RAB, C, F, FNA, G, X; D. filiformis -- HC, K, W, infraspecific taxa not distinguished; Syntherisma filiformis (Linnaeus) Nash -- S]

* Digitaria ischaemum (Schreber) Muhlenberg, Smooth Crab Grass. Cp, Pd, Mt (GA, NC, SC, VA): fields, lawns, disturbed areas; common, introduced from Eurasia. July-October. Two varieties have sometimes been recognized. Var. ischaemum has racemes (1-) 2-6, 1-9 (-10) cm long, mostly curved and plants mostly to 4 dm tall. Var. mississippiensis (Gattinger) Fernald has racemes 5-7, 6-15 cm long, mostly stiff and straight and plants to 10 dm tall. [=C, FNA, K, W; > D. ischaemum var. ischaemum -- F , $\mathrm{G}, \mathrm{HC} ;>\mathrm{D}$. ischaemum (Schreber) Muhlenberg var. mississippiensis (Gattinger) Fernald - F, G, HC; = D. ischaemum var. ischaemum -- RAB; = = Syntherisma ischaemum (Schreber) Nash -- S]
* Digitaria sanguinalis (Linnaeus) Scopoli, Northern Crab Grass. Cp, Pd, Mt (GA, NC, SC, VA): fields, roadsides, disturbed areas; common. July-October. [= RAB, FNA, C, G, K, W, Z; D. sanguinalis var. sanguinalis -- F, HC; Syntherisma sanguinalis (Linnaeus) Dulac -- S]

Digitaria serotina (Walter) Michaux, Dwarf Crab Grass. Cp (GA, SC, VA): sandy woodlands; rare (VA Rare). October. [= RAB, C, F, FNA, G, GW, HC, K; = Syntherisma serotina Walter -- W]

Digitaria villosa (Walter) Persoon. Cp (GA, NC, SC, VA), Pd, Mt (GA, NC, SC): sandy fields, roadsides; common (VA Watch List). September-October. [= HC, K; = D. filiformis var. villosa (Walter) Fernald -- RAB , C, F, FNA, G, X; = Syntherisma villosa Walter -- S]

* Digitaria violascens Link. Cp (GA, NC, SC), Pd (GA, SC), Mt (GA): sandy fields, roadsides, and woodland borders; common. September-October. [= C, FNA, G, HC, K; = D. ischaemum var. violascens (Link) Radford -- RAB; ? Syntherisma floridana (A.S. Hitchcock) A.S. Hitchcock - S]
* Digitaria horizontalis Willdenow, Jamaican Crabgrass, is reported for SC on the basis of a specimen at NCU (Kartesz 1999). \{check specimen\} [= FNA, K] \{not yet keyed\}

Digitaria insularis (Linnaeus) Mez ex Ekman. AL, FL, MS. [= K] \{not yet keyed\}

Dinebra Jacquin (Viper Grass)
References: Barkworth in FNA (2003a).

* Dinebra retroflexa (Vahl) Panzer, Viper Grass, native of Africa and s. Asia, has been collected as a waif in Mecklenburg County, NC (Mellichamp, Matthews, \& Smithka 1987). [= FNA, K] \{not keyed\}

## Distichlis Rafinesque (Saltgrass)

A genus of about 5 species, of North, Central, and South America, and Australia. References: Barkworth in FNA (2003a).
Identification notes: When sterile, Distichlis spicata is easily confused with Sporobolus virginicus, with which it sometimes occurs. Distichlis spicata is generally a coarser plant, and lacks long hairs around the collar of the sheath; Sporobolus virginicus is more delicate, and typically has long hairs on either side of the collar.

Distichlis spicata (Linnaeus) Greene, Saltgrass, Spike Grass. Cp (GA, NC, SC, VA): coastal marshes and shores, especially common in hypersaline flats (where infrequent tidal inundation is followed by evaporation); common. June-October. Two varieties (or subspecies or species) have often been recognized: var. spicata ranging along the Atlantic coast from Nova Scotia and Prince Edwards Island south to tropical America, and on the Pacific coast of North America, and var. stricta (Torrey) Scribner widespread in saline situations in western North America. These do not appear to warrant taxonomic recognition (Barkworth in FNA 2003a). [= RAB, FNA, GW, K, S; > D. spicata var. spicata -- C; > D. spicata -- F, G, HC, in the narrow sense; > D. spicata ssp. spicata]

Echinochloa Palisot de Beauvois (Barnyard-grass, Jungle-rice)
References: Michael in FNA (2003a). Key based in part on C.
1 Panicle elongate, the branches few, distant, unbranched, and short, to $2(-3) \mathrm{cm}$ long; spikelets awnless; leaves 3-6 (-9) mm wide
E. colona

1 Panicle broader, the branches numerous, approximate, often further branched, short to long, some (at least) exceeding 2 cm long; spikelets awnless or awned; leaves $5-30 \mathrm{~mm}$ wide.

Lower sheaths usually papillate-pubescent; fertile lemma $2.5-4 \times$ as long as wide . . . . . . . . . . . . . . . . . . . . . . . E. walteri Lower sheaths glabrous; fertile lemma $1.5-2.5 \times$ as long as wide.

Inflorescence nodding; awns 4-29 mm long.
E. cruspavonis var. cruspavonis

3 Inflorescence erect, stiff; awns 0-25 mm long.
4 Second glume and sterile lemma hairy or scabrous to nearly glabrous, the hairs usually not papillose-based; fertile lemma obtuse or broadly acute, with a thin, membranous (later withering) tip set off from the body by a line of minute hairs.
5 Panicle fairly open, the branches erect, appressed, or spreading; spikelets green or purple-tinged, awnless or with a well-developed awn (to 25 mm long); leaves $5-15 \mathrm{~mm}$ wide; plants mostly 3-7 dm tall
E. crusgalli var. crusgalli

5 Panicle very crowded, the branches appressed to slightly spreading, the tips often incurved; spikelets purplish-brown, awnless (or with awn to 2 mm long); leaves mostly $15-30 \mathrm{~mm}$ wide; plants mostly $7-15 \mathrm{dm}$ tall $\qquad$
4 Second glume and sterile lemma usually with stout, papillose-based hairs on the veins; fertile lemma acuminate, abruptly narrowed to a firm, persistent tip.
6 Spikelets less than 3.5 mm long, not including the awn (if present); sterile lemma awnless or with an awn to $6(-10) \mathrm{mm}$ long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . E. muricata var. microstachya
6 Spikelets more than 3.5 mm long, not including the awn (if present); sterile lemma usually awned (rarely awnless), the awn 6-25 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . E. muricata var. muricata

* Echinochloa colona (Linnaeus) Link, Jungle-rice. Cp, Pd (GA, NC, SC, VA), Mt (GA, SC, NC): fields, ditches, disturbed wet areas; uncommon, introduced from the Old World tropics. July-October. [=FNA, K, S; = E. colonum -- RAB, C, F, G, GW, HC, orthographic variant]
* Echinochloa crusgalli (Linnaeus) Palisot de Beauvois var. crusgalli, Barnyard-grass. \{GA, NC, SC, VA\} July-October. [= C, G; E. crusgalli -- RAB, GW, in part (also including E. muricatum); E. crus-galli -- K, orthographic variant; E. crusgalli -- F, FNA, infraspecific taxa not distinguished; E. crus-galli ssp. crus-galli -- S, in part (also see E. muricata)]

Echinochloa cruspavonis (Kunth) J.A. Schultes var. cruspavonis. \{AL, MS, FL\} July-October. [E. crus-pavonis -- HC, infraspecific taxa not distinguished; E. crus-pavonis var. crus-pavonis -- FNA, K, orthographic variant]

Echinochloa frumentacea Link, Japanese Millet, Billion-dollar Grass, White Panic. Cp (NC), \{VA\}: disturbed areas; rare, introduced from Asia. July-October. [=F, FNA, K; E. crusgalli -- RAB, GW, in part; E. crusgalli (Linnaeus) Palisot de Beauvois var. frumentacea (Link) W. Wight -- C, G; E. crus-galli ssp. edulis A.S. Hitchcock -- S]

Echinochloa muricata (Palisot de Beauvois) Fernald var. microstachya Wiegand, Barnyard-grass. \{GA, NC, SC, VA\} JulyOctober. [= C, FNA, K; E. crusgalli -- RAB, GW, in part; E. pungens (Poiret) Rydberg var. microstachya (Wiegand) Fernald \& Griscom -- F; E. microstachya (Wiegand) Rydberg -- G; E. crus-galli ssp. crus-galli -- S, in part]

Echinochloa muricata (Palisot de Beauvois) Fernald var. muricata, Barnyard-grass. Cp (NC): interdune wetlands. JulyOctober. [= C, FNA, K; E. crusgalli -- RAB, GW, in part; E. pungens (Poiret) Rydberg var. pungens -- F; E. pungens var. Iudoviciana (Wiegand) Fernald \& Griscom -- F; E. muricata -- G (narrow sense); E. crus-galli ssp. crus-galli -- S, in part]

Echinochloa walteri (Pursh) Heller. Cp (GA, NC, SC, VA), Pd (GA): marshes; common. July-October. MA south to FL, west to TX on the outer Coastal Plain; also inland from OH west to WI, south to MO and AR. [= RAB, C, F, FNA, GW, HC, K, S, W]

## Eleusine Gaertner (Yard Grass)

References: Hilu in FNA (2003a). Key based on FNA.

* Eleusine coracana (Linnaeus) Gaertner ssp. africana (Kennedy \& O'Byrne) Hilu \& de Wet, Finger Millet. Cp (SC): disturbed areas; rare, introduced from Africa. There remains some doubt about the identity of the population discovered. Reported by Werth, Zeng, \& Baird (1997). [= FNA, K; = E. africana Kennedy \& O'Byrne]
* Eleusine indica (Linnaeus) Gaertner, Yard Grass, Goose Grass. Cp, Pd, Mt (GA, NC, SC, VA): lawns, roadsides, gardens, disturbed areas; common, introduced from Old World. [= RAB, C, F, FNA, G, HC, K, S, W]
* Eleusine tristachya (Lamarck) Lamarck, is introduced from South America in scattered states in e. United States, including VA, NJ (Hilu 1980) and AL (Small 1933). [= FNA, K, S] \{not yet keyed\}

## Elionurus Humboldt \& Bonpland ex Willdenow (Balsamscale)

A genus of about 15 species, native to tropical and subtropical parts of Africa and the Americas. References: Barkworth in FNA (2003a).

Elionurus tripsacoides Humboldt \& Bonpland ex Willdenow, Pan-American Balsamscale. Cp (GA): wet savannas; rare (GA Special Concern). S. GA south to s. FL, west to s. and w. TX, and south through Central America to s. South America. Reported for sw. GA by Jones \& Coile (1988), for s. MS and FL (Sorrie \& Leonard 1999). [= FNA, K; = Elyonurus tripsacoides - GW, HC, S, orthographic variant]

Elymus Linnaeus 1753 (Wild-rye, Rye Grass)
(also see Thinopyrum)
A genus of about 150 species, semicosmopolitan in temperate regions. The genus, as now circumscribed, includes all allopolyploid taxa with at least one chromosome complement contributed from Pseudoroegneria. North American Elymus are allopolyploids of Pseudoroegneria and Hordeum (Helfgott \& Mason-Gamer 2004). Reference: Barkworth \& Campbell (in prep.)=Y; Campbell (2000); Church (1967); Tucker (1996)=Z; Barkworth (1997)=X. This treatment largely follows Barkworth \& Campbell (in prep.).

Identification notes: Measurements of the spike include the awns, but measurements of spikelets and its components do not. Rachis internodes should be measured near the middle of the spike. Glume widths are measured at the widest point, or if the widest point is not apparent, at about 5 mm above the glume base.

1 Spikelets solitary at each node (occasionally paired at the lowest nodes); glumes and lemmas awned or unawned; plants cespitose to strongly rhizomatous.
2 Plants strongly rhizomatous; [common and weedy introduced species]; [section Elytrigia]
2 Plants cespitose; [rare natives and introductions]; [section Goulardia].
3 Spikelets 20-30 mm long; anthers 3-6 mm long; rachis internodes hirtellous below the spikelets; [very rare introduction, reported for c. GA] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [E. semicostatus]
3 Spikelets $8-25 \mathrm{~mm}$ long; anthers $0.8-3 \mathrm{~mm}$ long; rachis internodes glabrous below the spikelets; [rare natives of glades and barrens].
4 Lemma awns $15-40 \mathrm{~mm}$ long, longer than the body of the lemma ..... [E. trachycaulus ssp. subsecundus] 4 Lemma awns 1-13 mm long, shorter than the body of the lemma...... E. trachycaulus ssp. trachycaulus
1 Spikelets 2-3 (-5) at each node; glumes and lemmas usually awned; plants usually cespitose, occasionally short-rhizomatous.
5 Both glumes (including their awn) either 0-3 mm long and subulate or 1-20 mm long and differing in length by more than 5 $\mathrm{mm}, 0.1-0.6 \mathrm{~mm}$ wide, tapering from the base, with $0-1$ distinct veins, persistent; rachis internodes $4-12 \mathrm{~mm}$ long, ca. 0.5 mm thick at the narrowest section.
6 Spikelets appressed; lemma awns straight or curving; glumes sometimes absent, but usually 1-20 mm long, 0.1-0.6 mm wide, with a distinct vein; spikes erect or nodding [E. svensonii]
6 Spikelets widely spreading to horizontal; lemma awns straight (rarely slightly curving); glumes 0-3 mm long, with no distinct veins (rarely 1 glume to 20 mm long, 0.2 mm wide); spikes usually erect.
7 Lemmas pubescent . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . E. hystrix var. bigelovianus
7 Lemmas glabrous to scabrous . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . E. hystrix var. hystrix
5 Both glumes (including the awns) 10-40 mm long, usually differing in length by less than $5 \mathrm{~mm}, 0.2-2.3 \mathrm{~mm}$ wide,
lanceolate to setaceous, usually widest above the base, with 2-8 veins, persistent or disarticulating; rachis internodes slender (as above) or stout ( $2-5 \mathrm{~mm}$ long and ca. 1 mm thick at the narrowest section).
8 Glume bases flat, thin, and evidently veined, or indurate for less than 1 mm , the bodies not exceeding the adjacent (usually $8-15 \mathrm{~mm}$ long) lemmas; lemma awns usually curving outward; spikes usually nodding to pendent; internodes (2) $4-12 \mathrm{~mm}$ long.

9 Glumes 0.5-1.6 mm wide; lemma awns 15-40 (-50) mm long; paleas acute; rachis internodes 2-5 (-7) mm long; blades (3-) 4-15 (-20) mm wide, pale green, usually glabrous or scabridulous above
E. canadensis var. canadensis

9 Glumes 0.3-0.8 mm wide; lemma awns 15-25 (-35) mm long; paleas narrowly truncate; rachis internodes 5-8 (-
12) mm long; blades $8-24 \mathrm{~mm}$ wide, dark green, usually thinly pilose above
[E. wiegandii]
8 Glume bases terete, indurate, and lacking evident veins for $0.5-4 \mathrm{~mm}$, the bodies (unless indistinct from the awns) exceeding the adjacent (usually 6-12 mm long) lemmas; lemma awns straight; spikes erect or nodding; internodes 25 mm long (to 7 mm in $E . s p .1$ ).
10 Glumes persistent, $0.2-1 \mathrm{~mm}$ wide, with $2-4$ veins, the basal $0.5-2 \mathrm{~mm}$ essentially straight; lemmas rarely glabrous; spikelets with 1-3 (-4) florets; spikes nodding, exserted.
11 Blades glabrous to scabrous, pale dull green; spikes $7-25 \mathrm{~cm}$ long; internodes usually $3-5 \mathrm{~mm}$ long; spikelets with 2-3 (-4) florets; lemmas usually scabrous, $7-14 \mathrm{~mm}$ long, 1-5 mm longer than the acute paleas; flowering usually late June to late July $\qquad$ E. riparius

11 Blades villous to pilose, dark glossy green; spikes 4-12 cm long; internodes usually 2-3 mm long; spikelets with 1-2 (-3) florets; lemmas usually villous, $5.5-9 \mathrm{~mm}$ long, $0-1.5 \mathrm{~mm}$ longer than the obtuse paleas; flowering usually early June to early July . . . . . . . . . . . . . . . . . . . . . . . . . . . . . E. villosus var. villosus
10 Glumes disarticulating with the lowest floret, 0.7-2.3 mm wide, with (2-) 3-5 (-8) veins, the basal 1-4 mm clearly bowed-out; lemmas often glabrous; spikelets with (2-) 3-5 (-6) florets; [Elymus virginicus complex].
12 Spikes 2.5-6 cm wide, exserted; lemma awns $15-40 \mathrm{~mm}$ long; blades glabrous or villous.
13 Spikes with 9-18 nodes; internodes 4-7 mm long; blades usually lax, dark glossy green under the glaucous bloom; auricles 2-3 mm long, blackish at maturity; flowering usually in mid-May to mid-June
E. macgregorii

13 Spikes with 15-30 nodes; internodes 3-5 mm long; blades lax, or often ascending and involute, pale dull green; auricles $0-2 \mathrm{~mm}$ long, brownish at maturity; flowering usually in mid-June to late July. 14 Spikelets (and usually also the foliage) pubescent; spikes usually 6-12 cm long; lemmas 6-10 mm long. E. glabriflorus var. australis

14 Spikelets (and usually also the foliage) glabrous to scabrous); spikes usually 9-16 cm long; lemmas $7-13 \mathrm{~mm}$ long
E. glabriflorus var. glabriflorus

12 Spikes 0.7-2 cm wide (including the awns), exserted or sheathed; lemma awns 1-15(20) mm long; spikelets appressed to slightly spreading; blades usually glabrous to scabridulous.
15 Lemma awns 1-3(5) mm long; blades often ascending, somewhat involute, those higher on the stiffly erect culms broader and more persistent; flowering usually in early July to mid-August .
[E. submuticus]
15 Lemma awns 5-15(20) mm long; blades usually spreading or lax, not markedly broader or more persistent towards the culm summit; flowering usually in mid-June to late July . . . . . . . E. virginicus 16 Spikes glaucous, hispidulous to villous-hirsute, often intermediate in exsertion; glumes indurate in the lowest 1-2 mm; ligules and auricles usually absent; flowering usually early July to midAugust
E. virginicus var. intermedius

16 Spikes green to glaucous, usually glabrous to scabrous; ligules and auricles often present; flowering usually mid-June to mid-July.
17 Spikes partly sheathed; glumes $1-2.3 \mathrm{~mm}$ wide, strongly indurate and bowed-out in the lowest 2-4 mm; plants usually green to yellowish-brown; nodes mostly covered
E. virginicus var. virginicus

17 Spikes usually exserted; glumes (0.5-) 0.7-1.5 (-1.8) mm wide, moderately indurate and bowed out in the lowest $1-2 \mathrm{~mm}$; plants usually glaucous, sometimes reddish-brown at maturity; nodes often exposed.
18 Culms usually 3-8 dm tall, with 4-6 nodes; blades $2-9 \mathrm{~mm}$ wide, becoming involute; spikes $3.5-11 \mathrm{~cm}$ long, strongly glaucous; glumes usually indurate in the lowest 1-2 mm . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . E. virginicus var. halophilus 18 Culms usually 7-10 dm tall, with 6-8 nodes; blades $3-15 \mathrm{~mm}$ wide, flat; spikes $4-20 \mathrm{~cm}$ long, pale green or glaucous; glumes indurate only in the lowest 1 mm
E. virginicus var. jejunus

Elymus canadensis Linnaeus var. canadensis, Great Plains Wild-rye, Nodding Wild-rye. Mt (NC, VA), Pd (VA), \{SC\}: moist forests; rare (NC Watch List, VA Rare). [= Y; E. canadensis - RAB, C, F, GW, K, W, infraspecific taxa not distinguished]

Elymus glabriflorus (Vasey) Scribner \& Ball var. australis (Scribner \& C.R. Ball) J.J.N. Campbell, Southeastern Wild-rye. [E. virginicus var. glabriflorus (Vasey) Bush forma australis (Scribner \& Ball) Fernald - F; E. virginicus var. virginicus -- K, in part; $E$. glabriflorus var. australis - S, Y]

Elymus glabriflorus (Vasey) Scribner \& Ball var. glabriflorus, Southeastern Wild-rye. [= Y; E. virginicus var. glabriflorus (Vasey) Bush forma glabriflorus - F; E. virginicus var. virginicus -- K, in part; E. virginicus var. glabriflorus - S]

Elymus hystrix Linnaeus var. bigelovianus (Fernald) Bowden, Northern Bottlebrush Grass. Mt (NC): high elevation forests; rare. [= Y; Hystrix patula Moench - RAB, infraspecific taxa not distinguished; Elymus hystrix - C, infraspecific taxa not distinguished; Hystrix patula var. bigeloviana (Fernald) Deam - F; Hystrix patula forma bigeloviana (Fernald) Gleason - G; E. hystrix var. bigeloviana - K, orthographic variant; Hystrix hystrix (Linnaeus) Millspaugh - S, in part, infraspecific taxa not distinguished]

Elymus hystrix Linnaeus var. hystrix, Common Bottlebrush Grass. Mt (GA, NC, SC, VA), Pd (NC, SC, VA): moist forests, dry forests especially over more fertile soild; common. [=K, Y; Hystrix patula Moench - RAB, infraspecific taxa not distinguished; Elymus hystrix - C, infraspecific taxa not distinguished; Hystrix patula var. patula - F; Hystrix patula forma patula - G; Hystrix hystrix (Linnaeus) Millspaugh - S, in part, infraspecific taxa not distinguished]

Elymus macgregorii R. Brooks \& J.J.N. Campb., Early Wild-rye. Pd (GA, NC, VA), Mt, Cp (NC, VA): rich mesic forests, especially bottomlands; uncommon. ME west to SD, south to Panhandle FL and s. TX. See Campbell (2000). [= Y]

* Elymus repens (Linnaeus) Gould, Quackgrass, Dog-grass, Witchgrass. Mt, Pd, Cp (NC, VA): roadsides, disturbed areas, pastures; uncommon, probably introduced from Europe (sometimes considered to be partially native along the coast). June-August. [= K, X, Y; Elytrigia repens (Linnaeus) Nevski -- C, Z; Agropyron repens (Linnaeus) Palisot de Beauvois -- RAB, G, HC, S, W; Agropyron repens var. repens -- F; Agropyron repens var. subulatum (Schreber) Roemer \& J.A. Schultes -- F]

Elymus riparius Wiegand, Eastern Riverbank Wild-rye. Mt (NC, SC, VA), Pd (GA, NC, SC, VA), Cp (VA): moist forests; uncommon (NC Watch List). [= RAB, C, F, GW, K, S, W, Y]

Elymus trachycaulus (Link) Gould ex Shinners ssp. trachycaulus, Slender Wheatgrass. Mt (NC, VA): glades and barrens, over serpentine, etc.; rare (VA Rare). [= K, Y; Agropyron trachycaulum (Link) Malte ex H.F. Lewis - RAB, W, infraspecific taxa not distinguished; Elymus trachycaulus - C, infraspecific taxa not distinguished; Agropyron trachycaulum (Link) Malte ex H.F. Lewis var. novae-angliae (Scribner) Fernald - F; Agropyron trachycaulum (Link) Malte ex H.F. Lewis var. ciliatum (Scribner \& J.G. Smith) Gleason-G; Agropyron trachycaulum - HC, in the narrow sense]

Elymus villosus Muhlenberg ex Willdenow var. villosus, Downy Wild-rye. Mt (NC, SC, VA), Pd (NC, SC, VA), Cp (VA), \{GA\}: moist forests; uncommon. And reported for PA by Rhoads \& Klein (1993). [= Y; E. villosus -- RAB, C, F, GW, K, W, infraspecific taxa not distinguished]

Elymus virginicus Linnaeus var. halophilus (Bicknell) Wiegand, Salt-marsh Wild-rye. Cp (NC, VA): brackish marshes, maritime forests and hammocks; uncommon (VA Watch List). [= F, K, Y; E. virginicus - RAB, C, GW, infraspecific taxa not distinguished, and also including E. glabriflorus; E. virginicus var. virginicus - S]

Elymus virginicus Linnaeus var. intermedius (Vasey) Bush. [= Y; E. virginicus - RAB, C, GW, W, infraspecific taxa not distinguished, and also including E. glabriflorus; E. virginicus var. virginicus -- $\mathrm{F}, \mathrm{K}$, in part; E. virginicus var. hirsutiglumis (Scribner) A.S. Hitchcock - S]

Elymus virginicus Linnaeus var. jejunus (Ramaley) Bush. [=F, Y; E. virginicus - RAB, C, GW, W, infraspecific taxa not distinguished, and also including E. glabriflorus; E. virginicus var. virginicus -- K, in part; E. virginicus var. virginicus - S]

Elymus virginicus Linnaeus var. virginicus, Common Eastern Wild-rye, Terrell Grass. Mt, Pd, Cp (NC, SC, VA): moist forests; common. [= Y; E. virginicus - RAB, C, GW, W, infraspecific taxa not distinguished, and also including E. glabriflorus; $E$. virginicus var. virginicus $-\mathrm{F}, \mathrm{K}$, in part; $E$. virginicus var. virginicus -S ; $E$. striatus Willdenow - S ]

## Enteropogon Nees

* Enteropogon prieurii (Kunth) W.D. Clayton. \{attributed to NC by HC\} [= K; = Chloris prieurii Kunth]

## Eragrostis Wolf (Lovegrass)

A genus of about 350 species of temperate and tropical areas. References: Peterson in FNA (2003a); Koch (1978); Peterson \& Harvey (in prep.)=Z. Key adapted from Peterson \& Harvey (in prep.).
\{key and treatment need substantial additional review\}
1 Plants cespitose or rhizomatous perennials, with innovations near the base, and with or without buds in the basal sheaths.
2 Plants with short, knotty, thick rhizomes; florets articulating whole . . . . . . . . . . . . . . . . . . . . . . . . . . . . . E. spectabilis
2 Plants without short or thick rhizomes; florets usually disarticulating.

3 Caryopsis with a deep to shallow groove along the adaxial surface.
4 Caryopsis dorso-ventrally compressed, flattened parallel to the side of the embryo, translucent, light brownish
4 ................................................................................... E. curvula
4 Caryopsis laterally compressed, flattened on the side perpendicular to the embryo, or cylindric, opaque (rarely translucent), usually reddish brown.
5 Lateral veins of the lemmas conspicuous, often greenish, the lemmas strongly keeled ...... E. trichodes
5 Lateral veins of the lemmas inconspicuous and hardly evident, the lemmas sometimes weakly keeled.
6 Lemmas $1.2-1.8 \mathrm{~mm}$ long; culms $30-70 \mathrm{~cm}$ tall
E. Iugens

6 Lemmas 1.6-3.0 mm long; culms (30-) 40-110 (-120) cm tall.
7 Spikelets 2-6-flowered, greenish with purple tinges; leaf blades 3-8 (-11) mm wide, 25-60 cm long; sheaths often densely papillose-hirsute ................................ $\boldsymbol{E}$. hirsuta
Spikelets (3-) $5-12$-flowered, olive green to lead gray; leaf blades 1-3.8 mm wide (4-) 10-35 cm
7 Spikelets (3-) 5-12-flowered, olive green to lead gray; leaf blades 1-3.8 mm wide, (4-) 10-35 cm long; sheaths never papillose-hirsute . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . E. intermedia
3 Caryopsis not grooved on the adaxial surface.
8 Stamens 3.

8 Stamens 2.
11 Panicle 15-45 cm wide, open, diffuse, broadly ovate to obovate in outline, the panicle branches capillary; pedicels $0.5-35(-50) \mathrm{mm}$ long, longer than or shorter than the spikelets.
12 Spikelets with widely spreading pedicels, the lower pedicels all generally longer than the spikelets; disarticulation of the lemmas only, the paleas persistent
E. elliottii

12 Spikelets with appressed pedicels, lower pedicels of each branch shorter than the spikelets; disarticulation usually of the whole floret . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . E. refracta
11 Panicle (1-) 2-17 (-20) cm wide, contracted to open, narrowly ovate to oblong in outline;, the panicle branches stiffly spreading; pedicels (0-) 0.3-6 mm long, always shorter than the spikelets.
13 Spikelets 0.7-2.4 mm wide; glumes 0.3-2.2 mm long; lemma $1.5-2.5 \mathrm{~mm}$ long, the apex acute 13 (sometimes acuminate) ........................................................................... attenuate . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . E. secundiflora var. oxylepis 1 Plants cespitose, geniculate or mat-forming annuals, lacking innovations or buds in the lower sheaths.

14 Paleas prominently ciliate-pectinate on the keels, the hairs $0.1-0.8 \mathrm{~mm}$ long.
15 Panicles contracted, narrow, spike-like, usually $<1.5 \mathrm{~cm}$ wide $\ldots \ldots \ldots \ldots \ldots$. . . . . . . . . . ciliaris var. ciliaris
15 Panicles open, cylindrical to narrowly ovate, usually 1-8 cm wide.
16 Spikelets (1.0-) 1.5-3.5 mm long, 0.9-1.4 mm wide, 4-12-flowered; lemmas 0.7-1.1 mm long, membranous, the apex truncate to obtuse . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . E. amabilis
16 Spikelets 5-12 (-18) mm long, 1.4-2.4 mm wide, 12-42-flowered; lemmas (1.3-) 1.5-2.0 mm long, chartaceous, the apex acute
E. cumingii

14 Paleas smooth to scaberulous on the keels, the hairs (if present) $<0.1 \mathrm{~mm}$ long.
17 Plants extensively stoloniferous, creeping and forming flat mats; inflorescences 1-3.5 cm long; culms (2-) 5-12 (-20) cm tall on the erect portions. E. hypnoides

17 Plants not stoloniferous (sometimes creeping and forming flat mats); inflorescences 3-55 cm long; culms (2-) 6-130 cm tall.
18 Ligules membranous, glabrous
E. japonica

18 Ligules ciliate, with a row of tiny white hairs.
19 Caryopsis with a deep to shallow groove along the adaxial surface.
20 Spikelets (4-) 5-10 (-11) mm long, 5-11 (-15)-flowered; pedicels ascending, somewhat appressed along the branches.
21 Spikelets ovate to oblong in outline, >1.4 mm wide; lower glume $1.2-2.3 \mathrm{~mm}$ long
E. mexicana ssp. mexicana

21 Spikelets linear to linear-lanceolate, $<1.5 \mathrm{~mm}$ wide; lower glume 0.7-1.7 mm long
20 Spikelets (1.4-) 2-5 mm long, 2-6 (-7)-flowered; pedicels erect, spreading along the branches.
22 Panicle 10-45 (-55) cm long, $2 / 3$ or more the height of the plant; pedicels (4-) $5-25 \mathrm{~mm}$ long; glandular pits absent below the nodes, branches, and rachis . . . . . . . . . . . . . . . . E. capillaris
22 Panicle 4-20 cm long, less than $1 / 2$ the height of the plant; pedicels $1.5-5 \mathrm{~mm}$ long; glandular pits often present below the nodes, branches, and rachis
E. frankii

19 Caryopsis not grooved on the adaxial surface.
23 Plants with glandular pits or bands on the culm below the nodes, on the veins of the sheath, on the margins and veins of the blade, on the rachis, on the inflorescence branches and pedicels, and/or on the midveins of the lemma and palea.
24 Spikelets (1.7-) 2-4 mm long, 3-6-flowered ..... E. frankii
24 Spikelets (2-) 3.5-20 mm long, (3-) 5-40-flowered.25 Spikelets 0.6-1.3 mm wide; pedicels 1-10 mm long, flexuous and delicate, appressed orspreading . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . E. pilosa
25 Spikelets 1.1-4 mm wide; pedicels $0.2-4 \mathrm{~mm}$ long, straight and rigid, mostly spreading. 26 Spikelets $6-20 \mathrm{~mm}$ long, 2-4 mm wide, 10-40-flowered; lemmas 2-2.8 mm long, with 13 crateriform glands along the keel; disarticulation of the entire florets from the persistent rachilla; anthers yellow . . . . . . . . . . . . . . . . . . . . . . . . . . . . . E. cilianensis
26 Spikelets 4-7 (-11) mm long, 1.1-2.2 mm wide, $7-12$ (-20)-flowered; lemmas 1.4-1.8 mm long, rarely with 1-2 crateriform glands along the keel; disarticulation of the lemmas only, the palea and rachilla usually persistent; anthers reddish-brown.
27 Inflorescence with glandular areas of spots or rings on the rachis below the panicle branch bases, the glands often shiny or yellowish; stamens 3; blade margins lacking crateriform glands $\qquad$ E. barrelieri
27 Inflorescence sometimes with glandular areas of spots or crateriform pits on the rachis below the panicle branch bases, the glands usually dull and greenish-gray to straw-colored; stamens 2; blade margins sometimes with crateriform glands .
E. minor
23 Plants lacking glandular pits or bands on the culm below the nodes, on the veins of the sheath, on the margins and veins of the blade, on the rachis, on the inflorescence branches and pedicels, and/or on the midveins of the lemma and palea.
28 Spikelets (1.6-) 2-4 mm wide, 12-42-flowered; disarticulation of entire florets from a persistent rachilla . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [E. unioloides]
28 Spikelets 0.6-2.5 mm wide, 3-22-flowered; disarticulation of the lemmas only, the paleas usually persistent (or deciduous), the rachilla persistent.
29 Spikelets 3-6-flowered
E. frankii
29 Spikelets (3-) 5-22-flowered.
30 First glume 0.3-0.6 (-0.8) mm long, $<0.5 \times$ as long as the lowest lemma; spikelets 0.6 1.3 mm wide; panicle branches usually whorled at the lowest 2 nodes . . . . E. pilosa
30 First glume $0.5-1.5 \mathrm{~mm}$ long, $>0.5 \times$ as long as the lowest lemma; spikelets $1.2-2.5 \mathrm{~mm}$ wide; panicle branches solitary or paired at the 2 lowest nodes.
31 Pedicels widely spreading . . . . . . . . . . . . . . . . [E. pectinacea var. miserrima]
31 Pedicels appressed or rarely diverging up to 20 degrees from the branches
E. pectinacea var. pectinacea

* Eragrostis amabilis (Linnaeus) Wright \& Arnott ex Nees, Japanese Lovegrass. Cp (GA, SC), Pd? (GA?): disturbed areas; rare, introduced the Old World. June. [= RAB, FNA, HC, S, Z; E. tenella (Linnaeus) Palisot de Beauvois ex Roemer \& J.A. Schultes -- K]
* Eragrostis bahiensis (Schrader ex J.A. Schultes) J.A. Schultes, Bahia Lovegrass. Cp (GA, SC): disturbed areas; rare. Reported for SC (Kartesz 1999) and sw. GA (Jones \& Coile 1988, GW, Kartesz 1999). [= GW, HC, K, S, Z]
* Eragrostis barrelieri Daveau, Mediterranean Lovegrass. Cp (SC): waste areas near wool-combing mills; rare, introduced from. Also reported fore. TN (Chester et al. 1993). [= HC, K, Z]

Eragrostis capillaris (Linnaeus) Nees, Lacegrass. Mt, Pd, Cp (GA, NC, SC, VA): fields, roadsides, disturbed areas; common (uncommon in Piedmont, rare in Coastal Plain). July-October. ME and WI south to GA and TX. [= RAB, C, F, G, HC, K, S, W, Z]

* Eragrostis cilianensis (Allioni) Vignolo ex Janchen, Stinkgrass. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): fields, disturbed areas; common, introduced from Europe. July-October. [= RAB, C, G, HC, K, S, W, Z; E. megastachya (Koel.) Link -- F]

Eragrostis ciliaris (Linnaeus) R. Brown var. ciliaris. Cp (GA, SC): sandy shores; rare. S. SC south to TX, Central America, West Indies, South America, Africa, and Asia. [= FNA, HC; < E. ciliaris -- RAB, G, K, S, Z, infraspecific taxa not distinguished]

* Eragrostis cumingii Steudel, Fortyflower Lovegrass, Cuming's Lovegrass. Cp (GA), \{NC\}. Reported for NC (Kartesz 1999) and sw. GA (Jones \& Coile 1988, HC). [= FNA, K, Z; E. simplex Scribner -- HC]
* Eragrostis curvula (Schrader) Nees, Weeping Lovegrass. Cp, Pd, Mt (GA, NC, SC, VA): roadsides; common, introduced from s. Africa. May-June. Very commonly planted as a roadbank stabilizer, E. curvula is fire resistant and shows some capability to spread into adjacent natural habitats. [= RAB, C, HC, K, Z; > E. curvula var. conferta Stapf]

Eragrostis elliottii S. Watson, Elliott's Lovegrass. Cp (GA, NC, SC): savannas, pinelands, disturbed areas; rare. SeptemberOctober. NC south to FL, west to TX. [= RAB, GW, HC, K, S, Z]

Eragrostis frankii C.A. Meyer ex Steudel, Lacegrass. Mt (VA), Pd (NC, VA), Cp (VA), \{GA\}: disturbed areas; uncommon (NC Watch List). September. MA and MN south to FL and AR. [= RAB, C, G, GW, K, S, W, Z; E. frankii var. frankii -- F, HC]

Eragrostis hirsuta (Michaux) Nees, Bigtop Lovegrass. Cp, Pd, Mt (GA, NC, SC, VA): fields, roadsides, disturbed areas; common (uncommon in Mountains). July-October. MD south to FL, west to TX, north in the interior to TN, AR, and MO; Central America. [= RAB, C, K, S, W, Z; >E. hirsuta var. hirsuta -- F, G, HC; >E. hirsuta var. laevivaginata Fernald -- F, G, HC]

Eragrostis hypnoides (Lamarck) Britton, Sterns, \& Poggenburg, Creeping Lovegrass, Teal Lovegrass. Cp, Pd (GA, NC, SC, VA), Mt (NC, VA): marshes, shores; uncommon. September. Throughout most of North America, south to South America. [= RAB, C, F, FNA, G, GW, HC, K, S, W, Z]

Eragrostis intermedia A.S. Hitchcock, Plains Lovegrass. Cp, Pd (GA), \{NC, SC, VA\}. Reported for scattered locations as far east as NC, SC, VA (Kartesz 1999), e. GA (Jones \& Coile 1988), e. TN (Chester et al. 1993). [= C, F, G, HC, K, Z]

Eragrostis japonica (Thunberg) Trinius, Pond Lovegrass. Cp (GA, SC): moist or wet sandy areas; rare. SC and TN south to Central America, South America, and West Indies. Reported for SC by HC, G, and Small (1933), sw. GA by Jones \& Coile (1988), and for w. TN by Chester et al. (1993). [= FNA, K, Z; E. glomerata (Walter) L.H. Dewey - G, GW, HC, S] *? Eragrostis lugens Nees, Mourning Lovegrass. Cp (NC, SC), Pd (GA, NC, SC): marshes, roadsides, low fields; rare, introduced (NC Watch List). June-October. Perhaps only introduced from further south and west. [= RAB, HC, K, S, W, Z]

* Eragrostis mexicana (Hornemann) Link ssp. mexicana, Mexican Lovegrass. Cp (SC): waste areas near wool-combing mills; rare, introduced from. Reported to be naturalized as far east and north as SC, DE, and MD (Kartesz 1999). [= K; E. mexicana -- C, F, infraspecific taxa not distinguished; E. neomexicana Vasey -- C, F, HC; E. mexicana -- G, HC, in a narrow sense]

Eragrostis minor Host, Little Lovegrass. Pd (GA, NC, SC, VA), Mt (NC, SC, VA), Cp (VA): disturbed areas; uncommon, introduced from Europe. July-September. [= C, K, Z; E. poaeoides Palisot de Beauvois ex Roemer \& J.A. Schultes -- RAB, F, G, HC, W; E. eragrostis (Linnaeus) Palisot de Beauvois -- S]

Eragrostis pectinacea (Michaux) Nees ex Steudel var. pectinacea, Carolina Lovegrass. Cp, Pd, Mt (GA, NC, SC, VA): fields, roadsides, disturbed areas; common (VA Watch List). ME and WA south to Central America and West Indies. [=K, Z; E. pectinacea -- C, F, G, GW, W, infraspecific taxa not distinguished; E. pectinacea -- F, HC, S, in a narrow sense; E. diffusa Buckley -G]

Eragrostis pilosa (Linnaeus) Palisot de Beauvois. Cp, Pd, Mt (GA, NC, SC, VA): fields, roadsides, disturbed areas; common, introduced from tropical regions of the Old and New World. July-October. [= RAB, K, S, W, Z; > E. multicaulis Steudel -- F, G, HC; > E. pilosa -- F, G, HC, in the narrow sense]

Eragrostis refracta (Muhlenberg) Scribner, Coastal Lovegrass. Cp (GA, NC, SC, VA), Pd (NC, SC, VA): pinelands, savannas, woodlands, marshes; common (uncommon in Piedmont). July-October. DE south to FL, west to TX. [= RAB, C, F, G, GW, HC, K, S, Z; E. virginica (Zuccarini ex Roemer) Steudel]

* Eragrostis secundiflora J. Presl var. oxylepis (Torrey) S.D. Koch, Red Lovegrass. Cp (GA, NC, SC, VA): sandy roadsides, coastal dunes, and disturbed areas; rare, introduced from sw. United States. First reported for SC by Nelson \& Kelly (1997). [=E. oxylepis (Torrey) Torrey -- GW, HC; = E. secundiflora ssp. oxylepis S.D. Koch -- K, Z; < E. secundiflora -- S, infraspecific taxa not distinguished]

Eragrostis spectabilis (Pursh) Steudel, Purple Lovegrass, Tumblegrass. Cp, Pd, Mt (GA, NC, SC, VA): sandy fields, roadsides, woodlands; common. August-October. ME west to ND, south to FL and TX. [= RAB, C, G, GW, HC, K, S, W, Z; E. spectabilis var. spectabilis -- F; E. spectabilis var. sparsihirsuta Farwell -- F; E. pectinacea, misapplied]

* Eragrostis trichodes (Nuttall) Wood. Pd (VA): disturbed areas; rare, introduced from w. North America. [= C, K, Z; E. trichodes var. trichodes -- F, HC]
* Eragrostis elongata (Willdenow) Jacquin f., Long Lovegrass. Cp (SC): waste areas near wool-combing mills; rare, introduced from. [=K] \{not yet keyed\}
* Eragrostis leptostachya (R. Brown) Steudel, Australian Lovegrass, is reported for NC (Kartesz 1999). \{investigate\} [= K] \{not yet keyed\}

Eragrostis mexicana (Hornemann) Link ssp. virescens (J. PresI) S.D. Koch \& Sánchez, reported as an introduction on ballast in MD and FL. [= K; E. virescens J. Presl -- HC]

Eragrostis pectinacea (Michaux) Nees ex Steudel var. miserrima (Fournier) J. Reeder, from FL and westwards and southwards, may be in our area. [= K, Z; E. tephrosanthos J.A. Schultes -- HC, S; E. pectinacea -- GW, infraspecific taxa not distinguished]

* Eragrostis plana Nees, South African Lovegrass. Cp (SC): waste areas near wool-combing mills; rare, introduced from South Africa. [= K] \{not yet keyed\}
* Eragrostis setifolia Nees, Neverfail. Cp (SC): waste areas near wool-combing mills; rare, introduced from . [= K] \{not yet keyed\}

Eragrostis tef (Zuccagni) Trotter, Teff. Cp (SC): waste areas near wool-combing mills; rare, introduced from Africa. This is the grain used in making Ethiopian bread. [= HC, K] \{not yet keyed\}

* Eragrostis unioloides (Retzius) Nees ex Steudel, Chinese Lovegrass. Cp (GA): rare, introduced from Asia. Reported for s. GA (Jones \& Coile 1988, GW, HC). [= GW, HC, K, S, Z]

## Eremochloa Büse (Centipede Grass)

A genus of about 11 species, native of Asia and Australia. References: Thieret in FNA (2003a).
Identification notes: In the autumn, the inflorescences make this grass readily recognizable at a distance: a short, tight lawn grass with a reddish aspect.

* Eremochloa ophiuroides (Munro) Hackel, Centipede Grass. Cp (GA, NC, SC, VA), Pd (GA, NC, SC): lawns, roadsides, sometimes weedy in more natural sites; common, introduced from se. Asia. Now very commonly planted as a lawn and roadside grass in the Coastal Plain from se. NC southward. Stalter \& Lamont (1996) report the VA occurrence of this species. [= RAB, FNA, HC, K]

## Erianthus

(see Saccharum)

## Eriochloa Kunth (Cup Grass)

References: Crins (1991)=Z; Shaw, Webster, \& Bern in FNA (2003a); Shaw \& Webster (1987)=Y.
1 Lemma of fertile floret with an awn $>0.2 \mathrm{~mm}$ long; second glume awned; panicle compact, the raceme-like lateral branches close together and ascending-appressed, of irregular lengths; spikelets 8-16 on a typical, primary branch . . . . . . E. contracta
1 Lemma of fertile floret lacking an awn; second glume not awned; panicle open, the raceme-like lateral branches remote and divergent, the lowermost longest, the upper gradually reduced in length to the apex ( $E$. acuminata var. acuminata, $E$. michauxii var. michauxii) or compact ( $E$. villosa); spikelets $12-40$ on a typical, primary branch.

```
2 Spikelets 2.0-2.5 mm wide
2 Spikelets 1.1-1.8 mm wide.
3 Annual, 3-12 dm tall; spikelets 1.1-1.4 mm wide . . . . . . . . . . . . . . . . . . . . . . . . . . . E. acuminata var. acuminata
3 Perennial, 5-25 dm tall; spikelets 1.3-1.8 mm wide E. michauxii var. michauxii
```

* Eriochloa acuminata (J. Presl) Kunth var. acuminata. Cp, Pd (GA): disturbed areas; rare, presumably introduced from further south. Reported for NC (Kartesz 1999), and scattered locations in GA (Jones \& Coile 1988, as E. gracilis). The NC record is of cultivated material. [= FNA, K, Y, Z; E. gracilis (Fournier) A.S. Hitchcock - HC]
* Eriochloa contracta A.S. Hitchcock, Prairie Cupgrass. Pd, Mt (VA), Cp (SC): disturbed areas; rare, introduced from midwestern United States. The SC report in Kartesz (1999) is based on waifs at wool-combing mills. [= C, F, FNA, G, GW, HC, K, Y, Z]

Eriochloa michauxii (Poiret) A.S. Hitchcock var. michauxii, Longleaf Cupgrass. Cp (GA, SC): coastal freshwater and slightly brackish marshes, flatwoods, disturbed areas; rare (GA Special Concern). Se. SC south to FL, west to AL, or possibly LA. Var. simpsonii A.S. Hitchcock is endemic to sw. FL. [= FNA, HC, K, Y, Z; E. michauxii -- GW, S, infraspecific taxa not distinguished] * Eriochloa villosa (Thunberg) Kunth. Mt (VA): disturbed area (open edge of railroad bed); rare, introduced from e. Asia. See Belden et al. (2004) for additional information about the first occurrence in Virginia. [= FNA, K, Y] \{add synonymy\}

Eriochloa punctata (Linnaeus) Desvaux ex Hamilton, Louisiana Cupgrass. MS west to TX. [= K] \{not keyed\}

## Eustachys Desvaux (Finger-grass)

References: McKenzie, Urbatsch, \& Aulbach-Smith (1987)=Z. Key based on Z.
1 Lateral nerves of the fertile lemma glabrous; culms stout, 7-15 dm tall; spikes 8-16 (-20), 7-12 cm long .......... . E. glauca
1 Lateral nerves of the fertile lemma pubescent; culms slender, 3-10 dm tall; spikes 1-20, 2.5-9 cm long.
2 Keel of the fertile lemma appressed brownish-ciliate; spikes 1-6; [native].
3 Spikes 5-10 cm long; spikelets >3 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . E. floridana

2 Keel of the fertile lemma glabrous; spikes 7-20; [aliens, in disturbed situations].
4 Spikelets $>2.4 \mathrm{~mm}$ long; sterile floret oblanceolate, acute E. distichophylla

4 Spikelets $<2.1 \mathrm{~mm}$ long; sterile floret widely cuneate, truncate E. retusa

* Eustachys distichophylla (Lagasca y Segura) Nees, Weeping Finger-grass. Cp (GA): disturbed areas; rare, introduced from South America. In GA and FL (Kartesz 1999). [= K, Z; = Chloris distichophylla Lagasca y Segura - HC] \{not yet keyed\}

Eustachys floridana Chapman, Florida Finger-grass. Cp (GA): sandhills, pine flatwoods; rare (GA Special Concern). E. GA south to c. peninsular FL, west to w. Panhandle FL and s. AL. [= K, Z; = Chloris floridana (Chapman) Wood - HC] \{synonymy\}

Eustachys glauca Chapman, Saltmarsh Finger-grass. Cp (GA, NC, SC): marshes and marsh edges; rare. June-October. Se. NC south to FL and west to s. AL. [= K, Z; = Chloris glauca (Chapman) Wood -- RAB, GW, HC, S]

Eustachys petraea (Swartz) Desvaux, Dune Finger-grass. Cp (GA, NC, SC): dune slacks and sand flats, sometimes in disturbed areas; common (uncommon north of GA). (May-) June-October. NC (Dare County) south to FL and west to TX. [= K, Z; = Chloris petraea Swartz -- RAB, GW, HC, S]

* Eustachys retusa (Lagasca y Segura) Kunth, Argentine Finger-grass. Cp (GA, SC): sandy fields; rare, introduced from Argentina. June. [= K, Z; Chloris argentina (Hackel) Lillo \& Parodi -- RAB, G, HC]

## Festuca Linnaeus (Fescue)

(also see Vulpia)
References: Darbyshire (1993)=X; Aiken \& Darbyshire (1990)=Y; Tucker (1996)=Z; Soreng \& Terrell (1998). Key based in part on $C$ and $Y$.

1 Leaves 0.2-3 mm wide, often involute; [subgenus Festuca].
2 Plant loosely tufted, often rhizomatous; basal sheaths disintegrating into fibers; spikelets 6-13 mm long ....... F. rubra
2 Plant tufted, lacking rhizomes; basal sheaths persistent, remaining firm and entire; spikelets 3-9 mm long.
3 Lemmas 2.3-4.0 (-4.4) mm long, awnless, or with a minute projection to 0.4 mm long; anther 1.5-2.2 (-2.5) mm long;

3 Lemmas 3.8-5.5 mm long, with an awn 0.5-2.5 mm long; anther (2.3-) 2.5-3.0 mm long; spikelets 5.5-9.0 mm long ..

## 1 Leaves $3-12 \mathrm{~mm}$ wide, flat.

4 Larger lemmas 5.5-10 mm long; leaf blades auriculate at the base; anthers 2-4 mm long ........... [see Schedonorus]
5 Auricles ciliate (sometimes only very sparsely so -- check several at 10-20× magnification); spikelets with 3-6 (-9) florets; old sheaths pale straw-colored, often remaining intact; internodes of the rachilla antrorsely scabrous.
[Schedonorus arundinaceus]
5 Auricles glabrous; spikelets with (2-) 4-10 (-12) florets; old sheaths brown, decaying to fibers; internodes of the rachilla glabrous (smooth) or nearly so
[Schedonorus pratensis]
4 Larger lemmas 3.3-5.2 mm long; leaf blades not auriculate at the base; anthers 0.8-1.5 mm long; [subgenus Subulatae, section Obtusae].
6 Principal lowermost panicle branches with 8-20 spikelets clustered at the end; spikelets broadly ovate, 4-6 mm wide F. paradoxa

6 Principal lowermost panicle branches with 2-7 spikelets scattered along the outer half; spikelets narrowly ovate, 2-4 mm wide
F. subverticillata

* Festuca filiform is Pourret, Hair Fescue, Fineleaf Sheep Fescue. Mt, Pd (NC, VA): lawns, disturbed areas; rare, introduced from Eurasia. May-June. [= C, K, Y, Z; F. capillata Lamarck -- RAB, F, HC; F. ovina Linnaeus var. capillata (Lamarck) Alefeld -- G; F. tenuifolia Sibthorp -- W]

Festuca paradoxa Desvaux, Cluster Fescue. Cp, Pd, Mt (GA, NC, SC, VA): bottomlands, uplands over mafic rock; common. May-July. PA west to WI and IA, south to SC, c. GA, and e. TX. [= RAB, C, F, G, GW, HC, K, W, Z; F. shortii Kunth ex Wood -- S, misapplied]

Festuca rubra Linnaeus, Red Fescue. Mt (NC, SC, VA), Pd, Cp (GA, NC, VA): roadsides, fields, disturbed areas, pastures, grassy balds; common. May-July. In our area, this species is considered to be partly native and partly introduced. This species is circumboreal, extending south in North America to GA and MO. Many varieties or subspecies have been described in the F. rubra complex; it is uncertain how they might apply in our area. [= RAB, C, G, HC, S, Y, Z; F. rubra var. rubra -- F; F. rubra var. commutata Gaudin -- F; F. rubra ssp. rubra -- K]

Festuca subverticillata (Persoon) Alexeev, Nodding Fescue. Mt, Pd, Cp (GA, NC, SC, VA): moist to wet forests, woodlands, and disturbed areas; common. May-June. ME, Québec, and Manitoba south to FL and e. TX. [= C, K, Y, Z; F. obtusa Biehler -RAB, F, G, GW, HC, S, W]

* Festuca trachyphylla (Hackel) Krajina, Hard Fescue. Pd (GA, NC, VA), Mt (NC, VA), Cp (NC, SC, VA): meadows, pastures, disturbed areas; uncommon, introduced from Eurasia. May-June. The nomenclatural debate about the application of the name $F$. trachyphylla is summarized in Darbyshire \& Pavlick (1997). [= C, K, Y, Z; F. ovina -- RAB, S, W, in the broad sense (misapplied as to our material); F. ovina var. ovina -- F, G, HC; F. ovina var. duriuscula (Linnaeus) W.D.J. Kock -- F, G, HC, misapplied as to our material]
* Festuca thurberi Vasey. Introduced in SC. [= K] \{not keyed; investigate\}

Festuca versuta Beal, Texas Fescue. Native, east to TN. [= K] \{not keyed; investigate\}

## Glyceria R. Brown (Mannagrass)

(also see Torreyochloa)

## References: Tucker (1996)=Z.

1 Spikelets (10-) 15-40 mm long, linear, subterete, $5-15 \times$ as long as wide; [section Glyceria].
2 Lemma (6-) 7-8.5 (-10) mm long, acute to acuminate; palea longer than the lemma, extending 1.5-3 mm beyond the lemma apex
G. acutiflora

2 Lemma 2.5-5.3 mm long, obtuse to notched; palea about as long as the lemma (ranging from shorter than the lemma and included, to projecting up to 1 mm beyond the lemma apex).
3 Anthers $0.5-0.8 \mathrm{~mm}$ long; lemma mostly $2.5-3.5 \mathrm{~mm}$ long
G. arkansana

3 Anthers 1.0-2.0 mm long; lemma mostly $3.6-5.5 \mathrm{~mm}$ long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . G. septentrionalis
1 Spikelets 2.5-8 mm long, ovate to oblong, 1.5-3× as long as wide; [section Hydropoa].
4 Inflorescence compact (at maturity), the branches stiffly ascending to appressed, the tips never nodding; ligule less than 1 mm long.
5 Inflorescence branches elongate, appressed; lower internodes of the inflorescence 2-8 cm long; spikelets with 3-4 flowers, $3.5-4 \mathrm{~mm}$ long; lemma 1.9-2.8 mm long; leaves 2-5 mm wide; [of the Mountains, rarely elsewhere]
G. melicaria

5 Inflorescence branches short, stiffly ascending; lower internodes of the inflorescence 0.8-2.0 (-2.5) cm long; spikelets with 4-7 flowers, 4-8 mm long; lemma 3.0-3.7 mm long; leaves $3-10 \mathrm{~mm}$ wide; [of the Coastal Plain, rarely disjunct inland to the Mountains of VA]
G. obtusa

4 Inflorescence lax and diffuse (at maturity), the branches spreading to somewhat ascending, the tips often nodding or drooping; ligule 1-6 mm long.
6 Veins of the lemma visible, but not raised; lemma 2.3-4.0 mm long; ligule 2-6 mm long.
7 Lemma 2.9-4.0 mm long, projecting conspicuously beyond the palea; spikelets 4-8 mm long, with 5-10 flowers

Veins of the lemma prominently raised; lemma 1.4-3.0 mm long; ligule 1-4 mm long.
8 Lemma 1.4-2.1 mm long, usually green; first glume 0.5-1.0 mm long; second glume 0.8-1.3 mm long; culms mostly 5-12 dm tall; leaves 2-5 (-8) mm wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . G. striata var. striata 8 Lemma 2.5-3.0 mm long, purple or green; first glume 1.2-1.9 mm long; second glume 1.5-2.4 mm long; culms mostly $10-20 \mathrm{dm}$ tall; leaves $5-12 \mathrm{~mm}$ wide.
9 Glumes obtuse, subequal (the first 1.2-1.9 mm long, the second $1.5-2.4 \mathrm{~mm}$ long); spikelets $4-6.5 \mathrm{~mm}$ long, (4-) 5-9-flowered; lemmas purplish, contrasting with the pale glumes; ligule 2-4 (-5) mm long; [of various montane wetlands of VA and possibly NC] . . . . . . . . . . . . . . . . . . . . . . . G. grandis var. grandis
9 Glumes acute, unequal (the first 1.4-1.6 mm long, the second $1.8-2.1 \mathrm{~mm}$ long); spikelets mostly $3-4 \mathrm{~mm}$ long, 2-4-flowered; lemmas dark green (or purplish?); ligule $1.5-3 \mathrm{~mm}$ long; [of high elevation seepages in the Great Smoky Mountains of NC and TN]

Glyceria acutiflora Torrey. Mt (GA, VA): shallow water and wet mucky soils in mountain ponds, wet pastures; rare (GA Special Concern). June-July. ME west to MI, south to DE, VA, nw. GA (Jones \& Coile 1988), e. TN, and MO; also in e. Asia. [= C, F, G, GW, HC, K, W, Z; Panicularia acutiflora (Torrey) Kuntze -- S]

Glyceria arkansana Fernald, Arkansas Mannagrass. Cp (VA): swamps; rare. May-June. IL south to LA and AR; disjunct in se. VA and w. NY. The appropriate treatment of this taxon needs further investigation. [=F, HC, K, Z; G. septentrionalis -- C, G, in part; G. septentrionalis A.S. Hitchcock var. arkansana (Fernald) Steyermark \& Kučera]

Glyceria canadensis (Michaux) Trinius, Rattlesnake Mannagrass. Mt (NC, VA), Cp (VA): bogs, seepages, and wet meadows; rare. June-July. Newfoundland west to MN, south to NJ, VA, nw. NC, and IL. [= C, F, G, K, Z; G. canadensis var. canadensis -- HC, W]

Glyceria grandis S. Watson var. grandis, American Mannagrass. Mt (NC?, VA), Cp (VA): wet, mucky soils of open wetlands; rare. Nova Scotia west to AK, south to VA, IA, NM, and OR. Attributed to w. NC by Tucker (1996). [= K; G. grandis -- C, F, G, GW, HC, Z, infraspecific taxa not distinguished; Panicularia grandis (S. Watson) Nash -- S; G. maxima (Hartman) Holmberg ssp. grandis (S. Watson) Hultén]

Glyceria laxa (Scribner) Scribner, Lax Mannagrass. Mt (NC, VA): bogs; rare. June-July. Prince Edward Island south to NC, mostly Appalachian. Though often described as a hybrid of G. canadensis and either G. striata var. striata and/or G. grandis var. grandis, G. laxa ranges south of the distribution of both G. canadensis and G. grandis var. grandis. It is best considered as a species, perhaps of hybrid origin. [= F, G, K; G. canadensis (Michaux) Trinius var. laxa (Scribner) A.S. Hitchcock -- RAB, HC; G. $\times$ laxa -- C; G. canadensis -- GW, in a broad sense]

Glyceria melicaria (Michaux) F.T. Hubbard, Northeastern Mannagrass. Mt (GA, NC, VA), Pd (NC): mountain swamp forests and seepages; uncommon (GA Special Concern). June-August. Nova Scotia west to Québec, south to n. GA (Jones \& Coile 1988) and KY. [= RAB, C, F, G, GW, HC, K, W, Z; Panicularia melicaria (Michaux) A.S. Hitchcock -- S]

Glyceria nubigena W.A. Anderson, Smoky Mountain Mannagrass. Mt (NC): moderate to high elevation seepages in the Great Smoky Mountains, sometimes in areas appearing dry (such as heath balds), nearly endemic to Great Smoky Mountains National Park; rare (US Species of Concern, NC Rare). June-July. Endemic to the Great Smoky Mountains of w. NC and e. TN. G. nubigena has nearly the same range as Rugelia nudicaulis, but is more restricted to seepage. The distinctions and relationship between this taxon and G. grandis need further investigation. [= RAB, HC, K, W, Z]

Glyceria obtusa (Muhlenberg) Trinius, Coastal Mannagrass. Cp (NC, SC, VA), Mt (VA): blackwater swamp forests, wet meadows, freshwater marshes; uncommon. June-September. Nova Scotia south to SC, on or near the Coastal PLain. [= RAB, C, F, G, GW, HC, K, W, Z; Panicularia obtusa (Muhlenberg) Kuntze -- S]

Glyceria septentrionalis A.S. Hitchcock, Floating Mannagrass, Eastern Mannagrass. Cp, Pd (GA, NC, SC, VA), Mt (NC, VA): shallow water, wet mucky soils, floodplain sloughs, cypress ponds; uncommon (GA Special Concern). May-June. MA west to MN, south to SC, ne. GA, and TX. [= RAB, F, GW, HC, K, W, Z; G. septentrionalis -- C, G, in part (see also G. arkansana); Panicularia septentrionalis (A.S. Hitchcock) Bicknell -- S]

Glyceria striata (Lamarck) A.S. Hitchcock var. striata, Fowl Mannagrass. Mt, Pd, Cp (GA, NC, SC, VA): wet meadows, seepages, bogs, marshes, swamp forests; common. April-June. Newfoundland west to British Columbia, south to FL and CA. Var. stricta (Scribner) Fernald is more northern. [= C, F, G, HC, Z; G. striata -- RAB, GW, K, W, infraspecific taxa not distinguished; Panicularia striata (Lamarck) A.S. Hitchcock -- S; G. striata ssp. striata]

Gymnopogon Palisot de Beauvois (Beard Grass, Skeleton Grass)
References: Smith (1971)=Z.
Identification notes: When sterile, Gymnopogon is sometimes confused with Dichanthelium. Gymnopogon differs in having the sheaths conspicuously overlapping (vs. not overlapping in Dichanthelium) and leaves that are definitely cordate-clasping and of stiff texture (only a few Dichanthelium have this combination).

1 Awn of the lemma 4.5-12 mm long; inflorescence branches with spikelets distributed from the tip nearly to the base; leaves 515 mm wide; [of the Coastal Plain, Piedmont, and Mountains] G. ambiguus

1 Awn of the lemma 0.8-1.6 (-3.5) mm long; inflorescence branches with spikelets distributed from the tip nearly to the base ( $G$. chapmanianus) or to roughly the midpoint, the basal portion naked (or some branches rarely with a few spikelets) ( $G$.
brevifolius); leaves 2-8 mm wide; [of the Coastal Plain and lower Piedmont].

| 2 | Spikelets 1 -flowered; first glume 2.3-3.7 mm long | G. brevifolius |
| :---: | :---: | :---: |
| 2 | Spikelets 2-4-flowered; first glume 3.8-5 mm long | G. chapmanianus |

Gymnopogon ambiguus (Michaux) Britton, Sterns, \& Poggenburg, Eastern Beard Grass. Cp, Pd (GA, NC, SC, VA), Mt (NC, SC, VA): prairies, glades, barrens, dry pinelands and woodlands, dry fields; common (rare in Mountains). August-October. S. NJ west to KY, OH, and MO, south to FL and TX. [= RAB, C, F, G, HC, K, S, W, Z]

Gymnopogon brevifolius Trinius, Pineland Beard Grass. Cp, Pd (GA, NC, SC, VA), Mt (GA): pine savannas, sandhills, dry woodlands, prairies, calcareous glades; common (rare in lower Piedmont) (GA Special Concern, VA Watch List). August-October. S. NJ south to FL, west to LA and AR; disjunct in the Highland Rim of KY and TN. [= RAB, C, F, G, HC, K, S, Z]

Gymnopogon chapmanianus A.S.Hitchcock, Chapman's Beard Grass. Cp (GA): sandhills and other xeric, sandy habitats; rare (GA Special Concern). Se. GA south to FL. [= HC, K, S, Z; G. floridanus Swallen - Z]

## Hackelochloa Kuntze (Pitscale Grass

* Hackelochloa granularis (Linnaeus) Kuntze, Pitscale Grass. Cp (GA): disturbed areas; rare, introduced from the Old World. Reported for sw. GA and other Gulf Coast states (Thieret in FNA 2003a, Jones \& Coile 1988, Kartesz 1999). [= FNA, HC, K; = Rytilix granularis (Linnaeus) Skeels - S; = Mnesithea granularis (Linnaeus) Koning \& Sosef]

Hainardia W. Greuter (Thintail)
References: Tucker (1996)=Z.

* Hainardia cylindrica (Willdenow) W. Greuter, Thintail. Cp (SC): waste areas around wool-combing mills; rare, introduced from the Old World. April-June. [= K, Z; = Lepturus cylindricus (Willdenow) Trinius -- RAB; = Monerma cylindrica (Willdenow) Cosson \& Durieu -- HC]

## Heteropogon Persoon (Tanglehead)

A genus of about 10 species, pantropical and extending into subtropoical and warm temperate areas. References: Barkworth in FNA (2003a).

* Heteropogon melanocarpus (Elliott) Elliott ex Bentham, Sweet Tanglehead. Cp (GA, NC, SC): sandy roadsides, disturbed areas; rare, probably naturalized from further south (or even from the Old World). September-October. The species is widespread in the Old World and New World tropics, north in North America to se. NC. [= RAB, FNA, HC, K, S]

## Hierochloe R. Brown (Holy Grass, Sweet Grass, Vanilla Grass)

Tucker (1996) and Soreng et al. (2003) propose the inclusion of Hierochloe into a more broadly circumscribed Anthoxanthum. References: Tucker (1996)=Z; Soreng et al. (2003)=Y.

Hierochloe odorata (Linnaeus) Palisot de Beauvois ssp. odorata, Holy Grass, Sweet Grass, Vanilla Grass. Mt (NC, VA), Pd? (NC): fens, wet calcareous medaows, high elevation pastures and openings; rare (NC Rare). April-May. A circumboreal species and subspecies, widespread in $n$. Eurasia and n. North America, ranging south in North America to NJ, MD, PA, OH, IN, IL, IA, SD, CO, UT, NM, and CA, with several disjunct occurrences in North Carolina, in Long Hope Valley, Ashe County, the Nantahala River Bogs, Macon County, and Pond Mountain, Ashe County. The report by S ("recorded by Chapman from Statesville, N.C.") can probbaly be discounted; it is unlikely that this northern species would occur in the vicinity of Statesville. The record probably reflects a collection made in the mountains by a botanist based in Statesville, such as M.E. Hyams. Belden et al. (2004) document the first occurrence in Virginia. The sweet, vanilla-like odor of this grass is responsible for various folk uses -- by Native Americans for making fragrant baskets, in Scandinavia strewn on church floors on festival days. Kartesz (1999) maps the NC occurrence of Hierochloe as H. hirta (Schrank) Borbás ssp. arctica (J. Presl) G. Weimarck; the reasons for this are unknown \{investigate\}. [=K; H. odorata -- C, F, G, HC, infraspecific taxa not distinguished; Torresia odorata (Linnaeus) A.S. Hitchcock -- S; Anthoxanthum nitens (Weber) Y. Schouten \& Veldkamp -- Z; Anthoxanthum nitens (Weber) Y. Schouten \& Veldkamp spp. nitens - Y; H. odorata var. fragrans (Willdenow) Richter (the North American plants)]

Holcus Linnaeus (Velvet Grass, Soft Grass)

References: Tucker (1996)=Z.

[^6]1 Plant strongly rhizomatous; upper culm internodes glabrous; lemma awn straight H. mollis

* Holcus lanatus Linnaeus, Velvet Grass, Soft Grass, Yorkshire-fog. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): pastures, disturbed areas, roadsides, hedge-rows; common (rare in SC), introduced from Europe. May-October. [= RAB, C, F, G, HC, K, W, Z; Notholcus lanatus (Linnaeus) Nash -- S]

Holcus mollis Linnaeus, Creeping Soft Grass. Mt (NC): lawns; rare, introduced from Europe. September. This European species is known from scattered sites in e. North America. The species was documented for our area by Clay (1995). [= C, F, G, HC, K, Z]

## Hordeum Linnaeus 1753 (Barley)

Many recent authors place most of our species (other than H. vulgare) in Critesion Rafinesque. References: Tucker (1996)=Z; Petersen \& Seberg (2003); Blattner (2004).

1 Rachis remaining intact at maturity; leaves $5-12 \mathrm{~mm}$ wide, with well-developed auricles; [section Hordeum] . . . . . H. vulgare
1 Rachis disarticulating at maturity; leaves $1-5 \mathrm{~mm}$ wide, not auriculate (except in H . murium ssp. leporinum).
2 Perennial; glumes $25-150 \mathrm{~mm}$ long; [intersectional hybrid derivative of section Sibirica and section Critesion]. H. jubatum 2 Annual; glumes 7-22 (-28) mm long.

3 Leaves auriculate; glumes of the central spikelet (in the triad) with ciliate margins; [section Hordeum] H. murinum ssp. leporinum 3 Leaves not auriculate; glumes of the central spikelet (in the triad) with scabrous margins; [section Critesion]. H. pusillum

* Hordeum jubatum Linnaeus, Foxtail Barley, Squirreltail Barley. Mt, Pd (VA), Cp (NC, SC): disturbed areas; rare, apparently introduced in our area, introduced from w. United States. May-August. A tetraploid taxon. [= RAB, C, F, G, HC, W, Z; H. jubatum ssp. jubatum -- K; Critesion jubatum (Linnaeus) Nevski]
* Hordeum murinum Linnaeus ssp. leporinum (Link) Arcangeli. Pd (GA, NC, VA), Cp (SC, VA): disturbed areas; rare, introduced from Mediterranean Europe. May. A tetraploid taxon. [= K, Z; H. leporinum Link -- RAB, C, HC; Hordeum murinum Linnaeus -- G, S; Critesion murinum (Linnaeus) Á. Löve ssp. leporinum (Link) Á. Löve]

Hordeum pusillum Nuttall, Little Barley. Cp, Pd, Mt (GA, NC, SC, VA): roadsides, ditches, disturbed areas; common. AprilJune. Se. NY west to MN, south to n. FL, s. TX, and s. AZ. A diploid taxon. [= RAB, C, F, G, HC, K, S, W, Z; = Critesion pusillum (Nuttall) Á. Löve]

* Hordeum vulgare Linnaeus, Barley. Cp, Pd (NC, SC, VA), Mt (VA): cultivated fields, occasionally persistent as a waif; commonly cultivated, rare as a waif, introduced from Eurasia. May-June. A diploid taxon. The original wild form is often treated as $H$. vulgare ssp. spontaneum \{\} and the cultivated, non-shattering derivative as ssp. vulgare (Hancock 2004). The wild form was used as a food source since at least 19,000 years BP, and ssp. vulgare developed by 8500 years BP. [= RAB, C, F, G, HC, K, Z; > H. aegiceras Nees ex Royle -- G; > H. vulgare var. trifurcatum (Schlechtendahl) Alefeld -- G, HC]
*? Hordeum brachyantherum Nevski ssp. brachyantherum is reported for se. PA (Rhoads \& Klein 1993) and also is apparently known from specimens from GA (Sorrie, pers. comm.). A tetraploid taxon. [= K; Critesion brachyantherum (Nevski) Barkworth \& D.R. Dewey] \{not yet keyed\}
* Hordeum depressum (Scribner \& J.G. Smith) Rydberg is reported as introduced in SC (Kartesz 1999). \{investigate\} A tetraploid taxon. [= K; Critesion depressum (Scribner \& J.G. Smith) Á. Löve] \{not yet keyed\}

## Hystrix Moench <br> (see Elymus)

Imperata Cirillo (Cogongrass)
References: Gabel in FNA (2003a); Ward (2004c)=Z.

* Imperata cylindrica (Linnaeus) Palisot de Beauvois, Cogongrass, Brazil Satintail. Cp (GA, SC): grassy roadside; rare, introduced fom the tropics. See Nelson (1993) for first report from SC. An extremely aggressive and dangerous weed, now wellestablished and rapidly invading fire-maintained Coastal Plain areas (such as longleaf pine and slash pine flatwoods and longleaf pine clayhills) on the Gulf Coastal Plain of FL, AL, and MS. Hall (1998) argues that I. cylindrica and I. brasiliensis are not distinct. The only character considered to separate them is that $I$. brasiliensis has 1 anther and $I$. cylindrica has 2. Ward (2004c) treats the 2 taxa at varietal level. [= FNA, HC, K; I. brasiliensis Trinius -- FNA, HC, K, S; I. cylindrica var. mexicana (Ruprecht) D.B. Ward - Z]

## Koeleria Persoon (Junegrass, Koeleria)

Koeleria macrantha (Ledeb.) J.A. Schultes, Junegrass, South to DE, MD, PA, KY, and AL (Kartesz 1999). [= K; K. pyramidata (Lamarck) Palisot de Beavois - C]

## Lachnagrostis Trinius 1820

A genus of about 20 species, of the Southern Hemisphere. References: Soreng et al. (2003).

* Lachnagrostis filiformis (G. Forst.) Trinius, Pacific Bentgrass. Cp (SC): waste areas around wool-combing mill; rare, perhaps only a waif, native of Australia. [= FNA; = Agrostis avenacea J.F. Gmelin -- K]

Lagurus Linnaeus (Hare's-tail Grass)
References: Tucker (1996)=Z.

* Lagurus ovatus Linnaeus, Hare's-tail Grass. Cp (NC): on ballast; rare, introduced from Mediterranean Europe. April-June. [= RAB, HC, K, Z]

Leersia Swartz (Cutgrass)
References: Tucker (1988)=Z.
1 Lower panicle branches whorled or closely approximate; spikelets 4.0-5.5 mm long, 1.5-2.0 mm broad; stamens 3
1 Lower panicle branches alternate (rarely opposite); spikelets 2.2-5.0 mm long, 0.8-4.0 mm broad; stamens 2 or 6 .
2 Spikelets suborbicular-falcate, $3.0-4.0 \mathrm{~mm}$ broad, less than $2 \times$ as long as broad; principal leaf-blades $10-15 \mathrm{~mm}$ wide; stamens 2 ................................................................................. . L. Ienticularis
2 Spikelets narrowly elliptic-falcate, 1.0-2.0 mm broad, more than $2 \times$ as long as wide; principal leaf-blades usually less than 7 mm wide; stamens 2 or 6 .
3 Spikelets $3.8-4.7 \mathrm{~mm}$ long, $1.5-2.0 \mathrm{~mm}$ broad; panicle branches short, bearing spikelets nearly to their bases; stamens 6 . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . L. hexandra
3 Spikelets 2.2-3.5 mm long, 0.8-1.2 mm broad; panicle branches long, filiform, the longer ones bearing spikelets only in their upper half; stamens 2
L. virginica

Leersia hexandra Swartz, Southern Cutgrass. Cp (GA, NC, SC, VA): clay-based Carolina bays, limesink ponds, lakes, pools, usually in places where periodically or seasonally inundated; uncommon (VA Rare). June-August. Pantropical, ranging north in North America to MD, TN, and TX. This species is considered a serious weed in the Old World and New World tropics; in our area, however, it is uncommon and not weedy. [= RAB, C, F, G, GW, HC, K, Z; Homalocenchrus hexandrus (Swartz) Kuntze -- S]

Leersia lenticularis Michaux, Catchfly Cutgrass. Cp (GA, NC, SC, VA): floodplain forests and swamps; uncommon. September-October. Se. VA south to n. FL, west to e. TX, north in the interior to IN and MN. [= RAB, C, F, G, GW, HC, K, Z; Homalocenchrus lenticularis (Michaux) Kuntze -- S]

Leersia oryzoides (Linnaeus) Swartz, Rice Cutgrass. Cp, Pd, Mt (GA, NC, SC, VA): marshes, riverbanks, pond-shores; common. August-October. Nova Scotia west to British Columbia, south to FL and CA; also in Europe and e. Asia. [= RAB, C, F, G, GW, HC, K, Z; Homalocenchrus oryzoides (Linnaeus) Pollich -- S]

Leersia virginica Willdenow, White Grass, White Cutgrass. Cp, Pd, Mt (GA, NC, SC, VA): floodplain forests, swamps, streambanks; common. August-October. Québec west to MN and SD, south to FL and TX. [= RAB, C, F, G, GW, HC, K, Z; L. virginica var. ovata (Poiret) Fernald -- F; Homalocenchrus virginicus (Willdenow) Britton -- S]

## Leptochloa Palisot de Beauvois (Sprangletop, Feathergrass)

The circumscription of Leptochloa has been controversial; many authors have preferred to separate Diplachne as a separate genus. References: Snow in FNA (2003a); Snow (1998); Cronquist (1991).

1 Spikelets 1-2.5 mm long, with 2-4 flowers; sheaths sparsely pilose with long, pustular-based hairs . . L. panicea ssp. brachiata 1 Spikelets $3.5-10 \mathrm{~mm}$ long, with 5-12 flowers; sheaths glabrous (rarely slightly scabrous).

2 Lemmas $2-3 \mathrm{~mm}$ long, the apex obtuse to truncate, with the midrib often extended as a mucro ........... L. uninervia 2 Lemmas $3-5 \mathrm{~mm}$ long, the apex acuminate or awned.

3 Lemmas acuminate; leaf blades 5-10 mm wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . L. panicoides 3 Lemmas awned; leaf blades $1-3 \mathrm{~mm}$ wide.

4 Low sprawling grasses, less than 5 dm tall; lemma awns (1-) 2.5-5 mm long; first glume 2.5-3.5 mm long; second glume 4-7 mm long
L. fascicularis var. maritima

4 Taller grasses, usually 5-10 dm tall; lemma awns 0.5-2.5 mm long; first glume 1.3-3.4 mm long; second glume $2.2-5 \mathrm{~mm}$ long.
5 First glume 2.3-3.4 mm long; second glume 3.4-5.0; lemmas 4-5 mm long, with an awn 0.5-2.5 mm long
[L. fascicularis var. acuminata]
5 First glume 1.3-2 mm long; second glume 2.2-3.5; lemmas 3-4 mm long, with an awn 0.5-1 mm long

## L. fascicularis var. fascicularis

* Leptochloa fascicularis (Lamarck) A. Gray var. fascicularis, Bearded Sprangletop. Pd (NC): bed of artificial impoundment; rare, adventive from further west. September. Widespread in e. North America, primarily west of the Appalachians (adventive further east), and extending into South America. [= C, G; L. fascicularis -- RAB, GW, HC, S, in part, infraspecific taxa not distinguished; L. fusca (Linnaeus) Kunth ssp. fascicularis (Lamarck) N. Snow -- FNA, K, in part only; Diplachne fascicularis (Lamarck) Palisot de Beauvois -- F]

Leptochloa fascicularis (Lamarck) A. Gray var. maritima (Bicknell) Gleason, Salt-meadow Grass. Cp (NC, SC, VA): fresh to brackish marshes, overwash flats, other disturbed brackish habitats; rare (NC Rare, VA Watch List). August-October. Along the coast from s. NH south to SC. This taxon appears to warrant status as a species separate from L. fascicularis. Reported (as L. fascicularis) for SC by Nelson \& Kelly (1997). [= C, G; L. fascicularis -- RAB, GW, HC, S, in part, infraspecific taxa not distinguished; Diplachne maritima Bicknell -- F; L. fusca (Linnaeus) Kunth ssp. fascicularis (Lamarck) N. Snow -- FNA, K, in part]

Leptochloa panicea (Retzius) Ohwi ssp. brachiata (Steudel) N. Snow, Red Sprangletop. Pd (GA, NC, SC, VA), Cp (NC, SC, VA): disturbed areas; uncommon (VA Watch List). June-October. Widespread in the Western Hemisphere. The more familiar name, L. filiformis, must be replaced for reasons of nomenclatural priority. [= FNA, K; L. filiformis (Lamarck) Palisot de Beauvois -RAB, C, F, G, GW, HC, K, S, W]

* Leptochloa panicoides (J. Presl) A. Hitchcock \& Chase, Amazon Sprangletop. Pd (VA), Cp (GA): drawdown habitats on lake margins; rare, introduced from South America. Belden et al. (2004) discuss the Virginia occurrences along the banks of the Roanoke (Staunton) River at Kerr Reservoir. Also reported for e. GA in the Coastal Plain (Sorrie, pers. comm.). [= C, FNA, G, GW, HC, K; Diplachne halei Nash -- F; Leptochloa floribunda Doell -- S; Diplachne panicoides (J. Presl) McNeill]
* Leptochloa uninervia (J. Presl) A. Hitchcock \& Chase. Cp (GA, SC, VA), Pd (NC): disturbed areas; rare, adventive from further west. July-August. Widespread in the Western Hemisphere, the native range obscure, but not likely native in our area. Reported for SC by Nelson \& Kelly (1997). [= RAB, C, G, GW, HC, K, S; L. fusca (Linnaeus) Kunth ssp. uninervia (J. Presl) N. Snow - FNA, K; Diplachne uninervia (J. Presl) Parodi]
* Leptochloa decipiens (R. Brown) Stapf ex Maiden ssp. peacockii (Maiden \& Betche) N. Snow. Cp (SC): waif at wool-combing mill; rare, introduced, probably not established. [= K] \{not keyed\}
* Leptochloa digitata (R. Brown) Domin. Cp (SC): waif at wool-combing mill; rare, introduced, probably not established. [= K] \{not keyed\}
* Leptochloa divaricatissima S.T. Blake. Cp (SC): waif at wool-combing mill; rare, introduced, probably not established. [= K] \{not keyed\}

Leptochloa dubia (Kunth) Nees. Cp (SC): waif at wool-combing mill; rare, introduced, probably not established. Also reported for NC by Kartesz (1999), but the documentation indicates that it was cultivated at a Soil Conservation Service test nursery in Chapel Hill, Orange County. [= FNA, HC, K] \{not keyed\}

Leptochloa fascicularis (Lamarck) A. Gray var. acuminata (Nash) Gleason has been reported as adventive in PA and along highways in WV from halophytic habitats of w. United States (Cusick 1994). [= C, G; Diplachne acuminata Nash -- F; L. fascicularis -- HC, infraspecific taxa not distinguished; L. fusca (Linnaeus) Kunth ssp. fascicularis (Lamarck) N. Snow -- FNA, K, in part; L. acuminata (Nash) Mohlenbrock] \{not keyed\}

* Leptochloa virgata (Linnaeus) Palisot de Beauvois, tropical Sprangletop. Cp (SC): waif at wool-combing mill; rare, introduced, probably not established. [= FNA, HC, K] \{not keyed\}

## Leptoloma (see Digitaria)

## Limnodea L.H. Dewey 1894

## References: Brandenburg \& Thieret (2000)=Z.

* Limnodea arkansana (Nuttall) L.H. Dewey. Cp (SC): waste at wool-combing mill, probably not established; rare, introduced from sc. United States. [= HC, K, S, Z; Cinna arkansana (Nuttall) G. Tucker]

Lolium Linnaeus (Rye-grass, Darnel, Fescue)<br>(also see Schedonorus)

References: Darbyshire (1993) $=\mathrm{Y}$; Aiken \& Darbyshire (1990) $=\mathrm{X}$; Tucker (1996)=Z. Key based in part on C and X.
1 Inflorescence paniculate (spikelets borne on branches off the central axis) . . . . . . . . . . . . . . . . . . . . . . . [see Schedonorus]
1 Inflorescence spikelike (spikelets sessile on the central axis); [subgenus Lolium].
2 Glumes (12-) 15-25 mm long, subcoriaceous, equalling or surpassing the uppermost lemma (therefore the length of the spikelet); florets $4-9$ per spikelet; annual . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . L. temulentum
2 Glumes 4-12 mm long, herbaceous, shorter than the lemmas (therefore shorter than the spikelet); florets (2-) 5-22 per spikelet; annual or perennial.
3 Lemmas (at least the upper) awned, the awns to 15 mm long; florets 11-22 per spikelet; annual or perennial

```
3 Lemmas awnless; florets (2-) 5-10 per spikelet; perennial
L. perenne var. aristatum
L. perenne var. perenne
```

* Lolium perenne Linnaeus var. aristatum Willdenow, Italian Rye-grass. Cp (GA, NC, SC, VA), Pd, Mt (NC, SC, VA): fields, roadsides, pastures, disturbed areas; common, introduced from Eurasia. April-July. [=C, Z; L. multiflorum Lamarck -- RAB, F, G, HC, S; L. perenne ssp. multiflorum (Lamarck) Husnot -- K; L. perenne -- W, infraspecific taxa not distinguished]
* Lolium perenne Linnaeus var. perenne, English Rye-grass, Perennial Rye-grass. Cp (GA, NC, SC, VA), Pd, Mt (GA, NC, VA): fields, roadsides, pastures, disturbed areas; uncommon, introduced from Eurasia. April-July. [=C, Z; L. perenne -- RAB, F, G, HC, S, in the narrow sense; L. perenne ssp. perenne -- K; L. perenne -- W, infraspecific taxa not distinguished]
* Lolium temulentum Linnaeus, Darnel. Pd (GA, NC, VA), Cp (NC, VA), \{SC\}: fields, roadsides, pastures, disturbed areas; common, introduced from Eurasia. May-June. [= RAB, C, F, G, HC, S, Z; L. temulentum var. leptochaeton A. Braun -- G; L. temulentum var. macrochaeton A. Braun -- G; L. temulentum ssp. temulentum - K]

## Luziola Antoine Laurent de Jussieu (Southern Water Grass)

References: Tucker (1988)=Z; Judziewicz et al. (2000)=Y.
Identification notes: A very unusual grass, truly aquatic, with flexuous stems and unwettable, floating leaves. In addition to floating leaves (helpful in the field but not in the herbarium!), other useful characters include two secondary blade nerves on either side of the midnerve and virtually as prominent as the midnerve, and which extend onto the sheath where they occur with another 5 or so strong nerves; often with cilia $0.5-1 \mathrm{~mm}$ long at the summit of the ventral face of the sheath (an unusual place); and a hyaline ligule about 1 mm long on the same plane as the sheath (i.e., free from the base of diverging blades).

Luziola fluitans (Michaux) Terrell \& H. Robinson var. fluitans, Southern Water Grass. Cp (GA, NC, SC), Pd? (GA?): aquatic in water of natural lakes, slow-moving blackwater rivers, and other stagnant waters; rare (NC Watch List). August-October. Var. fluitans ranges from ne. NC to c. FL and west to e. TX; var. oconnerii (Guzman M.) G. Tucker occurs in the highlands of w. Mexico (Tucker 1988). [= Y, Z; L. fluitans -- K, infraspecific taxa not distinguished; Hydrochloa carolinensis Palisot de Beauvois -- RAB, GW, HC, S]

[^7]
## Melica Linnaeus (Melic)

## References: Tucker (1996)=Z.

1 First glume oblong, $6.5-10 \mathrm{~mm}$ long, $2-4 \times$ as long as wide, acute to obtuse at the apex, about the same length and width as the second glume; inflorescence with (0-) 1-5 branches from the lower nodes only; fertile lemmas 2; leaves 1-6 mm wide; [common species, widespread in our area] $\qquad$ M. mutica

1 First glume broadly ovate, $5-8 \mathrm{~mm}$ long, $1.5-2 \times$ as long as wide, obtuse to rounded at the apex, shorter and broader than the second glume; inflorescence with 2-10 (or more) branches from most nodes; fertile lemmas (2-) 3; leaves 3-12 mm wide; [rare species of the Mountains of NC and VA, northwards and westwards]
M. nitens

Melica mutica Walter, Two-flower Melic. Cp, Pd, Mt (GA, NC, SC, VA): forests, woodlands; common. April-May. MD west to IN and IL, south to FL and TX. [= RAB, C, F, G, HC, K, S, W, Z]

Melica nitens (Scribner) Nuttall ex Piper, Three-flower Melic. Mt (GA, NC, VA): rocky upland woodlands, barrens, and glades, over calcareous rocks (such as limestone, calcareous shale); rare (NC Rare, VA Rare). May. PA west to s. MN and NE, south to nw. GA and TX. [= RAB, C, F, G, HC, K, W, Z]

## Melinis Palisot de Beauvois (Natalgrass)

A genus of ca. 22 species, native to Africa and w. Asia. References: Wipff in FNA (2003a).

* Melinis repens (Willdenow) Zizka ssp. repens, Rose Natalgrass. Cp, Pd, Mt (GA): disturbed areas, roadsides; rare, introduced from Africa. The report for NC by Kartesz (1999) is an error. [= FNA; < M. repens -- K, infraspecific taxa not distinguished; Rhynchelytrum roseum (Nees) Stapf \& C.E. Hubbard ex Bews -- HC; < Rhynchelytum repens (Willdenow) C.E. Hubbard]

References: Barden (1987); Fairbrothers \& Gray (1972); Winter, Schmitt, \& Edwards (1982); Koyama (1987); Thieret in FNA (2003a).

* Microstegium vimineum (Trinius) A. Camus, Flexible Sasa-grass, Japanese-grass. Pd, Mt, Cp (GA, NC, SC, VA): disturbed areas, colonizing moist, rich soil, especially in floodplains; common, native of tropical se. Asia. The following chronological synopsis of flora accounts of Microstegium is perhaps instructive: not treated by Small (1933), "local" (Fernald 1950), "rarely introduced and possibly not established" (Gleason \& Cronquist 1952), "sporadically naturalized" (Godfrey \& Wooten 1979), "a rapidly spreading pernicious invader on moist ground, too common" (Wofford 1989). RAB report it from fewer than $1 / 3$ of the counties of the Carolinas (in 1968); it is now undoubtedly in every county, an abundant weed in most of them. This species has become a very serious pest, now ranking as one of the most destructive introduced plants in our area, forming extensive and dense patches, sprawling over and eliminating nearly all other herbaceous plants. Eradication is very difficult, and considering its obvious colonizing abilities, only temporary. Hunt \& Zaremba (1992) document the continuing northern expansion of Microstegium into NY and CT. Redman (1995) discusses its habitat preferences in MD and DC. Koyama (1987) reports it as "common as undergrowth of forests" in Japan, part of its native distribution. [= RAB, C, FNA, GW, HC, K, W; Eulalia viminea (Trinius) Kuntze -- F, G; Eulalia viminea var. variabilis Kuntze -- F; M. vimineum var. imberbe (Nees) Honda -- HC]

## Milium Linnaeus (Wood-millet, Millet-grass)

References: Tucker (1996)=Z; Fernald (1950b) $=\mathrm{Y}$.
Milium effusum Linnaeus var. cisatlanticum Fernald, American Wood-millet, Millet-grass. Mt (NC, VA): forests at high (or rarely moderate) elevations; rare (NC Rare, VA Watch List). June. A circumboreal species, ranging in North America south to w. NC (Swain County), e. TN (Sevier County), w. VA, WV, OH, IN, IL, and MN. The American plants are sometimes segregated as var. cisatlanticum Fernald (Fernald 1950b). Though considered "probably accidentally introduced and established" in NC by Radford, Ahles, \& Bell (1968), the native occurrence of this northern species is more plausible; the only known occurrence in NC (not recently seen) is in the Great Smoky Mountains National Park. [ $=\mathrm{K}, \mathrm{Y} ;<\mathrm{M}$. effusum -- RAB, C, F, G, HC, W, Z, infraspecific taxa not distinguished]

Miscanthus Andersson (Eulalia)

## References: Barkworth in FNA (2003a).

Miscanthus sinensis Andersson, Eulalia, Chinese Silver Grass. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): roadsides; common, introduced from e. Asia. September-November. This species is becoming aggressively weedy. Forms with leaves crossvariegated or linear-variegated with yellow are cultivated and sometimes escape or persist (in addition to the much more common green-leaved form). [= RAB, C, F, FNA, G, HC, K, S, W; M. sinensis var. variegatus Beal -- F, HC; M. sinensis var. zebrinus Beal -$\mathrm{F}, \mathrm{HC}]$

## Muhlenbergia Schreber (Muhly)

Muhlenbergia is a large and diverse genus; the various groups seem very different. References: Pohl (1969); Morden \& Hatch (1989); Peterson in FNA (2003a).

1 Panicle open and diffuse, more than 4 cm broad, the spikelets borne on slender or capillary pedicels longer than the lemmas.
2 Plant with rhizomes, the rhizomes prominent, creeping, and covered with imbricate scales; culms and sheaths strongly compressed at base, the leaves distichous; spikelets $1.5-2 \mathrm{~mm}$ long M. torreyana

2 Plant without rhizomes, tufted with erect culms (a "bunchgrass"); culm and sheaths terete, the leaves not distichous; spikelets $1.5-5 \mathrm{~mm}$ long (excluding awns, if present); [subgenus Podosemum].

Spikelets $1.5-2 \mathrm{~mm}$ long, awnless
3 Spikelets 2.5-5 mm long (excluding awns), awned or awnless.
4 Lemma awn 0-1.5 (-4) mm long; glumes (1.1-) 2.0-3.3 (-3.6) mm long, acuminate, not awned (rarely the second with a short awn less than 0.6 mm long); spikelets usually brown or bronze (when fresh); basal sheaths usually very fibrous $\qquad$ M. expansa

4 Lemma awn (2-) 3-33 mm long; glumes (0.3-) 0.7-1.7 (-2.4) mm long, one or both glumes sometimes awned; spikelets usually purple (when fresh); basal sheaths rarely strongly fibrous.
5 Lemma awn (0-) 3-13 (-18) mm long, first glume awnless (or rarely with an awn to 3.2 mm long), second glume awnless (or rarely with an awn up to 5.0 mm long), palea awnless; lemma lacking setaceous teeth flanking the awn; flowering late August-October; [widespread in our area, particularly in rocky, clayey, or sandy glades, barrens, and woodlands with prairie affinities]
M. capillaris

5 Lemma awn (8-) 12-26 (-35) mm long, first glume awn (0.5-) 1-7 (-10) mm long, second glume awn (1-) 5-19 (-25) mm long, palea awn-tipped; lemma with two setaceous teeth flanking the awn, the teeth 0.5-2.5 $(-4.7) \mathrm{mm}$ long; flowering October-November; [of sandy maritime situations on barrier islands of the outer Coastal Plain]
$\qquad$ M. sericea

1 Panicle slender, dense, less than 2.5 cm broad, the spikelets sessile or on non-capillary pedicels shorter than the lemmas; [subgenus Muhlenbergia].
5 Glumes minute, 0-0.5 mm long; plant lacking rhizomes; culms weak, decumbent and cespitosely branching in their lower portions, rooting at the nodes, the upper portions erect and sparsely branched
M. schreberi

5 Glumes well-developed, 1-7 mm long; plant with scaly rhizomes (except for M. cuspidata); culms firm (rarely sprawling), few or solitary (rarely forming dense colonies).
6 Glumes $5-7 \mathrm{~mm}$ long (tapered to arched or straight awns), about double the length of the lemma (excluding its awn); panicle dense and spike-like, 2-6 cm long and $3-10 \mathrm{~mm}$ broad
M. glomerata

6 Glumes 1.2-3 mm long, shorter than to barely exceeding the lemma; panicle usually slender, arching, generally less dense and not spike-like, often with some elongated (though appressed) branches, 4-50 cm long, 2-15 mm broad.
$7 \quad$ Callus glabrous; plant lacking scaly rhizomes (with slender stolons and a hard, knotty crown); leaves $0.5-2 \mathrm{~mm}$ wide; [of calcareous cliffs] M. cuspidata

7 Callus bearded (sometimes only slightly so) (glabrous in M. glabriflora); plant with scaly rhizomes; leaves (1-) 214 mm wide; [collectively of various habitats].
8 Panicle linear, loosely flowered, much exceeding the leaves; culm erect, simple or sparingly branched; glumes relatively broad, the body ovate, 1.2-2.5 mm long, abruptly narrowed to the acuminate tip; ligule obsolete or shorter than the elongate cartilaginous summit of the leaf sheath.
9 Lemmas awnless or awn less than 0.5 mm long; spikelets $1.5-2.5 \mathrm{~mm}$ long; leaf blades usually (1-) 26 mm wide . M. sobolifera

9 Lemma awn 1-11 mm long (rarely awnless); spikelets 3-5 mm long; leaf blades (2) 6-10 (-13) mm wide (often more than 8 mm wide). M. tenuiflora

8 Panicle lanceolate, densely (rarely loosely) flowered, leaves often extending conspicuously into the inflorescence; culm geniculate, freely branched; glumes relatively narrow, the body lanceolate, 2-3 mm long, tapering from base to apex; ligule usually obvious above the short cartilaginous summit of the leaf sheath.
10 Culm glabrous throughout (including below the nodes).
11 Glumes 1.4-2.0 mm long; ligule 0.2-0.5 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . M. bushii
11 Glumes 2-4 (-5) mm long; ligule 0.8-1.5 mm long . . . . . . . . . . . . . . . . . . . . . . . . . M. frondosa
10 Culm pubescent, at least below the nodes.
12 Lemma awn 7-12 mm long; spikelets loosely clustered, on pedicels 2-4 mm long .. M. sylvatica
12 Lemma awnless or with a short awn tip (rarely to 9 mm long); spikelets densely clustered, on pedicels less than 1 mm long.
13 Lemma glabrous below, or with short basal bearding; ligule $0.5-1.5 \mathrm{~mm}$ long
M. glabrifloris

13 Lemma pilose basally; ligule $0.5-1 \mathrm{~mm}$ long . . . . . . . . . . . . . . . . . . . . . . . . M. mexicana
Muhlenbergia bushii Pohl, Bush's Muhly. Pd (VA), Mt (GA), \{NC\}: bottomlands and other moist forests; rare (VA Rare). IN west IA, south to NE and TX; apparently disjunct eastwards in scattered localities, including in n. GA (Jones \& Coile 1988) and VA. The habitat is variously given in floras as "dry woods" or "moist woods." [= C, FNA, K; M. brachyphylla Bush -- F, G, HC]

Muhlenbergia capillaris (Lamarck) Trinius, Hairgrass. Pd, Cp (GA, NC, SC, VA), Mt (GA, NC, VA): in the Piedmont primarily in clayey or thin rocky soils (especially in areas which formerly burned and were prairie-like), open woodlands, in the Coastal Plain in savannas, dry woodlands, and coastal grasslands (where sometimes in close proximity with M. sericea), in the mountains around calcareous rock outcrops; uncommon. Late August-October. The species is widespread in e. North America. M. capillaris and its relatives, $M$. expansa and $M$. sericea, have been the subject of an herbarium morphological study by Morden \& Hatch (1989), who conclude that the three taxa are not sharply separable and should be recognized only at the varietal level. If one considers behavior in the field, ecology, and geography in conjunction with morphologic characters, however, there is little doubt that the three taxa are biological species. Distribution and typical habitat are different for the three species, but $M$. capillaris can be found growing with or in proximity to each of the other two (I have not seen M. sericea and M. expansa together). In such situations, the two taxa present are readily distinguishable at a glance, and there is no evidence of intermediates or hybrids. [=F, FNA, G, W; = M. capillaris -- RAB, GW, in part only (including also M. sericea); = M. capillaris var. capillaris -- C, HC, K, S]

Muhlenbergia cuspidata (Torrey ex Hooker) Rydberg, Plains Muhly. Mt (VA): dolomite and limestone palisade cliffs along the New, Roanoke, and Shenandoah rivers; rare (VA Rare). OH west to MT and Alberta, south to sw. VA, KY, MO, OK, and NM. [= C, F, FNA, G, HC, K]

Muhlenbergia expansa (Poiret) Trinius, Savanna Hairgrass. Cp (GA, NC, SC, VA): pine savannas, pine flatwoods, mesic areas in sandhill-pocosin ecotones; common (VA Rare). September-October. An important part of the grassy component of many longleaf pine savannas, M. expansa is a Coastal Plain species, ranging from se. VA south to FL, and west to e. TX (nearly exactly the range of Pinus palustris). Its flowering is stimulated by fire, and, lacking fire, it may be found in large populations in solely vegetative condition. It can be distinguished in sterile condition from other savanna bunchgrasses (Sporobolus teretifolius, S. pinetorum, S. floridanus, S. curtissii, Aristida stricta, and A. beyrichiana) by the following characteristics: old leaf bases fibrous and curly (rather than hardened and cartilaginous), ligules $1-3 \mathrm{~mm}$ long (rather than 0.2 to 0.5 mm long). The open panicle somewhat resembles that of several species of similar habitat which often co-occur with M. expansa -- Sporobolus teretifolius, S. pinetorum, S. curtissii, S. floridanus, and Calamovilfa brevipilis, but the panicle of $M$. expansa is capillary, flexuous, and fragile, tending to break up over the winter (vs. fine-textured but not capillary, the branches rigid and ascending, more likely to persist over the winter in relatively intact condition). The vegetative characters listed above and under Calamovilfa brevipilis are also useful. See $M$. capillaris for discussion of Morden \& Hatch (1989) advocating varietal status for the three taxa in the M. capillaris-expansa-sericea
complex. [= RAB, F, FNA, GW, HC, S; = M. capillaris var. trichopodes (Elliott) Vasey -- C, K]
Muhlenbergia frondosa (Poiret) Fernald, Smooth Wirestem Muhly. Mt, Pd (GA, NC, VA), Cp (NC): moist forests and disturbed areas; uncommon (rare in Piedmont and Coastal Plain). September-October. This species is widespread in e. North America, south to ne. GA and west into the Plains. [= RAB, F, FNA, G, GW, HC, K, W; M. mexicana -- S, misapplied]

Muhlenbergia glabriflora Scribner, Clay-pan Muhly. Pd (NC, VA): in clayey soils (such as those derived from diabase); rare (NC Watch List, VA Rare). October-November. VA and NC west to IA, MO, AL, and TX, local and apparently rare in all of that range. In NC, only known from one collection, that from Durham County in 1936, with vague habitat data. F describes the habitat as "dry exsiccated or baked soils, prairies, gravels or rocky slopes," Pohl (1969) as "mostly on low ground, in shade on heavy clay soils." [= C, F, G, HC, K; = M. glabrifloris - FNA, orthographic variant]

Muhlenbergia glomerata (Willdenow) Trinius, Spiked Muhly. Mt (NC, VA): fens and seeps over mafic (amphibolite) or ultramafic (olivine) rocks; rare (NC Rare, VA Rare). August-October. This species is widespread in n . North America, ranging south in a scattered and disjunct pattern to NC. [= RAB, F, FNA, GW, HC, K, W; M. racemosa (Michaux) B.S.P. -- G, in part; M. racemosa -- S, misapplied]

Muhlenbergia mexicana (Linnaeus) Trinius, Hairy Wirestem Muhly. Mt (NC, VA), Pd (VA): forest edges; rare (NC Watch List). September-October. The epithet is a misnomer; the species is largely northern, occurring nearly throughout the United States and s. Canada. [= RAB , F, G , HC, K, W; > M. mexicana var. filiformis (Torrey) Scribner - FNA; > M. mexicana var. mexicana FNA; M. foliosa (Roemer \& J.A. Schultes) Trinius -- S]

Muhlenbergia schreberi J.F. Gmelin, Nimblewill, Dropseed. Mt, Pd, Cp (GA, NC, SC, VA): bottomland and other moist forests, disturbed areas; common. August-October. This species is widespread in e. United States. [= RAB, F, FNA, GW, HC, K, S, W; > M. schreberi var. schreberi-G; > M. schreberi var. palustris (Scribner) Scribner -- G; M. palustris Scribner]

Muhlenbergia sericea (Michaux) P.M. Peterson, Dune Hairgrass. Cp (GA, NC, SC): maritime dry grasslands, maritime wet grasslands, interdune swales, low dunes, sometimes edges of freshwater or brackish marshes, apparently limited to the barrier islands (sometimes in close proximity with M. capillaris); uncommon, though sometimes locally abundant (SC Rare). OctoberNovember. This species is a very conspicuous part of the Outer Banks flora in the autumn, especially showy and abundant between Rodanthe (Chicamacomico) and Avon (Kinnakeet), Dare County, NC, and also abundant on Ocracoke Island, Hyde County, NC. The capillary pedicels and awns of its purple inflorescences are so light as to be moved by the slightest breeze. By December or January they fade to tan, but remain showy. This grass is a major component of baskets made in the Low Country of SC by the Gullah, who call it "sweet grass." I agree with Curtis (1843), Blomquist (1948), Pinson \& Batson (1971), Gould (1975), and others who consider M. sericea (as M. filipes) a species distinct from M. capillaris. Its range is from NC (slightly north of Oregon Inlet, Dare County, south of Nags Head) south to FL and west to TX, primarily on barrier islands. In addition to a discussion of its relationship to M. capillaris, Pinson and Batson (1971) and Morden \& Hatch (1989) provide descriptions, not elsewhere available. See $M$. capillaris for a discussion of a recent paper (Morden \& Hatch 1989) advocating varietal status for the three taxa in the M. capillaris-expansa-sericea complex. [= FNA; <M. capillaris -- RAB, GW, in part; = M. capillaris var. filipes (M.A. Curtis) Chapman ex Beal -HC, K, S; = M. filipes M.A. Curtis]

Muhlenbergia sobolifera (Muhlenberg ex Willdenow) Trinius, Rock Muhly. Mt (GA, NC, VA), Pd (VA): dry wooded limestone slopes, rock outcrops and rocky forests; uncommon (GA Special Concern, NC Watch List). July-September. This species is widespread in e. United States, south to AL. [= RAB, F, FNA, G, HC, K, S, W]

Muhlenbergia sylvatica Torrey ex A. Gray, Woodland Muhly. Mt (GA, NC, SC, VA), Pd (NC, VA), Cp (VA): bottomland and other moist forests, calcareous strembanks; rare (GA SPecial Concern, NC Watch List). September. This species is widespread in e. United States, south to ne. GA. [= RAB, FNA, K, W; M. sylvatica var. sylvatica -- F, G, GW, HC; M. umbrosa Scribner -- S]

Muhlenbergia tenuiflora (Willdenow) Britton, Sterns, \& Poggenburg, Slender Muhly. Mt, Pd (GA, NC, VA), Cp (VA), \{SC\}: moist forests and disturbed areas, up to at least 1400 m ; uncommon (rare in Piedmont). August-October. This species is widespread in e. United States. Two varieties are sometimes recognized: var. tenuiflora, with lemma awn 4-11 mm long and the sheaths and stems retrorsely hirsute, especially around the nodes, and var. variabilis (endemic to the Southern Appalachians), with lemma awn 1-4 mm long or absent, and the sheaths and stems glabrous or nearly so. The validity of the varieties needs further assessment. [= RAB, F, FNA, G, HC, K, S, W; > M. tenuiflora var. tenuiflora - C; > M. tenuiflora var. variabilis (Scribner) Pohl - C]

Muhlenbergia torreyana (J.A. Schultes) A.S. Hitchcock, Pinebarren Smokegrass. Cp (GA, NC): moist soils of depression meadows and clay-based Carolina bays, often under or near Taxodium ascendens; rare (GA Special Concern, NC Endangered). August-November. NJ to GA in the Coastal Plain, and disjunct in KY and TN; currently known to be extant only in NJ, NC, and TN. It was first discovered in NC in 1987. Although it rarely flowers except following fire, it can be recognized in sterile condition by its forming clonal patches with evenly spaced, upright, blue-green tufts, each tuft a flattened stem with 5-10 ascending-erect, rather stiff, usually conduplicate leaves, the summit of each sheath with a pronounced cartilaginous thickening, easily felt by running the flattened stem from base to apex between thumb and forefinger. [= C, F, FNA, G, HC, K; = Sporobolus torreyanus (J.A. Schultes) Nash -- S]

Muhlenbergia asperifolia (Nees \& Meyen ex Trinius) Parodi, Alkali Muhly, Scratchgrass, is reported east and south to MD, PA, and OH (Kartesz 1999). [= FNA, K] \{not yet keyed; synonymy\}

* Muhlenbergia emersleyi Vasey, Bull Muhly, is reported as introduced in NC (Kartesz 1999), based on a specimen at UNC Herbarium. However, the specimen makes clear that it was cultivated at a Soil Conservation Service test nursery; there is no evidence that the species is established in our area. [= FNA, HC, K] \{not keyed\}

Muhlenbergia uniflora (Muhlenberg) Fernald, south to NJ and se. PA (Rhoads \& Klein 1993). [= C, FNA, K] \{not keyed; add to synonymy\}

* Nassella leucotricha (Trinius \& Ruprecht) Pohl, Texas Needlesgrass. Cp (SC): waste areas near wool-combing mill; rare, introduced from sc. United States and Mexico. [= K; = Stipa leucotricha Trinius \& Ruprecht - HC]

## Neeragrostis Bush

References: Peterson \& Harvey (in prep.)=Z.
Neeragrostis reptans (Michaux) Nicora, is reported for scattered locations as far east as c. TN by Chester et al. (1993), as well as in WV, KY, and possibly GA (Kartesz 1999). [= K, Z; = Eragrostis reptans (Michaux) Nees -- C, F, G, GW, HC]

## Oplismenus Palisot de Beauvois (Woods-grass, Basket-grass)

A genus of about 5 species, widespread in the New World and Old World tropics, subtropics, and warm temperate areas. References: Wipff in FNA (2003a); Crins (1991)=Z; Scholz (1981)=Y; Peterson et al. (1999).

1 Sheath and culm axis glabrous or with a few scattered hairs, the hairs less than 1 mm long; lemma (7-) 9-11-veined . . . . . . . O. hirtellus ssp. setarius

1 Sheath and culm axis noticeably pilose, the hairs 1-3 mm long; lemma 7 -veined . . . . ..... [O. hirtellus ssp. undulatifolius]
Oplismenus hirtellus (Linnaeus) Palisot de Beauvois ssp. setarius (Lamarck) Mez ex Ekman, Woods-grass. Cp (GA, NC, SC), Pd (GA, SC): maritime forests, shell middens, moist forests; uncommon (NC Watch List). August-October. O. hirtellus is widespread in tropical and subtropicals areas of the New and Old World; ssp. setarius ranges from e. NC south to FL, west to AR and TX, and south through the Caribbean and Central America to central South America. Scholz (1981) recognizes many other sspp. This species is undoubtedly native in our area, occurring in undisturbed habitats in natural communities entirely devoid of alien species; the basis of Gould's (1975) assertion that Oplismenus is "introduced or adventive in the United States" is unknown. Superficially, Oplismenus resembles Arthraxon, but has the leaves only slightly cordate at the base (vs. strongly cordate-clasping). Crins (1991) favors treating $O$. setarius as a taxonomically unrecognized component within a polymorphic $O$. hirtellus. [=FNA, K, Y; $=$ O. setarius (Lamarck) Roemer \& J.A. Schultes -- RAB, HC, S; < O. hirtellus (Linnaeus) Palisot de Beauvois -- Z, in part]

* Oplismenus hirtellus (Linnaeus) Palisot de Beauvois ssp. undulatifolius (Ard.) U. Scholz, native to the Eastern Hemisphere, has been reported as an introduction in Baltimore Co., MD (Peterson et al. 1999). It can be expected to spread, and may likely be found in our area. [= FNA, K, Y; < O. hirtellus (Linnaeus) Palisot de Beauvois -- Z, in part]

Oryza Linnaeus (Rice)
A genus of about 20 species, native of tropical and warm temperate portions of the Old World. References: Tucker (1988)=Z; Judziewicz et al. (2000)=Y; Nanda \& Sharma (2003=X.

* Oryza sativa Linnaeus, Rice. Cp (GA, NC, SC): escaped in marshes (probably not truly naturalized); rare, native of Asia. October. Perhaps the single most important food crop in the world, developed as a crop in Asia and cultivated at least since 10,000 years BP (Hancock 2004). Rice was an important crop before the Civil War in SC and extreme se. NC. [= RAB, C, G, GW, HC, K, S, X, Y, Z]

Oryzopsis Michaux (Ricegrass)
(also see Piptatherum)
1 Leaves involute when dry, 1-2 mm wide; glumes 3.5-4.8 mm long ....................... [see Piptatherum canadense]
1 Leaves flat, $5-15 \mathrm{~mm}$ wide; glume $6-9 \mathrm{~mm}$ long.
2 Leaves primarily basal or low-cauline, 2-4 (-5) dm long, 4-10 mm wide; inflorescence a raceme or a racemiform panicle; culms prostrate, the upper leaves very reduced, often merely bladeless sheaths
O. asperifolia

2 Leaves primarily cauline, 1-2.5 dm long, 8-15 mm wide; inflorescence a panicle; culms erect, the upper leaves welldeveloped . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [see Piptatherum racemosum]

Oryzopsis asperifolia Michaux, Rough-leaved Ricegrass, Whiteseed Mountain-ricegrass. Mt (VA): high elevation pineoak/heath barrens and woodlands; rare (VA Rare). Newfoundland west to British Columbia, south to w. VA, WV, n. IN, SD, NM, and UT. This grass forms large cespitose clumps, the leaves evergreen and somewhat bicolored (green on the upper surface, bluish on the lower). [= C, F, G, K]

Panicum Linnaeus (Panic Grass)
(also see Dichanthelium, Phanopyrum, Setaria, Steinchisma, and Urochloa)
(contributed by Richard J. LeBlond)
\{INTRODUCTION: Describe differences between Panicum, Dichanthelium, Urochloa (=Brachiaria), and Paspalidium (now in Setaria), all of which are treated as Panicum in RAB. Describe collection methods and character analysis.\}

There has been considerable controversy over the generic limits of Panicum. In its broader recent conceptions, it has been considered to include (in our area) taxa sometimes and variously segregated as Brachiaria, Dichanthelium, Eriochloa, Paspalidium, Phanopyrum, Steinchisma, and Urochloa. All were originally recognized based on morphological characteristics, to which have recently been added anatomical, chemical, and other evidence. Crins (1991) recognizes Eriochloa, Urochloa (including Brachiaria), Paspalidium, and Panicum as genera, with Panicum subdivided into subgenera Panicum, Agrostoides, Dichanthelium, Phanopyrum, and Steinchisma. We prefer to recognize most of the segregates as genera, pending further analyses, since there is little evidence that these groups are more closely related to one another than they are to other genera recognized in the Paniceae. Phanopyrum and Dichanthelium are the only segregate groups with $\mathrm{C}_{3}$ photosynthesis. Eriochloa and Urochloa (including Brachiaria) have $\mathrm{C}_{4}$ photosynthesis, with PEP-ck decarboxylation. Panicum and Setaria (Paspalidium) have C ${ }_{4}$ photosynthesis, with NAD-me or NADPme decarboxylation. Steinchisma, in addition to its unusual expansion of the palea, apparently has a peculiar photosynthetic pathway, described by Crins (1991) as "intermediate between" $C_{3}$ and $C_{4}$ photosynthesis; "the leaves have Kranz anatomy, but there are fewer organelles than usual in the outer sheath."

We agree with Hansen \& Wunderlin (1988) that "Dichanthelium is as 'good' a grass genus as many others (e.g. Brachiaria, Sacciolepis, and many more in other tribes)." Despite arguments to the contrary, there is little doubt that Dichanthelium is a natural group. Zuloaga, Ellis, and Morrone (1993) argue against the recognition of Dichanthelium as a genus, preferring to treat it as a subgenus under Panicum. They state, however, "within Panicum, Dichanthelium can be distinguished at the subgeneric level by the following set of characters: lax inflorescences; ellipsoid to obovoid spikelets; upper glume and lower lemma usually $7-11$ nerved; upper anthecium apiculate or shortly crested, and simple papillae on the lemma and palea. Anatomically, all species are non-Kranz or $\mathrm{C}_{3}$, with the outer parenchymatous sheath lacking specialized chloroplasts", etc. The argument that Phanopyrum also has $\mathrm{C}_{3}$ photosynthesis does not materially affect the issue of the taxonomic rank at which to recognize the groups.

We also agree with Hansen \& Wunderlin (1988) that "the acceptance of Dichanthelium provides a more consistent generic classification." It offers conveniences, as well, in our area, where Dichanthelium and Panicum are readily distinguishable from each other, and the combined genus would be very large, indeed. References: Lelong (1986) $=$ Z; Zuloaga \& Morrone (1996) $=\mathrm{Y}$; Freckmann \& Lelong in FNA (2003a).

2 First glume $5-7.5 \mathrm{~mm}$ long, nearly as long as sterile lemma; fertile lemma $1 / 3$ length of sterile lemma
[Phanopyrum gymnocarpon]
2 First glume shorter, or if this long, then at most $3 / 4$ length of sterile lemma; fertile lemma more than $1 / 2$ length of sterile lemma.
3 Sterile palea indurate and expanding the spikelet at maturity, as long as sterile lemma; outer surface of the distal palea with compound papillae
[Steinchisma hians]
3 Sterile palea membranous, not expanding the spikelet at maturity, usually shorter than sterile lemma or absent; outer surface of the distal palea lacking compound papillae.
$4 \quad$ Panicle less than 2 cm wide at maturity.
5 Spikelets more than 4.5 mm long; first glume more than 2.4 mm long; ligule $4-6 \mathrm{~mm}$ long; [of coastal dunes]; [subgenus Panicum, section Repentia] . . . . . . . . . . . . . . . . . . . . . . . . . P. amarum var. amarum
5 Spikelets less than 4 mm long; first glume less than 2.1 mm long; ligule less than 2 mm long; [not of coastal dunes].
6 Blades involute, 1.5-4 mm wide; culms wiry; [subgenus Agrostoides, section Tenera] . . . P. tenerum 6 Blades flat, the larger $6-20 \mathrm{~mm}$ wide; culms stout.

7 Panicles constricted, 0.3-1.6 cm wide; spikelets subsessile to short-pediceled; summit of fertile palea not enclosed by fertile lemma . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. hemitomon
7 Panicles wider than 1 cm ; spikelets short to long-pediceled; summit of fertile palea enclosed by fertile lemma; [subgenus Agrostoides, section Agrostoidea].
8 Plants tufted, without rhizomes; culms strongly compressed below; fertile lemma 1.3-1.5 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. rigidulum var. condensum 8 Plants rhizomatous; culms slightly compressed below; fertile lemma 1.8-2.2 mm long. 9 Rhizomes short, usually less than 3 cm long; leaves $20-50 \mathrm{~cm}$ long, $4-18 \mathrm{~mm}$ wide; spikelets 2.5-3.9 mm long, acuminate; first glume with 3-5 green nerves.
$P$. anceps var. anceps 9 Rhizomes elongate, often more than 4 cm long; leaves $10-30(-40) \mathrm{cm}$ long, 2-10 mm wide; spikelets 2.2-2.8 mm long, acute to short-acuminate; first glume with 1-3 green nerves
$P$. anceps var. rhizomatum
4 Panicle more than 2 cm wide at maturity.
10 Plants from a cluster of fibrous roots, without rhizomes or hard knotty crowns, annual.
11 First glume $1 / 5$ to $1 / 4$ length of spikelet, broadly rounded to truncate; sheaths usually glabrous; nodes glabrous; [subgenus Panicum, section Dichotomiflora] . . P. dichotomiflorum var. dichotomiflorum 11 First glume $1 / 3$ to $1 / 2$ length of spikelet, acute to subacute; sheaths villous or hispid; nodes often
bearded; [subgenus Panicum, section Panicum].
12 Spikelets 4.5-6 mm long; panicle branches often nodding or drooping at maturity . P. miliaceum
12 Spikelets 1.8-3.6 mm long; panicle branches ascending-spreading at maturity.
13 Spikelets long-acuminate, (2.6-)3.0-3.6 mm long; mature panicle slender, usually 2-3 times as long as wide P. flexile

13 Spikelets short-pointed to acuminate, 1.8-2.5 (-2.8) mm long; mature panicle usually more than $1 / 2$ as wide to wider than long.
14 Panicle usually equal to or longer than culm; largest blades usually $10-20 \mathrm{~mm}$ wide; spikelets acuminate, lanceolate to lance-ovoid . . . . . . . . . . . . . . . . . . . P. capillare
14 Panicle usually not as long as culm; largest blades usually 10 mm or less wide; spikelets short-pointed, ellipsoid, ovoid, or obovoid.
15 Herbage purple-tinged; blades $2-6 \mathrm{~mm}$ wide, ascending; pulvini glabrous to sparsely pilose; spikelets 1.8-2.2 mm long, more than twice as long as wide; mature fertile lemma blackish P. lithophilum

15 Herbage yellow-green to green; blades 2-12 mm wide, spreading; pulvini glabrous or pilose; spikelets $1.4-2.4 \mathrm{~mm}$ long, less than twice as long as wide; mature fertile lemma straminous.
16 Culm blades 5-12 mm wide; blade of flag (inflorescence bract) usually more than $1 / 2$ as long as panicle; panicle ellipsoid to obovoid; pulvini glabrous; secondary panicle branches and pedicels divergent; spikelets $1.9-2.4 \mathrm{~mm}$ long
... P. gattingeri
16 Culm blades 2-6 mm wide; blade of flag usually less than $1 / 2$ as long as panicle; panicle broadly ovoid to deltoid; pulvini pilose; secondary panicle branches and pedicels appressed; spikelets $1.4-2.1 \mathrm{~mm}$ long

10 Plants with rhizomes or hard knotty crowns, perennial.
17 Plants with rhizomes; fertile lemma 1.6-4 mm long.
18 First glume truncate apically
P. repens

18 First glume acute to obtuse.
19 Culms slightly compressed below; ligules 0.5 mm long or less; spikelets subsessile and subsecund, usually some obliquely bent above the first glume; fertile lemma 1.8-2.2 mm long; [subgenus Agrostoides, section Agrostoidea].
20 Rhizomes short, usually less than 3 cm long; leaves $20-50 \mathrm{~cm}$ long, $4-18 \mathrm{~mm}$ wide; spikelets 2.5-3.9 mm long, acuminate; first glume with 3-5 green nerves . . . . . . . . . .
P. anceps var. anceps

20 Rhizomes elongate, often more than 4 cm long; leaves $10-30(-40) \mathrm{cm}$ long, $2-10 \mathrm{~mm}$ wide; spikelets 2.2-2.8 mm long, acute to short-acuminate; first glume with 1-3 green nerves .......................................... P. anceps var. rhizomatum
19 Culms terete; ligules 1-6 mm long; spikelets pediceled and not at all secund, essentially straight; fertile Iemma 2-4 mm long; (subgenus Panicum, section Repentia].
21 Panicle narrow, the branches erect; sheaths longer than internodes; spikelets 4.3-7.7 mm long; fertile lemma 3-4 mm long.
22 Rhizomes usually elongate; culms solitary to loosely tufted, 0.2-1.5 m tall; leaves 0.7-3.6 dm long; panicles 2-6 cm wide, the primary branches usually 1-2 per node, loosely flowered; spikelets 4.7-7.7 mm long; first glumes $2.5-5.5 \mathrm{~mm}$ long, 2/3-3/4 as long as the spikelet, 7-9 nerved, the nerves thickened and raised; fertile lemma 1.3-1.8 mm wide ................... . . $\boldsymbol{P}$. amarum var. amarum 22 Rhizomes usually short; culms usually tufted, 1-2 (-3) m tall; leaves 2-5 dm long; panicles $3-10 \mathrm{~cm}$ wide, the primary branches usually 2 or more per node, densely flowered; spikelets $4.0-5.9 \mathrm{~mm}$ llong; first glumes $2-3.5 \mathrm{~mm}$ long, $1 / 2-2 / 3$ as long as the spikelet, 3-5 (-7) nerved, the nerves thin and wiry; fertile lemma 1.0-1.5 mm wide
P. amarum var. amarulum

21 Panicle with divergent to spreading-ascending branches; upper sheaths shorter than internodes; spikelets $2.8-5 \mathrm{~mm}$ long; fertile lemma 2-2.6 mm long.
23 Spikelets $3.5-5 \mathrm{~mm}$ long; first glume $2 / 3$ length of spikelet, acuminate
P. virgatum var. virgatum

23 Spikelets 2.8-3.5 mm long; first glume $1 / 2$ length of spikelet, blunt to acute P. virgatum var. cubense

17 Plants with hard crowns, lacking rhizomes; fertile lemma 1.2-1.6 mm long; [subgenus Agrostoides, section Agrostoidea].
24 Ligule of white hairs $0.5-3 \mathrm{~mm}$ long; culms to 1 m long; cauline blades $2-8 \mathrm{~mm}$ wide, usually pilose adaxially near the base; spikelets $2.0-4.0 \mathrm{~mm}$ long.
25 Ligules 1-3 mm long; spikelets 2.0-2.7 mm long, 2.5-4× as long as wide, often obliquely set on the pedicels . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. Iongifolium var. Iongifolium
25 Ligules 0.5-1.5 mm long; spikelets 2.4-4.0 mm long, $3.5-5 \times$ as long as wide, erect on the pedicels
P. longifolium var. combsii

24 Ligule a tawny membrane $0.5-1.0 \mathrm{~mm}$ long, often erose or lacerate, or with a minute ciliate fringe; culms to 1.8 m long; cauline blades $4-12 \mathrm{~mm}$ wide, usually glabrous; spikelets $1.6-2.8$ mm long.
26 Spikelets 2.4-2.8 mm long, long-acuminate, usually less than 0.7 mm wide; fertile lemma often conspicuously stipitate
$P$. rigidulum var. elongatum
26 Spikelets $1.6-2.5 \mathrm{~mm}$ long, short-acuminate, usually more than 0.7 mm wide; fertile lemma estipitate to short stipitate.
27 Culms to 1 m long; mature panicle $1 / 2$ to nearly as wide as long, the branches ascending to spreading; spikelets $1.6-2.2 \mathrm{~mm}$ long .... P. rigidulum var. rigidulum
27 Culms to 1.8 m long; mature panicle less than $1 / 3$ as wide as long, the branches erect; spikelets $2.0-2.5 \mathrm{~mm}$ long . . . . . . . . . . . . . . . . . . . . P. rigidulum var. condensum

Panicum amarum Elliott var. amarulum (A.S. Hitchcock \& Chase) P.G. Palmer, Southern Seabeach Grass. Cp (GA, NC, SC, VA): coastal dunes and shores, sandflats, and sandhills; rare. July-November. NJ s. to FL and West Indies, w. to TX and Mexico; restricted to the Coastal Plain except for WV. Although well-marked individuals of var. amarulum and var. amarum are quite distinctive, only the number and structure of first glume nerves appears to be a constant over the range of the two taxa (Palmer 1975). Primarily a coastal plant, var. amarulum has been found in the Sandhills of NC (Richmond Co.). Blomquist 1948 says this taxon "does not seem to grow naturally in North Carolina." $[=K, Z ;=P$. amarulum A.S. Hitchcock \& Chase -- RAB, C, F, G, HC, S; = P. amarum ssp. amarulum (A.S. Hitchcock \& Chase) Freckmann \& Lelong - FNA; not Panicum]

Panicum amarum Elliott var. amarum, Bitter Seabeach Grass. Cp (GA, NC, SC, VA): coastal dunes and shores; common. August-November. CT s. to FL, w. to TX; restricted to the coast. See note under var. amarulum. [= K, Z; = P. amarum -- RAB, C, F, G, HC, S; = P. amarum ssp. amarum - FNA; not Panicum]

Panicum anceps Michaux var. anceps, Beaked Panic Grass. Mt, Pd, Cp (NC, SC, VA), \{GA\}: moist sandy woods, swamps, sloughs, roadsides, fields, waste places; common. June-October. NJ w. to IL, s. to FL and TX. The sheaths of var. anceps are glabrous to pilose, while those of var. rhizomatum are often villous; the leaves of var. rhizomatum also tend to be hairier. [= RAB, F, $\mathrm{G}, \mathrm{Z}$; < $P$. anceps -- C, GW, K, W, infraspecific taxa not recognized; = $P$. anceps ssp. anceps -FNA ; $=P$. anceps -- HC, S; not Panicum]

Panicum anceps Michaux var. rhizomatum (A.S. Hitchcock \& Chase) Fernald, Small Beaked Panic Grass. Cp (GA, NC, SC, VA): moist to dry sandy or loamy pinelands, ditches; common (VA Watch List). July-October. Se. VA and KY s. to FL and TX. See note under var. anceps. [= RAB, F, G, Z; < P. anceps -- C, GW, K, infraspecific taxa not recognized; = $P$. anceps ssp. rhizomatum (A.S. Hitchcock \& Chase) Freckmann \& Lelong - FNA; = P. rhizomatum A.S. Hitchcock \& Chase -- HC, S; not Panicum]

Panicum capillare Linnaeus, Old-witch Grass, Tumbleweed, Tickle Grass. Mt, Pd (GA, NC, SC, VA), Cp (VA): open sandy or stony soil, fields, roadsides, waste places, often weedy in cultivated soil; common (rare in SC). August-November. E. to c. Canada, s. to FL and TX; Bermuda. Plants formerly known as P. capillare var. occidentale Rydberg, ranging from Canada south to NJ, WV, KY, TX, and CA, are distinguished by long-acuminate spikelets $2.5-4 \mathrm{~mm}$ long that are mostly subsessile or short-pedicelled. In our region, $P$. capillare has short-acuminate spikelets $1.8-2.8 \mathrm{~mm}$ long, mostly on long pedicels. [= RAB, K, $\mathrm{S}, \mathrm{Z}$; < P. capillare -- $\mathrm{C}, \mathrm{Y}$, in part (also see $P$. gattingeri); $P$. capillare var. capillare -- $\mathrm{F}, \mathrm{HC}, \mathrm{W} ; P$. capillare ssp. capillare - FNA; $P$. capillare var. agreste Gattinger -- G; Panicum s.s.]

Panicum dichotomiflorum Michaux var. dichotomiflorum, Spreading Panic Grass, Fall Panic Grass. Mt, Pd, Cp (GA, NC, SC, VA): marshy shores, exposed wet soils, alluvial deposits in floodplain forests, spoil banks, ditches; common. July-October. E. Canada w. to SD, s. to FL and TX; also in the Bahamas (Sorrie \& LeBlond 1997). P. dichotomiflorum var. puritanorum ranges along the coast from s. NH to DE, and occurs inland in n. IN. It is distinguished by ovoid to ellipsoid, abruptly short-tipped spikelets only 1.8-2.2 mm long, culms to 6 dm long, and leaves 1-8 mm wide. In var. dichotomiflorum, the oblong-lanceolate, acuminate spikelets are (2.0-) 2.6-3.6 mm long, culms to 2 m long, and leaves $4-20 \mathrm{~mm}$ wide. Plants with geniculate bases, enlarged lower nodes and sheaths, and panicles with included peduncles and divergent branches have been recognized as var. geniculatum (A. Wood) Fernald. Plants with spikelets similar to those of var. puritanorum, but with culm and leaf features of var. dichotomiflorum, have been recognized as var. imperiorum Fernald, and are known only from se. VA. Recognition of any infraspecific taxa in this morphologically complex species is risky business. [=F, G, HC, K, W; P. dichotomiflorum -- RAB, GW, S, Z, infraspecific taxa not distinguished; $P$. dichotomiflorum -- C, in part, infraspecific taxa not recognized; $P$. dichotomiflorum var. geniculatum -- $F$, $G, W$, $P$. dichotomiflorum var. imperiorum -- F; Panicum s.s.]

Panicum flexile (Gattinger) Scribner, Wiry Panic Grass. Pd (GA, NC, SC, VA), Mt (GA, NC,VA): glades and openings over mafic rocks, damp sandy meadows, open woods; rare (NC Rare). July-October. NY, sw. Québec, S. Ontario, and ND south to FL and TX. First reported for SC by Nelson \& Kelly (1997). [= RAB, C, F, FNA, G, HC, K, S, W, Y, Z; Panicum s.s.]

Panicum gattingeri Nash, Gattinger's Panic Grass. Mt, Pd (NC, VA), \{GA\}: damp or dry, usually calcareous sandy soils of fields, roadsides, shores, and cultivated ground; frequent in Mountains, uncommon in Piedmont (VA Watch List). August-October. NY, sw. Québec, and MN south to NC, TN, GA, AL, and AR. [= RAB, F, HC, K, S; P. capillare -- C, Y, in part; P. philadelphicum Bernhardi ex Trinius ssp. gattingeri (Nash) Freckmann \& Lelong - FNA; P. capillare Linnaeus var. campestre Gattinger -- G, W; Panicum s.s.]

Panicum hemitomon J.A. Schultes, Maidencane. Cp (GA, NC, SC, VA), Mt (VA): lake, pond, and river shores, swamp borders, marshes, ditches, often in shallow water; common (VA Rare). June-July. Coastal Plain from s. NJ south to FL, west to TX; also TN; South America. Often forming dense colonies in the low margin and shallow waters of limesink ponds. [= RAB, C, F, FNA, G, GW, HC, K, S, W, Z; not Panicum]

Panicum lithophilum Swallen, Flatrock Panic Grass. Pd (GA, NC, SC), Mt (NC): soil islands on granitic flatrocks and domes; rare (NC Rare). August-October. Restricted to granite outcrops in NC, SC, and ec. GA. There is some question about the distinctness of this taxon from P. philadelphicum; Zuloaga \& Morrone (1996) did not consider it separable from P. philadelphicum.
[= RAB, HC, K; P. philadelphicum Bernhardi ex Trinius ssp. lithophilum (Swallen) Freckmann \& Lelong - FNA; P. capillare Linnaeus var. sylvaticum Torrey -- W, in part; P. philadelphicum -- Y, in part; Panicum s.s.]

Panicum longifolium Torrey var. combsii (Scribner \& Ball) Fernald, Combs Panic Grass. Cp (GA, NC, SC, VA): pond shores, depression meadows, cypress savannas, marshes, low woods; uncommon (VA Watch List). July-October. Scattered on the outer Coastal Plain from se. MA, NJ, se. VA, se. NC, e. SC, e. GA, and FL, west to se. LA. First glumes of var. combsii typically are longer than 1.5 mm long, while those of var. longifolium are shorter than 1.5 mm long. [= RAB, $\mathrm{F}, \mathrm{G}$; $P$. rigidulum Bosc ex Nees ssp. combsii (Scribner \& Ball) Freckmann \& Lelong - FNA; P. rigidulum Bosc ex Nees var. combsii (Scribner \& Ball) Lelong - K, Z; P. longifolium -- C, in part; P. combsii Scribner \& Ball -- HC, S; not Panicum]

Panicum longifolium Torrey var. longifolium, Long-leaved Panic Grass. Cp, Pd (GA, NC, SC, VA), Mt (NC, SC, VA): wet sandy or peaty soils of bogs, savannas, pond shores, depression meadows; common (uncommon in Piedmont, rare in Mountains). July-October. Nova Scotia, NH, MA, PA, and IN south to FL, west to TX. See note under var. combsii. [= RAB, F, G; P. rigidulum Bosc ex Nees ssp. pubescens (Vasey) Freckmann \& Lelong - FNA; P. rigidulum Bosc ex Nees var. pubescens (Vasey) Lelong -- K, W, Z; P. Iongifolium -- C, GW, in part; P. longifolium -- HC, S; P. longifolium var. pubescens (Vasey) Fernald -- F; not Panicum]

Panicum miliaceum Linnaeus ssp. miliaceum, Broomcorn Millet, Proso Millet, Hog Millet. Cp (NC), Mt (VA): planted in wildlife food plots, sometimes persistent or self-sowing; rare, introduced, native of Eurasia. July-October. [= C, FNA, K; P. miliaceum - F, HC, S, Y, infraspecific taxa not distinguished; P. miliaceum ssp. miliaceum -- C, K; Panicum s.s.]

Panicum philadelphicum Bernhardi ex Trinius, Woodland Panic Grass. Pd, Mt (GA, NC, SC, VA), Cp (VA): glades, barrens, desiccated pondshores, riversides, or other rocky or dry sandy soil of open woods and roadsides; frequent (rare in SC). Nova Scotia west to WI, south to GA and e. TX. Plants formerly known as $P$. tuckermanii Fernald, ranging from se. Canada south to $n$. VA and OH , are distinguished by included or short-exerted peduncles less than one-third as long as the panicles. [= RAB, C, G, F, HC, K, S; P. tuckermanii Fernald -- F, HC; P. philadelphicum Bernhardi ex Trinius ssp. philadelphicum - FNA; P. capillare Linnaeus var. sylvaticum Torrey -- W, in part; P. philadelphicum -- Y, in part (also see P. lithophilum); Panicum s.s.]
*? Panicum repens Linnaeus, Torpedo Grass. Cp (GA, NC, SC): disturbed coastal sands, in area where ship's ballast was deposited; rare, apparently introduced. First reported for NC by Leonard (1971b). [= FNA, GW, HC, K, S; Panicum s.s.]

Panicum rigidulum Bosc ex Nees var. condensum (Nash) Mohlenbrock, Dense Panic Grass. Cp (GA, NC, SC, VA): marshes, meadows, low woods, ditches, stream and pond shores, freshwater tidal shores; occasional. September-October. Coastal Plain south from se. MA to FL, west to se. TX and AR; West Indies. Usually readily identified by its tall stature and compact inflorescence, somewhat resembling a large $P$. hemitomon, with which it occasionally occurs. [P. agrostoides Sprengel var. condensum (Nash) Fernald -- RAB, F; P. rigidulum -- C, GW, in part; P. rigidulum Bosc ex Nees ssp. rigidulum - FNA, in part; $P$. agrostoides -- G, in part; $P$. condensum Nash - HC, S; P. rigidulum var. rigidulum -K , in part; $P$. rigidulum var. rigidulum -- $Z$, in part; not Panicum]

Panicum rigidulum Bosc ex Nees var. elongatum (Pursh) Lelong, Tall Flat Panic Grass. Pd, Cp, Mt (GA, NC, SC, VA): marshes, low woods, ditches, swamps, shores, meadows; occasional (common in Piedmont). August-October. CT and NY west to IN, south to GA, LA, and ne. TX. [= K, W, Z; P. stipitatum Nash -- RAB, F, HC, S; P. rigidulum Bosc ex Nees ssp. elongatum (Pursh) Freckmann \& Lelong - FNA; P. rigidulum -- C, GW, in part; P. agrostoides Sprengel var. elongatum (Pursh) Scribner -- G; not Panicum]

Panicum rigidulum Bosc ex Nees var. rigidulum, Redtop Panic Grass. Cp, Pd (GA, NC, SC, VA): wet sandy or peaty soils low woods, meadows, marshes, shores, swamps, ditches; frequent. July-October. ME and MI south to FL and TX; also in CA and British Columbia; Central America. [= W; P. agrostoides Sprengel var. agrostoides -- RAB, F, G, HC; P. rigidulum Bosc ex Nees ssp. rigidulum - FNA, in part; $P$. rigidulum var. rigidulum - K, in part only; $P$. rigidulum -- C, GW, in part; $P$. agrostoides var. ramosius (C. Mohr) Fernald -- F, HC; P. agrostoides -- S; P. rigidulum var. rigidulum -- Z , in part; not Panicum]

Panicum tenerum Beyrich ex Trinius, Southeastern Panic Grass. Cp (GA, NC, SC): limesink ponds, depression meadows, cypress savannas, wet pinelands, bogs; rare (GA Special Concern, NC Rare). June-September. Coastal Plain from se. NC to FL, west to e. TX; West Indies. The rhizomes produce lines of closely spaced culms. Though $0.5-1 \mathrm{~m}$ tall, the culms are narrow and inconspicuous. [= RAB, FNA, GW, HC, K, S, Z; not Panicum]

Panicum verrucosum Muhlenberg, Warty Panic Grass. Cp, Pd, Mt (GA, NC, SC, VA): wet pinelands, marshes, shores, ditches; common (occasional in Piedmont, rare in Mountains). August-October. MA and PA west to MI and IN, south to FL and se. TX. Spikelets deep green, the warty surface unique among Panicum in our region. [= RAB, C, F, FNA, G, GW, HC, K, S, W, Z; not Panicum]

Panicum virgatum Linnaeus var. cubense Grisebach, Blunt Panic Grass. Cp (GA, NC, SC, VA?): wet to dry sandy pinelands; occasional (frequent in the Sandhills). June-October. Coastal Plain from MA to FL, west to MS; also in MI; West Indies. $[=F, H C, S ; P$. virgatum -- RAB, C, FNA, G, GW, W, Z, in part, infraspecific taxa not distinguished; $P$. virgatum var. virgatum -- K, in part]

Panicum virgatum Linnaeus var. virgatum, Switchgrass. Cp, Pd, Mt (GA, NC, SC, VA): dry or wet sandy soils of pinelands, fresh and brackish marshes, shores; common (occasional in Mountains). June-October. Sw. Québec and ND south to FL and TX, west to NV; Bermuda; Central and South America. [=F, HC, S; P. virgatum -- RAB, C, FNA, G, GW, W, Z, in part, infraspecific taxa not distinguished; $P$. virgatum var. virgatum -- K, in part only; not Panicum]

* Panicum antidotale Retzius. Cp (SC): Native of India. Reported for NC and SC (FNA, Kartesz 1999). \{investigate\} [= FNA, K; not Panicum] \{not yet keyed; add synonymy\}
* Panicum bergii Arechav. Cp (GA): disturbed areas; rare, native of South America. Reported for sc. GA (HC) and AL (Kartesz 1999). \{investigate\} [= FNA, K; Panicum s.s.] \{not yet keyed\}
* Panicum bisulcatum Thunberg. Cp (GA, SC): disturbed areas; rare, native of Asia. Reported introduction in SC, GA, and PA (Kartesz 1999), and as a ballast plant for se. PA (Philadelphia) (Rhoads \& Klein 1993, as P. acroanthum Steudel). [= FNA, K; P. acroanthum Thunberg] \{not yet keyed\}

Panicum brachyanthum Steudel. Cp (GA): \{habitat unknown\}; rare. Sw. GA west to c. TX. [= FNA, K]
Panicum dichotomiflorum Michaux var. puritanorum Svenson, Puritan Panic Grass. Alleged to be in VA northwards (FNA). [= K; P. dichotomiflorum Michaux ssp. puritanorum (Svenson) Freckmann \& Lelong - FNA; P. dichotomiflorum var. imperiorum Fernald]

* Panicum miliaceum Linnaeus ssp. ruderale (Kitag.) Tzvelev, Panic Millet. [= FNA, K]

Panicum virgatum Linnaeus var. spissum Linder ranges south to PA, MD, and DE (Kartesz 1999). [= K; P. virgatum - FNA, infraspecific taxa not distinguished; not Panicum] \{not yet keyed\}

Parapholis C.E. Hubbard (Sickle Grass)
References: Tucker (1996)=Z.

* Parapholis incurva (Linnaeus) C.E. Hubbard, Sickle Grass, Hard Grass, Thin-tail. Cp (NC, VA): sandy and muddy flats, brackish or salt marshes; rare, introduced from Europe. [= RAB, C, HC, K, Z; Pholiurus incurvus (Linnaeus) Schinzius \& Thellung -F, G; Lepturus filiformis (Roth) Trinius]

Pascopyrum A. Löve (Wheatgrass)

* Pascopyrum smithii (Rydberg) A. Löve, Western Wheatgrass. Mt (GA): \{habitat\}; rare. Reported for ne. GA (Rabun County) by Jones \& Coile (1988), as Agropyron smithii Rydberg. It is also reported for TN and KY (Kartesz 1999). [= K; Elytrigia smithii (Rydberg) Nevski - C; Agropyrum smithii Rydberg - F, G, W]

Paspalidium
(see Setaria)

Paspalum Linnaeus (Paspalum, Crown Grass, Beadgrass)
References: Allen \& Hall in FNA (2003a); Banks (1966)=Z; Silveus (1942)=Y. Key based in part on Banks (1966).

## Key to the Paspalum setaceum complex

 (by Richard J. LeBlond)
## 1 Leaves variously pubescent.

2 Leaves villous to villous-hirsute, 2-10 mm wide; spikelets $1.3-1.9 \mathrm{~mm}$ long.
3 Leaves villous, 2-7 mm wide, not especially crowded towards the base, erect to spreading; [widespread]
P. setaceum var. setaceum

3 Leaves villous-hirsute, 3-10 mm wide, crowded towards the base, recurved; [of $n$. FL south to Cuba]
. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [P. setaceum var. villosissimum]

2 Leaves puberulent, pilose, or hirsute, $3-15 \mathrm{~mm}$ wide; spikelets $1.6-2.5 \mathrm{~mm}$ long.
4 Leaves puberulent at least distally on the adaxial surface (and often also pilose in var. stramineum); spikelets 1.6-2.2 mm long.
5 Plants erect to spreading; leaves puberulent and often pilose to nearly glabrous except for the puberulent distal adaxial surface; spikelets glabrous to pubescent . . . . . . . . . . . . . . . . . . . . P. setaceum var. stramineum
5 Plants spreading to prostrate; leaves densely puberulent; spikelets pubescent
P. setaceum var. psammophilum

4 Leaves pilose or hirsute but not puberulent; spikelets $1.8-2.5 \mathrm{~mm}$ long.
6 Plants mostly erect; leaves pilose; spikelets usually glabrous; sterile lemma midnerve usually present
P. setaceum var. muhlenbergii

6 Plants mostly widely spreading; leaves hirsute; spikelets glabrous or pubescent; sterile lemma midnerve present or absent
P. setaceum var. supinum

1 Leaves glabrous to glabrate (if glabrate, also see var. stramineum in couplet 5).
7 Blades crowded towards the base, often recurved, 3-8 mm wide; spikelets 1.4-1.9 mm long, usually glabrous.
$P$. setaceum var. longepedunculatum
7 Blades not especially crowded towards the base, erect, ascending or spreading, 2-20 mm wide; spikelets $1.6-2.6 \mathrm{~mm}$ long, pubescent or glabrous.
8 Blades 3-8 mm wide; spikelets 1.6-1.9 mm long, pubescent, sub-acute; [of GA and FL southward] ...............

8 Blades 2-20 mm wide; spikelets 1.7-2.6 mm long (if less than 2.0 then larger leaves usually $7+\mathrm{mm}$ wide), glabrous or pubescent, rounded to blunt; [plants of FL northward and westward].
9 Plants stiffly erect; blades 2-6 mm wide; spikelets 2.0-2.6 mm long; [of GA and FL]

> P. setaceum var. rigidifolium
> 9 Plants erect to spreading; blades $3-20 \mathrm{~mm}$ wide; spikelets $1.7-2.6 \mathrm{~mm}$ long; [of NJ to TX]
> $P$. setaceum var. ciliatifolium

Paspalum bifidum (Bertoloni) Nash, Pitchfork Paspalum, Pitchfork Crown Grass. Cp (GA, NC, SC, VA), Pd (GA, SC): mesic to wet longleaf pine savannas and mesic swales in sandhills; uncommon (NC Watch List, VA Rare). August-October. [= RAB, C, F, G, GW, HC, K, S, Y; P. bifidum var. projectum Fernald -- F, G]

Paspalum boscianum Flügge, Bull Paspalum. Cp, Pd (GA, NC, SC, VA), Mt (GA, SC, VA): low fields, ditches; common (VA Watch List). July-October. [= RAB, C, F, FNA, G, GW, HC, K, S, W, Y]

* Paspalum dilatatum Poiret, Dallis Grass. Cp, Pd, Mt (GA, NC, SC, VA): roadsides, fields, disturbed areas; common, introduced from tropical America. May-October. [= RAB, C, F, FNA, G, GW, HC, K, S, W, Y]

Paspalum dissectum (Linnaeus) Linnaeus, Mudbank Crown Grass, Walter Paspalum. Cp (GA, NC, SC, VA), Pd (NC, SC): mud flats, drawdown zones; rare (NC Rare, VA Rare). September. [= RAB, C, F, FNA, G, HC, K, S, Y]

Paspalum distichum Linnaeus, Joint Paspalum, Knotgrass. Cp (GA, NC, SC, VA), Pd (GA, NC, SC), Mt (NC): brackish and freshwater marshes; uncommon (VA Rare). June-August. [= RAB, C, F, FNA, G, HC, K, S, W, Y; < P. distichum -- GW, in part only (also see $P$. vaginatum); P. paspaloides (Michaux) Scribner]

Paspalum floridanum Michaux, Florida Paspalum. Cp, Pd, Mt (GA, NC, SC, VA): wet forests; pine savannas; common (rare in Mountains). August-October. [= RAB, C, F, FNA, G, GW, HC, K, S, W, Y; P. difforme Le Conte -- G, HC, S, Y; P. floridanum var. glabratum Engelmann ex Vasey -- F, HC, S, Y; P. giganteum Baldwin ex Vasey -- HC, S, Y]

Paspalum fluitans (Elliott) Kunth, Water Paspalum, Horsetail Crown Grass. Cp (GA, NC, SC, VA), Pd (NC, VA): mucky soils in swamp forests; uncommon (NC Watch List). October. [= RAB, C, F, G, HC, K; P. repens P.J. Bergius -- FNA, GW, S, Y]

Paspalum laeve Michaux var. circulare (Nash) Stone. \{GA, NC, VA\}: \{need additional herbarium work to fully determine range and abundance of varieties \} June-August. [= F; < P. laeve -- RAB, C, FNA, G, GW, K, W, infraspecific taxa not distinguished; $=P$. circulare Nash -- HC, S, Y]

Paspalum laeve Michaux var. laeve. Cp, Pd, Mt (GA, NC, SC, VA): \{need additional herbarium work to fully determine range and abundance of varieties \} June-August. [>F; < P. laeve -- RAB, C, FNA, G, GW, K, W, infraspecific taxa not distinguished; >P. laeve -- HC, S, Y, in the narrow sense; > P. laeve var. pilosum Scribner -- F; > P. longipilum Nash -- HC, S, Y]

* Paspalum notatum Flügge, Bahia Grass. Cp (GA, NC, SC), Pd (GA, SC), Mt (GA): roadsides and disturbed areas; uncommon, introduced from tropical America. June-October. [= FNA, G, GW, Y; P. notatum var. notatum -- HC, K; P. notatum Flügge var. saurae Parodi - RAB, HC, K]

Paspalum plicatulum Michaux, Brownseed Paspalum. Cp (GA, SC): pine savannas, fields; uncommon. May-July. [= RAB, FNA, GW, HC, K, S, Y]

Paspalum praecox Walter var. curtisianum (Steudel) Vasey, Curtis Crown Grass. Cp (GA, NC, SC, VA): pine savannas; rare (NC Watch List, VA Rare). June-October. The variety was named for the Rev. Moses Ashley Curtis, of Hillsborough, North Carolina, not Allen Hiram Curtiss, of Jacksonville, Florida; the correct spelling of the epithet is therefore "curtisianum." [=RAB, F, G; $=P$. praecox var. curtissianum -- C, orthographic error; < $P$. praecox -- FNA, GW, K, infraspecific taxa not distinguished; = $P$. lentiferum Lamarck -- HC, S, Y]

* Pennisetum villosum R. Brown ex Fresen., Feathertop. Reported as an introduction in GA (Kartesz 1999). [= C, FNA, K]

## Phalaris Linnaeus (Canary-grass)

## References: Tucker (1996)=Z.

1 Perennial, with scaly rhizomes; inflorescence obviously paniculate, 7-25 cm long, with ascending to appressed branches, the main branches of the inflorescence apparent, the inflorescence outline thus appearing lobed.
2 Glumes broadly winged; fertile lemmas ovate-lanceolate, densely pubescent
2 Glumes not winged; fertile lemmas narrowly lanceolate, glabrous to sparsely pubescent ............ Ph. arundinacea
1 Annual, without rhizomes; inflorescence densely spikelike or almost capitate, 1-6 cm long, the branches not apparent, the inflorescence outline a single ovoid, ellipsoid, or lanceolate form.
3 Keels of the glumes broadly winged (the wing ca. 1 mm wide); sterile lemmas 2.5-4.5 mm long ........ Ph. canariensis
3 Keels of the glume narrowly winged (the wing less than 0.5 mm wide); sterile lemmas $1.5-2.5 \mathrm{~mm}$ long.
4 Nerves of the glumes scabrous; panicle cylindric in outline, $6-18 \mathrm{~cm}$ long; glumes $3.5-4.0 \mathrm{~mm}$ long .... Ph. angusta
4 Nerves of the glumes not scabrous; panicle narrowly ovate in outline, usually 2-6 cm long; glumes 5-6 mm long ...
Ph. caroliniana

* Phalaris angusta Nees ex Trinius. Cp (GA, SC): waterfowl impoundments, marshes; uncommon, introduced from tropical America. [= GW, HC, K, Z]
* Phalaris aquatica Linnaeus, Bulbous Canary-grass. Cp (NC, SC, VA): disturbed areas; rare, introduced from Europe. [= K, Z; Ph. tuberosa Linnaeus var. stenoptera (Hackel) Hitchcock -- HC]
*? Phalaris arundinacea Linnaeus, Reed Canary-grass, Ribbon Grass. Mt, Pd (NC, VA), Cp (VA): moist forests, moist disturbed areas, bogs; common (rare in Coastal Plain). June. Newfoundland west to AK, south to NC, TN, AR, NM, CA; Mexico; Eurasia. A variegated form, Ph. arundinacea forma variegata (Parn.) Druce, is cultivated for ornament, as Ribbon Grass. [= RAB, C, F, GW, K,

S, W, Z; > Ph. arundinacea var. arundinacea - G, HC; > Ph. arundinacea var. picta Linnaeus -- G, HC]

* Phalaris canariensis Linnaeus, Birdseed Grass, Canary-grass. Cp, Pd (GA, NC, SC, VA), Mt (VA): disturbed areas; rare, introduced from Mediterranean Europe. [= RAB, C, F, G, GW, HC, K, S, Z]

Phalaris caroliniana Walter, Maygrass. Cp (GA, NC, SC, VA), Pd (GA, NC, SC): ditches, roadsides, disturbed areas; uncommon. May-June. [= RAB, C, F, G, GW, HC, K, S, Z]

* Phalaris minor Retzius, Lesser Canary Grass. Cp (SC): waste areas near wool-combing mills; rare, introduced from Mediterranean Europe. Also reported for other scattered states in e. North America (Kartesz 1999). [= HC, K] \{not yet keyed; add synonymy\}
* Phalaris paradoxa Linnaeus, Mediterranean Canary Grass, is reported for MD, NJ, and PA (Kartesz 1999). [= K; > Ph. paradoxa var. paradoxa - HC; > Ph. paradoxa var. praemorsa (Lamarck) Coss. \& Durieu - HC] \{not yet keyed; add synonymy\}

## Phanopyrum (Rafinesque) Nash (Phanopyrum)

Phanopyrum is variously treated as a distinct genus or as a subgenus of Panicum. Panicum verrucosum perhaps belongs here as well. References: Crins (1991)=Z; Webster (1988)=Y; Freckmann \& Lelong in FNA (2003a).

Phanopyrum gymnocarpon (Elliott) Nash, Swamp Phanopyrum, Savanna Phanopyrum. Cp (GA, NC, SC, VA): swamps, seasonally flooded soils of cypress-gum sloughs, tidal (freshwater) cypress-gum swamps, disturbed wet soils, low woods, ditches, muddy banks of streams and lakes, sinks, floodplains, and marshes; uncommon (NC Watch List, VA Rare). August-October. Se. VA south to FL, west to TX and AR. [= K, Y; Panicum gymnocarpon Elliott -- RAB, FNA, GW, HC, S, Z]

## Phleum Linnaeus (Timothy)

References: Tucker (1996)=Z; Stace (1997)=Y. Key based on Stace (1997).
1 Spikelets 2.0-3.5 mm long, including the 0.2-1.0 (-1.2) mm long awns; panicle 3-6 mm wide; leaves 2-6 mm wide; ligule usually acute

Phl. pratense ssp. nodosum 1 Spikelets (3.5-) 4-5.5 mm long, including the (0.8-) 1.0-2.0 mm long awns; panicle 6-10 mm wide; leaves $3-9 \mathrm{~mm}$ wide; ligule usually obtuse . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . PhI. pratense ssp. pratense

* Phleum pratense Linnaeus ssp. nodosum (Linnaeus) Arcangeli, Small Timothy. (NC) \{included based on Fernald's report -corroboration and additional information needed\} [Ph. pratense -- RAB, C, G, HC, K, S, W, Z, infraspecific taxa not distinguished; Ph. pratense var. nodosum (Linnaeus) Hudson -- F; Ph. bertolonii Augustin de Candolle -- Y]
* Phleum pratense Linnaeus ssp. pratense, Timothy. Mt, Pd, Cp (GA, NC, SC, VA): meadows, pastures, roadsides, disturbed areas; common, introduced from Europe. June-October. The American common name comes from the name of the man who is believed to have introduced it into the United States in 1720, Timothy Hanson; in England, Phleum is called "cat's-tail." [Ph. pratense -- RAB, C, G, HC, K, S, W, Z, infraspecific taxa not distinguished; Ph. pratense var. pratense -- F; Ph. pratense -- Y, in the narrow sense]
* Phleum subulatum (Savi) Ascherson \& Graebner, Italian Timothy, is reported as introduced in MD and PA (Kartesz 1999). Not keyed. [= K, Y]

## Phragmites Adanson (Common Reed)

A genus with one species and 2 or more varieties, nearly worldwide in distribution. References: Allred in FNA (2003a); Saltonstall, Peterson, \& Soreng (2004)=Z; Saltonstall (2002). Key based on Z.

1 Ligules 1.0-1.7 mm long; lower glumes 3.0-6.5 mm long; upper glumes 5.5-11.0 mm long; lemmas 8.0-13.5 mm long; leaf sheaths caducous with age; culms exposed in the winter smooth and shiny; [native south to WV and NC]

Ligules 0.4-0.9 mm long; lower glumes 2.5-5.0 mm long; upper glumes 4.5-7.5 mm long; lemmas 7.5-12.5 mm long; leaf sheaths not caducous with age; culms not exposed in the winter, either smooth and shiny or ridged and not shiny.
2 Culms smooth and shiny; [native on the Gulf Coast] . . . . . . . . . . . . . . . . . . . . . . . . . . . [Phr. australis var. berlandieri]
2 Culms ridged and not shiny; [introduced and weedy] . . . . . . . . . . . . . . . . . . . . . . . . . . . Phr. australis ssp. australis

1 First glume 2.3-4.2 mm long; stems at base of plant in summer and late fall mostly tan-brown or yellow; [alien and weedy] . . .
Phr. australis var. australis
1 First glume 3.5-6.4 mm long; stems at base of plant in summer and late fall reddish-brown or reddish-purple; [native] ..
Phr. australis var. berlandieri

* Phragmites australis (Cavanilles) Trinius ex Steudel var. australis, Common Reed. Cp (GA, NC, SC, VA), Pd, Mt (NC, VA): marshes, dredge-spoil deposit islands, ditches; common in outer Coastal Plain (rare elsewhere). September-October. Nearly worldwide in distribution. Fox, Godfrey, \& Blomquist (1950) report its first collection in NC (in 1948). In most of our area, reed is of relatively recent introduction, reported from only nine counties in RAB, but now becoming a serious weed in coastal areas, where it aggressively colonizes freshwater and brackish marshes, excluding the native species. [Ph. australis -- C, FNA, GW, K, infraspecific taxa not distinguished; Ph. communis Trinius -- RAB, G, HC, infraspecific taxa not distinguished; Ph. communis var. communis -- F; Ph. phragmites (Linnaeus) Karsten -- S, in part]

Phragmites australis (Cavanilles) Trinius ex Steudel var. berlandieri (Fornier) C.F. Reed, North American Reed. Cp (VA): freshwater marshes; rare. September-October. [Ph. australis -- C, FNA, GW, K, infraspecific taxa not distinguished; Ph. communis Trinius -- RAB, G, HC, infraspecific taxa not distinguished; Ph. communis var. berlandieri (Fournier) Fernald -- F; Ph. phragmites (Linnaeus) Karsten -- S, in part]

## Phyllostachys Siebold \& Zuccarini (Bamboo)

References: Duncan \& Duncan [in prep.]=Z; Judziewicz et al. (2000)=Y. Key adapted from Z.
1 Internodes at the base of principal culms dissimilar in length, the lowermost internode 1-12 cm long, the next 3 internodes distinctly longer, with nodal junctions mostly straight across
1 Internodes at the base of principal culms all similar in length, mostly 4-8 cm , with nodal junctions oblique.
2 Groove on internode (above the branch) yellowish-green, the rest of the culm dull greenish .......... Ph. aureosulcata 2 Groove on internode (above the branch) the same color as the rest of the culm.

3 Internodes of principal culms densely velvety; outer surface of culm sheaths with abundant erect brown hairs; lowest internode of principal culms ca. 5 cm long; culms pale green atfirst, becoming gray with accumulated waxy powder in age Ph. heterocycla
3 Internodes of principal culms glabrous or slightly hairy; outer surface of culm sheaths lacking erect brown hairs; lowest internode of principal culms ca. 8.5-12 cm long; culms various (see below, but not as decribed in first lead). 4 Largest culms to 15 cm in diameter and 25 m tall; upper culm sheaths with auricles; outer surface of culm sheaths usually with a green streak down the middle, flanked by streaks of purple and buff; culms medium to dark glossy green at first (some cultivars golden yellow or yellow streaked), remaining so in age

Ph. bambusoides
4 Largest culms to $3.2(-4) \mathrm{cm}$ in diameter and 10 m tall (rarely taller); upper culm sheaths with or without auricles; outer surface of culm sheaths variously streaked, spotted, or mottled with brown or red (but not as above); culms pale green to green at first, usually becoming purple spotted, gray, or yellow in age.
5 Lowest internode of principal culms ca. 8.5 cm long; culm sheaths with auricles, usually sparsely pubescent with erect, pale hairs, usually pinkish-brown at maturity, marked with numerous brown spots near the tip; culms green at first, usually becoming speckled and then more-or-less completely darkened with purplish spots (remaining green in some cultivars)

Ph. nigra
5 Lowest internode of principal culms ca. 12 cm long; culm sheaths lacking auricles, glabrous, usually green to buff at maturity, striped and marginally bordered with red; culms pale green at first, becoming gray to yellowish in age

Ph. rubromarginata

* Phyllostachys aurea Carrière ex A. \& C. Rivière, Golden Bamboo, Fishpole Bamboo. Cp, Pd (NC, SC, VA): suburban woodlands; uncommon, native of China and Japan. Not known to flower in our area. This is the usual large bamboo cultivated and nasturalizing in our area, forming dense stands, up to 15 m tall. [= RAB, K, Y, Z]
* Phyllostachys aureosulcata McClure, Yellowgroove Bamboo. Cp (SC), Pd (VA), \{GA\}: cultivated as an ornamental, persistent or spreading from plantings; rare, native of China. [= K, Y, Z]
* Phyllostachys bambusoides Siebold \& Zuccarini, Giant Timber Bamboo. Cp, Pd, Mt (NC, SC): cultivated as an ornamental, persistent or spreading from plantings; rare, native of China. [= K, Y, Z]
* Phyllostachys heterocycla (Carrière) S. Matsum, Moso Bamboo. Cp (SC): cultivated as an ornamental, persistent or spreading from plantings; rare, native of China. [= Y; Ph. edulis (Carrière) Houz. de Leh. - K; Ph. pubescens Mazel ex Houz. de Leh. -- Z]
* Phyllostachys nigra (Loddiges) Munro, Black Bamboo. Pd (SC), Cp (VA): cultivated as an ornamental, persistent or spreading from plantings; rare, native of China and Japan. [=K, Y, Z]
* Phyllostachys rubromarginata McClure. Pd (SC): cultivated as an ornamental, persistent or spreading from plantings; rare, native of China. [=K, $\mathrm{Y}, \mathrm{Z}$ ]
* Phyllostachys meyeri McClure is reported as introduced in NC and SC (Kartesz 1999). \{investigate\} [= K] \{not yet keyed\}

A number of other species are sometimes cultivated in our area, and may be encountered. Bamboos are seriously underrepresented in herbaria, since they rarely flower and are impractical to press. All of the species above should be anticipated in other physiographic provinces and states than those listed.

Piptatherum Palisot de Beauvois

## References:

1 Leaves involute when dry, 1-2 mm wide; glumes $3.5-4.8 \mathrm{~mm}$ long
[P. canadense]
1 Leaves flat, $5-15 \mathrm{~mm}$ wide; glume $6-9 \mathrm{~mm}$ long.
2 Leaves primarily basal or low-cauline, 2-4 (-5) dm long, 4-10 mm wide; inflorescence a raceme or a racemiform panicle; culms prostrate, the upper leaves very reduced, often merely bladeless sheaths . . . . . . . . [see Oryzopsis asperifolia]
2 Leaves primarily cauline, 1-2.5 dm long, 8-15 mm wide; inflorescence a panicle; culms erect, the upper leaves welldeveloped
P. racemosum

Piptatherum racemosum Ricker ex A.S. Hitchcock, Blackseed Ricegrass. Mt (VA): calcareous woodlands and forests; common. Québec and Ontario west to ND, south to w. VA, KY, MO, and NE. [= K; = Oryzopsis racemosa (Smith) Ricker ex A.S. Hitchcock -- C, F, G, HC, W]

long; anthers 1.1-1.4 mm long
P. wolfii
13 Lower nodes of the panicles mostly with (4-) 5 or more branches.
15 Lemmas 5 -veined (intermediate veins well-developed); ligule ca. 1 mm long; [section
Sylvestres] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. sylvestris
15 Lemmas 3-veined (intermediate veins obscure); ligule either (2-) 3-5 mm long or 0.2-1 (-
1.5) mm long.
16 Ligule 0.2-1 (-1.5) mm long, truncate; culms 4-8 dm tall; anthers 1.2-1.6 mm long;
[section Stenopoa] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. nemoralis
16 Ligule (2-) 3-5 mm long, ovate-triangular; culms 5-15 dm tall; anthers 0.8-1.2 mm long;
[section Pandemos]
P. palustris

Poa alsodes A. Gray, Woodland Bluegrass. Mt (NC, VA), Pd (NC): rich forests; uncommon. May-June. Nova Scotia west to SD, south to NC and IL; also in w. United States. [= RAB, C, F, G, HC, K, W, Z]

* Poa annua Linnaeus, Speargrass, Six-weeks Grass, Annual Bluegrass. Cp, Pd, Mt (GA, NC, SC, VA): fields, roadsides, disturbed areas; common, introduced from Eurasia. April-May. [= RAB, C, F, G, GW, HC, K, W, Z]
* Poa arachnifera Torrey, Texas Bluegrass. Pd (GA, NC, SC): disturbed areas; rare, introduced from South America and w. United States. April. [= RAB, HC, K]

Poa autumnalis Muhlenberg ex Elliott. Cp, Pd, Mt (GA, NC, SC, VA): moist or dry nutrient-rich forests; common. April-May. NJ west to MI, south to FL and TX. [= RAB, C, F, G, GW, HC, K, W, Z]

* Poa bulbosa Linnaeus, Bulbous Bluegrass. Cp (NC, VA), Pd (GA, NC, VA): lawns; rare, introduced from Europe. April-May. [= RAB, C, F, G, HC, K, Z]

Poa chapmaniana Scribner. Pd, Cp (GA, NC, SC, VA): low fields, roadsides, disturbed areas; common (VA Watch List). April-May. DE west to IA, south to FL and LA. [= RAB, C, F, G, HC, K, W, Z]

* Poa compressa Linnaeus, Canada Bluegrass. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): fields, roadsides, disturbed areas; common, introduced from Europe. May-August. [= RAB, C, F, G, HC, K, W, Z]

Poa cuspidata Nuttall. Mt, Pd (GA, NC, SC, VA), Cp (GA, NC, VA): moist forests; common. March-April. NJ west to s. IN, south to sw. GA. [= RAB, C, F, G, HC, K, W, Z]

Poa languida Hitchcock, Drooping Bluegrass. Mt (VA): ultramafic outcrop woodlands, barrens, and glades; rare (VA Rare as $P$. saltuensis). April-May. VT and MA west to MN, south to PA, w. VA, KY, and IA. See comments under $P$. saltuensis. [= C, F, G, HC, W; P. saltuensis -- K, in part: P. saltuensis Fernald \& Wiegand ssp. languida (Hitchcock) A. Haines - Y]

* Poa nemoralis Linnaeus, Wood Bluegrass. Mt (NC, VA), Pd (VA): sandy creek bottoms; rare, introduced from Europe (NC Watch List). [= C, F, G, HC; P. nemoralis ssp. nemoralis - K]

Poa paludigena Fernald \& Wiegand, Bog Bluegrass. Mt (NC, VA): mountain bogs, especially in deep shade under shrubs; rare (US Species of Concern, NC Endangered, VA Rare). April-May. NY west to MN, south to PA, w. NC, and IL. This species withers and disintegrates shortly after flowering; its ephemeral habit may be responsible for its being overlooked in our area for many years. [= C, F, G, HC, K]

Poa palustris Linnaeus, Fowl Bluegrass, Fowl Meadow-grass. Mt (NC, SC, VA), Pd (VA): meadows, moist areas; rare (NC Rare, VA Rare). June-July. Circumboreal, south in North America to VA, w. NC, MO, and NM. [= RAB, C, F, G, HC, K, W, Z] * Poa pratensis Linnaeus, Kentucky Bluegrass, Junegrass, Speargrass. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): lawns, roadsides, disturbed areas; common, introduced from Europe. April-August. [= RAB, C, F, G, HC, W, Z; P. pratensis ssp. pratensis -K]

Poa saltuensis Fernald \& Wiegand, Old-pasture Bluegrass. Mt (NC, VA): northern hardwood forests, ultramafic outcrop woodlands, barrens, and glades; rare (NC Rare, VA Rare). April-May. Newfoundland west to MN, south to PA, w. VA, and w. NC. The NC occurrences (on serpentinized olivine barrens) reported as $P$. languida are actually $P$. saltuensis. The taxonomic distinctions between $P$. saltuensis and $P$. languida have been controversial; Haines (2004) provides a detailed and valuable discussion. [= C, G, HC, W; P. languida -- RAB, Z, misidentification; P. saltuensis var. saltuensis -- F; P. saltuensis -- K, in part (also see $P$. languida); $P$. saltuensis ssp. saltuensis $-Y$ ]

Poa sylvestris A. Gray, Forest Bluegrass. Mt, Pd, Cp (GA, NC, SC, VA): moist forests; common. April-May. NY west to WI and IA, south to FL and TX. [= RAB, C, F, G, GW, HC, K, W, Z]

* Poa trivialis Linnaeus, Rough Bluegrass. Mt, Pd (NC, VA), Cp (VA), \{GA\}: moist forests, disturbed areas, bottomlands;
common, introduced from Europe. April-June. [= RAB, C, F, G, GW, HC, K, W, Z]
Poa wolfii Scribner. Mt (VA): \{moist forests\}; rare (VA Rare). \{\} OH west to MN, south to n. VA, MO, and e. NE. [= C, F, G, HC, K, W, Z]
* Poa infirma Kunth. Introduced in SC (Kartesz 1999). \{investigate\} [= K] \{not yet keyed; add synonymy\}

## Polypogon Desfontaines

References: Tucker (1996)=Z; Barkworth in FNA (in prep.).
1 Inflorescence verticillate, the rachis visible between the verticils; glumes 1.6-2.3 mm long, without awns; spikelets disarticulating near base of pedicel; stoloniferous perennial . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . .
1 Inflorescence dense, cylindrical, and spikelike; glumes 2-3 mm long, with prominent awns 3.5-7 mm long; spikelets disarticulating near apex of pedicel; annual.
2 Glumes deeply lobed, the awn borne between the lobes; glume ciliate-fringed; lemma 0.4-0.7 mm long, awnless P. maritimus var. maritimus

2 Glumes slightly notched at the tip, the awn borne from near the tip; glume not ciliate-margined; lemma 0.7-1.1 mm long, awned ......................................................................................... . . P. monspeliensis

Polypogon maritimus Willdenow var. maritimus, Meditteranean Beardgrass. Cp (GA, SC): brackish marshes; rare, introduced from Meditteranean Europe. P. maritimus Willdenow is reported as introduced to GA (Small 1933). [P. maritimus -- HC, K, S, Z, infraspecific taxa not distinguished]

* Polypogon monspeliensis (Linnaeus) Desfontaines, Rabbitfoot Grass, Beardgrass, Annual Beardgrass. Cp (GA, NC, SC,

VA), Pd (GA): brackish marshes, disturbed areas; uncommon, introduced from s. Europe and w. Asia. May-July. [= RAB, C, F, G, GW, HC, K, S, Z]

* Polypogon viridis (Gouan) Breistr., Water Bent-grass. Cp (SC): introduced on ballast around old ports, probably not persistent; rare, introduced from the Old World. Distinguished from Agrostis in having the spikelet falling as a whole, disarticulating below the glumes. [= K, Z; Agrostis viridis Gouan -- C; Agrostis verticillata Villars -- F; Agrostis semiverticillata (Forskål) C. Christensen -- G, HC]

Pseudosasa Makino ex Nakai (Arrow Bamboo)
References: Duncan \& Duncan [in prep.]=Z; Judziewicz et al. (2000)=Y. Key adapted from Z.

* Pseudosasa japonica (Siebold \& Zuccarini ex Steudel) Makino ex Nakai, Arrow Bamboo. Cp (VA): cultivated as an ornamental, persistent or spreading from plantings; rare, native of Japan. [= K, Y, Z; Sasa japonica (Siebold \& Zuccarini ex Steudel) Makino]

## Puccinellia Parlatore (Alkali Grass, Goosegrass)

1 Lemmas 3.0-4.5 mm long; spikelets 5-11-flowered . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [P. maritima]
1 Lemmas 1.5-2.5 mm long; spikelets 2-6-flowered.
2 Inflorescence diffuse, the lower branches with spikelets restricted to the distal portions; lower inflorescence branches spreading horizontal to deflexed at maturity; lemma $1.5-2.1 \mathrm{~mm}$ long, the midnerve not reaching the apex ... P. distans
2 Inflorescence compact, the lower branches bearing spikelets nearly to the base; lower inflorescence branches ascending at maturity; lemma $2.0-2.5 \mathrm{~mm}$ long, the midnerve reaching the apex, and often excurrent as a mucro .... P. fasciculata

* Puccinellia distans (Jacquin) Parlatore, European Alkali Grass, Goosegrass. Cp (VA): coastal sands; rare, introduced from Europe. [= P. distans -- C, G, HC; > P. distans var. distans -- F; > P. distans ssp. distans - K]

Puccinellia fasciculata (Torrey) Bicknell, Eastern Alkali Grass, Saltmarsh Goosegrass. Cp (VA): salt or brackish marshes; rare (VA Rare). Nova Scotia south to VA; Europe; and in sw. United States. [= C, F, G, HC, K]

* Puccinellia maritima (Hudson) Parlatore, Seaside Alkali Grass, Seaside Speargrass, salt marshes and ballast near ports, is introduced south to se. PA (Philadelphia), NJ (Camden), and DE, especially on ballast. [= C, F, G, HC; > P. americana Sorenson -K] \{add synonymy\}

Reimarochloa A.S. Hitchcock

Reimarochloa oligostachya (Munro ex Bentham) A.S. Hitchcock. AL, FL. [= K]

Ripidium Trinius (Ravenna-grass)
References: Hodkinson et al. (2002).

* Ripidium ravennae (Linnaeus) Trinius, Ravenna-grass, Plume-grass. Cp (GA): cultivated as an ornamental and rarely escaping or persisting; rare, introduced from s. Europe. In sw. GA, TN, and MD (Kartesz 1999). [= Saccharum ravennae (Linnaeus) Linnaeus -- FNA, K; = Erianthus ravennae (Linnaeus) Palisot de Beauvois - F; > Erianthus ravennae var. ravennae - HC; > Erianthus ravennae var. purpurascens (Anderss.) Hackel-HC]

## Rostraria Trinius

* Rostraria cristata (Linnaeus) Tzvelev. Cp (SC): waste areas near wool-combing mills; rare, introduced. It also occurs at scattered other sites in eastern United States, such as on ballast in se. PA (Rhoads \& Klein 1993), and reported for MD, AL, and FL (Kartesz 1999). Not keyed. [= K; Lophochloa cristata (Linnaeus) Hylander; Koeleria phleoides (Vill.) Persoon - HC]

Rottboellia Linnaeus f. (Itch-grass)
A genus of about 5 species, native to tropical Asia and Africa. References: Wipff in FNA (2003a); Wipff \& Rector (1993)=Z.

* Rottboellia cochinchinensis (Loureiro) Clayton, Itch-grass. Cp (GA, NC): disturbed ground; rare, native of tropical Asia. August-October. This grass, considered a noxious weed, was found in at least 13 GA counties by 1985 (Duncan 1985) and on a farm in Robeson County, NC in 1984. [= FNA, K, Z; Rottboellia exaltata Linnaeus f. -- HC; Manisuris exaltata (Linnaeus f.) Kuntze -S]

## Saccharum Linnaeus (Plume Grass)

(also see Ripidium)
Clayton \& Renvoize (1986) have pointed out that the "traditional division [of Saccharum] into awned (Erianthus) and awnless species seems wholly artificial;" Hodkinson et al. (2002) develop molecular evidence which suggests that our species are not congeneric with Saccharum, however. Further study is needed, but likely our native southeastern species will be merged into Miscanthidium Stapf, while the introduced S. ravennae will be placed in the genus Ripidium Trinius (Hodkinson et al. 2002). Sugarcane (Saccharum officinarum Linnaeus, S. sinense Roxburgh, S. barberi Jeswiet, S. spontaneum Linnaeus, and cultivars and hybrids derived from those four species) is cultivated further south, notably in FL and LA. References: Webster in FNA (2003a); Webster \& Shaw (1995)=Z; Gandhi \& Dutton (1993); Hodkinson et al. (2002).

1 Lowermost inflorescence node densely hairy; callus hairs (ring of hairs beneath the spikelet) (7-) 9-25 mm long, equal to or longer than the spikelet; stem appressed-pubescent below the inflorescence, on the internodes as well as the nodes.
2 Lemma awn flattened and spirally twisted at base; callus hairs $9-14 \mathrm{~mm}$ long, silvery or tinged with purple; leaves usually glabrous on the upper surface at maturity; [of moist to dry sites, rarely in wetlands]. $\qquad$ S. alopecuroides

2 Lemma awn nearly terete, straight or slightly flexuous; callus hairs (7-) 15-20 (-25) mm long, tawny or brown; leaves usually pilose on the upper surface at maturity; [of moist to wet sites, rarely in uplands] $\qquad$ S. giganteum

1 Lowermost inflorescence node glabrous; callus hairs (ring of hairs beneath the spikelet) 0-6.5 mm long, shorter than or equal to the spikelet (or absent in S. brevibarbe); stem glabrous below the inflorescence, except sometimes on the nodes.
3 Callus hairs (ring of hairs beneath the spikelet) absent, or of few hairs 0-2 mm long (much shorter than the spikelet); panicle branches closely appressed, the panicle usually $1-3 \mathrm{~cm}$ broad; panicle branches glabrous ........ S. baldwinii
3 Callus hairs (ring of hairs beneath the spikelet) present, dense, $3-6.5 \mathrm{~mm}$ long (from about half as long to nearly as long as the spikelet); panicle branches ascending, the panicle usually $4-10 \mathrm{~cm}$ broad; panicle branches pubescent. 4 Awn of the lemma of the upper floret terete at the base, and not spiraled; spikelets dark brown; spikelet pair dissimilar in size, the lemma of the upper floret 0.7-0.8× as long as the lemma of the lower floret; lemma of the lower floret typically 3-nerved;
S. coarctatum

4 Awn of the lemma of the upper floret flattened at the base, either spiraled or not; spikelets straw-colored or purplish; spikelet pair homomorphic, the upper lemma $0.9-1.0 \times$ as long as the lower lemma; lemma of the lower floret not distinctly nerved.
5 Awn of the lemma of the upper floret not basally spiraled, $10-18 \mathrm{~mm}$ long; lemma of the upper floret entire ....
.............................................................. S. brevibarbe var. brevibarbe
5 Awn of the lemma of the upper floret basally spiraled, $15-22 \mathrm{~mm}$ long; lemma of the upper floret bifid, the tooth on either side of the lemma 2.0-2.5 mm long
S. brevibarbe var. contortum

Saccharum alopecuroides (Linnaeus) Nuttall, Silver Plume Grass. Pd, Mt, Cp (GA, NC, SC, VA): fields, roadsides, woodland borders; common (rare in Mountains). October. NJ west to IN, IL, MO, and OK, south to FL and TX. [= FNA; Saccharum
alopecuroideum (LInnaeus) Nuttall -- Z, orthographic variant; Erianthus alopecuroides (Linnaeus) Elliott -- RAB, C, F, G, GW, HC, W; Saccharum alopecuroidum -- K, orthographic variant; Erianthus divaricatus (Linnaeus) A.S. Hitchcock -- S; Miscanthidium]

Saccharum baldwinii Sprengel, Narrow Plume Grass. Cp (GA, NC, SC, VA): marshes, clay-based Carolina bays, ditches; common. July-October. E. VA south to FL, west to TX, AR, scattered northwards inland to TN and MO. [= FNA, K, Z; Erianthus strictus Elliott -- RAB, C, F, G, GW, HC, S; Miscanthidium]

Saccharum brevibarbe (Michaux) Persoon var. brevibarbe, Short-bearded Plume Grass. Cp (NC): marshes, ditches; rare. September-October. MS, AL, and TN west to TX, AR, and OK; disjunct in e. NC. [=FNA, K, Z; Erianthus brevibarbis Michaux -RAB, C, G, GW, S, in part only (also see S. coarctatum); Erianthus coarctatus Fernald -- F, HC; Erianthus coarctatus var. elliottianus Fernald -- HC; Miscanthidium]

Saccharum brevibarbe (Michaux) Persoon var. contortum (Elliott) R. Webster, Bent-awn Plume Grass. Cp, Pd, Mt (GA, NC, SC, VA): open woodlands and forests, woodland borders; common, rare in Mountains. Late July-October. DE and MD south to panhandle FL, west to TX and AR, with scattered occurrences north to TN. [= FNA, K, Z; Erianthus contortus Elliott -- RAB, C, F, G, GW, HC, S, W; Saccharum contortum (Elliott) Nuttall; Erianthus brevibarbis Michaux var. contortus (Elliott) D.B. Ward;

## Miscanthidium]

Saccharum coarctatum (Michaux) Persoon, Brown Plume Grass. Cp (GA, NC, SC, VA): marshes, ditches, clay-based Carolina bays, swamps; common (rare in VA). September-October. DE and MD south to FL, west to TX (Brown \& Marcus 1998). [= FNA, K, Z; Erianthus brevibarbis Michaux -- RAB, C, G, GW, S, in part; Erianthus coarctatus Fernald -- F, HC; Erianthus coarctatus var. elliottianus Fernald -- HC; Miscanthidium]

Saccharum giganteum (Walter) Persoon, Sugarcane Plume Grass, Giant Plume Grass. Cp, Pd, Mt (GA, NC, SC, VA): marshes, ditches; common, rare in Mountains. September-October. NY south to FL, west to se. TX and AR; inland in TN and KY. [= FNA, K, Z; Erianthus giganteus (Walter) Palisot de Beauvois -- RAB, C, F, G, GW, HC, W; Erianthus giganteus var. compactus (Nash) Fernald -- F; Erianthus saccharoides Michaux -- S; Miscanthidium]

## Sacciolepis Nash

A genus of about 30 species, primarily in the tropics and subtropics. References: Wipff in FNA (2003a).
1 Annual, cespitose; spikelets 2.5-3.5 mm long; [rare alien] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. indica
1 Perennial, from creeping stolons; spikelets (3-) 4-5 mm long; [common native] . . . . . . . . . . . . . . ................ S. striata

* Sacciolepis indica (Linnaeus) Chase. Cp (GA, NC, SC): low fields, ditches; rare, introduced from India. October. [= RAB, FNA, GW, HC, K]

Sacciolepis striata (Linnaeus) Nash, American Cupscale. Cp, Pd (GA, NC, SC, VA), Mt (GA, NC, SC): marshes, interdune swales, ditches, swamps; common (rare in Piedmont and Mountains). July-October. S. NJ south to FL, west to e. TX and OK, nearly limited to the Coastal Plain, but occasionally inland as in w. NC and TN; also native in the West Indies and n. South America. $[=R A B, C, F, F N A, G, G W, H C, K, W]$

## Schedonorus Palisot de Beauvois

The correct generic placement of the introduced species Schedonorus arundinaceus (= Festuca elatior; = Festuca arundinacea; = Lolium arundinaceum) and Sch. pratense has been disputed. The traditional placement in Festuca has been defended by Aiken et al. (1997); Darbyshire (1993) transferred them to Lolium; and Soreng \& Terrell (1998) place them in the genus Schedonorus. NOTE: apparently, the Soreng \& Terrell (1998) paper was preceded by another paper which renders Soreng \& Terrell's combinations superfluous. References: Darbyshire (1993)=X; Aiken \& Darbyshire (1990)=Y; Tucker (1996)=Z; Soreng \& Terrell (1998) $=\mathrm{V}$; Darbyshire in FNA (in prep.). Key based in part on C and Y.

1 Auricles ciliate (sometimes only very sparsely so -- check several at 10-20× magnification); spikelets with 3-6 (-9) florets; old sheaths pale straw-colored, often remaining intact; internodes of the rachilla antrorsely scabrous Sch. arundinaceus
1 Auricles glabrous; spikelets with (2-) 4-10 (-12) florets; old sheaths brown, decaying to fibers; internodes of the rachilla glabrous (smooth) or nearly so

Sch. pratensis

* Schedonorus arundinaceus (Schreber) Dumortier, Tall Fescue, Alta Fescue. Cp, Pd, Mt (GA, NC, SC, VA): fields, roadsides, pastures, disturbed areas; common, introduced from Eurasia. May-July. [= FNA, V; < Festuca elatior Linnaeus -- RAB, F, S, W, in part, misapplied; = Festuca arundinacea Schreber -- HC, Y; = Festuca elatior Linnaeus -- C; = Festuca elatior var. arundinacea (Schreber) Wimmer -- G; < Festuca pratensis Hudson -- GW, in part; = Lolium arundinaceum (Schreber) Darbyshire -K, X, Z; Schedonorus phoenix (Scopoli) Holub]
* Schedonorus pratensis (Hudson) Palisot de Beauvois, Meadow Fescue. Mt (VA): fields, roadsides, pastures, disturbed areas; rare, introduced from Eurasia. May-July.\} [= FNA, V; < Festuca elatior Linnaeus -- RAB, F, S, W, in part, misapplied; = Festuca pratensis Hudson -- C, Y; = Festuca elatior var. pratensis (Hudson) A. Gray -- G; < Festuca pratensis Hudson -- GW, in part; = Festuca elatior - HC, misapplied; = Lolium pratense (Hudson) Darbyshire -- K, X, Z ]

Schizachne purpurascens (Torrey) Swallen, Purple Oatgrass, False Melic. Mt (VA): moist, rocky northern hardwood and spruce forests; rare (VA Rare). Newfoundland west to AK, south to MD, w. VA, WV, KY, IL, NM, and Mexico; also in ne. Asia. MayJuly. [= F, G, HC, K; S. purpurascens var. purpurascens -- C]

## Schizachyrium Nees (Little Bluestem)

A genus of about 60 species, widespread in tropical, subtropical and warm temperate regions of the World. References: Wipff (1996a) $=$ Z; Gandhi (1989)=Y; Wipff in FNA (2003a). Key based in part on Wipff in FNA (2003a).

1 Leaf blades 0.5-1.5 mm wide, with a lighter-colored zone in the center of the upper surface; sessile spikelet ca. 4 mm long ...
1 Leaf blades >1.5 mm wide, lacking a distinct lighter zone on the upper surface; sessile spikelet 5-11 mm long. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 2 First glume of sessile spikelet pubescent . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Sch. sanguineum var. hirtiflorum
2 First glume of sessile spikelet glabrous.
3 Plants rhizomatous, with internodes 6 mm long or longer; sessile spikelet 5-7 mm long
Sch. scoparium var. stoloniferum
3 Plants tufted, rhizome internodes absent or less than 3 mm long, the stem sometimes decumbent at the base and rooting at the lower nodes (appearing nearly rhizomatous); sessile spikelet $6-10 \mathrm{~mm}$ long.
4 Leaf sheaths broad and strongly keeled, hairs of the raceme internodes ca. 5 mm long; stems decumbent at base, rooting at the lower nodes . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Sch. littorale
4 Leaf sheaths rounded or weakly keeled; hairs of the raceme internodes 1-3 (-4) mm long; stems erect, not rooting at the lower nodes.
5 Pedicellate spikelets of the proximal spikelet units on each rame staminate, $5-10 \mathrm{~mm}$ long, with a lemma, the pedicellate spikelets of the distal units usually smaller ( $1-4 \mathrm{~mm}$ long) and sterile; sheaths and blades densely tomentose to glabrate
[Sch. scoparium var. divergens]
5 Most pedicellate spikelets sterile, 1-6 mm long, without a lemma; sheaths and blades usually glabrous, occasionally pubescent

Sch. scoparium var. scoparium
Schizachyrium littorale (Nash) Bicknell, Seaside Little Bluestem. Cp (GA, NC, VA): coastal dunes and maritime dry grasslands, often with Uniola paniculata, Panicum amarum, and other dune plants; common. August-October. E. MA south to NC (or SC?), and inland on the shores of the Great Lakes. In NC, Sch. littorale is present and abundant on dunes of barrier islands from Shackleford Banks, Carteret County south to Brunswick County, near the SC border, and entirely absent from the Outer Banks (from Cape Lookout, Carteret County, north through Hyde County to Dare County). [= FNA, GW, K; < Andropogon scoparium Michaux -- RAB, in part; = Sch. scoparium var. littorale (Nash) Gould -- C, Z; = Andropogon scoparius Michaux var. littoralis (Nash) A.S. Hitchcock -- F, G; = Andropogon littoralis Nash -- HC, S; < Sch. scoparium (Michaux) Nash ssp. littorale (Nash) Gandhi \& Smeins -- Y, in part]

Schizachyrium sanguineum (Retzius) Alston var. hirtiflorum (Nees) Hatch, Hairy Crimson Bluestem. Cp (GA): \{habitat\}; rare. Sw. GA and FL west to AZ and south through Central America to South America. [= FNA, K; = Andropogon hirtiflorus (Nees) Kunth -- HC, S; Sch. sanguineum var. brevipedicellatum (Beal) Hatch]

Schizachyrium scoparium (Michaux) Nash var. scoparium, Common Little Bluestem. Cp, Pd, Mt (GA, NC, SC, VA): in a wide range of moist to dry habitats; common. (June-) August-October. New Brunswick west to Alberta, south to FL and Mexico. One of the most ubiquitous plants in the modern landscape of our area, occurring throughout in the majority of habitats. This species is extremely variable, some of the variability correlated with habitat and geography; the recognition of infraspecific taxa is warranted. [= C, FNA, Z; < Andropogon scoparius Michaux -- RAB, in part (also see Sch. littorale); = Sch. scoparium -- GW; > Andropogon scoparius var. scoparius -- F, G, HC; > Andropogon praematurus Fernald -- F, G; > Andropogon scoparius var. polycladus Scribner \& Ball -- F; > Andropogon scoparius var. frequens F.T. Hubbard -- F; = Sch. scoparium ssp. scoparium -- K, Y; < Andropogon scoparius -- S, W, in part]

Schizachyrium scoparium (Michaux) Nash var. stoloniferum (Nash) J. Wipff, Creeping Little Bluestem. Cp (GA, SC?): fallline sandhills in the inner Coastal Plain, perhaps in other dry habitats, the habitat and range in our area requiring further study; uncommon? August-October. SC (?) and GA south to FL and west to MS. See Wipff (1996a) for additional discussion. [= FNA, K, Z; = Sch. stoloniferum Nash -- GW; = Andropogon stolonifer (Nash) A.S. Hitchcock -- HC, S; < Sch. scoparium ssp. littorale (Nash) Gandhi \& Smeins -- Y, in part]

Schizachyrium tenerum Nees, Slender Bluestem. Cp (GA): longleaf pine savannas; uncommon. GA west to e. TX. [= FNA, K; = Andropogon tener (Nees) Kunth -- HC, S]

Schizachyrium maritimum (Chapman) Nash. AL, FL west to LA. [= K] \{not yet keyed; add synonymy\}
Schizachyrium niveum (Swallen) Gould, Pinescrub Bluestem, is reported for Lowndes Co. in sc. GA (Kral 1973), but the report has been discounted by later authors (Wipff in FNA 2003a). Not keyed. [= FNA, K; = Andropogon niveus Swallen - HC, S]

Schizachyrium scoparium (Michaux) Nash var. divergens (Hackel) Gould, Pinehill Bluestem. East to c. TN, AL, KY. [= FNA, K; = Andropogon scoparius Michaux var. divergens Hackel; = Andropogon divergens - HC; < Andropogon scoparius -- S, in part]

References: Tucker (1996)=Z; Brandenburg, Estes, \& Thieret (1991).

* Sclerochloa dura (Linnaeus) Palisot de Beauvois. Mt (VA): disturbed areas; rare, introduced from Mediterranean Europe. A monotypic genus, native to s. Europe. [= C, HC, K, Z]

## Secale Linnaeus 1753 (Rye)

References: Tucker (1996)=Z.

* Secale cereale Linnaeus, Rye. Cp, Pd, Mt (GA, NC, SC, VA): fields; commonly cultivated, rarely persistent or volunteering following cultivation, introduced from Eurasia. May-June. An important crop. The lemmas are awned from 2-6 cm long. [= RAB, C, F, G, HC, K, Z]

## Setaria Palisot be Beauvois (Foxtail Grass)

 (also see Pennisetum)References: Webster (1993)=Z; Webster (1995)=Y; Crins (1991)=X; Webster (1988); Rominger in FNA (2003a); Allen in FNA (2003a). Key adapted from FNA.

1S. geminata var. paludivaga
1

Setaria corrugata (Elliott) J.A. Schultes. Cp (GA, NC, SC): pinelands, disturbed areas; common. From ne. NC south to s. FL, west to e. TX; Cuba; Dominican Republic. [= RAB, FNA, HC, K, Z]

* Setaria faberi R.A.W. Herrmann, Nodding Foxtail Grass, Giant Foxtail-grass. Mt, Pd, Cp (GA, NC, SC, VA): disturbed areas; uncommon, native of China. [= RAB, C, FNA, K; = S. faberii -- HC, Z, orthographic variant]

Setaria geminata (Forsskål) Veldkamp var. paludivaga (A.S. Hitchcock \& Chase) R.D. Webster, Alligator Grass, Paspalidium. $C p$ (GA, SC): in shallow water; rare. December. S. SC south to FL, west to TX; also in Central and South America. This taxon is sometimes considered an introduction from the Old World, but its occurrence in undisturbed wetlands remote from extensive human activity suggests that it is native. Webster (1995) has merged Paspalidium into Setaria. [= Y; = Panicum paludivagum A.S. Hitchcock \& Chase -- RAB, HC, S; < Paspalidium geminatum -- FNA, GW, X, infraspecific taxa not distinguished; = Paspalidium geminatum (Forsskål) Stapf var. paludivagum (A.S. Hitchcock \& Chase) Gould - K; = Paspalidium paludivagum (A.S. Hitchcock \& Chase) Parodi]

* Setaria italica (Linnaeus) Palisot de Beauvois, Foxtail-millet, Italian-millet. Pd (GA, NC, SC, VA), Cp, Mt (VA): disturbed areas, rare, native of Eurasia. Probably derived via cultivation from S. viridis, and cultivated as a food crop in China since at least 6000 BP and later in Europe (Hancock 2004). [= RAB, C, FNA, HC, K, Z]

Setaria macrosperma (Scribner \& Merrill) K. Schumann, Coral Bristlegrass. Cp (GA, SC): hammocks and maritime forests, also disturbed areas; rare. SC south to FL; Bahamas, Mexico. [= RAB, FNA, HC, K, Z]

Setaria magna Grisebach, Saltmarsh Foxtail-grass, Giant Foxtail-grass. Cp (GA, NC, SC, VA), Pd* (GA*): interdune swales, near-coastal marshes; uncommon. NJ south to s. FL, west to e. TX; disjunct inland in GA, AR, LA, TX, and NM; West Indies, Bermuda, Costa Rica. [= RAB, C, FNA, HC, K, Z]

Setaria parviflora (Poiret) Kerguélen, Knotroot Bristlegrass, Perennial Foxtail-grass. Cp, Pd, Mt (GA, NC, SC, VA): marshes, ditches, moist disturbed areas; common. MA to IA south to s. FL and s. TX, south through Mexico to Central America; CA and NV; West Indies. Gandhi \& Barkworth (2003) provide a detailed discussion of the reasons for the nomenclatural change. [= FNA, K, Z; $=S$. geniculata Palisot de Beauvois -- RAB, C, HC]

* Setaria pumila (Poiret) Roemer \& Schultes ssp. pumila, Yellow Foxtail. Mt, Pd, Cp (GA, NC, SC, VA): disturbed areas, lawns, fields; common, native of Europe. [= FNA; Setaria glauca - RAB, misapplied]
* Setaria verticillata (Linnaeus) Palisot de Beauvois, Hooked Bristlegrass. Mt (VA): disturbed areas; uncommon, introduced from Europe. [= FNA, K; = S. verticillata var. verticillata -- C, HC; < S. verticillata -- Z, in part only]
* Setaria viridis (Linnaeus) Palisot de Beauvois var. viridis. Cp, Pd, Mt (GA, NC, SC, VA): fields, disturbed areas; common, introduced from Eurasia. [= C, FNA, K, Z; S. viridis -- RAB, HC, infraspecific taxa not distinguished]

Setaria adhaerans (Forsskål) Chiovenda. Distributed widely throughout the tropics and subtropics, in North America from s. AL west to CA (perhaps only adventive in portions of that distribution). [= FNA, K, Z] \{add synonymy\}

Setaria geminata (Forsskål) Veldkamp var. geminata. AL, FL. [= Y; < Paspalidium geminatum -- FNA, GW, X, infraspecific taxa not distinguished; = Paspalidium geminatum (Forsskål) Stapf var. geminatum - K] \{add synonymy\}

* Setaria verticilliformis Dunart. is reported for NJ, PA, MD, and AL (FNA 2003a, Kartesz 1999). [= FNA, K; = S. verticillata (Linnaeus) Palisot de Beauvois var. ambigua (Guss.) Parlatore -- C, HC; < S. verticillata -- Z, in part]
* Setaria viridis (Linnaeus) Palisot de Beauvois var. major (Gaudin) Pospichal, Giant Green Foxtail, is reported as introduced in TN, MD, and PA (Kartesz 1999). [= C, FNA, K, Z; < S. viridis -- RAB, HC, infraspecific taxa not distinguished]
* Sinocalamus latiflorus (Munro) McClure is reported for NC (Kartesz 1999). \{investigate\} [= K]

## Sorghastrum Nash (Indiangrass)

A genus of about 18 species, of tropical and subtropical America, temperate America, and Africa. References: Hall (1982)=Z; Dávila Aranda \& Hatch in FNA (2003a). Key adapted from Z.

1 Awns 10-22 (-30) mm long, once-geniculate; plants rhizomatous; surfaces of the glumes tan to slightly brown basally; ligule 310 mm long, prominently auricled
S. nutans

1 Awns 16-46 mm long, twice-geniculate; plants cespitose; surfaces of the glumes brown; ligule 1-5 mm long, truncate.
2 Axis of the panicle straight, erect, the branchlets appressed to ascending, the spikelets drooping-secund; spikelets 0.8-1.2 mm wide S. secundum

2 Axis of the panicle arching, usually strongly so, the branchlets ascending to spreading, the spikelets not drooping-secund; spikelets $1.1-1.8 \mathrm{~mm}$ wide.
3 Axis of the panicle straight, with the branches distributed no more than 180 degrees around the axis (as viewed from above) ................................................................................ [S. apalachicolense]
3 Axis of the panicle arching, with the branchlets distributed through 360 degrees around the axis (as viewed from above)
S. elliottii

Sorghastrum elliottii (C. Mohr) Nash, Slender Indiangrass. Cp, Pd (GA, NC, SC, VA), Mt (GA, NC, SC): woodlands and forests, river-scour areas, including oak-hickory forests and woodlands over mafic rocks; uncommon. September-October. MD south to FL and west to TX, inland to TN, AR, and OK, mainly on the Coastal Plain, but extending inland to other physiographic provinces. [= RAB , C, F, G, HC, K, S, W, Z; < S. elliottii - FNA, in part only (also see S. apalachicolense)]

Sorghastrum nutans (Linnaeus) Nash, Yellow Indiangrass. Mt, Pd, Cp (GA, NC, SC, VA): xeric and mesic woodlands and forests of a wide variety, powerline rights-of-way, roadbanks; common. September-October. ME and Québec west to s. Manitoba, south to FL, TX, UT, AZ, and Mexico. Along with Andropogon gerardii, Schizachyrium scoparium, and Panicum virgatum, Sorghastrum nutans is one of the dominant grasses of the tall-grass prairie. It is also common in a variety of open habitats (natural and altered) in the forested landscape of eastern North America. [= RAB, C, F, FNA, G, HC, K, S, W, Z; = S. avenaceum (Michaux) Nash]

Sorghastrum secundum (Elliott) Nash, Lopsided Indiangrass. Cp (GA, SC): sandhills; uncommon. September-October. S. SC south to FL and west to s. AL (Sorrie \& Leonard 1999). [= RAB, FNA, HC, K, S, Z]

Sorghastrum apalachicolense D.W. Hall, Apalachicola Indiangrass, Open Indiangrass, occurs in flatwoods and sandhills in Panhandle FL west to s. MS (Sorrie \& Leonard 1999); it may well occur as well in GA. July-August. [= K, Z; < S. elliottii - FNA, in part]

## Sorghum Moench (Sorghum, Milo, Johnson Grass)

A genus of about 25 species, of tropical and subtropical Old World (1 species in Mexico). References: Barkworth in FNA (2003a); de Wet (1978)=Z.

1 Rhizomatous perennial; leaves 1-2 cm wide ............................................................. S. halepense
1 Fibrous-rooted annual; leaves (2-) 3-5 cm wide.
2 Inflorescence dense, compact; plants 0.5-1.3 m tall . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. bicolor var. bicolor
2 Inflorescence open, with spreading branches; plants 1.0-3.0 m tall . . . . . . . . . . . . . . . . . S. bicolor var. drummondii

* Sorghum bicolor (Linnaeus) Moench var. bicolor, Sorghum, Milo, Broomcorn, Sorgo. Cp, Pd (GA, NC, SC, VA): cultivated, rarely persistent; common in cultivation, rare as an escape. October. [ $=\mathrm{C}$; < Sorghum vulgare Persoon -- RAB, in part; < Sorgum vulgare -- F, in part, orthographic variant; = S. vulgare var. vulgare -- HC; = S. bicolor ssp. bicolor -- FNA, K; < Holcus sorghum Linnaeus -- S, in part]
* Sorghum bicolor (Linnaeus) Moench var. drummondii (Nees ex Steudel) Mohlenbrock, Shattercane. Cp, Pd (GA, NC, SC, VA): cultivated, rarely persistent; common in cultivation, rare as an escape. October. This is the taller variety with open inflorescences, usually sporadically present in sorghum fields. [= C; < Sorghum vulgare Persoon -- RAB, in part; < Sorgum vulgare -- F, in part, orthographic variant; = Sorghum bicolor ssp. ×drummondii (Nees ex Steudel) de Wet - FNA; = Sorghum vulgare Persoon var. drummondii (Nees ex Steudel) Hackel ex Chiov. -- HC; = Sorghum bicolor ssp. drummondii (Nees ex Steudel) de Wet \& Harlan -- K; < Holcus sorghum Linnaeus -- S, in part]
* Sorghum halepense (Linnaeus) Persoon, Johnson Grass. Cp, Pd, Mt (GA, NC, SC, VA): roadsides, fields, waste places; common, introduced from Eurasia. A serious weed, difficult to eradicate. [= RAB, C, FNA, GW, HC, K, W; = Sorgum halepense -F, G, orthographic variant; = Holcus halepensis Linnaeus -- S]

## Spartina Schreber (Cordgrass)

A genus of ca. 15 species. References: Barkworth in FNA (2003a).

1 Leaf blades mostly 5-40 mm wide, flat towards the base, generally somewhat involute towards the tip, or involute after drying; plants 0.3-4.0 m tall.
2 Glumes with smooth keels; spikelets spaced $3-8 \mathrm{~mm}$ apart on each face of the rachis (the rachis triangular in crosssection, with spikelets attached on two faces); [of salt to brackish coastal marshes] . . . . . . . . . . . . . . . . . S. alterniflora
2 Glumes with scabrous keels; spikelets spaced 1-3 mm apart on each face of the rachis; [of fresh to brackish coastal marshes, or inland].
3 Second glume acute, not awned; first glume averaging ca. 1/2 as long as the lemma; spikes (6-) 20-50 (-more) per inflorescence; [of fresh to brackish coastal marshes] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. cynosuroides
3 Second glume with an awn 3-10 mm long; first glume averaging ca. 7/8 as long as the lemma; spikes (5-) 7-27 per inflorescence; [of fresh marshes, either inland or coastal]
S. pectinata

1 Leaf blades mostly 1-4 (-6) mm wide, involute; plants $0.3-1.0 \mathrm{~m}$ tall (to 2.0 m tall in the distinctly clumped $S$. bakeri).
4 Plants forming large clumps with numerous culms and leaves; spikelets 6-9 mm long; spikes usually 9-14 per inflorescence; [of se. SC southwards]
S. bakeri

4 Plants with creeping rhizomes, culms arising singly or few together from a point; spikelets 7-13 mm long; spikes usually 1 9 per inflorescence; [widely distributed in coastal parts of our area].
5 Spikelets 7-10 mm long; second glume acute to obtuse (rarely acuminate); spikes (2-) 4-9 per inflorescence; second highest leaf blade on the stem (1-) avg. $2(-5) \mathrm{dm}$ long; plants to 15 dm tall; culms to 6 mm in diameter at base S. patens var. monogyna

5 Spikelets 9-13 mm long; second glume acuminate; spikes 1-4 per inflorescence; second highest leaf blade on the stem (0.5-) avg. 1 (-2) dm long; plants to 8 dm tall; culms to 3 mm in diameter at base . . . . . S. patens var. patens

Spartina alterniflora Loiseleur, Saltmarsh Cordgrass, Smooth Cordgrass. Cp (GA, NC, SC, VA): salt marshes; common. August-October. Newfoundland south to FL, west to TX; e. South America; introduced in n. Europe. S. alterniflora is the dominant plant (often essentially a monoculture) of intratidal salt marshes in our area. [= RAB, C, FNA, GW, K; > S. alterniflora var. alterniflora - F, G, HC, S; > S. alterniflora var. glabra (Muhlenberg ex Bigelow) Fernald -- F, G, HC, S; > S. alterniflora var. pilosa (Merrill) Fernald -- F, G, HC]

Spartina bakeri Merrill, Sand Cordgrass. Cp (GA, SC): brackish marshes, marsh edges, wet coastal hammocks, under Sabal palmetto, Quercus virginiana, and Juniperus virginiana var. silicicola; rare. June. Se. SC south to s. FL, west to panhandle FL. Distinctive among our species in its densely clumped growth form. [= FNA, GW, HC, K, S]

Spartina cynosuroides (Linnaeus) Roth, Giant Cordgrass. Cp (GA, NC, SC, VA): brackish and freshwater tidal marshes, especially along margins of tidal creeks; common. June-September. MA south to FL, west to e. TX. [= RAB, C, FNA, G, GW, HC, K, S; > S. cynosuroides var. cynosuroides -- F]

Spartina patens (Aiton) Muhlenberg var. monogyna (M.A. Curtis) Fernald, Large Saltmeadow Cordgrass. Cp (GA, NC, SC, VA): sandy shores, overwash flats; common. June-September. MA south to FL, west to TX. Whether var. monogyna is worthy of recognition is a matter of debate; there appear to morphological differences correlated with geography and, according to some authors, habitat, but positive identification to variety is sometimes difficult. [= F, G, HC; < S. patens -- RAB, C, FNA, GW, K, S, infraspecific taxa not distinguished]

Spartina patens (Aiton) Muhlenberg var. patens, Small Saltmeadow Cordgrass, Salt Hay, Marsh-hay Cordgrass. Cp (NC, VA): dunes, sand flats, upper edges of marshes, maritime wet grasslands; common. June-September. Newfoundland south to NC, and perhaps further. [=F, G, HC; < S. patens -- RAB, C, FNA, GW, K, S, infraspecific taxa not distinguished]

Spartina pectinata Link, Prairie Cordgrass, Slough Grass. Mt, Cp (NC, VA): spray cliffs below waterfalls, rocky or sandy flood-scoured riverside grasslands, tidal freshwater (oligohaline) marshes, calcareous oak flatwoods and prairies; rare (GA Rare, NC Rare, VA Rare). July-September. Newfoundland west to WA, south to ne. NC, sw. NC, AR, TX, and NM. [= RAB, C, F, FNA, G, GW, HC, K, W; > S. pectinata var. pectinata - F; > S. pectinata var. suttiei (Farwell) Fernald -- F; = S. michauxiana A.S. Hitchcock -S]

Spartina spartinae (Trinius) Merr. ex A.S. Hitchcock, Gulf Cordgrass. Brackish marshes and inland saline situations. AL and FL west to TX. [= K] \{not yet keyed; add to synonymy\}

## Sphenopholis Scribner (Wedgegrass)

References: Tucker (1996)=Z. Key based in part on C.
1 Spikelets 5-9.5 mm long; second lemma with an awn 3.5-7 mm long . . . ................................ S. pensylvanica

1 Spikelets 1.5-5 mm long; second lemma awnless, or with an awn up to 3.5 mm long.
2 Lower leaf blades mostly (10-) 15-45 cm long, involute, less than 2 mm wide . . . . . . . . . . . . . . . . . . . . . . . S. filiform is
2 Lower leaf blades mostly less han 10 cm long, flat, 2-8 mm wide.
3 First glume $1 / 3$ to $2 / 3$ as wide as the second glume; second glume strongly scabrous .................. S. nitida 3 First glume less tha $1 / 3$ as wide as the second glume; second glume smooth to slightly scabrous.

4 First lemma with an awn up to 3.5 mm long
S. xpallens

4 First lemma unawned.
5 Panicle open; second glume $3-6 \times$ as long as wide, acute at the tip; lowermost rachilla internode 0.8-1.0 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. intermedia
5 Panicle densely cylindrical; second glume $2-3 \times$ as long as wide, rounded or truncate at the tip; lowermost rachilla internode $0.5-0.7 \mathrm{~mm}$ long
S. obtusata

Sphenopholis filiformis (Chapman) Scribner. Cp (GA, NC, SC, VA), Pd (GA, NC, SC): pine savannas, sandy woodlands; uncommon (VA Rare). April-May. Se. VA south to c. FL, west to e. TX. [= RAB, C, F, K, S, Z]

Sphenopholis intermedia (Rydberg) Rydberg, Slender Wedgegrass. Mt, Pd, Cp (GA, NC, SC, VA): moist nutrient-rich forests; rare. May-June. Newfoundland west to c. AK, south to panhandle FL, c. TX, and AZ. [= RAB, F, G, K, S; = S. obtusata (Michaux) Scribner var. major (Torrey) K.S. Erdman -- C, Z; < S. obtusata -- GW, W, in part]

Sphenopholis nitida (Biehler) Scribner. Cp, Pd, Mt (GA, NC, SC, VA): moist forests, bottomlands; common. April-May. MA west to IL, south to FL and TX. [= RAB, C, G, K, W, S, Z; < S. nitida var. glabra (Nash) Scribner -- G; < S. nitida var. nitida - G]

Sphenopholis obtusata (Michaux) Scribner, Prairie Wedgegrass. Cp, Pd, Mt (GA, NC, SC, VA): forests, roadsides, disturbed areas; common (uncommon in Mountains). April-May. ME west to MN and British Columbia, south to s. FL, TX, c. Mexico, and s. CA. [= RAB, F, G, K, S; = S. obtusata var. obtusata -- C, Z; < S. obtusata var. obtusata - F; < S. obtusata var. pubescens (Scribner \& Merrill) Scribner -- F; < S. obtusata -- GW, W, in part only (also see S. intermedia)]

Sphenopholis xpallens (Biehler) Scribner (pro sp.) [S. obtusata $\times$ pensylvanica]. Cp (NC, SC, VA): ditches, wet forests; rare. Not always with its parents. May. [= C, K; = S. pallens -- RAB, F, S]

Sphenopholis pensylvanica (Linnaeus) A.S. Hitchcock, Swamp-oats. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): bogs, ditches, wet forests; uncommon. April-June. MA west to OH and se. MO, south to n. FL and LA. [= C, K, Z; = Trisetum pensylvanicum (Linnaeus) Palisot de Beauvois ex Roemer \& J.A. Schultes -- RAB, F, G, S; = S. pennsylvanica -- GW, orthographic variant]

Sporobolus R. Brown (Dropseed)
A genus of about 160 species, perennials and annuals, of tropical subtropical and warm-temperate parts of the New World and Old World. References: Riggins (1977)=Z; Weakley \& Peterson (1998)=Y; Peterson, Hatch, \& Weakley in FNA (2003a).

1 Inflorescence an open panicle, more than 2 cm broad, the branches ascending to spreading.
2 Branches of the panicle verticillate, whorled; spikelets 2.5-4 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. junceus
2 Branches of the panicle alternate (some occasionally rather randomly subopposite or opposite, but never regularly whorled); spikelets either $4-6.5 \mathrm{~mm}$ long, or $1.5-2.5$ (2.7) mm long.
3 Spikelets 1.5-2.5 (-2.7) mm long.
4 Panicle branches bare of spikelets in the lower $1 / 4$ to $1 / 8$ of their length . . . . . . . . . . . . . . . . S. cryptandrus
4 Panicle branches bearing spikelets to the base S. domingensis

## 3 Spikelets 4-6.5 mm long.

5 First glume scaberulous, acuminate or awn-like; spikelets dark gray; base of plant relatively fibrous; grain spherical; [of rocky barrens of the Mountains of NC and VA] . . . . . . . . . . . . . . . . . . . . . . . . . . . S. heterolepis
5 First glume glabrous, acute to acuminate; spikelets purplish (fading tan); base of plant smooth and hard, made up of the indurated leaf bases; grain oblong (when present, usually abortive); [of pine savannas and seeps of the Coastal Plain of NC, SC, and southwards].
6 Leaves terete or subterete (wiry), oval in cross-section, sometimes irregularly channelled for portions of their lengths (never with any portion above the sheath flat), less than 1 mm wide, tending to senesce and turning tan in autumn, the margins generally smooth; culms (including the inflorescence) (2-) 4-7 (-10) dm tall; culms (from base to first inflorescence branch) 1.5-5 dm tall; first glume averaging about $0.7 \times$ as long as the second glume (though variable, ranging from 0.5-0.75×). $\qquad$ S. teretifolius

6 Leaves flat (folded when dry), plane or V-shaped in cross-section, with free margins their entire length, 1.2-$2(-2.7) \mathrm{mm}$ wide, tending to remain green into the winter (at least until December), the margins scabrous (except in S. curtissii); culms (including the inflorescence) 3-22 dm tall; culms (from base to first inflorescence branch) (4-) 6-10 dm tall; first glume averaging $0.75-1 \times$ as long as the second glume (though variable, collectively ranging from about 0.6-1.2×).
7 First glume averaging $0.95-1.1 \times$ as long as the second glume (though variable, ranging from 0.8 $1.3 \times$ ); pedicels mostly $1-3 \mathrm{~mm}$ long (a few sometimes as long as 10 mm long), appressed; culms (including the inflorescence) 3-7 dm tall; inflorescence branches stiffly ascending; leaves $0.5-1.5 \mathrm{~mm}$ wide (or to 2.0 mm wide when unburned), mostly $1.5-4 \mathrm{dm}$ long (rarely to 5 dm long), smooth on the margins; [of e. SC southwards] S. curtissii

7 First glume averaging $0.6-0.9 \times$ as long as the second glume (though variable, ranging from 0.6$0.95 \times$ ); pedicels mostly $4-15 \mathrm{~mm}$ long, spreading; culms (including the inflorescence) (3-) 7-16 (-22) dm tall; inflorescence branches initially ascending, later loosely ascending to spreading; leaves 1.210.0 mm wide, mostly (3-) 4-8 dm long, upwardly scabrous on the margins; [of e. NC southwards]. 8 Leaves (2.0-) 3-10 mm wide, pale bluish-green (often with some yellowish leaves as well); first glume averaging $0.75-0.9 \times$ as long as the second glume (though variable, ranging from 0.6$0.95 \times$ ); culms (including the inflorescence) usually 12-22 dm tall; inflorescence usually 3.5-5 dm long; [of se. SC southwards]
S. floridanus

8 Leaves 1.2-2.0 (-3.0) mm wide, dark green; first glume averaging 0.6-0.8x as long as the second glume (though variable, ranging from 0.6-0.8×); culms (including the inflorescence) usually 6-12 $(-18) \mathrm{dm}$ tall; inflorescence usually $2-3.5 \mathrm{dm}$ long; [of e. NC south to e. GA]
S. pinetorum

1 Inflorescence a contracted, spike-like panicle, less than 2 cm broad, the branches appressed.
9 Plant a geniculate annual; most inflorescences enclosed by sheaths (or most or all exserted); inflorescence 2-5 cm long.

10 Spikelets (1.3-) 1.6-2.8 mm long; grain falling free of the lemma and palea; lemma glabrous ....... S. neglectus
10 Spikelets 2.3-5 mm long; grain falling enclosed in the lemma and palea; lemma strigose (use $10 \times$ or more) or glabrous.
11 Lemma and palea shorter than the glumes; palea usually shorter than the lemma; lemma glabrous or strigose with hairs less than 0.2 mm long; spikelets 2.3-3.3 (-3.8) mm long; floret (lemma, palea and enclosed grain) 1.6-3.3 (-3.8)× as long as wide
S. ozarkanus

11 Lemma and palea longer than the glumes; palea usually longer than the lemma; lemma strigose with hairs more than 0.2 mm long; spikelets $2.8-5 \mathrm{~mm}$ long; floret (lemma, palea and enclosed grain) 2.2-5.7 (-7.5)× as long as wide
S. vaginiflorus

9 Plant a rhizomatous or tufted perennial; most inflorescences exserted to partly enclosed; inflorescence 5-15 cm long.
12 Plant creeping extensively by slender rhizomes; leaf blades cauline, distichous, to 12 cm long . . . . . . S. virginicus
12 Plant loosely tufted, from short rhizomes; leaf blades basal or cauline, not distichous, 10-100 cm long.
13 Spikelets $1.5-2.2 \mathrm{~mm}$ long; first glume $0.5-0.8 \mathrm{~mm}$ long; leaves primarily basal
S. indicus

13 Spikelets 4-8 mm long; first glume $2-5 \mathrm{~mm}$ long; leaves cauline and basal.
14 Lemma pubescent, usually conspicuously shorter than the palea; pericarp loose when moist.
14 Lemma glabrous, about as long as the palea; pericarp gelatinous when moist.
15 Culms (1.4-) 2.0-5.0 mm thick; terminal sheath (1.3-) 1.5-6.0 mm wide; panicles with $12-35$ primary branches, crowded, dense . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. compositus var. compositus
15 Culms 1.0-2.0 (-2.5) mm thick; terminal sheath $0.8-2.0(-2.5) \mathrm{mm}$ wide; panicles with $8-18$ primary branches, lax, loosely flowered
[S. compositus var. drummondii]
Sporobolus clandestinus (Biehler) A.S. Hitchcock, Rough Dropseed. Pd, Cp (GA, NC, SC, VA), Mt (VA): glades, barrens, and thin soil of woodlands, also in dry sands; uncommon. September-October. This species is widespread in e. United States. Wipff \& Jones (1995) recommend reducing this taxon to a variety under S. compositus, because of its morphologic similarity. While S. clandestinus and S. compositus are undoubtedly closely related, I prefer to retain the two as species. [= RAB, C, FNA, F, G, HC, K, S, W, Z; = S. compositus (Poiret) Merrill var. clandestinus (Biehler) J. Wipff \& S.D. Jones]

Sporobolus compositus (Poiret) Merrill var. compositus, Tall Dropseed. Pd (NC?, VA), Mt, Cp (VA): diabase glades and barrens, limestone glades and barrens, disturbed areas over diabase or calcareous rocks; rare (NC Watch List, VA Rare). September-November. This species and variety are reported for NC in a recent revision of the S. asper group (Riggins 1977); little is known about the occurrence of this species in NC. The general range is centered in the Plains, but extending east into ne. United States. The name S. compositus has nomenclatural priority over the more familiar S. asper (Kartesz \& Gandhi 1995). [= FNA, K; = S. asper (Michaux) Kunth var. asper -- C, G, HC, Z; = S. asper -- F, S, in the narrow sense]

Sporobolus cryptandrus (Torrey) A. Gray, Sand Dropseed. Cp? (NC?): disturbed areas; rare, probably adventive from c. and $w$. North America. This species is reported for NC by HC, F, and S. [= C, FNA, G, K, HC, S, X; S. cryptandrus var. cryptandrus -- F]

Sporobolus curtissii (Vasey ex Beal) Small ex Scribner, Curtiss's Dropseed. Cp (GA, SC): moist, gummy-clay flatwoods; uncommon (rare north of GA). September-November. E. SC south to c. FL. First positively documented for our area in 1993. Earlier attributions of S. curtissii to NC and SC were apparently based on misapplication or confusion with S. teretifolius and/or Sporobolus pinetorum. S. curtissii differs from other "bunchgrass" Sporobolus of our area in having the spikelets short-pedicelled and appressed against the panicle branches (as opposed to long-pedicelled and spreading in S. teretifolius and Sporobolus pinetorum). [= FNA, HC, K, S, Y]
*? Sporobolus domingensis (Trinius) Kunth, Coral Dropseed. Cp (GA): coastal sands?; rare, uncertain whether native or introduced. Se. GA south to s. FL; West Indies, Mexico. The e. GA record (Glynn County) is at Univ. of Georgia (Sorrie, pers. comm.). [= FNA, HC, K, S]

Sporobolus floridanus Chapman, Florida Dropseed. Cp (GA, SC): wet savannas; uncommon (rare north of GA). JuneSeptember. Se. SC south to ne. FL, west to Panhandle FL. First positively documented for our area in 1995. Earlier attributions of S. floridanus to NC and SC were apparently based on misapplication or confusion with Sporobolus pinetorum. [= FNA, K, Y; < S. floridanus -- RAB, GW, HC, S, in part only (also see S. pinetorum); the inclusion of S. floridanus in RAB was based on a misidentification of $S$. pinetorum]

Sporobolus heterolepis (A. Gray) A. Gray, Prairie Dropseed. Mt (GA, NC, VA): barrens and glades over mafic, ultramafic, and calcareous rocks (olivine, serpentine, limestone); rare (NC Endangered, VA Rare). August-September. The primary distribution of S. heterolepis is in the Plains, with outliers east to nw. GA (Jones \& Coile 1988), w. NC, w. VA, se. PA, ne. United States, and adjacent Canada in calcareous, mafic, or ultramafic glades, barrens, and prairies. [= RAB, C, F, FNA, G, HC, K, W, Y]

* Sporobolus indicus (Linnaeus) R. Brown, Smut Grass, Blackseed. Cp, Pd, Mt (GA, NC, SC, VA): roadsides, lawns, disturbed situations; common, introduced from the tropics of Asia. July-October. [= C, FNA, GW, HC, W; S. poiretii (Roemer \& J.A. Schultes) A.S. Hitchcock -- RAB, F, G; S. poiretii -- HC; S. berteroanus (Trinius) A.S. Hitchcock \& Chase -- S; S. indicus var. indicus -- K]

Sporobolus junceus (Palisot de Beauvois) Kunth, Sandhills Dropseed. Cp (GA, NC, SC), Pd (GA, NC, SC, VA): sandhills, other dry, open areas; common, uncommon in Piedmont (VA Rare). September-October. Se. VA south to FL and west to se. TX. [= RAB, C, F, FNA, G, HC, K, Y; = S. gracilis (Trinius) Merr. -- S]

Sporobolus neglectus Nash, Barrens Dropseed. Mt (VA): dry rocky barrens and outcrops, over calcareous rocks (such as limestone or dolomite); rare (VA Rare). August-September. ME west to ND, south to NJ, w. VA, TN, LA, and TX; apparently disjunct in WA and AZ. S. ozarkanus, S. neglectus, and S. vaginiflorus form a still very poorly understood complex. [= C, F, FNA, G, HC, K, S, W]

Sporobolus ozarkanus Fernald, Ozark Dropseed. Pd (NC): diabase glades; rare (NC Rare). September-October. KY west to KS, south to e. TN, AR, and TX; disjunct in c. NC. In Granville County, NC, it is associated (on glades of diabase, a mafic rock) with other taxa with affinities to midwestern glades and prairies: Oligoneuron rigidum, Oligoneuron album, Baptisia australis var. aberrans, Symphyotrichum depauperatum, Silphium terebinthinaceum, Parthenium auriculatum, Ruellia humilis, and others. S. ozarkanus, S. neglectus, and S. vaginiflorus form a still very poorly understood complex. [= C, F, G, HC, K; = S. vaginiflorus (Torrey ex A. Gray) Wood var. ozarkanus (Fernald) Shinners -- FNA, K]

Sporobolus pinetorum Weakley \& P.M. Peterson, Carolina Dropseed, Savanna Dropseed. Cp (GA, NC, SC): wet savannas, savanna-pocosin ecotones, sandhill-pocosin ecotones, and extending upslope into mesic flatwoods or loamy or clayey shelves in the fall-line sandhills; rare (GA Rare, NC Watch List, SC Rare). June-September (and into December in response to growingseason fire). The identity of this taxon has been obscure; it is now clear that it is a previously unrecognized species, endemic to NC, SC, and adjacent e. GA. RAB included it in their concept of $S$. teretifolius, though it does not key well (keying imperfectly to either $S$. floridanus or S. heterolepis); in S and HC, it will key to S. floridanus, but the leaves are much narrower. Additionally, S. floridanus is a taller and coarser plant, the culms often averaging about 1.5 meters in height and 2-3 mm in diameter basally (vs. 1 meter high and 1 mm in diameter for Sporobolus pinetorum). In wet savannas of Columbus County, NC, S. species 1 occurs with true S. teretifolius (the two codominant over many hectares!), and the two taxa are manifestly distinct. The leaves of S. pinetorum are not terete; after lengthy drought in the field (or dry on an herbarium sheet), the leaves become tightly folded to involute and can appear wiry. Like many Southeastern pineland grasses, S. pinetorum flowers only following fire. In vegetative condition it may be distinguished from Aristida stricta and A. beyrichiana, with which it often grows, by the leaf pubescence ( $S$. pinetorum with scaberulous margins, best felt by running a finger along the margin near the base, from apex towards base, $A$. stricta and $A$. beyrichiana not scaberulous, and with a sparse line of pilose hairs running more or less the length of the leaf in $A$. stricta and sometimes in A. beyrichiana) and base (much more indurated and polished in Sporobolus than in Aristida). [= FNA, K, Y; < S. teretifolius - RAB, in part; S. floridanus -- RAB, misapplied; ? S. floridanus Chapman -- HC, S, in part only, misapplied]

Sporobolus teretifolius Harper, Wireleaf Dropseed. Cp (GA, NC, SC): wet savannas, pitcherplant bogs; rare (US Species of Concern, GA Rare, NC Threatened). July-September (and later in response to growing-season fire). Very similar vegetatively to Aristida stricta, S. teretifolius can be distinguished by its tuft of hairs at the base of the otherwise glabrous blade (as opposed to line of pilose hairs the length of the blade in A. stricta). This very rare species is known only from se. NC, ne. SC, s. GA. Many of the counties reported for this species in RAB actually are based on misidentified specimens of Sporobolus pinetorum. In a few very wet savannas of Columbus and Brunswick counties, NC, S. teretifolius is dominant or codominant over many hectares. Like many savanna grasses, S. teretifolius generally flowers only following fire. [= FNA, HC, K, S, Y; < S. teretifolius -- RAB, in part only (see also Sporobolus species 1)]

Sporobolus vaginiflorus (Torrey ex A. Gray) Wood, Poverty Dropseed. Pd, Mt (GA, NC, SC, VA), Cp (VA): glades, abarrens, open disturbed sites; uncommon. September-October. The species occurs nearly throughout e. United States. S. ozarkanus, S. neglectus, and S. vaginiflorus form a still very poorly understood complex. [=RAB, C, G, HC, W; = S. vaginiflorus var. vaginiflorus -F, FNA, K; = S. vaginaeflorus -- S, an orthographic variant]

Sporobolus virginicus (Linnaeus) Kunth, Seashore Dropseed, Coastal Dropseed. Cp (GA, NC, SC): salt marshes, tidal mud flats, and low dunes in the outer Coastal Plain; rare (NC Watch List). September-October. This species occurs from se. NC along the coast to TX, in the West Indies and into $n$. South America (its alleged occurrence in se. VA is apparently incorrect). Sporobolus virginicus is similar in aspect and growth form to Distichlis spicata, with which it occurs in tidal flats. Sporobolus virginicus is more delicate, and typically has long hairs on either side of the collar of the sheath; Distichlis spicata is generally a coarser plant, and lacks long hairs around the collar of the sheath. [= RAB, C, F, FNA, G, GW, HC, K, S]

* Sporobolus airoides (Torrey) Torrey. Cp (SC): waste areas near wool-combing mills; rare, intoduced from, not known to be established or persistent. [= FNA, K] \{not keyed; add synonymy\}

Sporobolus compositus (Poiret) Merrill var. drummondii (Trinius) Kartesz \& Gandhi, ranges east to the Ridge and Valley province of e. TN (Chester et al. 1993), occurring over limestone, and allegedly to KY and GA (Kartesz 1999). It could very likely occur in sw. VA, as it is in Hawkins County, TN, immediately adjacent to VA (Chester et al. 1993). [ F FNA, K; = S. asper (Michaux) Kunth var. drummondii (Trinius) Vasey -- C, Z; = S. drummondii (Trinius) Vasey -- F, S; S. asper var. hookeri (Trinius) Vasey -- G, HC, misapplied]

* Sporobolus fimbriatus (Trinius) Nees. Cp (SC): waste areas near wool-combing mills; rare, intoduced from, not known to be established or persistent. [= FNA, K] \{not keyed; add synonymy\}
* Sporobolus flexuosus (Thurb. ex Vasey) Rydberg. Cp (SC): waste areas near wool-combing mills; rare, intoduced from , not known to be established or persistent. [= FNA, K] \{not keyed; add synonymy\}
* Sporobolus tenuissimus (Martius ex Schrank) Kuntze. Cp (SC): waste areas near wool-combing mills; rare, intoduced from , not known to be established or persistent. [=FNA, K] \{not keyed; add synonymy\}
* Sporobolus wrightii Munro ex Scribner. Cp (SC): waste areas near wool-combing mills; rare, intoduced from, not known to be established or persistent. [= FNA, K] \{not keyed; add synonymy\}

## Steinchisma Rafinesque 1830 (Gaping Panic Grass)

A genus of about 6 species, perennial herbs, of s. North America, Central America, and South America. See discussion following Panicum regarding generic concepts. References: Zuloaga et al. (1998)=Z; Freckmann \& Lelong in FNA (2003a).

Steinchisma hians (Elliott) Nash, Gaping Panic Grass. Cp (GA, NC, SC, VA), Pd (GA, NC, SC), Mt (GA): stream, pond, and lake shores, low woods, cypress-gum ponds, floodplains, marshes, ditches, seepage slopes; common in Piedmont, occasional in Coastal Plain. May-October. Se. VA south to FL, west to TX and OK, and south through Mexico and Central America to Colombia;
also in s. South America. The large, thickened, pale sterile palea of this species is unique among panicoids of our region; it is one of several characters that has led to the segregation of Steinchisma as a genus, or as a subgenus of Panicum. The enlargement of the sterile palea causes the spikelet to spread open, or "gape." [= FNA, K, Z; = Panicum hians Elliott -- RAB, C, F, G, GW, HC, S, W]

## Stenotaphrum Trinius (St. Augustine Grass)

References: Allred in FNA (2003a); Sauer (1972)=Z.
Stenotaphrum secundatum (Walter) Kuntze, St. Augustine Grass, Carpet Grass. Cp (GA, NC, SC): brackish marshes, roadsides, lawns; common. July-October. A pioneer species of beaches and shores, S. secundatum was known from the Carolinas prior to 1800. It has been interpreted as native or introduced in our area; its original range is probably now impossible to determine. Sauer (1972) maps it as widespread along the coasts of s. North America, Central America, South America, the West Indies, Africa, Australia, and sw. Pacific Islands. In our area it is certainly now more frequently encountered as a lawn or roadside grass than in anything that could be construed as a natural habitat. The other 6 species in the genus are Asian, or on islands of the sw. Pacific or Indian Oceans. [= RAB, FNA, HC, K, S, Z]

Stipa<br>(see Nassella and Piptochaetium)

## Thinopyrum (Prat) Á. Löve

References: Tucker (1996)=Z; Barkworth (1997)=Y.

* Thinopyrum intermedium (Host) Barkworth \& D.R. Dewey is reported for nc. GA by Jones \& Coile (1988), as Agropyron intermedium. Tucker (1996) states that the record is as a waif in railroad yards. [=K, Z; = Elytrigia intermedia (Host) Nevski; = Agropyron intermedium (Host) Palisot de Beauvois] \{not yet keyed; add to synonymy\}
* Thinopyrum ponticum (Podp.) Z.W. Liu \& R. R.-C. Wang, Tall Wheatgrass. Cp (SC): waste areas near wool-combing mills; rare, intoduced from \{\}, not known to be established or persistent. [= K; Agropyron elongatum (Host) Palisot de Beauvois] \{not yet keyed; add to synonymy\}

## Torreyochloa Church (Pale Mannagrass)

A genus of 4 species, with a classic Tertiary moist temoperate disjunct pattern; Torreyochloa is distributed in e. North America (our taxa), one species in the Pacific Northwest, and two in e. Asia (Tucker 1996). References: Davis (1991)=Y; Tucker (1996)=Z.

1 Leaf blades 1-3 mm wide; anthers 0-.2-0.5 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [T. pallida var. fernaldii]
1 Leaf blades 4-8 mm wide; anthers ca. 1 mm long . . . ..................................................... T. pallida var. pallida
Torreyochloa pallida (Torrey) Church var. pallida, Pale Mannagrass. Mt (GA, NC, VA), Cp (NC, VA), Pd (SC): bogs, mucky wetlands such as old beaver-ponds, pools in cypress swamps, drawdown shores of natural ponds; rare (GA Special Concern, NC Rare). June-July. The species as a whole is widespread in e. North America. Var. pallida ranges from Nova Scotia west to MN, south to e. VA, se. NC (Columbus County), nw. NC (Avery County), and nw. GA (Jones \& Coile 1988). Var. pauciflora (J. Presl) J.J. Davis is distributed in w. North America. Intermediates occur between the varieties. [=K, Y, Z; < Glyceria pallida (Torrey) Trinius -RAB, GW, HC, W, infraspecific taxa not distinguished; < Puccinellia pallida (Torrey) Clausen -- C, infraspecific taxa not distinguished; = G. pallida -F , in a narrow sense, distinguished from G. fernaldii (A.S. Hitchcock) St. John; = G. pallida var. pallida -- G; = Panicularia pallida (Torrey) Kuntze -- S]

Torreyochloa pallida (Torrey) Church var. fernaldii (A.S. Hitchcock) Dore ex Koyama \& Koyama ranges from Newfoundland west to MN, south to WV and TN. [= K, Y, Z; < Glyceria pallida (Torrey) Trinius -- RAB, GW, HC, W, infraspecific taxa not distinguished; < Puccinellia pallida (Torrey) Clausen -- C, infraspecific taxa not distinguished; = G. fernaldii (A.S. Hitchcock) St. John -- F; = G. pallida var. fernaldii A.S. Hitchcock -- G]

## Tragus Haller

* Tragus racemosus (Linnaeus) Allioni, Texas Bur. Cp (NC): on ballast near old seaports; rare, introduced from the Old World, probably no longer present. [= HC, C, F, G, K]

Other species have been collected as wool combing mill waifs in the Coastal Plain of SC: Tragus australianus S.T. Blake, Tragus berteronianus J.A. Schultes, and Tragus heptaneuron W.D. Clayton. There is no evidence that they are established. \{not keyed\}

Tridens Roemer \& J.A. Schultes (Triodia, Redtop, Tridens, Fluffgrass)
A genus of about 14 species, native to the Western Hemisphere. References: Valdés-Reyna in FNA (2003a).
1 Panicle dense and spike-like, more than $4 \times$ as long as wide, the branches ascending to appressed.

| 2 | Plants from elongate rhizomes; lemma 4-5 mm long; spikelet 7-9 mm long | linianus |
| :---: | :---: | :---: |
| 2 | Plants cespitose; lemma $2.5-3 \mathrm{~mm}$ long; spikelet $4-6 \mathrm{~mm}$ long | T. strictus |

1 Panicle open and spreading, less than $4 \times$ as long as wide, the branches well-developed and spreading-ascending to reflexed.
3 Spikelets $4-5 \mathrm{~mm}$ long, $2.5-3.5 \mathrm{~mm}$ wide
T. ambiguus

## 3 Spikelets $6-8 \mathrm{~mm}$ long, $1.5-2.2 \mathrm{~mm}$ wide.

4 Primary pulvini densely pubescent, the hairs encircling the base of the panicle branch; secondary pulvini pubescent; spikelets mostly on pedicels $3-20 \mathrm{~mm}$ long; main branches of the inflorescence stiffly spreading .... T. chapmanii 4 Primary pulvini glabrous to sparsely pubescent, tufted only in the axil (the upper surface of the panicle branch); secondary pulvini glabrous; spikelets on pedicels mostly less than 3 mm long; main branches of the inflorescence spreading, ascending or drooping
T. flavus

Tridens ambiguus (Elliott) J.A. Schultes, Pineland Triodia, Flatwoods Fluffgrass. Cp (GA, NC, SC): wet savannas, claybased Carolina bays; uncommon (rare north of GA) (NC Rare). August-October. S. NC south to FL, west to e. TX. [= RAB, FNA, GW, HC, K; = Triodia elliottii Bush -- S]

Tridens carolinianus (Steudel) Henrard, Carolina Triodia, Carolina Fluffgrass. Cp (GA, NC, SC): mesic swales in sandhills; rare (GA Rare, NC Rare). August-October. S. NC south to FL, west to LA. [= RAB, FNA, HC, K; = Triodia drummondii Scribner \& Kearney -- S]

Tridens chapmanii (Small) Chase, Chapman's Triodia. Cp (GA, NC, SC, VA): loamy sands of disturbed longleaf pine woodlands, roadsides; rare (NC Watch List). August-October. NJ south to FL, west to TX and OK. [= HC; = Tridens flavus (Linnaeus) A.S. Hitchcock var. chapmanii (Small) Shinners -- RAB, C, FNA, K; = Triodia chapmanii (Small) Bush -- F, G; > Triodia flava (Linnaeus) Smyth -- S, in part]

Tridens flavus (Linnaeus) A.S. Hitchcock, Redtop, Tall Redtop, Purpletop Tridens, Greasy Grass. Cp, Pd, Mt (GA, NC, SC, VA): roadsides, disturbed areas, glades; common. July-October. NH west to NE, south to FL and TX. [= HC; = Tridens flavus var. flavus -- RAB, C, FNA, K; = Triodia flava (Linnaeus) Smyth -- F, G; < Triodia flava (Linnaeus) Smyth -- S, in part (also see Tridens chapmanii); < Tridens flavus -- W, in a broad sense]

Tridens strictus (Nuttall) Nash, Spike Triodia, Longspike Fluffgrass, Longspike Tridens. Cp (GA, NC, SC, VA), Pd (GA, SC, VA): sandhills, moist pine savannas, roadsides; rare (NC Rare, VA Rare). August-October. S. VA south to AL, west to TX, north in the interior to IL and KS. It is possible that this grass is introduced only north and east of GA (thus in our entire area). Rhoads \& Klein (1993) report an old specimen from w. PA. [= RAB, FNA, GW, HC, K; = Triodia stricta (Nuttall) Bentham ex Vasey -- F, G, S]

## Triplasis Palisot de Beauvois (Sandgrass)

A genus of 2 species, of eastern and central North America south through Mexico to Costa Rica. References: Hatch in FNA (2003a).

Identification notes: The foliage of both of our species has a sour taste.
1 Lemma awn 4.5-8 mm long; culm internodes appressed pilose or puberulent; perennial ....................... T. americana
1 Lemma awn 0.5-1.5 mm long; culm internodes glabrous to minutely scaberulous; annual (or rarely perennial).
T. purpurea var. purpurea

Triplasis americana Palisot de Beauvois, Southern Sandgrass. Cp (GA, NC, SC): open sandy areas; common. AugustOctober. A Southeastern Coastal Plain endemic: NC south to FL, west to e. LA. [= RAB, FNA, HC, K, S]

Triplasis purpurea (Walter) Chapman var. purpurea, Purple Sandgrass. Cp (GA, NC, SC, VA): dunes, maritime dry grasslands, open sandy areas; common. September-October. NH south to FL, and west to TX, along the coast; also around the Great Lakes, and in central United States. [= FNA; < T. purpurea - RAB, C, F, G, HC, K, S, infraspecific taxa not distinguished; > $T$. intermedia Nash -- S; > T. purpurea - S]

## Tripsacum Linnaeus (Gamma Grass)

References: Barkworth in FNA (2003a); DeWet, Harlan, \& Brink (1982)=Z.
Tripsacum dactyloides (Linnaeus) Linnaeus var. dactyloides, Gamma Grass. Pd, Mt, Cp (GA, NC, SC, VA): roadsides, moist areas, disturbed areas, moist riverbanks; common. Late May-November. T. dactyloides is widespread in e. North America north to MA, MI, IA, and NE, ranging south into tropical Central and South America; var. dactyloides is North American. This important species of moist and wetland areas in the Great Plains is generally seen in disturbed habitats in our area; its original habitats in our area (if indeed it was native in the flora area) are poorly understood. [= FNA, Z; < T. dactyloides -- RAB, C, G, HC, K, S , W, infraspecific taxa not distinguished; > T. dactyloides var. dactyloides - F; > T. dactyloides var. occidentale Cutler \& Anderson -- F]

Trisetum Persoon (Oat-grass)
(also see Sphenopholis)
References: Randall \& Hilu (1986)=Z; Tucker (1996)=Y.
Trisetum spicatum (Linnaeus) K. Richter, Alpine Oat-grass, Spike Trisetum. Mt (NC, VA): mountain cliffs at high elevations; rare (NC Endangered, VA Rare). June-August. A circumboreal species, widespread and common in arctic and alpine areas, south in e. North America to New England, NY, and, rarely, PA, and disjunct to Hawksbill Mountain, Page County, VA (where extant) and Roan Mountain, Mitchell County, NC (where not seen since the nineteenth century). The species is also known from the West Indies, Mexico, and s. South America. T. spicatum, as broadly treated here, following Randall \& Hilu (1986), is polymorphic and consists of several ploidies. [= C, HC, K, S, Y, Z; > T. spicatum var. molle (Michaux) Beal -- RAB, F, G; > T. triflorum (Bigelow) Löve \& Löve ssp. molle (Michaux) Löve \& Löve -- W; > T. spicatum var. maidenii (Gandoger) Fernald -- F]

Triticum Linnaeus 1753 (Wheat)
References: Tucker (1996)=Z; Zohary \& Hopf (1994).
Triticum aestivum Linnaeus, Bread Wheat. Cp, Pd, Mt (GA, NC, SC, VA): fields; frequently cultivated, rarely persistent or volunteering following cultivation, introduced from Eurasia. May-June. One of the most important crops in the world. The lemmas can either be awnless or with long awns (to 8 cm long). [= RAB, C, F, G, HC, K, Z]

## Uniola Linnaeus (Sea Oats) (also see Chasmanthium)

A genus of 2 species. The only other species of the genus ranges from Baja California south along the Pacific Ocean to Ecuador; other species previously treated in Uniola have been shown to be only distantly related and are now treated as Chasmanthium. References: Yates in FNA (2003a); Yates (1966a, 1966b)=Z.

Uniola paniculata Linnaeus, Sea Oats. Cp (GA, NC, SC, VA): abundant on unforested primary and secondary dunes on barrier islands, and on dry to mesic sand flats and interdune swales; common (VA Watch List). June-November. Se. VA south to FL and west to TX and Mexico; West Indies. This is the most important sand-binding grass on ocean dunes from NC south, playing a critical role in primary succession on dunes. It is against the law in NC to pick or destroy Uniola paniculata. [= RAB, C, F, FNA, G, HC, K, S, Z]

Urochloa Palisot de Beauvois (Para-grass, Signal-grass)
References: Crins (1991)=Z; Webster (1988)=Y; Wipff \& Thompson in FNA (2003a). Key adapted in part from GW.
1 Spikelets suffused with purple, borne in pairs (or threes) in each row . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . U. mutica
1 Spikelets green, borne singly in each row.

* Urochloa mutica (Forskål) Nguyen, Para-grass. Cp (SC): margin of pond; rare, introduced from Africa. August. [= FNA, K, Z; Panicum purpurascens Raddi -- RAB, HC; B. purpurascens (Raddi) Henrard -- GW; = Brachiaria mutica (Forskål) Stapf]

Urochloa platyphylla (Munro ex Wright) R. Webster, Broadleaf Signal-grass. Cp (GA, NC, SC, VA), Pd (GA, SC, NC): disturbed wet or seasonally moist areas; rare, presumably introduced from South America. E. NC south to FL, west to TX, north in the interior to AR, OK, and se. MO; also in MD (Terrell \& Reveal (1996). [= FNA, K, Y, Z; = Brachiaria platyphylla (Munro ex Wright) Nash -- RAB, GW, HC; B. extensa Chase -- S]

* Urochloa ramosa (Linnaeus) Nguyen, Browntop Millet, Dixie Signalgrass. Pd, Cp (GA, NC, SC, VA): disturbed areas; rare, introduced from tropical Africa and Asia. This species has apparently been widely planted for wildlife food and erosion control in southeastern states. [= FNA, K, Z; = Panicum ramosum Linnaeus -- HC; = Brachiaria ramosa (Linnaeus) Stapf]
* Urochloa texana (Buckley) R. Webster, Texas Millet, Texas Signalgrass. Cp (GA, NC, SC, VA), Pd (GA, SC): disturbed areas, fields, gardens; uncommon, introduced from TX. First reported for South Carolina by Hill \& Horn (1997). [= K, Y, Z; = Panicum texanum Buckley -- RAB, C, HC, S; = Brachiaria texana (Buckley) S.T. Blake]

Urochloa fusca (Swartz) B.F. Hansen \& Wunderlin var. reticulata (Torrey) B.F. Hansen \& Wunderlin, east to GA (Kartesz 1999). [Urochloa fasciculata (Sw.) R. Webster -- K; Panicum fasciculatum Swartz - HC] \{not yet keyed; add synonymy\}

* Urochloa maxima (Jacquin) R. Webster var. maxima, Guinea Grass. Introduced in the Gulf states, east to GA (FNA). Native of Africa. [= FNA; U. maxima - K, infraspecific taxa not distinguished; Panicum maximum Jacquin] \{not yet keyed; add synonymy\} * Urochloa plantaginea (Link) R. Webster. Cp (GA): Reported for s. GA by Jones \& Coile (1988), as Brachiaria plantaginea. [= FNA, K, Y, Z; Brachiaria plantaginea (Link) A.S. Hitchcock] \{not yet keyed; add synonymy\} Urochloa reptans (Linnaeus) Stapf. Cp (GA): [= FNA] \{not yet keyed; add synonymy\}

2 Lemma glabrous or scabrous; lowest lemma 2.7-7 mm long; grains 1.7-3.3 mm long.
3 First glume 1.7-4.5 mm long; lemma awns 3-12 mm long; spikelets with 4-7 loosely imbricate florets; rachilla internodes mostly $0.9-1.1 \mathrm{~mm}$ long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . V. bromoides
3 First glume 3.5-5 mm long; lemma awns 0.3-6 (-9) mm long; spikelets with 5-11 (-more) closely imbricate florets; rachilla internodes mostly $0.5-0.7 \mathrm{~mm}$ long.
4 Spikelets 4-5.5 mm long; awn of the lowest lemma 2.5-6 (-9) mm long . . . . . . . . . . V. octoflora var. glauca
4 Spikelets $5.5-10 \mathrm{~mm}$ long; awn of the lowest lemma 0.3-3 mm long . . . . . . . . . . . V. octoflora var. octoflora

* Vulpia bromoides (Linnaeus) S.F. Gray, European Squirreltail Fescue, Brome Fescue. Cp (VA): sandy disturbed areas; rare introduced from Eurasia. [= C, K, Z; Festuca dertonensis (Allioni) Ascherson \& Graebner -- G, HC]

Vulpia elliotea (Rafinesque) Fernald, Squirreltail Fescue. Cp (GA, NC, SC, VA), Pd (GA): sandy roadsides, fields, disturbed areas; common. April-May. S. NJ south to FL, west to TX, and north in the interior to MO. [= C, F, K; = Vulpia sciurea (Nuttall) Henrard -- Z; = Festuca sciurea Nuttall -- RAB, G, HC, S]

* Vulpia myuros (Linnaeus) K.C. Gmelin, Rat-tail Fescue. Cp (NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC): roadsides, fields, disturbed areas; common, introduced from Eurasia. May-June. [= C, F, K, Z; = Festuca myuros Linnaeus -- RAB, G, HC, S, W]

Vulpia octoflora (Walter) Rydberg var. glauca (Nuttall) Fernald, Northern Six-weeks Fescue. \{Cp, Pd, Mt (GA, NC, SC, VA): fields, roadsides, disturbed areas; common.\} April-June. S. ME west to British Columbia, south to GA, AR, TX, and CA. [= C, K; < Festuca octoflora Walter -- RAB, GW, S, W, infraspecific taxa not distinguished; = Festuca octoflora var. tenella (Willdenow) Fernald -- F, G, HC; < Vulpia octoflora -- Z, infraspecific taxa not distinguished]

Vulpia octoflora (Walter) Rydberg var. octoflora, Southern Six-weeks Fescue. \{Cp, Pd, Mt (GA, NC, SC, VA): fields, roadsides, disturbed areas; common.\} April-June. S. NJ south to FL, west to TX, north in the interior to MO and OK. [= C, F, K; Festuca octoflora Walter -- RAB, GW, S, W, infraspecific taxa not distinguished; Festuca octoflora var. aristulata Torrey ex L.H. Dewey -- G; Festuca octoflora var. octoflora -- HC; Vulpia octoflora -- Z, infraspecific taxa not distinguished]

## Zea Linnaeus (Corn, Maize)

A genus of about 5 species, native of Mexico and Central America. References: Iltis in FNA (2003a).

1 Pistillate spikelets embedded in a hardened rachis.
$\qquad$
$\qquad$

* Zea mays Linnaeus ssp. mays, Corn, Maize. Cp, Pd, Mt (GA, NC, SC, VA): very commonly cultivated, rarely volunteering in old fields or around trashpiles; common in cultivation, rare as a short-lived escape. June-October. Zea is one of the most important cultivated plants in the world, originating in Mexico, probably from Zea mays ssp. parviglumis Iltis \& Doebley. It was initially cultivated in sw. Mexico (before 8000 BP ), spreading to the sw. United States before 5000 BP , and to the e. United States by 2000 years BP. At the time of European contact, Zea mays ssp. mays was an important staple crop from s. Canada south to s, South America (Hancock 2004). [= FNA, K; < Z. mays -- RAB, F, HC, S, infraspecific taxa not distinguished]
* Zea perennis (A.S. Hitchcock) Reeves \& Manglesdorf, Mexican Teosinte. Cp (SC): disturbed areas; rare, apparently established at least formerly. Z. perennis was considered by HC to be "established on James Island, S.C." [= K; = Euchlaena perennis A.S. Hitchcock -- HC]
* Zea mays (Schrader) Kuntze ssp. mexicana (Schrader) H.H. Iltis, Chalco Teosinte, Nobogame Teosinte. Reported for AL and FL (Kartesz 1999). HC state that this taxon is "occasionally cultivated in the Southern States for green forage" and is similar to $Z$. perennis, except in being, like Z. mays ssp. mays, a coarse annual. It is considered to be an ancestor of Zea mays. [= FNA; = Z. mexicana (Schrader) Kuntze -- K; = Euchlaena mexicana Schrader -- HC, S]

## Zizania Linnaeus (Wild-rice)

A genus of 4 species (and 6 taxa) of northern and eastern North America. References: Terrell et al. (1997)=Y; Tucker (1988)=Z; Judziewicz et al. (2000)=X.

Zizania aquatica Linnaeus var. aquatica, Northern Wild-rice. Cp (GA, NC, SC, VA): freshwater marshes, usually tidal; common (uncommon in NC). May-October. Var. aquatica ranges from ME west to WI, south to FL and LA; var. brevis Fassett is restricted to the St. Lawrence River in Québec. Zizania was formerly an important food for Amerindians; it is now gathered as a specialty grain, commanding high prices. [=C,F,G,HC,K, X, Y, Z; Z. aquatica -- RAB, GW, S, infraspecific taxa not distinguished]

## Zizaniopsis Döll \& Ascherson (Southern Wild-rice)

References: Tucker (1988)=Z; Judziewicz et al. (2000)=Y.
Identification notes: Superficially similar to Zizania in its habitat and large size, Zizaniopsis may be distinguished by its very different inflorescence and by its stout horizontal rhizomes (Zizania is annual or perennial, but not rhizomatous).

Zizaniopsis miliacea (Michaux) Döll \& Ascherson, Southern Wild-rice, Water-millet, Giant Cutgrass. Cp (GA, NC, SC, VA): brackish and freshwater marshes; common. May-July. MD south to FL, west to TX, north in the interior to MO, and disjunct in w. Mexico. The other species of the genus are South American. [= RAB, C, F, G, GW, HC, K, S, Y, Z; = Zizania miliacea Michaux]

## Zoysia Willdenow (Zoysia)

* Zoysia japonica Steudel, Zoysia, is used as a lawn grass. Reported for VA (Kartesz 1999). It is not known to naturalize in our area. [= C, HC, K]
* Zoysia matrella (Linnaeus) Merr. var. matrella, Zoysia, is used as a lawn grass. Reported for GA (Kartesz 1999). It is not known to naturalize in our area. [= K; = Z. matrella -- HC, in the narrow sense]

## PONTEDERIACEAE Kunth in Humboldt, Bonpland, \& Kunth 1816 (Pickerelweed Family)

A family of about 9 genera and 33 species, primarily of the tropics, but with some temperate representatives. References: Rosatti (1987a); Cook in Kubitzki (1998b); Horn in FNA (2002a).

1 Plant floating (or stranded by dropping water levels), the petioles expanded into air-filled floats; perianth lobes 3-4 cm long ...
. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Eichhornia

1 Plant rooted, the petioles not adapted as floats; perianth lobes $0.4-1.0 \mathrm{~cm}$ long.
2 Leaves lanceolate to ovate, 1.5-10× as long as wide, the base cordate, truncate, or cuneate; flowers 2-lipped; corolla blue, marked with yellow; stamens 6 ( 3 each of 2 different lengths) . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Pontederia
2 Leaves either reniform, 0.5-1.5× as long as wide, the base cordate, or narrowly linear, 20-50× as long as wide, the base attenuate; flowers radially symmetrical; corolla white, pale blue, or yellow; stamens 3

Heteranthera

Eichhornia Kunth 1842 (Water Hyacinth)
A genus of $7-8$ species, native of tropical America and Africa, but now introduced widely in warm regions. References: Cook in Kubitzki (1998b); Horn in FNA (2002a).

* Eichhornia crassipes (Martius) Solms-Laub, Water Hyacinth. Cp (GA, NC, SC, VA), Pd (GA, NC): ponds, ditches, sluggish water; uncommon, introduced from South America. June-September. E. crassipes is "generally considered the world's most serious aquatic weed" (Rosatti 1987). Originally native to tropical South America, E. crassipes is now a widespread naturalized weed throughout the tropics and subtropics. In the northern part our area, water hyacinth is rare, probably not long persisting. Further south, it can be an aggressive aquatic weed. [= RAB, C, F, FNA, G, GW, K; = Piaropus crassipes (Martius) Rafinesque -- S]

```
Heteranthera Ruiz \& Pavón 1794 (Mud-plantain)
(also see Zosterella)
```

A genus of 10-12 species, of tropical and temperate America and tropical Africa. References: Cook in Kubitzki (1998b); Horn (1998) $=$ Z; Horn in FNA (2002a).

1 Leaves narrowly linear, 20-50× as long as wide, the base attenuate; flowers solitary, the corolla yellow; stamens and anthers all alike .................................................................................................... H. dubia
1 Leaves reniform, 0.5-1.5× as long as wide, the base cordate; flowers 1 -several, the corolla white or pale blue; stamens and
anthers dimorphic.
2 Spathe with solitary flower; perianth tube $15-45 \mathrm{~mm}$ long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [H. limosa]
2 Spathe with 2-several flowers; perianth tube 3-12 mm long.
3 Anthers and filaments with dark purple hairs; internode below the spathe $<1 \mathrm{~cm}$ long; spike with (3-) $7-16$ flowers, typically elongating well out of the spathe
H. multiflora

3 Anthers and filaments with white hairs; internode below the spathe $>1 \mathrm{~cm}$ long; spike with 2-8 flowers, typically mostly included within the spathe
H. reniformis

Heteranthera dubia (Jacquin) MacMillan, Water Stargrass. Mt (NC, VA), Pd (VA), Cp (VA): streams, rivers; uncommon (rare in NC). August-September. Québec west to WA, south to Cuba and Central America, but rare or absent in much of the se. United States. The attribution of this species to SC is in error (as by Kartesz 1999), based on a misidentified specimen (C. Horn, pers. comm.). [= RAB, F, FNA, GW, K, W; = Zosterella dubia (Jacquin) Small - C, G, S]

Heteranthera multiflora (Grisebach) Horn. Cp (NC, VA): in shallow, stagnant water in floodplains, or emersed on mud; rare (NC Watch List). June-October. IL west to NE, south to MS; also on the Atlantic Coastal Plain from NJ south through PA to ne. NC; also in South America (Brazil, Paraguay, Argentina, and Venezuela). [= C, FNA, K, Z]

Heteranthera reniformis Ruíz \& Pavón. Cp (NC, VA), Pd (GA, NC, SC, VA): in shallow, stagnant water in floodplains, or emersed on mud; uncommon (SC Rare). June-October. CT west to NE, south to FL and TX and into South America. First reported for South Carolina by Hill \& Horn (1997). [= RAB, C, F, FNA, G, GW, K, S, W, Z]

Heteranthera limosa (Swartz) Willdenow occurs east to TN, KY, and FL (Kartesz 1999); it is attributed to VA in Small (1933), but the documentation is not known. [= FNA, C, F, G, K] \{add synonymy\}

Heteranthera rotundifolia (Kunth) Grisebach occurs east to KY. [= FNA, C, K] \{not yet keyed; add synonymy\}

## Pontederia Linnaeus 1753 (Pickerelweed)

A genus of 3-6 species, from North America to South America. References: Lowden (1973)=Z; Cook in Kubitzki (1998b); Horn in FNA (2002a).

1 Floral tube villous when young, essentially glabrous to sparsely glandular in maturity; leaves primarily ovate to triangularlanceolate, 2.2-21 cm wide, the base generally cordate or truncate (rarely cuneate) . . . . . . . . . . . . . . P. cordata var. cordata 1 Floral tube persistently pubescent with short glandular hairs; leaves lanceolate, 0.4-8.3 cm wide, the base generally cuneate to truncate P. cordata var. lancifolia

Pontederia cordata Linnaeus var. cordata, Heartleaf Pickerelweed. Cp, Pd (GA, NC, SC, VA), Mt (NC): marshes, pondshores, lake-shores; common, uncommon in Piedmont, rare in Mountains. May-October. Nova Scotia west to MN, south to FL and TX; Belize; s. Brazil, Argentina, Paraguay, and Uruguay. The recognition of infraspecific taxa in Pontederia cordata is controversial and requires additional study. P. cordata exhibits tristyly, an interesting breeding system. Each plant has one of 3 types of flowers: (a) a short style, 3 medium and 3 long stamens, (b) a medium style, 3 short and 3 long stamens, or (c) a long style, 3 short and 3 medium stamens. [= GW, Z; < P. cordata -- RAB, C, FNA, K, W, infraspecific taxa not distinguished; = P. cordata -- F, G, S (sensu stricto)]

Pontederia cordata Linnaeus var. Iancifolia (Muhlenberg ex Elliott) Torrey, Lanceleaf Pickerelweed. Cp (GA, NC, SC): marshes, pond-shores, lake-shores; rare. May-October. S. MA (alleged to occur as far north as ME, but these reports may be entirely based on misidentifications of var. cordata) to s. FL, west to e. TX, mostly on the Coastal Plain, with a few records around the Great Lakes; Cuba; s. Brazil, Argentina, Paraguay, and Uruguay. A third variety of $P$. cordata, var. ovalis (Martens in Roemer \& Schultes) Solms in Augustin de Candolle, is restricted to South America. [= GW, Z; < P. cordata -- RAB, C, FNA, K, W, infraspecific taxa not distinguished; = P. lanceolata Nuttall -- F, G, S]

## Zosterella Small 1913

(see Heteranthera)

## POTAMOGETONACEAE Dumortier 1829 (Pondweed)

A family of 2-3 genera and about 90 species, aquatic herbs, nearly cosmopolitan. References: Haynes \& Hellquist in FNA (2000); Haynes (1978); Les \& Haynes (1996); Haynes, Les, \& Holm-Nielsen in Kubitzki (1998b); Wiegleb \& Kaplan (1998)=Z.

1 Stipules not adnate, or adnate to the blade less than $1 / 2$ the length of the stipule; peduncle stiff, the flowering spike elevated above the water's surface; submersed leaves translucent, flat, flexible; floating leaves present or absent. Potamogeton
1 Stipules adnate to the blade for at least $2 / 3$ the length of the stipule; peduncle flexible, the flowering spike submersed; submersed leaves opaque, channeled, stiff; floating leaves absent Stuckenia

A genus of about 80 species, aquatic herbs, nearly cosmopolitan. References: Haynes \& Hellquist in FNA (2000); Haynes \& Hellquist (1996); Wiegleb \& Kaplan (1998). Treatment adapted from Haynes \& Hellquist in FNA (2000).
1 Stipular sheaths of submersed leaves adnate with leaf blade base, the tip usually projecting as a ligule .............. . Key A 1 Stipular sheaths of submersed leaves free from the leaf blade base, or with only a few adnate, the ligule not obvious.
2 Submersed leaves broadly linear-oblong to lanceolate to elliptic or nearly orbicular, 10-58 mm wide (occasional stranded forms lack submersed leaves)
Key B
2 Submersed leaves linear, thread-like or ribbon-like, 0.1-10 mm wide ............................................ Key C

## Key A

1 Leaves stiffish, conspicuously 2-ranked, auriculate-lobed to rounded at the junction with the stipule, with 20-60 fine veins ...
$\qquad$
1 Leaves lax, not conspicuously 2-ranked, lacking basal lobes, with fewer than 20 veins.
2 Tips of submersed leaves obtuse to acute; floating leaves rounded at apex.
3 Tips of submersed leaves acute; fruit 1-2 mm wide, the lateral keel with acute tips, beak minute ... P. diversifolius 3 Tips of submersed leaves obtuse; fruit $1.3-2.4 \mathrm{~mm}$ wide, the lateral keel with blunt tips, beak lacking ... P. spirillus
2 Tips of submersed leaves acute to long-tapering; floating leaves acute at apex.
4 Submersed leaves 0.1-0.6 mm wide, without obvious lacunae; floating leaves 3-7 veined ......... . P. bicupulatus
4 Submersed leaves 0.2-1 (-2) mm wide, with abundant lacunae; floating leaves 9-23 veined ..... P. tennesseensis

## Key B

## Key C

1 Fruit with a prominent keel 0.2-1.2 mm broad; floating leaves often present; lacunae prominent in submersed leaves.
2 Submersed leaves 3-13 veined; stipules of submersed leaves not adnate to the leaf base; floating leaves rounded at apex P. epihydrus

2 Submersed leaves 1-3 (-7) veined; stipules of at least some submersed leaves adnate to the leaf base; floating leaves acute at apex . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. tenneseensis

1 Fruit with a keel less than 0.2 mm broad; floating leaves absent or present; lacunae present in some species, but generally not prominent.
3 Floating leaves present, at least in some plants of the population.
4 Floating leaves $0.3-1.6 \mathrm{~cm}$ long; peduncle $0.6-1.5 \mathrm{~cm}$ long; fruit less than 2.5 mm long

> [P. vaseyi]

4 Floating leaves 1.5-12 cm long; peduncle 2.5-3.5 mm long; fruit 2.5-5 mm long.
5 Petiole junction with leaf distinctly pale in color; floating leaves ovate, oblong-ovate, cordate at base, rarely tapering . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. natans
$5 \quad$ Petiole junction with leaf lacking pale color; floating leaves elliptical, ovate-elliptical, or oblong-elliptical.
6 Floating leaves 7-12 mm wide, tapering at both ends; fruit apparently not produced ...... [P. floridanus]
6 Floating leaves 10-20 (-30) mm wide, obtuse, round or tapering at the base; fruit often produced.
P. oakesianus

3 Floating leaves absent from all plants in the population.
7 Rhizomes obvious; peduncle 5-25 cm long; leaves thread-like, $0.1-0.5 \mathrm{~mm}$ wide $\ldots . .$. ........... P. confervoides
7 Rhizomes absent or not apparent; peduncle $0.3-7 \mathrm{~cm}$ long, often curved; leaves usually not thread-like, 0.1-5 mm wide.
8 Nodal glands absent.
9 Leaves 15-35 veined, greater than 2 mm wide; stem conspicuously flattened; peduncles terminal, usually straight $P$. zosteriformis
9 Leaves 3-5 veined, usually less than 2 mm wide; stem terete; peduncles usually axillary, recurved.
10 Leaves acute, $3(-5)$ veined, 0.3-1.5 (-2.3) mm wide; fruits 1-keeled, 1.4-2.3 (-2.7) mm long .. P. foliosus var. foliosus

10 Leaves usually bristle-tipped, occasionally apiculate to blunt, 3 veined, 1-2.2 (-4) mm wide; fruits 3keeled, 2.3-4 mm long
P. hillii 8 Nodal glands present.

11 Stipules fibrous, often whitish.
12 Leaf apex acute or apiculate; leaves 5-7 (-9) veined; turions with inner leaves at a right angle to outer leaves
[P. friesii]
12 Leaf apex usually bristle-tipped, acute or rarely obtuse to apiculate; leaves 3-5 (-7) veined; turions flattened with inner and outer leaves in same plane $P$. strictifolius 11 Stipules not fibrous, usually delicate, green, brown, or white.

13 Leaf apex bristle-tipped (rarely apiculate); peduncles recurved, axillary or axillary and terminal, 0.5-6.6 cm long P. hillii

13 Leaf apex blunt, acute, or apiculate, but not bristle-tipped; peduncles straight, terminal, 0.5-6.6 cm long.
14 Mature fruit obovate, sides concave, beak mostly forward; peduncle filiform to cylindrical, usually 1-3 per plant; inflorescence usually interrupted; leaves with up to 2 rows of lacunae along midrib, apex acute, rarely apiculate; stipules mostly connate
P. pusillus var. pusillus

14 Mature fruit mostly widest at middle, or ovate, sides rounded, beak mostly central; peduncle cylindrical, usually more than 3 per plant; inflorescence continuous; leaves with 1-5 rows of lacunae along midrib, apex acute to obtuse; stipules mostly convolute
P. pusillus var. tenuissimus

Potamogeton amplifolius Tuckerman, Bigleaf Pondweed. Cp (NC, VA), Pd (VA), Mt (GA, VA): ponds, lakes, sluggish streams; rare (GA Special Concern, VA Rare). June-September. Newfoundland west to British Columbia, south to e. NC, nw. GA (Jones \& Coile 1988), n. AL, OK, and CA. [= RAB, C, F, FNA, G, K, S, W, Z]

Potamogeton bicupulatus Fernald. Mt (VA): quiet waters; rare. July-September. ME west to WI, south to VA and se. TN. [= FNA, F, K, Z; = P. diversifolius Rafinesque var. trichophyllus Morong -- C, GW]

Potamogeton confervoides Reichenbach, Alga Pondweed, Conferva Pondweed, Tuckerman's Pondweed. Cp (NC, SC): acidic blackwater pools and streams; rare (NC Rare). April-September. Newfoundland west to Ontario, south to NJ and PA; disjunct in sc. NC and nc. SC (fall-line sandhills). [= RAB, C, F, FNA, G, K, Z]

* Potamogeton crispus Linnaeus, Curled Pondweed, Curly Pondweed. Cp, Pd (GA, NC, VA), Mt (NC, VA): uncommon. MaySeptember. ME, MN, s. Saskatchewan and s. British Columbia, south to NC, Panhandle FL, TX, AZ, and CA. [= RAB, C, F, FNA, G, GW, K, W, Z]

Potamogeton diversifolius Rafinesque, Common Snailseed Pondweed. Cp, Pd, Mt (GA, NC, SC, VA): pools, ponds, and lakes; common. June-September. MA and NY west to MN, MT, and OR, south to FL, TX, and CA. [= RAB, F, FNA, G, K, S, W, Z; $=P$. diversifolius var. diversifolius -- $\mathrm{C}, \mathrm{GW} ;>P$. capillaceus Poiret var. capillaceus -F ; $>P$. capillaceus Poiret var. atripes Fernald -- F]

Potamogeton epihydrus Rafinesque, Ribbonleaf Pondweed. Mt, Pd (NC, VA), Cp (NC, SC, VA): uncommon. JuneSeptember. Newfoundland west to AK, south to GA, s. MS (Sorrie \& Leonard 1999), LA, CO, and CA. [= RAB, C, F, FNA, G, K, S, W; P. epihydrus var. nuttallii (Chamisso \& Schlechtendahl) Fernald -- $\mathrm{F}, \mathrm{G}$; < $P$. epihydrus -Z , in part only (also see $P$. tennesseensis)]

Potamogeton foliosus Rafinesque var. foliosus, Leafy Pondweed. Mt (GA, NC, VA), Pd (SC, VA), Cp (NC, SC, VA): uncommon. May-October. Newfoundland west to AK, south to SC, w. FL, TX, and Mexico. [= C; < P. foliosus -- RAB, G, GW, S, W, Z, infraspecific taxa not distinguished; >P. foliosus var. foliosus - F; >P. foliosus var. macellus Fernald -- F; = P. foliosus ssp. foliosus -- FNA, K; > P. curtissii Morong -- S; > P. foliosus - S]

Potamogeton hillii Morong, Hill's Pondweed. Mt (VA): ponds, rare. [= C, F, FNA, G, K, Z; > P. hillii - F, in a narrow sense; > P. porteri Fernald -- F]

Potamogeton illinoensis Morong, Illinois Pondweed. Cp (GA, NC, SC, VA), Mt (GA, VA), Pd (VA): calcareous waters of streams, lakes, and ponds; rare. May-September. Québec west to Nortwest Territories and s. British Columbia, south to FL, TX, Mexico, and CA. [= RAB, C, F, FNA, G, GW, K, W, Z; > P. angustifolius Berchtold \& K. PresI -- S; > P. heterophyllus Schreber -- S; > P. lucens Linnaeus -- S , misapplied]

Potamogeton natans Linnaeus, Floating Pondweed. Mt (NC): lakes and slow streams; rare. June-September. Newfoundland west to AK, south to e. WV, w. NC, KS, NM, AZ, and CA. [= RAB, C, F, FNA, G, K, S, W, Z]

Potamogeton nodosus Poiret, Longleaf Pondweed, American Pondweed. Cp (GA, NC, VA), Mt (NC, VA), Pd (VA), \{SC\}: ponds, streams; uncommon. May-September. ME and Québec west to British Columbia, south to FL, TX, Mexico, and CA. [= RAB, C, F, FNA, G, GW, K, W, Z; P. fluitans Roth -- S; P. oblongifolium Forster, proposed for nomenclatural rejection (Reveal et al. 2003)]

Potamogeton oakesianus J.W. Robbins, Oakes Pondweed. Cp, Mt (VA): lakes and streams; rare (VA Rare). Newfoundland west to MN, south to VA and $n$. IL; apparently disjunct in MT, and British Columbia. [= C, F, FNA, G, K, W, Z]

Potamogeton perfoliatus Linnaeus, Perfoliate Pondweed, Redhead Grass. Cp (NC, VA): rare (VA Watch List). JuneOctober. Newfoundland, Labrador west to MI, south to ne. NC, and n. OH; apparently disjunct in w. FL, s. AL, and se. LA, and in SD. [= FNA, G, K, S, Z; > P. perfoliatus var. bupleuroides (Fernald) Farwell -- RAB, F, GW; P. bupleuroides Fernald]

Potamogeton pulcher Tuckerman, Spotted Pondweed. Cp, Pd, Mt (GA, NC, SC, VA): ponds, pools, ditches, streams; common. June-September. Nova Scotia west to WI, south to FL and e. TX. [= RAB, C, F, FNA, G, GW, K, S, W, Z; = P. rotundifolium Forster, proposed for nomenclatural rejection (Reveal et al. 2003)]

Potamogeton pusillus Linnaeus var. pusillus. Cp (GA, NC, SC, VA), Pd, Mt (NC, SC, VA): acid and alkaline waters; uncommon? May-September. Nova Scotia west to AK, south to Mexico. [<P. berchtoldii Fieber -- RAB, in part; >P. pusillus var. pusillus -- F, in a narrower sense; > P. pusillus var. minor (Bivona-Bernardi) Fernald \& Schubert -- F; = P. pusillus ssp. pusillus -FNA, K; < P. pusillus var. pusillus -- C; P. pusillus -- G, GW, S, Z, infraspecific taxa not distinguished]

Potamogeton pusillus Linnaeus var. tenuissimus F.K. Mertens \& W.D.J. Koch, Slender Pondweed. Cp, Pd, Mt (NC, SC, VA), $\{G A\}$ : millponds, other quiet waters; rare? (GA Special Concern). May-September. Newfoundland west to AK, south to w. FL, TX, NM, and CA. Reported from SC by Gaddy \& Rayner (1980). [= W; < P. berchtoldii Fieber -- RAB, in part; < P. pusillus var pusillus -- C; > P. berchtoldii var. acuminatus Fieber -- F; > P. berchtoldii var. berchtoldii -- F; > P. berchtoldii var. lacunatus (Hagström) Fernald -- F; > P. berchtoldii var. acuminatus Fieber -- F; > P. berchtoldii var. polyphyllus (Morong) Fernald -- F; > P. berchtoldii var. tenuissimus (Mertens \& Koch) Fernald -- F; < P. pusillus -- G, GW, S, Z, infraspecific taxa not distinguished; = $P$. pusillus ssp. tenuissimus (Mertens \& Koch) R.R. Haynes \& C.B. Hellquist -- FNA, K]

Potamogeton robbinsii Oakes, Fern Pondweed. Pd (VA): muddy waters; rare (VA Rare). August-September. Nova Scotia and Prince Edward Island west to Keewatin and AK, south to VA, n. IL, s. MN, CO, UT, and CA; disjunct in s. AL. [= C, F, FNA, G, K, Z]

Potamogeton spirillus Tuckerman, Northern Snailseed Pondweed. Cp (VA): quiet waters; rare (VA Rare). July-November. Newfoundland west to Manitoba, south to e. VA, n. OH, n. IA, and se. NE. [= C, F, FNA, G, K, Z]

Potamogeton strictifolius A. Bennett, Straightleaf Pondweed. Mt (VA): calcareous waters; rare (VA Rare). July-September. Newfoundland west to Yukon, south to VA, n. IL, WY, and n. UT. [= C, FNA, G, K, W, Z; > P. strictifolius var. strictifolius - F; > P. strictifolius var. rutiloides Fernald -- F; > P. longiligulatus Fernald -- F]

Potamogeton tennesseensis Fernald, Tennessee Pondweed. Mt (VA), \{NC?\}: quiet or flowing water; rare (VA Rare). Late May-September. PA and OH south to w. VA, and se. TN. [= F, FNA, K, W; < P. epihydrus -- Z, in part]

Potamogeton zosteriformis Fernald, Flatstem Pondweed. Cp (VA): quiet waters; rare (VA Rare). July-September. Newfoundland west to AK, south to VA, n. IL, KS, UT, and CA. [= C, F, FNA, G, K, Z]

Potamogeton alpinus Balbis, Red Pondweed, south to e. PA (Rhoads \& Klein 1993). [= FNA, G, K, Z; > P. alpinus var. tenuifolius (Rafinesque) Ogden -- C, F; P. tenuifolius Rafinesque]

Potamogeton floridanus Small, Florida Pondweed, is apparently endemic to blackwater rivers of the Panhandle of FL. Considering the poor collection of Potamogeton, it should be sought elsewhere. [= FNA, S; ? P. natans -- Z]

Potamogeton friesii Ruprecht, Fries's Pondweed, south to c. PA (Rhoads \& Klein 1993). (VA Watch List) [= C, F, FNA, G, K, Z]

Potamogeton gramineus Linnaeus, Variable Pondweed, south to sc. PA (Rhoads \& Klein 1993), NJ, and WV (Kartesz 1999). [= C, FNA, G, K, Z; > P. gramineus var. maximus Morong -- F]

Potamogeton obtusifolius Mertens \& Koch, south to MD, NJ, and PA. [= K] \{not yet keyed; add synonymy\}
Potamogeton praelongus Wulfen, Whitestem Pondweed, south to MD and nw. PA (Rhoads \& Klein 1993). [= C, F, FNA, K, Z]
Potamogeton richardsonii (Bennett) Rydberg, Richardson Pondweed, south to DE, MD, and PA. [= C, F, FNA, G, K, Z]
Potamogeton vaseyi J.W. Robbins, Vasey Pondweed, south to se. and sc. PA (Rhoads \& Klein 1993). [= C, F, FNA, G, K, Z]

Stuckenia C. Börner 1912 (Sago-pondweed)

A genus of about 10 species, nearly cosmopolitan. This genus should be called Stuckenia, which has priority over Coleogeton. References: Haynes \& Hellquist in FNA (2000); Les \& Haynes (1996)=Z; Haynes, Les, \& Král (1998)=Y; Wiegleb \& Kaplan (1998)=X.

1 Leaves minutely acute (use $10 \times$ magnification); achenes usually 3-4.5 mm long, with the style persistent as a very short beak
S. pectinata

1 Leaves minutely rounded or retuse (use $10 \times$ magnification); achenes usually 2-3 mm long, with the sessile stigma persistent as a bump
[S. filiformis ssp. alpina]

Stuckenia pectinata (Linnaeus) C. Börner, Sago-pondweed. Cp (NC, SC, VA), Mt, Pd (VA), \{GA\}: calcareous or brackish waters of ponds, lakes, estuaries, sounds; uncommon. June-September. The species is irregularly cosmopolitan. [= FNA, K, Y; = Potamogeton pectinatus Linnaeus -- RAB, C, F, G, GW, S, W, X; = Coleogeton pectinatus (Linnaeus) D.H. Les \& R.R. Haynes -- Z]

Stuckenia filiformis (Persoon) C. Börner ssp. alpina (Blytt) R.R. Haynes, D.H. Les, \& M. Král, Threadleaf Pondweed, approaches our area in se. and sc. PA. [= FNA, K, Y; = Potamogeton filiformis Persoon var. alpinus (Blytt) Ascherson \& Graebner; Potamogeton filiformis Persoon var. borealis (Rafinesque) H. St. John -- C, F, G; < Potamogeton filiformis -- X, infraspecific taxa not distinguished; = Coleogeton filiformis (Persoon) D.H. Les \& R.R. Haynes ssp. alpinus (Blytt) D.H. Les \& R.R. Haynes -- Z]

## RUPPIACEAE Horaninow ex Hutchinson 1934 (Wigeon-grass Family)

A family of a single genus and 1-10 species. References: Haynes (1978)=Z; Haynes in FNA (2000); Haynes, Holm-Nielsen, \& Les in Kubitzki (1998b).

## Ruppia Linnaeus (Wigeon-grass)

A genus of $1-10$ speces, nearly cosmopolitan. References: Haynes (1978)=Z; Haynes in FNA (2000); Haynes, Holm-Nielsen, \& Les in Kubitzki (1998b).

Identification notes: Separable from superficially similar species of Potamogeton by the stipules adnate their entire length (vs. separate at least at the tip in Potamogeton).

Ruppia maritima Linnaeus, Wigeon-grass, Ditch-grass. Cp (GA, NC, SC, VA): brackish estuaries, rivers, marsh pools; common. July-October. Nearly cosmopolitan. [=RAB, C, FNA, GW, K, S, Z; >R. maritima var. maritima - F, G; >R. maritima var. longipes Hagström -- F; > R. maritima var. rostrata Agardh -- F, G]

## RUSCACEAE M. Roemer 1840 (Ruscus Family)

As here circumscribed, a family of about 28 genera and 500 species, of North America, Central America, Europe, and Asia. The Convallariaceae has been supported by molecular studies (Judd 2003, Bogler \& Simpson 1995). Molecular studies show that Nolina is much more closely related to Convallaria, Polygonatum, etc. than to the Agavaceae (Yucca and Manfreda in our flora), with which it has often been associated. References: Bogler \& Simpson (1995); Bogler in Kubitzki (1998a); Yamashita \& Tamura (2000); Conran \& Tamura in Kubitzki (1998a).

1 Plant with an upright stem with alternate leaves; [tribe Polygonatae].
$\begin{array}{ll}2 & \text { Inflorescence terminal, a raceme or panicle; tepals separate . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Maianthemum } \\ 2 & \text { Inflorescence of 1-several axillary flowers; tepals fused . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Polygonatum }\end{array}$
1 Plant tufted, the leaves essentially basal (although the sheathing bases form a 'false' stem in Convallaria).
3 Leaves 2-3, narrowly elliptic; tepals fused, forming a nodding, bell-shaped flower, white or greenish; [tribe Convallarieae]

3 Leaves many, linear; tepals separate (or fused basally), spreading, white or violet; [tribe Ophiopogoneae] . . . . . . Liriope

## [add Nolina]

## Convallaria Linnaeus 1753 (Lily-of-the-Valley)

A genus of 3 species, of north temperate $n$. Eurasia and e. North America. References: Utech in FNA (2002a); Judd (2003)=Z; Conran \& Tamura in Kubitzki (1998a).

1 Leaf blades averaging $10-15 \mathrm{~cm}$ long, $3-5 \mathrm{~cm}$ wide; rhizomes short-creeping, the "individual" plants spaced closely (often no more than 5-10 cm apart); flowering scape more than half as long as the leaves; longer bracts of the inflorescence 4-10 mm long; [introduced, persistent around old home sites and other plantings] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . C. majalis
1 Leaf blades averaging $15-35 \mathrm{~cm}$ long, $5-13 \mathrm{~cm}$ wide; rhizomes absent or long-creeping, the individual plants spaced widely (usually at least 15 cm apart); flowering scape less than half as long as the leaves; longer bracts of the inflorescence $8-20 \mathrm{~mm}$ long; [native, of forests of the Mountains and upper Piedmont]
C. majuscula

* Convallaria majalis Linnaeus, European Lily-of-the-Valley. Pd, Cp, Mt (NC, VA): persistent after cultivation; rare, introduced from Eurasia. April-May; July-August. [= F, K, W; = C. majalis var. majalis -- RAB, FNA; < C. majalis -- C, G, S, Z, in part only (also see C. majuscula)]

## Flora of the Carolinas, Virginia, and Georgia, Working Draft of 10 June 2005 -- RUPPIACEAE

Convallaria majuscula Greene, American Lily-of-the-Valley. Mt (GA, NC, SC, VA), Pd (NC, VA): mountain forests, particularly in rocky woodlands or forests on or near ridgetops under northern red oak at about 1000 to 1500 m elevation, sometimes at lower elevations (down to at least 700 m ) and under Quercus montana; uncommon, rare in Piedmont (SC Rare). April-June; August. Endemic to the Southern Appalachians: WV and VA through NC and TN to ne. GA (Jones \& Coile 1988) and nw. SC. Cronquist's (1991) statement that Southern Appalachian plants "may reflect an early escape of a different phase of the species from cultivation" can be discounted; there is no doubt that C. majuscula is both native and taxonomically distinct, at a varietal level at least. Utech in FNA (2002a) states that our plants are more closely related to the Asian taxon, variously treated as C. keiskei Miquel or C. majalis var. keiskei (Miquel) Makino, than to the European C. majalis s.s. As best as can be determined, Rafinesque's name Convallaria montana does not apply to this species. [ $=\mathrm{K} ;=C$. majalis Linnaeus var. montana (Rafinesque) Ahles -- RAB, FNA, apparently misapplied; < C. majalis -- C, G, S, Z, in part; = C. montana Rafinesque -- F, W, apparently misapplied]

## Liriope Loureiro 1790 (Liriope, Lilyturf)

A genus of 8 species, herbs, of e. and se. Asia. References: Conran \& Tamura in Kubitzki (1998a); Judd (2003)=Z.

* Liriope muscari (Dcne.) Bailey, Liriope, Big Blue Lilyturf. \{SC\}: planted and persistent; commonly cultivated, rarely persistent. [ $=\mathrm{K}, \mathrm{Z}$ ]

Liriope spicatum Loureiro, Creeping Lilyturf. Reported for AL, FL, MD (Kartesz 1999). [= K; L. spicata Loureiro - Z, orthographic variant]

Maianthemum G.H. Weber ex Wiggers 1780 (Mayflower, Solomon's-plume)
A genus of about 28 species, herbs, of $n$. Europe, e. Asia, North America, and Central America. The inclusion of the traditional Smilacina in Maianthemum will cause considerable consternation; LaFrankie's (1986) reasoning, however, seems very strong, and has been additionally supported by more recent evidence (Conran \& Tamura in Kubitzki 1998a). The only consistent difference between the two previously accepted genera is whether the flowers are dimerous (Maianthemum) or trimerous (Smilacina). LaFrankie cites research that shows that the dimerous flowers of Maianthemum (sensu stricto) are the result of reduction from trimerous flowers, as indicated by vestigial vascular traces. Consideration of the many close similarities, particularly as compared to similar genera such as Prosartes, Polygonatum, Streptopus, and Clintonia, may convince the skeptical (see LaFrankie 1986 and Therman 1956). As an example, the fruits of $M$. canadense and $M$. racemosum are closely similar in form, coloration, and size; much more similar than the fruits of our 2 species of Prosartes. References: LaFrankie (1986)=Z; Judd (2003)=Y; LaFrankie in FNA (2002a); Conran \& Tamura in Kubitzki (1998a).

1 Flowers in a terminal panicle . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . M. racemosum ssp. racemosum
1 Flowers in a simple raceme.

2 Perianth segments 6 (flowers 3 -merous); leaves 6 or more (or 1-4 in M. trifolium).
3 Leaves 6 or more, pubescent beneath . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . M. stellatum
3 Leaves 1-4, glabrous beneath . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [M. trifolium]
Maianthemum canadense Desfontaines, Canada Mayflower, False Lily-of-the-valley. Mt (GA, NC, VA), Pd (VA): moist forests; common. Mid May-early July; August-September. Labrador and Newfoundland west to Mackenzie, south to MD, NC, n. GA (Jones \& Coile 1988), KY and SD. Two varieties have been described, but their recognition is not strongly supported. Var. canadense, with leaves glabrous beneath, the margins entire or minutely crenulate, cross-veins of the leaf well-developed, is widepread in the distribution of the species. Var. interius Fernald has the leaves pubescent beneath, the leaf margins distinctly ciliate, and cross-veins obscure; it is not known from our area, but extends east and south as far as MA, NY, and OH. Further study of these varieties is needed. Weller (1970) reports equivocal results on the recognition of varieties, based on a study in n. MI. [= RAB, FNA, K, W, Y, Z; > Maianthemum canadense Desfontaines var. canadense -- C, F, G; = Unifolium canadense (Desfontaines) Greene -- S]

Maianthemum racemosum (Linnaeus) Link ssp. racemosum, Eastern Solomon's-plume, False Solomon's-seal. Mt, Pd, Cp (GA, NC, SC, VA): forests; common. Mid April-June; August-October. The species ranges from Nova Scotia west to British Columbia, south to GA and AZ. A variety of chromosome races are known ( $2 \mathrm{n}=36,72,144$ ). The eastern ssp. racemosum is tetraploid; ssp. amplexicaule (Nuttall) LaFrankie is diploid and more western. Under the generic name Smilacina, two varieties had been described for our area, Smilacina racemosa var. racemosa and S. racemosa var. cylindrata Fernald, the former larger in nearly all respects and more northern than the latter, smaller, and more southern form (see $F$ for details). If these varieties are determined to have merit (further research is needed), the appropriate transfer to Maianthemum will need to be made. [= FNA, K, Y, Z; < Smilacina racemosa (Linnaeus) Desfontaines -- RAB, C, G, W; > S. racemosa var. racemosa - F; > S. racemosa var. cylindrata Fernald -- F; > Vagnera racemosa (Linnaeus) Morong -- S; > Vagnera australis Rydberg -- S]

Maianthemum stellatum (Linnaeus) Link, Starry Solomon's-plume. Mt, Pd (VA): alluvial forests; rare (VA Rare). April-June; August-October. Newfoundland west to British Columbia, south to NJ, w. VA, e. TN, IN, MO, and CA. [= FNA, K, Y, Z; = Smilacina stellata (Linnaeus) Desfontaines -- C, F, G, W]

Maianthemum trifolium (Linnaeus) Sloboda occurs in bogs and moist sphagnous forests, south to sc. PA. [= FNA, K, Z; =

Smilacina trifolia (Linnaeus) Desfontaines -- C, F, G]

## Nolina Michaux 1803 (Beargrass)

A genus of about 30 species, rosette shrubs and trees, of s. United States and Mexico. References: Hess in FNA (2002a); Judd (2003)=Z; Bogler in Kubitzki (1998a).

Nolina georgiana Michaux, Georgia Beargrass, Sandhills Lily. Cp (GA, SC): sandhills, sometimes locally common on slightly less xeric lower sandhill slopes; rare (SC Rare). Late May-June; late June-August. Nc. SC south to sc. GA. This species has been attributed to FL (Small 1933), but is not included in either Clewell (1985) or Wunderlin (1982, 1998). [= RAB, FNA, K, S, Z]

## Polygonatum P. Miller 1754 (Solomon's-seal)

A genus of about 57 species, of temperate Eurasia and North America (most diverse in e. Asia). The $P$. biflorum complex is in need of further study. References: Ownbey (1944)=Z; Judd (2003)=Y; Utech in FNA (2002a); Eigsti (1942); Therman (1950, 1953); Kawano \& Iltis (1963); Conran \& Tamura in Kubitzki (1998a).

1 Leaves pubescent on the veins beneath; flowers $7-13 \mathrm{~mm}$ long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . P. pubescens 1 Leaves glabrous; flowers $12-21 \mathrm{~mm}$ long.

2 Stem slender, $1.5-5 \mathrm{~mm}$ in diameter; plants to 9 dm tall; lower axillary peduncles terete or nearly so, with (1-) 2-3 (-5) flowers; lowest peduncle in the axil of the (1st-) 3rd (-5th) axil; larger leaves 5.5-15 cm long, 1.2-6 cm wide; lower leaves clasping to $90(-180)$ degrees
P. biflorum var. biflorum

2 Stem robust, $5-13 \mathrm{~mm}$ thick below the leaves; plants to 20 dm tall; lower axillary peduncles strongly flattened, with (2-) 3-6 (-15) flowers; lowest peduncle in the axil of the (3rd-) 4th-5th ( -8 th ) leaf; larger leaves $9-25 \mathrm{~cm}$ long, $3.5-13 \mathrm{~cm}$ wide; lower leaves clasping to 300 degrees
P. biflorum var. commutatum

Polygonatum biflorum (Walter) Elliott var. biflorum, Small Solomon's-seal. Mt, Pd, Cp (GA, NC, SC, VA): moist to dry forests; common. April-June; August-October. CT, NY, and s. Ontario west to MI, NE, and IN, south to n. FL and s. AL. In addition to the two varieties recognized for our area, P. biflorum includes several additional varieties: var. hebetifolium R.R. Gates of panhandle FL (Apalachicola River area), var. melleum (Farwell) R. Ownbey of MI and Ontario, and var. necopinum R. Ownbey from the Black Hills of SD. The complex needs additional study. See var. commutatum for discussion of its distinction from var. biflorum. $[=\mathrm{Z} ;<P$. biflorum -- RAB, C, FNA, W, Y, infraspecific taxa not distinguished; = P. biflorum -- $\mathrm{F}, \mathrm{G}$, in the narrow sense; < . biflorum var. commutatum (J.A. \& J.H. Schultes) Morong - K, in part; < P. commutatum (J.A. \& J.H. Schultes) A. Dietrich -- S, in part]

Polygonatum biflorum (Walter) Elliott var. commutatum (J.A. \& J.H. Schultes) Morong, Large Solomon's-seal, King Solomon's-seal. Mt (GA, NC, SC?, VA), Pd (NC, VA): moist forests, roadbanks; common. May-June; September-October. NH west to s. Manitoba, south to SC, GA, LA, and TX. There has been a wide divergence of opinion regarding the merits (and practicality) of distinguishing this taxon from typical $P$. biflorum, and the characters considered most reliable; the two taxa may differ in chromosome number and geographical distribution; they are not, however, always readily distinguished morphologically. I prefer to recognize this taxon as a variety. See references for additional discussion. [< P. biflorum -- RAB, C, FNA, W, Y, infraspecific taxa not distinguished; = P. canaliculatum (Muhlenberg ex Willdenow) Pursh -- F, G, misapplied; < P. biflorum var. commutatum (J.A. \& J.H. Schultes) Morong - K, in part only; < P. commutatum (J.A. \& J.H. Schultes) A. Dietrich -- S , in part; = P. commutatum -- Z]

Polygonatum pubescens (Willdenow) Pursh. Mt (GA, NC, SC?, VA): moist forests, especially cove forests; common. Late April-June; August-October. S. Québec west to s. Manitoba, south to nw. SC, WV, KY, IN, WI, and IA. [= RAB, C, F, FNA, G, K, W, $\mathrm{Y}, \mathrm{Z} ;=P$. biflorum -- S , misapplied]

## SCHEUCHZERIACEAE F. Rudolphi 1830 (Scheuchzeria Family)

A monotypic family, circumboreal in arctic and cold temperate regions. References: Nienaber in FNA (2000); Haynes, Les, \& HolmNielsen in Kubitzki (1998b).

## Scheuchzeria Linnaeus (Scheuchzeria, Pod-grass)

A monotypic genus, circumboreal in arctic and cold temperate regions. References: Nienaber in FNA (2000); Haynes, Les, \& HolmNielsen in Kubitzki (1998b).

Scheuchzeria palustris Linnaeus ssp. americana (Fernald) Hultén, Pod-grass, ranges south to sc. PA (Rhoads \& Klein 1993), NJ, and Pocahontas County, WV. It occurs in Sphagnum bogs. [= K; < Sch. palustris -- C, FNA, G, infraspecific taxa not distinguished; = Sch. palustris var. americana Fernald -- F; = Sch. americana (Fernald) G.N. Jones]

A family of 3-12 genera and about 375 species, widespread in tropical, subtropical, and temperate regions. References: Holmes in FNA (2002a); Judd (1998); Conran in Kubitzki (1998a).

## Smilax Linnaeus 1753 (Greenbrier, Carrionflower, Smilax)

A genus of about 300 species, woody vines and herbs, subcosmopolitan in temperate and tropical regions. Smilax berries and shoots provide important food sources for many wildlife species, including black bears (Ursus americanus). References: Mangaly (1968) $=$ Z; Judd (1998) $=$ Y; Holmes in FNA (2002a); Duncan (1967); Godfrey (1988). Key for the woody species based in part on Godfrey (1988).

1 Stem herbaceous, lacking prickles; ovules 2 per carpel; peduncles usually more than 4 cm long; [section Nemexia].
2 Plants erect, 0.2-1.0 m tall, even when well-developed with fewer than 20 leaves [note that immature or depauperate individuals (nonflowering) of S. pseudochina, S. herbacea, S. lasioneura, and S. pulverulenta often have this aspect]; tendrils absent or rudimentary; peduncles usually few (usually 1-4), the lowest often from bract axils.
3 Leaves glabrous and glaucous beneath, thick in texture, base cordate, tip acute or acuminate; lowest peduncle from a leaf axil (very rarely from bract axils), upper peduncles from leaf axils; leaves 5-7, clustered together near the summit of the stem
S. biltmoreana

3 Leaves pubescent and green (or glaucous) beneath, usually thin in texture, base cordate, truncate, or rounded, tip acuminate, acute, or obtuse; lowest peduncles from axils of bracts below the lowest leaves, upper peduncles also often from bracts (the uppermost often from leaf axils); leaves either clustered together near the summit of the stem or well distributed.
4 Leaves relatively many, (7-) 10-13 (-20), often well distributed in the upper half of the stem, notably reduced in size from lower to upper, mostly with the base cordate and the tip acuminate; berry 3-5 seeded . . . S. ecirrata
4 Leaves few, usually 4-8, usually clustered together near the summit of the stem (rarely well distributed), about the same size, mostly with the base ovate (to subcordate), the tip acute to obtuse; berry 2-3 seeded. S. hugeri
2 Plants vine-like, climbing or sprawling, to 3 m tall, when well-developed with over 30 leaves; tendrils present and numerous; peduncles usually many, from leaf axils.
5 Leaf bases hastate, the leaf margins straight or concave in outline; longest fruiting pedicels less than $2 \times$ as long as the fruit; anthers equaling or longer than the filaments; perianth $1.5-2.5 \mathrm{~mm}$ long; leaves glabrous and glaucous beneath
S. pseudochina

5 Leaf bases cordate, the leaf margins convex in outline; longest fruiting pedicels $2 \times$ or more as long as the fruit; anthers shorter than the filaments; perianth $3.5-6 \mathrm{~mm}$ long; leaves either puberulent beneath (at least along the veins), or glabrous and glaucous beneath.
6 Leaves glabrous and glaucous on the lower surface; fruit dark blue and glaucous; peduncles $5-8 \times$ as long as the subtending petioles . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. herbacea
6 Leaves puberulent on the lower surface, at least on the veins; fruit dark blue and glaucous or black and not glaucous; peduncles $1-10 \times$ as long as the subtending petioles.
7 Leaves bright green and shiny beneath; fruit black, not glaucous; peduncles 1-2 (-3)× as long as the subtending petioles .............................................................. . S. pulverulenta
7 Leaves pale green and dull below; fruit dark blue, glaucous; peduncles (3-) 5-10× as long as the subtending petioles
S. Iasioneura

1 Stem woody, usually with prickles; ovules 1 per carpel; peduncles usually less than 3 cm long; [section China].
8 Stems and petioles tomentose, lacking prickles; leaves densely tomentose beneath; berries red; plant trailing or ascending, rarely more than 0.5 m tall (with determinate growth)
S. pumila

8 Stems and petioles stellate-scurfy or glabrous, generally with prickles; leaves glabrous or papillate beneath; berries red, black, or dark blue; plant climbing, ascending, or trailing, mature plants generally well over 0.5 m tall (with indeterminate growth).
9 Lower surfaces of leaves strongly glaucous . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . S. glauca 9 Lower surfaces of leaves green (rarely very slightly glaucous).

10 Prickles of the stem abundant, thin and needle-like, shiny brown or black
10 Prickles of the stem fewer, broad-based and awl-like or catclaw-like, green, brown, or black.
11 Midvein (as seen on the lower surface) much more pronounced than the principal lateral veins, which are scarcely raised; leaves evergreen, thick, coriaceous
S. Iaurifolia

11 Midvein (as seen ion the lower surface) little if any more pronounced than the principal lateral veins; leaves evergreen or deciduous, thin, subcoriaceous.
12 Leaves mostly lanceolate, the base cuneate, the tip acute to acuminate; berries dull red . . S. smallii
12 Leaves mostly ovate, oblong, pandurate, or hastate, the base cordate, truncate, rounded, or cuneate, the tip rounded to acute; berries various in color.
13 Margin of the leaf blade prominently thickened with a marginal vein (this appearing as a thickening, a visible vein, or an apparent revolute margin); berries with 1-3 seeds.
14 Inflorescence peduncle (stalk of the umbel) as long as or shorter than the subtending leaf petiole; stems and prickles glabrous; leaves evergreen; berries usually with 2-3 seeds; [generally of xeric or less commonly mesic sands] . . . . . . . . . . . . . . . . . . . S. auriculata 14 Inflorescence peduncle (stalk of the umbel) more than $1.5 \times$ as long as the subtending leaf petiole; stems (especially the lower) and prickles brownish stellate-scurfy; leaves semi-
evergreen to evergreen; berries usually with 1 seed; [of a wide variety of habitats]
S. bona-nox

13 Margin of the leaf blade thin, sometimes revolute; berries with (1-) 2-4 seeds.
15 Berries blue-black; perianth green; leaves semi-evergreen to evergreen, margins of mature leaves generally not revolute, the margins of the leaves and the petioles often with minute, flattish, toothlike projections; berries with (1-) 2-3 seeds; [of a wide variety of upland and wetland habitats]
S. rotundifolia

15 Berries bright red; perianth brownish-yellow; leaves deciduous, margins of mature leaves usually revolute, the margins of the leaves and the petioles lacking minute, flattish, toothlike projections; berries with 2-4 seeds; [of swamp forests, bogs, often where submersed for at least part of the year]
S. walteri

Smilax auriculata Walter, Dune Greenbrier. Cp (GA, NC, SC): dunes on barrier islands, dry sandy openings in maritime forests or sandhills near the coast; common. May-July; October-November (and persisting). E. NC (Dare County) south to s. FL and west to LA; Bahama Islands. [= RAB, FNA, GW, K, S, Y]

Smilax biltmoreana (Small) J.B.S. Norton ex Pennell, Biltmore Carrionflower. Mt, Pd (GA, NC, SC), Cp (GA): dry forests (such as dry pine ridges and chestnut oak forests) and moist forests; rare (NC Rare). April-May; August-October. The species is apparently limited to to NC, SC, and GA, primarily in the Blue Ridge Escarpment region, with disjunct occurrences in panhandle FL, s. AL, and sc. KY. [= FNA, K, W, Y, Z; = Smilax ecirrata (Engelmann ex Kunth) S. Watson var. biltmoreana (Small) Ahles -- RAB; < S. ecirrhata -- G, in part (concept interpreted from stated geographic range); = Nemexia biltmoreana Small -- S]

Smilax bona-nox Linnaeus, Catbrier, Tramp's-trouble. Cp, Pd, Mt (GA, NC, SC, VA): in a wide variety of upland and wetland habitats; common. Late April-May; September-November. MD and MO south to c. FL and TX, and also in Mexico. [= RAB, C, FNA, G, GW, K, S, W, Y; > S. bona-nox var. hastata (Willdenow) Alphonse de Candolle -- F; > S. bona-nox var. exauriculata Fernald -- F; > S. bona-nox var. hederifolia (Beyrich) Fernald -- F; > S. bona-nox var. bona-nox - F]

Smilax ecirrata (Engelmann ex Kunth) S. Watson. Mt (VA): forests; rare (VA Rare). Mid May-early June; August-September. N. OH MI, WI, and s. MN south to w. VA, TN, s. IL, MO, and e. OK. [= K, Y, Z; = S. ecirrhata -- C, F, FNA, orthographic variant; < S. ecirrhata -- G, broader sense (apparently also including in statement of range S. hugeri and/or S. biltmoreana); = Nemexia ecirrhata (Engelmann ex Kunth) Small -- S]

Smilax glauca Walter, Whiteleaf Greenbrier, Wild Sarsaparilla. Mt, Pd, Cp (GA, NC, SC, VA): in a wide variety of upland and wetland habitats; common. Late April-early June; September-November (and persisting). NJ, c. PA, OH, IN, MO, and KA south to c. FL and TX, and also in Mexico. [= RAB, C, FNA, GW, S, W, Y; >S. glauca var. glauca - F, G, K; > S. glauca var. leurophylla Blake -- F, G, K]

Smilax herbacea Linnaeus, Common Carrionflower. Mt (GA, NC, SC, VA), Pd (GA, NC, SC, VA), Cp (GA, VA): moist deciduous forests; common. May-June; August-October. Centered in the Appalachian Mountains, from Québec and ME west to OH , south to AL, GA, and TN. Young, non-flowering plants closely resemble S. biltmoreana. [= F, FNA, K, W, Y, Z; = S. herbacea var. herbacea -- RAB, C, G; = Nemexia herbacea (Linnaeus) Small -- S]

Smilax hispida Rafinesque, Bristly Greenbrier, Hellfetter. Mt, Pd, Cp (GA, NC, SC, VA): moist to wet forests; common. CT, NY, MN, and NE south to c. FL and TX. Wilbur (2003) discusses the complicated nomenclatural problems involving this plant and concludes that S. hispida Raf. is the correct name. [= Smilax tamnoides Linnaeus -- FNA, GW, K, W, Y, misapplied; = S. hispida Muhlenberg -- RAB, C, G, S; > S. tamnoides var. hispida (Muhlenberg) Fernald -- F; > S. tamnoides var. tamnoides - F; > S. hispida var. australis Small -- S; > S. hispida var. hispida - S]

Smilax hugeri (Small) J.B.S. Norton ex Pennell, Huger's Carrionflower. Mt (GA, NC, SC), Pd (GA, NC, SC), Cp (GA, SC): moist deciduous forests; rare (NC Watch List). March-April; August-October. S. NC and e. TN south through SC, GA, and AL to panhandle FL. [= FNA, K, W, Y, Z; = S. ecirrata (Engelmann ex Kunth) S. Watson var. hugeri (Small) Ahles -- RAB; = Nemexia hugeri Small -- S]

Smilax lasioneura Hooker, Midwestern Carrionflower. Mt (NC, VA?), Pd (NC), \{GA\}: moist deciduous forests, bluff forests, pine-oak hickory submesic forests, perhaps only or primarily over mafic rocks; rare (GA Rare, NC Rare). April-May; AugustSeptember. Ontario and MT south to w. VA (?), w. NC, n. FL, OK, and CO. Material from VA is ambiguous. [= F, FNA, K; = S. herbacea var. lasioneura (Hooker) Alphonse de Candolle -- C, G; = Nemexia lasioneuron (Hooker) Rydberg -- S; = S. lasioneuron -Y, orthographic variant]

Smilax laurifolia Linnaeus, Blaspheme-vine, Bamboo-vine. Cp, Pd, Mt (GA, NC, SC, VA): pocosins, swamp forests, mountain bogs in sw. NC; common (rare in Piedmont and Mountains). July-August; September-October of the second year (and persisting). Primarily a Southeastern Coastal Plain species: NJ south to s. FL, west to w. TN, AR, and e. TX, and also in the Bahama Islands and Cuba. [= RAB, C, F, FNA, G, GW, K, S, W, Y]

Smilax pseudochina Linnaeus, Coastal Carrionflower. Cp (GA, NC, SC, VA): pocosins, swamp forests, edges of pine savannas; uncommon. May; August-October. An Atlantic Coastal Plain endemic: NJ, se. PA, and DE south to e. GA. [=C, FNA, K, Y; = S. tamnifolia Michaux -- RAB, G; = S. pseudo-china -- F, W, Z, orthographic variant; > Nemexia tamnifolia (Michaux) Small -S; > Nemexia leptanthera (Pennell) Small -- S]

Smilax pulverulenta Michaux. Mt (GA, NC, SC, VA), Pd, Cp (NC, SC, VA): moist deciduous forests: common. May-June; August-October. Se. NY, se. and sc. PA, IN, MO, and e. KS south to NC, TN, and AR. [= F, FNA, K, W, Y, Z; = S. herbacea var. pulverulenta (Michaux) A. Gray -- RAB, C, G; = Nemexia pulverulenta (Michaux) Small -- S]

Smilax pumila Walter, Sarsaparilla-vine, Dwarf Smilax. Cp (GA, SC): mesic to dryish hammocks and bluffs, northwards primarily in maritime-influenced mainland forest, with Magnolia grandiflora and Tilia americana var. caroliniana; rare (NC Watch List). October-November; January-April (and persisting). Ne. SC (within a few hundred meters of Brunswick County, NC) to FL and west to TX. It occurs on Colkins Neck, along the NC-SC border, in maritime-influenced forests with southern affinities, now largely destroyed by golf-course development. This unusual Smilax is sometimes cultivated as an ornamental ground-cover. [= RAB, FNA,

## $\mathrm{K}, \mathrm{S}, \mathrm{Y}]$

Smilax rotundifolia Linnaeus, Common Greenbrier, Bullbrier, Horsebrier. Mt, Pd, Cp (GA, NC, SC, VA): in a wide variety of upland and wetland habitats; common. April-May; September-November (and persisting). Nova Scotia and s. Ontario south to n. FL and e. TX. [= RAB, C, F, FNA, G, GW, K, S, W, Y; > S. rotundifolia var. quadrangularis (Muhlenberg ex Willdenow) Wood]

Smilax smallii Morong, Jackson-brier. Cp (GA, NC, SC, VA), Pd, Mt (GA): bottomland forests; uncommon, rare in VA (VA Rare). June-July; April-June of the next year. Se. VA to c. FL, west to s. AR ande. TX, primarily on the Coastal Plain. [= RAB, FNA, G, GW, K, W, Y; = S. lanceolata Linnaeus -- S, misapplied]

Smilax walteri Pursh, Coral Greenbrier, Red-berried Swamp Smilax. Cp, Pd (GA, NC, SC, VA): swamp forests, bogs, often where submersed for at least part of the year; common (rare in Piedmont). Late April-May; September-November (and persisting). NJ south to c. FL and west to TN, AR, and TX. [= RAB, C, F, FNA, G, GW, K, S, W, Y]

Smilax leptanthera Pennell. See Pennell (1916) for additional information. Treated as valid and rare by GAHP. [= Nemexia leptanthera (Pennell) Small-S; < S. pseudochina] \{investigate\}

SPARGANIACEAE (Bur-reed Family)
(see TYPHACEAE)

## STEMONACEAE Engler 1887 (Stemona Family)

A family of 3-4 genera and 30-35 species, herbs and shrubs, of Asia, Australia, and se. North America. References: Whetstone in FNA (2002a); Kubitzki in Kubitzki (1998a).

## Croomia Torrey 1840 (Croomia)

A genus of 3 species, 2 in China and Japan and 1 in se. North America. Sometimes segregated into the Croomiaceae. References: Whetstone in FNA (2002a); Kubitzki in Kubitzki (1998a).

Croomia pauciflora (Nuttall) Torrey, Croomia. Cp (GA): moist forests, often with beech and basswood; rare (GA Threatened). April-May. AL (or perhaps LA) to sw. GA, Panhandle FL, and allegedly se. GA (Whetstone in FNA 2002, Jones \& Coile 1988). [= FNA, K, S]

## THEMIDACEAE Salisbury 1866

A family of 12 genera and about 60 species, herbs, of $w$. North America south to Guatemala. References: Rahm in Kubitzki (1998a).

#### Abstract

Dichelostemma Kunth 1843 A genus of 5 species, of w. United States and Mexico. References: Pires in FNA (2002a); Rahm in Kubitzki (1998a). * Dichelostemma congestum (Smith) Kunth, native of the Pacific northwestern North America, is cultivated and apparently escaped in the Piedmont of nc. GA (Jones \& Coile 1988). \{further investigate\} [= FNA, K; = Brodiaea congesta Smith]

## TOFIELDIACEAE (False-asphodel Family)

A family of 5 genera and about 30 species, of disjunct distribution in north temperate and subarctic areas, and in the Guyana Shield and northern Andes areas of $n$. South America. Reveal \& Zomlefer (1998) place the Tofieldiaceae in the monotypic order Tofieldiales, only distantly related to the Liliaceae. Tamura in Kubitzki (1998a) treats this group as subfamily Tofieldioideae of the Nartheciaceae. References: Zomlefer (1997c, 1999); Tamura in Kubitzki (1998a).

1 Bracts of the inflorescence large, spathelike, acuminate-aristate at the tip; stamens (6-) 9 (-12) . . . . . . . . . . . . . . . . . . Pleea 1 Bracts of the inflorescence; stamens 6.

2 Inflorescence a raceme (the flower pedicels attached to the scape singly); scape smooth; flowering (late August-) late September-October

Tofieldia
2 Inflorecence a thyrse (flower pedicels attached to the scape in groups of 3-7); scape scurfy-scabrous; flowering June-August

Triantha

Pleea Michaux 1803 (Rush-featherling)
A monotypic genus, of se. North America, sometimes included in Tofieldia. References: Zomlefer (1997c)=Z; Tamura in Kubitzki (1998a); Packer in FNA (2002a).

## Flora of the Carolinas, Virginia, and Georgia, Working Draft of June 10, 2005 -- TOFIELDIACEAE

Pleea tenuifolia Michaux, Rush-featherling. Cp (GA?, NC, SC): locally abundant in wet savannas, pocosin margins, usually in peaty soil, locally abundant in a few counties in se. NC, rare inland (very rarely as far as Cumberland County, NC); uncommon (SC Rare). September-October; October-November. A Southeastern Coastal Plain endemic: se. NC and ne. SC south to sw. GA, n. FL and s. AL, but apparently absent from s. SC and ne. GA. When in flower in wet savannas and powerline rights-of-way in Brunswick County, Pleea visually dominates areas up to hundreds of hectares. In sterile condition, it is recognizable by its leathery equitant leaves, bright red at their bases. [= RAB, FNA, GW, K, S; = Tofieldia tenuifolia (Michaux) Utech]

## Tofieldia Hudson 1778 (Bog Asphodel)

A genus of about 7-8 species, of temperate to subarctic North America and Eurasia. There is controversy about the circumscription of Tofieldia.relative to the related genera Pleea and Triantha (here recognized, but sometimes subsumed into Tofieldia. Some believe that Tofieldia, Triantha, and Pleea should be treated together in a broadly circumscribed Tofieldia (Utech 1978, Zomlefer 1997c); others that all three should be treated separately (Ambrose 1980; Packer 1993; Cruden 1991). Packer in FNA (2002a) has recently recognized Triantha, Pleea, and Tofieldia as separate genera, a conclusion followed here in part because of the ancient, relictual nature of these units. References: Zomlefer (1997c)=Z; Packer (1993); Ambrose (1980); Utech (1978); Hitchcock (1944)=Y; Tamura in Kubitzki (1998a); Packer in FNA (2002a); Cruden (1991).

Tofieldia glabra Nuttall, Carolina Bog Asphodel, White Asphodel. Cp (NC, SC): savanna-pocosin ecotones, wet savannas, seepage bogs; rare (US Species of Concern, NC Rare, SC Rare). (Late August-) late September-October; October-November. Endemic to the coastal plain and sandhills of NC and northern SC (the reports from GA are dubious). In sterile condition, it can be distinguished from Iris verna by its minutely upwardly-scabrous margins (Iris has smooth margins). [= RAB, FNA, GW, K, S, Z]

## Triantha (Nuttall) Baker

A genus of ca. 4 species, herbs, of North America and Japan. References: Cruden (1991).

1 Perianth equal to or longer than the capsule; seeds with tails $1 / 2$ or less as long as the body ................. Tr. racemosa 1 Perianth shorter than the capsule; seeds with at least 1 tail equal to or longer than the body

Tr. glutinosa
Triantha glutinosa (Michaux) Baker, Sticky Bog Asphodel. Mt (GA, NC, VA), Pd (NC): bogs and seeps, especially over mafic or calcareous rocks; rare (GA Rare, NC Rare, VA Rare). July-August; September-October. Newfoundland west to British Columbia, south to w. NC, ne. GA (Jones \& Coile 1988), WV, OH, n. IN, WI, MT, and OR. [= FNA, K, S; = Tofieldia racemosa var. glutinosa (Michaux) Ahles -- RAB; = Tofieldia glutinosa (Michaux) Persoon -- F, G, W; > Tofieldia glutinosa ssp. glutinosa - GW, Y, Z; > Tofieldia glutinosa var. glutinosa -- C]

Triantha racemosa (Walter) Small, Coastal Bog Asphodel. Cp (GA, NC, SC, VA), Mt (VA), Pd (GA): savannas, savanna-pocosin ecotones, seepage bogs, sinkhole ponds (dolines) in the mountains of VA; uncommon (VA Rare). June-early August; late September-October. NJ south to nw. FL, west to e. TX; disjunct in c. TN. [= FNA, K, S; = Tofieldia racemosa var. racemosa -- RAB; = Tofieldia racemosa (Walter) Britton, Sterns, \& Poggenburg - C, F, G, GW, W, Z]

## TRILLIACEAE Lindley 1846 (Trillium Family)

References: Farmer \& Schilling (2002).

## Trillium Linnaeus 1753 (Trillium, Toadshade, Wake-robin)

A genus of about 50 species, of e. North America, w. North America, and e. Asia (especially se. North America). The genus Trillium in our area is difficult and complex. Trillium is now usually separated from the Liliaceae (along with Eurasian genera such as Paris) into the Trilliaceae (Zomlefer 1996, Kato et al. 1995, Kawano \& Kato 1995, and others) or less drastically as part of the Melanthiaceae (Chase et al. 2000; Tamura et al. 2004). The traditonal division of the genus into two well-marked subgenera, subgenus Trillium, the pedicellate trilliums, and subgenus Phyllantherum, the sessile-flowered trilliums, has been partly supported by molecular and morphological phylogenetic studies (Kawano \& Kato 1995, Kato et al. 1995). These studies support the monophyly of subgenus Phyllantherum, but suggest that subgenus Trillium consists of several groups which are only rather distantly related (Kawano \& Kato 1995, Kazempour Osaloo et al. 1999; Farmer \& Schilling 2002). Most species are slow-growing perennials; seedlings, juveniles, and depauperate or "tired" plants are one-leaved ("monilliums"), recognizable by the similar color, texture and venation of the single leaf to the three leaves of mature plants. In some species, such as $T$. pusillum, individual plants remain in the single-leaf stage for long periods of time, and populations may consist largely of juvenile plants. References: Patrick (1986)=Z; Freeman (1975) $=$ Y; Case \& Case 1997=X; Patrick in Wofford (1989); Case in FNA (2002a); Mitchell (1990); Kato et al. (1995); Kawano \& Kato (1995); Tamura in Kubitzki (1998a); Zomlefer (1996); Farmer \& Schilling (2002). Key adapted from Z, unpublished keys of J.D. Freeman, and other sources.

Identification notes: Teratological forms are frequent in some species, as, for instance, leaves, sepals, and stamens in 2's or 4's, petals sepaloid, or sepals petaloid, and so forth.

1 Leaves mottled with 2-3 different shades of green (very rarely the mottling not apparent); flower sessile; [subgenus Phyllantherum]
. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . .

1 Leaves solid green; flower on a pedicel (the pedicel sometimes very short or essentially absent in $T$. pusillum); [subgenus Trillium].
2 Petals relatively thick in texture, straight-margined, maroon or white, rarely yellow or green (if white, turning brown with age); stigmas thicker at base, tapering gradually toward tip, distinct; ovary purple-black, maroon, pink, or white, 6-angled; [Erectum group]

Key B
2 Petals relatively delicate in texture, wavy-margined, white to deep pink (if white, generally fading to pink with age); stigmas thin, uniform in thickness from base to apex, somewhat fused at the base into a short style; ovary greenish-white to white, 3 - or 6 -angled or -lobed

Key C

## Key A -- trilliums with sessile flowers and mottled leaves (subgenus Phyllantherum)

1 Scape more-or-less decumbent in a gentle S-shape, the leaves lying on the ground, or nearly so; flower fragrance putrid; [ $T$. sessile group].
2 Anther dehiscence extrorse (towards the outside of the flower); stamens about $0.25 \times$ as long as the petals; upper stem puberulent; petals $4-10 \mathrm{~cm}$ long; filaments $2-5 \mathrm{~mm}$ long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . T. decumbens
2 Anther dehiscence introrse (towards the inside of the flower); stamens about $0.5 \times$ as long as the petals; upper stem glabrous; petals 2.5-5.5 cm long; filaments $1-2 \mathrm{~mm}$ long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . T. reliquum
1 Scape erect, straight, the leaves bone well above the ground (the leaf tips sometimes nearly touching the ground); flower fragrance various.
3 Sepals abruptly deflexed between and below the leaves, distinctly descending below a horizontal plane; filaments about as long as incurved anthers; [T. recurvatum group].
4 Leaves sessile or subsessile, borne in a descending or drooping manner (similar to the sepals); petals usually more
than $4 \times$ as long as wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . T. Iancifolium
4 Leaves distinctly petiolate, borne in an ascending manner (strongly contrasting in position with the strongly deflexed
sepals); petals usually ca. $2 \times$ as long as wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . T. recurvatum
3 Sepals erect, ascending, or spreading, usually borne at or above a horizontal plane; filaments much shorter than the upright anthers.
5 Petals spreading to horizontal, with 1-2 spiral twists (looking something like an airplane propellor); anther dehiscence extrorse (towards the outside of the flower); [T. sessile group] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . [T. stamineum]
5 Petals erect to slightly spreading, not spirally twisted; anther dehiscence introrse (towards the outside of the flower), or latrorse (towards the side).
6 Petals broadly spatulate, clawed; petals pale lemon-yellow (the claws greenish or maroon); flower fragrance clove-like; [of the Savannah River drainage, from sw. NC southeastwards along the GA-SC border]; [T. sessile group] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . T. discolor
6 Petals lanceolate, elliptic, obovate, or oblanceolate, but not broadly spatulate and distinctly clawed; petals maroon-red, purplish-brown, yellow, or green; flower fragrance various; [collectively widespread in our area]. $7 \quad$ Stigmas more than $1.5 \times$ as long as the ovary; stamens about $0.5 \times$ as long as the petals; anther connectives prominently prolonged into a beak $1.0-5.0 \mathrm{~mm}$ long (beyond the anther sacs); [ $T$. sessile group] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . T. sessile
7 Stigmas as long as the ovary or shorter; stamens less than $0.5 \times$ as long as the petals; anthers blunt, the connectives extended less than 1.0 mm beyond the anther sacs.
8 Ovary ellipsoid; leaves acute, the margins of the outer $1 / 3$ more or less straight; leaf blade mottled with 3 or more shades of green, the palest shade forming a very conspicuous pale green streak along the midvein; [of the Coastal Plain and fall-line area of GA, AL, and FL panhandle]; [T. sessile group].
9 Stem 2.5-3× as long as the leaves; petals oblanceolate-obovate, usually $1.5-3 \times$ as long as wide
T. decipiens

9 Stem $1-2 \times$ as long as the leaves; petals narrowly elliptic to oblanceolate-obovate, usually $3-5 \times$ as long as wide . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . T. underwoodii
8 Ovary ovoid; leaves acute to acuminate, the margins of the outer $1 / 3$ convex; leaf blade mottled with 2-3 shades of green, paler shades sometimes prominent along the midvein, but not as above; [collectively widespread in our area]; [T. maculatum group].
10 Ovary 3-angled at base of stigmas (rarely hexagonal); petals narrowly spatulate (appearing clawed), mostly $4.5 \times$ or more as long as wide; outer whorl of stamens broader, anther dehiscence introrse
T. maculatum

10 Ovary hexagonal or 6-ridged at base of stigmas; petals elliptic-oblanceolate to oblanceolate, mostly less than $4 \times$ as long as wide; stamens uniform, anther dehiscence introrse or lateral. 11 Flower fragrance fruity-spicy, like green apples or Calycanthus (rarely musky); petals maroon, bronze, green, yellow; portions of ovary and stamens purplish during anthesis .

## T. cuneatum

11 Flower fragrance lemon-like; petals greenish-yellow darkening to yellow; ovary and stamens greenish-white during anthesis
T. Iuteum

## Key B -- trilliums with unmottled leaves and pedicellate flowers, of the Erectum Group

1 Pedicel abruptly declined below the leaves; leaves petiolate to subsessile (or even sessile); petals recurved between the sepals.
2 Stamens far exceeding the pistil, filaments as long as the ovary or longer, at least partly maroon, the anther sacs yellow to maroon; ovary small, globose, 3-12 mm long; flower fragrance pungent, rose-like; pedicel long, 3-13 cm long; petals strongly overlapping, usually maroon (rarely white or whitish)
2 Stamens at most $1.5 \times$ longer than the pistil, filaments shorter than the ovary, white, the anther sacs lavendar to vivid purple (or albino); ovary large, ovoid, $10-17 \mathrm{~mm}$ long; flower fragrance weak, like green apples; pedicel short, $1.5-3 \mathrm{~cm}$ long; petals not strongly overlapping, usually white (rarely maroon).
3 Anthers 7.5 mm long or less, about as long as the filaments or shorter; petals narrowly elliptic to obovate, often scarcely larger than the sepals, delicate, occasionally margined in pink or green; [of damp forests south to n. VA] .
T. cernuum

3 Anthers 7.0 mm long or more, longer than the filaments; petals ovate to elliptic, much broader than the sepals; [of mesic forests north to n . NC] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . T. rugeliin
1 Pedicel inclined, erect or declined (the flower generally borne above the leaves); leaves sessile to subsessile; petals variously disposed, generally spreading in the same plane as the sepals or forming a cup concealing the ovary in side view (then recurved toward the apex).
4 Anthers creamy-white, $2-5 \times$ as long as the filaments; ovary white to pink (rarely darker), ovoid (widest near the base); stigmas prominent, nearly as long as the ovary; flower fragrance weakly sweet to musty . . . . . . . . . . . . . . . T. flexipes
4 Anthers creamy-white, yellowish, or purplish, at most $2.2 \times$ as long as the filaments; ovary purple-black to maroon (or albino), subglobose; stigmas smaller, less than $0.3 \times$ as long as the ovary; flower fragrance variable (see below).
5 Petals lanceolate to narrowly ovate or elliptic, spreading from base in the same plane as the sepals, rarely more than $2 \times$ as broad as the sepals; sepals $0.5-0.8 \times$ as long as the pedicel. weakly sulcate-tipped (keeled and upturned near apex); flower fragrance unpleasant, musty
T. erectum

5 Petals ovate, overlapping in some instances and forming a cup-shaped base, variably recurved apically, more than $2 \times$ as broad as the sepals; sepals less than 0.5 as long as the pedicel, sulcate-tipped; fragrance pleasant, sweet to fungal.
6 Sepals $0.4-0.7 \times$ as long as the pedicel; leaves broadly elliptic; stamens 1.2-1.8× pistil height; flowers generally large, petals much longer than the sepals; sepals green; petals usually white (rarely maroon); flower fragrance sweet, like green apples; [of sw. NC and nw. SC in our area] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . T. simile
6 Sepals 0.2-0.4× as long as the pedicel; leaves broadly obovate; stamens 0.9-1.6× pistil height; flowers relatively small, petals only slightly longer than the sepals; sepals suffused with purple; petals usually maroon (rarely white); flower fragrance fungal, like fresh mushrooms; [of sw. VA and nw. NC in our area]
T. sulcatum

## Key C -- trilliums with unmottled leaves and pedicellate flowers, of various affinities

1 Petals white with triangular red blaze (rarely entirely white or pinkish); anther sacs lavender to white, dehiscence extrorse; fruit a red berry; leaves long-acuminate; [of acidic sites in the Mountains, generally strongly associated with either Pinus, Tsuga,
Picea, Rhododendron, or other heaths]
T. undulatum

1 Petals white to deep pink, lacking a red blaze; anther sacs yellow, dehiscence introrse; fruit a white to greenish-white, fleshy, irregularly dehiscent capsule; leaves obtuse to acute (or somewhat acuminate in T. grandiflorum); [of less distinctly acidic sites, collectively widespread in our area].
2 Pedicel declined below the leaves (rarely erect); sepals arcuate-recurved; anthers irregularly twisted outward; pollen eggyolk yellow
T. catesbaei

2 Pedicel inclined above leaves to strictly erect; sepals not arcuate-recurved; anthers erect, regular; pollen light yellow.
3 Sepals about as broad as the petals or broader, obtuse; leaves obtuse; anthers purplish-green between anther sacs; pedicel erect through fruiting.
4 Pedicel $1-4 \mathrm{~mm}$ long
T. pusillum var. virginianum

4 Pedicel 5-30 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . T. pusillum var. pusillum
3 Sepals narrower than the petals, acute; anthers white to greenish-white between the anther sacs; leaves obtuse, acute, or acuminate; pedicel somewhat angled from the vertical.
5 Ovary obscurely 3-lobed; leaves less than 5 cm long, blue-green, obtuse
T. nivale

5 Ovary sharply 6 -angled (-winged); leaves more than 5 cm long, green, acute to acuminate.
6 Petals obovate, tightly rolled at base, abruptly flared near the apex; leaves broadly elliptic, acuminate; style minute, less than 1.0 mm long . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . T. grandiflorum
6 Petals elliptic, loose, gradually separating; leaves ovate, acute; style conspicuous, more than 1.5 mm long T. persistens

Trillium catesbaei Elliott, Catesby's Trillium, Bashful Trillium, Rosy Wake-robin. Pd (GA, NC, SC), Mt (GA, NC, SC), Cp (GA, NC): bottomland forests, mesic slopes, cove forests; common (uncommon in Mountains). Late March-early June; July-August. Nc. NC south to sw. GA and se. AL, north in the interior to $n$. AL and se. TN, centered in the Piedmont from NC to GA, but extending into the Mountains and Coastal Plain. Petals white to pink. [= RAB, FNA, K, S, W, X, Z]

Trillium cernuum Linnaeus, Northern Nodding Trillium. Mt (VA): damp forest with Fraxinus nigra and Ulmus americana; rare (VA Rare). Late April-May. Newfoundland, Hudson Bay area, and se. Saskatchewan south to n. VA, ne. WV, n. IN, n. IL, n. IA, and SD. Petals white, pink, maroon, or green. [=FNA, K, W, X, Z; < T. cernuum -- RAB, C, F, S, in part (apparently also including $T$. rugelii)]

Trillium cuneatum Rafinesque, Sweet Betsy, Purple Toadshade, Large Toadshade, Wedge-petal Trillium, Bloody Butcher. Pd, Mt (GA, NC, SC), Cp (GA): in rich soils of cove forests, moist slopes, and bottomlands, usually over mafic or calcareous rocks; uncommon, but locally abundant. Mid March-April; late May-June. Centered in the Southern Appalachians (but is more abundant in adjacent physiographic provinces), extending north to the Highland Rim of KY, west to the Interior Low Plateau of TN, south to the Coastal Plain of MS and AL, and east to the Piedmont of GA, SC, and NC. Petals maroon, yellow, green, or various intermediate shades. [= C, F, FNA, K, W, X, Y, Z; = T. cuneatum var. cuneatum -- RAB; T. viride Beck -- F, misapplied with respect to NC material; T. viride var. Iuteum (Muhlenberg) Gleason -- G, in part and misapplied (also see T. luteum); T. hugeri -- S; T. underwoodii -- S, misapplied]

Trillium decipiens Freeman, Deceptive Trillium. Cp (GA): moist forests; uncommon. W. FL and sc. AL east to ec. GA, and might be expected in SC, near the Fall Line. It is similar to T. underwoodii. [= FNA, K, X, Y, Z]

Trillium decumbens Harbison, Decumbent Trillium. Mt, Pd, Cp (GA): moist forests; uncommon (rare in Piedmont and Coastal Plain). Se. TN (Chester et al. 1993) south and west to nw. GA and nc. AL, and disjunct in Houston County, in central GA Coastal Plain; it should be sought in extreme sw. NC, an extremely "under-botanized" area. [= FNA, K, S, X, Y, Z]

Trillium discolor Wray ex Hooker, Pale Yellow Trillium, Pale Trillium, Small Yellow Toadshade. Mt (GA, NC, SC), Pd (GA, SC): rich cove forests, restricted to the Savannah River drainage; rare (GA Special Concern, NC Threatened, SC Rare). Late March-early May; June-July. Endemic to the Savannah River drainage of nw. SC, ne. GA, and sw. NC, occurring in the Blue Ridge and Piedmont. In NC it is restricted to a few sites along the Whitewater and Thompson Rivers. Petals pale yellow, with maroon or greenish claws. [= RAB, FNA, K, S, W, X, Y, Z]

Trillium erectum Linnaeus, Red Trillium, Purple Trillium, Stinking Willie, Stinking Benjamin, Wake-robin. Mt (GA, NC, SC, VA): wooded slopes, usually at middle to high elevations; common. April-early June; July-August. New Brunswick, Québec, and MI south to w. NC, nw. SC, n. GA, e. TN, IN, and se. WI. Petals maroon, white, yellow, green, or various intermediate shades. [= C, K, W, X, Z; T. erectum var. erectum -- RAB, in part only (also see $T$. sulcatum); $T$. erectum -- $\mathrm{F}, \mathrm{G}$, S , in part only (also see $T$. sulcatum); T. erectum var. erectum - FNA; T. erectum var. album (Michaux) Pursh - FNA]

Trillium flexipes Rafinesque, Bent White Trillium. Mt (GA, NC, VA): moist coves over mafic or calcareous rocks; rare (GA Special Concern, NC Rare, VA Rare). E. PA, s. Ontario and s. MN south to w. NC, nw. GA, n. AL, n. MS, mostly west of the Blue Ridge, but scattered in the Blue Ridge of NC, and disjunct east of the Blue Ridge in DE, PA, and MD. Petals white or maroon. [= C, F, FNA, K, W, X, Z; < T. erectum var. vaseyi -- RAB, in part; T. gleasoni Fernald -- G; T. declinatum (A. Gray) Gleason -- S, misapplied]

Trillium grandiflorum (Michaux) Salisbury, Large-flowered Trillium, White Trillium, Great White Trillium. Mt (GA, NC, SC, VA), Pd (NC, SC, VA): rich coves and mesic slopes, also less typically on ridges over "rich" rock types; common (SC Rare). April-May; July-August. S. Québec, s. Ontario, MI, and MN, south to NJ, c. NC, nw. SC, n. GA, n. AL, s. IL, and IA. Petals white to pink. [= RAB, C, F, FNA, G, K, S, W, X, Z]

Trillium lancifolium Rafinesque, Lanceleaf Trillium, Narrowleaf Trillium. Pd (SC), Mt (GA), Cp (GA): rich forests over marble, limestone, and other calcareous substrates, floodplain forests; rare (GA Special Concern, SC Rare). Late March-April. Nc. SC and se. TN south through w. GA and AL to panhandle FL and se. AL. Petals purple, green, or greenish-purple. [= FNA, K, Y, X, Z; T. lanceolatum (S. Watson) Boykin ex Small -- RAB, S]

Trillium Iuteum (Muhlenberg) Harbison, Yellow Trillium, Yellow Toadshade, Wax Trillium, Lemon-scented Trillium. Mt (GA, NC, VA*): moist coves over mafic or calcareous rocks, restricted to the vicinity of the Great Smokies; uncommon (but locally abundant). Mid March-April; late May-June. Nearly endemic to the Southern Appalachians: w. NC, e. TN, nw. GA, and se. KY, allegedly disjunct in c. AL (planted and naturalized in Frederick County, VA). Petals yellow. [= C, F, FNA, K, W, X, Y, Z; = T. cuneatum var. Iuteum (Muhlenberg) Ahles -- RAB; < $T$. viride Beck var. luteum (Muhlenberg) Gleason -- G, in part only (also see $T$. cuneatum); $T$. sessile -- S , in part, misapplied]

Trillium maculatum Rafinesque, Mottled Trillium, Spotted Trillium. Cp, Pd (GA, SC): rich forests and floodplains, over calcareous materials such as coquina limestone ("marl") or on shell middens; uncommon. March-mid April. S. SC south to $n$. FL, west to sc. AL. Petals maroon or yellow. [= FNA, K, X, Y, Z; T. viride -- RAB, misapplied; T. sessile -- S, in part, misapplied]

Trillium nivale Riddell, Snow Trillium, Dwarf White Trillium. Mt (VA): rocky, calcareous forests; rare (VA Rare). MA, sw. PA, MI, WI, s. MN, and e. SD south to n. VA, KY, s. IN, s. IL, s. MO, and se. NE. Petals white to pink. [= C, F, FNA, G, K, X, Z]

Trillium persistens Duncan, Persistent Trillium. Mt (GA, SC): acidic forests with hemlocks and heaths; rare (US Endangered, GA Endangered, SC Rare). April. Endemic to a short stretch of the Tallulah-Tugaloo river system in nw. SC and ne. GA. Petals white to pink. [= FNA, K, W, X, Z]

Trillium pusillum Michaux var. pusillum, Carolina Least Trillium, Carolina Dwarf Trillium. Cp (NC, SC), Mt (GA, NC): bottomland forests along small streams in the upper Coastal Plain, ecotones of calcareous savannas and swamp forests in the lower Coastal Plain, moist slopes in the Mountains; rare (US Species of Concern, GA Special Concern, NC Endangered, SC Rare). Late March-May; June-July. T. pusillum is somewhat reminiscent of a tiny T. grandiflorum. The species as a whole has a highly disjunct and fragmented range, involving most of the Southeastern states. The complex includes $T$. texanum Buckley (of TX), $T$. pusillum var. ozarkanum (Palmer \& Steyermark) Steyermark (of the Ozarks), and the taxa discussed below. Our area has three named varieties, and additional putative varieties, under study (S. Farmer, pers. comm. 2005). Var. pusillum (as currently circumscribed) ranges from the Coastal Plain of e. NC south to SC, west to the Blue Ridge of NC, and west into e. KY, c. TN, n. AL, and $s$. MS. One putative new variety would include all material from the Blue Ridge of NC and south and west of it, leaving the typic variety as endemic to the Coastal Plain of NC, SC, and perhsps s. MS. The Trillium pusillum complex is currently undergoing study by Susan Farmer (Univ. of Tennessee); preliminary analysis shows that the published varieties are "good" and that the recognition of additional varieties may be warranted. Petals white to pink. [= C, F, FNA, K, X; <T. pusillum -- RAB, G, S, Z, infraspecific taxa
not distinguished; > T. pusillum var. "alabamicum" -- X (nomen nudum)]
Trillium pusillum Michaux var. virginianum Fernald, Virginia Least Trillium, Virginia Dwarf Trillium. Cp (NC, VA), Mt (VA): swamps and bottomland forests, also mesic beech islands in swamp forests, moist forests along small mountain streams; rare (US Species of Concern, NC Endangered, VA Rare). Late March-May; June-July. Var. virginianum occurs in the Coastal Plain of se. VA and ne. NC. The controversial var. monticulum Bodkin \& Reveal occurs the mountains of nw. VA, e. WV, and w. MD, and disjunctly in sw. VA, at The Glades, Grayson County, VA. The Grayson County site is within a kilometer of the Alleghany County, NC border, and the plant may be found to occur in nw. NC. Var. monticulum Bodkin \& Reveal has been controversial; see Cabe (1995) and Cabe \& Werth (1995) for additional discussion of variation within T. pusillum in Virginia and elsewhere. Petals white to pink. [= C, F, FNA, K, X; <T. pusillum -- G, S, Z, infraspecific taxa not distinguished; > T. pusillum var. monticulum Bodkin \& Reveal (populations from the mountains of VA and $W V$ )]

Trillium recurvatum Beck, Prairie Trillium, Prairie Wake-robin. Mt (NC): rich soils of cove over calcareous rock; rare (NC Rare). Primarily a midwestern species, T. recurvatum ranges from w. OH west to s. MI, s. WI, and e. IA, south to c. TN, c. AL, c. MS, n. LA, and e. TX, with disjunct occurrences in the Cumberland Plateau of e. TN, e. KY, and w. NC (in the Hot Springs Window). The single known NC occurrence appears to be native. Petals maroon or yellow. [=C, F, FNA, G, K, S, X, Y, Z]

Trillium reliquum J.D. Freeman, Relict Trillium. Pd (GA, SC), Cp (GA): rich forests on bluffs and ravine slopes; rare (US Endangered, GA Endangered, SC Rare). Mid March-late April. Known from two disjunct areas, along the Savannah River in the vicinity of Augusta, on the border of SC (Aiken County) and GA (Richmond counties), and along the Chattahootchee River in sw. GA (Clay and Early counties). [= FNA, K, X, Y, Z]

Trillium rugelii Rendle, Southern Nodding Trillium. Mt, Pd (GA, NC, SC): rich woodlands and forests over mafic or calcareous rocks; rare (NC Watch List, SC Rare). W. NC and e. TN south to c. GA, and c. AL. Petals white or maroon. [= FNA, K, $\mathrm{W}, \mathrm{X}, \mathrm{Z} ;<\operatorname{T}$. cernuum -- RAB, C, F, S, in part (apparently including T. rugelii); T. cernuum var. macranthum A.J. Eames \& Wiegand -- C, G]

Trillium sessile Linnaeus, Sessile Trillium, Sessile Toadshade, Toad Trillium. Mt (VA), Pd (VA), Cp (NC, VA): rich forests, in NC limited to very rich soils of natural levees and lower slopes along the Roanoke River; uncommon in VA, rare in NC (NC Rare). Primarily a species of the northern Midwest, T. sessile ranges from MD, w. PA, w. NY, s. MI, n. IL and n. MO, south to e. VA, ne. NC, c. TN, n. AL, and n. AR. The easternmost occurrences are disjunct populations east of the Blue Ridge, in MD, VA, and along the Roanoke River in ne. NC. Petals maroon or green. [=C, F, FNA, G, K, W, X, Y, Z]

Trillium simile Gleason, Sweet White Trillium. Mt (GA, NC, SC): very rich soils of slopes and coves over mafic or calcareous rocks, often also in or near seepage; rare (GA Special Concern, NC Rare, SC Rare). Late March-early May; June-July. A Southern Appalachian endemic: Blue Ridge of w. NC, nw. SC, e. TN, and n. GA. Petals white or very rarely maroon. [= FNA, K, S, W, X, Z; < T. erectum var. vaseyi -- RAB, in part]

Trillium sulcatum T. Patrick, Southern Red Trillium, Barksdale Trillium. Mt (GA, NC, VA): coves and moist slopes; uncommon (GA Special Concern). Primarily a species of the sedimentary rock Appalachians, T. sulcatum ranges from s . WV, sw. VA, and e. KY south to nw. NC (where it enters the Blue Ridge), w. TN, nw. GA, and ne. AL. This species seems quite distinctive for its small, generally maroon flowers (with strongly sulcate sepals purplish as well), borne on very long pedicels. Petals maroon or white. [= C, FNA, K, W, X, Z; < T. erectum var. erectum -- RAB, in part; < T. erectum -- F, G, S, in part]

Trillium underwoodii Small, Underwood's Trillium. Cp (GA): moist forests; uncommon. N. FL north to wc. GA and c. and s. AL; it is the only erect trillium with the stems less than $2 \times$ as long as the leaves. [= FNA, K, S, X, Y, Z]

Trillium undulatum Willdenow, Painted Trillium, Striped Wake-robin. Mt (GA, NC, SC, VA): acidic soils of ridges, slopes, and bog margins, mostly at high elevations and often associated with Rhododendron, Tsuga, Pinus, or Picea; common (SC Rare). Late April-May; late July-August. New Brunswick, e. Québec, s. Ontario, and MI, south to w. NC, nw. SC, n. GA, e. TN, and ne. OH. Of all our species, this is the species best adapted to acidic soils. Petals white with a red blaze. [= RAB, C, F, FNA, G, K, S, W, X, Z]

Trillium vaseyi Harbison, Sweet Trillium, Vasey Trillium, Sweet Beth. Mt (GA, NC, SC), Pd (GA): cove forests; uncommon. This species is a Southern Appalachian endemic: w. NC and e. TN south to nw. SC, n. GA, and ne. AL. Perhaps the largest trillium species, with the stems to 7 dm tall. Petals maroon or white. [= FNA, K, S, W, X, Z; < T. erectum var. vaseyi (Harbison) Ahles -RAB, in part only (also see $T$. simile and $T$. flexipes)]

Trillium foetidissimum J.D. Freeman. MS west to LA. [= FNA, K, X, Y, Z] \{not keyed\}
Trillium ludovicianum Harbison, Louisiana Wakerobin. AL west to LA. [= FNA, K, X, Y, Z] \{not keyed\}
Trillium sp. 1. Pd (SC): rich forests; rare. Under study by L.L. Gaddy. [misidentified as T. lancifolium] \{not keyed\}
Trillium stamineum Harbison, Twisted Trillium. C. TN (Chester et al. 1993) south to c. AL, and e. MS. [= FNA, K, S, X, Y, Z]

## TYPHACEAE de Jussieu 1789 (Cattail Family)

A family of 2 genera with $16-30$ species, wetland herbs, cosmopolitan. References: Kaul in FNA (2000); Smith in FNA (2000); Thieret \& Luken (1996); Kubitzki in Kubitzki (1998b).

1 Inflorescences headlike, globular . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Sparganium
1 Inflorescences spikelike, cylindrical . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . Typha

Sparganium Linnaeus 1753 (Bur-reed)
A genus of about 14 species, wetland and aquatic herbs, primarily circumboreal in arctic and temperate regions, but also in the tropics of Asia, and temperate Australia. References: Kaul in FNA (2000); Thieret (1982)=Z; Beal (1960)=Y; Crow \& Hellquist

1 Stigmas 2; fruits truncate at apex, obpyramidal, very abruptly beaked, 4-8 mm broad
S. eurycarpum

1 Stigmas 1; fruits rounded or acuminate to a beak at the apex, elliptic, fusiform, or obovate, 1-3 (-4) mm broad.
2 Pistillate heads (primarily those upwards) supra-axillary (borne distinctly above the axils of the subtending leaf-like bracts); tepals lacking subapical dark spot
S. emersum

2 Pistillate heads (all) axillary (borne in the axils of the subtending leaf-like bracts) or several on axillary branches which lack leaf-like bracts; tepals with prominent subapical dark spot.
3 Mature fruits dull, finely pitted, the body $3-5 \mathrm{~mm}$ long; fruiting heads $1.5-2.5 \mathrm{~cm}$ in diameter; branches of the inflorescence with (0-) 1-3 pistillate heads (in addition to staminate heads); stigma 0.8-1.9 (-2.8 in the Coastal Plain) mm long
S. americanum

3 Mature fruits shiny, smooth, the body 5.5-7 mm long; fruiting heads 2.5-3.5 cm in diameter; branches of the inflorescence with 0 (-1) pistillate heads (in addition to staminate heads); stigma 1.5-3 mm long . . S. androcladum

Sparganium americanum Nuttall, American Bur-reed. Cp, Mt, Pd (GA, NC, SC, VA): streams, marshes, ponds, pools, often submerged; common (rare in NC and SC Piedmont). May-September. Newfoundland west to MN, south to c. peninsular FL and c. TX. Beal (1960) discusses the interesting variation in S. americanum, perhaps worthy of taxonomic recognition. The "Appalachian Race" has stigmas $0.6-0.9 \mathrm{~mm}$ long, inflorescence branches $0-3$, and relatively narrow leaves; in our area it is montane in distribution, and in general is Appalachian, Ozarkian, and northern. The "Coastal Race" has stigmas 1.5-2.8 mm long, 2-5 inflorescence branches, and relatively wide leaves; in our area it is primarily of the Coastal Plain, disjunct to the mountains of NC and SC south of the Asheville Basin (like many Coastal Plain taxa), and in general is nearly limited to the Coastal Plain, ranging from MA south to FL, west to e. TX, and north in the interior to sc. TN, s. IN, and s. MO. The "Ubiquitous Race" is intermediate, with stigmas 1.0-1.4 m long; it occurs throughout the range of the species. The pattern is suggestive of imperfect evolutionary separation of two taxa. [= RAB, C, F, FNA, G, GW, K, S, W, X, Y, Z; S. eurycarpum -- S, misapplied]

Sparganium androcladum (Engelmann) Morong. Cp, Pd (VA): marshes, shores; rare (VA Rare). May-September. ME and Québec west to MN, south to se. VA, e. TN, s. MO, and ne. OK. [= C, F, FNA, G, K, W, X, Y, Z]

Sparganium emersum Rehmann, Greenfruit Bur-reed. Mt (NC, VA): bogs, stream margins; rare (NC Rare, VA Rare). MaySeptember. Newfoundland and c. Québec west to s. Alberta and WA, south to w. NC, IN, IA, CO, and CA. [= FNA, X; Sparganium chlorocarpum Rydberg -- RAB, C, F, G, W, Y, Z; S. chlorocarpum var. acaule (Beeby) Fernald -- F; S. angustifolium Michaux - K, misapplied]

Sparganium eurycarpum Engelmann ex A. Gray, Giant Bur-reed. Cp, Pd, Mt (VA): marshes, shores; uncommon (VA Watch List). Nova Scotia west to British Columbia, south to w. VA, IN, OK, and CA. [= C, F, FNA, G, K, W, X; S. erectum Linnaeus ssp. stoloniferum (Graebner) C.D.K. Cook \& M.S. Nicholls]

Sparganium angustifolium Michaux, Narrow-leaved Bur-reed. Attributed to VA and WV by Kartesz (1999), apparently erroneously. [= C, FNA, K, X] \{not keyed; add synonymy\}

## Typha Linnaeus 1753 (Cattail)

A genus of 8-13 species, wetland herbs, cosmopolitan. References: Smith in FNA (2000); Kubitzki in Kubitzki (1998b).
1 Staminate and pistillate portions of spike normally contiguous; pistillate portion of spike (1.5-) 2.0-3.5 cm in diameter at maturity; leaves (8-) 10-24 mm wide, flat on one side; stigmas lance-ovate, fleshy, persistent; pollen grains in 4's; [in acid to alkaline waters, widespread in our area]
T. Iatifolia

1 Staminate and pistillate portions of spike normally separated by a gap; pistillate portion of spike 0.5-2.2 (-2.5) cm in diameter at maturity; leaves $4-15 \mathrm{~mm}$ wide, biconvex (or flat on one side in $T$. $\times$ glauca); stigmas linear to lance-linear, not fleshy (or slightly so in $T$. × glauca), either quickly deciduous or persistent; pollen grains single; [in circumneutral to alkaline waters, primarily in tidal situations in the outer Coastal Plain, but scattered inland, especially in VA].
2 Pith at base of stem yellowish buff; stigmas lance-linear, slightly fleshy; pistillate portion of spike 1.6-2.5 cm in diameter at maturity; pistillate bracteoles usually absent (or present on a few flowers) . . . . . . . . . . . . . . . . . . . . . . . . . T. $\times$ glauca
2 Pith at base of stem white; stigmas linear, not fleshy; pistillate portion of spike 0.5-2.5 cm in diameter at maturity; pistillate bracteoles present on all flowers.
3 Leaves 4-7 (-11) mm wide, auriculate at the junction of the blade and the sheath; pistillate portion of spike $0.5-2.0 \mathrm{~cm}$ in diameter and dark brown at maturity; plants 1-1.5 m tall; pistillate bracteoles rounded to blunt at the tip T. angustifolia

3 Leaves 6-12 (-15) mm wide, most or all not auricled at the junction of the blade and the sheath; pistillate portion of spike (0.8-) 1.3-2.5 cm in diameter and light cinnamon brown at maturity; plants (1-) 2-4 m tall; pistillate bracteoles acute to acuminate at the tip
T. domingensis

Typha angustifolia Linnaeus, Narrowleaf Cattail. Cp (GA?, NC, SC, VA), Pd, Mt (VA): brackish to fresh waters of marshes and swamps, usually tidal; common (rare in Piedmont and Mountains). May-July; June-November. Nova Scotia west to ND, south to SC, FL (?), LA, and TX (?); Eurasia. [= C, F, FNA, G, GW, K, W; < T. angustifolia -- S, in part only (also see T. domingensis)]

Typha domingensis Persoon, Southern Cattail. Cp (GA, NC, SC, VA): brackish to nearly fresh waters of marshes and swamps, usually tidal; common. June-July; July-November. DE south to s. FL, west to TX; north inland to NE and UT; and south into tropical America; Eurasia; Africa; Oceania. [= C, F, FNA, G, GW, K; < T. angustifolia -- S, in part]

Typhaxglauca Godron (pro sp.), Hybrid Cattail. Cp (GA?, NC, SC, VA), Mt (VA): fresh to brackish waters of lakes, ponds, and rivers; rare. May-July; June-November. Both C and K apply this name to two different hybrids: $T$. angustifolia $\times$ latifolia and $T$. domingensis $\times$ latifolia. The name properly applies to $T$. angustifolia $\times$ latifolia (Smith in FNA 2000). [ $=$ C, GW, K; = T. glauca Godron -- RAB, F]

Typha latifolia Linnaeus, Common Cattail. Mt, Pd, Cp (GA, NC, SC, VA): fresh waters of ponds, lakes, ditches, marshes, including in tidal freshwater marshes; common. May-July; June-November. Newfoundland west to AK, south to FL, TX, CA, and Mexico; Central America; South America; Eurasia. [= C, F, FNA, G, GW, K, S, W]

## UVULARIACEAE (Bellwort Family)

[see CALOCHORTACEAE (Prosartes, Streptopus, Tricyrtis), COLCHICACEAE (Uvularia), LILIACEAE (Clintonia)]

## XYRIDACEAE C. Agardh 1823 (Yellow-eyed Grass Family)

A family of 5 genera and about 325-350 species, nearly cosmopolitan (most diverse in tropical and subtropical regions, and especially South America). References: Kral in FNA (2000); Kral in Kubitzki (1998b).

## Xyris Linnaeus 1753 (Yellow-eyed Grass)

A genus of about 300 species, nearly cosmopolitan (most diverse in tropical and subtropical regions, and especially South America). This "technical" genus is known well by only a few botanists, and additional undescribed taxa are possible. References: Kral in FNA (2000); Bridges \& Orzell (2003)=X; Kral (1966a)=Z; Kral (1983b, 1999); Kral in Kubitzki (1998b). Key adapted from X, GW, and Z.

Identification notes: In vegetative condition, Xyris is often confused with other monocots with equitant leaves, such as Iris spp. (Iridaceae), Lachnanthes caroliniana (Haemodoraceae), and Tofieldia spp. (Tofieldiaceae).

1 Keel of the lateral sepals shortly ciliate-scabrid (or sometimes entire in $X$. brevifolia, and then the bract tips purplish-tinged)
2 Plants relatively small, usually less than 30 cm tall; principal leaves usually less than 10 cm long; mature spikes less than 1 cm long when mature.
3 Leaves filiform, with expanded brownish lustrous bases, usually exceeding the sheath of the scape; [plants of s. AL and the FL Panhandle] [X. isoetifolia]
3 Leaves linear, the bases not expanded, shorter than, equalling, or slightly exceeding the sheath of the scape; [plants collectively more widespread].
4 Keel of the lateral sepals straight to slightly curved, remotely ciliate or entire; spikes broadly ovoid to subglobose, the bracts loose, bicolored, the outer portions maroon or purplish and often with erose margins
. . . . . .... ...... X. brevifolia
4 Keel of the lateral sepals strongly curved, densely ciliate; spikes lance-ovoid to ovoid, the bracts entire, not purple-tinged, and lacking erose borders.
5 Plants perennial; leaves ascending, green with a distinct brown patch at the base; fruiting spikes ovoid, blunt, somewhat 2-edged from the strongly keeled outer bracts . . . . . . . . . . . . . . . . X drummond
5 Plants annual; leaves flabellate arranged, spreading to recurved against the substrate, usually maroon; fruiting spikes often elongated and acute, not 2-edged . . . . . . . . . . . . . . . . . . . . . . . . . X. $\boldsymbol{\text { flabelliformis }}$
2 Plants relatively large, usually more than 30 cm tall; principal leaves more than 10 cm long; mature spikes more than 1 cm long when mature.
6 Leaves ascending, twisted, strongly grooved; spikes ovoid, the bracts and lateral sepals with a small tuft of short, reddish-brown hairs; bases of leaves abruptly expanded, pinkish or purplish (dark brown in age), the outermost leaves often scalelike, the plant base therefore appearing bulbous; [of the Mountains, Piedmont, and Coastal Plain]

6 Leaves spreading, not twisted or only slightly so; spikes narrowly ovoid, ellipsoidal, or oblong; bracts and sepals without a small apical tuft of hairs; bases of leaves whitish, tan, pink, purplish, maroon, or dark brown, the outermost leaves not scalelike, the plant base not appearing bulbous; [typically of the Coastal Plain, rarely disjunct inland].
7 Seeds lustrous, translucent, broadly ovoid; spike pale brown or tan, the scales loosely imbricate; plant bases pinkish, purplish, or tan, with dark longitudinal striations on the inner leaf bases; leaves 3-20 mm wide; petal blades obovate, 6-7 mm long, opening in early morning, usually closing by mid-day . . . . . . . . . . X. ambigua 7 Seeds farinose, dark brown (X. stricta) or pale (X. louisianica) at maturity, narrowly ellipsoid to ovoid; spike dark brown, the scales tightly imbricate; plant bases maroon, purplish, dark-brown, or reddish-brown; leaves 2-5 mm wide; petal blades triangular-cuneate, 3-5 mm long, opening at mid-day.
8 Seeds pale when mature; plant bases maroon to maroon-brown, solitary or in small clumps; upper end of scape somewhat flattened, but not nearly as broad as the spike; spike narrowly ovoid to ellipsoid, slightly pointed . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . X. Iouisianica
8 Seeds dark brown when mature; plant bases dark maroon to dark brown, desnely cespitose; upper end of the scape conspicuously flattened, almost as broad as the spike; spike oblong-cylindrical, obtuse $\boldsymbol{X}$. stricta
1 Keel of the lateral sepals irregularly lacerate or fimbriate, or if entire then the the bract tips not purplish.

## Flora of the Carolinas, Virginia, and Georgia, Working Draft of 10 June 2005 -- XYRIDACEAE

9 Leaves narrowly linear to filiform, 0.5-2.0 (-2.5) mm wide, not twisted (or scarcely so); leaf bases expanded, lustrous, hard, tan to brown, neither bulbous or deeply set in the substrate; spikes ovoid or ellipsoid, 4-15 mm long.
10 Leaves filiform, terete or elliptic in cross-section, $0.5-1.0 \mathrm{~mm}$ wide, without a paler, hardened margin; scape as broad as or broader than the leaf blades; scales smooth-edged to denticulate, not curled away from the head, the head thus appearing smooth; staminodia beardless.
X. baldwiniana

10 Leaves linear, flattened in cross-section, 1-2 (-2.5) mm wide, with a pale, hardened margin; scape usually narrower than the leaf blades; scales ragged-lacerate, the tips curling away from the head, giving it a ragged appearance; staminodia bearded
X. elliottii

9 Leaves broader, (1.5-) 2.0-25 mm wide, strongly twisted to straight, the leaf bases either not expanded, lustrous, hard, and tan to brown, or, if so, then the base also either bulbous and/or deeply seated in the substrate; spikes narrowly lanceolate, ellipsoid, to broadly ovoid, 4-40 mm long.
11 Keel of the lateral sepals long-fimbriate towards its apex, the fimbriate tip conspicuously exserted from the subtending bract (sometimes eroded and less conspicuous on older spikes).
12 Leaves strongly twisted, 2-5 mm wide; leaf bases hardened, swollen, bulbous, dark lustrous brown; scape ridges smooth; petal blades white or yellow; [of moist to dry pinelands] . . . . . . . . . . . . . . . . . . X. caroliniana 12 Leaves not twisted, $5-25 \mathrm{~mm}$ wide; leaf bases soft, not swollen, not bulbous, pale; scape ridges strongly scabrous; petal blades yellow; [of aquatic to very wet peaty, mucky, or sandy ponds, marshes, or other wetlands] X. fimbriata

11 Keel of the lateral sepals lacerate, or if very shortly fimbriate, then not conspicuously exserted from the subtending bract.
13 Lateral sepals longer than and exserted from the subtending bracts; scapes 5-15 dm tall . . . . . . . X. smalliana 13 Lateral sepals shorter than the subtending bracts, and therefore hidden (except when the spikes open to shed seeds); scapes 1.5-12 dm tall.
14 Scapes flexuous, usually spirally twisted; upper portion of leaf blades conspicuously twisted; plant bases pinkish, purplish, or dark brown, bulbous or deeply set in the substrate.
15 Base of plant deeeply set in the substrate, without distinct outer scale leaves; leaf bases not noticeably expanded, the plant base therefore not bulbous; leaves smooth, 2-4 mm wide; petal blades ca. 3 mm long
X. chapmanii

15 Base of plant shallowly set on the substrate, often with short, black outer scale leaves; leaf bases noticeably expanded, the plant base therefore appearing bulbous; leaves either smooth and $5-10 \mathrm{~mm}$ wide, or scabrous and 2-10 mm wide; petal blades ca. 5 mm long.
16 Leaf and scape surfaces smooth (or scabrous only along margins and ridges); petal blades obovate, white or yellow; seeds ovoid, 0.5-0.6 mm long . . . . . . . . . . . . . . . . . . . . X. platylepis 16 Leaf and scape surfaces prominently papillose or tuberculate-scabrid; petal blades suborbicular, yellow; seeds narrowly ovoid or narrowly ellipsoidal, ca. 1.0 mm long $\ldots .$. . . . . $\boldsymbol{X}$. scabrifolia
14 Scapes usually not flexuous, usually not spirally twisted; upper portion of leaf blades not conspicuously twisted; plant bases variously colored, flabellate or equitant and set at ground level.
17 Summit of the scape distinctly flattened and broad relative to the spike; scape ridges 2-3, the 2 most prominent comprising the flattened edge of the scape.
18 The 2 principal scape ridges noticeably and abruptly flattened and winglike below the spike, their combined width (on fresh material) broader than the scape proper; fruiting spikes mostly 8-15 mm long; seeds $0.4-0.6 \mathrm{~mm}$ long, translucent, ovoid or ellipsoidal, about $1.5 \times$ as long as wide, with lines of very fine papillae, not farinose
X. difformis

18 The 2 principal scape ridges not abruptly flattened and winglike below the spike, their combined width less than the scape proper, which is itself flattened (narrowly elliptic in cross-section); fruiting spikes mostly (10-) 20-25 mm long; seeds $0.8-1.0 \mathrm{~mm}$ long, dark when ripe, fusiform to narrowly elliptic, $2-3 \times$ as long as wide, with lines of very fine papillae, these however obscured by a farinose covering
X. iridifolia

17 Summit of the scape nearly terete or somewhat flattened, much narrower than the spike; scape ridges several (usually more than 3), at least on the mid to lower portion of the scape.
19 Seeds farinose, very dark; surfaces of leaves tuberculate-scabrid, the leaves strongly ascending, linear, generally more than 10 cm long; leaves generally dull-colored.
20 Mature spikes ovoid, sharply acute; plants solitary or in small clumps; leaves 10-30 (-50) cm long, $1.5-6.0 \mathrm{~mm}$ wide, dark maroon or purplish at the base . . . . . . . . . . X. floridana
20 Mature spikes ovoid to ellipsoid, acute to obtuse; plants typically in large dense tufts; leaves $20-50 \mathrm{~cm}$ long, 3-12 mm wide, the older ones with dark-brown to gray bases, the younger with tan bases . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . X. serotina
19 Seeds translucent, not farinose; surfaces of leaves smooth (or sparsely tuberculate-scabrid in $X$. difformis var. curtissii, which also has leaves linear-curvate and generally less than 10 cm long); leaves generally a bright yellowish-green above the base.
21 Leaves broadly linear-curvate, spreading, typically less than 10 cm long, $2-4.5 \mathrm{~mm}$ wide; plants perennial, in tufts (rarely solitary); mature spikes acute, with less than 10 flowers; leaf bases pinkish or purplish; old flowers fugacious, not persisting on spikes . . X. curtissii
21 Leaves linear, ascending, 10-60 cm long, $5-10 \mathrm{~mm}$ wide; plants annual, solitary or in small tufts; mature spikes obtuse, many-flowered; leaf bases tan (very rarely pinkish); old flowers often persistent on the spikes, drying blackish
X. jupicai

Xyris ambigua Beyrich ex Kunth. Cp (GA, NC, SC, VA), Pd (NC), Mt (VA): wet savannas and flatwoods, pinelands, edges of depression ponds; common. June-August. Se. VA south to FL, west to AL and ec. TX, primarily on the Coastal Plain. [= RAB, C, F, FNA, G, GW, K, S, W, X]

Xyris baldwiniana J.A. Schultes, Grassleaf Yellow-eyed Grass. Cp (GA, NC, SC), Pd (NC): wet savannas, seepage bogs, sandhill seeps, wet savanna ecotones; rare (NC Watch List). June-July. Se. NC south to n. FL, west to s. AR and ec. TX, primarily on the Coastal Plain. [= RAB, FNA, GW, K, S, X]

Xyris brevifolia Michaux, Shortleaf Yellow-eyed Grass. Cp (GA, NC, SC): wet sands of pinelands, especially seasonally wet, open, white sands of spodosol longleaf pine flatwoods (Leon series soils), margins of Carolina bay sandrims; rare (NC Rare, SC Rare). June-August. Se. NC south to s. FL, west to s. AL and w. FL, and in the West Indies and South America. [= RAB, FNA, GW, K, S, X]

Xyris caroliniana Walter, Pineland Yellow-eyed Grass. Cp (GA, NC, SC, VA): dry to moist pine flatwoods, moist savannas, scrub oak sandhills; common (VA Rare). June-July. Se. VA south to FL, west to se. TX, and disjunct northward in s. NJ. Whitepetaled populations of $X$. caroliniana occurring in the East Gulf Coastal Plain need additional study. [= RAB, C, FNA, GW, K, X; > $X$. flexuosa Muhlenberg ex Elliott -- F, G, S; > X. pallescens (C. Mohr) Small -- S]

Xyris chapmanii Bridges \& Orzell, Chapman's Yellow-eyed Grass. Cp (GA?, NC, SC): sandhill seepage bogs in areas of copious lateral seepage in deep muck soils; rare (NC Rare). Sc. NC south to panhandle FL, west to e. TX. This taxon is abundantly distinct from $X$. scabrifolia. [= X; < X. scabrifolia - FNA, K, in part]

Xyris curtissii Malme, Curtiss's Yellow-eyed Grass. Cp (GA, NC, SC, VA), Pd (SC): savannas; rare (NC Watch List, VA Rare). July-August. Se. NC (VA?) south to $n$. FL and west to s. AR and ec. TX, primarily on the Coastal Plain; disjunct in s. NJ. [= RAB, $\mathrm{G} ;==$. difformis Chapman var. curtissii (Malme) Kral -- C, FNA, GW, K, X; > X. bayardii Fernald -- F ; > X. curtissii -F , in a narrower sense; $X$. neglecta Small -- S]

Xyris difformis Chapman. Cp (GA, NC, SC, VA), Pd (GA, NC, SC), Mt (NC): savannas, roadside ditches, pond margins, other wet habitats; common (VA Watch List). August-October. New England and s. Canada south to n. FL and ec. TX. [= X; = $X$. difformis Chapman var. difformis -- C, FNA, GW, K, Y; < X. difformis -- RAB, F, G, S, W, in a broader sense]

Xyris drummondii Malme, Drummond's Yellow-eyed Grass. Cp (GA): wet pine flatwoods, ditches; uncommon. se. GA south to Panhandle FL, west to s. MS. [= FNA, GW, K, X, Z]

Xyris elliottii Chapman, Elliott's Yellow-eyed Grass. Cp (GA, SC): margins of drawdown zones of clay-based Carolina bays, limesinks and flatwoods swales, wet savannas; uncommon. May-June. E. SC south to the Gulf Coastal Plain. [= RAB, FNA, GW, $\mathrm{K}, \mathrm{S}, \mathrm{X}]$

Xyris fimbriata Elliott, Giant Yellow-eyed Grass. Cp (GA, NC, SC, VA): in mucky or sandy soils of upland depression ponds, also along sandhill streams, impoundments and in deep muck of sandhills seepage slopes often just below the zone occupied by Xyris chapmanii; common (VA Rare). September-October. Se. VA south to c. FL, west (interruptedly) to se. TX; disjunct in s. NJ, DE, and c. TN. [= RAB, C, F, FNA, G, GW, K, S, X]

Xyris flabelliformis Chapman, Savanna Yellow-eyed Grass. Cp (GA, NC, SC): wet sands of pinelands, especially seasonally wet, open, white sands of spodosol longleaf pine flatwoods (Leon series soils), margins of Carolina bay sandrims; rare (NC Rare, SC Rare). May-June. Se. NC south to s. FL, west to se. LA, on the Coastal Plain. [= RAB, FNA, GW, K, S, X]

Xyris floridana (Kral) Bridges \& Orzell, Florida Yellow-eyed Grass. Cp (GA, NC, SC): savannas, wet pine flatwoods, ditches; rare (NC Rare, SC Rare). August. Se. NC south to s. FL, west to se. LA. [= X; = Xyris difformis Chapman var. floridana Kral -FNA, GW, K, Y]

Xyris iridifolia Chapman, Irisleaf Yellow-eyed Grass. Cp (GA, NC, SC, VA): marshes, upland pond margins, blackwater river channels, floodplain pools, other wet habitats; uncommon (NC Watch List, Va Rare). July-September. Se. VA south to $n$. FL, west to e. TX; disjunct in c. TN. [= RAB, C, GW, S; = X. laxifolia Mart. var. iridifolia (Chapman) Kral -- FNA, K, X]

Xyris jupicai L.C. Richard. Cp (GA, NC, SC, VA), Pd (NC), Mt (VA): ditches, various wet habitats; common. July-September. NJ south to s. FL, west to TN, AR, OK, and TX, and in Latin America. Sometimes weedy and considered by some to be adventive from further south. At least some populations in our area are native and may additionally be worthy of taxonomic recognition as distinct from "true" X. jupicai (P. McMillan, pers. comm., 2003). [= RAB, C, FNA, G, GW, K, W, X; > X. elata Chapman -- G, S; > X. communis Kunth -- S; > X. caroliniana -- F, G, S, misapplied]

Xyris platylepis Chapman. Cp (GA, NC, SC, VA): sandhill seeps, savannas, ditches; common (VA Watch List). JulySeptember. Se. VA south to s. FL, west to se. LA; disjunct in sw. LA and se. TX. [= RAB, C, F, FNA, G, GW, K, S, X]

Xyris scabrifolia Harper, Roughleaf Yellow-eyed Grass. Cp (GA, NC, SC): sandhill seepage bogs and wet pine savannas; rare (US Species of Concern, NC Rare). Sc. and se. NC south to panhandle FL, west to s. AL and s. MS; disjunct in sw. LA-se. TX. $X$. chapmanii is a taxon distinct from X. scabrifolia. [ $=\mathrm{GW}, \mathrm{S}, \mathrm{X} ;<X$. scabrifolia - FNA, K, in part only (also see $X$. chapmanii)]

Xyris serotina Chapman. Cp (GA, NC, SC): depression meadows, ultisol savannas (Lynchburg/Rains complex or Eulonia/Oketee), ditches; rare (NC Rare, SC Rare). September. Se. NC south to c. FL, west to s. MS, in the Coastal Plain. Reported for our area by Kral (1966b) and relocated by B.A. Sorrie. [= RAB, FNA, GW, K, S, X]

Xyris smalliana Nash, Small's Yellow-eyed Grass. Cp (GA, NC, SC), Mt (SC): pond margins, ditches; uncommon (NC Watch List). July-August. ME south to FL, west to s. MS; disjunct to se. TX. [= RAB, C, FNA, GW, K, S, W, X; > X. congdonii Small -- F; > $X$. smalliana -F , in a narrow sense; $>X$. smalliana var. olneyi (Wood) Gleason -- G ]

Xyris stricta Chapman. Cp (GA, NC, SC): depression ponds, depression meadows, borrow pits, ultisol savannas and ditches; rare. July-September. SC south to n. FL, west to s. MS and se. LA. Reported for our area by Kral (1966b). P. McMillan (pers. comm.) reports this species from a number of locations in the outer Coastal Plain of NC and SC. [= GW, K, S, X; = $X$. stricta var. stricta - FNA]

Xyris torta J.M. Smith, Mountain Yellow-eyed Grass. Mt, Pd (GA, NC, SC, VA), Cp (SC, VA): mountain bogs, marshes, ditches; uncommon (SC Rare). June-August. NH west to WI, south to e. VA, e. NC, w. SC, c. GA, LA, OK, and TX. This is our only species of Xyris not strongly associated with the Coastal Plain. [= RAB, C, F, FNA, G, GW, K, S, W; > X. torta var. macropoda

Fernald -- F; > X. torta var. torta - F]
Xyris isoetifolia Kral. Bogs, savannas, and depression pond margins. FL Panhandle and s. AL. [= FNA, GW, K, X] \{add synonymy\}

Xyris longisepala Kral. Depression pond margins. Endemic to the FL Panhandle and s. AL, will key close to $X$. smalliana because ot its long, exserted lateral sepals. It differs in being a more delicate plant, with leaves less than 25 cm long and 3 mm wide (vs. more than 30 cm long and 5 mm wide). [= FNA, K, X] \{not yet keyed\}

Xyris louisianica Bridges \& Orzell, ranging from the FL Panhandle and GA west to se. TX, will key most closely to $X$. stricta. [= K, X; = X. stricta Chapman var. obscura Kral - FNA]

Xyris tennesseensis Kral, Tennessee Yellow-eyed Grass. Mt (GA): seepy, boglike areas over limestone; rare (US Endangered, GA Endangered). TN, AL, and nw. GA (Jones \& Coile 1988). See Kral (1978b). [= FNA, K] \{not yet keyed; add synonymy\}

## ZANNICHELLIACEAE Dumortier 1829 (Horned Pondweed Family)

A family of 4 genera and about 10-12 species, aquatic herbs, nearly cosmopolitan. Probably better included in the Potamogetonaceae (Angiosperm Phylogeny Group 2003). References: Haynes \& Hellquist in FNA (2000); Haynes \& Holm-Nielsen (1987)=Z; Haynes, Les, \& Holm-Nielsen in Kubitzki (1998b).

## Zannichellia Linnaeus 1753 (Horned Pondweed)

A genus of about 5 species, aquatic herbs, nearly cosmopolitan. References: Haynes \& Hellquist in FNA (2000); Haynes \& HolmNielsen (1987)=Z.

Zannichellia palustris Linnaeus, Horned Pondweed. Cp (NC, VA), Mt (VA), \{GA\}: fresh or brackish water; common. February-October. The species occurs throughout much of the world. Zannichellia is sometimes confused with other aquatics, such as Ruppia and narrow-leaved Potamogeton. Potamogeton has at least some leaves alternate; Zannichellia and Ruppia are opposite-leaved. Zannichellia lacks the abruptly broadened sheath of Najas. Also, the seeds are flattened in Zannichellia, and toothed down one side; Najas has a cylindric or elliptic fruit. Zannichellia has longer leaves ( $3-10 \mathrm{~cm}$ long) than Najas (less than 4 cm long). [= RAB, C, FNA, G, GW, K, S, W, Z; > Z. palustris var. major (Hartman) W.D.J. Koch -- F; > Z. palustris var. palustris - F]

ZOSTERACEAE Dumortier 1829 (Eelgrass Family)
A family of 3 genera and about 18 species, nearly cosmopolitan in distribution. References: Haynes in FNA (2000); Kuo \& McComb in Kubitzki (1998b).

## Zostera Linnaeus 1753 (Eelgrass)

A genus of about 12 species, aquatic herbs, of nearly cosmopolitan distribution. References: Haynes in FNA (2000); Crow \& Hellquist (2000)=Y; Kuo \& McComb in Kubitzki (1998b); Green \& Short=Z.

Zostera marina Linnaeus var. stenophylla Ascherson \& Graebner, Eelgrass. Cp (NC,VA): estuarine waters; common. February-March. The species occurs in Eurasia and North America. Var. stenophylla is North American, and ranges south along the Atlantic coast to NC and allegedly to FL (though reports from that state are apparently not substantiated and may be based on misidentification of other aquatics). [= F, G, Y; < Z. marina -- RAB, C, FNA, K, S, Z, infraspecific taxa not distinguished]

[^0]:    1 Flowers and fruits on pedicels (3-) 5-20 mm long
    S. portulacastrum

    1 Flowers and fruits sessile (or on pedicels to 1 mm long).
    2 Stamens numerous, in fascicles; leaves $3-6 \mathrm{~cm}$ long, $10-20 \times$ as long as wide; [rare waif] . . . . . . . . . . . . . S. crithmoides
    2 Stamens 5, distinct; leaves 1-3.5 cm long, 3-10× as long as wide; [native] . . . . . . . . . . . . . . . . . . . . . . . . . S. maritimum

    * Sesuvium crithmoides Welwitsch, Tropical Sea-purslane. Cp (GA): disturbed area; rare, waif, native of Africa. Reported for GA by Small (1933) and Boetsch (2002) based on collections in Brunswick, GA in 1902 by Roland Harper. It is native to Africa. [= FNA, K, S, Z]

    Sesuvium maritimum (Walter) Britton, Sterns, \& Poggenburg, Small Sea-purslane, Slender Sea-purslane. Cp (GA, NC, SC, VA): island end flats and sea beaches, salt flats; uncommon (NC Watch List, VA Watch List). May-December. NY south to s. FL, west to TX; also in the West Indies. [= RAB, C, F, FNA, G, GW, K, S, Z]

    Sesuvium portulacastrum (Linnaeus) Linnaeus, Large Sea-purslane, Shoreline Sea-purslane. Cp (GA, NC, SC): island end flats and sea beaches; uncommon (NC Watch List). May-December. A pantropical coastal species, in North America from e. NC south to s. FL, west to e. TX; also in the West Indies and south into the tropics (introduced on ballast in se. PA). [= RAB, FNA, GW, $\mathrm{K}, \mathrm{S}, \mathrm{Z}]$

[^1]:    * Conyza bonariensis (Linnaeus) Cronquist, South American Horseweed. Cp (GA, NC, SC, VA), Pd (SC): fields, disturbed

[^2]:    1 Leaves larger near or slightly below mid-stem; leaves toothed only
    L. lacustre

    1 Leaves larger towards the base of the plant; leaves usually at least partly lobed or pinnatisect, as well as toothed. L. vulgare

    * Leucanthemum lacustre (Brotero) Sampaio, Portuguese Daisy. Cp (NC, SC, VA), Pd (NC, SC): old fields, ditches, disturbed areas; rare, introduced from Europe. June-July. [= K, Z; = Chrysanthemum lacustre Brotero -- RAB, C, SE]
    * Leucanthemum vulgare Lamarck, Oxeye Daisy, White Daisy, Common Daisy, Marguerite. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): fields, roadsides, pastures, disturbed areas; common, introduced from Eurasia. April-July. [= K, Z; = Chrysanthemum leucanthemum Linnaeus -- RAB, C, G, SE, W; > Ch. leucanthemum var. pinnatifidum Lecoq \& Lamotte -- F; = Leucanthemum leucanthemum (Linnaeus) Rydberg -- S]

[^3]:    1 Phyllaries in 2 series; phyllaries $3.5-8 \mathrm{~mm}$ wide; inner phyllaries $12-20 \mathrm{~mm}$ long; plant annual or biennial
    P. echioides

    1 Phyllaries imbricate; phyllaries <3 mm wide; inner phyllaries $11-13 \mathrm{~mm}$ long; plant biennial to perennial ..... P. hieracioides

[^4]:    1 Leaf margins smooth, entire; ray flowers 8 -13 per head; disk flowers 14-25 per head; pappus (2.5-) 3.0-3.5 mm long ....... S. pulchra

    1 Leaf margins (of the basal leaves at least) scabrous-margined, also often toothed; ray flowers 2-7 per head; disk flowers 6-16

[^5]:    1 All spikelets unisexual, plants usually dioecious; [introduced species] . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . B. dactyloides
    1 Lowest floret in each spikelet bisexual, the upper staminate or sterile; [introduced or native species].
    2 Panicle branches deciduous; disarticulation occurring at the base of the branch (the branch therefore falling whole); spikelets 2-3 per branch, appressed to the branch; [native species of limestone habitats, also with introduced populations]; [subgenus Bouteloua]
    B. curtipendula var. curtipendula

    2 Panicle branches persistent; disarticulation occurring above the glumes (the individual florets therefore falling); spikelets $>6$ per branch, pectinately disposed; [rare introductions]; [subgenus Chondrosum].

[^6]:    1 Plant not rhizomatous; upper culm internodes velvety-villous; lemma awn recurved
    H. Ianatus

[^7]:    Luziola bahiensis (Steudel) Hitchcock. Streams and riverbanks. Apparently native, in AL, FL, MS. See Anderson \& Hall (1993). [= HC, K] \{not keyed\}

    * Luziola peruviana Gmelin, Peruvian Water Grass. Disturbed wet areas. Apparently an introduction, occurring in disturbed situations. See Anderson \& Hall (1993). [= HC, K] \{not keyed\}
